   - If the request matches a permit rule, the gateway forwards the request.
   - If the request matches a deny rule, the gateway drops the request.
   - If the request does not match any rules in the URI ACL or if no URI ACL is available, the gateway proceeds to step 3.
3. Matches the request against rules in the advanced ACL:

- If the request matches a permit rule, the gateway forwards the request.
- If the request matches a deny rule, the gateway drops the request.
- If the request does not match any rules in the advanced ACL or if no advanced ACL is available, the gateway drops the request.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Configure policy group **abcpg** to use URI ACL **abcuriacl1** for Web access filtering.

```
<Sysname> system-view
[Sysname] sslvpn context abc
[Sysname-sslvpn-context-abc] policy-group abcpg
[Sysname-sslvpn-context-abc-policy-group-abcpg] filter web-access uri-acl abcuriacl1
```

Related commands

filter web-access acl

force-logout

Use **force-logout** to force online users to log out.

Syntax

force-logout [**all** | **session** *session-id* | **user** *user-name*]

Views

SSL VPN context view

Predefined user roles

network-admin

context-admin

Parameters

all: Logs out all users.

session *session-id*: Logs out all users in a session. The *session-id* argument specifies the session ID in the range of 1 to 4294967295.

user *user-name*: Logs out a user. The *user-name* argument specifies the username, a case-sensitive string of 1 to 63 characters.

Examples

Log out all users in session 1.

```
<Sysname> system-view
[Sysname] sslvpn context ctx1
[Sysname-sslvpn-context-ctx1] force-logout session 1
```

force-logout max-onlines enable

force-logout max-onlines enable to enable the force logout feature.

undo force-logout max-onlines enable to disable the force logout feature.

Syntax

force-logout max-onlines enable

undo force-logout max-onlines enable

Default

The force logout feature is disabled.

Views

SSL VPN context view

Predefined user roles

network-admin

context-admin

Usage guidelines

By default, a user cannot log in if the number of logins using the account reaches the limit.

When a login is attempted but logins using the account reach the maximum, this feature logs out the user with the longest idle time to allow the new login.

Examples

Enable the force logout feature.

```
<Sysname> system-view
[Sysname] sslvpn context ctx1
[Sysname-sslvpn-context-ctx1] force-logout max-onlines enable
```

gateway (SMS gateway authentication view)

Use **gateway** to specify an SMS gateway for SMS authentication.

Use **undo gateway** to restore the default.

Syntax

gateway *sms-gateway-name*

undo gateway

Default

No SMS gateway is specified for SMS authentication.

Views

SMS gateway authentication view

Predefined user roles

network-admin

context-admin

Parameters

sms-gateway-name: Specifies an SMS gateway by its name, a case-insensitive string of 1 to 31 characters. Valid characters are letters, digits, and underscores (_).

Examples

Specify SMS gateway **gw1** in SMS gateway authentication view.

```
<Sysname> system-view
[Sysname] sslvpn context ctx1
[Sysname-sslvpn-context-ctx1] sms-auth sms-gw
[Sysname-sslvpn-context-ctx1-sms-auth-sms-gw] gateway gw1
```

gateway (SSL VPN context view)

Use **gateway** to associate an SSL VPN context with an SSL VPN gateway.

Use **undo gateway** to remove associated SSL VPN gateways.

Syntax

gateway *gateway-name* [**domain** *domain-name* | **virtual-host** *virtual-host-name*]

undo gateway [*gateway-name*]

Default

An SSL VPN context is not associated with an SSL VPN gateway.

Views

SSL VPN context view

Predefined user roles

network-admin

context-admin

Parameters

gateway-name: Specifies an SSL VPN gateway by its name, a case-insensitive string of 1 to 31 characters. Valid characters are letters, digits, and underscores (_).

domain *domain-name*: Specifies a domain name for the SSL VPN context, a case-insensitive string of 1 to 127 characters.

virtual-host *virtual-host-name*: Specifies a virtual host name for the SSL VPN context, a case-insensitive string of 1 to 127 characters. Valid characters are letters, digits, underscores (_), hyphens (-), and dots (.).

Usage guidelines

When you associate an SSL VPN context with an SSL VPN gateway, follow these guidelines:

- Make sure the context has a domain name or virtual host name different than any existing contexts associated with the SSL VPN gateway.

  The SSL VPN gateway uses the domain name or virtual host name that a remote user entered to determine the SSL VPN context to which the user belongs.
- If you do not specify a domain name or virtual host name for the context, you cannot associate other SSL VPN contexts with the SSL VPN gateway.

You can associate an SSL VPN context with a maximum of 10 SSL VPN gateways.

Examples

Associate SSL VPN context **ctx1** with SSL VPN gateway **gw1**, and specify the domain name as **domain1** for the context.

```
<Sysname> system-view
[Sysname] sslvpn context ctx1
[Sysname-sslvpn-context-ctx1] gateway gw1 domain domain1
```

Related commands

display sslvpn context

heading

Use **heading** to configure a heading for a URL list.

Use **undo heading** to restore the default.

Syntax

heading *string*

undo heading

Default

The heading of a URL list is **Web**.

Views

URL list view

Predefined user roles

network-admin

context-admin

Parameters

string: Specifies a URL list heading, a case-sensitive string of 1 to 31 characters.

Examples

Specify **urlhead** as the heading of URL list **url**.

```
<Sysname> system-view
[Sysname] sslvpn context ctx1
[Sysname-sslvpn-context-ctx1] url-list url
[Sysname-sslvpn-context-ctx1-url-list-url] heading urlhead
```

Related commands

sslvpn context

url-list

http-redirect

Use **http-redirect** to enable HTTP redirection.

Use **undo http-redirect** to disable HTTP redirection.

Syntax

http-redirect [**port** *port-number*]

undo http-redirect

Default

HTTP redirection is disabled. An SSL VPN gateway does not process HTTP traffic.

Views

SSL VPN gateway view

Predefined user roles

network-admin

context-admin

Parameters

port-number: Specifies the HTTP port number to listen to, a value of 80 (the default) or in the range of 1025 to 65535.

Usage guidelines

This command enables an SSL VPN gateway to perform the following operations:

1. Listen to an HTTP port.
2. Redirect HTTP requests with the port number to the port used by HTTPS.
3. Send redirection packets to clients.

Examples

Enable HTTP redirection for HTTP port 1025.

```
<Sysname> system-view
[Sysname] sslvpn gateway gateway1
[Sysname-sslvpn-gateway-gateway1] http-redirect port 1025
```

idle-cut traffic-threshold

Use **idle-cut traffic-threshold** to set the SSL VPN session idle-cut traffic threshold.

Use **undo idle-cut traffic-threshold** to restore the default.

Syntax

idle-cut traffic-threshold *kilobytes*

undo idle-cut traffic-threshold

Default

The SSL VPN session idle-cut traffic threshold is 0 Kilobytes. An SSL VPN session will be disconnected if no traffic is transmitted within the session idle timeout.

Views

SSL VPN context view

Predefined user roles

network-admin

context-admin

Parameters

kilobytes: Specifies the session idle-cut traffic threshold in Kilobytes. The value range is 1 to 4294967295.

Usage guidelines

The SSL VPN session idle-cut traffic threshold refers to the minimum traffic required in the session idle timeout interval for a session not to be disconnected as an idle session.

After the idle-cut traffic threshold is set, the system counts the traffic transmitted in each SSL VPN session at intervals specified by the **timeout idle** command. If the traffic is less than the idle-cut traffic threshold, the system determines the session to be idle and disconnects the session.

If you change the setting of the **idle-cut traffic-threshold** or **timeout idle** command in an SSL VPN context, all session idle-cut traffic counters in the SSL VPN context will be cleared.

Examples

Set the SSL VPN session idle-cut traffic threshold to 1000 Kilobytes in SSL VPN context **ctx1**.

```
<Sysname> system-view
```

```
[Sysname] sslvpn context ctx1
[Sysname-sslvpn-context-ctx1] idle-cut traffic-threshold 1000
```

Related commands

timeout idle

include

Use **include** to add an included route to a route list.

Use **undo include** to delete an included route from a route list.

Syntax

include *ip-address* { *mask* | *mask-length* }

undo include *ip-address* { *mask* | *mask-length* }

Default

No included routes exist.

Views

Route list view

Predefined user roles

network-admin

context-admin

Parameters

ip-address: Specifies the destination IP address of the route. It cannot be a multicast, broadcast, or loopback address. The specified IP address must be the address of the network segment where the internal servers reside.

mask: Specifies the subnet mask.

mask-length: Specifies the mask length of the route, an integer in the range of 0 to 32.

Usage guidelines

To permit user access to specific network nodes or segments behind an SSL VPN gateway, configure included routes for those nodes or segments.

When a client accesses an SSL VPN gateway in IP access mode, the SSL VPN gateway issues the included routes to the client. The client adds the included routes to the local routing table, using the VNIC as the output interface. Traffic that matches the included routes are sent to the SSL VPN gateway through the VNIC.

You can add multiple included routes to a route list.

If you execute the **include** and **exclude** commands to add the same route to a route list, the most recent configuration takes effect.

Examples

Add included route 10.0.0.0/8 to route list **rtlist**.

```
<Sysname> system-view
[Sysname] sslvpn context ctx1
[Sysname-sslvpn-context-ctx1] ip-route-list rtlist
[Sysname-sslvpn-context-ctx1-route-list-rtlist] include 10.0.0.0 8
```

Related commands

exclude

interface sslvpn-ac

Use **interface sslvpn-ac** to create an SSL VPN AC interface and enter its view, or enter the view of an existing SSL VPN AC interface.

Use **undo interface sslvpn-ac** to delete an SSL VPN AC interface.

Syntax

interface sslvpn-ac *interface-number*

undo interface sslvpn-ac *interface-number*

Default

No SSL VPN AC interfaces exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

interface-number: Specifies an SSL VPN AC interface number in the range of 0 to 4095.

Examples

Create SSL VPN AC 1000 and enter its view.

```
<Sysname>system-view
[Sysname]interface SSLVPN-AC 1000
[Sysname-SSLVPN-AC1000]
```

ip address

Use **ip address** to configure an IPv4 address and a port number for an SSL VPN gateway.

Use **undo ip address** to restore the default.

Syntax

ip address *ip-address* [**port** *port-number*]

undo ip address

Default

An SSL VPN gateway uses IPv4 address 0.0.0.0 and port number 443.

Views

SSL VPN gateway view

Predefined user roles

network-admin

context-admin

Parameters

ip-address: Specifies an IP address for the SSL VPN gateway, in dotted decimal notation.

port *port-number*: Specifies a port number for the SSL VPN gateway. The port number is 443 (the default value) or in the range of 1025 to 65535.

Usage guidelines

A remote user uses the IPv4 address and port number configured by this command to access an SSL VPN gateway.

The specified IPv4 address must be the IP address of an interface on the gateway device and is reachable from clients and internal servers.

If the gateway uses the default address (0.0.0.0), make sure its port number is different from the port number of the HTTPS server on the device.

The IPv4 address and port number of an SSL VPN gateway cannot both be the same as those of the HTTPS server on the device. Otherwise, you can access only the SSL VPN Web interface but cannot access the device management Web interface by using those IPv4 address and port number.

If you execute this command multiple times, the most recent configuration takes effect.

An SSL VPN gateway can use an IPv4 address, an IPv6 address, but not both. If you configure both IPv4 and IPv6 addresses, the most recent configuration takes effect. (The IPv6 address is configured by using the **ipv6 address** command.)

Examples

Configure the IPv4 address of SSL VPN gateway **gw1** as 10.10.1.1 and the port number as 8000.

```
<Sysname> system-view
[Sysname] sslvpn gateway gw1
[Sysname-sslvpn-gateway-gw1] ip address 10.10.1.1 port 8000
```

Related commands

ipv6 address

ip-route-list

Use **ip-route-list** to create a route list for an SSL VPN context and enter its view, or enter the view of an existing route list.

Use **undo ip-route-list** to delete a route list.

Syntax

ip-route-list *list-name*

undo ip-route-list *list-name*

Default

No route lists exist.

Views

SSL VPN context view

Predefined user roles

network-admin

context-admin

Parameters

list-name: Specifies a name for the route list, a case-insensitive string of 1 to 31 characters.

Usage guidelines

You can add routes to a route list. The routes can be issued to IP access clients for them to access internal servers behind the SSL VPN gateway.

You cannot delete a route list that is used by a policy group. To delete the route list, execute the **undo ip-tunnel access-route** command to remove the configuration and then execute the **undo ip-route-list** command.

Examples

In SSL VPN context **ctx1**, create a route list named **rtlist** and enter its view.

```
<Sysname> system-view
[Sysname] sslvpn context ctx1
[Sysname-sslvpn-context-ctx1] ip-route-list rtlist
[Sysname-sslvpn-context-ctx1-route-list-rtlist]
```

Related commands

ip-tunnel access-route

ip-tunnel access-route

Use **ip-tunnel access-route** to specify the routes to be issued to clients.

Use **undo ip-tunnel access-route** to restore the default.

Syntax

ip-tunnel access-route { *ip-address* { *mask-length* | *mask* } | **force-all** | **ip-route-list** *list-name* }

undo ip-tunnel access-route

Default

No routes to be issued to clients are specified.

Views

SSL VPN policy group view

Predefined user roles

network-admin

context-admin

Parameters

ip-address { *mask-length* | *mask* }: Configures a route to be issued to a client. The *ip-address* argument specifies the destination address of the route. It cannot be a multicast, broadcast, or loopback address. The *mask-length* argument specifies the mask length of the route, in the range of 0 to 32.

force-all: Forces all traffic to be sent to the SSL VPN gateway.

ip-route-list *list-name*: Issues routes in the specified route list to clients. The *list-name* argument specifies the route list name, a case-insensitive string of 1 to 31 characters. The specified route list must have been created by using the **ip-route-list** command.

Usage guidelines

When a client accesses an SSL VPN gateway in IP access mode, the SSL VPN gateway issues the configured route or the specified routes to the client. The client adds the routes, using the VNIC as the output interface. Packets from the client to the internal servers match the routes, and therefore are sent to the SSL VPN gateway through the VNIC.

To issue multiple routes to a client, execute the **ip-tunnel access-route ip-route-list** *list-name* command. To issue a route to a client, execute the **ip-tunnel access-route** *ip-address* { *mask-length* | *mask* } command.

After you execute the **ip-tunnel access-route force-all** command, the SSL VPN gateway issues a default route to the SSL VPN client. The default route uses the VNIC as the output interface and has the highest priority among all default routes on the client. Packets for destinations not in the routing table are sent to the SSL VPN gateway through the VNIC. The SSL VPN gateway monitors the SSL VPN client in real time. It does not allow the client to delete the default route or add a default route with a higher priority.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

In the view of policy group **pg1**, configure the SSL VPN gateway to issue routes in route list **rtlist** to a client.

```
<Sysname> system-view
[Sysname] sslvpn context ctx1
[Sysname-sslvpn-context-ctx1] ip-route-list rtlist
[Sysname-sslvpn-context-ctx1-route-list-rtlist] include 10.0.0.0 8
[Sysname-sslvpn-context-ctx1-route-list-rtlist] include 20.0.0.0 8
[Sysname-sslvpn-context-ctx1-route-list-rtlist] quit
[Sysname-sslvpn-context-ctx1] policy-group pg1
[Sysname-sslvpn-context-ctx1-policy-group-pg1] ip-tunnel access-route ip-route-list
rtlist
```

Related commands

ip-route-list

ip-tunnel address-pool (SSL VPN context view)

Use **ip-tunnel address-pool** to specify an address pool for IP access in an SSL VPN context.

Use **undo ip-tunnel address-pool** to restore the default.

Syntax

ip-tunnel address-pool *pool-name* **mask** { *mask-length* | *mask* }

undo ip-tunnel address-pool

Default

No address pool is specified for IP access in an SSL VPN context.

Views

SSL VPN context view

Predefined user roles

network-admin

context-admin

Parameters

pool-name: Specifies an address pool by its name, a case-insensitive string of 1 to 31 characters.

mask { *mask-length* | *mask* }: Specifies the mask length or mask of the address pool. The value range for the mask length is 1 to 30.

Usage guidelines

When a client accesses an SSL VPN gateway in IP access mode, the SSL VPN gateway allocates an IP address to the client from either of the following address pools:

- Address pool specified for the policy group authorized to the client.
- Address pool specified for the SSL VPN context. This address pool is used only if no address pool is specified for the policy group authorized to the client.

If no free address is available in the address pool or the address pool does not exist, address allocation to the client will fail and the client's IP access request will be rejected.

If you specify a nonexistent address pool, the pool is effective for address allocation after it is created.

You can specify only one address pool for an SSL VPN context. If you execute this command multiple times, the most recent configuration takes effect.

For IP access users to access the SSL VPN gateway correctly, make sure the IP addresses in the address pool do not conflict with the IP addresses used on the device.

Examples

Specify address pool **pool1** for IP access.

```
<Sysname> system-view
[Sysname] sslvpn context ctx
[Sysname-sslvpn-context-ctx] ip-tunnel address-pool pool1 mask 24
```

Related commands

sslvpn ip address-pool

ip-tunnel address-pool (SSL VPN policy group view)

Use **ip-tunnel address-pool** to specify an address pool for IP access in an SSL VPN policy group.

Use **undo ip-tunnel address-pool** to restore the default.

Syntax

ip-tunnel address-pool *pool-name* **mask** { *mask-length* | *mask* }

undo ip-tunnel address-pool

Default

No address pool is specified for IP access in an SSL VPN policy group.

Views

SSL VPN policy group view

Predefined user roles

network-admin

context-admin

Parameters

pool-name: Specifies an address pool by its name, a case-insensitive string of 1 to 31 characters.

mask { *mask-length* | *mask* }: Specifies the mask length or mask of the address pool. The value range for the mask length is 1 to 30.

Usage guidelines

When a client accesses an SSL VPN gateway in IP access mode, the SSL VPN gateway allocates an IP address to the client from either of the following address pools:

- Address pool specified for the policy group authorized to the client.
- Address pool specified for the SSL VPN context. This address pool is used only if no address pool is specified for the policy group authorized to the client.

If no free address is available in the address pool or the address pool does not exist, address allocation to the client will fail and the client's IP access request will be rejected.

If you specify a nonexistent address pool, the pool is effective for address allocation after it is created.

You can specify only one address pool for an SSL VPN policy group. If you execute this command for an SSL VPN policy group multiple times, the most recent configuration takes effect.

For IP access users to access the SSL VPN gateway correctly, make sure the IP addresses in the address pool do not conflict with the IP addresses used on the device.

Examples

Specify address pool **pool1** for IP access in SSL VPN policy group **pg1**.

```
<Sysname> system-view
[Sysname] sslvpn context ctx1
[Sysname-sslvpn-context-ctx1] policy-group pg1
[Sysname-sslvpn-context-ctx1-policy-group-pg1] ip-tunnel address-pool pool1 mask 24
```

Related commands

sslvpn ip address-pool

ip-tunnel bind address

Use **ip-tunnel bind address** to bind IP addresses to an SSL VPN user.

Use **undo ip-tunnel bind address** to restore the default.

Syntax

ip-tunnel bind address { *ip-address-list* | **auto-allocate** *number* }

undo ip-tunnel bind address

Default

An SSL VPN user is not bound to IP addresses.

Views

SSL VPN user view

Predefined user roles

network-admin

context-admin

Parameters

ip-address-list: Specifies an IP address list, a string of 1 to 255 characters, which can contain digits, dots (.), commas (,), and hyphens (-). The IP address list specifies comma-separated IP address items. Each item specifies an IP address or specifies a range of IP addresses in the form of

start IP address-end IP address. For example, 10.1.1.5,10.1.1.10-10.1.1.20. The IP address list can contain a maximum of 10000 addresses excluding multicast addresses, broadcast addresses, and loopback addresses.

auto-allocate *number*: Enables the SSL VPN gateway to automatically bind the specified number of free IP addresses to the user. The value range for the *number* argument is 1 to 10.

Usage guidelines

When an SSL VPN user accesses the SSL VPN gateway in IP access mode, the SSL VPN gateway must assign an IP address to the user. This command allows you to specify the IP addresses that can be assigned to a user.

You can bind IP addresses to an SSL VPN user as follows:

- Use the *ip-address-list* argument to bind a list of IP addresses to the user.

  When the user accesses the SSL VPN gateway in IP access mode, the SSL VPN gateway assigns a bound IP address to the user.

  If an IP address has been assigned to another user, the SSL VPN gateway terminates the connection for that user and releases the IP address.
- Use the **auto-allocate** *number* option to enable the SSL VPN gateway to automatically bind the specified number of free addresses in the IP access address pool to the user.

The IP addresses to be bound to an SSL VPN user must meet the following requirements:

- If an IP access address pool is specified for the SSL VPN policy group authorized to the user, the IP addresses must exist in the address pool.
- If no address pool is specified for the SSL VPN policy group, the IP addresses must exist in the address pool specified for the SSL VPN context of the user.

You can bind the same IP address to different SSL VPN users only when the SSL VPN contexts of the users are associated with different VPN instances.

If you configure this command multiple times, the most recent configuration takes effect.

Examples

Bind IP addresses 10.1.1.5, 10.1.1.10 through 10.1.1.20, and 10.1.1.30 to SSL VPN user **user1**.

```
<Sysname> system-view
[Sysname] sslvpn context ctx
[Sysname-sslvpn-context-ctx] user user1
[Sysname-sslvpn-context-ctx-user-user1] ip-tunnel bind address
10.1.1.5,10.1.1.10-10.1.1.20,10.1.1.30
```

Related commands

user

ip-tunnel dns-server

Use **ip-tunnel dns-server** to specify a DNS server for IP access.

Use **undo ip-tunnel dns-server** to restore the default.

Syntax

ip-tunnel dns-server { **primary** | **secondary** } *ip-address*

undo ip-tunnel dns-server { **primary** | **secondary** }

Default

No DNS servers are specified for IP access.

Views

SSL VPN context view

Predefined user roles

network-admin

context-admin

Parameters

primary: Specifies the primary DNS server.

secondary: Specifies the secondary DNS server.

ip-address: Specifies the IP address of the DNS server. It cannot be a multicast, broadcast, or loopback address.

Examples

Specify the primary DNS server 1.1.1.1 for IP access.

```
<Sysname> system-view
[Sysname] sslvpn context ctx
[Sysname-sslvpn-context-ctx] ip-tunnel dns-server primary 1.1.1.1
```

ip-tunnel interface

Use **ip-tunnel interface** to specify an SSL VPN AC interface for IP access in an SSL VPN context.

Use **undo ip-tunnel interface** to restore the default.

Syntax

ip-tunnel interface sslvpn-ac *interface-number*

undo ip-tunnel interface

Default

No SSL VPN AC interface is specified for IP access in an SSL VPN context.

Views

SSL VPN context view

Predefined user roles

network-admin

context-admin

Parameters

sslvpn-ac *interface-number*: Specifies the number of an SSL VPN AC interface. The interface must have been created.

Usage guidelines

The SSL VPN gateway uses the specified SSL VPN AC interface to communicate with SSL VPN users in IP access mode. It uses the SSL VPN AC interface to forward packets sent by the user to remote servers and to forward the servers' replies back to the user.

Examples

Specify SSL VPN AC 100 for IP access.

```
<Sysname> system-view
[Sysname] sslvpn context ctx
```

```
[Sysname-sslvpn-context-ctx] ip-tunnel interface sslvpn-ac 100
```

Related commands

interface sslvpn-ac

ip-tunnel keepalive

Use **ip-tunnel keepalive** to set the keepalive interval for IP access.

Use **undo ip-tunnel keepalive** to restore the default.

Syntax

ip-tunnel keepalive *seconds*

undo ip-tunnel keepalive

Default

The keepalive interval is 30 seconds for IP access.

Views

SSL VPN context view

Predefined user roles

network-admin

context-admin

Parameters

seconds: Specifies the keepalive interval in the range of 0 to 600 seconds. If the interval is set to 0 seconds, a client does not send keepalive messages to the SSL VPN gateway.

Usage guidelines

A client sends keepalive messages to the SSL VPN gateway to maintain sessions between them.

If an SSL VPN gateway does not receive any data or keepalive messages from a client during the session idle timeout time, it terminates the session with the client.

Set the keepalive interval to be shorter than the session idle timeout timer configured by the **timeout idle** command.

Examples

Set the keepalive interval to 50 seconds for SSL VPN context **ctx**.

```
<Sysname> system-view
[Sysname] sslvpn context ctx
[Sysname-sslvpn-context-ctx] ip-tunnel keepalive 50
```

ip-tunnel log

Use **ip-tunnel log** to enable logging for IP address allocations and releases, IP access connection close events, or IP access packet drop events.

Use **undo ip-tunnel log** to disable logging for IP address allocations and releases, IP access connection close events, or IP access packet drop events.

Syntax

ip-tunnel log { **address-alloc-release** | **connection-close** | **packet-drop** }

undo ip-tunnel log { **address-alloc-release** | **connection-close** | **packet-drop** }

Default

Logging is disabled for IP access connection close events or IP access packet drop events.

Views

SSL VPN context view

Predefined user roles

network-admin

context-admin

Parameters

address-alloc-release: Enables logging for IP address allocations and releases for the VNIC of the IP access client.

connection-close: Enables logging for IP access connection close events.

packet-drop: Enables logging for IP access packet drop events.

Usage guidelines

If logging is enabled for IP address allocations and releases for the VNIC of the IP access client, the SSL VPN gateway generates logs when the VNIC's IP address is allocated or released.

If logging for IP access connection close events is enabled, the SSL VPN gateway generates logs when the connections established for SSL VPN IP access users are closed.

If logging for IP access packet drop events is enabled, the SSL VPN gateway generates logs when packets for SSL VPN IP access users are dropped.

The logs are sent to the information center of the device. For the logs to be output correctly, you must also configure the information center on the device. For more information about the information center, see *Network Management and Monitoring Configuration Guide*.

Examples

Enable logging for IP access connection close events.

```
<Sysname> system-view
[Sysname] sslvpn context ctx1
[Sysname-sslvpn-context-ctx1] ip-tunnel log connection-close
```

Related commands

ip-tunnel rate-limit

Use **ip-tunnel rate-limit** to set a rate limit for IP access upstream or downstream traffic.

Use **undo ip-tunnel rate-limit** to remove the rate limit set for IP access upstream or downstream traffic.

Syntax

ip-tunnel rate-limit { **downstream** | **upstream** } { **kbps** | **pps** } *value*

undo ip-tunnel rate-limit { **downstream** | **upstream** }

Default

No rate limit is set for IP access upstream or downstream traffic.

Views

SSL VPN context view

Predefined user roles

network-admin

context-admin

Parameters

downstream: Specifies the IP access downstream traffic, which is sent by internal servers to IP access users.

upstream: Specifies the IP access upstream traffic, which is sent by IP access users to internal servers.

kbps: Sets the unit of measurement for the rate limit to kilobits per second.

pps: Sets the unit of measurement for the rate limit to packets per second.

value: Sets the rate limit value, in the range of 1000 to 100000000.

Usage guidelines

You can set a rate limit for IP access upstream and downstream traffic, respectively. If you set the rate limit for the same traffic direction multiple times, the most recent configuration takes effect.

If the IP access upstream or downstream traffic exceeds the rate limit, subsequent upstream or downstream traffic will be discarded.

Examples

In SSL VPN context **ctx1**, set the rate limit to 10000 pps for IP access upstream traffic.

```
<Sysname> system-view
[Sysname] sslvpn context ctx1
[Sysname-sslvpn-context-ctx1] ip-tunnel rate-limit upstream pps 10000
```

ip-tunnel web-resource auto-push

Use **ip-tunnel web-resource auto-push** to enable automatic pushing of accessible resources to IP access users through the Web page.

Use **undo ip-tunnel web-resource auto-push** to disable automatic pushing of accessible resources to IP access users through the Web page.

Syntax

ip-tunnel web-resource auto-push

undo ip-tunnel web-resource auto-push

Default

Automatic pushing of accessible resources to IP access users through the Web page is disabled.

Views

SSL VPN context view

Predefined user roles

network-admin

context-admin

Usage guidelines

This feature enables automatic pushing of accessible resources to a user through the Web page after the user logs in to the SSL VPN gateway through the IP access client (iNode client).

This feature is supported only when the iNode client is installed in the Windows system. You can install the iNode client in one of the following methods:

- Log in to the SSL VPN gateway through the browser, and then download and install the iNode client that comes with the device.
- Install the iNode client downloaded from the official website. In this way, you must select the iNode installation package for VPN gateway generation when customizing the iNode client. Otherwise, the user will be automatically logged out because the pushed webpage cannot detect whether the iNode client is logged in.

Examples

Enable automatic pushing of accessible resources to IP access users through the Web page in SSL VPN context **ctx1**.

```
<Sysname> system-view
[Sysname] sslvpn context ctx1
[Sysname-sslvpn-context-ctx1] ip-tunnel web-resource auto-push
```

ip-tunnel wins-server

Use **ip-tunnel wins-server** to specify a WINS server for IP access.

Use **undo ip-tunnel wins-server** to restore the default.

Syntax

ip-tunnel wins-server { **primary** | **secondary** } *ip-address*

undo ip-tunnel wins-server { **primary** | **secondary** }

Default

No WINS servers are specified for IP access.

Views

SSL VPN context view

Predefined user roles

network-admin

context-admin

Parameters

primary: Specifies the primary WINS server.

secondary: Specifies the secondary WINS server.

ip-address: Specifies the IPv4 address of the WINS server. It cannot be a multicast, broadcast, or loopback address.

Examples

Specify the primary WINS server 1.1.1.1 for IP access.

```
<Sysname> system-view
[Sysname] sslvpn context ctx
[Sysname-sslvpn-context-ctx] ip-tunnel wins-server primary 1.1.1.1
```

ipv6 address

Use **ipv6 address** to configure an IPv6 address and a port number for an SSL VPN gateway.

Use **undo ipv6 address** to restore the default.

Syntax

ipv6 address *ipv6-address* [**port** *port-number*]

undo ipv6 address

Default

No IPv6 address is configured for an SSL VPN gateway.

Views

SSL VPN gateway view

Predefined user roles

network-admin

context-admin

Parameters

ipv6-address: Specifies an IPv6 address for the SSL VPN gateway, a 16-byte hexadecimal string separated by colons.

port *port-number*: Specifies a port number for the SSL VPN gateway. The port number is 443 (the default value) or in the range of 1025 to 65535.

Usage guidelines

A remote user uses the IPv6 address and port number configured by this command to access an SSL VPN gateway.

The specified IPv6 address must be the address of an interface on the gateway device and is reachable from clients and internal servers.

Do not use the management address of the device as the IPv6 address of the SSL VPN gateway.

The IPv6 address and port number of an SSL VPN gateway cannot both be the same as those of the HTTPS server on the device. Otherwise, you can access only the SSL VPN Web interface but cannot access the device management Web interface by using those IPv6 address and port number.

If you execute this command multiple times, the most recent configuration takes effect.

An SSL VPN gateway can use an IPv4 address, an IPv6 address, but not both. If you configure both IPv4 and IPv6 addresses, the most recent configuration takes effect. (The IPv4 address is configured by using the **ip address** command.)

Examples

Configure the IPv6 address of SSL VPN gateway **gw1** as 200::1 and the port number as 8000.

```
<Sysname> system-view
[Sysname] sslvpn gateway gw1
[Sysname-sslvpn-gateway-gw1] ipv6 address 200::1 port 8000
```

Related commands

display sslvpn gateway

ip address

local-port

Use **local-port** to configure a port forwarding instance for a port forwarding item.

Use **undo local-port** to remove the configuration.

Syntax

local-port *local-port-number* **local-name** *local-name* **remote-server** *remote-server* **remote-port** *remote-port-number* [**description** *text*]

undo local-port

Default

A port forwarding item does not contain a port forwarding instance.

Views

Port forwarding item view

Predefined user roles

network-admin

context-admin

Parameters

local-port-number: Specifies a local port number in the range of 1 to 65535. The specified port number must be different from the port numbers of any existing services on the SSL VPN client.

local-name *local-name*: Specifies a local address or a local host name, a case-insensitive string of 1 to 253 characters. Valid characters are letters, digits, underscores (_), hyphens (-), and dots (.). To specify an IPv4 address, use an address in the network segment 127.0.0.0/8. To specify an IPv6 address, enclose the IPv6 address in brackets. For example, **local-name** [1234::5678].

remote-server *remote-server*: Specifies the IP address or domain name of a TCP service on an internal server. The *remote-server* argument is a case-insensitive string of 1 to 253 characters. Valid characters are letters, digits, underscores (_), hyphens (-), and dots (.). To specify an IPv6 address, enclose the IPv6 address in brackets. For example, **remote-server** [1234::5678].

remote-port *remote-port-number*: Specifies the port number of the TCP service on the internal server, in the range of 1 to 65535.

description *text*: Specifies a description, a case-sensitive string of 1 to 63 characters.

Usage guidelines

A port forwarding instance maps a TCP service on an internal server to a local address and port number on an SSL VPN client.

For example, for an SSL VPN client to use local address 127.0.0.1 and port 80 to access the internal HTTP server 192.168.0.213, perform the following tasks:

1. Create a port forwarding item (**tcp1** in this example).
2. Configure a port forwarding instance for the port forwarding item.

   ```
   local-port 80 local-name 127.0.0.1 remote-server 192.168.0.213 remote-port 80
   ```

   The port forwarding instance will be displayed together with the port forwarding item name on the SSL VPN Web page. In this example, **tcp1 (127.0.0.1:80 -> 192.168.0.213)** will be displayed.

If you map a TCP service to a local host name, the TCP access client software will add the IP address corresponding to the host name to the host file **hosts**. When the client logs out, the software restores the original host file. The host file **hosts** is in the directory **C:\Windows\System32\drivers\etc** of the client host.

You can configure only one port forwarding instance for a port forwarding item. If you execute this command for a port forwarding item multiple times, the most recent configuration takes effect.

Examples

Configure a port forwarding instance for port forwarding item **pfitem1**. The port forwarding instance maps IP address 192.168.0.213 and port 80 of the internal HTTP server to local address 127.0.0.1 and port 80.

```
<Sysname> system-view
[Sysname] sslvpn context ctx1
[Sysname-sslvpn-context-ctx1] port-forward-item pfitem1
[Sysname-sslvpn-context-ctx1-port-forward-item-pfitem1] local-port 80 local-name
127.0.0.1 remote-server 192.168.0.213 remote-port 80 description http
```

Related commands

port-forward-item

log resource-access enable

Use **log resource-access enable** to enable resource access logging.

Use **undo log resource-access enable** to disable resource access logging.

Syntax

log resource-access enable [**brief** | **filtering**] *

undo log resource-access enable

Default

Resource access logging is disabled.

Views

SSL VPN context view

Predefined user roles

network-admin

context-admin

Parameters

brief: Records brief resource access information. If you specify this keyword, only the address and port number of the accessed resource will be recorded. If you do not specify this keyword, a large amount of information including webpage formatting information will be recorded.

filtering: Enables resource access log filtering. With this keyword specified, the device generates only one log for accesses of the same user to the same resource in a minute. If this keyword is not specified, the device generates a log for each resource access.

Usage guidelines

This feature logs resource accesses of SSL VPN users. The logs are sent to the information center of the device.

With the information center, you can set log message filtering and output rules, including output destinations.

The information center can output SSL VPN resource access logs to any destinations except the console and the monitor terminal. If you configure the console or monitor terminal as an output destination, the output destination setting will not take effect.

To view SSL VPN resource access logs stored on the device, use the **display logbuffer** command. Make sure you do not disable log output to the log buffer, which is enabled by default.

For more information about configuring the information center, see *Network Management and Monitoring Configuration Guide*.

If you execute the **log resource-access enable** command multiple times, the most recent configuration takes effect.

Examples

Enable resource access logging.

```
<Sysname> system-view
[Sysname] sslvpn context ctx1
[Sysname-sslvpn-context-ctx1] log resource-access enable
```

log user-login enable

Use **log user-login enable** to enable logging for user login and logoff events.

Use **undo log user-login enable** to disable logging for user login and logoff events.

Syntax

log user-login enable

undo log user-login enable

Default

Logging for user login and logoff events is disabled.

Views

SSL VPN context view

Predefined user roles

network-admin

context-admin

Usage guidelines

This feature logs user login and logoff events. The logs are sent to the information center of the device. For the logs to be output correctly, you must also configure the information center on the device. For more information about the information center, see *Network Management and Monitoring Configuration Guide*.

Examples

Enable logging for user logins and logouts.

```
<Sysname> system-view
[Sysname] sslvpn context ctx1
[Sysname-sslvpn-context-ctx1] log user-login enable
```

login-message

Use **login-message** to configure the welcome message to be displayed on the SSL VPN login page.

Use **undo log login-message** to restore the default.

Syntax

login-message { **chinese** *chinese-message* | **english** *english-message* }

undo login-message { **chinese** | **english** }

Default

The login welcome message is **Welcome to SSL VPN**.

Views

SSL VPN context view

Predefined user roles

network-admin

context-admin

Parameters

chinese *chinese-message*: Configures a login welcome message for the Chinese Web interface, a case-sensitive string of 1 to 255 characters.

english *english-message*: Configures a login welcome message for the English Web interface, a case-sensitive string of 1 to 255 characters.

Examples

Configure the login welcome message as **hello**.

```
<Sysname> system-view
[Sysname] sslvpn context ctx1
[Sysname-sslvpn-context-ctx1] login-message english hello
```

logo

Use **logo** to specify a logo to be displayed on SSL VPN webpages.

Use **undo logo** to restore the default.

Syntax

logo { **file** *file-name* | **none** }

undo logo

Views

SSL VPN context view

Predefined user roles

network-admin

context-admin

Parameters

file *file-name*: Specifies a logo file by its name, a case-insensitive string of 1 to 255 characters. The file must be a .gif, .jpg, or .png file, and its size cannot exceed 100 KB. As a best practice, use a file whose image resolution is 110*30 pixels.

none: Specifies that no logo is displayed.

Usage guidelines

The specified logo file must exist on the local device.

After you specify a logo file, the logo is displayed on SSL VPN webpages even if the file is deleted.

Examples

Specify the logo in file **flash:/mylogo.gif** as the logo displayed on SSL VPN webpages.

```
<Sysname> system-view
[Sysname] sslvpn context ctx1
[Sysname-sslvpn-context-ctx1] logo file flash:/mylogo.gif
```

max-onlines

Use **max-onlines** to set the maximum number of concurrent logins for each account.

Use **undo max-onlines** to restore the default.

Syntax

max-onlines *number*

undo max-onlines

Default

The maximum number of concurrent logins for each account is 32.

Views

SSL VPN context view

Predefined user roles

network-admin

context-admin

Parameters

number: Specifies the maximum number, in the range of 0 to 1048575. Value 0 indicates that the number of concurrent logins for each account is not limited.

Usage guidelines

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Set the maximum number of concurrent logins for each account to 50.

```
<Sysname> system-view
[Sysname] sslvpn context ctx1
[Sysname-sslvpn-context-ctx1] max-onlines 50
```

max-users

Use **max-users** to set the maximum number of sessions for an SSL VPN context.

Use **undo max-users** to restore the default.

Syntax

max-users *max-number*

undo max-users

Default

An SSL VPN context supports a maximum of 1048575 sessions.

Views

SSL VPN context view

Predefined user roles

network-admin

context-admin

Parameters

max-number: Specifies the maximum number of sessions, in the range of 1 to 1048575

Usage guidelines

If the limit is reached, new users cannot access the SSL VPN gateway.

Examples

Set the maximum number of sessions to 500 for SSL VPN context **ctx1**.

```
<Sysname> system-view
[Sysname] sslvpn context ctx1
[Sysname-sslvpn-context-ctx1] max-users 500
```

Related commands

display sslvpn context

message-server

Use **message-server** to specify a message server for mobile clients.

Use **undo message-server** to restore the default.

Syntax

message-server address { *host-name* | *ipv4-address* } **port** *port-number*

undo message-server

Default

No message server is specified for mobile clients.

Views

SSL VPN context view

Predefined user roles

network-admin

context-admin

Parameters

address: Specifies the host name or IPv4 address of the message server.

host-name: Specifies the host name of the message server, a case-insensitive string of 1 to 127 characters. Valid characters are letters, digits, underscores (_), hyphens (-), and dots (.).

ipv4-address: Specifies the IPv4 address of the message server, in dotted decimal notation. The IP address cannot be a multicast, broadcast, or loopback address.

port *port-number*: Specifies the port number of the message server, in the range of 1025 to 65535.

Usage guidelines

A message server provides services for mobile clients. The SSL VPN gateway issues the message server information to the clients, and the clients can access the message server.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Specify the IP address of the message server as 10.10.1.1 and the port number as 8000 for context **ctx1**.

```
<Sysname> system-view
[Sysname] sslvpn context ctx
[Sysname-sslvpn-context-ctx] message-server address 10.10.1.1 port 8000
```

Related commands

sslvpn context

mobile-num

Use **mobile-num** to specify the mobile number for receiving SMS messages.

Use **undo mobile-num** to restore the default.

Syntax

mobile-num *number*

undo mobile-num

Default

No mobile number is specified for receiving SMS messages.

Views

SSL VPN user view

Predefined user roles

network-admin

context-admin

Parameters

number: Specifies the mobile number, a string of 1 to 31 digits.

Usage guidelines

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Specify the mobile number as 111111 for user **user1** to receive SMS messages.

```
<Sysname> system-view
[Sysname] sslvpn context ctx1
[Sysname-sslvpn-context-ctx1] user user1
[Sysname-sslvpn-context-ctx1-user-user1] mobile-num 111111
```

mobile-num-binding enable

Use **mobile-num-binding enable** to enable mobile number binding.

Use **undo mobile-num-binding enable** to disable mobile number binding.

Syntax

mobile-num-binding enable

undo mobile-num-binding enable

Default

Mobile number binding is disabled.

Views

SMS gateway authentication view

Predefined user roles

network-admin

context-admin

Usage guidelines

After SMS gateway authentication is enabled, a user must complete authentication through SMS messages to log in to the SSL VPN gateway.

- If the mobile number binding feature is enabled, the SSL VPN gateway displays **Please enter mobile number** for the user at the first login of the user. The user will use the entered mobile number to receive SMS messages for authentication. The SSL VPN gateway will bind the mobile number to the user and will not ask the user for the mobile number in subsequent logins.
- If the mobile number binding feature is disabled, the SSL VPN gateway will use the mobile number specified in SSL VPN user view for authentication of the user. If no mobile number is specified in SSL VPN user view, the login will fail.

If a mobile number is specified in SSL VPN user view, the mobile number binding feature does not take effect for the user. The SMS gateway always sends SMS messages to the specified mobile number for authentication of the user.

Examples

Enable mobile number binding in SMS gateway authentication view.

```
<Sysname> system-view
[Sysname] sslvpn context ctx1
[Sysname-sslvpn-context-ctx1] sms-auth sms-gw
[Sysname-sslvpn-context-ctx-sms-auth-sms-gw] mobile-num-binding enable
```

Related commands

mtu

Use **mtu** to set the MTU of an SSL VPN AC interface.

Use **undo mtu** to restore the default.

Syntax

mtu *size*

undo mtu

Default

The default MTU is 1500 bytes.

Views

SSL VPN AC interface view

Predefined user roles

network-admin

context-admin

Parameters

size: Specifies an MTU value in the range of 100 to 64000 bytes.

Examples

Set the MTU of interface SSL VPN AC 1000 to 1430 bytes.

```
<Sysname> system-view
[Sysname] interface sslvpn-ac 1000
[Sysname-SSLVPN-AC1000] mtu 1430
```

new-content

Use **new-content** to specify the new content used to replace the old content.

Use **undo new-content** to restore the default.

Syntax

new-content *string*

undo new-content

Default

The new content used to replace the old content is not specified.

Views

Rewrite rule view

Predefined user roles

network-admin

context-admin

Parameters

string: Specifies the new content, a case-sensitive string of 1 to 256 characters.

Usage guidelines

During file content rewriting, the new content will replace the old content specified by using the **old-content** command.

If the new content contains spaces, enclose the content in double quotation marks.

Examples

Specify the new content in rewrite rule **rule1** of file policy **fp**.

```
<Sysname> system-view
[Sysname] sslvpn context ctx
[Sysname-sslvpn-context-ctx] file-policy fp
[Sysname-sslvpn-context-ctx-file-policy-fp] rewrite-rule rule1
[Sysname-sslvpn-context-ctx-file-policy-fp-rewrite-rule-rule1] new-content

undo notify-message { **login-page** | **resource-page** } { **chinese** | **english** }

Default

No notification message is configured.

Views

SSL VPN context view

Predefined user roles

network-admin

context-admin

Parameters

login-page: Specifies the SSL VPN gateway login page.

resource-page: Specifies the SSL VPN gateway resource page.

chinese *chinese-message*: Specifies the notification message to be displayed on the Chinese Web interface, a case-sensitive string of 1 to 255 characters.

english *english-message*: Specifies the notification message to be displayed on the English Web interface, a case-sensitive string of 1 to 255 characters.

Usage guidelines

Execute this command to configure a notification message displayed on the SSL VPN login page or resource page. The message is generally used to notify users to change their passwords.

In an SSL VPN context, if you execute this command multiple times for the same page of the same language, the most recent configuration takes effect.

Examples

In SSL VPN context **ctx1**, specify the notification message on the SSL VPN gateway login page as **Please change the password after login**.

```
<Sysname> system-view
[Sysname] sslvpn context ctx1
[Sysname-sslvpn-context-ctx1] notify-message login-page english Please change the
password after login
```

old-content

Use **old-content** to specify the old file content to be rewritten.

Use **undo old-content** to restore the default.

Syntax

old-content *string*

undo old-content

Default

The old file content to be rewritten is not specified.

Views

Rewrite rule view

Predefined user roles

network-admin

context-admin

Parameters

string: Specifies the old content, a case-sensitive string of 1 to 256 characters.

Usage guidelines

During file content rewriting, the old file content will be replaced by the new content specified by using the **new-content** command.

If the old content contains spaces, enclose the content in double quotation marks.

In the same file policy, the old content specified in different rewrite rules must be unique.

Examples

Specify the content to be rewritten in rewrite rule **rule1** of file policy **fp**.

```
<Sysname> system-view
[Sysname] sslvpn context ctx
[Sysname-sslvpn-context-ctx] file-policy fp
[Sysname-sslvpn-context-ctx-file-policy-fp] rewrite rule rule1
[Sysname-sslvpn-context-ctx-file-policy-fp-rewrite-rule-rule1] old-content
"a.b.c.innerHTML = d;"
```

Use **`password-box hide`** to hide the password input box on the SSL VPN Web login page.

Use **`undo password-box hide`** to display the password input box on the SSL VPN Web login page.

Syntax

`password-box hide`

`undo password-box hide`

Default

The password input box is displayed on the SSL VPN Web login page.

Views

SSL VPN context view

Predefined user roles

network-admin

context-admin

Usage guidelines

If you want users to log in to the SSL VPN webpage by using authentication methods other than the username/password method, hide the password input box and configure the intended authentication methods.

After the password input box is hidden on the SSL VPN Web login page, only SSL VPN users with empty passwords can log in through the username/password authentication method.

Examples

Hide the password input box on the SSL VPN Web login page.

```
<Sysname> system-view
[Sysname] sslvpn context ctx1
[Sysname-sslvpn-context-ctx1] password-box hide
```

password-changing enable (SSL VPN context view)

Use **`password-changing enable`** to enable SSL VPN users to modify passwords.

Use **`undo password-changing enable`** to disable SSL VPN users from modifying passwords.

Syntax

`password-changing enable`

`undo password-changing enable`

Default

SSL VPN users are allowed to modify passwords.

Views

SSL VPN context view

Predefined user roles

network-admin

context-admin

Usage guidelines

The password modification feature allows you to determine whether SSL VPN users in the SSL VPN context can modify their login passwords.

If you enable this feature, SSL VPN users that log in to the SSL VPN Web interface can modify the login password on the personal settings page. If you disable this feature, the modify password function will be hidden on the SSL VPN Web interface, so users cannot modify their passwords.

An SSL VPN user is able to modify the password only when password modification is enabled in both SSL VPN user view and SSL VPN context view.

Examples

Enable password modification for SSL VPN users in SSL VPN context **ctx1**.

```
<Sysname> system-view
[Sysname] sslvpn context ctx1
[Sysname-sslvpn-context-ctx1] password-changing enable
```

password-complexity-message

Use **password-complexity-message** to configure a password complexity message.

Use **undo password-complexity-message** to restore the default.

Syntax

password-complexity-message { **chinese** *chinese-message* | **english** *english-message* }

undo password-complexity-message { **chinese** | **english** }

Default

No password complexity message is configured.

Views

SSL VPN context view

Predefined user roles

network-admin

context-admin

Parameters

chinese *chinese-message*: Specifies the password complexity message to be displayed on the Chinese Web interface, a case-sensitive string of 1 to 255 characters.

english *english-message*: Specifies the password complexity message to be displayed on the English Web interface, a case-sensitive string of 1 to 255 characters.

Usage guidelines

The password complexity message will be displayed on the SSL VPN password modification page to notify users of password complexity requirements.

In an SSL VPN context, if you execute this command multiple times for the same language, the most recent configuration takes effect.

Examples

In SSL VPN context **ctx1**, specify the password complexity message as **The password must contain uppercase and lowercase letters**.

```
<Sysname> system-view
[Sysname] sslvpn context ctx1
[Sysname-sslvpn-context-ctx1] password-complexity-message english The password must
contain uppercase and lowercase letters
```

policy-group

Use **policy-group** to create an SSL VPN policy group and enter its view, or enter the view of an existing SSL VPN policy group.

Use **undo policy-group** to delete a policy group.

Syntax

policy-group *group-name*

undo policy-group *group-name*

Default

No SSL VPN policy groups exist.

Views

SSL VPN context view

Predefined user roles

network-admin

context-admin

Parameters

group-name: Specifies a name for the policy group, a case-insensitive string of 1 to 31 characters.

Usage guidelines

An SSL VPN policy group contains a set of rules for resource access authorization.

You can configure multiple SSL VPN policy groups for an SSL VPN context. When a remote user accesses the SSL VPN context, the AAA server issues the authorized policy group to the associated SSL VPN gateway. The user can access only the resources allowed by the authorized policy group. If the AAA server does not authorize the user to use a policy group, the user can access only the resources allowed by the default policy group.

Examples

Create a policy group named **pg1** and enter its view.

```
<Sysname> system-view
[Sysname] sslvpn context ctx1
[Sysname-sslvpn-context-ctx1] policy-group pg1
[Sysname-sslvpn-context-ctx1-policy-group-pg1]
```

default-policy-group

port-forward

Use **port-forward** to create a port forwarding list for an SSL VPN context and enter its view, or enter the view of an existing port forwarding list.

Use **undo port-forward** to delete a port forwarding list.

Syntax

port-forward *port-forward-name*

undo port-forward *port-forward-name*

Default

No port forwarding lists exist.

Views

SSL VPN context view

Predefined user roles

network-admin

context-admin

Parameters

port-forward-name: Specifies a name for the port forwarding list, a case-insensitive string of 1 to 31 characters. The name cannot start with **item-**.

Usage guidelines

Port forwarding lists provide TCP access services for SSL VPN users.

In port forwarding list view, you can use the **port-forward-item** command to create port forwarding items. Each port forwarding item defines an accessible TCP service provided on an internal server.

You can assign a port forwarding list to a policy group by using the **resources port-forward** command. After the AAA server authorizes a user to use a policy group, the SSL VPN Web page provides the user the port forwarding list assigned to the group. The user can access the TCP services provided by the port forwarding list.

Examples

Create port forwarding list **pflist1** and enter its view.

```
<Sysname> system-view
[Sysname] sslvpn context ctx1
[Sysname-sslvpn-context-ctx1] port-forward pflist1
[Sysname-sslvpn-context-ctx1-port-forward-pflist1]
```

Related commands

local-port

resources port-forward

port-forward-item

Use **port-forward-item** to create a port forwarding item and enter its view, or enter the view of an existing port forwarding item.

Use **undo port-forward-item** to delete a port forwarding item.

Syntax

port-forward-item *item-name*

undo port-forward-item *item-name*

Default

No port forwarding items exist.

Views

SSL VPN context view

Predefined user roles

network-admin

context-admin

Parameters

item-name: Specifies a name for the port forwarding item, a case-insensitive string of 1 to 31 characters.

Usage guidelines

A port forwarding item defines an accessible TCP service provided on an internal server. It contains the following settings:

- A port forwarding instance.

  A port forwarding instance is configured by using the **local-port** command. It makes an internal TCP service accessible through a local address and port number on the SSL VPN client.

- (Optional.) A resource link.

  A resource link is configured by using the **execution** command.

  After you configure a resource link for a port forwarding item, the port forwarding item name will be displayed on the SSL VPN Web page as a link. You can click the link to access the resource directly.

  Make sure the resource link matches the TCP service specified by the port forwarding instance.

After you create a port forwarding item, you can assign it to a port forwarding list by using the **resources port-forward-item** command.

Examples

Create a port forwarding item named **pfitem1** and enter its view.

```
<Sysname> system-view
[Sysname] sslvpn context ctx1
[Sysname-sslvpn-context-ctx1] port-forward-item pfitem1
[Sysname-sslvpn-context-ctx1-port-forward-item-pfitem1]
```

prevent-cracking freeze-ip

Use **prevent-cracking freeze-ip** to configure IP address freezing parameters for cracking prevention.

Use **undo prevent-cracking freeze-ip** to restore the default.

Syntax

prevent-cracking freeze-ip login-failures *login-failures* **freeze-time** *freeze-time*

undo prevent-cracking freeze-ip

Default

The maximum number of consecutive login failures allowed for an IP address is 64, and the period of time to freeze an IP address is 30 seconds.

Views

SSL VPN context view

Predefined user roles

network-admin

context-admin

Parameters

login-failures *login-failures*: Specifies the maximum number of consecutive login failures allowed for an IP address before freezing it to prevent cracking.

freeze-time *freeze-time*: Specifies the period of time to freeze an IP address, in the range of 30 to 1800 seconds.

Usage guidelines

The cracking prevention feature reduces the risk of brute-force cracking of user login information by limiting the number of login attempts from the same IP address.

If the number of consecutive login failures of the same IP address reaches the maximum number specified by this command, the IP address will be frozen for the specified period. During the freeze period, the IP address is prohibited from logging in to the SSL VPN context. When the freeze period expires, the frozen IP address will be unfrozen automatically.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

In SSL VPN context **ctx1**, configure the device to freeze an IP address if it consecutively fails login for 100 times and set the freeze period of time to 60 seconds.

```
<Sysname> system-view
[Sysname] sslvpn context ctx1
[Sysname-sslvpn-context-ctx1] prevent-cracking freeze-ip login-failures 100 freeze-time
60
```

Related commands

display sslvpn prevent-cracking frozen-ip

prevent-cracking freeze-ip enable

Use **prevent-cracking freeze-ip enable** to enable IP address freezing for cracking prevention.

Use **undo prevent-cracking freeze-ip enable** to disable IP address freezing for cracking prevention.

Syntax

prevent-cracking freeze-ip enable

undo prevent-cracking freeze-ip enable

Default

IP address freezing for cracking prevention is disabled.

Views

```

Related commands

display sslvpn prevent-cracking frozen-ip

pevent-cracking unfreeze-ip

Use **prevent-cracking unfreeze-ip** to unfreeze IP addresses frozen for cracking prevention.

Syntax

prevent-cracking unfreeze-ip { **all** | { **ipv4** | **ipv6** } *ip-address* }

Views

SSL VPN context view

Predefined user roles

network-admin

context-admin

Parameters

all: Specifies all frozen IP addresses.

ipv4: Specifies a frozen IPv4 address.

Ipv6: Specifies a frozen IPv6 address.

ip-address: IP address to be unfrozen.

Usage guidelines

Unfrozen IP addresses are allowed to log in to the SSL VPN context again.

Examples

In SSL VPN context **ctx1**, unfreeze all frozen IP addresses.

```
<Sysname> system-view
[Sysname] sslvpn context ctx1
[Sysname-sslvpn-context-ctx1] prevent-cracking unfreeze-ip all
```

Related commands

display sslvpn prevent-cracking frozen-ip

pevent-cracking verify-code

Use **prevent-cracking verify-code** to configure code verification parameters for cracking prevention.

Use **undo prevent-cracking verify-code** to restore the default.

Syntax

prevent-cracking verify-code login-failures *login-failures*

undo prevent-cracking verify-code

Default

A maximum of five consecutive login failures are allowed for an IP address.

Views

SSL VPN context view

Predefined user roles

network-admin

context-admin

Parameters

login-failures *login-failures*: Specifies the maximum number of consecutive login failures allowed for an IP address, in the range of 1 to 63.

Usage guidelines

The cracking prevention feature reduces the risk of brute-force cracking of user login information by limiting the number of login attempts from the same IP address.

If the number of consecutive login failures of an IP address exceeds the maximum number specified by this command, code verification is performed to prevent cracking. An SSL VPN user using the IP address must enter a correct verification code to log in to the SSL VPN context.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

In SSL VPN context **ctx1**, configure the device to perform code verification if an IP address consecutively fails login for more than 10 times.

```
<Sysname> system-view
[Sysname] sslvpn context ctx1
[Sysname-sslvpn-context-ctx1] prevent-cracking verify-code login-failures-times 10
```

pevent-cracking verify-code enable

Use **prevent-cracking verify-code enable** to enable code verification for cracking prevention.

Use **undo prevent-cracking verify-code enable** to disable code verification for cracking prevention.

Syntax

prevent-cracking verify-code enable

undo prevent-cracking verify-code enable

Default

Code verification for cracking prevention is disabled.

Views

SSL VPN context view

Predefined user roles

network-admin

Examples

In SSL VPN context **ctx1**, enable code verification for cracking prevention.

```
<Sysname> system-view
[Sysname] sslvpn context ctx1
[Sysname-sslvpn-context-ctx1] prevent-cracking verify-code enable
```

rate-limit

Use **rate-limit** to set a rate limit for SSL VPN session upstream or downstream traffic.

Use **undo rate-limit** to remove the rate limit set for SSL VPN session upstream or downstream traffic.

Syntax

rate-limit { **downstream** | **upstream** } *value*

undo rate-limit { **downstream** | **upstream** }

Default

No rate limit is set for SSL VPN session upstream or downstream traffic.

Views

SSL VPN context view

Predefined user roles

network-admin

context-admin

Parameters

downstream: Specifies the SSL VPN downstream traffic, which is sent by internal servers to SSL VPN users.

upstream: Specifies the SSL VPN upstream traffic, which is sent by SSL VPN users to internal servers.

value: Sets the rate limit for the specified traffic, in the range of 1000 to 100000000 kbps.

Usage guidelines

You can set a rate limit for SSL VPN session upstream and downstream traffic, respectively. If you set the rate limit for the same traffic direction multiple times, the most recent configuration takes effect.

If the SSL VPN session upstream or downstream traffic exceeds the rate limit, subsequent upstream or downstream traffic will be discarded.

Examples

In SSL VPN context **ctx1**, set the rate limit to 10000 kbps for SSL VPN session upstream traffic.

```
<Sysname> system-view
[Sysname] sslvpn context ctx1
[Sysname-sslvpn-context-ctx1] rate-limit upstream 10000
```

redirect-resource

Use **redirect-resource** to specify the Web resource to which SSL VPN users are redirected after login.

Use **undo redirect-resource** to restore the default.

Syntax

redirect-resource { **shortcut** | **url-item** } *resource-name*

undo redirect-resource

Default

After logging in to the SSL VPN gateway, a user directly enters the SSL VPN resource list page, and no webpage redirection is performed.

Views

SSL VPN policy group view

Predefined user roles

network-admin

context-admin

Parameters

shortcut: Specifies a shortcut resource.

url-item: Specifies a URL item resource.

resource-name: Specifies the resource name, a case-insensitive string of 1 to 31 characters.

Usage guidelines

By default, a user directly enters the SSL VPN resource list page after logging in to the SSL VPN gateway. You can use this command to redirect a user to a specific webpage after the user logs in to the SSL VPN gateway.

If a policy group authorized to a user contains a redirect resource, the SSL VPN gateway first opens the SSL VPN resource list page for the user. After a while, it redirects the user to the webpage specified in the redirect resource. The user can press the back button on the Web browser to return to the SSL VPN resource list page.

If multiple policy groups are authorized to a user, the device searches the policy groups for a redirect resource in authorization time order (first authorized first searched). If a redirect resource is found, the device stops searching and redirects the user to the redirect resource. If no redirect resource is found, no redirection will be performed.

In an SSL VPN policy group view, if you execute this command multiple times, the most recent configuration takes effect.

Examples

Specify URL item **url1** as the redirect resource of SSL VPN policy group **pg1**.

```
<Sysname> system-view
[Sysname] sslvpn context ctx1
[Sysname-sslvpn-context-ctx1] policy-group pg1
[Sysname-sslvpn-context-ctx1-policy-group-pg1] redirect-resource url-item url1
```

Related commands

display sslvpn policy-group

reset counters interface sslvpn-ac

Use **reset counters interface sslvpn-ac** to clear SSL VPN AC interface statistics.

Syntax

reset counters interface [**sslvpn-ac** [*interface-number*]]

Views

User view

Predefined user roles

network-admin

context-admin

Parameters

sslvpn-ac [*interface-number*]: Specifies an SSL VPN AC interface by its number in the range of 0 to 4095. If you do not specify this option, the command clears statistics for all interfaces. If you specify the **sslvpn-ac** keyword without the *interface-number* argument, this command clears statistics for all existing SSL VPN AC interfaces.

Usage guidelines

Use this command to clear old statistics so you can observe new traffic statistics on an SSL VPN AC interface.

Examples

Clear statistics for SSL VPN AC 1000.

```
<Sysname> reset counters interface sslvpn-ac 1000
```

Related commands

display interface sslvpn-ac

reset sslvpn ip-tunnel statistics

Use **reset sslvpn ip-tunnel statistics** to clear packet statistics for IP access users.

Syntax

reset sslvpn ip-tunnel statistics [**context** *context-name* [**session** *session-id*]]

Views

User view

Predefined user roles

network-admin

context-admin

Parameters

context *context-name*: Specifies an SSL VPN context by its name. An SSL VPN context name is a case-insensitive string of 1 to 31 characters, and can contain only letters, digits, and underscores (_). If you do not specify an SSL VPN context, this command clear packet statistics for IP access users in all SSL VPN contexts.

session *session-id*: Specifies a session by its ID in the range of 1 to 4294967295. If you do not specify a session, this command clears packet statistics for all IP access users in the specified SSL VPN context.

Usage guidelines

To view the SSL VPN sessions in different SSL VPN contexts, execute the **display sslvpn session** command.

If you do not specify any parameters, this command clear packets statistics for all IP access users in all SSL VPN contexts.

Examples

Clear the IP access packet statistics in all SSL VPN contexts.

```
<Sysname> reset sslvpn ip-tunnel statistics
```

Clear the IP access packet statistics in SSL VPN context **ctx1**.

```
<Sysname> reset sslvpn ip-tunnel statistics context ctx1
```

Clear the IP access packet statistics of session 1 in SSL VPN context **ctx**.

```
<Sysname> reset sslvpn ip-tunnel statistics context ctx1 session 1
```

Related commands

resources port-forward

Use **resources port-forward** to assign a port forwarding list to an SSL VPN policy group.

Use **undo resources port-forward** to remove the configuration.

Syntax

resources port-forward *port-forward-name*

undo resources port-forward

Default

An SSL VPN policy group does not contain a port forwarding list.

Views

SSL VPN policy group view

Predefined user roles

network-admin

context-admin

Parameters

port-forward-name: Specifies the name of an existing port forwarding list. A port forwarding list name is a case-insensitive string of 1 to 31 characters.

Usage guidelines

After the AAA server authorizes a user to use a policy group, the SSL VPN Web page provides the user the port forwarding list assigned to the group. The user can access the TCP services provided by the port forwarding list.

Examples

Assign port forwarding list **pflist1** to SSL VPN policy group **pg1**.

```
<Sysname> system-view
[Sysname] sslvpn context ctx1
[Sysname-sslvpn-context-ctx1] policy-group pg1
[Sysname-sslvpn-context-ctx1-policy-group-pg1] resources port-forward pflist1

```

resources shortcut-list

Use **resources shortcut-list** to assign a shortcut list to an SSL VPN policy group.

Use **undo resources shortcut-list** to restore the default.

Syntax

resources shortcut-list *list-name*

undo resources shortcut-list

Default

An SSL VPN policy group does not contain a shortcut list.

Views

SSL VPN policy group view

Predefined user roles

network-admin

context-admin

Parameters

list-name: Specifies a shortcut list by its name, a case-insensitive string of 1 to 31 characters.

Usage guidelines

You can assign only one shortcut list to an SSL VPN policy group. After the AAA server authorizes a user to use a policy group, the SSL VPN Web page provides the user the shortcut list assigned to the group. The user can click a shortcut to access the associated resource.

If you execute this command for an SSL VPN policy group multiple times, the most recent configuration takes effect.

Examples

Assign shortcut list **list1** to SSL VPN policy group **pg1**.

```
<Sysname> system-view
[Sysname] sslvpn context ctx1
[Sysname-sslvpn-context-ctx1] shortcut-list list1
[Sysname-sslvpn-context-ctx1-shortcut-list-list1] quit
[Sysname-sslvpn-context-ctx1] policy-group pg1
[Sysname-sslvpn-context-ctx1-policy-group-pg1] resources shortcut-list list1
```

resources uri-acl

Use **resources uri-acl** to specify a URI ACL for URL resource filtering in a URL item.

Use **undo resources uri-acl** to remove the URI ACL configuration from a URL item.

Syntax

resources uri-acl *uri-acl-name*

undo resources uri-acl

Default

No URI ACL is specified for URL resource filtering in a URL item.

Views

URL item view

Predefined user roles

network-admin

context-admin

Parameters

uri-acl-name: Specifies a URI ACL by its name, a case-insensitive string of 1 to 31 characters. The specified URI ACL must already exist.

Usage guidelines

The specified URI ACL will be used to filter the accessible resources under the URL specified in the URL item.

Examples

Specify URI ACL **abc** in URL item **serverA**.

```
<Sysname> system-view
[Sysname] sslvpn context ctx1
[Sysname-sslvpn-context-ctx1] url-item serverA
[Sysname-sslvpn-context-ctx1-url-item-serverA] resources uri-acl abc
```

resources-file

Use **resources-file** to specify a file for SSL VPN users to download on the SSL VPN resource page.

Use **undo resources-file** to restore the default.

Syntax

resources-file { **chinese** *chinese-filename* | **english** *english-filename* }

undo resources-file { **chinese** | **english** }

Default

No file is provided for SSL VPN users to download.

Views

SSL VPN context view

Predefined user roles

network-admin

context-admin

Parameters

chinese *chinese-filename*: Specifies the name of the file to be provided on the Chinese Web interface, a case-sensitive string of 1 to 31 characters.

english *english-filename*: Specifies the name of the file to be provided on the English Web interface, a case-sensitive string of 1 to 31 characters.

Usage guidelines

Before executing this command, you must upload the file for users to download to the file system on the device in advance. The specified file name must be the absolute path of the file.

In an SSL VPN context, if you execute this command multiple times for the same language, the most recent configuration takes effect.

Examples

In SSL VPN context **ctx1**, specify the file for users to download on the SSL VPN resource page as **flash:/sslvpnhelp.pdf**.

```
<Sysname> system-view
[Sysname] sslvpn context ctx1
[Sysname-sslvpn-context-ctx1] resources-file english flash:/sslvpnhelp.pdf
```

rewrite server-response-message

Use **rewrite server-response-message** to rewrite a server reply message.

Use **undo rewrite server-response-message** to restore the default.

Syntax

rewrite server-response-message *server-response-message* { **chinese** *chinese-message* | **english** *english-message* }

undo rewrite server-response-message *server-response-message* { **chinese** | **english** }

Default

No server reply message is rewritten.

Views

SSL VPN context view

Predefined user roles

network-admin

context-admin

Parameters

server-response-message: Specifies the original server reply message to be rewritten, a case-sensitive string of 1 to 127 characters. If this message contains spaces, enclose the message in double quotation marks.

chinese *chinese-message*: Specifies the new server reply message to be displayed on the Chinese Web interface, a case-sensitive string of 1 to 127 characters.

english *english-message*: Specifies the new server reply message to be displayed on the English Web interface, a case-sensitive string of 1 to 127 characters.

Usage guidelines

If a server reply message (for example, an authentication, authorization, or accounting reply message) is hard to understand, execute this command to rewrite the server reply message. You can obtain server reply messages from the server to determine which messages should be rewritten.

If you execute this command multiple times to rewrite the same original server reply message in the same language, the most recent configuration takes effect.

Examples

In SSL VPN context **ctx1**, rewrite the server reply message **Success** to **User identity authentication succeeded**.

```
<Sysname> system-view
[Sysname] sslvpn context ctx1
[Sysname-sslvpn-context-ctx1] rewrite server-response-message Success english User
identity authentication succeeded
```

rewrite-rule

Use **rewrite-rule** to create a rewrite rule and enter its view, or enter the view of an existing rewrite rule.

Use **undo rewrite-rule** to delete a rewrite rule.

Syntax

rewrite-rule *rule-name*

undo rewrite-rule *rule-name*

Default

No rewrite rules exist.

Views

File policy view

Predefined user roles

network-admin

context-admin

Parameters

rule-name: Specifies a rule name, a case-insensitive string of 1 to 31 characters.

Usage guidelines

You can configure multiple rewrite rules in a file policy.

Examples

Create a rewrite rule named **rule1** and enter its view.

```
<Sysname> system-view
[Sysname] sslvpn context ctx
[Sysname-sslvpn-context-ctx] file-policy fp
[Sysname-sslvpn-context-ctx-file-policy-fp] rewrite-rule rule1
[Sysname-sslvpn-context-ctx-file-policy-fp-rewrite-rule-rule1]
```

rule

Use **rule** to create a rule for a URI ACL.

Use **undo rule** to remove a rule from a URI ACL.

Syntax

rule [*rule-id*] { **deny** | **permit** } **uri** *uri-pattern-string*

undo rule *rule-id*

Default

No URL ACL rules exist in a URI ACL

Views

URI ACL view

Predefined user roles

network-admin

context-admin

Parameters

deny: Denies matching packets to pass.

permit: Allows matching packets to pass.

rule-id: Specifies a rule ID in the range of 0 to 65534. If you do not specify a rule ID when creating an ACL rule, the system automatically assigns it a rule ID. The numbering step is 5 for automatic numbering of rule IDs. An automatically assigned rule ID takes the nearest multiple of 5 higher than the current highest rule ID. For example, if the current highest rule ID is 28, the rule is numbered 30.

uri *uri-pattern-string*: Specifies a URI pattern. The URI pattern can contain a maximum of 256 characters in the format of *protocol*://*host:port/path*, where *protocol* and *host* are required. See Table 14 for descriptions of the fields in a URI pattern.

Table 14 URI field descriptions

Field	Description
protocol	Protocol name. Options are: • http. • https. • tcp. • udp. • icmp. • ip.

host	Domain name or address of a host.
	• Valid host address formats:
	  ○ IPv4 or IPv6 address. For example, 192.168.1.1.
	  ○ IPv4 or IPv6 address range in the format of *start address-end address*. For example, 3.3.3.1-3.3.3.200.
	  ○ IPv4 address with a mask length or IPv6 address with a prefix length. For example 2.2.2.2/24.
	  ○ A combination of the preceding host address formats separated by comma (,). For example, 192.168.1.1,3.3.3.1-3.3.3.200,2.2.2.2/24.
	• Valid domain name formats:
	  ○ Fully qualified domain name. For example, www.domain.com
	  ○ Domain name with the following wildcard characters:
	Asterisk (*)—Matches zero or more characters. For example, *.com.
	Question mark (?)—Matches one character. For example, www.do?main.com.
	Percent sign (%)—Matches one or more characters in a field of the domain name. For example, www.%.com.

port	Port number. If no port number is specified, the default port number of the protocol is used. Valid formats for this field: • Single port number. For example, 1002. • Port number range in the format of *start port-end port*. For example, 8080-8088. • A combination of the preceding formats separate by comma (,). For example, 1002,90,8080-8088.
path	String that identifies a directory or file on the host. The path is a sequence of fields separated by forward or backward slashes. The following wildcard characters are supported: • **Asterisk (*)**—Matches zero or more characters. For example, /path1/*. • **Question mark (?)**—Matches one character. For example, /path?/. • **Percent sign (%)**—Matches one or more characters in a field of the path. For example, /path1/%/.

Usage guidelines

You can add multiple rules to a URI ACL. The device matches a packet against the rules in ascending order of rule ID. The match process stops once a matching rule is found.

Examples

Add a rule to URI ACL **uriacla**.

```
<Sysname> system-view
[Sysname] sslvpn context abc
[Sysname-sslvpn-context-abc] uri-acl uriacla
[Sysname-sslvpn-context-abc-uri-acl-uriacla] rule 1 permit uri
http://*.abc.com:80,443,2000-5000/path/
```

self-service imc address

Use **self-service imc address** to specify an IMC server for password modification.

Use **undo self-service imc address** to restore the default.

Syntax

self-service imc address *ip-address* **port** *port-number* [**vpn-instance** *vpn-instance-name*]

undo self-service imc address

Default

No IMC server is specified for password modification.

context-admin

Parameters

ip-address: Specifies the IP address of the IMC server, in dotted decimal notation.

port *port-number*: Specifies the port number of the IMC server, in the range of 1 to 65535.

vpn-instance *vpn-instance-name*: Specifies the MPLS L3VPN instance to which the IMC server belongs. The *vpn-instance-name* argument represents the VPN instance name, a case-sensitive string of 1 to 31 characters. Do not specify this option if the IMC server is on the public network.

Usage guidelines

Password modification allows users to modify login passwords by themselves, and it is supported for local users and users authenticated by an IMC server.

Execute this command only when IMC authentication users need to modify the SSL VPN login passwords. After a user passes the identity authentication, the user can modify the password on the SSL VPN Web page. The new password is sent to the IMC server specified by this command for verification. If the verification succeeds, the user will use the new password for next logins.

Examples

Specify the IMC server at IP address 192.168.10.1 and port 443 in VPN instance **vpn1** for password modification of users in SSL VPN context **ctx1**.

```
<Sysname> system-view
[Sysname] sslvpn context ctx1
[Sysname-sslvpn-context-ctx1] self-service imc address 192.168.10.1 port 443 vpn-instance
vpn1
```

server-address

Use **server-address** to specify an IMC server for SMS authentication.

Use **undo server-address** to restore the default.

Syntax

server-address *ip-address* **port** *port-number* [**vpn-instance** *vpn-instance-name*]

undo server-address

Default

No IMC server is specified for SMS authentication.

Views

IMC SMS authentication view

Predefined user roles

Parameters

ip-address: Specifies the IP address of the IMC server, in dotted decimal notation.

port *port-number*: Specifies the port number of the IMC server, in the range of 1 to 65535.

vpn-instance *vpn-instance-name*: Specifies the MPLS L3VPN instance to which the IMC server belongs. The *vpn-instance-name* argument represents the VPN instance name, a case-sensitive string of 1 to 31 characters. Do not specify this option if the IMC server is on the public network.

Examples

In IMC SMS authentication view, specify an IMC server (with IP address 192.168.151.1 and port 2000) in VPN instance **vpn1** for SMS authentication of users.

```
<Sysname> system-view
[Sysname] sslvpn context ctx1
[Sysname-sslvpn-context-ctx1] sms-auth imc
[Sysname-sslvpn-context-ctx1-sms-auth-imc] server-address 192.168.151.1 port 2000
vpn-instance vpn1
```

service enable (SSL VPN context view)

Use **service enable** to enable an SSL VPN context.

Use **undo service enable** to disable an SSL VPN context.

Syntax

service enable

undo service enable

Default

An SSL VPN context is disabled.

[Sysname-sslvpn-gateway-gw1] service enable
```

Related commands

display sslvpn gateway

session-connections

Use **session-connections** to set the maximum number of connections allowed per session.

Use **undo session-connections** to restore the default.

Syntax

session-connections *number*

undo session-connections

Default

A maximum of 64 connections are allowed per session.

Views

SSL VPN context view

Predefined user roles

network-admin

context-admin

Parameters

number: Set the maximum number of connections allowed per session. The value can be 0 or in the range of 10 to 1000. Value 0 indicates that the number of connections per session is not limited.

Usage guidelines

If the number of connections in a session has reached the maximum, new connection requests for the session will be rejected with a **503 Service Unavailable** message.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Set the maximum number of connections allowed per session to 10.

```
<Sysname> system-view
[Sysname] sslvpn context ctx1
[Sysname-sslvpn-context-ctx1] session-connections 10
```

shortcut

Use **shortcut** to create a shortcut and enter its view, or enter the view of an existing shortcut.

Use **undo shortcut** to delete a shortcut.

Syntax

shortcut *shortcut-name*

undo shortcut *shortcut-name*

Default

No shortcuts exist.

Views

SSL VPN context view

Predefined user roles

network-admin

context-admin

Parameters

shortcut-name: Specifies a shortcut name, a case-insensitive string of 1 to 31 characters. The shartcut name cannot start with **list-**.

Usage guidelines

After you create a shortcut, use the **execution** command to configure a resource link for it. Users can then click the shortcut name on the SSL VPN Web page to access the associated resource.

Examples

Create a shortcut named **shortcut1** and enter its view.

```
<Sysname> system-view
[Sysname] sslvpn context ctx1
[Sysname-sslvpn-context-ctx1] shortcut shortcut1
[Sysname-sslvpn-context-ctx1-shortcut-shortcut1]
```

shortcut-list

Use **shortcut-list** to create a shortcut list and enter its view, or enter the view of an existing shortcut list.

Use **undo shortcut-list** to delete a shortcut list.

Syntax

shortcut-list *list-name*

undo shortcut-list *list-name*

Default

No shortcut lists exist.

Views

SSL VPN context view

Predefined user roles

network-admin

context-admin

Parameters

list-name: Specifies a name for the shortcut list, a case-insensitive string of 1 to 31 characters.

Examples

Create a shortcut list named **list1** and enter its view.

```
<Sysname> system-view
[Sysname] sslvpn context ctx1
[Sysname-sslvpn-context-ctx1] shortcut-list list1
[Sysname-sslvpn-context-ctx1-shortcut-list-list1]
```

shutdown

Use **shutdown** to shut down an SSL VPN AC interface.

Use **undo shutdown** to bring up an SSL VPN AC interface.

Syntax

shutdown

undo shutdown

Default

An SSL VPN AC interface is up.

Views

SSL VPN AC interface view

Predefined user roles

network-admin

context-admin

Usage guidelines

CAUTION:

The **shutdown** command interrupts ongoing network services. Make sure you are fully aware of the impact of this command when you use it on a live network.

Examples

Shut down SSL VPN AC 1000.

```
<Sysname> system-view
[Sysname] interface sslvpn-ac 1000
[Sysname-SSLVPN-AC1000] shutdown
```

sms-auth

Use **sms-auth** to create an SMS authentication view and enter its view, or enter the view of an existing SMS authentication view.

Use **undo sms-auth** to delete an SMS authentication view.

Syntax

sms-auth { **imc** | **sms-gw** }

undo sms-auth { **imc** | **sms-gw** }

Default

No SMS authentication views exist.

Views

SSL VPN context view

Predefined user roles

network-admin

context-admin

Parameters

imc: Specifies the IMC SMS authentication view.

sms-gw: Specifies the SMS gateway authentication view.

Examples

Create and enter SMS gateway authentication view in SSL VPN context **ctx1**.

```
<Sysname> system-view
[Sysname] sslvpn context ctx1
[Sysname-sslvpn-context-ctx1] sms-auth sms-gw
```

```
[Sysname-sslvpn-context-ctx1-sms-auth-sms-gw]
```

Related commands

sms-auth type

sms-auth type

Use **sms-auth type** to specify an SMS authentication type and enable SMS authentication.

Use **undo sms-auth type** to restore the default.

Syntax

sms-auth type { **imc** | **sms-gw** }

undo sms-auth type

Default

SMS authentication is disabled.

Views

SSL VPN context view

Predefined user roles

network-admin

context-admin

Parameters

imc: Specifies IMC SMS authentication.

sms-gw: Specifies SMS gateway authentication.

Usage guidelines

After you enable SMS authentication, the device uses SMS verification codes to authenticate SSL VPN users. A user is allowed to log in to the SSL VPN gateway only when the user passes the SMS authentication.

The device supports the following types of SMS authentication:

- IMC SMS authentication.

  SMS authentication for SSL VPN users is performed by an IMC server. You must configure the IP address and port number for the IMC server in IMC SMS authentication view.

- SMS gateway authentication.

  SMS gateway authentication for SSL VPN users is performed by an SMS gateway. You must specify the SMS gateway, the verification code resend interval, and the verification code validity period in SMS gateway authentication view.

Examples

Specify the SMS authentication type as SMS gateway authentication in SSL VPN context **ctx1**.

```
<Sysname> system-view
[Sysname] sslvpn context ctx1
[Sysname-sslvpn-context-ctx1] sms-auth type sms-gw
```

Related commands

display sslvpn context

sms-auth

sms-content

Use **sms-content** to configure the SMS content template.

Use **undo sms-content** to restore the default.

Syntax

sms-content *string*

undo sms-content

Default

The SMS content template is **Hello, $$USER$$, the verification code is $$VERIFYCODE$$, and its validity period is $$VALIDTIME$$ minutes.**

Views

SMS gateway authentication view

Predefined user roles

network-admin

context-admin

Parameters

string: Specifies the SMS content template, a case-sensitive string of 1 to 127 characters.

Usage guidelines

Use this command to configure the SMS content template that the SMS gateway uses to send SMS messages.

An SMS content template must contain the following variables:

- **$$USERNAME$$**—User name variable.
- **$$VERIFYCODE$$**—Verification code variable.
- **$$VALIDTIME$$**—Verification code validity period variable.

Examples

In SMS gateway authentication view, configure the SMS content template as **Hello, $$USER$$, the verification code is $$VERIFYCODE$$, and its validity period is $$VALIDTIME$$ in minutes.**

```
<Sysname> system-view
[Sysname] sslvpn context ctx1
[Sysname-sslvpn-context-ctx1] sms-auth sms-gw
[Sysname-sslvpn-context-ctx1-sms-auth-sms-gw] sms-content Hello, $$USER$$, the
verification code is $$VERIFYCODE$$, and its validity period is $$VALIDTIME$$ in minutes.
```

ssl client-policy

Use **ssl client-policy** to apply an SSL client policy to an SSL VPN context.

Use **undo ssl client-policy** to restore the default.

Syntax

ssl client-policy *policy-name*

undo ssl client-policy

Default

The default SSL client policy for SSL VPN is used. This policy supports the **dhe_rsa_aes_128_cbc_sha**, **dhe_rsa_aes_256_cbc_sha**, **rsa_3des_ede_cbc_sha**, **rsa_aes_128_cbc_sha**, and **rsa_aes_256_cbc_sha** cipher suites.

Views

SSL VPN context view

Predefined user roles

network-admin

context-admin

Parameters

policy-name: Specifies an SSL client policy by its name, a case-insensitive string of 1 to 31 characters.

Usage guidelines

You can apply only one SSL client policy to an SSL VPN context. For the applied SSL client policy to take effect, you must enable the SSL VPN context by using the **service enable** command. The SSL VPN gateway will use the parameters defined by the policy to establish SSL connections to HTTPS servers.

If you execute this command multiple times, the new configuration overwrites the previous configuration, but does not take effect. For the new configuration to take effect, disable the SSL VPN context and then re-enable it.

For information about configuring SSL client policies, see *Security Configuration Guide*.

Examples

Apply SSL client policy **abc** to SSL VPN context **ctx1**.

```
<Sysname> system-view
[Sysname] sslvpn context ctx1
[Sysname-sslvpn-context-ctx1] ssl client-policy abc
```

ssl server-policy

Use **ssl server-policy** to apply an SSL server policy to an SSL VPN gateway.

Use **undo ssl server-policy** to remove the application.

Syntax

ssl server-policy *policy-name*

undo ssl server-policy

Default

An SSL VPN gateway uses the SSL server policy of its self-signed certificate.

Views

SSL VPN gateway view

Predefined user roles

network-admin

context-admin

Parameters

policy-name: Specifies the name of an SSL server policy, a case-insensitive string of 1 to 31 characters.

Usage guidelines

You can apply only one SSL server policy to an SSL VPN gateway. For the applied SSL server policy to take effect, you must enable the SSL VPN gateway by using the **service enable** command. The SSL VPN gateway will use the parameters defined by the policy to establish SSL connections to remote users.

If you execute this command multiple times, the new configuration overwrites the previous configuration but does not take effect. For the new configuration to take effect, disable the SSL VPN gateway and then enable the SSL VPN gateway. To disable and enable an SSL VPN gateway, use the **undo service enable** and **service enable** commands.

After you modify the content of the SSL server policy applied to an SSL VPN gateway, you must disable and then re-enable the gateway to validate the policy. To disable and enable an SSL VPN gateway, use the **undo service enable** and **service enable** commands.

Examples

Apply SSL server policy **CA_CERT** to SSL VPN gateway **gw1**.

```
<Sysname> system-view
[Sysname] sslvpn gateway gw1
[Sysname-sslvpn-gateway-gw1] ssl server-policy CA_CERT
```

Related commands

display sslvpn gateway

sslvpn context

Use **sslvpn context** to create an SSL VPN context and enter its view, or enter the view of an existing SSL VPN context.

Use **undo sslvpn context** to delete an SSL VPN context.

Syntax

sslvpn context *context-name*

undo sslvpn context *context-name*

Default

No SSL VPN contexts exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

context-name: Specifies an SSL VPN context name, a case-insensitive string of 1 to 31 characters. Valid characters are letters, digits, and underscores (_).

Usage guidelines

SSL VPN contexts contain different user sessions, accessible resources, and user authentication methods.

An SSL VPN gateway can be associated with multiple SSL VPN contexts. After a remote user logs in to an SSL VPN gateway, the user can access only the resources in the SSL VPN context to which the user belongs.

Examples

Create an SSL VPN context named **ctx1** and enter its view.

```
<Sysname> system-view
[Sysname] sslvpn context ctx1
[Sysname-sslvpn-context-ctx1]
```

Related commands

display sslvpn context

sslvpn gateway

Use **sslvpn gateway** to create an SSL VPN gateway and enter its view, or enter the view of an existing SSL VPN gateway.

Use **undo sslvpn gateway** to delete an SSL VPN gateway.

Syntax

sslvpn gateway *gateway-name*

undo sslvpn gateway *gateway-name*

Default

No SSL VPN gateways exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

gateway-name: Specifies an SSL VPN gateway name, a case-insensitive string of 1 to 31 characters. Valid characters are letters, digits, and underscores (_).

Usage guidelines

An SSL VPN gateway resides between remote users and the enterprise network to ensure secure access of remote users to the enterprise internal network. The SSL VPN gateway establishes an SSL connection to a remote user, and then authenticates the user before allowing the user to access an internal server.

You must perform the following tasks in the view of an SSL VPN gateway:

- Execute the **ip address** command to configure an IP address and a port number for the SSL VPN gateway.
- Execute the **ssl server-policy** command to apply an SSL server policy to the SSL VPN gateway.
- Execute the **service enable** command to enable the SSL VPN gateway.

You cannot delete an SSL VPN gateway that has been associated with an SSL VPN context. To delete the SSL VPN gateway, execute the **undo gateway** command to remove the association and then execute the **undo sslvpn gateway** command.

Examples

Create an SSL VPN context named **gw1** and enter its view.

```
<Sysname> system-view
[Sysname] sslvpn gateway gw1
[Sysname-sslvpn-gateway-gw1]
```

Related commands

display sslvpn gateway

sslvpn ip address-pool

Use **sslvpn ip address-pool** to create an address pool.

Use **undo sslvpn ip address-pool** to delete an address pool.

Syntax

sslvpn ip address-pool *pool-name start-ip-address end-ip-address*

undo sslvpn ip address-pool *pool-name*

Default

No address pools exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

pool-name: Specifies a name for the address pool, a case-insensitive string of 1 to 31 characters.

start-ip-address end-ip-address: Specifies the start IP address and end IP address for the pool. The end IP address must be greater than the start IP address. The start IP address and end IP address cannot be a multicast, broadcast, or loopback address.

Usage guidelines

The created address pools are used for address allocation to SSL VPN IP access clients. You can specify an address pool for an SSL VPN context or an SSL VPN policy group. An SSL VPN gateway uses the specified address pools to assign IP addresses to IP access clients.

Examples

Create an address pool named **pool1** and specify the address range as 10.1.1.1 to 10.1.1.254.

```
<Sysname> system-view
[Sysname] sslvpn ip address-pool pool1 10.1.1.1 10.1.1.254
```

Related commands

sslvpn log enable

Use **sslvpn log enable** to enable the SSL VPN global logging feature.

Use **undo sslvpn log enable** to disable the SSL VPN global logging feature.

Syntax

sslvpn log enable

undo sslvpn log enable

Default

The SSL VPN global logging feature is disabled.

Views

System view

Predefined user roles

network-admin

context-admin

Usage guidelines

This feature logs the following global events:

- SSL VPN access failures because of not associating SSL VPN contexts with gateways.
- SSL VPN access failures because of not enabling SSL VPN contexts.

The logs are sent to the information center of the device. For the logs to be output correctly, you must also configure the information center on the device. For more information about the information center, see *Network Management and Monitoring Configuration Guide*.

Examples

Enable the SSL VPN global logging feature.

```
<Sysname> system-view
[Sysname] sslvpn log enable
```

sslvpn webpage-customize

Use **sslvpn webpage-customize** to specify a webpage template for SSL VPN webpage customization.

Use **undo sslvpn webpage-customize** to restore the default.

Syntax

sslvpn webpage-customize *template-name*

undo sslvpn webpage-customize

Default

SSL VPN uses the system default webpages.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

template-name: Specifies a webpage template by its name, a string of 1 to 31 characters. The name cannot contain any of the following characters: forward slash (/), backslash (\), vertical bar (|),

colon (:), asterisk (*), quotation mark ("), question mark (?), left angle bracket (<), and right angle bracket (>).

Usage guidelines

This command allows you to set the global SSL VPN webpage template. Both predefined and user-defined webpage templates are available.

You can upload and download webpage templates through the SSL VPN Web interface.

To view all webpage templates in the system, use the **display sslvpn webpage-customize template** command.

In an SSL VPN context, the webpage template specified for the SSL VPN context takes precedence over the global SSL VPN webpage template. To specify a webpage template for an SSL VPN context, use the **webpage-customize** command in SSL VPN context view.

Examples

Use webpage template **template1** to customize SSL VPN webpages.

```
<Sysname> system-view
[Sysname] sslvpn webpage-customize template1
```

Related commands

display sslvpn webpage-customize template

webpage-customize

sso auto-build code

Use **sso auto-build code** to specify a character encoding method for SSO login requests that are built automtically.

Use **undo sso auto-build code** to restore the default.

Syntax

sso auto-build code { **gb18030** | **utf-8** }

undo sso auto-build code

Default

UTF-8 encoding is used for automatically built SSO login requests.

Views

URL item view

Predefined user roles

network-admin

context-admin

Parameters

gb18030: Specifies GB18030 encoding.

utf-8: Specifies UTF-8 encoding.

Usage guidelines

Encoding a login request is to convert the login request into a binary string for transmission. The SSL VPN gateway supports GB18030 and UTF-8 encoding methods. Specify an encoding method according to the decoding method used by the internal server.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

In URL item **servera**, set the encoding method to **GB18030** for automatically built SSO login requests.

```
<Sysname> system-view
[Sysname] sslvpn context ctx1
[Sysname-sslvpn-context-ctx1] url-item servera
[Sysname-sslvpn-context-ctx1-url-item-servera] sso auto-build code gb18030
```

sso auto-build custom-login-parameter

Use **sso auto-build custom-login-parameter** to configure a custom login parameter for automatic building of SSO login requests.

Use **undo sso auto-build custom-login-parameter** to restore the default.

Syntax

sso auto-build custom-login-parameter name *parameter-name* **value** *value* [**encrypt**]

undo sso auto-build custom-login-parameter name *parameter-name*

Default

No custom parameter is configured for automatic building of SSO login requests.

Views

URL item view

Predefined user roles

network-admin

context-admin

Parameters

name *parameter-name*: Specifies the parameter name, a case-sensitive string of 1 to 63 characters.

value *value*: Specifies the attribute value, a case-sensitive string of 1 to 255 characters.

encrypt: Enables attribute value encryption through an encryption file. The encryption file is specified by the **sso auto-build encrypt-file** command.

Usage guidelines

Use this command to configure a custom login parameter (attribute name and value) if the auto-build SSO method is enabled.

The SSL VPN gateway will use the custom login parameter and other auto-build login parameters (configured by using the **sso auto-build login-parameter** command) to build login requests automatically.

Examples

In URL item **servera**, configure a custom login parameter for auto-build SSO. Configure the parameter's name as **commit** and the value as **login**.

```
<Sysname> system-view
[Sysname] sslvpn context ctx1
[Sysname-sslvpn-context-ctx1] url-item servera
[Sysname-sslvpn-context-ctx1-url-item-servera] sso auto-build custom-login-parameter
name commit value login
```

Use **undo timeout idle** to restore the default.

Syntax

sso auto-build encrypt-file *filename*

undo sso auto-build encrypt-file

Default

No encryption file is specified for SSO login in the auto-build method.

Views

URL item view

Predefined user roles

network-admin

context-admin

Parameters

filename: Specifies an encryption file by its name, a case-insensitive string of 1 to 255 characters.

Usage guidelines

Use this command to specify an encryption file to encrypt the values of the parameters in automatically built SSO login requests. Encryption files are files that contain encryption functions written in JavaScript, and these files must be uploaded to the file management system of the device in advance.

If the encryption file to be used is the root directory of the device, you do not need to specify the file path when you execute this command. If the encryption file to be used is in a non-root directory of the device, you must specify the absolute path of the file when you execute this command.

You must write encryption functions in the following template:

```
function sslvpn_sso_encrypt(code)
{
```

```
//Encryption code
}
```

If you execute this command multiple times, the most recent configuration takes effect.

Examples

In URL item **servera**, specify encryption file **test.js** to encrypt the values of the parameters in automatically built SSO login requests.

```
<Sysname> system-view
[Sysname] sslvpn context ctx1
[Sysname-sslvpn-context-ctx1] url-item servera
[Sysname-sslvpn-context-ctx1-url-item-servera] sso auto-build encrypt-file test.js
```

sso method

sso auto-build login-parameter

Use **sso auto-build login-parameter** to configure a login parameter for automatic building of SSO login requests.

Use **undo sso auto-build login-parameter** to restore the default.

Syntax

sso auto-build login-parameter { **cert-fingerprint** | **cert-serial** | **cert-title** | **custom-password** | **custom-username** | **login-name** | **login-password** | **mobile-num** | **user-group** } **name** *parameter-name* [**encrypt**]

undo sso auto-build login-parameter { **cert-fingerprint** | **cert-serial** | **cert-title** | **custom-password** | **custom-username** | **login-name** | **login-password** | **mobile-num** | **user-group** }

Default

No login parameters are configured for automatic building of SSO login requests.

Views

URL item view

Predefined user roles

network-admin

context-admin

Parameters

login-name: Uses the SSL VPN login username as the value of the SSO login parameter.

login-password: Uses the SSL VPN login password as the value of the SSO login parameter.

cert-title: Uses the certificate title as the value of the SSO login parameter.

cert-serial: Uses the certificate serial number as the value of the SSO login parameter.

cert-fingerprint: Uses the certificate fingerprint as the value of the SSO login parameter.

mobile-num: Uses the mobile phone number as the value of the SSO login parameter.

user-group: Uses the user group name as the value of the SSO login parameter.

custom-username: Uses the customized username as the value of the SSO login parameter.

custom-password: Uses the customized password as the value of the SSO login parameter.

name *parameter-name*: Specifies an attribute name for the SSO login parameter, a case-sensitive string of 1 to 63 characters.

encrypt: Enables attribute value encryption through an encryption file. The encryption file is specified by the **sso auto-build encrypt-file** command.

Usage guidelines

Use this command to configure a login parameter (attribute name and value) if the auto-build SSO method is enabled by using the **sso method auto-build** command. The attribute name is the parameter name used by the SSL VPN gateway to log in to the internal server. The parameter value used to log in to the internal server is the actual value abstracted according to the parameter value keyword specified in the command. For example, if you specify the **login-name** keyword for a parameter, the parameter value carried in the login request is the actual SSL VPN login username.

You can configure different values for the same attribute name, and configure different attribute names with the same value.

The SSL VPN gateway will use the login parameters configured by this command and custom login parameters (configured by the **sso auto-build custom-login-parameter** command) to build login requests automatically.

Upon receiving a login request, the internal server searches for the parameter values according to the parameter names to determine whether the login user is legitimate.

Examples

In URL item **servera**, configure a login parameter for auto-build SSO. Configure the parameter's value keyword as **cert-title** and attribute name as **login**.

```
<Sysname> system-view
[Sysname] sslvpn context ctx1
[Sysname-sslvpn-context-ctx1] url-item servera
[Sysname-sslvpn-context-ctx1-url-item-servera] sso auto-build login-parameter
cert-title name login encrypt
```

SSL VPN login username and password are used for SSO login through basic authentication.

Views

URL item view

Predefined user roles

network-admin

context-admin

Usage guidelines

Execute this command if you specify basic authentication for SSO login. The custom username and password are configured in the SSL VPN Web interface.

Examples

In URL item **servera**, enable using the custom username and password for SSO login through basic authentication.

```
<Sysname> system-view
[Sysname] sslvpn context ctx1
[Sysname-sslvpn-context-ctx1] url-item servera
[Sysname-sslvpn-context-ctx1-url-item-servera] sso basic custom-username-password
enable
```

Related commands

sso method

sso method

Use **sso method** to enable SSO and specify the SSO method.

Use **undo sso method** to restore the default.

Syntax

sso method { **auto-build** | **basic** }

undo sso method

Default

SSL VPN SSO login is disabled.

Views

URL item view

Predefined user roles

network-admin

context-admin

Parameters

auto-build: Automatically builds login requests to implement SSO.

basic: Performs basic authentication automatically to implement SSO.

Usage guidelines

SSO allows a user to use one set of login credentials (such as username and password) to access multiple trusted systems. With SSO, after users log in to the SSL VPN gateway in Web access mode, they can gain access to internal servers without entering the login credentials for the internal servers. The device supports the following methods for SSO login:

- Auto-build method

  Use a packet capture tool to obtain internal server login requests, and then configure SSO login settings based on the login requests to automatically build login requests to the internal servers. SSO login settings include the HTTP request method, login request encoding method, login parameters, and login data encryption file.

- Basic authentication

Basic authentication is a simple HTTP authentication scheme, which requires a Web client to enter a username and password to access the server. The server authenticates the client based on the username and password.

To implement SSO in the basic authentication method, the SSL VPN gateway acts as a Web client and automatically enters a username and password to perform HTTP basic authentication. The entered username and password can be SSL VPN username and password or a custom username and password.

The basic authentication SSO method is applicable only for logging in to the internal servers that support basic authentication.

Examples

In URL item **servera**, specify the SSO method as basic authentication.

```
<Sysname> system-view
[Sysname] sslvpn context ctx1
[Sysname-sslvpn-context-ctx1] url-item servera
[Sysname-sslvpn-context-ctx1-url-item-servera] sso method basic
```

timeout idle

Use **timeout idle** to set the idle timeout timer for SSL VPN sessions.

Use **undo timeout idle** to restore the default.

Syntax

timeout idle *minutes*

undo timeout idle

Default

The idle timeout timer is 30 minutes for SSL VPN sessions.

Views

SSL VPN context view

Predefined user roles

network-admin

context-admin

Parameters

seconds: Specifies the idle timeout timer in the range of 1 to 1440 minutes.

Usage guidelines

If the idle time of an SSL VPN session exceeds the specified idle timeout time, the session is terminated.

Examples

Set the idle timeout timer to 50 minutes for SSL VPN sessions.

```
<Sysname> system-view
[Sysname] sslvpn context ctx1
[Sysname-sslvpn-context-ctx1] timeout idle 50
```

Related commands

display sslvpn policy-group

title

Use **title** to configure a title to be displayed on SSL VPN webpages.

Use **undo title** to restore the default.

Syntax

title { **chinese** *chinese-title* | **english** *english-title* }

undo title { **chinese** | **english** }

Default

The title is **SSL VPN**.

Views

SSL VPN context view

Predefined user roles

network-admin

context-admin

Parameters

chinese *chinese-title*: Configures a title in Chinese, a case-sensitive string of 1 to 255 characters.

english *english-title*: Configures a title in English, a case-sensitive string of 1 to 255 characters.

Examples

Configure the title as **SSL VPN service for company A**.

```
<Sysname> system-view
[Sysname] sslvpn context ctx1
[Sysname-sslvpn-context-ctx1] title english SSL VPN service for company A
```

uri-acl

Use **uri-acl** to create a URI ACL and enter its view, or enter the view of an existing URI ACL.

Use **undo uri-acl** to delete a URI ACL.

Syntax

uri-acl *uri-acl-name*

undo uri-acl *uri-acl-name*

Default

No URI ACLs exist.

Views

SSL VPN context view

Predefined user roles

network-admin

context-admin

Parameters

uri-acl-name: Specifies a name for the URI ACL, a case-insensitive string of 1 to 31 characters.

Usage guidelines

A URI ACL is a set of rules that permit or deny access to resources. You can use URI ACLs for IP, TCP, and Web access filtering of SSL VPN users.

You can create multiple URI ACLs in an SSL VPN context.

Examples

Create a URI ACL named **uriacla** and enter its view.

```
<Sysname> system-view
[Sysname] sslvpn context abc
[Sysname-sslvpn-context-abc] uri-acl uriacla
[Sysname-sslvpn-context-abc-uri-acl-uriacla]
```

url (file policy view)

Use **url** to specify the URL of the Web page file to be rewritten in a file policy.

Use **undo url** to restore the default.

Syntax

url *url*

undo url

Default

No file URL is specified in a file policy.

Views

File policy view

Predefined user roles

network-admin

context-admin

Parameters

url: Specifies the complete file path, a case-insensitive string of 1 to 256 characters.

Usage guidelines

A file policy can be used to modify only the Web page file whose URL is the same as the URL configured in the policy.

A file URL is in the format of *scheme://user:password@host:port/path*. Table 15 describes the fields in the file URL.

Table 15 URL field descriptions

Field	Description
scheme	Protocol type. Options include http and https.
user:password	Username and password used to access the file.
host	Host name or IP address of the server where the file resides. To specify an IPv6 address, enclose the IPv6 address in brackets. For example, http://[1234::5678]:8080/a.html.
port	Port number on which the server listens for resource access requests. If you do not specify a port number, the default port number of the protocol is used, which is 80 for HTTP and 443 for HTTPS.
path	Local path of the file on the server.

You can specify only one file URL in a file policy. In the same SSL VPN context, the URL specified for each file policy must be unique.

Examples

Specify a file URL for file policy **fp**.

```
<Sysname> system-view
[Sysname] sslvpn context ctx
[Sysname-sslvpn-context-ctx] file-policy fp
[Sysname-sslvpn-context-ctx-file-policy-fp] url http://192.168.1.1:8080/js/test.js
```

url (URL item view)

Use **url** to specify a URL in a URL item.

Use **undo url** to remove the URL from a URL item.

Syntax

url *url*

undo url

Default

No URL is specified in a URL item.

Views

URL item view

Predefined user roles

network-admin

context-admin

Parameters

url: Specifies a URL, a case-insensitive string of 1 to 253 characters in the format of *protocol://host:port/path*.

Usage guidelines

Table 16 describes the fields in a URL.

Table 16 URL field descriptions

Field	Description
protocol	Protocol name. Options are: • http. • https. If you do not specify a protocol name, the default protocol (HTTP) is used.
host	Domain name or IP address of a host. To specify an IPv6 address, enclose the IPv6 address in brackets. For example. http://[1234::5678]:8080.
port	Port number. If you do not specify a port number, the default port number of the protocol is used, which is 80 for HTTP and 443 for HTTPS.
path	Path to the resource on the host.

You can specify only one URL in a URL item. If you execute this command multiple times, the most recent configuration takes effect.

Examples

Specify **www.abc.com** as the URL in URL item **serverA**.

```
<Sysname> system-view
[Sysname] sslvpn context ctx1
[Sysname-sslvpn-context-ctx1] url-item serverA
[Sysname-sslvpn-context-ctx1-url-item-serverA] url www.abc.com
```

url-item

Use **url-item** to create a URL item and enter its view, or enter the view of an existing URL item.

Use **undo url-item** to delete a URL item.

Syntax

url-item *url-item-name*

undo url-item *url-item-name*

Default

No URL items exist in an SSL VPN context.

Views

SSL VPN context view

Predefined user roles

network-admin

context-admin

Parameters

url-item-name: Specifies a name for the URL item, a case-insensitive string of 1 to 31 characters.

Usage guidelines

You can create multiple URL items in an SSL VPN context. Each URL item contains an accessible resource URL and can be assigned to a URL list in the SSL VPN context.

A URL item that has been assigned to a URL list cannot be deleted.

Examples

Create a URL item named **serverA** and enter URL item view.

```
<Sysname> system-view
[Sysname] sslvpn context ctx1
[Sysname-sslvpn-context-ctx1] url-item serverA
[Sysname-sslvpn-context-ctx1-url-item-serverA]
```

url-list

Use **url-list** to create a URL list and enter its view, or enter the view of an existing URL list.

Use **undo url-list** to delete a URL list.

Syntax

url-list *name*

undo url-list *name*

Default

No URL lists exist.

Views

SSL VPN context view

Predefined user roles

network-admin

context-admin

Parameters

name: Specifies a name for the URL list, a case-insensitive string of 1 to 31 characters.

Examples

Create a URL list named **url1** and enter URL list view.

```
<Sysname> system-view
[Sysname] sslvpn context ctx1
[Sysname-sslvpn-context-ctx1] url-list url1
[Sysname-sslvpn-context-ctx1-url-list-url1]
```

Related commands

sslvpn context

url-mapping

Use **url-mapping** to configure URL mapping in a URL item.

Use **undo url-mapping** to restore the default.

Syntax

url-mapping { **domain-mapping** *domain-name* | **port-mapping gateway** *gateway-name* [**virtual-host** *virtual-host-name*] } [**rewrite-enable**]

undo url-mapping

Default

The normal rewriting method is used.

Views

URL item view

Predefined user roles

network-admin

context-admin

Parameters

domain-mapping *domain-name*: Specifies the domain name mapping method. This method maps the URL to a domain name, a case-insensitive string of 1 to 127 characters which can contain letters, digits, underscores (_), hyphens (-), and dots (.). The specified domain cannot be the same as the domain name of the SSL VPN gateway.

port-mapping gateway *gateway-name*: Specifies the port mapping method. This method maps the URL to a gateway name and an optional virtual host name. The *gateway-name* argument specifies the gateway name, a case-insensitive string of 1 to 31 characters which can contain letters, digits, and underscores (_). The specified SSL VPN gateway name must be the name of an existing SSL VPN gateway.

virtual-host *virtual-host-name*: Specifies the virtual host name, a case-insensitive string of 1 to 127 characters which can contain letters, digits, underscores (_), hyphens (-), and dots (.). Do not specify a virtual host name if you want to use the SSL VPN gateway exclusively for the URL item.

rewrite-enable: Enables the SSL VPN gateway to rewrite the absolute URLs in the resource access response returned from the internal server. These absolute URLs are generally the URLs linked to other servers from the internal server. If you do not specify this keyword, these absolute URLs are not accessible. Enable this rewriting feature as a best practice to improve user experience.

Usage guidelines

The SSL VPN gateway rewrites the resource URLs in resource access responses that contain HTML, XML, CSS, or JavaScript files before sending the URLs to the requesting users. By default, the normal rewriting method is used for the URL rewriting. You can also configure the SSL VPN gateway to use the domain mapping or port mapping method.

Normal rewriting might cause problems such as missed URL rewriting and rewriting errors, resulting in SSL VPN clients not being able to access the internal resources. Use domain mapping or port mapping as a best practice. For more information about these mapping methods, see SSL VPN configuration in *Security Configuration Guide*.

When configuring the domain mapping method, make sure the SSL VPN client can resolve the mapped domain name (through DNS or the Hosts file) into the IP address of the SSL VPN gateway.

When configuring the port mapping method, you can specify an SSL VPN gateway exclusively for a URL item by specifying the gateway name without a virtual host name. To share an SSL VPN gateway with other URL items or SSL VPN contexts, specify the SSL VPN gateway name together with a virtual host name.

If you execute this command for a URL item multiple times, the most recent configuration takes effect.

Examples

Create URL item **serverA** and specify **www.server.com** as the resource URL. Map the resource URL to domain name **www.domain.com** and enable URL rewriting.

```
<Sysname> system-view
[Sysname] sslvpn context ctx1
[Sysname-sslvpn-context-ctx1] url-item serverA
```

```
[Sysname-sslvpn-context-ctx1-url-item-serverA] url www.server.com
[Sysname-sslvpn-context-ctx1-url-item-serverA] url-mapping domain-mapping
www.domain.com rewrite-enable
```

Create URL item **serverB** and specify **www.server.com** as the resource URL. Map the resource URL to gateway **gw1** with virtual host name **host1** and enable URL rewriting.

```
<Sysname> system-view
[Sysname] sslvpn context ctx1
[Sysname-sslvpn-context-ctx1] url-item serverB
[Sysname-sslvpn-context-ctx1-url-item-serverB] url www.server.com
[Sysname-sslvpn-context-ctx1-url-item-serverB] url-mapping port-mapping gateway gw1
virtual-host host1 rewrite-enable
```

Related commands

`url-item`

`url`

url-masking enable

Use **`url-masking enable`** to enable URL masking.

Use **`undo url-masking enable`** to disable URL masking.

Syntax

`url-masking enable`

`undo url-masking enable`

Default

URL masking is disabled.

Views

SSL VPN context view

URL item view

Predefined user roles

network-admin

context-admin

Usage guidelines

The URL masking feature hides the real Web access resource URLs configured in an SSL VPN context by converting the URLs into coded strings.

If URL masking is enabled in an SSL VPN context, all the Web resources in the context are enabled with URL masking. In this case, if you want to disable URL masking, you must use the **undo `url-masking enable`** command in the SSL VPN context view for all the Web resources.

You can enable or disable URL masking for a single URL in URL item view only when URL masking is disabled in SSL VPN context view.

Examples

Enable URL masking for the Web resource URL in a URL item.

```
<Sysname> system-view
[Sysname] sslvpn context ctx
[Sysname-sslvpn-context-ctx] url-item urlitem
```

```
[Sysname-sslvpn-context-ctx-url-item-urlitem] url-masking enable
```

Enable URL masking for all Web resource URLs in an SSL VPN context.

```
<Sysname> system-view
[Sysname] sslvpn context ctx
[Sysname-sslvpn-context-ctx] url-masking enable
```

user

Use **user** to create an SSL VPN user and enter SSL VPN user view, or enter the view of an existing SSL VPN user.

Use **undo user** to delete an SSL VPN user.

Syntax

user *username*

undo user *username*

Default

No SSL VPN users exist.

Views

SSL VPN context view

Predefined user roles

network-admin

context-admin

Parameters

username: Specifies the SSL VPN username, a case-sensitive string of 1 to 63 characters. The username cannot contain any of the following characters: forward slash (/), backslash (\), vertical bar (|), colon (:), asterisk (*), question mark (?), left angle bracket (<), and right angle bracket (>).

Usage guidelines

You can create multiple SSL VPN users in an SSL VPN context.

Examples

Create SSL VPN user **user1** and enter SSL VPN user view.

```
<Sysname> system-view
[Sysname] sslvpn context ctx
[Sysname-sslvpn-context-ctx] user user1
[Sysname-sslvpn-context-ctx-user-user1]
```

verification-code send-interval

Use **verification-code send-interval** to set the SMS verification code resend interval.

Use **undo verification-code send-interval** to restore the default.

Syntax

verification-code send-interval *seconds*

undo verification-code send-interval

Default

The SMS verification code resend interval is 60 seconds.

Views

SMS gateway authentication view

Predefined user roles

network-admin

context-admin

Parameters

seconds: Specifies the verification code resend interval, in the range of 0 to 3600 seconds.

Usage guidelines

This interval is the minimum amount of time that a user must wait before the user can re-obtain the SMS verification code.

Examples

In SMS gateway authentication view, set the verification code resend interval to 80 seconds.

```
<Sysname> system-view
[Sysname] sslvpn context ctx1
[Sysname-sslvpn-context-ctx1] sms-auth sms-gw
[Sysname-sslvpn-context-ctx1-sms-auth-sms-gw] verification-code send-interval 80
```

verification-code validity

Use **verification-code validity** to set the SMS verification code validity period.

Use **undo verification-code validity** to restore the default.

Syntax

verification-code validity *minutes*

undo verification-code validity

Default

The SMS verification code validity period is one minute.

Views

SMS gateway authentication view

Predefined user roles

network-admin

context-admin

Parameters

seconds: Specifies the verification code validity period, in the range of 1 to 1440 minutes.

Examples

In SMS gateway authentication view, set the verification code validity period to 30 minutes.

```
<Sysname> system-view
[Sysname] sslvpn context ctx1
[Sysname-sslvpn-context-ctx1] sms-auth sms-gw
[Sysname-sslvpn-context-ctx1-sms-auth-sms-gw] verification-code validity 30
```

verify-code

Use **verify-code enable** to enable code verification.

Use **undo verify-code enable** to disable code verification.

Syntax

verify-code enable

undo verify-code enable

Default

Code verification is disabled.

Views

SSL VPN context view

Predefined user roles

context-admin

Usage guidelines

After code verification is enabled, a user must enter a correct verification code to log in to the SSL VPN webpage.

Examples

Enable code verification.

```
<Sysname> system-view
[Sysname] sslvpn context ctx
[Sysname-sslvpn-context-ctx] verify-code enable
```

vpn-instance (SSL VPN context view)

Use **vpn-instance** to associate an SSL VPN context with a VPN instance.

Use **undo vpn-instance** to restore the default.

Syntax

vpn-instance *vpn-instance-name*

undo vpn-instance

Default

An SSL VPN context is associated with the public network.

Views

SSL VPN context view

Predefined user roles

network-admin

context-admin

Parameters

vpn-instance-name: Specifies the name of a VPN instance, a case-sensitive string of 1 to 31 characters.

Usage guidelines

After you associate an SSL VPN context with a VPN instance, the resources managed by the context belong to the VPN instance.

An SSL VPN context can be associated with only one VPN instance.

You can associate an SSL VPN context with a nonexistent VPN instance. The context does not take effect until the associated VPN instance is created.

If you change the VPN instance associated with an SSL VPN context, all user-to-IP address bindings configured for SSL VPN users in the SSL VPN context will be removed.

Examples

Associate SSL VPN context **context1** with VPN instance **vpn1**.

```
<Sysname> System-view
[Sysname] sslvpn context context1
[Sysname-sslvpn-context-context1] vpn-instance vpn1
```

vpn-instance (SSL VPN gateway view)

Use **vpn-instance** to specify a VPN instance for an SSL VPN gateway.

Use **undo vpn-instance** to restore the default.

Syntax

vpn-instance *vpn-instance-name*

undo vpn-instance

Default

An SSL VPN gateway belongs to the public network.

Views

SSL VPN gateway view

Predefined user roles

network-admin

context-admin

Parameters

vpn-instance-name: Specifies the name of a VPN instance, a case-sensitive string of 1 to 31 characters.

Usage guidelines

The VPN instance specified for an SSL VPN gateway is called a front VPN instance.

You can specify only one VPN instance for an SSL VPN gateway.

You can specify a nonexistent VPN instance for an SSL VPN gateway. The SSL VPN gateway does not take effect until the VPN instance is created.

Examples

Specify VPN instance **vpn1** for SSL VPN gateway **gateway1**.

```
<Sysname> system-view
[Sysname] sslvpn gateway gateway1
[Sysname-sslvpn-gateway-gateway1] vpn-instance vpn1
```

web-access ip-client auto-activate

Use **web-access ip-client auto-activate** to enable automatic startup of the IP access client after Web login.

Use **undo web-access ip-client auto-activate** to disable automatic startup of the IP access client after Web login.

Syntax

web-access ip-client auto-activate

undo web-access ip-client auto-activate

Default

Automatic startup of the IP access client after Web login is disabled.

Views

SSL VPN context view

Predefined user roles

network-admin

context-admin

Usage guidelines

With this feature enabled, after a user logs in to the SSL VPN gateway through a Web browser, the IP access client on the user host will automatically connect to the gateway. If the IP access client software is not installed, the user will be prompted to install the software first.

For the IP access client to connect to the SSL VPN gateway correctly, make sure the IP access service and resources are configured on the SSL VPN gateway.

If an SSL VPN user has already logged in through an IP access client when this feature is enabled, the user cannot access the SSL VPN gateway directly through the Web browser. To access the SSL VPN gateway through the Web browser, the user must click **Open Resource List** in the IP access client.

Examples

Enable automatic startup of the IP access client after Web login in SSL VPN context **ctx1**.

```
<Sysname> system-view
[Sysname] sslvpn context ctx1
[Sysname-sslvpn-context-ctx1] web-access ip-client auto-activate
```

webpage-customize

Use **webpage-customize** to specify a webpage template for SSL VPN webpage customization.

Use **undo webpage-customize** to restore the default.

Syntax

webpage-customize *template-name*

undo webpage-customize

Default

The global SSL VPN webpage template is used.

Views

SSL VPN context view

Predefined user roles

network-admin

context-admin

Parameters

template-name: Specifies a webpage template by its name, a string of 1 to 31 characters. The name cannot contain any of the following characters: forward slash (/), backslash (\), vertical bar (|), colon (:), asterisk (*), quotation mark ("), question mark (?), left angle bracket (<), and right angle bracket (>).

Usage guidelines

This command allows you to set the webpage template for an SSL VPN context. Both predefined and user-defined webpage templates are available.

You can upload and download webpage templates through the SSL VPN Web interface.

To view all webpage templates in the system, use the **display sslvpn webpage-customize template** command.

In an SSL VPN context, the webpage template specified for the SSL VPN context takes precedence over the global SSL VPN webpage template. To set the global SSL VPN webpage template, use the **sslvpn webpage-customize** command in system view.

If a user-defined webpage template is specified in an SSL VPN context, all other webpage customization settings are invalid for the SSL VPN context.

Examples

Use webpage template **template1** to customize SSL VPN webpages in SSL VPN context **ctx**.

```
<Sysname> system-view
[Sysname] sslvpn context ctx
[Sysname-sslvpn-context-ctx] webpage-customize template1
```

Related commands

wechat-work-authentication app-secret

Use **wechat-work-authentication app-secret** to specify the app secret key for WeChat Work (or WeCom) authentication.

Use **undo wechat-work-authentication app-secret** to restore the default.

Syntax

wechat-work-authentication app-secret *app-secret*

undo wechat-work-authentication app-secret

Default

No app secret key is specified for WeChat Work authentication.

Views

SSL VPN context view

Predefined user roles

network-admin

context-admin

Parameters

template-name: Specifies the app secret key, a case-insensitive string of 1 to 127 characters.

Usage guidelines

Each app has an independent secret key to ensure data security. Make sure the app secret key is not leaked.

The app secret key and the company ID are used together to generate important credentials for the SSL VPN gateway to obtain user information from the WeChat Work API server.

To view this secret key on the WeChat Work management platform, select the target app on the **App Management** page.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Specify the app secret key as **hpLRFnu7OxedV5bNd9OD0Xi** in SSL VPN context **ctx**.

```
<Sysname> system-view
[Sysname] sslvpn context ctx
[Sysname-sslvpn-context-ctx] wechat-work-authentication app-secret
hpLRFnu7OxedV5bNd9OD0Xi
```

Related commands

wechat-work-authentication corp-id

wechat-work-authentication authorize-field

Use **wechat-work-authentication authorize-field** to specify the name of the authorization policy group field.

Use **undo wechat-work-authentication authorize-field** to restore the default.

Syntax

wechat-work-authentication authorize-field *authorize-field*

undo wechat-work-authentication authorize-field

Default

No authorization policy group field name is specified for WeChat Work authentication.

Views

SSL VPN context view

Predefined user roles

network-admin

context-admin

Parameters

authorize-field: Specifies the name of the authorization policy group field, a case-insensitive string of 1 to 31 characters. Chinese characters are supported.

Usage guidelines

The SSL VPN gateway uses the specified field name to obtain the authorization policy group name (the organization information of users) from the response of the WeChat Work API server.

Assume that the name of the authorization policy group field is **group**. If the response of the WeChat Work API server contains the field **group:ziliao**, the SSL VPN gateway obtains the user's

authorization policy group name, **ziliao**. Then, the gateway will check whether a local policy group named **ziliao** exists:

- If yes, the user is authorized to access the corresponding internal resources in this policy group.
- If no, the user is authorized to access internal resources in the default policy group.

For the SSL VPN gateway to successfully resolve the authorization policy group name from the response, make sure you specify the correct authorization policy group field name in this command. You can obtain the authorization policy group field name from WeChat Work before executing this command.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Specify the name of the authorization policy group field as **group** in SSL VPN context **ctx**.

```
<Sysname> system-view
[Sysname] sslvpn context ctx
[Sysname-sslvpn-context-ctx] wechat-work-authentication authorize-field group
```

wechat-work-authentication corp-id

Use **wechat-work-authentication corp-id** to specify the company ID for WeChat Work authentication.

Use **undo wechat-work-authentication corp-id** to restore the default.

Syntax

wechat-work-authentication corp-id *corp-id*

undo wechat-work-authentication corp-id

Default

No company ID is specified for WeChat Work authentication.

Views

SSL VPN context view

Predefined user roles

network-admin

context-admin

Parameters

corp-id: Specifies the company ID, a case-insensitive string of 1 to 63 characters.

Usage guidelines

A company ID uniquely identifies a company on WeChat Work. The company ID and the secret key are used together to generate important credentials for the SSL VPN gateway to obtain user information from the WeChat Work API server.

To view the company ID on the WeChat Work management platform, go to **My Company** > **Company Information**.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Specify the company ID as **wxdd725338566d6ffe** in SSL VPN context **ctx**.

```
<Sysname> system-view
[Sysname] sslvpn context ctx
```

```
[Sysname-sslvpn-context-ctx] wechat-work-authentication corp-id wxdd725338566d6ffe
```

Related commands

context-admin

Parameters

pre-defined: Specifies the predefined WeChat open platform URL, **https://open.weixin.qq.com**.

user-defined *user-defined-url*: Specifies the WeChat open platform URL as needed, a case-insensitive string of 1 to 63 characters.

Usage guidelines

In general, after receiving a response from the internal server, the SSL VPN gateway will check whether the HTTP header contains the **Location** field. If the **Location** field exists, the SSL VPN gateway will rewrite the URL in the **Location** field and forward the response to the SSL VPN client. The subsequent requests of the SSL VPN client must access the redirected URL.

In particular cases, the response from the internal server to the SSL VPN gateway might require the user to send an authentication request to WeChat Work again. In this case, the SSL VPN gateway must not rewrite the WeChat Work server URL in the **Location** field so that the client can access the WeChat Work server to complete authentication and authorization. If the SSL VPN gateway rewrites the WeChat Work server URL, the WeChat Work server cannot receive the request from the client and WeChat Work authentication fails.

This command specifies the URL in the **Location** field that will not be rewritten by the SSL VPN gateway. For WeChat Work authentication to operate correctly, set the URL as the WeChat open platform URL.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Specify the predefined URL **https://open.weixin.qq.com** as the WeChat open platform URL in SSL VPN context **ctx**.

```
<Sysname> system-view
[Sysname] sslvpn context ctx
[Sysname-sslvpn-context-ctx] wechat-work-authentication open-platform url pre-defined
```

wechat-work-authentication timeout

Use **wechat-work-authentication timeout** to specify the WeChat Work authentication timeout.

Use **undo wechat-work-authentication timeout** to restore the default.

Syntax

wechat-work-authentication timeout *seconds*

undo wechat-work-authentication timeout

Default

The WeChat Work authentication timeout is 15 seconds.

Views

SSL VPN context view

Predefined user roles

network-admin

context-admin

Parameters

seconds: Specifies the WeChat Work authentication timeout, in the range of 5 to 50 seconds.

Usage guidelines

A WeChat Work authentication fails if the SSL VPN gateway does not receive the response from the WeChat Work API server within the timeout time after sending an HTTP request.

If the network delay is large, increase the timeout as a best practice to avoid misidentification of timeouts. If the network delay is small, reduce the timeout as a best practice for better identification of timeouts.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Specify the WeChat Work authentication timeout as 20 seconds in SSL VPN context **ctx**.

```
<Sysname> system-view
[Sysname] sslvpn context ctx
[Sysname-sslvpn-context-ctx] wechat-work-authentication timeout 20
```

wechat-work-authentication url

Use **wechat-work-authentication url** to specify the URL of the WeChat Work API server.

Use **undo wechat-work-authentication url** to restore the default.

Syntax

wechat-work-authentication url *url*

undo wechat-work-authentication url

Default

No WeChat Work API server URL is specified.

Views

SSL VPN context view

Predefined user roles

network-admin

context-admin

Parameters

url: Specifies the URL of the WeChat Work API server, a case-insensitive string of 1 to 255 characters.

Usage guidelines

To use WeChat Work authentication, you must execute this command to specify the actual URL of the WeChat Work API server. The SSL VPN gateway interacts with the specified WeChat Work API server to obtain user information upon receiving a packet redirected from the WeChat Work server. Then, the SSL VPN gateway uses the obtained information for user authentication and authorization.

The SSL VPN gateway requires domain name resolution to resolve the specified URL into the IP address of the WeChat Work API server. For more information about domain name resolution, see DNS configuration in *Layer 3—IP Services Configuration Guide*.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Specify the URL of the WeChat Work API server as **https://qyapi.weixin.qq.com** in SSL VPN context **ctx**.

```
<Sysname> system-view
[Sysname] sslvpn context ctx
[Sysname-sslvpn-context-ctx] wechat-work-authentication url https://qyapi.weixin.qq.com
```

wechat-work-authentication userid-field

Use **wechat-work-authentication userid-field** to specify the user ID field name used by the SSL VPN gateway to access the internal server.

Use **undo wechat-work-authentication userid-field** to restore the default.

Syntax

wechat-work-authentication userid-field *userid-field*

undo wechat-work-authentication userid-field

Default

No user ID field name is configured for the SSL VPN gateway to access the internal server.

Views

SSL VPN context view

Predefined user roles

network-admin

context-admin

Parameters

url: Specifies the user ID field name, a case-insensitive string of 1 to 63 characters.

Usage guidelines

A user ID (user account) on WeChat Work uniquely identifies a user within a company. The SSL VPN gateway interacts with the WeChat Work API server to obtain user information, which contains the user ID of a user.

The SSL VPN gateway uses the specified user ID field name and the obtained user ID to construct the parameter to be carried in an access request sent to an internal server. For example, if you configure the user ID field name as **login** and the obtained user ID is **zhangsan**, the SSL VPN gateway will construct the parameter as **login=zhangsan**. When receiving the request from the SSL VPN gateway, the internal server abstracts the **login** field's value **zhangsan** as the user ID. To make sure the SSL VPN gateway can accurately encapsulate the parameter, you must obtain the user ID field name from the internal server in advance.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Specify the user ID field name as **login** in SSL VPN context **ctx**.

```
<Sysname> system-view
[Sysname] sslvpn context ctx
[Sysname-sslvpn-context-ctx] wechat-work-authentication url https://qyapi.weixin.qq.com
```

Contents

IPsec commands

The SM1 algorithm is supported only on devices installed with a GM network data encryption module.

activate link

Use **activate link** to manually activate a link.

Syntax

activate link *link-id*

Views

IPsec smart link policy view

Predefined user roles

network-admin

context-admin

Parameters

link-id: Specifies the ID of an existing link in the IPsec smart link policy. The value range for this argument is 1 to 10.

Usage guidelines

To establish an IPsec tunnel over a specific link, use this command to activate the link.

If smart link selection is enabled, traffic will be switched to another link in turn if the packet loss ratio or delay over the link exceeds the link switchover thresholds. The first cyclic link switchover starts from the manually activated link and ends with the link that has the lowest priority. For example, after you activate the third link of four links, the first link switchover cycle is 3 > 4, and the subsequent link switchover cycles each are 1 > 2 > 3 > 4.

If smart link selection is disabled in the IPsec smart link policy, the manually activated link is always used and no link switchover will occur.

Examples

Manually activate link 2 in IPsec smart policy **smlkpolicy1**.

```
<Sysname> system-view
[Sysname] ipsec smart-link policy smlkpolicy1
[Sysname-ipsec-smart-link-policy-smlkpolicy1] activate link 2
```

Related commands

display ipsec smart-link policy

ah authentication-algorithm

Use **ah authentication-algorithm** to specify authentication algorithms for the AH protocol.

Use **undo ah authentication-algorithm** to restore the default.

Syntax

ah authentication-algorithm { **aes-xcbc-mac** | **md5** | **sha1** | **sha256** | **sha384** | **sha512** | **sm3** } *

undo ah authentication-algorithm

Default

AH does not use any authentication algorithms.

Views

IPsec transform set view

Predefined user roles

network-admin

context-admin

Parameters

aes-xcbc-mac: Specifies the HMAC-AES-XCBC-96 algorithm, which uses a 128-bit key. This keyword is available only for IKEv2.

md5: Specifies the HMAC-MD5-96 algorithm, which uses a 128-bit key.

sha1: Specifies the HMAC-SHA1-96 algorithm, which uses a 160-bit key.

sha256: Specifies the HMAC-SHA256 algorithm, which uses a 256-bit key.

sha384: Specifies the HMAC-SHA384 algorithm, which uses a 384-bit key.

sha512: Specifies the HMAC-SHA512 algorithm, which uses a 512-bit key.

sm3: Specifies the HMAC-SM3-96 algorithm, which uses a 256-bit key. This keyword is available only for IKEv1.

Usage guidelines

You can specify multiple AH authentication algorithms for one IPsec transform set, and the algorithm specified earlier has a higher priority.

For a manual or IKEv1-based IPsec policy, the first specified AH authentication algorithm takes effect. To make sure an IPsec tunnel can be established successfully, the IPsec transform sets specified at both ends of the tunnel must have the same first AH authentication algorithm.

Examples

Specify HMAC-SHA1 as the AH authentication algorithm for IPsec transform set **tran1**.

```
<Sysname> system-view
[Sysname] ipsec transform-set tran1
[Sysname-ipsec-transform-set-tran1] ah authentication-algorithm sha1
```

description

Use **description** to configure a description for an IPsec policy, IPsec profile, or IPsec policy template.

Use **undo description** to restore the default.

Syntax

description *text*

undo description

Default

No description is configured for an IPsec policy, IPsec profile, or IPsec policy template.

Views

IPsec policy view

IPsec policy template view

IPsec profile view

Predefined user roles

network-admin

context-admin

Parameters

text: Specifies a description, a case-sensitive string of 1 to 80 characters.

Usage guidelines

You can configure different descriptions for IPsec policies, IPsec profiles, or IPsec policy templates to distinguish them.

Examples

Configure the description for IPsec policy **policy1** as **CenterToA**.

```
<Sysname> system-view
[Sysname] ipsec policy policy1 1 isakmp
[Sysname-ipsec-policy-isakmp-policy1-1] description CenterToA
```

display ipsec { ipv6-policy | policy }

Use **display ipsec** { **ipv6-policy** | **policy** } to display information about IPsec policies.

Syntax

display ipsec { **ipv6-policy** | **policy** } [*policy-name* [*seq-number*]]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

ipv6-policy: Displays information about IPv6 IPsec policies.

policy: Displays information about IPv4 IPsec policies.

policy-name: Specifies an IPsec policy by its name, a case-insensitive string of 1 to 63 characters.

seq-number: Specifies an IPsec policy entry by its sequence number in the range of 1 to 65535.

Usage guidelines

If you do not specify any parameters, this command displays information about all IPsec policies.

If you specify an IPsec policy name and a sequence number, this command displays information about the specified IPsec policy entry. If you specify an IPsec policy name without any sequence number, this command displays information about all IPsec policy entries with the specified name.

Examples

Display information about all IPv4 IPsec policies.

Table 1 Command output

Field	Description
IPsec Policy	IPsec policy name.
Interface	Interface applied with the IPsec policy.
Sequence number	Sequence number of the IPsec policy entry.
Mode	Negotiation mode of the IPsec policy: • **Manual**—Manual mode. • **ISAKMP**—IKE negotiation mode. • **Template**—IPsec policy template mode.
The policy configuration is incomplete	IPsec policy configuration incomplete. Possible causes include: • The ACL is not configured.

Field	Description
	• The IPsec transform set is not configured. • The ACL does not have any **permit** statements. • The IPsec transform set configuration is not complete. • The peer IP address of the IPsec tunnel is not specified. • The SPI and key of the IPsec SA do not match those in the IPsec policy.
Description	Description of the IPsec policy.
Traffic Flow Confidentiality	Whether Traffic Flow Confidentiality (TFC) padding is enabled.
Security data flow	ACL used by the IPsec policy.
Selector mode	Data flow protection mode of the IPsec policy: **standard**, **aggregation**, or **per-host**.
Local address	Local end IP address of the IPsec tunnel (available only for the IKE-based IPsec policy).
Remote address	Remote end IP address or host name of the IPsec tunnel. The IP addresses and host name each are displayed in a separate line. The primary IP address is displayed in the first line. The other IP addresses and the host name are displayed in subsequent lines in the order that they were configured in the IPsec policy.
Transform set	Transform set used by the IPsec policy.
IKE profile	IKE profile used by the IPsec policy.
IKEv2 profile	IKEv2 profile used by the IPsec policy.
smart-link policy	Smart link policy used by the IPsec policy.
SA trigger mode	IPsec SA negotiation triggering mode: • **Auto**—Triggers SA negotiation when required IPsec configuration is complete. • **Traffic-based**—Triggers SA negotiation when traffic requires IPsec protection.
SA duration(time based)	Time-based IPsec SA lifetime, in seconds.
SA duration(traffic based)	Traffic-based IPsec SA lifetime, in Kilobytes.
SA soft-duration buffer(time based)	Time-based IPsec SA soft lifetime buffer, in seconds. If the time-based IPsec SA soft lifetime buffer is not configured, this field displays two consecutive hyphens (--).
SA soft-duration buffer(traffic based)	Traffic-based IPsec SA soft lifetime buffer, in Kilobytes. If the traffic-based IPsec SA soft lifetime buffer is not configured, this field displays two consecutive hyphens (--).
SA idle time	Idle timeout of the IPsec SA, in seconds. If the IPsec SA idle timeout is not configured, this field displays two consecutive hyphens (--).
AH string-key	AH string key. This field displays ****** if the key is configured and it is empty if the key is not configured.
AH authentication hex key	AH authentication hexadecimal key. This field displays ****** if the key is configured and it is empty if the key is not configured.
ESP string-key	ESP string key. This field displays ****** if the key is configured and it is empty if the key is not configured.
ESP encryption hex key	ESP encryption hexadecimal key. This field displays ****** if the

Field	Description
	key is configured and it is empty if the key is not configured.
ESP authentication hex key	ESP authentication hexadecimal key. This field displays ****** if the key is configured and it is empty if the key is not configured.

Parameters

brief: Displays brief information about all IPsec SAs.

count: Displays the number of IPsec SAs.

interface *interface-type interface-number*: Specifies an interface by its type and number.

ipv6-policy: Displays detailed information about IPsec SAs created by using a specified IPv6 IPsec policy.

policy: Displays detailed information about IPsec SAs created by using a specified IPv4 IPsec policy.

policy-name: Specifies an IPsec policy by its name, a case-insensitive string of 1 to 63 characters.

seq-number: Specifies an IPsec policy entry by its sequence number. The value range is 1 to 65535.

profile: Displays detailed information about IPsec SAs created by using a specified IPsec profile.

profile-name: Specifies an IPsec profile by its name, a case-insensitive string of 1 to 63 characters.

remote *ip-address*: Specifies an IPsec SA by its remote end IP address.

ipv6: Specifies an IPsec SA by its remote end IPv6 address. If this keyword is not specified, the specified remote end IP address is an IPv4 address.

Usage guidelines

If you do not specify any parameters, this command displays detailed information about all IPsec SAs.

Examples

Display brief information about IPsec SAs.

```
<Sysname> display ipsec sa brief
```

```
------------------------------------------------------------------------
Interface/Global   Dst Address      SPI         Protocol  Status

Field	Description
Interface/Global	Interface where the IPsec SA belongs to or global IPsec SA (created by using an IPsec profile).
Dst Address	Remote end IP address of the IPsec tunnel. For the IPsec SAs created by using IPsec profiles, this field displays two hyphens (**--**).
SPI	IPsec SA SPI.
Protocol	Security protocol used by IPsec.
Status	Status of the IPsec SA, which can only be **Active**.

Display the number of IPsec SAs.

```
<Sysname> display ipsec sa count
Total IPsec SAs count: 4
```

Display detailed information about all IPsec SAs.

```
<Sysname> display ipsec sa
-------------------------------
Interface: GigabitEthernet1/0/1
-------------------------------

  ----------------------------
  IPsec policy: r2
  Sequence number: 1
  Mode: ISAKMP
  ----------------------------
    Tunnel id: 3
    Encapsulation mode: tunnel
    Perfect Forward Secrecy:
    Inside VPN: vp1
    Extended Sequence Numbers enable: Y
    Traffic Flow Confidentiality enable: N
    Transmitting entity: Initiator
    Path MTU: 1443
    Tunnel:
        local  address: 2.2.2.2
        remote address: 1.1.1.2
    Flow:
        sour addr: 192.168.2.0/255.255.255.0  port: 0  protocol: ip
        dest addr: 192.168.1.0/255.255.255.0  port: 0  protocol: ip
```

```
    [Inbound ESP SAs]
      SPI: 3564837569 (0xd47b1ac1)
      Connection ID: 90194313219
      Transform set: ESP-ENCRYPT-AES-CBC-128 ESP-AUTH-SHA1
      SA duration (kilobytes/sec): 4294967295/604800
      SA remaining duration (kilobytes/sec): 1843200/2686
      Max received sequence-number: 5
      Anti-replay check enable: Y
      Anti-replay window size: 32
      UDP encapsulation used for NAT traversal: N
      Status: Active

    [Outbound ESP SAs]
      SPI: 801701189 (0x2fc8fd45)
      Connection ID: 64424509441
      Transform set: ESP-ENCRYPT-AES-CBC-128 ESP-AUTH-SHA1
      SA duration (kilobytes/sec): 4294967295/604800
      SA remaining duration (kilobytes/sec): 1843200/2686
      Max sent sequence-number: 6
      UDP encapsulation used for NAT traversal: N

```

Table 5 Command output

Field	Description
Interface	Interface where the IPsec SA belongs.
IPsec policy	Name of the IPsec policy.
IPsec profile	Name of the IPsec profile.

Field	Description
Sequence number	Sequence number of the IPsec policy entry.
Mode	Negotiation mode used by the IPsec policy: • **Manual**—Manual mode. • **ISAKMP**—IKE negotiation mode. • **Template**—IPsec policy template mode.
Tunnel id	IPsec tunnel ID.
Encapsulation mode	Encapsulation mode, transport or tunnel.
Perfect Forward Secrecy	Perfect Forward Secrecy (PFS) used by the IPsec policy for negotiation: • 768-bit Diffie-Hellman group (**dh-group1**). • 1024-bit Diffie-Hellman group (**dh-group2**). • 1536-bit Diffie-Hellman group (**dh-group5**). • 2048-bit Diffie-Hellman group (**dh-group14**). • 2048-bit and 256_bit subgroup Diffie-Hellman group (**dh-group24**). • 256-bit ECP Diffie-Hellman group (**dh-group19**). • 384-bit ECP Diffie-Hellman group (**dh-group20**).
Extended Sequence Numbers enable	Whether Extended Sequence Number (ESN) is enabled.
Traffic Flow Confidentiality enable	Whether Traffic Flow Confidentiality (TFC) padding is enabled.
Inside VPN	VPN instance to which the protected data flow belongs.
Transmitting entity	Role of the IKE negotiation entity: **Initiator** or **Responder**.
Path MTU	Path MTU of the IPsec SA.
Tunnel	Local and remote addresses of the IPsec tunnel.
local address	Local end IP address of the IPsec tunnel.
remote address	Remote end IP address of the IPsec tunnel.
Flow	Information about the data flow protected by the IPsec tunnel.
sour addr	Source IP address of the data flow.
dest addr	Destination IP address of the data flow.
port	Port number.
protocol	Protocol type of the protected flow.
SPI	SPI of the IPsec SA.
Connection ID	Identifier of the IPsec SA.
Transform set	Security protocol and algorithms used by the IPsec transform set.
SA duration (kilobytes/sec)	IPsec SA lifetime, in Kilobytes or seconds.
SA remaining duration (kilobytes/sec)	Remaining IPsec SA lifetime, in Kilobytes or seconds.

Field	Description
Max received sequence-number	Max sequence number in the received packets.
Max sent sequence-number	Max sequence number in the sent packets.
Anti-replay check enable	Whether anti-replay checking is enabled.
UDP encapsulation used for NAT traversal	Whether NAT traversal is used by the IPsec SA.
Status	Status of the IPsec SA, which can only be **Active**.
No duration limit for this SA	The manual IPsec SAs do not have lifetime.

Related commands

ipsec sa global-duration

reset ipsec sa

display ipsec smart-link policy

Use **display ipsec smart-link policy** to display information about IPsec smart link policies.

Syntax

display ipsec smart-link policy [**brief** | **name** *policy-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

brief: Displays brief information about all IPsec smart link policies.

name *policy-name*: Displays detailed information about a specific IPsec smart link policy. The *policy-name* argument specifies the policy name.

Usage guidelines

If you do not specify any parameters, this command displays detailed information about all IPsec smart link policies.

Examples

Display detailed information about IPsec smart link **smlkpolicy1**.

```
<Sysname> display ipsec smart-link policy name smlkpolicy1
-------------------------------------------------------------------------
Policy name                 :smlkpolicy1
State                       :Enabled
```

```
Probe count                  :10
Probe interval               :1 sec
Probe source IP address      :1.1.1.1
Probe destination IP address :3.3.3.3
Max link switch cycles       :3
IPsec policy name            :ipsecpolicy1
Interface                    :GigabitEthernet1/0/1
IPsec policy sequence number :1
Link ID   Local address   Remote address   Loss(%)   Delay(ms)   State
1         1.1.1.1         3.3.3.3          2         10          Active
2         2.2.2.2         4.4.4.4          0         0           Inactive
------------------------------------------------------------------------------
```

Table 6 Command output

Field	Description
Policy name	Name of the IPsec smart link policy.
State	State of the IPsec smart link selection feature in the policy: **Enabled** or **Disabled**.
Probe count	Number of link quality probe packets sent in each probe cycle.
Probe interval	Probe packet sending interval, in seconds.
Probe source IP address	Source IP address of the probe packets.
Probe destination IP address	Destination IP address of the probe packets.
Max link switch cycles	Maximum number of link switchover cycles.
IPsec policy name	Name of the IPsec policy to which the IPsec smart link policy is applied.
IPsec policy sequence number	Sequence number of the IPsec policy entry.
Link ID	ID of a link configured in the IPsec smart link policy.
Local address	Local IP address of the link.
Remote address	Remote IP address of the link.
Loss(%)	Packet loss ratio calculated during the last link quality probe cycle. If no link quality probe operation has been performed on the link, this field displays two hyphens (**--**).
Delay(ms)	Packet round-trip delay calculated during the last link quality probe cycle. If the calculated delay exceeds 3000 ms or no link quality probe operation has been performed on the link, this field displays two hyphens (**--**).
State	State of the link: **Active** or **Inactive**.

Display brief information about all IPsec smart link policies.

```
<Sysname> display ipsec smart-link policy brief
Name           Active link ID    Loss(%)           Delay(ms)
policy1        1                 0                 10
policy2        2                 --                --
```

Table 7 Command output

Field	Description
Name	Name of an IPsec smart link policy.

Field	Description
Active link ID	ID of the link over which the IPsec tunnel is established.
Loss(%)	Packet loss ratio calculated during the last link quality probe cycle. If no link quality probe operation has been performed on the link, this field displays two hyphens (**--**).
Delay(ms)	Packet round-trip delay calculated during the last link quality probe cycle. If the calculated delay exceeds 3000 ms or no link quality probe operation has been performed on the link, this field displays two hyphens (**--**).

Related commands

display ipsec statistics

Use **display ipsec statistics** to display IPsec packet statistics.

Syntax

display ipsec statistics [**tunnel-id** *tunnel-id*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

tunnel-id *tunnel-id*: Specifies an IPsec tunnel by its ID. The value range for the *tunnel-id* argument is 0 to 4294967294. You can use the **display ipsec tunnel brief** command to view the IDs of established IPsec tunnels.

Usage guidelines

If you do not specify any parameters, this command displays statistics for all IPsec packets.

Examples

Display statistics for all IPsec packets.

```
<Sysname> display ipsec statistics
  IPsec packet statistics:
    Received/sent packets: 47/64
    Received/sent bytes: 3948/5208
    Received/sent packet rate: 5/5 packets/sec
    Received/sent byte rate: 290/290 bytes/sec
    Dropped packets (received/sent): 0/45

    Dropped packets statistics
      No available SA: 0
      Wrong SA: 0
      Invalid length: 0
```

```
      Authentication failure: 0
      Encapsulation failure: 0
      Decapsulation failure: 0
      Replayed packets: 0
      ACL check failure: 45
      MTU check failure: 0
      Loopback limit exceeded: 0
      Crypto speed limit exceeded: 0
```

Display statistics for the packets of IPsec tunnel 1.

```
<Sysname> display ipsec statistics tunnel-id 1
  IPsec packet statistics:
    Received/sent packets: 5124/8231
    Received/sent bytes: 52348/64356
    Received/sent packet rate: 4/4 packets/sec
    Received/sent byte rate: 232/232 bytes/sec
    Dropped packets (received/sent): 0/0

    Dropped packets statistics
      No available SA: 0
      Wrong SA: 0
      Invalid length: 0
      Authentication failure: 0
      Encapsulation failure: 0
      Decapsulation failure: 0
      Replayed packets: 0
      ACL check failure: 0
      MTU check failure: 0
      Loopback limit exceeded: 0
      Crypto speed limit exceeded: 0
```

Table 8 Command output

Field	Description
Received/sent packets	Number of received/sent IPsec-protected packets.
Received/sent bytes	Number of bytes of received/sent IPsec-protected packets.
Received/sent packet rate	Receiving or sending rate (in pps) of IPsec-protected packets.
Received/sent bytes rate	Receiving or sending rate (in Bps) of bytes of IPsec-protected packets.
Dropped packets (received/sent)	Number of dropped IPsec-protected packets (received/sent).
No available SA	Number of packets dropped due to lack of available IPsec SA.
Wrong SA	Number of packets dropped due to wrong IPsec SA.
Invalid length	Number of packets dropped due to invalid packet length.
Authentication failure	Number of packets dropped due to authentication failure.
Encapsulation failure	Number of packets dropped due to encapsulation failure.
Decapsulation failure	Number of packets dropped due to decapsulation failure.
Replayed packets	Number of dropped replayed packets.

Field	Description
ACL check failure	Number of packets dropped due to ACL check failure.
MTU check failure	Number of packets dropped due to MTU check failure.
Loopback limit exceeded	Number of packets dropped due to loopback limit exceeded.
Crypto speed limit exceeded	Number of packets dropped due to crypto speed limit exceeded.

Related commands

reset ipsec statistics

display ipsec transform-set

Use **display ipsec transform-set** to display information about IPsec transform sets.

Syntax

display ipsec transform-set [*transform-set-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

transform-set-name: Specifies an IPsec transform set by its name, a case-insensitive string of 1 to 63 characters.

Usage guidelines

If you do not specify an IPsec transform set, this command displays information about all IPsec transform sets.

Examples

Display information about all IPsec transform sets.

```
<Sysname> display ipsec transform-set
IPsec transform set: mytransform
  State: incomplete
  Encapsulation mode: tunnel
  ESN: Enabled
  PFS:
  Transform: ESP

IPsec transform set: completeTransform
  State: complete
  Encapsulation mode: transport
  ESN: Enabled
  PFS:
```

```
Transform: AH-ESP
AH protocol:
  Integrity: SHA1
ESP protocol:
  Integrity: SHA1
  Encryption: AES-CBC-128
```

Table 9 Command output

Field	Description
IPsec transform set	Name of the IPsec transform set.
State	Whether the IPsec transform set is complete.
Encapsulation mode	Encapsulation mode used by the IPsec transform set: **transport** or **tunnel**.
ESN	Whether Extended Sequence Number (ESN) is enabled.
PFS	Perfect Forward Secrecy (PFS) used by the IPsec policy for negotiation: • 768-bit Diffie-Hellman group (**dh-group1**). • 1024-bit Diffie-Hellman group (**dh-group2**). • 1536-bit Diffie-Hellman group (**dh-group5**). • 2048-bit Diffie-Hellman group (**dh-group14**). • 2048-bit and 256_bit subgroup Diffie-Hellman group (**dh-group24**). • 256-bit ECP Diffie-Hellman group (**dh-group19**). • 384-bit ECP Diffie-Hellman group (**dh-group20**).
Transform	Security protocols used by the IPsec transform set: AH, ESP, or both. If both protocols are configured, IPsec uses ESP before AH.
AH protocol	AH settings.
ESP protocol	ESP settings.
Integrity	Authentication algorithm used by the security protocol.
Encryption	Encryption algorithm used by the security protocol.

Related commands

ipsec transform-set

display ipsec tunnel

Use **display ipsec tunnel** to display information about IPsec tunnels.

Syntax

display ipsec tunnel { **brief** | **count** | **tunnel-id** *tunnel-id* }

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

brief: Displays brief information about all IPsec tunnels.

count: Displays information about the specified number of IPsec tunnels.

tunnel-id *tunnel-id*: Specifies an IPsec tunnel by its ID. The value range for the *tunnel-id* argument is 0 to 4294967294.

Usage guidelines

IPsec is a Layer 3 VPN technology that transmits data in a secure channel established between two endpoints (such as two security gateways). Such a secure channel is usually called an IPsec tunnel.

Examples

Display brief information about all IPsec tunnels.

```
<Sysname> display ipsec tunnel brief
-------------------------------------------------------------------------------
Tunn-id   Src Address     Dst Address     Inbound SPI   Outbound SPI  Status
-------------------------------------------------------------------------------
0         --              --              1000          2000          Active
                                          3000          4000
1         1.2.3.1         2.2.2.2         5000          6000          Active
                                          7000          8000
```

Table 10 Command output

Field	Description
Src Address	Source IP address of the IPsec tunnel. For IPsec SAs created by using IPsec profiles, this field displays two hyphens (**--**).
Dst Address	Destination IP address of the IPsec tunnel. For IPsec SAs created by using IPsec profiles, this field displays two hyphens (**--**).
Inbound SPI	Valid SPI in the inbound direction of the IPsec tunnel. If the tunnel uses two security protocols, two SPIs in the inbound direction are displayed in two lines.
Outbound SPI	Valid SPI in the outbound direction of the IPsec tunnel. If the tunnel uses two security protocols, two SPIs in the outbound direction are displayed in two lines.
Status	Status of the IPsec SA, which can only be **Active**.

Display the number of IPsec tunnels.

```
<Sysname> display ipsec tunnel count
Total IPsec Tunnel Count: 2
```

Display detailed information about all IPsec tunnels.

```
<Sysname> display ipsec tunnel
Tunnel ID: 0
Status: Active
Perfect forward secrecy:
Inside vpn-instance:
SA's SPI:
    outbound:  2000        (0x000007d0)   [AH]
    inbound:   1000        (0x000003e8)   [AH]
    outbound:  4000        (0x00000fa0)   [ESP]
```

```
    inbound:   3000        (0x00000bb8)   [ESP]
Tunnel:
    local  address:
    remote address:
Flow:

Tunnel ID: 1
Status: Active
Perfect forward secrecy:
Inside vpn-instance:
SA's SPI:
    outbound:  6000        (0x00001770)   [AH]
    inbound:   5000        (0x00001388)   [AH]
    outbound:  8000        (0x00001f40)   [ESP]
    inbound:   7000        (0x00001b58)   [ESP]
Tunnel:
    local  address: 1.2.3.1
    remote address: 2.2.2.2
Flow:
    as defined in ACL 3100
```

Display detailed information about IPsec tunnel 1.

```
<Sysname> display ipsec tunnel tunnel-id 1
Tunnel ID: 1
Status: Active
Perfect forward secrecy:
Inside vpn-instance:
SA's SPI:
    outbound:  6000        (0x00001770)   [AH]
    inbound:   5000        (0x00001388)   [AH]
    outbound:  8000        (0x00001f40)   [ESP]
    inbound:   7000        (0x00001b58)   [ESP]
Tunnel:
    local  address: 1.2.3.1
    remote address: 2.2.2.2
Flow:
    as defined in ACL 3100
```

Table 11 Command output

Field	Description
Tunnel ID	IPsec ID, used to uniquely identify an IPsec tunnel.
Status	IPsec tunnel status, which can only be **Active**.
Perfect forward secrecy	Perfect Forward Secrecy (PFS) used by the IPsec policy for negotiation: • 768-bit Diffie-Hellman group (**dh-group1**). • 1024-bit Diffie-Hellman group (**dh-group2**). • 1536-bit Diffie-Hellman group (**dh-group5**). • 2048-bit Diffie-Hellman group (**dh-group14**). • 2048-bit and 256_bit subgroup Diffie-Hellman group (**dh-group24**). • 256-bit ECP Diffie-Hellman group (**dh-group19**).

Field	Description
	• 384-bit ECP Diffie-Hellman group (**dh-group20**).
Inside vpn-instance	Name of the VPN instance to which the IPsec-protected data belongs.
SA's SPI	SPIs of the inbound and outbound SAs.
Tunnel	Local and remote addresses of the IPsec tunnel.
local address	Local end IP address of the IPsec tunnel.
remote address	Remote end IP address of the IPsec tunnel.
Flow	Information about the data flow protected by the IPsec tunnel, including source IP address, destination IP address, source port, destination port, and protocol.
as defined in ACL 3001	Range of data flow protected by the IPsec tunnel that is established manually. This information shows that the IPsec tunnel protects all data flows defined by ACL 3001.

encapsulation-mode

Use **encapsulation-mode** to set the encapsulation mode that the security protocol uses to encapsulate IP packets.

Use **undo encapsulation-mode** to restore the default.

Syntax

encapsulation-mode { **transport** | **tunnel** }

undo encapsulation-mode

Default

IP packets are encapsulated in tunnel mode.

Views

IPsec transform set view

Predefined user roles

network-admin

context-admin

Parameters

transport: Uses the transport mode for IP packet encapsulation.

tunnel: Uses the tunnel mode for IP packet encapsulation.

Usage guidelines

IPsec supports the following encapsulation modes:

- **Transport mode**—The security protocols protect the upper layer data of an IP packet. Only the transport layer data is used to calculate the security protocol headers. The calculated security protocol headers and the encrypted data (only for ESP encapsulation) are placed after the original IP header. You can use the transport mode when end-to-end security protection is required (the secured transmission start and end points are the actual start and end points of the data). The transport mode is typically used for protecting host-to-host communications.
- **Tunnel mode**—The security protocols protect the entire IP packet. The entire IP packet is used to calculate the security protocol headers. The calculated security protocol headers and the encrypted data (only for ESP encapsulation) are encapsulated in a new IP packet. In this mode,

the encapsulated packet has two IP headers. The inner IP header is the original IP header. The outer IP header is added by the network device that provides the IPsec service. You must use the tunnel mode when the secured transmission start and end points are not the actual start and end points of the data packets (for example, when two gateways provide IPsec but the data start and end points are two hosts behind the gateways). The tunnel mode is typically used for protecting gateway-to-gateway communications.

The IPsec transform sets at both ends of the IPsec tunnel must have the same encapsulation mode.

Examples

Configure IPsec transform set **tran1** to use the transport mode for IP packet encapsulation.

```
<Sysname> system-view
[Sysname] ipsec transform-set tran1
[Sysname-ipsec-transform-set-tran1] encapsulation-mode transport
```

Related commands

ipsec transform-set

esn enable

Use **esn enable** to enable the Extended Sequence Number (ESN) feature.

Use **undo esn enable** to disable the ESN feature.

Syntax

esn enable [**both**]

undo esn enable

Default

The ESN feature is disabled.

Views

IPsec transform set view

Predefined user roles

network-admin

context-admin

Parameters

both: Specifies IPsec to support both extended sequence number and traditional sequence number. If you do not specify this keyword, IPsec only supports extended sequence number.

Usage guidelines

The ESN feature applies only to IPsec SAs negotiated by IKEv2.

The ESN feature extends the sequence number length from 32 bits to 64 bits. This feature prevents the sequence number space from being exhausted when large volumes of data are transmitted at high speeds over an IPsec SA. If the sequence number space is not exhausted, the IPsec SA does not need to be renegotiated.

This feature must be enabled at both the initiator and the responder.

Examples

Enable the ESN feature in IPsec transform set **tran1**.

```
<Sysname> system-view
[Sysname] ipsec transform-set tran1
```

```
[Sysname-ipsec-transform-set-tran1] esn enable
```

Related commands

display ipsec transform-set

esp authentication-algorithm

Use **esp authentication-algorithm** to specify authentication algorithms for ESP.

Use **undo esp authentication-algorithm** to restore the default.

Syntax

esp authentication-algorithm { **aes-xcbc-mac** | **md5** | **sha1** | **sha256** | **sha384** | **sha512** | **sm3** } *

undo esp authentication-algorithm

Default

ESP does not use any authentication algorithms.

Views

IPsec transform set view

Predefined user roles

network-admin

context-admin

Parameters

aes-xcbc-mac: Specifies the HMAC-AES-XCBC-96 algorithm, which uses a 128-bit key. This keyword is available only for IKEv2.

md5: Specifies the HMAC-MD5-96 algorithm, which uses a 128-bit key.

sha1: Specifies the HMAC-SHA1-96 algorithm, which uses a 160-bit key.

sha256: Specifies the HMAC-SHA256 algorithm, which uses a 256-bit key.

sha384: Specifies the HMAC-SHA384 algorithm, which uses a 384-bit key.

sha512: Specifies the HMAC-SHA512 algorithm, which uses a 512-bit key.

sm3: Specifies the HMAC-SM3-96 algorithm, which uses a 256-bit key. This keyword is available only for IKEv1.

Usage guidelines

You can specify multiple ESP authentication algorithms for one IPsec transform set, and the algorithm specified earlier has a higher priority.

For a manual or IKEv1-based IPsec policy, the first specified ESP authentication algorithm takes effect. To make sure an IPsec tunnel can be established successfully, the IPsec transform sets specified at both ends of the tunnel must have the same first ESP authentication algorithm.

Examples

Configure IPsec transform set **tran1** to use the HMAC-SHA1 algorithm as the ESP authentication algorithm.

```
<Sysname> system-view
[Sysname] ipsec transform-set tran1
[Sysname-ipsec-transform-set-tran1] esp authentication-algorithm sha1
```

ipsec transform-set

esp encryption-algorithm

Use **esp encryption-algorithm** to specify encryption algorithms for ESP.

Use **undo esp encryption-algorithm** to restore the default.

Syntax

esp encryption-algorithm { **3des-cbc** | **aes-cbc-128** | **aes-cbc-192** | **aes-cbc-256** | **aes-ctr-128** | **aes-ctr-192** | **aes-ctr-256** | **camellia-cbc-128** | **camellia-cbc-192** | **camellia-cbc-256** | **des-cbc** | **gmac-128** | **gmac-192** | **gmac-256** | **gcm-128** | **gcm-192** | **gcm-256** | **null** | **sm1-cbc-128** | **sm4-cbc** } *

undo esp encryption-algorithm

Default

ESP does not use any encryption algorithms.

Views

IPsec transform set view

Predefined user roles

network-admin

context-admin

Parameters

3des-cbc: Specifies the 3DES algorithm in CBC mode, which uses a 168-bit key.

aes-cbc-128: Specifies the AES algorithm in CBC mode, which uses a 128-bit key.

aes-cbc-192: Specifies the AES algorithm in CBC mode, which uses a 192-bit key.

aes-cbc-256: Specifies the AES algorithm in CBC mode, which uses a 256-bit key.

aes-ctr-128: Specifies the AES algorithm in CTR mode, which uses a 128-bit key. This keyword is available only for IKEv2.

aes-ctr-192: Specifies the AES algorithm in CTR mode, which uses a 192-bit key. This keyword is available only for IKEv2.

aes-ctr-256: Specifies the AES algorithm in CTR mode, which uses a 256-bit key. This keyword is available only for IKEv2.

camellia-cbc-128: Specifies the Camellia algorithm in CBC mode, which uses a 128-bit key. This keyword is available only for IKEv2.

camellia-cbc-192: Specifies the Camellia algorithm in CBC mode, which uses a 192-bit key. This keyword is available only for IKEv2.

camellia-cbc-256: Specifies the Camellia algorithm in CBC mode, which uses a 256-bit key. This keyword is available only for IKEv2.

des-cbc: Specifies the DES algorithm in CBC mode, which uses a 64-bit key.

gmac-128: Specifies the GMAC algorithm, which uses a 128-bit key. This keyword is available only for IKEv2.

gmac-192: Specifies the GMAC algorithm, which uses a 192-bit key. This keyword is available only for IKEv2.

gmac-256: Specifies the GMAC algorithm, which uses a 256-bit key. This keyword is available only for IKEv2.

gcm-128: Specifies the GCM algorithm, which uses a 128-bit key. This keyword is available only for IKEv2.

gcm-192: Specifies the GCM algorithm, which uses a 192-bit key. This keyword is available only for IKEv2.

gcm-256: Specifies the GCM algorithm, which uses a 256-bit key. This keyword is available only for IKEv2.

null: Specifies the NULL algorithm, which means encryption is not performed.

sm1-cbc-128: Specifies the SM1 algorithm in CBC mode, which uses a 128-bit key. This keyword is available only for IKEv1.

sm4-cbc: Uses the SM4 algorithm in CBC mode, which uses a 128-bit key. This keyword is available only for IKEv1.

Usage guidelines

You can specify multiple ESP encryption algorithms for one IPsec transform set, and the algorithm specified earlier has a higher priority.

For a manual or IKEv1-based IPsec policy, the first specified ESP encryption algorithm takes effect. To make sure an IPsec tunnel can be established successfully, the IPsec transform sets specified at both ends of the tunnel must have the same first ESP encryption algorithm.

GCM and GMAC algorithms are combined mode algorithms. GCM algorithms provide encryption and authentication services. GMAC algorithms only provide authentication service. Combined mode algorithms can be used only when ESP is used alone without AH. Combined mode algorithms cannot be used together with ordinary ESP authentication algorithms.

Examples

Configure IPsec transform set **tran1** to use the AES-CBC-128 algorithm as the ESP encryption algorithm.

```
<Sysname> system-view
[Sysname] ipsec transform-set tran1
[Sysname-ipsec-transform-set-tran1] esp encryption-algorithm aes-cbc-128
```

Related commands

ipsec transform-set

gateway

Use **gateway** to specify the gateway address for an interface that uses a manually configured IP address.

Use **undo gateway** to delete the gateway address together with the default route that uses the gateway address as the next hop address.

Syntax

gateway *gateway-address* [**no-route**]

undo gateway

Default

An interface that uses a manually configured IP address does not have a gateway address.

Views

Interface view

Predefined user roles

network-admin

context-admin

Parameters

gateway-address: Specifies the gateway IP address in dotted decimal notation.

no-route: Disables generation of a default route with the gateway address as the next hop address. If you do not specify this keyword, a default route with the gateway address as the next hop address will be generated.

Usage guidelines

You must configure the gateway address for an interface that uses a manually configured IP address if the following conditions are met:

- The interface is configured as the local interface of a link in an IPsec smart link policy (by using the **link** command).
- The **nexthop** *nexthop-address* option is not specified in the **link** command.

The **gateway** command does not take effect if the interface acquires its IP address through DHCP or PPPoE. Such interfaces always use the gateway address assigned by the DHCP or PPPoE server.

The automatically generated default route (which uses the gateway address as the next hop address) cannot be deleted by using the **undo ip route-static** command.

Examples

Specify 10.1.1.254 as the gateway address for GigabitEthernet 1/0/1, and disable generation of a default route that uses the gateway address as the next hop address.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] gateway 10.1.1.254 no-route
```

ike-profile

Use **ike-profile** to specify an IKE profile for an IPsec policy, IPsec profile, or IPsec policy template.

Use **undo ike-profile** to restore the default.

Syntax

ike-profile *profile-name*

undo ike-profile

Default

No IKE profile is specified.

Views

IPsec policy view

IPsec policy template view

IPsec profile view

Predefined user roles

network-admin

context-admin

Parameters

profile-name: Specifies an IKE profile by its name, a case-insensitive string of 1 to 63 characters.

Usage guidelines

If no IKE profile is specified for an IPsec policy, IPsec profile, or IPsec policy template, the device selects an IKE profile configured in system view for negotiation. If no IKE profile is configured in system view, the device uses the global IKE settings.

The IKE profile specified for an IPsec policy, IPsec profile, or IPsec policy template defines the parameters used for IKE negotiation.

You can specify only one IKE profile for an IPsec policy, IPsec profile, or IPsec policy template.

Examples

Specify IKE profile **profile1** for IPsec policy **policy1**.

```
<Sysname> system-view
[Sysname] ipsec policy policy1 10 isakmp
[Sysname-ipsec-policy-isakmp-policy1-10] ike-profile profile1
```

Related commands

ike profile

ikev2-profile

Use **ikev2-profile** to specify an IKEv2 profile for an IPsec policy, IPsec profile, or IPsec policy template.

Use **undo ikev2-profile** to restore the default.

Syntax

ikev2-profile *profile-name*

undo ikev2-profile

Default

No IKEv2 profile is specified.

Views

IPsec policy view

IPsec policy template view

IPsec profile view

Predefined user roles

network-admin

context-admin

Parameters

profile-name: Specifies an IKEv2 profile by its name, a case-insensitive string of 1 to 63 characters.

Usage guidelines

The IKEv2 profile specified for an IPsec policy, IPsec profile, or IPsec policy template defines the parameters used for IKEv2 negotiation.

You can specify only one IKEv2 profile for an IPsec policy, IPsec profile, or IPsec policy template. On the initiator, an IKEv2 profile is required. On the responder, an IKEv2 profile is optional. If you do not specify an IKEv2 profile, the responder can use any IKEv2 profile for negotiation.

Examples

Specify IKEv2 profile **profile1** for IPsec policy **policy1**.

```
<Sysname> system-view
[Sysname] ipsec policy policy1 10 isakmp
[Sysname-ipsec-policy-isakmp-policy1-10] ikev2-profile profile1
```

Related commands

display ipsec ipv6-policy

display ipsec policy

ikev2 profile

ipsec { ipv6-policy | policy }

Use **ipsec** { **ipv6-policy** | **policy** } to create an IPsec policy entry and enter its view, or enter the view of an existing IPsec policy entry.

Use **undo ipsec** { **ipv6-policy** | **policy** } to delete an IPsec policy.

Syntax

ipsec { **ipv6-policy** | **policy** } *policy-name seq-number* [**isakmp** | **manual**]

undo ipsec { **ipv6-policy** | **policy** } *policy-name* [*seq-number*]

Default

No IPsec policies exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

ipv6-policy: Specifies an IPv6 IPsec policy.

policy: Specifies an IPv4 IPsec policy.

policy-name: Specifies a name for the IPsec policy, a case-insensitive string of 1 to 63 characters.

seq-number: Specifies a sequence number for the IPsec policy entry, in the range of 1 to 65535.

isakmp: Establishes IPsec SAs through IKE negotiation.

manual: Establishes IPsec SAs manually.

Usage guidelines

When you create an IPsec policy, you must specify the SA setup mode (**isakmp** or **manual**). When you enter the view of an existing IPsec policy, you do not need to specify the SA setup mode.

You cannot change the SA setup mode of an existing IPsec policy.

An IPsec policy is a set of IPsec policy entries that have the same name but different sequence numbers. In the same IPsec policy, an IPsec policy entry with a smaller sequence number has a higher priority.

If you specify the *seq-number* argument, the **undo** command deletes the specified IPsec policy entry. If you do not specify this argument, the **undo** command deletes the specified IPsec policy.

An IPv4 IPsec policy and IPv6 IPsec policy can have the same name.

Examples

Create an IKE-based IPsec policy entry and enter the IPsec policy view. The policy name is **policy1** and the sequence number is 100.

```
<Sysname> system-view
[Sysname] ipsec policy policy1 100 isakmp
[Sysname-ipsec-policy-isakmp-policy1-100]
```

Create a manual IPsec policy entry and enter the IPsec policy view. The policy name is **policy1** and the sequence number is 101.

```
<Sysname> system-view
[Sysname] ipsec policy policy1 101 manual
[Sysname-ipsec-policy-manual-policy1-101]
```

Related commands

ipsec apply

ipsec { ipv6-policy | policy } template

Use **ipsec** { **ipv6-policy** | **policy** } **template** to create an IPsec policy entry by using an IPsec policy template.

Use **undo ipsec** { **ipv6-policy** | **policy** } to delete an IPsec policy.

Syntax

ipsec { **ipv6-policy** | **policy** } *policy-name seq-number* **isakmp template** *template-name*

undo ipsec { **ipv6-policy** | **policy** } *policy-name* [*seq-number*]

Default

No IPsec policies exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

ipv6-policy: Specifies an IPv6 IPsec policy.

policy: Specifies an IPv4 IPsec policy.

policy-name: Specifies a name for the IPsec policy, a case-insensitive string of 1 to 63 characters.

seq-number: Specifies a sequence number for the IPsec policy entry, in the range of 1 to 65535. A smaller number indicates a higher priority.

isakmp: Specifies the IKE mode for the IPsec policy entry.

template *template-name*: Specifies the IPsec policy template to be used to create the IPsec policy entry. The template name is a case-insensitive string of 1 to 63 characters.

Usage guidelines

If you specify the *seq-number* argument, the **undo** command deletes the specified IPsec policy entry. If you do not specify this argument, the **undo** command deletes the specified IPsec policy.

An interface applied with an IPsec policy that is configured by using an IPsec policy template cannot initiate an SA negotiation, but it can respond to a negotiation request. The parameters not defined in the template are determined by the initiator. When the remote end's information (such as the IP address) is unknown, this method allows the remote end to initiate negotiations with the local end.

Examples

Create an IKE-based IPsec policy entry by using IPsec policy template **temp1**, and specify the IPsec policy name as **policy2** and the sequence number as 200.

```
<Sysname> system-view
[Sysname] ipsec policy policy2 200 isakmp template temp1
```

Related commands

display ipsec { **ipv6-policy** | **policy** }

ipsec { **ipv6-policy-template** | **policy-template** }

ipsec { ipv6-policy | policy } local-address

Use **ipsec** { **ipv6-policy** | **policy** } **local-address** to bind an IPsec policy to a source interface.

Use **undo ipsec** { **ipv6-policy** | **policy** } **local-address** to remove the binding between an IPsec policy and a source interface.

Syntax

ipsec { **ipv6-policy** | **policy** } *policy-name* **local-address** *interface-type interface-number*

undo ipsec { **ipv6-policy** | **policy** } *policy-name* **local-address**

Default

No IPsec policy is bound to a source interface.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

ipv6-policy: Specifies an IPv6 IPsec policy.

policy: Specifies an IPv4 IPsec policy.

policy-name: Specifies an IPsec policy name, a case-insensitive string of 1 to 63 characters.

local-address *interface-type interface-number*: Specifies the shared source interface by its type and number.

Usage guidelines

For high availability, two interfaces can operate in backup mode. After an IPsec policy is applied to the two interfaces, they negotiate with their peers to establish IPsec SAs separately. When one interface fails and a link failover occurs, the other interface needs to take some time to renegotiate SAs, resulting in service interruption.

To solve these problems, bind a source interface to an IPsec policy and apply the policy to both interfaces. This enables the two physical interfaces to use the same source interface to negotiate IPsec SAs. As long as the source interface is up, the negotiated IPsec SAs will not be removed and will keep working, regardless of link failover.

After an IPsec policy is applied to a service interface and IPsec SAs have been established, if you bind the IPsec policy to a source interface, the existing IPsec SAs are deleted.

Only an IKE-based IPsec policy can be bound to a source interface.

An IPsec policy can be bound to only one source interface. If you execute this command multiple times, the most recent configuration takes effect.

A source interface can be bound to multiple IPsec policies.

As a best practice, use a stable interface, such as a Loopback interface, as a source interface.

Examples

Bind IPsec policy **map** to source interface Loopback 11.

```
<Sysname> system-view
[Sysname] ipsec policy map local-address loopback 11
```

Related commands

ipsec { **ipv6-policy** | **policy** }

ipsec { ipv6-policy-template | policy-template }

Use **ipsec** { **ipv6-policy-template** | **policy-template** } to create an IPsec policy template entry and enter its view, or enter the view of an existing IPsec policy template entry.

Use **undo ipsec** { **ipv6-policy-template** | **policy-template** } to delete an IPsec policy template.

Syntax

ipsec { **ipv6-policy-template** | **policy-template** } *template-name seq-number*

undo ipsec { **ipv6-policy-template** | **policy-template** } *template-name* [*seq-number*]

Default

No IPsec policy templates exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

ipv6-policy-template: Specifies an IPv6 IPsec policy template.

policy-template: Specifies an IPv4 IPsec policy template.

template-name: Specifies a name for the IPsec policy template, a case-insensitive string of 1 to 63 characters.

seq-number: Specifies a sequence number for the IPsec policy template entry, in the range of 1 to 65535. A smaller number indicates a higher priority.

Usage guidelines

The configurable parameters for an IPsec policy template are similar to the parameters that you use when you configure an IKE-based IPsec policy. However, all parameters except for the IPsec transform sets and the IKE peer are optional for an IPsec policy template.

An IPsec policy template is a set of IPsec policy template entries that have the same name but different sequence numbers.

With the *seq-number* argument specified, the **undo** command deletes an IPsec policy template entry.

An IPv4 IPsec policy template and an IPv6 IPsec policy template can have the same name.

Examples

Create an IPsec policy template entry and enter the IPsec policy template view. The template name is **template1** and the sequence number is 100.

```
<Sysname> system-view
[Sysname] ipsec policy-template template1 100
[Sysname-ipsec-policy-template-template1-100]
```

Related commands

ipsec anti-replay check

Use **ipsec anti-replay check** to enable IPsec anti-replay checking.

Use **undo ipsec anti-replay check** to disable IPsec anti-replay checking.

Syntax

ipsec anti-replay check

undo ipsec anti-replay check

Default

IPsec anti-replay checking is enabled.

Views

System view

Predefined user roles

network-admin

context-admin

Usage guidelines

IPsec packet de-encapsulation involves complicated calculation. De-encapsulation of replayed packets is not necessary but consumes large amounts of resources and degrades performance, resulting in DoS. IPsec anti-replay checking, when enabled, is performed before the de-encapsulation process, reducing resource waste.

In some situations, service data packets are received in a different order than their original order. The IPsec anti-replay feature drops them as replayed packets, which impacts communications. If this happens, disable IPsec anti-replay checking or adjust the size of the anti-replay window as required.

Only IPsec SAs negotiated by IKE support anti-replay checking. Manually created IPsec SAs do not support anti-replay checking. Enabling or disabling IPsec anti-replay checking does not affect manually created IPsec SAs.

Examples

Enable IPsec anti-replay checking.

```
<Sysname> system-view
[Sysname] ipsec anti-replay check
```

Related commands

ipsec anti-replay window

ipsec anti-replay window

Use **ipsec anti-replay window** to set the anti-replay window size.

Use **undo ipsec anti-replay window** to restore the default.

Syntax

ipsec anti-replay window *width*

undo ipsec anti-replay window

Default

The anti-replay window size is 64.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

width: Specifies the size for the anti-replay window. It can be 64, 128, 256, 512, or 1024 packets.

Usage guidelines

Service data packets might be received in a very different order than their original order, and the IPsec anti-replay feature might drop them as replayed packets, affecting normal communications. If this happens, disable IPsec anti-replay checking or adjust the size of the anti-replay window as required.

Changing the anti-replay window size affects only the IPsec SAs negotiated later.

Examples

Set the size of the anti-replay window to 128.

```
<Sysname> system-view
```

```
[Sysname] ipsec anti-replay window 128
```

Related commands

ipsec anti-replay check

ipsec apply

Use **ipsec apply** to apply an IPsec policy to an interface.

Use **undo ipsec apply** to remove an IPsec policy application from an interface.

Syntax

ipsec apply { **ipv6-policy** | **policy** } *policy-name*

undo ipsec apply { **ipv6-policy** | **policy** }

Default

No IPsec policy is applied to an interface.

Views

Interface view

Predefined user roles

network-admin

context-admin

Parameters

ipv6-policy: Specifies an IPv6 IPsec policy.

policy: Specifies an IPv4 IPsec policy.

policy-name: Specifies an IPsec policy name, a case-insensitive string of 1 to 63 characters.

Usage guidelines

On an interface, you can apply a maximum of two IPsec policies: one IPv4 IPsec policy and one IPv6 IPsec policy.

An IKE-based IPsec policy that is bound to a source interface can be applied to multiple interfaces. A manual IPsec policy can be applied to only one interface.

Examples

Apply IPsec policy **policy1** to GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] ipsec apply policy policy1
```

Related commands

display ipsec { **ipv6-policy** | **policy** }

ipsec { **ipv6-policy** | **policy** }

ipsec decrypt-check enable

Use **ipsec decrypt-check enable** to enable ACL checking for de-encapsulated IPsec packets.

Use **undo ipsec decrypt-check** to disable ACL checking for de-encapsulated IPsec packets.

Syntax

ipsec decrypt-check enable

undo ipsec decrypt-check enable

Default

ACL checking for de-encapsulated IPsec packets is enabled.

Views

System view

Predefined user roles

network-admin

context-admin

Usage guidelines

In tunnel mode, the IP packet encapsulated in an inbound IPsec packet might not be under the protection of the ACL specified in the IPsec policy. After being de-encapsulated, such packets bring threats to the network security. In this scenario, you can enable ACL checking for de-encapsulated IPsec packets. All packets failing the checking are discarded, improving the network security.

Examples

Enable ACL checking for de-encapsulated IPsec packets.

```
<Sysname> system-view
[Sysname] ipsec decrypt-check enable
```

ipsec df-bit

Use **ipsec df-bit** to configure the DF bit for the outer IP header of IPsec packets on an interface.

Use **undo ipsec df-bit** to restore the default.

Syntax

ipsec df-bit { **clear** | **copy** | **set** }

undo ipsec df-bit

Default

The DF bit is not configured for the outer IP header of IPsec packets on an interface. The global DF bit setting is used.

Views

Interface view

Predefined user roles

network-admin

context-admin

Parameters

clear: Clears the DF bit in the outer IP header. IPsec packets can be fragmented.

copy: Copies the DF bit setting of the original IP header to the outer IP header.

set: Sets the DF bit in the outer IP header. IPsec packets cannot be fragmented.

Usage guidelines

This command is effective only when the IPsec encapsulation mode is tunnel mode. It is not effective in transport mode because the outer IP header is not added in transport mode.

This command does not change the DF bit for the original IP header of IPsec packets.

If multiple interfaces use an IPsec policy that is bound to a source interface, you must use the same DF bit setting on these interfaces.

Packet fragmentation and reassembly might cause packet forwarding to be delayed. You can set the DF bit to avoid the forwarding delay. However, to prevent the IPsec packets from being discarded, you must make sure the path MTU is larger than the IPsec packet size. As a best practice, clear the DF bit if you cannot make sure the path MTU is larger than the IPsec packet size.

Examples

Set the DF bit in the outer IP header of IPsec packets on GigabitEthernet 1/0/2.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/2
[Sysname-GigabitEthernet1/0/2] ipsec df-bit set
```

Related commands

ipsec flow-overlap check enable

Use **ipsec flow-overlap check enable** to enable IPsec flow overlap check.

Use **undo ipsec flow-overlap check enable** to disable IPsec flow overlap check.

Syntax

ipsec flow-overlap check enable

undo ipsec flow-overlap check enable

Default

IPsec flow overlap check is disabled.

Views

System view

Predefined user roles

network-admin

context-admin

Usage guidelines

In a hub-spoke network, the hub typically uses an IPsec policy template to negotiate IPsec SAs with spokes. The data flows to be protected by the IPsec SAs might overlap with each other. To avoid IPsec flow overlapping, you can enable IPsec flow overlap check on the hub device. When negotiating an IPsec SA for a data flow, the device checks whether the data flow overlaps with an existing protected data flow. If yes, the new IPsec SA negotiation fails and the device generates an IPsec flow overlap notification. On receiving such notifications, you must reconfigure the ACL settings for IPsec on the spoke devices.

This feature checks the destination IP address of a data flow to be protected with the destination IP addresses of the existing protected data flows. If an overlap exists, the feature determines that the data flow overlaps.

The following applies to the IPsec flow overlap check feature:

- As a best practice, enable this feature on the hub device of a hub-spoke network.
- This feature takes effect only on IPsec SAs negotiated by using IPsec policy templates.
- This feature takes effect only for new IPsec SA negotiations. It does not take effect on existing IPsec SAs.
- This feature takes effect only on IPsec SAs negotiated on the same interface and in the same VPN instance.
- This feature does not take effect on renegotiated IPsec SAs.
- This feature does not check overlaps for source IP addresses of data flows.
- This feature impacts device performance, enable this feature only when necessary (for example, for network upgrade or expansion) and disable it in time.

Examples

Enable IPsec flow overlap check.

```
<Sysname> system-view
[Sysname] ipsec flow-overlap check enable
```

ipsec fragmentation

Use **ipsec fragmentation** to configure the IPsec fragmentation feature.

Use **undo ipsec fragmentation** to restore the default.

Syntax

ipsec fragmentation { **after-encryption** | **before-encryption** }

undo ipsec fragmentation

Default

The device fragments packets before IPsec encapsulation.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

after-encryption: Fragments packets after IPsec encapsulation.

before-encryption: Fragments packets before IPsec encapsulation.

Usage guidelines

If you configure the device to fragment packets before IPsec encapsulation, the device predetermines the encapsulated packet size before the actual encapsulation. If the encapsulated packet size exceeds the MTU of the output interface and the DF bit is not set, the device fragments the packet before encapsulation. If the packet's DF bit is set, the device drops the packet and sends an ICMP error message.

If you configure the device to fragment packets after IPsec encapsulation, the device directly encapsulates the packets and fragments the encapsulated packets in subsequent service modules.

Examples

Configure the device to fragment packets after IPsec encapsulation.

```
<Sysname>system-view
```

```
[Sysname] ipsec fragmentation after-encryption
```

ipsec global-df-bit

Use **ipsec global-df-bit** to configure the DF bit for the outer IP header of IPsec packets on all interfaces.

Use **undo ipsec global-df-bit** to restore the default.

Syntax

ipsec global-df-bit { **clear** | **copy** | **set** }

undo ipsec global-df-bit

Default

The DF bit setting of the original IP header is copied to the outer IP header for IPsec packets.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

clear: Clears the DF bit in the outer IP header. IPsec packets can be fragmented.

copy: Copies the DF bit setting of the original IP header to the outer IP header.

set: Sets the DF bit in the outer IP header. IPsec packets cannot be fragmented.

Usage guidelines

This command is effective only when the IPsec encapsulation mode is tunnel mode. It is not effective in transport mode because the outer IP header is not added in transport mode.

This command does not change the DF bit for the original IP header of IPsec packets.

Packet fragmentation and reassembly might cause packet forwarding to be delayed. You can set the DF bit to avoid the forwarding delay. However, to prevent IPsec packets from being discarded, you must make sure the path MTU is larger than the IPsec packet size. As a best practice, clear the DF bit if you cannot make sure the path MTU is larger than the IPsec packet size.

Examples

Set the DF bit in the outer IP header of IPsec packets on all interfaces.

```
<Sysname> system-view
[Sysname] ipsec global-df-bit set
```

Related commands

ipsec df-bit

ipsec limit max-tunnel

Use **ipsec limit max-tunnel** to set the maximum number of IPsec tunnels.

Use **undo ipsec limit max-tunnel** to restore the default.

Syntax

ipsec limit max-tunnel *tunnel-limit*

undo ipsec limit max-tunnel

Default

The number of IPsec tunnels is not limited.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

tunnel-limit: Specifies the maximum number of IPsec tunnels, in the range of 1 to 4294967295.

Usage guidelines

To maximize concurrent performance of IPsec when memory is sufficient, increase the maximum number of IPsec tunnels. To ensure service availability when memory is insufficient, decrease the maximum number of IPsec tunnels.

Examples

Set the maximum number of IPsec tunnels to 5000.

```
<Sysname> system-view
[Sysname] ipsec limit max-tunnel 5000
```

Related commands

ike limit

ipsec logging negotiation enable

Use **ipsec logging negotiation enable** to enable logging for IPsec negotiation.

Use **undo ipsec logging negotiation packet enable** to disable logging for IPsec negotiation.

Syntax

ipsec logging negotiation enable

undo ipsec logging negotiation enable

Default

Logging for IPsec negotiation is enabled.

Views

System view

Predefined user roles

network-admin

context-admin

Usage guidelines

This command enables the device to output logs for the IPsec negotiation process.

Examples

Enable logging for IPsec negotiation.

```
<Sysname> system-view
```

```
[Sysname] ipsec logging negotiation enable
```

ipsec logging packet enable

Use **ipsec logging packet enable** to enable logging for IPsec packets.

Use **undo ipsec logging packet enable** to disable logging for IPsec packets.

Syntax

ipsec logging packet enable

undo ipsec logging packet enable

Default

Logging for IPsec packets is disabled.

Views

System view

Predefined user roles

network-admin

context-admin

Usage guidelines

After logging for IPsec packets is enabled, the device outputs a log when an IPsec packet is discarded. IPsec packets might be discarded due to lack of inbound SA, AH/ESP authentication failure, or ESP encryption failure. A log contains the source and destination IP addresses, SPI, and sequence number of the packet, and the reason it was discarded.

Examples

Enable logging for IPsec packets.

```
<Sysname> system-view
[Sysname] ipsec logging packet enable
```

ipsec netmask-filter

Use **ipsec netmask-filter** to configure IPsec netmask filtering.

Use **undo ipsec netmask-filter** to restore the default.

Syntax

ipsec netmask-filter { **destination-mask** *mask-length* | **source-mask** *mask-length* } *

undo ipsec netmask-filter [**destination-mask** | **source-mask**]

Default

IPsec netmask filtering is not configured.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

destination-mask *mask-length*: Specifies the minimum mask length for IPv4 flow destination addresses, in the range of the 1 to 32.

source-mask *mask-length*: Specifies the minimum mask length for IPv4 flow source IP addresses, in the range of the 1 to 32.

Usage guidelines

This feature is supported only on IPv4 networks.

This feature takes effect only IPsec SAs negotiated by using IPsec policy templates.

As a best practice, configure this feature on the hub device of a hub-spoke network.

On a hub-spoke network, if the IPsec data flow range configured on a spoke is too large, traffic of other spokes might be directed to that spoke incorrectly. To avoid incorrect packet forwarding, you can enable IPsec netmask filtering on the hub device. When negotiating an IPsec SA for a data flow, the device checks the mask lengths of the data flow. The IPsec SA negotiation proceeds only if the mask lengths of the source and destination IP addresses of the data flow are greater than or equal to those configured by IPsec netmask filtering. If the data flow fails to pass the netmask filtering, the IPsec SA negotiation fails and the device generates a corresponding SA negotiation failure notification. On receiving such notifications, you must reconfigure the ACL settings for IPsec on the spoke devices.

If you execute this command multiple times, the most recent configuration takes effect.

If you do not specify any parameters, the **undo ipsec netmask-filter** command disables both the destination and source netmask filtering features.

Examples

Configure IPsec netmask filtering: set the source IP mask length to 24 and destination IP mask length to 24.

```
<Sysname> system-view
[Sysname] ipsec netmask-filter source-mask 24 destination-mask 24
```

ipsec profile

Use **ipsec profile** to create an IPsec profile and enter its view, or enter the view of an existing IPsec profile.

Use **undo ipsec profile** to delete an IPsec profile.

Syntax

ipsec profile *profile-name* [**manual** | **isakmp**]

undo ipsec profile *profile-name*

Default

No IPsec profiles exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

profile-name: Specifies a name for the IPsec profile, a case-insensitive string of 1 to 63 characters.

manual: Specifies the IPsec SA setup mode as manual.

isakmp: Specifies the IPsec SA setup mode as IKE.

Usage guidelines

When you create an IPsec profile, you must specify the IPsec SA setup mode (**manual** or **isakmp**). When you enter the view of an existing IPsec profile, you do not need to specify the IPsec SA setup mode.

A manual IPsec profile is similar to a manual IPsec policy. It is used exclusively for IPsec protection for application protocols, including OSPFv3, IPv6 BGP, and RIPng.

An IKE-based IPsec profile is similar to an IKE-based IPsec policy. It uses IKE negotiation to establish IPsec SAs to protect IPv4 and IPv6 application protocols, such as ADVPN. An IKE-based IPsec profile does not require you to specify the remote end address or an ACL.

Examples

Create a manual IPsec profile named **profile1**.

```
<Sysname> system-view
[Sysname] ipsec profile profile1 manual
[Sysname-ipsec-profile-manual-profile1]
```

Create an IKE-based IPsec profile named **profile1**.

```
<Sysname> system-view
[Sysname] ipsec profile profile1 isakmp
[Sysname-ipsec-profile-isakmp-profile1]
```

Related commands

display ipsec profile

ipsec redundancy enable

Use **ipsec redundancy enable** to enable IPsec redundancy.

Use **undo ipsec redundancy enable** to disable IPsec redundancy.

Syntax

ipsec redundancy enable

undo ipsec redundancy enable

Default

IPsec redundancy is disabled.

Views

System view

Predefined user roles

network-admin

context-admin

Usage guidelines

With IPsec redundancy enabled, the system synchronizes the following information from the active device to the standby device at configurable intervals:

- Lower bound values of the IPsec anti-replay window for inbound packets.
- IPsec anti-replay sequence numbers for outbound packets.

The synchronization ensures uninterrupted IPsec traffic forwarding and anti-replay protection when the active device fails.

To configure synchronization intervals, use the **redundancy replay-interval** command.

Examples

Enable IPsec redundancy.

```
<Sysname> system-view
[Sysname] ipsec redundancy enable
```

Related commands

redundancy replay-interval

ipsec sa global-duration

Use **ipsec sa global-duration** to configure the global IPsec SA lifetime.

Use **undo ipsec sa global-duration** to restore the default.

Syntax

ipsec sa global-duration { **time-based** *seconds* | **traffic-based** *kilobytes* }

undo ipsec sa global-duration { **time-based** | **traffic-based** }

Default

The time-based global IPsec SA lifetime is 3600 seconds, and the traffic-based global lifetime is 1843200 Kilobytes.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

time-based *seconds*: Specifies the time-based global lifetime for IPsec SAs, in the range of 180 to 604800 seconds.

traffic-based *kilobytes*: Specifies the traffic-based global lifetime for IPsec SAs, in the range of 2560 to 4294967295 Kilobytes. When traffic on an SA reaches this value, the SA expires.

Usage guidelines

You can also configure IPsec SA lifetimes in IPsec policy view or IPsec policy template view. The device prefers the IPsec SA lifetimes configured in IPsec policy view or IPsec policy template view over the global IPsec SA lifetimes.

When IKE negotiates IPsec SAs, it uses the local lifetime settings or those proposed by the peer, whichever are smaller.

An IPsec SA can have both a time-based lifetime and a traffic-based lifetime. The IPsec SA expires when either lifetime expires. Before the IPsec SA expires, IKE negotiates a new IPsec SA, which takes over immediately after its creation.

Examples

Configure the global IPsec SA lifetime as 7200 seconds.

```
<Sysname> system-view
[Sysname] ipsec sa global-duration time-based 7200
```

Configure the global IPsec SA lifetime as 10240 Kilobytes.

```
[Sysname] ipsec sa global-duration traffic-based 10240
```

Related commands

display ipsec sa

sa duration

ipsec sa global-soft-duration buffer

Use **ipsec sa global-soft-duration buffer** to set the global time-based or traffic-based IPsec SA soft lifetime buffer.

Use **undo ipsec sa global-soft-duration buffer** to restore the default.

Syntax

ipsec sa global-soft-duration buffer { **time-based** *seconds* | **traffic-based** *kilobytes* }

undo ipsec sa global-soft-duration buffer { **time-based** | **traffic-based** }

Default

The global time-based and traffic-based IPsec SA soft lifetime buffers are not configured.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

time-based *seconds*: Specifies the time-based IPsec SA soft lifetime buffer, in seconds. The value range is 20 to 201600.

traffic-based *kilobytes*: Specifies the traffic-based IPsec SA soft lifetime buffer, in Kilobytes. The value range is 1000 to 4294901760.

Usage guidelines

This command takes effect only when IKEv1 is used.

The IPsec SA soft lifetime buffers are used to determine the IPsec SA soft lifetimes.

If no IPsec SA soft lifetime buffers are configured, the system calculates a default time-based and a default traffic-based IPsec SA soft lifetime.

If IPsec SA soft lifetime buffers are configured, the system calculates IPsec SA soft lifetimes as follows:

- Time-based IPsec SA soft lifetime = time-based IPsec SA lifetime – time-based IPsec SA soft lifetime buffer.

  If the calculated time-based IPsec SA soft lifetime is shorter than or equal to 20 seconds, the system uses the default time-based IPsec SA soft lifetime.
- Traffic-based IPsec SA soft lifetime = traffic-based IPsec SA lifetime – traffic-based IPsec SA soft lifetime buffer.

If the calculated traffic-based IPsec SA soft lifetime is smaller than or equal to 1000 Kilobytes, the system uses the default traffic-based IPsec SA soft lifetime.

You can also configure IPsec SA soft lifetime buffers in IPsec policy view or IPsec profile view. The device prefers the IPsec SA lifetime buffers configured in IPsec policy view or IPsec profile view over the global lifetime buffers configured in system view.

Examples

Set the global time-based IPsec SA soft lifetime buffer to 600 seconds.

```
<Sysname> system-view
[Sysname] ipsec sa global-soft-duration buffer time-based 600
```

Set the global traffic-based IPsec SA soft lifetime buffer to 10000 Kilobytes.

```
<Sysname> system-view
[Sysname] ipsec sa global-soft-duration buffer traffic-based 10000
```

Related commands

ipsec sa idle-time

Use **ipsec sa idle-time** to enable the global IPsec SA idle timeout feature and set the idle timeout.

Use **undo ipsec sa idle-time** to disable the global IPsec SA idle timeout feature.

Syntax

ipsec sa idle-time *seconds*

undo ipsec sa idle-time

Default

The global IPsec SA idle timeout feature is disabled.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

seconds: Specifies the IPsec SA idle timeout in the range of 60 to 86400 seconds.

Usage guidelines

This feature applies only to IPsec SAs negotiated by IKE.

The IPsec SA idle timer starts when an IPsec SA is created. If no traffic matches the IPsec SA within the idle timeout interval, the IPsec SA is deleted.

The IPsec SA idle timeout can also be configured in IPsec policy view, IPsec profile view, or IPsec policy template view, which takes precedence over the global IPsec SA timeout.

Examples

Enable the global IPsec SA idle timeout feature and set the IPsec SA idle timeout to 600 seconds.

```
<Sysname> system-view
[Sysname] ipsec sa idle-time 600
```

Related commands

ipsec smart-link policy

Use **ipsec smart-link policy** to create an IPsec smart link policy and enter its view, or enter the view of an existing IPsec smart link policy.

Use **undo ipsec smart-link policy** to delete an IPsec smart link policy.

Syntax

ipsec smart-link policy *policy-name*

undo ipsec smart-link policy *policy-name*

Default

No IPsec smart link policies exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

policy-name: Specifies a name for the IPsec smart link policy. The policy name is a case-insensitive string of 1 to 63 characters and can contain only letters, digits, hyphens (-), and underscores (_).

Usage guidelines

An IPsec smart link policy defines the link quality probe parameters, link switchover thresholds, and links for smart link selection.

The device supports a maximum of three IPsec smart link policies.

An IPsec smart link policy takes effect after it is applied to an IKE-based IPsec policy. You cannot apply an IPsec smart link policy to a manual IPsec policy or an IPsec policy created by using an IPsec policy template.

An IPsec smart link policy can be applied to only one IPsec policy, and an IPsec policy can use only one IPsec smart link policy.

Examples

Created an IPsec smart link policy named **smlkpolicy1**.

```
<Sysname> system-view
[Sysname] ipsec smart-link policy smlkpolicy1
[Sysname-ipsec-smart-link-policy-smlkpolicy1]
```

Related commands

display ipsec smart-link policy

ipsec transform-set

Use **ipsec transform-set** to create an IPsec transform set and enter its view, or enter the view of an existing IPsec transform set.

Use **undo ipsec transform-set** to delete an IPsec transform set.

Syntax

ipsec transform-set *transform-set-name*

undo ipsec transform-set *transform-set-name*

Default

No IPsec transform sets exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

transform-set-name: Specifies a name for the IPsec transform set, a case-insensitive string of 1 to 63 characters.

Usage guidelines

An IPsec transform set, part of an IPsec policy, defines the security parameters for IPsec SA negotiation, including the security protocol, encryption algorithms, authentication algorithms, and encapsulation mode.

Examples

Create an IPsec transform set named **tran1** and enter its view.

```
<Sysname> system-view
[Sysname] ipsec transform-set tran1
[Sysname-transform-set-tran1]
```

Related commands

display ipsec transform-set

link

Use **link** to configure a link for IPsec smart link selection.

Use **undo link** to delete a link from IPsec smart link selection.

Syntax

link *link-id* **interface** *interface-type interface-number* [**local** *local-address* **nexthop** *nexthop-address*] **remote** *remote-address*

undo link *link-id*

Default

An IPsec smart link policy does not contain any links.

Views

IPsec smart link policy view

Predefined user roles

network-admin

context-admin

Parameters

link-id: Specifies a link ID in the range of 1 to 10.

interface *interface-type interface-number*: Specifies the local interface of the link.

local *local-address*: Specifies the local IP address of the link, in dotted decimal notation. The specified local IP address must be the same as the IP address of the link local interface. By default, the IP address of the local interface is used.

nexthop *nexthop-address*: Specifies the next hop IP address for the link, in dotted decimal notation. The specified next hop address must be the same as the gateway address on the local interface of the link. If you do not specify a next hop IP address, the gateway address of the link local interface is used. If the gateway address of the link local interface cannot be obtained, the remote IP address of the link is used.

remote *remote-address*: Specifies the remote IP address for the link, in dotted decimal notation.

Usage guidelines

A maximum of 10 links can be configured in an IPsec smart link policy. A link configured earlier is given a higher priority than the one configured later. You can use the **move link** command to adjust the priorities of the links. During link switchover, IPsec traffic will be switched over the links in descending order of the link priority.

After a link is selected, the device applies the IPsec policy that uses the IPsec smart link policy to the local interface of the link. The local and remote IP addresses of the link will be set as the local and remote IP addresses of the IPsec tunnel.

To correctly forward IKE negotiation packets and IPsec packets, the device automatically generates a route for the active link over which the IPsec tunnel is established. The remote address and next hop address of the link are used as the destination address and next hop address of the route.

Examples

Configure link 1 with local interface GigabitEthernet 1/0/1, local IP address 1.1.1.1, next hop IP address 1.1.1.254, and remote IP address 3.3.3.3.

```
<Sysname> system-view
[Sysname] ipsec smart-link policy smlkpolicy1
[Sysname-ipsec-smart-link-policy-smlkpolicy1] link 1 interface gigabitethernet 1/0/1
local 1.1.1.1 nexthop 1.1.1.254 remote 3.3.3.3
```

Related commands

gateway

link-probe

Use **link-probe** to set the number of link quality probe packets sent in each probe cycle and the probe packet sending interval.

Use **undo link-probe** to restore the default.

Syntax

link-probe { **count** *number* | **interval** *interval* }

undo link-probe { **count** | **interval** }

Default

The device sends 10 probe packets in each probe cycle and the probe packet sending interval is 1 second.

Views

IPsec smart link policy view

Predefined user roles

network-admin

context-admin

Parameters

count *number*: Specifies the number of probe packets sent in each probe cycle. The value range is 1 to 30.

interval *interval*: Specifies probe packet sending interval in seconds. The value range is 1 to 3.

Usage guidelines

After sending the specified number of probe packets over the active link, the device calculates the packet loss ratio and delay, and compares the results with the configured thresholds. If the packet loss ratio or delay over the link exceeds the threshold, a link switchover is triggered.

Examples

Set the interval for sending link quality probe packets to 2 seconds and the number of probe packets sent in each probe cycle to 15.

```
<Sysname> system-view
[Sysname] ipsec smart-link policy smlkpolicy1
[Sysname-ipsec-smart-link-policy-smlkpolicy1] link-probe interval 2
[Sysname-ipsec-smart-link-policy-smlkpolicy1] link-probe count 15
```

Related commands

link-probe source

link-switch threshold

link-probe source

Use **link-probe source** to specify the source and destination IP addresses for link quality probe packets.

Use **undo link-probe source** to remove the source and destination IP addresses configured for link quality probe packets.

Syntax

link-probe source *source-address* **destination** *destination-address*

undo link-probe source *source-address* **destination** *destination-address*

Default

The source and destination IP addresses of link quality probe packets are the local and remote IP addresses of the link over which the packets are sent.

Views

IPsec smart link policy view

Predefined user roles

network-admin

context-admin

Parameters

source *source-address*: Specifies the source IP address for link quality probe packets, in dotted decimal notation.

destination *destination-address*: Specifies the destination IP address for link quality probe packets, in dotted decimal notation.

Usage guidelines

IPsec uses ICMP packets as probe packets for link quality probe. The *source-address* of the probe packets can be any address on the local subnet. The *destination-address* can be the IP address of a device on the remote subnet or an interface IP address of the remote gateway. The *destination-address* and *source-address* must be reachable to each other.

To ensure that probe packets can be sent over the IPsec tunnel to the destination, the branch gateway performs the following operations:

- Adds a static route destined for the probe destination address. The next hop address of the route is the local IP address of the IPsec tunnel at the headquarters (the link remote IP address configured on the branch gateway).

  The link remote address refers to the address specified by the *remote-address* argument in the **link** command.
- Adds the following rule to the ACL used by the IPsec policy:

  rule permit ip source *source-address* 0 **destination** *dest-address* 0

For the remote device (the headquarters gateway) to correctly receive and respond to the probe packets, configure the following settings on the remote device:

- In the ACL used by the IPsec policy template, add ACL rules to permit the data flows that need IPsec protection.
- Enable IPsec RRI or add a static route destined for the source address of the probe packets..

Examples

Set the source and destination IP addresses for link quality probe packets to 10.3.1.10 and 10.3.2.10, respectively.

```
<Sysname> system-view
[Sysname] ipsec smart-link policy smlkpolicy1
[Sysname-ipsec-smart-link-policy-smlkpolicy1] link-probe source 10.3.1.10 destination
10.3.2.10
```

Related commands

link-probe

link-switch cycles

Use **link-switch cycles** to set the maximum number of link switchover cycles.

Use **undo link-switch cycles** to restore the default.

Syntax

link-switch cycles *number*

undo link-switch cycles

Default

The maximum number of link switchover cycles is 3.

Views

IPsec smart link policy view

Predefined user roles

network-admin

context-admin

Parameters

number: Specifies the maximum number of link switchover cycles. The value range is 0 to 5. Value 0 indicates that the number of link switchover cycles is not limited.

Usage guidelines

If the delay or packet loss ratio over the active link exceeds the configured threshold, the device performs cyclic link switchovers in descending order of the link priorities. The first link switchover cycle starts from the current active link. For example, suppose a smart link policy contains four links and the active link is link 3. The first link switchover cycle is 3 > 4. The subsequent link switchover cycles each are 1 > 2 > 3 > 4.

Cyclic link switchover probes the available links one by one in descending order of the link priority, and uses the first qualified link to transfer traffic. If no links are qualified when the maximum number of link switchover cycles is reached, the device selects a link for traffic as follows:

- Selects the link with the lowest packet loss ratio.
- Selects the link with the lowest delay if the links have the same packet loss ratio.
- Selects the link with the lowest priority if the links have the same packet loss ratio and delay.

After 10 minutes, the device starts link quality probing and cyclic link switchovers again.

If the maximum number of link switchover cycles is set to 0, the device never stops link quality probing and cyclic link switchovers.

Examples

Set the maximum number of link switchover cycles to 2.

```
<Sysname> system-view
[Sysname] ipsec smart-link policy smlkpolicy1
[Sysname-ipsec-smart-link-policy-smlkpolicy1] link-switch cycles 2
```

Related commands

link-switch threshold

link-switch threshold

Use **link-switch threshold** to set the link switchover thresholds.

Use **undo link-switch threshold** to restore the default.

Syntax

link-switch threshold { **delay** *delay* | **loss** *loss-ratio* }

undo link-switch threshold { **delay** | **loss** }

Default

The packet loss ratio threshold is 30%, and the delay threshold is 500 milliseconds.

Views

IPsec smart link policy view

Predefined user roles

network-admin

context-admin

Parameters

delay *delay*: Specifies the delay threshold, in milliseconds. The value range is 1 to 3000.

loss *loss-ratio*: Specifies the packet loss ratio threshold, in percentages. The value range is 1 to 100.

Usage guidelines

After sending the specified number of probe packets (a probe cycle), the device calculates the average delay and packet loss ratio and compares the results with the configured thresholds. A link switchover is triggered if either threshold is exceeded.

The packet loss ratio within a link quality probe cycle is calculated as follows: Packet loss ratio = number of received response packets / total number of link quality probe packets sent.

The delay is calculated as follows: Delay = time when a response packet is received – time when the probe packet is sent. The device calculates the delay of each probe packet within a probe cycle and takes an average.

Examples

Set the packet loss ratio threshold to 10% and the delay threshold to 300 milliseconds.

```
<Sysname> system-view
[Sysname] ipsec smart-link policy smlkpolicy1
[Sysname-ipsec-smart-link-policy-smlkpolicy1] link-switch threshold loss 10
[Sysname-ipsec-smart-link-policy-smlkpolicy1] link-switch threshold delay 300
```

local-address

Use **local-address** to configure the local IP address for the IPsec tunnel.

Use **undo local-address** to restore the default.

Syntax

local-address { *ipv4-address* | **ipv6** *ipv6-address* }

undo local-address

Default

The primary IPv4 address of the interface to which the IPsec policy is applied is used as the local IPv4 address. The first IPv6 address of the interface to which the IPsec policy is applied is used as the local IPv6 address.

Views

IPsec policy view

IPsec policy template view

Predefined user roles

network-admin

context-admin

Parameters

ipv4-address: Specifies the local IPv4 address for the IPsec tunnel.

ipv6 *ipv6-address*: Specifies the local IPv6 address for the IPsec tunnel.

Usage guidelines

The remote IP address on the IKE negotiation initiator must be the same as the local address on the IKE negotiation responder.

The local address cannot be a secondary IP address of the interface where the IPsec policy is applied.

Examples

Configure local address 1.1.1.1 for the IPsec tunnel.

```
<Sysname> system-view
[Sysname] ipsec policy map 1 isakmp
[Sysname-ipsec-policy-isakmp-map-1] local-address 1.1.1.1
```

Related commands

move link

Use **move link** to move links in an IPsec smart link policy to adjust their priorities.

Syntax

move link *link-id1* **before** *link-id2*

Views

IPsec smart link policy view

Predefined user roles

network-admin

context-admin

Parameters

link-id1: Specifies the ID of the link to be moved. The value range is 1 to 10. The specified link ID must already exist.

before: Moves *link-id1* to the front of *link-id2*.

link-id2: Specifies the target link ID. The value range is 1 to 10. The specified link ID must already exist.

Usage guidelines

By default, a link configured earlier is given a higher priority in IPsec smart link selection. You can use this command to adjust the link priorities in an IPsec smart link policy.

To view the links and their priorities in an IPsec smart link policy, use the **display ipsec smart-link policy** command.

Examples

Move link 5 in IPsec smart link policy **smlkpolicy1** to the front of link 1 so that link 5 takes precedence over link 1.

```
<Sysname> system-view
[Sysname] ipsec smart-link policy smlkpolicy1
[Sysname-ipsec-smart-link-policy-smlkpolicy1] move link 5 before 1
```

Related commands

display ipsec smart-link policy

pfs

Use **pfs** to enable the Perfect Forward Secrecy (PFS) feature for an IPsec transform set.

Use **undo pfs** to restore the default.

Syntax

pfs { **dh-group1** | **dh-group2** | **dh-group5** | **dh-group14** | **dh-group19** | **dh-group20** | **dh-group24** }

undo pfs

Default

The PFS feature is disabled for the IPsec transform set.

Views

IPsec transform set view

Predefined user roles

network-admin

context-admin

Parameters

dh-group1: Uses 768-bit Diffie-Hellman group.

dh-group2: Uses 1024-bit Diffie-Hellman group.

dh-group5: Uses 1536-bit Diffie-Hellman group.

dh-group14: Uses 2048-bit Diffie-Hellman group.

dh-group24: Uses 2048-bit and 256-bit subgroup Diffie-Hellman group.

dh-group19: Uses 256-bit ECP Diffie-Hellman group. This keyword is available only for IKEv2.

dh-group20: Uses 384-bit ECP Diffie-Hellman group. This keyword is available only for IKEv2.

dh-group24: Uses 2048-bit and 256-bit subgroup Diffie-Hellman group.

Usage guidelines

In terms of security and required calculation time, the following groups are in descending order:

- 384-bit ECP Diffie-Hellman group (**dh-group20**).
- 256-bit ECP Diffie-Hellman group (**dh-group19**).
- 2048-bit and 256-bit subgroup Diffie-Hellman group (**dh-group24**).
- 2048-bit Diffie-Hellman group (**dh-group14**).
- 1536-bit Diffie-Hellman group (**dh-group5**).
- 1024-bit Diffie-Hellman group (**dh-group2**).

- 768-bit Diffie-Hellman group (**dh-group1**).

If IKEv1 is used, the security level of the Diffie-Hellman group of the initiator must be higher than or equal to that of the responder. This restriction does not apply to IKEv2.

The end without the PFS feature performs IKE negotiation according to the PFS requirements of the peer end.

Examples

Enable PFS using 2048-bit Diffie-Hellman group for IPsec transform set **tran1**.

```
<Sysname> system-view
[Sysname] ipsec transform-set tran1
[Sysname-ipsec-transform-set-tran1] pfs dh-group14
```

protocol

Use **protocol** to specify a security protocol for an IPsec transform set.

Use **undo protocol** to restore the default.

Syntax

undo protocol

Default

The IPsec transform set uses the ESP protocol.

Views

IPsec transform set view

Predefined user roles

network-admin

context-admin

Parameters

ah: Specifies the AH protocol.

ah-esp: Specifies using the ESP protocol first and then using the AH protocol.

ah: Specifies the AH protocol.

Usage guidelines

The two tunnel ends must use the same security protocol in the IPsec transform set.

Examples

Specify the AH protocol for the IPsec transform set.

```
<Sysname> system-view
[Sysname] ipsec transform-set tran1
[Sysname-ipsec-transform-set-tran1] protocol ah
```

qos pre-classify

Use **qos pre-classify** to enable the QoS pre-classify feature.

Use **undo qos pre-classify** to disable the QoS pre-classify feature.

Syntax

qos pre-classify

undo qos pre-classify

Default

The QoS pre-classify feature is disabled. QoS uses the new IP header of IPsec packets to perform traffic classification.

Views

IPsec policy view

IPsec policy template view

Predefined user roles

network-admin

context-admin

Usage guidelines

The QoS pre-classify feature enables QoS to classify packets by using the IP header of the original IP packets.

Examples

Enable the QoS pre-classify feature.

```
<Sysname> system-view
[Sysname] ipsec policy policy1 100 manual
[Sysname-ipsec-policy-manual-policy1-100] qos pre-classify
```

redundancy replay-interval

Use **redundancy replay-interval** to set the anti-replay window lower bound value synchronization interval for inbound packets and the sequence number synchronization interval for outbound packets.

Use **undo redundancy replay-interval** to restore the default.

Syntax

redundancy replay-interval inbound *inbound-interval* **outbound** *outbound-interval*

undo redundancy replay-interval

Default

The active device synchronizes the anti-replay window lower bound value every time it receives 1000 packets and synchronizes the sequence number every time it sends 100000 packets.

Views

IPsec policy view

IPsec policy template view

IPsec profile view

Predefined user roles

network-admin

context-admin

Parameters

inbound *inbound-interval*: Specifies the interval at which the active device synchronizes the lower bound value of the IPsec anti-replay window to the standby device. This interval is expressed in the number of received packets, in the range of 0 to 1000. If you set the value to 0, the lower bound value of the anti-replay window will not be synchronized.

outbound *outbound-interval*: Specifies the interval at which the active device synchronizes the IPsec anti-replay sequence number to the standby device. This interval is expressed in the number of sent packets, in the range of 1000 to 100000.

Usage guidelines

The intervals take effect only after you enable IPsec redundancy by using the **ipsec redundancy enable** command.

A short interval improves the anti-replay information consistency between the active device and the standby device, but it sacrifices the forwarding performance of the devices.

Examples

Set the anti-replay window lower bound value synchronization interval for inbound packets to 800. Set the sequence number synchronization interval for outbound packets to 50000.

```
<Sysname> system-view
[Sysname] ipsec policy test 1 manual
[sysname-ipsec-policy-manual-test-1] redundancy replay-interval inbound 800 outbound
50000
```

remote-address

Use **remote-address** to configure the remote IP address for the IPsec tunnel.

Use **undo remote-address** to restore the default.

Syntax

remote-address { [**ipv6**] *host-name* | *ipv4-address* | **ipv6** *ipv6-address* } [**primary**]

undo remote-address { [**ipv6**] *host-name* | *ipv4-address* | **ipv6** *ipv6-address* }

Default

No remote IP address is configured for the IPsec tunnel.

Views

IPsec policy view

IPsec policy template view

Predefined user roles

network-admin

context-admin

Parameters

ipv6: Specifies the remote address or host name of an IPv6 IPsec tunnel. To specify the remote address or host name of an IPv4 IPsec tunnel, do not specify this keyword.

hostname: Specifies the remote host name, a case-insensitive string of 1 to 253 characters. The host name can be resolved to an IP address by the DNS server.

ipv4-address: Specifies a remote IPv4 address.

ipv6-address: Specifies a remote IPv6 address.

primary: Sets the specified remote address as the primary address, which has the highest priority in tunnel setup. If you do not set a primary address, the address specified earlier has a higher priority.

Usage guidelines

This remote IP address configuration is required on the IKE negotiation initiator and optional on the responder if the responder uses an IPsec policy template.

A manual IPsec policy does not support DNS. Therefore, you must specify a remote IP address rather than a remote host name for the manual IPsec policy.

If you configure a remote host name, the local end resolves the host name into the latest IP address of the remote end.

- If a DNS server is used for resolution, the local end queries the remote IP address again from the DNS server after the previously cached remote IP address expires. This mechanism ensures that the local end can always obtain the latest remote IP address.
- If a static DNS entry is used for resolution, the local end always obtains the latest remote IP address corresponding to the host name.

For example, the local end has a static DNS entry which maps the host name **test** to the IP address 1.1.1.1. Configure the following commands:

Configure the remote host name to **test** for the IPsec tunnel in the IPsec policy **policy1**.

```
[Sysname] ipsec policy policy1 1 isakmp
[Sysname-ipsec-policy-isakmp-policy1-1] remote-address test
```

Change the IP address for the host **test** to 2.2.2.2.

```
[Sysname] ip host test 2.2.2.2
```

In this case, the local end obtains the latest IP address of the remote host, which is 2.2.2.2.

You can execute this command multiple times to specify multiple remote IP addresses. When establishing an IPsec tunnel, the local end initiates IPsec negotiation to the first specified IP address. If the negotiation succeeds, the local end establishes the IPsec tunnel with this IP address. If the negotiation fails, the local end tries IPsec tunnel setup to the second IP address, and so forth to the last IP address.

If a primary remote address is set, the primary address has the highest priority in tunnel setup. The local end starts IPsec negotiation first to the primary address for each tunnel setup.

Each IPsec policy can have only one primary remote address. To change the primary address, you must first execute the **undo remote-address** command, and then use the **remote-address** command to specify a new primary address.

Examples

Specify remote IP address 10.1.1.2 for the IPsec tunnel.

```
<Sysname> system-view
[Sysname] ipsec policy policy1 10 manual
[Sysname-ipsec-policy-manual-policy1-10] remote-address 10.1.1.2
```

Related commands

local-address

reset ipsec sa

Use **reset ipsec sa** to clear IPsec SAs.

Syntax

reset ipsec sa [{ **ipv6-policy** | **policy** } *policy-name* [*seq-number*] | **profile** *policy-name* | **remote** { *ipv4-address* | **ipv6** *ipv6-address* } | **spi** { *ipv4-address* | **ipv6** *ipv6-address* } { **ah** | **esp** } *spi-num*]

Views

User view

Predefined user roles

network-admin

context-admin

Parameters

{ **ipv6-policy** | **policy** } *policy-name* [*seq-number*]: Clears IPsec SAs for the specified IPsec policy.

- **ipv6-policy**: Specifies an IPv6 IPsec policy.
- **policy**: Specifies an IPv4 IPsec policy.
- *policy-name*: Specifies the name of the IPsec policy, a case-insensitive string of 1 to 63 characters.
- *seq-number*: Specifies the sequence number of an IPsec policy entry, in the range of 1 to 65535. If you do not specify this argument, all the entries in the IPsec policy are specified.

profile *profile-name*: Clears IPsec SAs for the IPsec profile specified by its name, a case-insensitive string of 1 to 63 characters.

remote: Clears IPsec SAs for the specified remote address.

ipv4-address: Specifies a remote IPv4 address.

ipv6 *ipv6-address*: Specifies a remote IPv6 address.

spi { *ipv4-address* | **ipv6** *ipv6-address* } { **ah** | **esp** } *spi-num*: Clears IPsec SAs matching the specified SA triplet: the remote address, the security protocol, and the SPI.

- *ipv4-address*: Specifies a remote IPv4 address.
- **ipv6** *ipv6-address*: Specifies a remote IPv6 address.
- **ah**: Specifies the AH protocol.
- **esp**: Specifies the ESP protocol.

spi-num: Specifies the security parameter index in the range of 256 to 4294967295.

Usage guidelines

If you do not specify any parameters, this command clears all IPsec SAs.

If you specify an SA triplet, this command clears the IPsec SA matching the triplet, and all the other IPsec SAs that were established during the same negotiation process, including the corresponding

IPsec SA in the other direction, and the inbound and outbound IPsec SAs using the other security protocol (AH or ESP).

An outbound SA is uniquely identified by an SA triplet and an inbound SA is uniquely identified by an SPI. To clear IPsec SAs by specifying a triplet in the outbound direction, you should provide the remote IP address, the security protocol, and the SPI, where the remote IP address can be any valid address if the SAs are established by IPsec profiles. To clear IPsec SAs by specifying a triplet in the inbound direction, you should provide the SPI and use any valid values for the other two parameters.

After a manual IPsec SA is cleared, the system automatically creates a new SA based on the parameters of the IPsec policy. After IKE negotiated SAs are cleared, the system creates new SAs only when IKE negotiation is triggered by packets.

Examples

Clear all IPsec SAs.

```
<Sysname> reset ipsec sa
```

Clear the inbound and outbound IPsec SAs for the triplet of SPI 256, remote IP address 10.1.1.2, and security protocol AH.

```
<Sysname> reset ipsec sa spi 10.1.1.2 ah 256
```

Clear all IPsec SAs for remote IP address 10.1.1.2.

```
<Sysname> reset ipsec sa remote 10.1.1.2
```

Clear all IPsec SAs for entry 10 of IPsec policy **policy1**.

```
<Sysname> reset ipsec sa policy policy1 10
```

Clear all IPsec SAs for IPsec policy **policy1**.

```
<Sysname> reset ipsec sa policy policy1
```

reset ipsec statistics

Use **reset ipsec statistics** to clear IPsec packet statistics.

Syntax

reset ipsec statistics[**tunnel-id** *tunnel-id*]

Views

User view

Predefined user roles

network-admin

context-admin

Parameters

tunnel-id *tunnel-id*: Clears IPsec packet statistics for the specified IPsec tunnel. The value range for the *tunnel-id* argument is 0 to 4294967295. If you do not specify this option, the command clears all IPsec packet statistics.

Examples

Clear IPsec packet statistics.

```
<Sysname> reset ipsec statistics
```

Related commands

display ipsec statistics

reverse-route dynamic

Use **reverse-route dynamic** to enable IPsec reverse route inject (RRI).

Use **undo reverse-route dynamic** to disable IPsec RRI.

Syntax

reverse-route [**next-hop** [**ipv6**] *ip-address*] **dynamic**

undo reverse-route dynamic

Default

IPsec RRI is disabled.

Views

IPsec policy view

IPsec policy template view

Predefined user roles

network-admin

context-admin

Parameters

next-hop: Specifies a next hop IP address for the IPsec RRI-created static route. If you do not specify a next hop IP address, the static route uses the remote IP address of the IPsec tunnel as the next hop IP address.

ipv6: Specifies an IPv6 address.

ip-address: Specifies the next hop IPv4 or IPv6 address.

Usage guidelines

IPsec RRI is usually used on a gateway device at the headquarters side in an IPsec VPN. After IPsec RRI is enabled for an IPsec policy or an IPsec policy template on a gateway device, the gateway device automatically creates a static route upon IPsec SA creation according to this IPsec policy or IPsec policy template. By default, the static route uses the protected peer private network as the destination IP address and the remote IP address of the IPsec tunnel as the next hop address. If there are multiple paths to the remote tunnel end, you can use the **next-hop** keyword to specify a next hop IP address for the static route.

When you enable IPsec RRI for an IPsec policy, the device deletes all IPsec SAs that are created according to this IPsec policy. Upon IPsec SAs are renegotiated, the static routes are created.

When you disable IPsec RRI for an IPsec policy, the device deletes all IPsec SAs that are created according to this IPsec policy, and the associated static routes.

To display the static routes created by RRI, use the **display ip routing-table** command.

Examples

Enable IPsec RRI to create a static route according to the IPsec SA negotiated by the specified IPsec policy. The destination IP address is the protected peer private network 3.0.0.0/24, and the next hop is the IP address (1.1.1.2) of the remote tunnel interface.

```
<Sysname> system-view
[Sysname] ipsec policy 1 1 isakmp
[Sysname-ipsec-policy-isakmp-1-1] reverse-route dynamic
[Sysname-ipsec-policy-isakmp-1-1] quit
```

Display the routing table. You can see a created static route. (Other information is not shown.)

```
[Sysname] display ip routing-table

Destination/Mask    Proto  Pre  Cost         NextHop         Interface
3.0.0.0/24          Static 60   0            1.1.1.2         GE1/0/1
```

Enable IPsec RRI to create a static route according to the IPsec SA negotiated by the specified IPsec policy. Set the next hop IP address of the static route to 2.2.2.3.

```
<Sysname> system-view
[Sysname] ipsec policy 1 1 isakmp
[Sysname-ipsec-policy-isakmp-1-1] reverse-route next-hop 2.2.2.3 dynamic
[Sysname-ipsec-policy-isakmp-1-1] quit
```

Display the routing table. You can see a created static route. (Other information is not shown.)

```
[Sysname] display ip routing-table
Destination/Mask    Proto  Pre  Cost         NextHop         Interface
4.0.0.0/24          Static 60   0            2.2.2.3         GE1/0/1
```

reverse-route preference

Use **reverse-route preference** to set the preference of the static routes created by IPsec RRI.

Use **undo reverse-route preference** to restore the default.

Syntax

reverse-route preference *number*

undo reverse-route preference

Default

The preference for the static routes created by IPsec RRI is 60.

Views

IPsec policy view

IPsec policy template view

Predefined user roles

network-admin

context-admin

Parameters

number: Specifies a preference value. The value range is 1 to 255. A smaller value represents a higher preference.

Usage guidelines

When you change this preference in an IPsec policy, the device deletes all IPsec SAs created according to this IPsec policy, and the associated static routes.

Examples

Change the preference to 100 for static routes created by IPsec RRI.

```
<Sysname> system-view
[Sysname] ipsec policy 1 1 isakmp
[Sysname-ipsec-policy-isakmp-1-1] reverse-route preference 100
```

reverse-route tag

Use **reverse-route tag** to set a route tag for the static routes created by IPsec RRI.

Use **undo reverse-route tag** to restore the default.

Syntax

reverse-route tag *tag-value*

undo reverse-route tag

Default

The route tag value is 0 for the static routes created by IPsec RRI.

Views

IPsec policy view

IPsec policy template view

Predefined user roles

network-admin

context-admin

Parameters

tag-value: Specifies a tag value. The value range is 1 to 4294967295.

Usage guidelines

The tag value set by this command helps in implementing flexible route control through routing policies.

When you change this tag value in an IPsec policy, the device deletes all IPsec SAs created by this IPsec policy, and all associated static routes.

Examples

Set the tag value to 50 for the static routes created by IPsec RRI.

```
<Sysname>system-view
[Sysname] ipsec policy 1 1 isakmp
[Sysname-ipsec-policy-isakmp-1-1] reverse-route tag 50
```

Related commands

ipsec policy-template

sa df-bit

Use **sa df-bit** to configure the DF bit for the outer IP header of IPsec packets.

Use **undo sa df-bit** to restore the default.

Syntax

sa df-bit { **clear** | **copy** | **set** }

undo sa df-bit

Default

The DF bit is not configured for the outer IP header of IPsec packets. The interface-specific or global DF bit setting is used.

Views

IPsec policy view

IPsec policy template view

IPsec profile view

Predefined user roles

network-admin

context-admin

Parameters

clear: Clears the DF bit in the outer IP header. IPsec packets can be fragmented.

copy: Copies the DF bit setting of the original IP header to the outer IP header.

set: Sets the DF bit in the outer IP header. IPsec packets cannot be fragmented.

Usage guidelines

This command is effective only when the IPsec encapsulation mode is tunnel mode. It is not effective in transport mode because the outer IP header is not added in transport mode.

This command is supported only when the IKE negotiation mode is used for IPsec SA setup.

This command does not change the DF bit for the original IP header of IPsec packets.

Packet fragmentation and reassembly might cause packet forwarding to be delayed. You can set the DF bit to avoid the forwarding delay. If the DF bit is set, make sure the path MTU is larger than the IPsec packet size to prevent the IPsec packets from being discarded. Clear the DF bit if you cannot make sure the path MTU is larger than the IPsec packet size.

If the DF bit setting is not configured in the IPsec policy, IPsec profile, or IPsec policy template, the interface-specific DF bit setting is used. If the interface-specific DF bit setting is not configured either, the global DF bit setting is used.

Examples

Set the DF bit in the outer IP header of IPsec packets in IPsec policy **policy1**.

```
<Sysname> system-view
[Sysname] ipsec policy policy1 100 isakmp
[Sysname-ipsec-policy-isakmp-policy1-100] sa df-bit set
```

Related commands

ipsec df-bit

ipsec global-df-bit

sa duration

Use **sa duration** to set an SA lifetime.

Use **undo sa duration** to remove an SA lifetime.

Syntax

sa duration { **time-based** *seconds* | **traffic-based** *kilobytes* }

undo sa duration { **time-based** | **traffic-based** }

Default

The SA lifetime of an IPsec policy, IPsec profile, or IPsec policy template is the current global SA lifetime.

Views

IPsec policy view

IPsec policy template view

IPsec profile view

Predefined user roles

network-admin

context-admin

Parameters

time-based *seconds*: Specifies the time-based SA lifetime in the range of 180 to 604800 seconds.

traffic-based *kilobytes*: Specifies the traffic-based SA lifetime in the range of 2560 to 4294967295 Kilobytes.

Usage guidelines

IKE prefers the SA lifetime of the IPsec policy, IPsec profile, or IPsec policy template over the global SA lifetime configured by the **ipsec sa global-duration** command. If the IPsec policy, IPsec profile, or IPsec policy template is not configured with the SA lifetime, IKE uses the global SA lifetime for SA negotiation.

During SA negotiation, IKE selects the shorter SA lifetime between the local SA lifetime and the remote SA lifetime.

Examples

Set the SA lifetime to 7200 seconds for IPsec policy **policy1**.

```
<Sysname> system-view
[Sysname] ipsec policy policy1 100 isakmp
[Sysname-ipsec-policy-isakmp-policy1-100] sa duration time-based 7200
```

Set the SA lifetime to 20 MB for IPsec policy **policy1**. The IPsec SA expires after transmitting 20480 Kilobytes.

```
<Sysname> system-view
[Sysname] ipsec policy policy1 100 isakmp
[Sysname-ipsec-policy-isakmp-policy1-100] sa duration traffic-based 20480
```

sa hex-key authentication

Use **sa hex-key authentication** to configure a hexadecimal authentication key for manual IPsec SAs.

Use **undo sa hex-key authentication** to remove the hexadecimal authentication key.

Syntax

sa hex-key authentication { **inbound** | **outbound** } { **ah** | **esp** } { **cipher** | **simple** } *string*

undo sa hex-key authentication { **inbound** | **outbound** } { **ah** | **esp** }

Default

No hexadecimal authentication key is configured for manual IPsec SAs.

Views

IPsec policy view

IPsec profile view

Predefined user roles

network-admin

context-admin

Parameters

inbound: Specifies a hexadecimal authentication key for the inbound SA.

outbound: Specifies a hexadecimal authentication key for the outbound SA.

ah: Uses AH.

esp: Uses ESP.

cipher: Specifies a key in encrypted form.

simple: Specifies a key in plaintext form. For security purposes, the key specified in plaintext form will be stored in encrypted form.

string: Specifies the key. Its plaintext form is case insensitive and must be a 16-byte hexadecimal string for HMAC-MD5, a 32-byte hexadecimal string for HMAC-SM3, and a 20-byte hexadecimal string for HMAC-SHA1. Its encrypted form is a case-sensitive string of 1 to 85 characters.

Usage guidelines

This command applies only to manual IPsec policies and IPsec profiles.

You must set an authentication key for both the inbound and outbound SAs.

The local inbound SA must use the same authentication key as the remote outbound SA, and the local outbound SA must use the same authentication key as the remote inbound SA.

In an IPsec profile to be applied to an IPv6 routing protocol, the local authentication keys of the inbound and outbound SAs must be identical.

The keys for the IPsec SAs at the two tunnel ends must be input in the same format (either in hexadecimal or character format). Otherwise, they cannot establish an IPsec tunnel.

If you execute this command multiple times for the same protocol and direction, the most recent configuration takes effect.

Examples

Configure plaintext authentication keys **0x112233445566778899aabbccddeeff00** and **0xaabbccddeeff001100aabbccddeeff00** for the inbound and outbound SAs that use AH.

```
<Sysname> system-view
[Sysname] ipsec policy policy1 100 manual
[Sysname-ipsec-policy-manual-policy1-100] sa hex-key authentication inbound ah simple
11223344556778899aabbccddeeff00
[Sysname-ipsec-policy-manual-policy1-100] sa hex-key authentication outbound ah simple
aabbccddeeff001100aabbccddeeff00
```

sa hex-key encryption { **inbound** | **outbound** } **esp** { **cipher** | **simple** } *string*

undo sa hex-key encryption { **inbound** | **outbound** } **esp**

Default

No hexadecimal encryption key is configured for manual IPsec SAs.

Views

IPsec policy view

IPsec profile view

Predefined user roles

network-admin

context-admin

Parameters

inbound: Specifies a hexadecimal encryption key for the inbound SA.

outbound: Specifies a hexadecimal encryption key for the outbound SA.

esp: Uses ESP.

cipher: Specifies a key in encrypted form.

simple: Specifies a key in plaintext form. For security purposes, the key specified in plaintext form will be stored in encrypted form.

string: Specifies the key. Its encrypted form is a case-sensitive string of 1 to 117 characters. Its plaintext form is a case-insensitive hexadecimal string and the key length varies by algorithm.

The following matrix shows the key length for the algorithms:

Algorithm	Key length (bytes)
DES-CBC	8
3DES-CBC	24
AES128-CBC	16
AES192-CBC	24

Algorithm	Key length (bytes)
AES256-CBC	32
SM1128-CBC	16
SM4128-CBC	16

Usage guidelines

This command applies only to manual IPsec policies and IPsec profiles.

You must set an encryption key for both the inbound and outbound SAs.

The local inbound SA must use the same encryption key as the remote outbound SA, and the local outbound SA must use the same encryption key as the remote inbound SA.

In an IPsec profile to be applied to an IPv6 routing protocol, the local encryption keys of the inbound and outbound SAs must be identical.

The keys for the IPsec SAs at the two tunnel ends must be configured in the same format (either in hexadecimal or character format). Otherwise, they cannot establish an IPsec tunnel.

If you execute this command multiple times for the same direction, the most recent configuration takes effect.

Examples

Configure plaintext encryption keys **0x1234567890abcdef** and **0xabcdefabcdef1234** for the inbound and outbound IPsec SAs that use ESP.

```
<Sysname> system-view
[Sysname] ipsec policy policy1 100 manual
[Sysname-ipsec-policy-manual-policy1-100] sa hex-key encryption inbound esp simple
1234567890abcdef
[Sysname-ipsec-policy-manual-policy1-100] sa hex-key encryption outbound esp simple
abcdefabcdef1234
```

Related commands

sa idle-time

Use **sa idle-time** to set the IPsec SA idle timeout.

Use **undo sa idle-time** to restore the default.

Syntax

sa idle-time *seconds*

undo sa idle-time

Default

An IPsec policy, IPsec profile, or IPsec policy template uses the global IPsec SA idle timeout.

Views

IPsec policy view

IPsec policy template view

IPsec profile view

Predefined user roles

network-admin

context-admin

Parameters

seconds: Specifies the IPsec SA idle timeout in the range of 60 to 86400 seconds.

Usage guidelines

This feature applies only to IPsec SAs negotiated by IKE and takes effect after the **ipsec sa idle-time** command is configured.

The IPsec SA idle timer starts when an IPsec SA is created. If no traffic matches the IPsec SA within the idle timeout interval, the IPsec SA is deleted.

The IPsec SA idle timeout configured by this command takes precedence over the global IPsec SA timeout configured by the **ipsec sa idle-time** command. If the IPsec policy, IPsec profile, or IPsec policy template is not configured with the SA idle timeout, IKE uses the global SA idle timeout.

Examples

Set the IPsec SA idle timeout to 600 seconds for IPsec policy **map**.

```
<Sysname> system-view
[Sysname] ipsec policy map 100 isakmp
[Sysname-ipsec-policy-isakmp-map-100] sa idle-time 600
```

Related commands

display ipsec sa

ipsec sa idle-time

sa soft-duration buffer

Use **sa soft-duration buffer** to set the time-based or traffic-based IPsec SA soft lifetime buffer.

Use **undo sa soft-duration buffer** to restore the default.

Syntax

sa soft-duration buffer { **time-based** *seconds* | **traffic-based** *kilobytes* }

undo sa soft-duration buffer { **time-based** | **traffic-based** }

Default

The time-based and traffic-based IPsec SA soft lifetime buffers are not configured.

Views

IPsec policy view

IPsec profile view

Predefined user roles

network-admin

context-admin

Parameters

time-based *seconds*: Specifies the time-based IPsec SA soft lifetime buffer in seconds. The value range is 20 to 201600.

traffic-based *kilobytes*: Specifies the traffic-based IPsec SA soft lifetime buffer in Kilobytes. The value range is 1000 to 4294901760.

Usage guidelines

This command takes effect only when IKEv1 is used.

The IPsec SA soft lifetime buffers are used to determine the IPsec SA soft lifetimes.

If no IPsec SA soft lifetime buffers are configured, the system calculates a default time-based and a default traffic-based IPsec SA soft lifetime.

If IPsec SA soft lifetime buffers are configured, the system calculates IPsec SA soft lifetimes as follows:

- Time-based IPsec SA soft lifetime = time-based IPsec SA lifetime – time-based IPsec SA soft lifetime buffer.

  If the calculated time-based IPsec SA soft lifetime is shorter than or equal to 20 seconds, the system uses the default time-based IPsec SA soft lifetime.
- Traffic-based IPsec SA soft lifetime = traffic-based IPsec SA lifetime – traffic-based IPsec SA soft lifetime buffer.

  If the calculated traffic-based IPsec SA soft lifetime is smaller than or equal to 1000 Kilobytes, the system uses the default traffic-based IPsec SA soft lifetime.

Examples

Set the time-based IPsec SA soft lifetime buffer to 600 seconds in IPsec policy **example 1**.

```
<Sysname> system-view
[Sysname] ipsec policy example 1 isakmp
[Sysname-ipsec-policy-isakmp-example-1] sa soft-duration buffer time-based 600
```

Set the traffic-based IPsec SA soft lifetime buffer to 10000 Kilobytes in IPsec policy **example 1**.

```
<Sysname> system-view
[Sysname] ipsec policy example 1 isakmp
[Sysname-ipsec-policy-isakmp-example-1] sa soft-duration buffer traffic-based 10000
```

ipsec sa global-soft-duration buffer

sa spi

Use **sa spi** to configure an SPI for IPsec SAs.

Use **undo sa spi** to remove the SPI.

Syntax

sa spi { **inbound** | **outbound** } { **ah** | **esp** } *spi-number*

undo sa spi { **inbound** | **outbound** } { **ah** | **esp** }

Default

No SPI is configured for IPsec SAs.

Views

IPsec policy view

IPsec profile view

Predefined user roles

network-admin

context-admin

Parameters

inbound: Specifies an SPI for inbound SAs.

outbound: Specifies an SPI for outbound SAs.

ah: Uses AH.

esp: Uses ESP.

spi-number: Specifies a security parameters index (SPI) in the range of 256 to 4294967295.

Usage guidelines

This command applies only to manual IPsec policies and IPsec profiles.

You must configure an SPI for both inbound and outbound SAs, and make sure the SAs in each direction are unique: For an outbound SA, make sure its triplet (remote IP address, security protocol, and SPI) is unique. For an inbound SA, make sure its SPI is unique.

The local inbound SA must use the same SPI as the remote outbound SA, and the local outbound SA must use the same SPI as the remote inbound SA.

When you configure an IPsec profile for an IPv6 routing protocol, follow these guidelines:

- The local inbound and outbound SAs must use the same SPI.
- The IPsec SAs on the devices in the same scope must have the same SPI. The scope is defined by protocols. For OSPFv3, the scope consists of OSPFv3 neighbors or an OSPFv3 area. For RIPng, the scope consists of directly-connected neighbors or a RIPng process. For BGP4+, the scope consists of BGP4+ peers or a BGP4+ peer group.

Examples

Set the SPI for the inbound SA to 10000 and the SPI for the outbound SA to 20000 in a manual IPsec policy.

```
<Sysname> system-view
[Sysname] ipsec policy policy1 100 manual
[Sysname-ipsec-policy-manual-policy1-100] sa spi inbound ah 10000
[Sysname-ipsec-policy-manual-policy1-100] sa spi outbound ah 20000
```

Related commands

display ipsec sa

sa string-key

Use **sa string-key** to set a key string (a key in character format) for manual IPsec SAs.

Use **undo sa string-key** to remove the key string.

Syntax

sa string-key { **inbound** | **outbound** } { **ah** | **esp** } [**cipher** | **simple**] *string*

undo sa string-key { **inbound** | **outbound** } { **ah** | **esp** }

Default

No key string is configured for manual IPsec SAs.

Views

IPsec policy view

IPsec profile view

Predefined user roles

network-admin

context-admin

Parameters

inbound: Sets a key string for inbound IPsec SAs.

outbound: Sets a key string for outbound IPsec SAs.

ah: Uses AH.

esp: Uses ESP.

cipher: Specifies a key string in encrypted form.

simple: Specifies a key string in plaintext form. For security purposes, the key string specified in plaintext form will be stored in encrypted form.

string: Specifies the key string. Its encrypted form is a case-sensitive string of 1 to 373 characters. Its plaintext form is a case-sensitive string of 1 to 255 characters. Using the key string, the system automatically generates keys that meet the algorithm requirements. When the protocol is ESP, the system automatically generates keys for the authentication algorithm and encryption algorithm.

Usage guidelines

This command applies only to manual IPsec policies and IPsec profiles.

You must set a key for both inbound and outbound SAs.

The local inbound SA must use the same key as the remote outbound SA, and the local outbound SA must use the same key as the remote inbound SA.

The keys for the IPsec SAs at the two tunnel ends must be input in the same format (either in hexadecimal or character format). Otherwise, they cannot establish an IPsec tunnel.

When you configure an IPsec profile for an IPv6 routing protocol, follow these guidelines:

- The local inbound and outbound SAs must use the same key.
- The IPsec SAs on the devices in the same scope must have the same key. The scope is defined by protocols. For OSPFv3, the scope consists of OSPFv3 neighbors or an OSPFv3 area. For RIPng, the scope consists of directly-connected neighbors or a RIPng process. For BGP, the scope consists of BGP peers or a BGP peer group.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Configure the inbound and outbound SAs that use AH to use plaintext keys **abcdef** and **efcdab**, respectively.

```
<Sysname> system-view
[Sysname] ipsec policy policy1 100 manual
[Sysname-ipsec-policy-manual-policy1-100] sa string-key inbound ah simple abcdef
[Sysname-ipsec-policy-manual-policy1-100] sa string-key outbound ah simple efcdab
```

In an IPv6 IPsec policy, configure the inbound and outbound SAs that use AH to use plaintext key **abcdef**.

```
<Sysname> system-view
[Sysname] ipsec ipv6-policy policy1 100 manual
[Sysname-ipsec-ipv6-policy-manual-policy1-100] sa string-key inbound ah simple abcdef
[Sysname-ipsec-ipv6-policy-manual-policy1-100] sa string-key outbound ah simple abcdef
```

Related commands

display ipsec sa

sa hex-key

sa trigger-mode

Use **sa trigger-mode** to set the IPsec SA negotiation triggering mode.

Use **undo sa trigger-mode** to restore the default.

Syntax

sa trigger-mode { **auto** | **traffic-based** }

undo sa trigger-mode

Default

IPsec SA negotiation is triggered when traffic requires IPsec protection.

Views

IPsec policy view

Predefined user roles

network-admin

context-admin

Parameters

auto: Triggers IPsec SA negotiation when required IPsec configuration is complete.

traffic-based: Triggers IPsec SA negotiation when traffic requires IPsec protection.

Usage guidelines

You can specify the IPsec SA negotiation triggering mode only for IKE-based IPsec policies.

Compared to the auto mode, the traffic-based mode is more economical in terms of resource usage because it triggers IPsec SA negotiation only when traffic requires IPsec protection. However, the traffic-based mode leaves traffic unprotected before IPsec SAs are successfully established.

This command does not take effect if a smart link policy with smart link selection enabled is applied to the IPsec policy.

The IPsec SA negotiation triggering modes on the local and remote ends of an IPsec tunnel can be different.

Modifying the IPsec SA negotiation triggering mode does not affect existing IPsec SAs.

If the IPsec SA negotiation triggering mode is set to **auto**, change the mode to **traffic-based** as a best practice after IPsec SA establishment is complete.

If the ACL for an IPsec policy or IPsec policy template uses the aggregation or the per-host mode, the IPsec policy or IPsec policy template cannot trigger IPsec SA negotiation in auto mode.

Examples

Set the IPsec SA negotiation triggering mode to **auto** for IPsec policy **policy1**.

```
<Sysname> system-view
[Sysname] ipsec policy policy1 10 isakmp
[Sysname-ipsec-policy-isakmp-policy1-10] sa trigger-mode auto
```

security acl

Use **security acl** to specify an ACL for an IPsec policy or IPsec policy template.

Use **undo security acl** to restore the default.

Syntax

security acl [**ipv6**] { *acl-number* | **name** *acl-name* } [**aggregation** | **per-host**]

undo security acl

Default

An IPsec policy or IPsec policy template does not use any ACL.

Views

IPsec policy view

IPsec policy template view

Predefined user roles

network-admin

context-admin

Parameters

ipv6: Specifies an IPv6 ACL.

acl-number: Specifies an ACL by its number in the range of 3000 to 3999.

name *acl-name*: Specifies an ACL by its name, a case-insensitive string of 1 to 63 characters.

aggregation: Specifies the data protection mode as aggregation. The device does not support protecting IPv6 data flows in aggregation mode.

per-host: Specifies the data protection mode as per-host.

Usage guidelines

An IKE-based IPsec policy supports the following data flow protection modes:

- **Standard mode**—One IPsec tunnel protects one data flow. The data flow permitted by an ACL rule is protected by one IPsec tunnel that is established solely for it. The standard mode is used if you do not specify the aggregation or the per-host mode.
- **Aggregation mode**—One IPsec tunnel protects all data flows permitted by all the rules of an ACL. This mode is only used to communicate with old-version devices.
- **Per-host mode**—One IPsec tunnel protects one host-to-host data flow. One host-to-host data flow is identified by one ACL rule and protected by one IPsec tunnel established solely for it. This mode consumes more system resources when multiple data flows exist between two subnets to be protected.

A manual IPsec policy supports only the aggregation mode.

If the ACL for an IPsec policy or IPsec policy template uses the aggregation or the per-host mode, the IPsec policy or IPsec policy template cannot trigger IPsec SA negotiation in auto mode.

If the specified ACL does not exist or does not contain rules, the IPsec policy does not take effect.

If the **vpn-instance** keyword is specified in an ACL rule, the rule applies only to VPN packets. If the **vpn-instance** keyword is not specified in an ACL rule, the rule applies only to public network packets.

Examples

Specify IPv4 advanced ACL 3001 for IPsec policy **policy1**.

```
<Sysname> system-view
[Sysname] acl advanced 3001
```

```
[Sysname-acl-ipv4-adv-3001] rule permit tcp source 10.1.1.0 0.0.0.255 destination
10.1.2.0 0.0.0.255
[Sysname-acl-ipv4-adv-3001] quit
[Sysname] ipsec policy policy1 100 manual
[Sysname-ipsec-policy-manual-policy1-100] security acl 3001
```

Specify IPv4 advanced ACL 3002 for IPsec policy **policy2** and specify the data protection mode as aggregation.

```
<Sysname> system-view
[Sysname] acl advanced 3002
[Sysname-acl-ipv4-adv-3002] rule 0 permit ip source 10.1.2.1 0.0.0.255 destination
10.1.2.2 0.0.0.255
[Sysname-acl-ipv4-adv-3002] rule 1 permit ip source 10.1.3.1 0.0.0.255 destination
10.1.3.2 0.0.0.255
[Sysname-acl-ipv4-adv-3002] quit
[Sysname] ipsec policy policy2 1 isakmp
[Sysname-ipsec-policy-isakmp-policy2-1] security acl 3002 aggregation
```

Related commands

display ipsec sa

display ipsec tunnel

smart-link enable

Use **smart-link enable** to enable IPsec smart link selection.

Use **undo smart-link enable** to disable IPsec smart link selection.

Syntax

smart-link enable

undo smart-link enable

Default

IPsec smart link selection is disabled in an IPsec smart link policy.

Views

IPsec smart link policy view

Predefined user roles

network-admin

context-admin

Usage guidelines

The device performs link quality probing and cyclic link switchovers only when IPsec smart link selection is enabled in the IPsec smart link policy. After you disable IPsec smart link selection in the IPsec smart link policy, the IPsec tunnel created based on the policy still takes effect but no link switchover will occur.

Examples

Disable IPsec smart link selection in IPsec smart link policy **smlkpolicy1**.

```
<Sysname> system-view
[Sysname] ipsec smart-link policy smlkpolicy1
[Sysname-ipsec-smart-link-policy-smlkpolicy1] undo smart-link enable
```

Related commands

smart-link policy

smart-link policy

Use **smart-link policy** to apply an IPsec smart link policy to an IPsec policy.

Use **undo smart-link policy** to restore the default.

Syntax

smart-link policy *policy-name*

undo smart-link policy

Default

An IPsec smart link policy is not applied to an IPsec policy.

Views

IPsec policy view

Predefined user roles

network-admin

context-admin

Parameters

policy-name: Specifies an existing IPsec smart link policy by its name.

Usage guidelines

An IPsec smart link policy takes effect after it is applied to an IKE-based IPsec policy.

You can apply only one IPsec smart link policy to an IPsec policy.

After the device selects a link to establish the IPsec tunnel, it applies the IPsec policy that uses the IPsec smart link policy to the local interface of the link.

Examples

Apply IPsec smart link policy **smlkpolicy1** to IPsec policy **policy1**.

```
<Sysname> system-view
[Sysname] ipsec policy policy1 1 isakmp
[Sysname-ipsec-policy-isakmp-policy1-1] smart-link policy smlkpolicy1
```

Related commands

smart-link enable

snmp-agent trap enable ipsec

Use **snmp-agent trap enable ipsec** command to enable SNMP notifications for IPsec.

Use **undo snmp-agent trap enable ipsec** command to disable SNMP notifications for IPsec.

Syntax

snmp-agent trap enable ipsec [**auth-failure** | **connection-start** | **connection-stop** | **decrypt-failure** | **encrypt-failure** | **global** | **invalid-sa-failure** | **no-sa-failure** | **policy-add** | **policy-attach** | **policy-delete** | **policy-detach** | **tunnel-start** | **tunnel-stop**] *

undo snmp-agent trap enable ipsec [**auth-failure** | **connection-start** | **connection-stop** | **decrypt-failure** | **encrypt-failure** | **global** | **invalid-sa-failure** | **no-sa-failure** | **policy-add** | **policy-attach** | **policy-delete** | **policy-detach** | **tunnel-start** | **tunnel-stop**] *

Default

All SNMP notifications for IPsec are disabled.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

auth-failure: Specifies notifications about authentication failures.

connection-start: Specifies notifications about successful establishment of the first IPsec tunnel under IPsec policy entries with the same description.

connection-stop: Specifies notifications about successful removal of the last IPsec tunnel under IPsec policy entries with the same description.

decrypt-failure: Specifies notifications about decryption failures.

encrypt-failure: Specifies notifications about encryption failures.

global: Specifies notifications globally.

invalid-sa-failure: Specifies notifications about invalid-SA failures.

no-sa-failure: Specifies notifications about SA-not-found failures.

policy-add: Specifies notifications about events of adding IPsec policies.

policy-attach: Specifies notifications about events of applying IPsec policies to interfaces.

policy-delete: Specifies notifications about events of deleting IPsec policies.

policy-detach: Specifies notifications about events of removing IPsec policies from interfaces.

tunnel-start: Specifies notifications about events of creating IPsec tunnels.

tunnel-stop: Specifies notifications about events of deleting IPsec tunnels.

Usage guidelines

If you do not specify any keywords, this command enables or disables all SNMP notifications for IPsec.

To generate and output SNMP notifications for a specific IPsec failure type or event type, perform the following tasks:

1. Enable SNMP notifications for IPsec globally.
2. Enable SNMP notifications for the failure type or event type.

Examples

Enable SNMP notifications for IPsec globally.

```
<Sysname> system-view
[Sysname] snmp-agent trap enable ipsec global
```

Enable SNMP notifications for events of creating IPsec tunnels.

```
[Sysname] snmp-agent trap enable ipsec tunnel-start
```

tfc enable

Use **tfc enable** to enable Traffic Flow Confidentiality (TFC) padding.

Use **undo tfc enable** to disable TFC padding.

Syntax

tfc enable

undo tfc enable

Default

TFC padding is disabled.

Views

IPsec policy view

IPsec policy template view

Predefined user roles

network-admin

context-admin

Usage guidelines

TFC padding applies only to IPsec SAs negotiated by IKEv2.

TFC padding can hide the length of the original packet, and might affect the packet encapsulation and de-encapsulation performance. This feature takes effect on UDP packets encapsulated by ESP in transport mode and on original IP packets encapsulated by ESP in tunnel mode.

Examples

Enable TFC padding for IPsec policy **policy1**.

```
<Sysname> system-view
[Sysname] ipsec policy policy1 10 isakmp
[Sysname-ipsec-policy-isakmp-policy1-10] tfc enable
```

Related commands

display ipsec policy

transform-set

Use **transform-set** to specify an IPsec transform set for an IPsec policy, IPsec profile, or IPsec policy template.

Use **undo transform-set** to remove the IPsec transform set specified for an IPsec policy, IPsec profile, or IPsec policy template.

Syntax

transform-set *transform-set-name*&<1-6>

undo transform-set [*transform-set-name*]

Default

No IPsec transform set is specified for an IPsec policy, IPsec profile, or IPsec policy template.

Views

IPsec policy view

IPsec policy template view

IPsec profile view

Predefined user roles

network-admin

context-admin

Parameters

transform-set-name&<1-6>: Specifies a space-separated list of up to six IPsec transform sets. The specified transform set names must be different. A transform set name is a case-insensitive string of 1 to 63 characters.

Usage guidelines

You can specify only one IPsec transform set for a manual IPsec policy. If you execute this command multiple times, the most recent configuration takes effect.

You can specify a maximum of six IPsec transform sets for an IKE-based IPsec policy. During an IKE negotiation, IKE searches for a fully matched IPsec transform set at the two ends of the IPsec tunnel. If no match is found, no SA can be set up, and the packets expecting to be protected will be dropped.

If you do not specify the *transform-set-name* argument, the **undo transform-set** command removes all IPsec transform sets specified for the IPsec policy, IPsec profile, or IPsec policy template.

Examples

Specify IPsec transform set **prop1** for IPsec policy **policy1**.

```
<Sysname> system-view
[Sysname] ipsec transform-set prop1
[Sysname-ipsec-transform-set-prop1] quit
[Sysname] ipsec policy policy1 100 manual
[Sysname-ipsec-policy-manual-policy1-100] transform-set prop1
```

Related commands

ipsec { **ipv6-policy** | **policy** }

ipsec profile

ipsec transform-set

tunnel protection ipsec

Use **tunnel protection ipsec** to apply an IPsec profile to a tunnel interface.

Use **undo tunnel protection ipsec** to restore the default.

Syntax

tunnel protection ipsec profile *profile-name* [**acl** [**ipv6**] { *acl-number* | **name** *acl-name* }]

undo tunnel protection ipsec profile

Default

No IPsec profile is applied to a tunnel interface.

Views

Tunnel interface view

Predefined user roles

network-admin

context-admin

Parameters

profile *profile-name*: Specify an IPsec profile by its name, a case-insensitive string of 1 to 63 characters. The specified IPsec profile must be an IKE-based IPsec profile.

ipv6: Specifies an IPv6 ACL. To specify an IPv4 ACL, do not specify this keyword.

acl-number: Specifies an ACL by its number in the range of 3000 to 3999.

name *acl-name*: Specifies an ACL by its name, a case-insensitive string of 1 to 63 characters.

Usage guidelines

After an IPsec profile is applied to a tunnel interface, the peers negotiate an IPsec tunnel through IKE to protect data transmitted through the tunnel interface.

If you specify an ACL when applying an IPsec profile to a tunnel interface, only the ACL-permitted data on the tunnel interface can be protected by IPsec. To protect the traffic of a VPN instance on the tunnel interface, do not specify the VPN instance in the ACL. If you do so, the IPsec profile cannot initiate IPsec negotiation. Instead, you should bind the VPN instance to the tunnel interface. Therefore, the VPN instance of the IPsec SAs negotiated by using the IPsec profile is the VPN instance bound to the tunnel interface.

Specify an IPv4 ACL if the IPsec profile is applied to an IPv4 tunnel interface.

Specify an IPv6 ACL if the IPsec profile is applied to an IPv6 tunnel interface.

Examples

Apply IPsec profile **prf1** to tunnel interface Tunnel 1.

```
<Sysname> system-view
[Sysname] interface tunnel 1 mode advpn gre
[Sysname-Tunnel1] tunnel protection ipsec profile prf1
```

Apply IPsec profile **prf1** to IPv4 tunnel interface Tunnel 1 and use IPv4 ACL 3000 to filter the data to be protected by IPsec on the tunnel interface.

```
<Sysname> system-view
[Sysname] acl advanced 3000
[Sysname-acl-ipv4-adv-3000] rule 0 permit ip source 1.0.0.0 0.0.0.255 destination 2.0.0.0
0.0.0.255
[Sysname-acl-ipv4-adv-3000] quit
[Sysname] interface tunnel 1 mode ipsec
[Sysname-Tunnel1] tunnel protection ipsec profile prf1 acl 3000
```

Apply IPsec profile **prf1** to IPv6 tunnel interface Tunnel 1 and use IPv6 ACL 3000 to filter the data to be protected by IPsec on the tunnel interface.

```
<Sysname> system-view
[Sysname] acl ipv6 advanced 3000
[Sysname-acl-ipv6-adv-3000] rule 0 permit ipv6 source 1:1::/64 destination 2:2::/64
[Sysname-acl-ipv6-adv-3000] quit
[Sysname] interface tunnel 1 mode ipsec ipv6
[Sysname-Tunnel1] tunnel protection ipsec profile prf1 acl ipv6 3000
```

IKE commands

aaa authorization

Use **aaa authorization** to enable IKE AAA authorization.

Use **undo aaa authorization** to disable IKE AAA authorization.

Syntax

aaa authorization domain *domain-name* **username** *user-name*

undo aaa authorization

Default

IKE AAA authorization is disabled.

Views

IKE profile view

Predefined user roles

network-admin

context-admin

Parameters

domain *domain-name*: Specifies the ISP domain used for requesting authorization attributes. The ISP domain name is a case-insensitive string of 1 to 255 characters and must meet the following requirements:

- The name cannot contain a forward slash (/), backslash (\), vertical bar (|), quotation mark ("), colon (:), asterisk (*), question mark (?), left angle bracket (<), right angle bracket (>), or an at sign (@).
- The name cannot be **d**, **de**, **def**, **defa**, **defau**, **defaul**, **default**, **i**, **if**, **if-**, **if-u**, **if-un**, **if-unk**, **if-unkn**, **if-unkno**, **if-unknow**, or **if-unknown**.

username *user-name*: Specifies the username used for requesting authorization attributes. The username is a case-sensitive string of 1 to 55 characters and must meet the following requirements:

- The username cannot contain the domain name.
- The username cannot contain a forward slash (/), backslash (\), vertical bar (|), colon (:), asterisk (*), question mark (?), left angle bracket (<), right angle bracket (>), or an at sign (@).
- The username cannot be **a**, **al**, or **all**.

Usage guidelines

The AAA authorization feature enables IKE to request authorization attributes, such as the IKE address pool, from AAA.

IKE uses the ISP domain and username to request authorization attributes. AAA uses the authorization settings in the ISP domain to request the user's authorization attributes from the remote AAA server or the local user database. After IKE passes the username authentication, it obtains the authorization attributes.

This feature is applicable when AAA is used to centrally manage and deploy authorization attributes.

Examples

Create IKE profile **profile1**.

```
<Sysname> system-view
```

```
[Sysname] ike profile profile1
```

Enable AAA authorization. Specify ISP domain **abc** and username **test**.

```
[Sysname-ike-profile-profile1] aaa authorization domain abc username test
```

app-dev-info

Use **app-dev-info** to specify a GD-quantum access ID.

Use **undo app-dev-info** to restore the default.

Syntax

app-dev-info *app-dev-info*

undo app-dev-info

The following compatibility matrixes show the support of hardware platforms for this command:

Models	Command compatibility
NFNX5-HD6480	Yes
NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB1780, NFNX3-HDB3080, NFNX3-HDB1180, NFNX3-HDB1480, NFNX3-HDB680, NFNX3-HDB1080	No

Default

No GD-quantum access ID is specified.

Views

IKE GD-quantum view

Predefined user roles

network-admin

context-admin

Parameters

app-dev-info: Specifies a GD-quantum access ID, a nine-digit string.

Usage guidelines

The GD-quantum access IDs are uniformly distributed by the GD-quantum server, unique one for each device. You can use a GD-quantum access ID and a GD-quantum authentication key to log in to the GD-quantum server.

To obtain a GD-quantum access ID, contact the administrator of the GD-quantum server.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Configure the GD-quantum access ID **185110851**.

```
<Sysname> system-view
[Sysname] ike gd-quantum
[Sysname-ike-gdquantum] app-dev-info 185110851
```

authentication-algorithm

Use **authentication-algorithm** to specify an authentication algorithm for an IKE proposal.

Use **undo authentication-algorithm** to restore the default.

Syntax

authentication-algorithm { **md5** | **sha** | **sha256** | **sha384** | **sha512** | **sm3** }

undo authentication-algorithm

Default

The IKE proposal uses the HMAC-SHA1 authentication algorithm.

Views

IKE proposal view

Predefined user roles

network-admin

context-admin

Parameters

md5: Specifies the HMAC-MD5 algorithm.

sha: Specifies the HMAC-SHA1 algorithm.

sha256: Specifies the HMAC-SHA256 algorithm.

sha384: Specifies the HMAC-SHA384 algorithm.

sha512: Specifies the HMAC-SHA512 algorithm.

sm3: Specifies the HMAC-SM3 algorithm.

Examples

Specify HMAC-SHA1 as the authentication algorithm for IKE proposal 1.

```
<Sysname> system-view
[Sysname] ike proposal 1
[Sysname-ike-proposal-1] authentication-algorithm sha
```

Related commands

authentication-method

Use **authentication-method** to specify an authentication method to be used in an IKE proposal.

Use **undo authentication-method** to restore the default.

Syntax

authentication-method { **dsa-signature** | **pre-share** | **rsa-de** | **rsa-signature** | **sm2-de** }

undo authentication-method

Default

The preshared key authentication method is used.

Views

IKE proposal view

Predefined user roles

network-admin

context-admin

Parameters

dsa-signature: Specifies the DSA signature authentication method.

pre-share: Specifies the preshared key authentication method.

rsa-de: Specifies the RSA digital envelope authentication method.

rsa-signature: Specifies the RSA signature authentication method.

sm2-de: Specifies the SM2 digital envelope authentication method.

Usage guidelines

Preshared key authentication does not require certificates as signature authentication does, and it is usually used on a simple network.

Signature authentication provides higher security, and it is usually deployed on a large-scale network, such as a network with many branches.

On a network with many branches, using preshared key authentication requires the headquarters to configure a preshared key for each branch. Using signature authentication only requires the headquarters to configure one PKI domain.

The digital envelope authentication method is supported only in IKEv1 and must be used if the device is subject to China OSCCA regulations.

Authentication methods configured on both IKE ends must match.

If you specify the RSA or DSA signature authentication method, you must configure the IKE peer to obtain certificates from a CA.

If you specify the preshared key authentication method, you must configure the same preshared key on both IKE ends.

Examples

Specify the preshared key authentication method for IKE proposal 1.

```
<Sysname> system-view
[Sysname] ike proposal 1
[Sysname-ike-proposal-1] authentication-method pre-share
```

Related commands

display ike proposal

pre-shared-key

auth-key

Use **auth-key** to configure a GD-quantum authentication key.

Use **undo auth-key** to restore the default.

Syntax

auth-key { **cipher** | **simple** } *key-value*

undo auth-key

The following compatibility matrixes show the support of hardware platforms for this command:

Models	Command compatibility
NFNX5-HD6480	Yes
NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB1780, NFNX3-HDB3080, NFNX3-HDB1180, NFNX3-HDB1480, NFNX3-HDB680, NFNX3-HDB1080	No

Default

No GD-quantum authentication key is configured.

Views

IKE GD-quantum view

Predefined user roles

network-admin

context-admin

Parameters

cipher: Specifies a GD-quantum authentication key in encrypted form.

simple: Specifies a GD-quantum authentication key in plaintext form. For security purposes, the key specified in plaintext form will be stored in encrypted form.

key-value: Specifies the GD-quantum authentication key. The key is case sensitive. Its plaintext form is a 64-bit hexadecimal number, and its encrypted form is a 117-bit hexadecimal number.

Usage guidelines

The GD-quantum authentication keys are used by the GD-quantum server for identity authentication. Each GD-quantum authentication key corresponds to one GD-quantum access ID (specified by using the **app-dev-info** command). Only devices with correct GD-quantum access IDs and GD-quantum authentication keys can successfully log in to the GD-quantum server when sending login requests to the server.

To obtain a GD-quantum authentication key, contact the administrator of the GD-quantum server.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Configure the GD-quantum authentication key **0x66c7f0f462eeedd9d1f2d46bdc10e4e24167c4875cf2f7a2297da02b8f4ba8e0** for logging in to the GD-quantum server.

```
<Sysname> system-view
[Sysname] ike gd-quantum
[Sysname-ike-gdquantum] auth-key simple
66c7f0f462eeedd9d1f2d46bdc10e4e24167c4875cf2f7a2297da02b8f4ba8e0
```

certificate domain

Use **certificate domain** to specify a PKI domain for signature authentication.

Use **undo certificate domain** to remove a PKI domain for signature authentication.

Syntax

certificate domain *domain-name*

undo certificate domain *domain-name*

Default

No PKI domains are specified for signature authentication.

Views

IKE profile view

Predefined user roles

network-admin

context-admin

Parameters

domain-name: Specifies the name of a PKI domain, a case-insensitive string of 1 to 31 characters.

Usage guidelines

You can specify a maximum of six PKI domains for an IKE profile by executing this command multiple times.

IKE uses the specified PKI domains for enrollment, authentication, certificate issuing, validation, and signature. If you do not specify any PKI domains, IKE uses all PKI domains configured on the device.

Follow these restrictions and guidelines for the device to obtain the CA certificate during IKE negotiation:

- On the initiator:
  - If the IKE profile has a PKI domain and the automatic certificate request mode is configured for the PKI domain, the initiator automatically obtains the CA certificate.
  - If the IKE profile has no PKI domain, you must manually obtain the CA certificate.
- On the responder:
  - If main mode is used in IKE phase 1, the responder does not automatically obtain the CA certificate. You must manually obtain the CA certificate.
  - If aggressive mode is used in IKE phase 1, the responder automatically obtains the CA certificate if the following conditions are met:
    - A matching IKE profile is found.
    - An PKI domain is specified in the IKE profile.
    - The automatic certificate request mode is configured for the PKI domain.

    If the conditions are not met, you must manually obtain the CA certificate.

IKE first automatically obtains the CA certificate, and then requests a local certificate. If the CA certificate already exists locally, IKE automatically requests a local certificate.

Examples

Specify PKI domain **abc** for IKE profile 1.

```
<Sysname> system-view
[Sysname] ike profile 1
[Sysname-ike-profile-1] certificate domain abc
```

Related commands

authentication-method

pki domain

client-authentication

Use **client-authentication** to enable client authentication.

Use **undo client-authentication** to disable client authentication.

Syntax

client-authentication xauth

undo client-authentication xauth

Default

Client authentication is disabled.

Views

IKE profile view

Predefined user roles

network-admin

context-admin

Parameters

xauth: Uses Extended Authentication within ISAKMP/Oakley (XAUTH) for authentication.

Usage guidelines

Client authentication enables an IPsec gateway to authenticate remote users through a RADIUS server in IKE negotiation. Remote users who provide the correct username and password pass the authentication and continue with the IKE negotiation. This feature simplifies the configuration on the IPsec gateway and ensures the validity of the remote users. If you do not use this feature, you must configure an IPsec policy and an authentication password for each remote user.

Examples

Enable XAUTH client authentication.

```
<Sysname> system-view
[Sysname] ike profile test
[Sysname-ike-profile-test] client-authentication xauth
```

Related commands

local-user

client-authentication xauth user

Use **client-authentication xauth user** to specify the username and password for client authentication.

Use **undo client-authentication xauth user** to restore the default.

Syntax

client-authentication xauth user *username* **password** { **cipher** | **simple** } string

undo client-authentication xauth user

Default

The username and password for client authentication are not specified.

Views

IKE profile view

Predefined user roles

network-admin

context-admin

Parameters

username: Specifies the username for client authentication. The username is a case-sensitive string of 1 to 55 characters and must meet the following requirements:

- The username cannot contain a forward slash (/), backslash (\), vertical bar (|), colon (:), asterisk (*), question mark (?), left angle bracket (<), right angle bracket (>), or an at sign (@).
- The username cannot be **a**, **al**, or **all**.

password: Specifies the password for client authentication.

cipher: Specifies a password in encrypted form.

simple: Specifies a password in plaintext form. For security purposes, the password specified in plaintext form will be stored in encrypted form.

string: Specifies the password string. Its plaintext form is a case-sensitive string of 1 to 63 characters. Its encrypted form is a case-sensitive string of 1 to 110 characters.

Usage guidelines

Configure this command in the IKE profile used by a branch gateway. The branch gateway can then use the username and password to pass AAA authentication and establish an IPsec tunnel with the IPsec gateway at the enterprise center.

Examples

Specify username **abc** and password **123456TESTplat&!** for client authentication.

```
<Sysname> system-view
[Sysname] ike profile test
[Sysname-ike-profile-test] client-authentication xauth user abc password simple
123456TESTplat&!
```

decrypt-quantum-key

Use **decrypt-quantum-key** to configure a GD-quantum decryption key.

Use **undo decrypt-quantum-key** to restore the default.

Syntax

decrypt-quantum-key { **cipher** | **simple** } *key-value*

undo decrypt-quantum-key

The following compatibility matrixes show the support of hardware platforms for this command:

Models	Command compatibility
NFNX5-HD6480	Yes
NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB1780, NFNX3-HDB3080, NFNX3-HDB1180, NFNX3-HDB1480, NFNX3-HDB680, NFNX3-HDB1080	No

Default

No GD-quantum decryption key is configured.

Views

IKE GD-quantum view

Predefined user roles

network-admin

context-admin

Parameters

cipher: Specifies a GD-quantum decryption key in encrypted form.

simple: Specifies a GD-quantum decryption key in plaintext form. For security purposes, the key specified in plaintext form will be stored in encrypted form.

key-value: Specifies the GD-quantum decryption key. The key is case sensitive. Its plaintext form is a 64-bit hexadecimal number, and its encrypted form is a 117-bit hexadecimal number.

Usage guidelines

A device can request encrypted GD-quantum keys from the GD-quantum server after successfully logging in to the server. Use this command to configure GD-quantum decryption keys for decryption so as to be used in IPsec.

To obtain a GD-quantum decryption key, contact the administrator of the GD-quantum server.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Configure the GD-quantum decryption key **0x66c7f0f462eeedd9d1f2d46bdc10e4e24167c4875cf2f7a2297da02b8f4ba8e0**.

```
<Sysname> system-view
[Sysname] ike gd-quantum
[Sysname-ike-gdquantum] decrypt-quantum-key simple
66c7f0f462eeedd9d1f2d46bdc10e4e24167c4875cf2f7a2297da02b8f4ba8e0
```

description

Use **description** to configure a description for an IKE proposal.

Use **undo description** to restore the default.

Syntax

description *text*

undo description

Default

An IKE proposal does not have a description.

Views

IKE proposal view

Predefined user roles

network-admin

context-admin

Parameters

text: Specifies the description, a case-sensitive string of 1 to 80 characters.

Usage guidelines

When multiple IKE proposals exist, you configure different descriptions for them to distinguish them.

Examples

Configure a description of **test** for IKE proposal 1.

```
<Sysname> system-view
[Sysname] ike proposal 1
[Sysname-ike-proposal-1] description test
```

dh

Use **dh** to specify the DH group to be used for key negotiation in IKE phase 1.

Use **undo dh** to restore the default.

Syntax

dh { **group1** | **group14** | **group2** | **group24** | **group5** }

undo dh

Default

The 768-bit Diffie-Hellman group (**group1**) is used.

Views

IKE proposal view

Predefined user roles

network-admin

context-admin

Parameters

group1: Uses the 768-bit Diffie-Hellman group.

group14: Uses the 2048-bit Diffie-Hellman group.

group2: Uses the 1024-bit Diffie-Hellman group.

group24: Uses the 2048-bit Diffie-Hellman group with the 256-bit prime order subgroup.

group5: Uses the 1536-bit Diffie-Hellman group.

Usage guidelines

A DH group with a higher group number provides higher security but needs more time for processing. To achieve the best trade-off between processing performance and security, choose a proper Diffie-Hellman group for your network.

Examples

Specify the 2048-bit Diffie-Hellman group **group1** to be used for key negotiation in IKE phase 1 in IKE proposal 1.

```
<Sysname> system-view
[Sysname] ike proposal 1
[Sysname-ike-proposal-1] dh group14
```

Usage guidelines

This command displays the configuration information about all IKE proposals in descending order of proposal priorities. If no IKE proposal is configured, this command displays the default IKE proposal.

Examples

Display the configuration information about all IKE proposals.

```
<Sysname> display ike proposal
 Priority Authentication Authentication Encryption  Diffie-Hellman Duration
              method       algorithm    algorithm       group      (seconds)
------------------------------------------------------------------------------
 1        RSA-SIG            SHA1        DES-CBC     Group 1        5000
 11       PRE-SHARED-KEY     SHA1        DES-CBC     Group 1        50000
 default  PRE-SHARED-KEY     SHA1       DES-CBC     Group 1        86400
```

Table 12 Command output

Field	Description
Priority	Priority of the IKE proposal
Authentication method	Authentication method used by the IKE proposal.
Authentication algorithm	Authentication algorithm used in the IKE proposal: • **MD5**—HMAC-MD5 algorithm. • **SHA1**—HMAC-SHA1 algorithm. • **SHA256**—HMAC-SHA256 algorithm. • **SHA384**—HMAC-SHA384 algorithm. • **SHA512**—HMAC-SHA512 algorithm. • **SM3**—HMAC-SM3 algorithm.
Encryption algorithm	Encryption algorithm used by the IKE proposal: • **3DES-CBC**—168-bit 3DES algorithm in CBC mode. • **AES-CBC-128**—128-bit AES algorithm in CBC mode. • **AES-CBC-192**—192-bit AES algorithm in CBC mode. • **AES-CBC-256**—256-bit AES algorithm in CBC mode. • **DES-CBC**—56-bit DES algorithm in CBC mode. • **SM1-CBC-128**—128-bit SM1 algorithm in CBC mode. • **SM4-CBC**—128-bit SM4 algorithm in CBC mode.
Diffie-Hellman group	DH group used in IKE negotiation phase 1.
Duration (seconds)	IKE SA lifetime (in seconds) of the IKE proposal

display ike sa

Use **display ike sa** to display information about IKE SAs.

Syntax

display ike sa [**verbose** [**connection-id** *connection-id* | **remote-address** [**ipv6**] *remote-address* [**vpn-instance** *vpn-instance-name*]]]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

verbose: Displays detailed information.

connection-id *connection-id*: Displays detailed information about IKE SAs by connection ID in the range of 1 to 2000000000.

remote-address: Displays detailed information about IKE SAs with the specified remote address.

ipv6: Specifies an IPv6 address.

remote-address: Remote IP address.

vpn-instance *vpn-instance-name*: Displays detailed information about IKE SAs in an MPLS L3VPN instance. The *vpn-instance-name* argument represents the VPN instance name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command displays detailed information about IKE SAs for the public network.

Usage guidelines

If you do not specify any parameters, this command displays summary information about all IKE SAs.

Examples

Display summary information about all IKE SAs.

```
<Sysname> display ike sa
    Connection-ID  Remote          Flag        DOI
  -------------------------------------------------------------
      1            202.38.0.2/500  RD          IPsec
Flags:
RD--READY RL--REPLACED FD-FADING RK-REKEY
```

Table 13 Command output

Field	Description
Connection-ID	Identifier of the IKE SA.

Field	Description
Remote	Remote IP address and port number of the SA.
Flags	Status of the SA: • **RD--READY**—The SA has been established. • **RL--REPLACED**—The SA has been replaced by a new one and will be deleted later. • **FD-FADING**—The SA is in use, but it is about to expire and will be deleted soon. • **RK-REKEY**—The SA is a Rekey SA. • **Unknown**—The SA status is unknown.
DOI	Interpretation domain to which the SA belongs. **IPsec**—The SA belongs to an IPsec DOI.

Display detailed information about all IKE SAs.

```
<Sysname> display ike sa verbose

```

Table 14 Command output

Field	Description
Connection ID	Identifier of the IKE SA.
Outside VPN	VPN instance name of the MPLS L3VPN to which the receiving interface belongs.
Inside VPN	VPN instance name of the MPLS L3VPN to which the protected data belongs.
Profile	Name of the matching IKE profile found in the IKE SA negotiation. If no matching profile is found, this field displays nothing.
Transmitting entity	Role of the IKE negotiation entity: **Initiator** or **Responder**.
Initiator cookie	IKE SA initiator cookie.
Responder cookie	IKE SA responder cookie.
Local IP/port	IP address and port number of the local gateway.

Field	Description
Local ID type	Identifier type of the local gateway.
Local ID	Identifier of the local gateway.
Remote IP/port	IP address and port number of the remote gateway.
Remote ID type	Identifier type of the remote gateway.
Remote ID	Identifier of the remote security gateway.
Authentication-method	Authentication method used by the IKE proposal: • **DSA-SIG**—DSA signature. • **PRE-SHARED-KEY**—Preshared key. • **RSA-DE**—RSA digital envelop. • **RSA-SIG**—RSA signature. • **SM2-DE**—SM2 digital envelop.
Authentication-algorithm	Authentication algorithm used by the IKE proposal: • **MD5**—HMAC-MD5 algorithm. • **SHA1**—HMAC-SHA1 algorithm. • **SHA256**—HMAC-SHA256 algorithm. • **SHA384**—HMAC-SHA384 algorithm. • **SHA512**—HMAC-SHA512 algorithm. • **SM3**—HMAC-SM3 algorithm.
Encryption-algorithm	Encryption algorithm used by the IKE proposal: • **3DES-CBC**—168-bit 3DES algorithm in CBC mode. • **AES-CBC-128**—128-bit AES algorithm in CBC mode. • **AES-CBC-192**—192-bit AES algorithm in CBC mode. • **AES-CBC-256**—256-bit AES algorithm in CBC mode. • **DES-CBC**—56-bit DES algorithm in CBC mode. • **SM1-CBC-128**—128-bit SM1 algorithm in CBC mode. • **SM4-CBC**—128-bit SM4 algorithm in CBC mode.
Life duration(sec)	Lifetime of the IKE SA in seconds.
Remaining key duration(sec)	Remaining lifetime of the IKE SA in seconds.
Exchange-mode	IKE negotiation mode in phase 1: **Main**, **GM-main**, or **Aggressive**.
Diffie-Hellman group	DH group used for key negotiation in IKE phase 1. This field is not displayed if the IKE negotiation mode in phase 1 is GM main.
NAT traversal	Whether a NAT gateway is detected.
Extend authentication	Whether extended authentication for clients is enabled.
Assigned IP address	IP address assigned to the remote peer. This field is not displayed if no IP address is assigned.
Vendor ID index	Vendor ID index used when the IKE negotiation was triggered.
Vendor ID sequence number	Vendor ID sequence number used when the IKE negotiation was triggered.

reset ike statistics

dpd

Use **dpd** to configure IKE DPD.

Use **undo dpd** to disable IKE DPD.

Syntax

dpd interval *interval* [**retry** *seconds*] { **on-demand** | **periodic** }

undo dpd interval

Default

IKE DPD is disabled.

Views

IKE profile view

Predefined user roles

network-admin

context-admin

Parameters

interval *interval*: Specifies a DPD triggering interval in the range of 1 to 300 seconds.

retry *seconds*: Specifies the DPD retry interval in the range of 1 to 60 seconds. The default is 5 seconds.

on-demand: Triggers DPD on demand. The device triggers DPD if it has IPsec traffic to send and has not received any IPsec packets from the peer for the specified interval.

periodic: Triggers DPD at regular intervals. The device triggers DPD at the specified interval.

Usage guidelines

DPD is triggered periodically or on-demand. As a best practice, use the on-demand mode when the device communicates with a large number of IKE peers. For an earlier detection of dead peers, use the periodic triggering mode, which consumes more bandwidth and CPU.

When DPD settings are configured in both IKE profile view and system view, the DPD settings in IKE profile view apply. If DPD is not configured in IKE profile view, the DPD settings in system view apply.

It is a good practice to set the triggering interval longer than the retry interval so that a DPD detection does not occur during a DPD retry.

Examples

Configure DPD to be triggered every 10 seconds and every 5 seconds between retries if the peer does not respond.

```
<Sysname> system-view
[Sysname] ike profile 1
[Sysname-ike-profile-1] dpd interval 10 retry 5 on-demand
```

Related commands

ike dpd

encryption-algorithm

Use **encryption-algorithm** to specify an encryption algorithm for an IKE proposal.

Use **undo encryption-algorithm** to restore the default.

Syntax

encryption-algorithm { **3des-cbc** | **aes-cbc-128** | **aes-cbc-192** | **aes-cbc-256** | **des-cbc** | **sm1-cbc-128** | **sm4-cbc** }

undo encryption-algorithm

Default

An IKE proposal uses the 56-bit DES encryption algorithm in CBC mode.

Views

IKE proposal view

Predefined user roles

network-admin

context-admin

Parameters

3des-cbc: Specifies the 3DES algorithm in CBC mode. The 3DES algorithm uses a 168-bit key for encryption.

aes-cbc-128: Specifies the AES algorithm in CBC mode. The AES algorithm uses a 128-bit key for encryption.

aes-cbc-192: Specifies the AES algorithm in CBC mode. The AES algorithm uses a 192-bit key for encryption.

aes-cbc-256: Specifies the AES algorithm in CBC mode. The AES algorithm uses a 256-bit key for encryption.

des-cbc: Specifies the DES algorithm in CBC mode. The DES algorithm uses a 56-bit key for encryption.

sm1-cbc-128: Specifies the SM1 algorithm in CBC mode. The SM1 algorithm uses a 128-bit key for encryption.

sm4-cbc: Uses the SM4 algorithm in CBC mode as the encryption algorithm. The SM4 algorithm uses a 128-bit key.

Examples

Use the 128-bit AES algorithm in CBC mode as the encryption algorithm for IKE proposal 1.

```
<Sysname> system-view
[Sysname] ike proposal 1
[Sysname-ike-proposal-1] encryption-algorithm aes-cbc-128
```

Related commands

display ike proposal

exchange-mode

Use **exchange-mode** to select an IKE negotiation mode for phase 1.

Use **undo exchange-mode** to restore the default.

Syntax

exchange-mode { **aggressive** | **gm-main** | **main** }

undo exchange-mode

Default

Main mode is used for phase 1.

Views

IKE profile view

Predefined user roles

network-admin

context-admin

Parameters

aggressive: Specifies the aggressive mode.

gm-main: Specifies the GM main mode.

main: Specifies the main mode.

Usage guidelines

As a best practice, specify the **aggressive** mode at the local end if the following conditions are met:

- The local end, for example, a dialup user, obtains an IP address automatically.
- Preshared key authentication is used.

If you specify the GM main mode for phase 1 IKE negotiation, make sure the authentication method is RSA-DE or SM2-DE digital envelope authentication.

Examples

Specify that IKE negotiation operates in GM main mode.

```
<Sysname> system-view
[Sysname] ike profile 1
[Sysname-ike-profile-1] exchange-mode gm-main
```

Specify that IKE negotiation operates in main mode.

```
<Sysname> system-view
[Sysname] ike profile 1
[Sysname-ike-profile-1] exchange-mode main
```

Related commands

display ike proposal

ike address-group

Use **ike address-group** to configure an IKE IPv4 address pool for assigning IPv4 addresses to remote peers.

Use **undo ike address-group** to delete an IKE IPv4 address pool.

Syntax

ike address-group *group-name start-ipv4-address end-ipv4-address* [*mask* | *mask-length*]

undo ike address-group *group-name*

Default

No IKE IPv4 address pools exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

group-name: Specifies a name for the IKE IPv4 address pool, a case-insensitive string of 1 to 63 characters.

start-ipv4-address end-ipv4-address: Specifies an IPv4 address range. The *start-ipv4-address* argument specifies the start IPv4 address. The *end-ipv4-address* argument specifies the end IPv4 address.

mask: Specifies the IPv4 address mask.

mask-length: Specifies the length of the IPv4 address mask.

Usage guidelines

An IKE IPv4 address pool can contain a maximum of 8192 IPv4 addresses.

To modify or delete an address pool, you must delete all IKE SAs and IPsec SAs. Otherwise, the assigned IPv4 addresses might not be reclaimed.

Examples

Configure an IKE IPv4 address pool with name **ipv4group**, address range 1.1.1.1 to 1.1.1.2, and mask 255.255.255.0.

```
<Sysname> system-view
[Sysname] ike address-group ipv4group 1.1.1.1 1.1.1.2 255.255.255.0
```

Configure an IKE IPv4 address pool with name **ipv4group**, address range 1.1.1.1 to 1.1.1.2, and mask length 32.

```
<Sysname> system-view
[Sysname] ike address-group ipv4group 1.1.1.1 1.1.1.2 32
```

Related commands

aaa authorization

ike compatible-gm-main enable

Use **ike compatible-gm-main enable** to enable GM main mode compatibility.

Use **undo ike compatible-gm-main enable** to restore the default.

Syntax

ike compatible-gm-main enable

undo ike compatible-gm-main enable

Default

The GM main mode compatibility is disabled.

Views

System view

Predefined user roles

network-admin

context-admin

Usage guidelines

IKE peers running different software versions might have the GM main mode compatibility issue (signature verification failure) during IKE negotiation. If the device encounters this issue with its peer, you can execute this command on the device.

Do not execute this command on the device if the device does not have the GM main mode compatibility issue with its peers.

Examples

Enable GM main mode compatibility.

```
<Sysname> system-view
[Sysname] ike compatible-gm-main enable
```

ike compatible-sm4 enable

Use **ike compatible-sm4 enable** to enable SM4-CBC key length compatibility.

Use **undo ike compatible-sm4 enable** to restore the default.

Syntax

ike compatible-sm4 enable

undo ike compatible-sm4 enable

Default

SM4-CBC key length compatibility is disabled.

Views

System view

Predefined user roles

network-admin

context-admin

Usage guidelines

By default, IKE negotiation between two peers using the SM4-CBC encryption algorithm will fail if the peers use different SM4-CBC key lengths. You can enable SM4-CBC key length compatibility so the local IKE peer can successfully negotiate with a remote peer that uses a different SM4-CBC key length.

Examples

Enable SM4-CBC key length compatibility.

```
<Sysname> system-view
[Sysname] ike compatible-sm4 enable
```

ike dpd

Use **ike dpd** to configure global IKE DPD.

Use **undo ike dpd** to disable global IKE DPD.

Syntax

ike dpd interval *interval* [**retry** *seconds*] { **on-demand** | **periodic** }

undo ike dpd interval

Default

Global IKE DPD is disabled.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

interval *interval*: Specifies a DPD triggering interval in the range of 1 to 300 seconds.

retry *seconds*: Specifies the DPD retry interval in the range of 1 to 60 seconds. The default is 5 seconds.

on-demand: Triggers DPD on demand. The device triggers DPD if it has IPsec traffic to send and has not received any IPsec packets from the peer for the specified interval.

periodic: Triggers DPD at regular intervals. The device triggers DPD at the specified interval.

Usage guidelines

DPD is triggered periodically or on-demand. As a best practice, use the on-demand mode when the device communicates with a large number of IKE peers. For an earlier detection of dead peers, use the periodical triggering mode, which consumes more bandwidth and CPU.

When DPD settings are configured in both IKE profile view and system view, the DPD settings in IKE profile view apply. If DPD is not configured in IKE profile view, the DPD settings in system view apply.

It is a good practice to set the triggering interval longer than the retry interval so that a DPD detection does not occur during a DPD retry.

Examples

Configure DPD to be triggered every 10 seconds and every 5 seconds between retries if the peer does not respond.

```
<Sysname> system-view
[Sysname] ike dpd interval 10 retry 5 on-demand
```

Related commands

dpd

ike gd-quantum

Use **ike gd-quantum** to enable GD-quantum encryption for IKE and enter IKE GD-quantum view.

Use **undo ike gd-quantum** to disable GD-quantum encryption for IKE.

Syntax

ike gd-quantum

undo ike gd-quantum

The following compatibility matrixes show the support of hardware platforms for this command:

Models	Command compatibility
NFNX5-HD6480	Yes
NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB1780, NFNX3-HDB3080, NFNX3-HDB1180, NFNX3-HDB1480, NFNX3-HDB680, NFNX3-HDB1080	No

Default

GD-quantum encryption for IKE is disabled.

Views

system view

Predefined user roles

network-admin

context-admin

Usage guidelines

After enabling GD-quantum encryption for IKE, the device can use the symmetric key provided by the GD-quantum server to encrypt the IPsec protected data, which further enhance the security of IPsec.

The device obtains keys from the GD-quantum server in the following steps:

1. **Connecting the GD-quantum server**—After all commands in IKE GD-quantum view are configured, the device establishes a connection with the specified GD-quantum server.
2. **Logging in to the GD-quantum server**—After the connection is established, the device sends a login request to the GD-quantum server, carrying the GD-quantum access ID and the GD-quantum authentication key. Only devices with verified GD-quantum access IDs and GD-quantum authentication keys can successfully log in to the GD-quantum server.
3. **Obtaining the GD-quantum keys**—After successful login and the IKE phase 1 negotiation, the device obtains the encrypted GD-quantum keys from the GD-quantum server, decrypt them with the GD-quantum decryption keys configured on the device, and finally obtain the GD-quantum keys for IPsec.

When enabling GD-quantum encryption for IKE, the device enters IKE GD-quantum view. Configure the IP address and port number of the GD-quantum server, the GD-quantum access IDs and GD-quantum authentication keys, and the GD-quantum decryption keys in this view.

Examples

Enable GD-quantum encryption for IKE and enter IKE GD-quantum view.

```
<Sysname> system-view
[Sysname] ike gd-quantum
[Sysname-ike-gdquantum]
```

ike gm-main sm4-version

Use **ike gm-main sm4-version** to specify the SM4 algorithm version used in IKE GM main negotiation.

Use **undo ike gm-main sm4-version** to restore the default.

Syntax

ike gm-main sm4-version { **draft** | **standard** }

undo ike gm-main sm4-version

Default

The standard SM4 algorithm is used in IKE GM main negotiation.

Views

IKE profile view

Predefined user roles

network-admin

context-admin

Parameters

draft: Specifies the draft version of the SM4 algorithm. The attribute value for the standard SM4 is 127.

standard: Specifies the standard version of the SM4 algorithm. The attribute value for the standard SM4 is 129.

Usage guidelines

Specify the SM4 version used by the device to initiate an IKE negotiation with a device from other vendors to make sure the two devices use the same SM4 version in the negotiation.

This command takes effect only on negotiations for new IKE SAs. It does not apply to existing IKE SAs.

Examples

In IKE profile view, configure the IKE GM main negotiation to use the draft SM4 algorithm.

```
<Sysname> system-view
[Sysname] ike profile prof1
[Sysname-ike-profile-prof1] ike gm-main sm4-version draft
```

ike identity

Use **ike identity** to specify the global identity used by the local end during IKE negotiations.

Use **undo ike identity** to restore the default.

Syntax

ike identity { **address** { *ipv4-address* | **ipv6** *ipv6-address* }| **dn** | **fqdn** [*fqdn-name*] | **user-fqdn** [*user-fqdn-name*] }

undo ike identity

Default

The IP address of the interface where the IPsec policy applies is used as the IKE identity.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

address { *ipv4-address* | **ipv6** *ipv6-address* }: Uses an IPv4 or IPv6 address as the identity.

dn: Uses the DN in the digital signature as the identity.

fqdn *fqdn-name*: Uses the FQDN name as the identity. The *fqdn-name* argument is a case-sensitive string of 1 to 255 characters, for example, www.test.com. If you do not specify this argument, the device name configured by using the **sysname** command is used as the local FQDN.

user-fqdn *user-fqdn-name*: Uses the user FQDN name as the identity. The *user-fqdn-name* argument is a case-sensitive string of 1 to 255 characters, for example, abc@test.com. If you do not specify this argument, the device name configured by using the **sysname** command is used as the user FQDN.

Usage guidelines

The global local identity can be used for all IKE SA negotiations. The local identity (set by the **local-identity** command for an IKE profile) can be used only for IKE SA negotiations that use the IKE profile.

If the local authentication method is signature authentication, you can set an identity of any type. If the local authentication method is preshared key authentication, you cannot set the DN as the identity.

The **ike signature-identity from-certificate** command sets the local device to always use the identity information obtained from the local certificate for signature authentication. If the **ike signature-identity from-certificate** command is not set, the **local-identity** command configuration, if configured, takes precedence over the **ike identity** command configuration.

Examples

Specify IP address 2.2.2.2 as the identity.

```
<sysname> system-view
[sysname] ike identity address 2.2.2.2
```

Related commands

local-identity

ike signature-identity from-certificate

ike invalid-spi-recovery enable

Use **ike invalid-spi-recovery enable** to enable invalid security parameter index (SPI) recovery.

Use **undo ike invalid-spi-recovery enable** to disable invalid SPI recovery.

Syntax

ike invalid-spi-recovery enable

undo ike invalid-spi-recovery enable

Default

Invalid SPI recovery is disabled.

Views

System view

Predefined user roles

network-admin

context-admin

Usage guidelines

IPsec "black hole" occurs when one IPsec peer fails (for example, a peer can fail if a reboot occurs). One peer fails and loses its SAs with the other peer. When an IPsec peer receives a data packet for which it cannot find an SA, an invalid SPI is encountered. The peer drops the data packet and tries to send an SPI invalid notification to the data originator. This notification is sent by using the IKE SA. When no IKE SA is available, the notification is not sent. The originating peer continues sending the data by using the IPsec SA that has the invalid SPI, and the receiving peer keeps dropping the traffic.

The invalid SPI recovery feature enables the receiving peer to set up an IKE SA with the originator so that an SPI invalid notification can be sent. Upon receiving the notification, the originating peer deletes the IPsec SA that has the invalid SPI. If the originator has data to send, new SAs will be set up.

Use caution when you enable the invalid SPI recovery feature, because using this feature can result in a DoS attack. Attackers can make a great number of invalid SPI notifications to the same peer.

Examples

Enable invalid SPI recovery.

```
<Sysname> system-view
[Sysname] ike invalid-spi-recovery enable
```

ike ipv6-address-group

Use **ike ipv6-address-group** to configure an IKE IPv6 address pool for assigning IPv6 addresses to remote peers.

Use **undo ike ipv6-address-group** to delete an IKE IPv6 address pool.

Syntax

ike ipv6-address-group *group-name* **prefix** *prefix/prefix-len* **assign-len** *assign-len*

undo ike ipv6-address-group *group-name*

Default

No IKE IPv6 address pools exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

group-name: Specifies a name for the IKE IPv6 address pool. The *group-name* argument is a case-insensitive string of 1 to 63 characters.

prefix *prefix/prefix-len*: Specifies an IPv6 prefix in the format of *prefix*/*prefix length*. The value range for the *prefix-len* argument is 1 to 128.

assign-len *assign-len*: Specifies the assigned prefix length. The value range for the *assign-len* argument is 1 to 128, and the value must be greater than or equal to *prefix-len*. The difference between *assign-len* and *prefix-len* must be equal to or less than 16.

Usage guidelines

Different from the IKE IPv4 address pool, the device assigns an IPv6 subnet to a peer from the IKE IPv6 address pool. The peer can use the assigned IPv6 subnet to assign IPv6 addresses to other devices.

IKE IPv6 address pools cannot overlap with each other.

Examples

Configure an IKE IPv6 address pool with name **ipv6group**, prefix 1:1::/64, and assigned prefix length 80.

```
<Sysname> system-view
[Sysname] ike ipv6-address-group ipv6group prefix 1:1::/64 assign-len 80
```

Related commands

aaa authorization

ike keepalive interval

Use **ike keepalive interval** to set the IKE keepalive interval.

Use **undo ike keepalive interval** to restore the default.

Syntax

ike keepalive interval *interval*

undo ike keepalive interval

Default

No IKE keepalives are sent.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

interval: Specifies the number of seconds between IKE keepalives, in the range of 20 to 28800.

Usage guidelines

To detect the status of the peer, configure IKE DPD instead of the IKE keepalive feature, unless IKE DPD is not supported on the peer.

The keepalive timeout time configured at the local must be longer than the keepalive interval configured at the peer. Because more than three consecutive packets are rarely lost on a network, you can set the keepalive timeout time to three times as long as the keepalive interval.

Examples

Set the keepalive interval to 200 seconds

```
<Sysname> system-view
[Sysname] ike keepalive interval 200
```

Related commands

ike keepalive timeout

ike keepalive timeout

Use **ike keepalive timeout** to set the IKE keepalive timeout time.

Use **undo ike keepalive timeout** to restore the default.

Syntax

ike keepalive timeout *seconds*

undo ike keepalive timeout

Default

The IKE keepalive timeout time is not set.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

seconds: Specifies the number of seconds between IKE keepalives. The value range for this argument is 20 to 28800.

Usage guidelines

If the local end receives no keepalive packets from the peer during the timeout time, the IKE SA is deleted along with the IPsec SAs it negotiated.

The keepalive timeout time configured at the local end must be longer than the keepalive interval configured at the peer. Because more than three consecutive packets are rarely lost on a network, you can set the keepalive timeout time to three times as long as the keepalive interval.

Examples

Set the keepalive timeout time to 20 seconds.

```
<Sysname> system-view
[Sysname] ike keepalive timeout 20
```

Related commands

ike keepalive interval

ike keychain

Use **ike keychain** to create an IKE keychain and enter its view, or enter the view of an existing IKE keychain.

Use **undo ike keychain** to delete an IKE keychain.

Syntax

ike keychain *keychain-name* [**vpn-instance** *vpn-instance-name*]

undo ike keychain *keychain-name* [**vpn-instance** *vpn-instance-name*]

Default

No IKE keychains exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

keychain-name: Specifies an IKE keychain name, a case-insensitive string of 1 to 63 characters.

vpn-instance *vpn-instance-name*: Specifies the MPLS L3VPN instance to which the IKE keychain belongs. The *vpn-instance-name* argument represents the VPN instance name, a case-sensitive string of 1 to 31 characters. To create an IKE keychain for the public network, do not specify this option.

Usage guidelines

To use preshared key authentication, you must create and specify an IKE keychain for the IKE profile.

Examples

Create IKE keychain **key1** and enter its view.

```
<Sysname> system-view
[Sysname] ike keychain key1
[Sysname-ike-keychain-key1]
```

Related commands

authentication-method

pre-shared-key

ike limit

Use **ike limit** to set the maximum number of half-open or established IKE SAs.

Use **undo ike limit** to restore the default.

Syntax

ike limit { **max-negotiating-sa** *negotiation-limit* | **max-sa** *sa-limit* }

undo ike limit { **max-negotiating-sa** | **max-sa** }

Default

The maximum number of half-open IKE SAs and IPsec SAs is 200, and there is no limit to the maximum number of established IKE SAs.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

max-negotiating-sa *negotiation-limit*: Specifies the maximum number of half-open IKE SAs and IPsec SAs. The value range for the *negotiation-limit* argument is 1 to 99999.

max-sa *sa-limit*: Specifies the maximum number of established IKE SAs. The value range for the *sa-limit* argument is 1 to 99999.

Usage guidelines

The supported maximum number of half-open IKE SAs depends on the device's processing capability. Adjust the maximum number of half-open IKE SAs to make full use of the device's processing capability without affecting the IKE SA negotiation efficiency.

The supported maximum number of established IKE SAs depends on the device's memory space. Adjust the maximum number of established IKE SAs to make full use of the device's memory space without affecting other applications in the system.

Examples

Set the maximum number of half-open IKE SAs and IPsec SAs to 200.

```
<Sysname> system-view
[Sysname] ike limit max-negotiating-sa 200
```

Set the maximum number of established IKE SAs to 5000.

```
<Sysname> system-view
[Sysname] ike limit max-sa 5000
```

ike logging negotiation enable

Use **ike logging negotiation enable** to enable logging for IKE negotiation.

Use **undo ike logging negotiation packet enable** to disable logging for IKE negotiation.

Syntax

ike logging negotiation enable

undo ike logging negotiation enable

Default

Logging for IKE negotiation is enabled.

Views

System view

Predefined user roles

network-admin

context-admin

Usage guidelines

This command enables the device to output logs for the IKE negotiation process.

Examples

Enable logging for IKE negotiation.

```
<Sysname> system-view
[Sysname] ike logging negotiation enable
```

ike nat-keepalive

Use **ike nat-keepalive** to set the NAT keepalive interval.

Use **undo ike nat-keepalive** to restore the default.

Syntax

ike nat-keepalive *seconds*

undo ike nat-keepalive

Default

The NAT keepalive interval is 20 seconds.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

seconds: Specifies the NAT keepalive interval in seconds, in the range of 5 to 300.

Usage guidelines

This command takes effect only for a device that resides in the private network behind a NAT gateway. The device behind the NAT gateway needs to send NAT keepalives to its peer to keep the NAT session alive, so that the peer can access the device.

The NAT keepalive interval must be shorter than the NAT session lifetime.For information about how to display the lifetime of NAT sessions, see *NAT Command Reference.*

Examples

Set the NAT keepalive interval to 5 seconds.

```
<Sysname> system-view
[Sysname] ike nat-keepalive 5
```

ike profile

Use **ike profile** to create an IKE profile and enter its view, or enter the view of an existing IKE profile.

Use **undo ike profile** to delete an IKE profile.

Syntax

ike profile *profile-name*

undo ike profile *profile-name*

Default

No IKE profiles exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

profile-name: Specifies an IKE profile name, a case-insensitive string of 1 to 63 characters.

Examples

Create IKE profile 1 and enter its view.

```
<Sysname> system-view
[Sysname] ike profile 1
[Sysname-ike-profile-1]
```

ike proposal

Use **ike proposal** to create an IKE proposal and enter its view, or enter the view of an existing IKE proposal.

Use **undo ike proposal** to delete an IKE proposal.

Syntax

ike proposal proposal-number

undo ike proposal *proposal-number*

Default

An IKE proposal exists, which has the lowest priority and uses the following settings:

- **Encryption algorithm**—DES-CBC.
- **Authentication algorithm**—HMAC-SHA1.
- **Authentication method**—Preshared key authentication.
- **DH group**—768-bit Diffie-Hellman group.
- **IKE SA lifetime**—86400 seconds.

You cannot change the settings of the default IKE proposal.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

proposal-number: Specifies an IKE proposal number in the range of 1 to 65535. The lower the number, the higher the priority of the IKE proposal.

Usage guidelines

During IKE negotiation:

- The initiator sends its IKE proposals to the peer.
  - If the initiator is using an IPsec policy with an IKE profile, the initiator sends all IKE proposals specified for the IKE profile to the peer. An IKE proposal specified earlier for the IKE profile has a higher priority.
  - If the initiator is using an IPsec policy with no IKE profile, the initiator sends all its IKE proposals to the peer. An IKE proposal with a smaller number has a higher priority.
- The peer searches its own IKE proposals for a match. The search starts from the IKE proposal with the highest priority and proceeds in descending order of priority until a match is found. The matching IKE proposals are used to establish the IKE SA. If all user-defined IKE proposals are mismatched, the two peers use their default IKE proposals to establish the IKE SA.

Examples

Create IKE proposal 1 and enter its view.

```
<Sysname> system-view
[Sysname] ike proposal 1
[Sysname-ike-proposal-1]
```

Related commands

display ike proposal

ike signature-identity from-certificate

Use **ike signature-identity from-certificate** to configure the local device to obtain the identity information from the local certificate for signature authentication.

Use **undo ike signature-identity from-certificate** to restore the default.

Syntax

ike signature-identity from-certificate

undo ike signature-identity from-certificate

Default

The local end uses the identity information specified by the **local-identity** or **ike identity** command for signature authentication.

Views

System view

Predefined user roles

network-admin

context-admin

Usage guidelines

This command requires the local device to always use the identity information in the local certificate for signature authentication, regardless of the **local-identity** or **ike identity** configuration.

Configure this command when the aggressive mode and signature authentication are used and the device interconnects with a NF-based peer device. NF supports only DN for signature authentication.

If the **ike signature-identity from-certificate** command is not configured, the **local-identity** command configuration, if configured, takes precedence over the **ike identity** command configuration.

Examples

Configure the local device to always obtain the identity information from the local certificate for signature authentication.

```
<Sysname> system-view
[sysname] ike signature-identity from-certificate
```

Related commands

local-identity

ike identity

inside-vpn

Use **inside-vpn** to specify an inside VPN instance.

Use **undo inside-vpn** to restore the default.

Syntax

inside-vpn vpn-instance *vpn-instance-name*

undo inside-vpn

Default

No inside VPN instance is specified for an IKE profile. The device forwards protected data to the VPN instance where the interface that receives the data resides.

Views

IKE profile view

Predefined user roles

network-admin

context-admin

Parameters

vpn-instance *vpn-instance-name*: Specifies the MPLS L3VPN instance to which the device forwards protected data. The *vpn-instance-name* argument represents the VPN instance name, a case-sensitive string of 1 to 31 characters.

Usage guidelines

This command determines where the device should forward received IPsec protected data. If you configure this command, the device looks for a route in the specified VPN instance to forward the data. If you do not configure this command, the device looks for a route in the VPN instance where the receiving interface resides to forward the data.

The inside VPN instance specified in an IKE profile takes effect only on IPsec policies that use the IKE profile. It does not take effect on IPsec profiles that use the IKE profile.

Examples

Specify inside VPN instance **vpn1** for IKE profile **prof1**.

```
<Sysname> system-view
[Sysname] ike profile prof1
[Sysname-ike-profile-prof1] inside-vpn vpn-instance vpn1
```

keychain

Use **keychain** to specify an IKE keychain for preshared key authentication.

Use **undo keychain** to remove an IKE keychain.

Syntax

keychain *keychain-name*

undo keychain *keychain-name*

Default

No IKE keychain is specified for preshared key authentication.

Views

IKE profile view

Predefined user roles

network-admin

context-admin

Parameters

keychain-name: Specifies an IKE keychain name, a case-insensitive string of 1 to 63 characters.

Usage guidelines

You can specify a maximum of six IKE keychains for an IKE profile. An IKE keychain specified earlier has a higher priority.

Examples

Specify IKE keychain **abc** for IKE profile **1**.

```
<Sysname> system-view
[Sysname] ike profile 1
[Sysname-ike-profile-1] keychain abc
```

Related commands

ike keychain

local-identity

Use **local-identity** to configure the local ID, the ID that the device uses to identify itself to the peer during IKE negotiation.

Use **undo local-identity** to restore the default.

Syntax

local-identity { **address** { *ipv4-address* | **ipv6** *ipv6-address* } | **dn** | **fqdn** [*fqdn-name*] | **user-fqdn** [*user-fqdn-name*] }

undo local-identity

Default

No local ID is configured for an IKE profile. An IKE profile uses the local ID configured in system view by using the **ike identity** command. If the local ID is not configured in system view, the IKE profile uses the IP address of the interface to which the IPsec policy is applied as the local ID.

Views

IKE profile view

Predefined user roles

network-admin

context-admin

Parameters

address { *ipv4-address* | **ipv6** *ipv6-address* }: Uses an IPv4 or IPv6 address as the local ID.

dn: Uses the DN in the local certificate as the local ID.

fqdn *fqdn-name*: Uses an FQDN as the local ID. The *fqdn-name* argument is a case-sensitive string of 1 to 255 characters, such as www.test.com. If you do not specify this argument, the device name configured by using the **sysname** command is used as the local FQDN.

user-fqdn *user-fqdn-name*: Uses a user FQDN as the local ID. The *user-fqdn-name* argument is a case-sensitive string of 1 to 255 characters, such as adc@test.com. If you do not specify this argument, the device name configured by using the **sysname** command is used as the user FQDN.

Usage guidelines

For digital signature authentication, the device can use any type of ID. For preshared key authentication, the device can use any type of ID other than the DN.

In digital signature authentication, if the local ID is an IP address that is different from the IP address in the local certificate, the device uses its FQDN instead. The FQDN is the device name configured by using the **sysname** command.

In aggressive mode, for digital signature authentication, if the local ID is the DN in the local certificate, the device uses its FQDN instead for IKE negotiation. To use the DN in the local certificate as the local ID for IKE negotiation, execute the **ike signature-identity from-certificate** command in system view.

The initiator uses the local ID to identify itself to the responder. The responder compares the initiator's ID with the peer IDs configured by the **match remote** command to look for a matching IKE profile.

An IKE profile can have only one local ID.

An IKE profile with no local ID specified uses the local ID configured by using the **ike identity** command in system view.

Examples

Set the local ID to IP address **2.2.2.2**.

```
<Sysname> system-view
[Sysname] ike profile prof1
[Sysname-ike-profile-prof1] local-identity address 2.2.2.2
```

Related commands

match remote

ike identity

match local address (IKE keychain view)

Use **match local address** to specify a local interface or IP address to which an IKE keychain can be applied.

Use **undo match local address** to restore the default.

Syntax

match local address { *interface-type interface-number* | { *ipv4-address* | **ipv6** *ipv6-address* } [**vpn-instance** *vpn-instance-name*] }

undo match local address

Default

An IKE keychain can be applied to any local interface or IP address.

Views

IKE keychain view

Predefined user roles

network-admin

context-admin

Parameters

interface-type interface-number: Specifies a local interface. It can be any Layer 3 interface.

ipv4-address: Specifies the IPv4 address of a local interface.

ipv6 *ipv6-address*: Specifies the IPv6 address of a local interface.

vpn-instance *vpn-instance-name*: Specifies the MPLS L3VPN instance to which the IPv4 or IPv6 address belongs. The *vpn-instance-name* argument represents the VPN instance name, a case-sensitive string of 1 to 31 characters. If the IPv4 or IPv6 address belongs to the public network, do not specify this option.

Usage guidelines

Use this command to specify which address or interface can use the IKE keychain for IKE negotiation. Specify the local address configured in IPsec policy or IPsec policy template view (using the **local-address** command) for this command. If no local address is configured, specify the IP address of the interface that uses the IPsec policy.

You can specify a maximum of six IKE keychains for an IKE profile. An IKE keychain specified earlier has a higher priority. To give an IKE keychain a higher priority, you can configure this command for the keychain. For example, suppose you specified IKE keychain A before specifying IKE keychain B, and you configured the peer ID 2.2.0.0/16 for IKE keychain A and the peer ID 2.2.2.0/24 for IKE keychain B. For the local interface with the IP address 3.3.3.3 to negotiate with the peer 2.2.2.6, IKE keychain A is preferred because IKE keychain A was specified earlier. To use IKE keychain B, you can use this command to restrict the application scope of IKE keychain B to address 3.3.3.3.

Examples

Create IKE keychain **key1**.

```
<Sysname> system-view
[Sysname] ike keychain key1
```

Apply IKE keychain **key1** to IP address 2.2.2.2.

```
[sysname-ike-keychain-key1] match local address 2.2.2.1
```

Apply IKE keychain **key1** to the interface with IP address 2.2.2.2 in VPN instance **vpn1**.

```
[sysname-ike-keychain-key1] match local address 2.2.2.2 vpn-instance vpn1
```

match local address (IKE profile view)

Use **match local address** to specify a local interface or IP address to which an IKE profile can be applied.

Use **undo match local address** to restore the default.

Syntax

match local address { *interface-type interface-number* | { *ipv4-address* | **ipv6** *ipv6-address* } [**vpn-instance** *vpn-instance-name*] }

undo match local address

Default

An IKE profile can be applied to any local interface or IP address.

Views

IKE profile view

Predefined user roles

network-admin

context-admin

Parameters

interface-type interface-number: Specifies a local interface. It can be any Layer 3 interface.

ipv4-address: Specifies the IPv4 address of a local interface.

ipv6 *ipv6-address*: Specifies the IPv6 address of a local interface.

vpn-instance *vpn-instance-name*: Specifies the MPLS L3VPN instance to which the IPv4 or IPv6 address belongs. The *vpn-instance-name* argument represents the VPN instance name, a case-sensitive string of 1 to 31 characters. If the IPv4 or IPv6 address belongs to the public network, do not specify this option.

Usage guidelines

Use this command to specify which address or interface can use the IKE profile for IKE negotiation. Specify the local address configured in IPsec policy or IPsec policy template view (using the **local-address** command) for this command. If no local address is configured, specify the IP address of the interface that uses the IPsec policy.

An IKE profile configured earlier has a higher priority. To give an IKE profile that is configured later a higher priority, you can configure this command for the profile. For example, suppose you configured IKE profile A before configuring IKE profile B, and you configured the **match remote identity address range 2.2.2.1 2.2.2.100** command for IKE profile A and the **match remote identity address range 2.2.2.1 2.2.2.10** command for IKE profile B. For the local interface with the IP address 3.3.3.3 to negotiate with the peer 2.2.2.6, IKE profile A is preferred because IKE profile A was configured earlier. To use IKE profile B, you can use this command to restrict the application scope of IKE profile B to address 3.3.3.3.

Examples

Create IKE profile **prof1**.

```
<Sysname> system-view
[Sysname] ike profile prof1
```

Apply IKE profile **prof1** to IP address 2.2.2.2.

```
[sysname-ike-profile-prof1] match local address 2.2.2.1
```

Apply IKE profile **prof1** to the interface with IP address 2.2.2.2 in VPN instance **vpn1**.

```
[sysname-ike-profile-prof1] match local address 2.2.2.2 vpn-instance vpn1
```

match remote

Use **match remote** to configure a peer ID for IKE profile matching.

Use **undo match remote** to delete a peer ID for IKE profile matching.

Syntax

match remote { **certificate** *policy-name* | **identity** { **address** { { *ipv4-address* [*mask* | *mask-length*] | **range** *low-ipv4-address*

high-ipv4-address } | **ipv6** { *ipv6-address* [*prefix-length*] | **range** *low-ipv6-address high-ipv6-address* } } [**vpn-instance** *vpn-instance-name*] | **fqdn** *fqdn-name* | **user-fqdn** *user-fqdn-name* } }

undo match remote { **certificate** *policy-name* | **identity** { **address** { { *ipv4-address* [*mask* | *mask-length*] | **range** *low-ipv4-address high-ipv4-address* } | **ipv6** { *ipv6-address* [*prefix-length*] | **range** *low-ipv6-address high-ipv6-address* } } [**vpn-instance** *vpn-instance-name*] | **fqdn** *fqdn-name* | **user-fqdn** *user-fqdn-name* } }

Default

No peer ID is configured for IKE profile matching.

Views

IKE profile view

Predefined user roles

network-admin

context-admin

Parameters

certificate *policy-name*: Uses the DN in the peer's digital certificate as the peer ID for IKE profile matching. The *policy-name* argument is a string of 1 to 31 characters.

identity: Uses the specified information as the peer ID for IKE profile matching. The specified information is configured on the peer by using the **local-identity** command.

- **address** *ipv4-address* [*mask* | *mask-length*]: Uses an IPv4 host address or an IPv4 subnet address as the peer ID for IKE profile matching. The value range for the *mask-length* argument is 0 to 32, and the default is 32.
- **address range** *low-ipv4-address high-ipv4-address*: Uses a range of IPv4 addresses as the peer ID for IKE profile matching. The end address must be higher than the start address.
- **address ipv6** *ipv6-address* [*prefix-length*]: Uses an IPv6 host address or an IPv6 subnet address as the peer ID for IKE profile matching. The value range for the *prefix-length* argument is 0 to 128, and the default is 128.
- **address ipv6 range** *low-ipv6-address high-ipv6-address*: Uses a range of IPv6 addresses as the peer ID for IKE profile matching. The end address must be higher than the start address.
- **fqdn** *fqdn-name*: Uses the peer's FQDN as the peer ID for IKE profile matching. The *fqdn-name* argument is a case-sensitive string of 1 to 255 characters, such as www.test.com.
- **user-fqdn** *user-fqdn-name*: Uses the peer's user FQDN as the peer ID for IKE profile matching. The *user-fqdn-name* argument is a case-sensitive string of 1 to 255 characters, such as adc@test.com.

vpn-instance *vpn-instance-name*: Specifies the MPLS L3VPN instance to which the specified address or addresses belong. The *vpn-instance-name* argument represents the VPN instance name, a case-sensitive string of 1 to 31 characters. If the address or addresses belong to the public network, do not specify this option.

Usage guidelines

The responder compares the initiator's ID it received with the peer IDs of its local IKE profiles. If a match is found, the responder uses the IKE profile with the matching peer ID for IKE negotiation with the initiator.

On the responder, each IKE profile must have at least one peer ID configured. To make sure only one IKE profile is matched for a peer, do not configure the same peer ID for two or more IKE profiles.

If you configure the same peer ID for two or more IKE profiles, which IKE profile is selected for IKE negotiation is unpredictable.

For an IKE profile, you can configure multiple peer IDs. A peer ID configured earlier has a higher priority.

Examples

Create IKE profile **prof1**.

```
<Sysname> system-view
[Sysname] ike profile prof1
```

Configure a peer ID with the identity type of FQDN and the value of **www.test.com**.

```
[Sysname-ike-profile-prof1] match remote identity fqdn www.test.com
```

Configure a peer ID with the identity type of IP address and the value of **10.1.1.1**.

```
[Sysname-ike-profile-prof1] match remote identity address 10.1.1.1
```

Related commands

local-identity

pre-shared-key

Use **pre-shared-key** to configure a preshared key.

Use **undo pre-shared-key** to delete a preshared key.

Syntax

pre-shared-key { **address** { *ipv4-address* [*mask* | *mask-length*] | **ipv6** *ipv6-address* [*prefix-length*] } | **hostname** *host-name* } **key** { **cipher** | **simple** } *string*

undo pre-shared-key { **address** { *ipv4-address* [*mask* | *mask-length*] | **ipv6** *ipv6-address* [*prefix-length*] } | **hostname** *host-name* }

Default

No preshared key is configured.

Views

IKE keychain view

Predefined user roles

network-admin

context-admin

Parameters

address: Specifies a peer by its address.

ipv4-address: Specifies the IPv4 address of the peer.

mask: Specifies the mask in dotted decimal notation. The default mask is 255.255.255.255.

mask-length: Specifies the mask length in the range of 0 to 32. The default mask length is 32.

ipv6: Specifies an IPv6 peer.

ipv6-address: Specifies the IPv6 address of the peer.

prefix-length: Specifies the prefix length in the range of 0 to 128. The default prefix length is 128.

hostname *host-name*: Specifies a peer by its hostname, a case-sensitive string of 1 to 255 characters.

key: Specifies a preshared key.

cipher: Specifies a preshared key in encrypted form.

simple: Specifies a preshared key in plaintext form. For security purposes, the key specified in plaintext form will be stored in encrypted form.

string: Specifies the preshared key. The key is case sensitive.Its plaintext form is a string of 1 to 128 characters and its encrypted form is a string of 1 to 201 characters.

Usage guidelines

The address option or the hostname option specifies the peer with which the device can use the preshared key to perform IKE negotiation.

If you specify the peer by using the **hostname** option, the device can act as only a responder in IKE negotiation and it must use the aggressive mode in IKE phase 1. The peer device ID must be the peer FQDN that matches the hostname.

Two peers must be configured with the same preshared key to pass preshared key authentication.

Examples

Create IKE keychain **key1** and enter IKE keychain view.

```
<Sysname> system-view
[Sysname] ike keychain key1
```

Set the preshared key to be used for IKE negotiation with peer 1.1.1.2 to **123456TESTplat&!**.

```
[Sysname-ike-keychain-key1] pre-shared-key address 1.1.1.2 255.255.255.255 key simple
123456TESTplat&!
```

Related commands

keychain

priority (IKE keychain view)

Use **priority** to specify a priority for an IKE keychain.

Use **undo priority** to restore the default.

Syntax

priority *priority*

undo priority

Default

The priority of an IKE keychain is 100.

Views

IKE keychain view

Predefined user roles

network-admin

context-admin

Parameters

priority *priority*: Specifies a priority number in the range of 1 to 65535. The lower the priority number, the higher the priority.

Usage guidelines

To determine the priority of an IKE keychain, the device examines the existence of the **match local address** command before examining the priority number. An IKE keychain with the **match local address** command configured has a higher priority than an IKE keychain that does not have the **match local address** command configured.

Examples

Set the priority to 10 for IKE keychain **key1**.

```
<Sysname> system-view
[Sysname] ike keychain key1
[Sysname-ike-keychain-key1] priority 10
```

priority (IKE profile view)

Use **priority** to specify a priority for an IKE profile.

Use **undo priority** to restore the default.

Syntax

priority *priority*

undo priority

Default

The priority of an IKE profile is 100.

Views

IKE profile view

Predefined user roles

network-admin

context-admin

Parameters

priority *priority*: Specifies a priority number in the range of 1 to 65535. The smaller the priority number, the higher the priority.

Usage guidelines

To determine the priority of an IKE profile, the device examines the existence of the **match local address** command before examining the priority number. An IKE profile with the **match local address** command configured has a higher priority than an IKE profile that does not have the **match local address** command configured.

Examples

Set the priority to 10 for IKE profile **prof1**.

```
<Sysname> system-view
[Sysname] ike profile prof1
[Sysname-ike-profile-prof1] priority 10
```

proposal

Use **proposal** to specify IKE proposals for an IKE profile.

Use **undo proposal** to restore the default.

Syntax

proposal *proposal-number*&<1-6>

undo proposal

Default

No IKE proposals are specified for an IKE profile and the IKE proposals configured in system view are used for IKE negotiation.

Views

IKE profile view

Predefined user roles

network-admin

context-admin

Parameters

proposal-number&<1-6>: Specifies a space-separated list of up to six IKE proposals by their numbers in the range of 1 to 65535. An IKE proposal specified earlier has a higher priority.

Usage guidelines

When acting as the initiator, the device sends the specified IKE proposals to its peer for IKE negotiation. When acting as the responder, the device uses the IKE proposals configured in system view to match the IKE proposals received from the initiator.

Examples

Specify IKE proposal **10** for IKE profile **prof1**.

```
<Sysname> system-view
[Sysname] ike profile prof1
[Sysname-ike-profile-prof1] proposal 10
```

Related commands

ike proposal

reset ike sa

Use **reset ike sa** to delete IKE SAs.

Syntax

reset ike sa [**connection-id** *connection-id*]

Views

User view

Predefined user roles

network-admin

context-admin

Parameters

connection-id *connection-id*: Specifies the connection ID of the IKE SA to be cleared, in the range of 1 to 2000000000.

Usage guidelines

When you delete an IKE SA, the device automatically sends a notification to the peer.

Examples

Display the current IKE SAs.

```
<Sysname> display ike sa
    Connection-ID  Remote            Flag        DOI
  -------------------------------------------------------
      1            202.38.0.2        RD          IPsec
      2            202.38.0.3        RD          IPsec
Flags:
RD--READY RL--REPLACED FD-FADING RK-REKEY
```

Delete the IKE SA with the connection ID 2.

```
<Sysname> reset ike sa connection-id 2
```

Display the current IKE SAs.

```
<Sysname> display ike sa
    Connection-ID  Remote            Flag        DOI
  -------------------------------------------------------
      1            202.38.0.2        RD          IPsec
Flags:
RD--READY RL--REPLACED FD-FADING RK-REKEY
```

reset ike statistics

Use **reset ike statistics** command to clear IKE MIB statistics.

Syntax

reset ike statistics

Views

User view

Predefined user roles

network-admin

context-admin

Examples

Clears IKE MIB statistics.

```
<Sysname> reset ike statistics
```

Related commands

snmp-agent trap enable ike

sa duration

Use **sa duration** to set the IKE SA lifetime for an IKE proposal.

Use **undo sa duration** to restore the default.

Syntax

sa duration *seconds*

undo sa duration

Default

The IKE SA lifetime is 86400 seconds for an IKE proposal.

Views

IKE proposal view

Predefined user roles

network-admin

context-admin

Parameters

seconds: Specifies the IKE SA lifetime in seconds, in the range of 60 to 604800.

Usage guidelines

Before an IKE SA expires, IKE negotiates a new SA. The new SA takes effect immediately after it is negotiated. The old IKE SA will be cleared when it expires.

If the communicating peers are configured with different IKE SA lifetime settings, the smaller setting takes effect.

If the IPsec SA lifetime is also configured, set the IKE SA lifetime longer than the IPsec SA lifetime as a best practice.

Examples

Set the IKE SA lifetime to 600 seconds for IKE **proposal 1**.

```
<Sysname> system-view
[Sysname] ike proposal 1
[Sysname-ike-proposal-1] sa duration 600
```

Related commands

display ike proposal

sa soft-duration buffer

Use **sa soft-duration buffer** to set the IKE SA soft lifetime buffer time.

Use **undo sa soft-duration buffer** to restore the default.

Syntax

sa soft-duration buffer *seconds*

undo sa soft-duration buffer

Default

The IKE SA soft lifetime buffer time is not configured.

Views

IKE profile view

Predefined user roles

network-admin

context-admin

Parameters

seconds: Specifies the IKE SA soft lifetime buffer time, in seconds. The value range is 10 to 36000.

Usage guidelines

This command takes effect only when IKEv1 is used.

The IKE SA soft lifetime buffer time is used determine the IKE SA soft lifetime. A new IKE SA will be negotiated when the IKE SA soft lifetime expires.

The IKE SA soft lifetime is calculated as follows: IKE SA soft lifetime = IKE SA lifetime – IKE SA soft lifetime buffer time.

If the IKE SA soft lifetime buffer time is not configured, the system calculates a default IKE SA soft lifetime based on the IKE SA lifetime.

The default IKE SA soft lifetime is also used if the IKE soft lifetime calculated based on the soft lifetime buffer is shorter than or equal to 10 seconds.

Examples

Set the IKE SA soft lifetime buffer time to 600 seconds.

```
<Sysname> system-view
[Sysname] ike profile abc
[Sysname-ike-profile-abc] sa soft-duration buffer 600
```

Related commands

display ike sa

server-address

Use **server-address** to specify the IP address and port number of the GD-quantum server.

Use **undo server-address** to restore the default.

Syntax

server-address *ip-address* [**port** *port-number*]

undo server-address

The following compatibility matrixes show the support of hardware platforms for this command:

Models	Command compatibility
NFNX5-HD6480	Yes
NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB1780, NFNX3-HDB3080, NFNX3-HDB1180, NFNX3-HDB1480, NFNX3-HDB680, NFNX3-HDB1080	No

Default

No IP address or port number of the GD-quantum server is specified.

Views

IKE GD-quantum view

Predefined user roles

network-admin

context-admin

Parameters

ip-address: Specifies the IPv4 address of the GD-quantum server.

port *port-number*: Specifies the port number of the GD-quantum server, in the range of 1 to 65535. The default value for the *port-number* argument is 8013.

Usage guidelines

The device interacts with the GD-quantum server specified in this command to obtain the GD-quantum keys. Make sure you specify the IP address and port number that the GD-quantum server actually uses.

Any change to this command does affect the established connection between the device and the GD-quantum server.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Specify the IP address of the GD-quantum server as 192.168.0.111, and the port number as 5656.

```
<Sysname> system-view
[Sysname] ike gd-quantum
[Sysname-ike-gdquantum] server-address 192.168.0.111 port 5656
```

snmp-agent trap enable ike

Use **snmp-agent trap enable ike** command to enable SNMP notifications for IKE.

Use **undo snmp-agent trap enable ike** to disable SNMP notifications for IKE.

Syntax

snmp-agent trap enable ike [**attr-not-support** | **auth-failure** | **cert-type-unsupport** | **cert-unavailable** | **decrypt-failure** | **encrypt-failure** | **global** | **invalid-cert-auth** | **invalid-cookie** | **invalid-id** | **invalid-proposal** | **invalid-protocol** | **invalid-sign** | **no-sa-failure** | **proposal-add** | **proposal–delete** | **tunnel-start** | **tunnel-stop** | **unsupport-exch-type**] *

undo snmp-agent trap enable ike [**attr-not-support** | **auth-failure** | **cert-type-unsupport** | **cert-unavailable** | **decrypt-failure** | **encrypt-failure** | **global** | **invalid-cert-auth** | **invalid-cookie** | **invalid-id** | **invalid-proposal** | **invalid-protocol** | **invalid-sign** | **no-sa-failure** | **proposal-add** | **proposal–delete** | **tunnel-start** | **tunnel-stop** | **unsupport-exch-type**] *

Default

All SNMP notifications for IKE are disabled.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

attr-not-support: Specifies notifications about attribute-unsupported failures.

auth-failure: Specifies notifications about authentication failures.

cert-type-unsupport: Specifies notifications about certificate-type-unsupported failures.

cert-unavailable: Specifies notifications about certificate-unavailable failures.

decrypt-failure: Specifies notifications about decryption failures.

encrypt-failure: Specifies notifications about encryption failures.

global: Specifies notifications globally.

invalid-cert-auth: Specifies notifications about invalid-certificate-authentication failures.

invalid-cookie: Specifies notifications about invalid-cookie failures.

invalid-id: Specifies notifications about invalid-ID failures.

invalid-proposal: Specifies notifications about invalid-IKE-proposal failures.

invalid-protocol: Specifies notifications about invalid-protocol failures.

invalid-sign: Specifies notifications about invalid-signature failures.

no-sa-failure: Specifies notifications about SA-not-found failures.

proposal-add: Specifies notifications about events of adding IKE proposals.

proposal-delete: Specifies notifications about events of deleting IKE proposals.

tunnel-start: Specifies notifications about events of creating IKE tunnels.

tunnel-stop: Specifies notifications about events of deleting IKE tunnels.

unsupport-exch-type: Specifies notifications about negotiation-type-unsupported failures.

Usage guidelines

If you do not specify any keywords, this command enables or disables all SNMP notifications for IKE.

To generate and output SNMP notifications for a specific IKE failure type or event type, perform the following tasks:

1. Enable SNMP notifications for IKE globally.
2. Enable SNMP notifications for the failure type or event type.

Examples

Enable SNMP notifications for IKE globally.

```
<Sysname> system-view
[Sysname] snmp-agent trap enable ike global
```

Enable SNMP notifications for events of creating IKE tunnels.

```
[Sysname] snmp-agent trap enable ike tunnel-start
```

IKEv2 commands

aaa authorization

Use **aaa authorization** to enable IKEv2 AAA authorization.

Use **undo aaa authorization** to disable IKEv2 AAA authorization.

Syntax

aaa authorization domain *domain-name* **username** *user-name*

undo aaa authorization

Default

IKEv2 AAA authorization is disabled.

Views

IKEv2 profile view

Predefined user roles

network-admin

context-admin

Parameters

domain *domain-name*: Specifies the ISP domain used for requesting authorization attributes. The ISP domain name is a case-insensitive string of 1 to 255 characters and must meet the following requirements:

- The name cannot contain a forward slash (/), backslash (\), vertical bar (|), quotation mark ("), colon (:), asterisk (*), question mark (?), left angle bracket (<), right angle bracket (>), or an at sign (@).
- The name cannot be **d**, **de**, **def**, **defa**, **defau**, **defaul**, **default**, **i**, **if**, **if-**, **if-u**, **if-un**, **if-unk**, **if-unkn**, **if-unkno**, **if-unknow**, or **if-unknown**.

username *user-name*: Specifies the username used for requesting authorization attributes. The username is a case-sensitive string of 1 to 55 characters and must meet the following requirements:

- The username cannot contain the domain name.
- The username cannot contain a forward slash (/), backslash (\), vertical bar (|), colon (:), asterisk (*), question mark (?), left angle bracket (<), right angle bracket (>), or an at sign (@).
- The username cannot be **a**, **al**, or **all**.

Usage guidelines

The AAA authorization feature enables IKEv2 to request authorization attributes, such as the IKEv2 address pool, from AAA.

IKEv2 uses the ISP domain and username to request authorization attributes. AAA uses the authorization settings in the ISP domain to request the user's authorization attributes from the remote AAA server or the local user database. After IKEv2 passes the username authentication, it obtains the authorization attributes.

This feature is applicable when AAA is used to centrally manage and deploy authorization attributes.

Examples

Create an IKEv2 profile named **profile1**.

```
<Sysname> system-view
[Sysname] ikev2 profile profile1
```

Enable AAA authorization. Specify ISP domain name **abc** and username **test**.

```
[Sysname-ikev2-profile-profile1] aaa authorization domain abc username test
```

Related commands

display ikev2 profile

address

Use **address** to specify the IP address or IP address range of an IKEv2 peer.

Use **undo address** to restore the default.

Syntax

address { *ipv4-address* [*mask* | *mask-length*] | **ipv6** *ipv6-address* [*prefix-length*] }

undo address

Default

The IKEv2 peer's IP address or IP address range is not specified.

Views

IKEv2 peer view

Predefined user roles

network-admin

context-admin

Parameters

ipv4-address: Specifies the IPv4 address of the IKEv2 peer.

mask: Specifies the subnet mask of the IPv4 address.

mask-length: Specifies the subnet mask length of the IPv4 address, in the range of 0 to 32.

ipv6 *ipv6-address*: Specifies the IPv6 address of the IKEv2 peer.

prefix-length: Specifies the prefix length of the IPv6 address, in the range of 0 to 128.

Usage guidelines

Both the initiator and the responder can look up an IKEv2 peer by IP address in IKEv2 negotiation.

The IP addresses of different IKEv2 peers in the same IKEv2 keychain cannot be the same.

Examples

Create an IKEv2 keychain named **key1**.

```
<Sysname> system-view
[Sysname] ikev2 keychain key1
```

Create an IKEv2 peer named **peer1**.

```
[Sysname-ikev2-keychain-key1] peer peer1
```

Specify the IKEv2 peer's IP address 3.3.3.3 with subnet mask 255.255.255.0.

```
[Sysname-ikev2-keychain-key1-peer-peer1] address 3.3.3.3 255.255.255.0
```

Related commands

peer

authentication-method

Use **authentication-method** to specify the local or remote identity authentication method.

Use **undo authentication-method** to remove the local or remote identity authentication method.

Syntax

authentication-method { **local** | **remote** } { **dsa-signature** | **ecdsa-signature** | **pre-share** | **rsa-signature** }

undo authentication-method local

undo authentication-method remote { **dsa-signature** | **ecdsa-signature** | **pre-share** | **rsa-signature** }

Default

No local or remote identity authentication method is specified.

Views

IKEv2 profile view

Predefined user roles

network-admin

context-admin

Parameters

local: Specifies the local identity authentication method.

remote: Specifies the remote identity authentication method.

dsa-signature: Specifies the DSA signatures as the identity authentication method.

ecdsa-signature: Specifies the ECDSA signatures as the identity authentication method.

pre-share: Specifies the preshared key as the identity authentication method.

rsa-signature: Specifies the RSA signatures as the identity authentication method.

Usage guidelines

The local and remote identity authentication methods must both be specified and they can be different.

You can specify only one local identity authentication method. You can specify multiple remote identity authentication methods by executing this command multiple times when there are multiple remote ends whose authentication methods are unknown.

If you use RSA, DSA, or ECDSA signature authentication, you must specify PKI domains for obtaining certificates. You can specify PKI domains by using the **certificate domain** command in IKEv2 profile view. If you do not specify PKI domains in IKEv2 profile view, the PKI domains configured by the **pki domain** command in system view will be used.

If you specify the preshared key method, you must specify a preshared key for the IKEv2 peer in the keychain used by the IKEv2 profile.

Examples

Create an IKEv2 profile named **profile1**.

```
<Sysname> system-view
[Sysname] ikev2 profile profile1
```

Specify the preshared key and RSA signatures as the local and remote authentication methods, respectively.

```
[Sysname-ikev2-profile-profile1] authentication-method local pre-share
[Sysname-ikev2-profile-profile1] authentication-method remote rsa-signature
```

Specify PKI domain **genl** as the PKI domain for obtaining certificates.

```
[Sysname-ikev2-profile-profile1] certificate domain genl
```

Specify IKEv2 keychain **keychain1**.

```
[Sysname-ikev2-profile-profile1] keychain keychain1
```

Related commands

display ikev2 profile

certificate domain (IKEv2 profile view)

keychain (IKEv2 profile view)

certificate domain

Use **certificate domain** to specify a PKI domain for signature authentication in IKEv2 negotiation.

Use **undo certificate domain** to remove a PKI domain for signature authentication in IKEv2 negotiation.

Syntax

certificate domain *domain-name* [**sign** | **verify**]

undo certificate domain *domain-name*

Default

PKI domains configured in system view are used for signature authentication.

Views

IKEv2 profile view

Predefined user roles

network-admin

context-admin

Parameters

domain-name: Specifies a PKI domain by its name, a case-insensitive string of 1 to 31 characters.

sign: Uses the local certificate in the PKI domain to generate a signature.

verify: Uses the CA certificate in the PKI domain to verify the remote end's certificate.

Usage guidelines

If you do not specify the **sign** or **verify** keyword, the PKI domain is used for both **sign** and **verify** purposes. You can specify a PKI domain for each purpose by executing this command multiple times. If you specify the same PKI domain for both purposes, the later configuration takes

effect. For example, if you execute **certificate domain abc sign** and **certificate domain abc verify** successively, the PKI domain **abc** will be used only for verification.

If the local end uses RSA, DSA, or ECDSA signature authentication, you must specify a PKI domain for signature generation. If the remote end uses RSA, DSA, or ECDSA signature authentication, you must specify a PKI domain for verifying the remote end's certificate. If you do not specify PKI domains, the PKI domains configured in system view will be used.

Examples

Create an IKEv2 profile named **profile1**.

```
<Sysname> system-view
[Sysname] ikev2 profile profile1
```

Specify PKI domain **abc** for signature. Specify PKI domain **def** for verification.

```
[Sysname-ikev2-profile-profile1] certificate domain abc sign
[Sysname-ikev2-profile-profile1] certificate domain def verify
```

config-exchange

Use **config-exchange** to enable configuration exchange.

Use **undo config-exchange** to disable configuration exchange.

Syntax

config-exchange { **request** | **set** { **accept** | **send** } }

undo config-exchange { **request** | **set** { **accept** | **send** } }

Default

Configuration exchange is disabled.

Views

IKEv2 profile view

Predefined user roles

network-admin

context-admin

Parameters

request: Enables the device to send request messages carrying the configuration request payload during the IKE_AUTH exchange.

set: Specifies the configuration set payload exchange.

accept: Enables the device to accept the configuration set payload carried in Info messages.

send: Enables the device to send Info messages carrying the configuration set payload.

Usage guidelines

The configuration exchange feature enables the local and remote ends to exchange configuration data, such as gateway address, internal IP address, and route. The exchange includes data request and response, and data push and response. The enterprise center can push IP addresses to branches. The branches can request IP addresses, but the requested IP addresses cannot be used.

You can specify both **request** and **set** for the device.

If you specify **request** for the local end, the remote end will respond if it can obtain the requested data through AAA authorization.

If you specify **set send** for the local end, you must specify **set accept** for the remote end.

The device with **set send** specified pushes an IP address after the IKEv2 SA is set up if it does not receive any configuration request from the peer.

Examples

Create an IKEv2 profile named **profile1**.

```
<Sysname> system-view
[Sysname] ikev2 profile profile1
```

Enable the local end to add the configuration request payload to the request message of IKE_AUTH exchange.

```
[Sysname-ikev2-profile-profile1] config-exchange request
```

Related commands

aaa authorization

display ikev2 profile

dh

Use **dh** to specify DH groups to be used in IKEv2 key negotiation.

Use **undo group** to restore the default.

Syntax

dh { **group1** | **group14** | **group2** | **group24** | **group5** | **group19** | **group20** } *

undo dh

Default

No DH group is specified for an IKEv2 proposal.

Views

IKEv2 proposal view

Predefined user roles

network-admin

context-admin

Parameters

group1: Uses the 768-bit Diffie-Hellman group.

group2: Uses the 1024-bit Diffie-Hellman group.

group5: Uses the 1536-bit Diffie-Hellman group.

group14: Uses the 2048-bit Diffie-Hellman group.

group24: Uses the 2048-bit Diffie-Hellman group with the 256-bit prime order subgroup.

group19: Uses the 256-bit ECP Diffie-Hellman group.

group20: Uses the 384-bit ECP Diffie-Hellman group.

Usage guidelines

A DH group with a higher group number provides higher security but needs more time for processing. To achieve the best trade-off between processing performance and security, choose proper DH groups for your network.

You must specify a minimum of one DH group for an IKEv2 proposal. Otherwise, the proposal is incomplete and useless.

You can specify multiple DH groups for an IKEv2 proposal. A group specified earlier has a higher priority.

Examples

Specify DH group 1 for IKEv2 proposal 1.

```
<Sysname> system-view
[Sysname] ikev2 proposal 1
[Sysname-ikev2-proposal-1] dh group1
```

Parameters

policy-name: Specifies an IKEv2 policy by its name, a case-insensitive string of 1 to 63 characters.

default: Specifies the default IKEv2 policy.

Usage guidelines

If you do not specify any parameters, this command displays the configuration of all IKEv2 policies.

Examples

Display the configuration of all IKEv2 policies.

```
<Sysname> display ikev2 policy
IKEv2 policy: 1
  Priority: 100
  Match local address: 1.1.1.1
  Match local address ipv6: 1:1::1:1
  Match VRF: vpn1
  Proposal: 1
```

```
  Proposal: 2
IKEv2 policy: default
  Match VRF: any
  Proposal: default
```

Table 15 Command output

Field	Description
IKEv2 policy	Name of the IKEv2 policy.
Priority	Priority of the IKEv2 policy.
Match local address	IPv4 address to which the IKEv2 policy can be applied.
Match local address ipv6	IPv6 address to which the IKEv2 policy can be applied.
Match VRF	VPN instance to which the IKEv2 policy can be applied.
Proposal	IKEv2 proposal that the IKEv2 policy uses.

Parameters

profile-name: Specifies an IKEv2 profile by its name, a case-insensitive string of 1 to 63 characters. If you do not specify an IKEv2 profile, this command displays the configuration of all IKEv2 profiles.

Examples

Display the configuration of all IKEv2 profiles.

```
<Sysname> display ikev2 profile
IKEv2 profile: 1
  Priority: 100
  Match criteria:
    Local address 1.1.1.1
    Local address GigabitEthernet1/0/1
    Local address 1:1::1:1
    Remote identity ipv4 address 3.3.3.3/32
```

```
  VRF vrf1
Inside-vrf:
Local identity: address 1.1.1.1
Local authentication method: pre-share
Remote authentication methods: pre-share
Keychain: Keychain1
Sign certificate domain:
   Domain1
   abc
Verify certificate domain:
   Domain2
   yy
SA duration: 500
DPD: Interval 32, retry 23, periodic
Config-exchange: Request, Set send, Set accept
NAT keepalive: 10
AAA authorization: Domain domain1, username ikev2
```

Table 16 Command output

Field	Description
IKEv2 profile	Name of the IKEv2 profile.
Priority	Priority of the IKEv2 profile.
Match criteria	Criteria for looking up the IKEv2 profile.
Inside-vrf	Inside VPN instance.
Local identity	ID of the local end.
Local authentication method	Method that the local end uses for authentication.
Remote authentication methods	Methods that the remote end uses for authentication.
Keychain	IKEv2 keychain that the IKEv2 profile uses.
Sign certificate domain	PKI domain used for signature generation.
Verify certificate domain	PKI domain used for verifying the remote end's certificate.
SA duration	Lifetime of the IKEv2 SA.
DPD	DPD settings: • Detection interval in seconds. • Retry interval in seconds. • Detection mode, on demand or periodically. If DPD is disabled, this field displays **Disabled**.
Config-exchange	Configuration exchange settings: • **Request**—The local end sends request messages carrying the configuration request payload during the IKE_AUTH exchange. • **Set accept**—The local end accepts the configuration set payload carried in Info messages. • **Set send**—The local end sends Info messages carrying the configuration set payload.
NAT keepalive	NAT keepalive interval in seconds.
AAA authorization	AAA authorization settings:

Field	Description
	• ISP domain name. • Username.

Parameters

name: Specifies an IKEv2 proposal by its name, a case-insensitive string of 1 to 63 characters.

default: Specifies the default IKEv2 proposal.

Usage guidelines

This command displays IKEv2 proposals in descending order of priorities. If you do not specify any parameters, this command displays the configuration of all IKEv2 proposals.

Examples

Display the configuration of all IKEv2 proposals.

```
<Sysname> display ikev2 proposal
IKEv2 proposal : 1
  Encryption: 3DES-CBC AES-CBC-128 AES-CTR-192 CAMELLIA-CBC-128
  Integrity: MD5 SHA256 AES-XCBC-MAC
  PRF: MD5 SHA256 AES-XCBC-MAC
  DH Group: MODP1024/Group2 MODP1536/Group5

IKEv2 proposal : default
  Encryption: AES-CBC-128 3DES-CBC
  Integrity: SHA1 MD5
  PRF: SHA1 MD5
  DH Group: MODP1536/Group5 MODP1024/Group2
```

Table 17 Command output

Field	Description
IKEv2 proposal	Name of the IKEv2 proposal.

Field	Description
Encryption	Encryption algorithms that the IKEv2 proposal uses.
Integrity	Integrity protection algorithms that the IKEv2 proposal uses.
PRF	PRF algorithms that the IKEv2 proposal uses.
DH Group	DH groups that the IKEv2 proposal uses.

display ikev2 sa

Use **display ikev2 sa** to display the IKEv2 SA information.

Syntax

display ikev2 sa [**count** | [{ **local** | **remote** } { *ipv4-address* | **ipv6** *ipv6-address* } [**vpn-instance** *vpn-instance-name*]] [**verbose** [**tunnel** *tunnel-id*]]]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

count: Displays the number of IKEv2 SAs.

local: Displays IKEv2 SA information for a local IP address.

remote: Displays IKEv2 SA information for a remote IP address.

ipv4-address: Specifies a local or remote IPv4 address.

ipv6 *ipv6-address*: Specifies a local or remote IPv6 address.

vpn-instance *vpn-instance-name*: Displays information about the IKEv2 SAs in an MPLS L3VPN instance. The *vpn-instance-name* argument represents the VPN instance name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command displays information about IKEv2 SAs for the public network.

verbose: Displays detailed information. If you do not specify this keyword, the command displays the summary information.

tunnel *tunnel-id*: Displays detailed IKEv2 SA information for an IPsec tunnel. The *tunnel-id* argument specifies an IPsec tunnel by its ID in the range of 1 to 2000000000.

Usage guidelines

If you do not specify any parameters, this command displays summary information about all IKEv2 SAs.

Examples

Display summary information about all IKEv2 SAs.

```
<Sysname> display ikev2 sa
     Tunnel ID          Local             Remote             Status
  ------------------------------------------------------------------------
     1                  1.1.1.1/500       1.1.1.2/500        EST
     2                  2.2.2.1/500       2.2.2.2/500        EST
  Status:
  IN-NEGO: Negotiating, EST: Established, DEL: Deleting
```

Display summary IKEv2 SA information for the remote IP address 1.1.1.2.

```
<Sysname> display ikev2 sa remote 1.1.1.2
     Tunnel ID          Local             Remote             Status
  ------------------------------------------------------------------------
     1                  1.1.1.1/500       1.1.1.2/500        EST
  Status:
  IN-NEGO: Negotiating, EST: Established, DEL: Deleting
```

Table 18 Command output

Field	Description
Tunnel ID	ID of the IPsec tunnel to which the IKEv2 SA belongs.
Local	Local IP address of the IKEv2 SA.
Remote	Remote IP address of the IKEv2 SA.
Status	Status of the IKEv2 SA: • **IN-NEGO (Negotiating)**—The IKEv2 SA is under negotiation. • **EST (Established)**—The IKEv2 SA has been set up. • **DEL (Deleting)**—The IKEv2 SA is about to be deleted.

Display detailed information about all IKEv2 SAs.

```
<Sysname> display ikev2 sa verbose

Assigned IP address: 192.168.2.24
```

Table 19 Command output

Field	Description
Tunnel ID	ID of the IPsec tunnel to which the IKEv2 SA belongs.
Local IP/Port	IP address and port number of the local security gateway.
Remote IP/Port	IP address and port number of the remote security gateway.
Outside VRF	Name of the VPN instance to which the protected outbound data flow belongs. If the protected outbound data flow belongs to the public network, this field displays a hyphen (**-**).
Inside VRF	Name of the VPN instance to which the protected inbound data flow belongs. If the protected inbound data flow belongs to the public network, this field displays a hyphen (**-**).
Local SPI	SPI that the local end uses.
Remote SPI	SPI that the remote end uses.
Local ID type	ID type of the local security gateway.
Local ID	ID of the local security gateway.
Remote ID type	ID type of the remote security gateway.
Remote ID	ID of the remote security gateway.
Auth sign method	Signature method that the IKEv2 proposal uses in authentication.
Auth verify method	Verification method that the IKEv2 proposal uses in authentication.
Integrity algorithm	Integrity protection algorithms that the IKEv2 proposal uses.
PRF algorithm	PRF algorithms that the IKEv2 proposal uses.
Encryption algorithm	Encryption algorithms that the IKEv2 proposal uses.
Life duration	Lifetime of the IKEv2 SA, in seconds.
Remaining key duration	Remaining lifetime of the IKEv2 SA, in seconds.
Diffie-Hellman group	DH groups used in IKEv2 key negotiation.
NAT traversal	Whether a NAT gateway is detected between the local and remote ends.
DPD	DPD settings: • Detection interval in seconds. • Retry interval in seconds. If DPD is disabled, this field displays **Interval 0 secs, retry interval 0 secs**.
Transmitting entity	Role of the local end in IKEv2 negotiation, initiator or responder.

Field	Description
Local window	Window size that the local end uses.
Remote window	Window size that the remote end uses.
Local request message ID	ID of the request message that the local end is about to send.
Remote request message ID	ID of the request message that the remote end is about to send.
Local next message ID	ID of the message that the local end expects to receive.
Remote next message ID	ID of the message that the remote end expects to receive.
Pushed IP address	IP address pushed to the local end by the remote end.
Assigned IP address	IP address assigned to the remote end by the local end .

Display the number of IKEv2 SAs.

```
[Sysname] display ikev2 sa count
IKEv2 SAs count: 0
```

display ikev2 statistics

context-operator

Examples

Display IKEv2 statistics.

```
<Sysname> display ikev2 statistics
IKEv2 statistics:
  Unsupported critical payload: 0
  Invalid IKE SPI: 0
  Invalid major version: 0
  Invalid syntax: 0
  Invalid message ID: 0
  Invalid SPI: 0
  No proposal chosen: 0
  Invalid KE payload: 0
  Authentication failed: 0
  Single pair required: 0
  TS unacceptable: 0
  Invalid selectors: 0
```

```
Temporary failure: 0
No child SA: 0
Unknown other notify: 0
No enough resource: 0
Enqueue error: 0
No IKEv2 SA: 0
Packet error: 0
Other error: 0
Retransmit timeout: 0
DPD detect error: 0
Del child for IPsec message: 1
Del child for deleting IKEv2 SA: 1
Del child for receiving delete message: 0
```

Related commands

reset ikev2 statistics

dpd

Use **dpd** to configure IKEv2 DPD.

Use **undo dpd** to disable IKEv2 DPD.

Syntax

dpd interval *interval* [**retry** *seconds*] { **on-demand** | **periodic** }

undo dpd interval

Default

IKEv2 DPD is disabled. The global IKEv2 DPD settings are used.

Views

IKEv2 profile view

Predefined user roles

network-admin

context-admin

Parameters

interval *interval*: Specifies a DPD triggering interval in the range of 10 to 3600 seconds.

retry *seconds* Specifies the DPD retry interval in the range of 2 to 60 seconds. The default is 5 seconds.

on-demand: Triggers DPD on demand. The device triggers DPD if it has IPsec traffic to send and has not received any IPsec packets from the peer for the specified interval.

periodic: Triggers DPD at regular intervals. The device triggers DPD at the specified interval.

Usage guidelines

DPD is triggered periodically or on-demand. As a best practice, use the on-demand mode when the device communicates with a large number of IKEv2 peers. For an earlier detection of dead peers, use the periodic triggering mode, which consumes more bandwidth and CPU.

The triggering interval must be longer than the retry interval, so that the device will not trigger a new round of DPD during a DPD retry.

Examples

Configure on-demand IKEv2 DPD. Set the DPD triggering interval to 10 seconds and the retry interval to 5 seconds.

```
<Sysname> system-view
[Sysname] ikev2 profile profile1
[Sysname-ikev2-profile-profile1] dpd interval 10 retry 5 on-demand
```

Related commands

encryption

Use **encryption** to specify encryption algorithms for an IKEv2 proposal.

Use **undo encryption** to restore the default.

Syntax

encryption { **3des-cbc** | **aes-cbc-128** | **aes-cbc-192** | **aes-cbc-256** | **aes-ctr-128** | **aes-ctr-192** | **aes-ctr-256** | **camellia-cbc-128** | **camellia-cbc-192** | **camellia-cbc-256** | **des-cbc** } *

undo encryption

Default

No encryption algorithm is specified for an IKEv2 proposal.

Views

IKEv2 proposal view

Predefined user roles

network-admin

context-admin

Parameters

3des-cbc: Specifies the 3DES algorithm in CBC mode, which uses a 168-bit key.

aes-cbc-128: Specifies the AES algorithm in CBC mode, which uses a 128-bit key.

aes-cbc-192: Specifies the AES algorithm in CBC mode, which uses a 192-bit key.

aes-cbc-256: Specifies the AES algorithm in CBC mode, which uses a 256-bit key.

aes-ctr-128: Specifies the AES algorithm in CTR mode, which uses a 128-bit key.

aes-ctr-192: Specifies the AES algorithm in CTR mode, which uses a 192-bit key.

aes-ctr-256: Specifies the AES algorithm in CTR mode, which uses a 256-bit key.

camellia-cbc-128: Specifies the Camellia algorithm in CBC mode, which uses a 128-bit key.

camellia-cbc-192: Specifies the Camellia algorithm in CBC mode, which uses a 192-bit key.

camellia-cbc-256: Specifies the Camellia algorithm in CBC mode, which uses a 256-bit key.

des-cbc: Specifies the DES algorithm in CBC mode, which uses a 56-bit key.

Usage guidelines

You must specify a minimum of one encryption algorithm for an IKEv2 proposal. Otherwise, the proposal is incomplete and useless. You can specify multiple encryption algorithms for an IKEv2 proposal. An algorithm specified earlier has a higher priority.

Examples

Specify the 168-bit 3DES algorithm in CBC mode as the encryption algorithm for IKE proposal **prop1**.

```
<Sysname> system-view
[Sysname] ikev2 proposal prop1
[Sysname-ikev2-proposal-prop1] encryption 3des-cbc
```

Related commands

ikev2 proposal

hostname

Use **hostname** to specify the host name of an IKEv2 peer.

Use **undo hostname** to restore the default.

Syntax

hostname *name*

undo hostname

Default

The IKEv2 peer's host name is not specified.

Views

IKEv2 peer view

Predefined user roles

network-admin

context-admin

Parameters

name: Specifies the host name of the IKEv2 peer, a case-insensitive string of 1 to 253 characters.

Usage guidelines

Only the initiator can look up an IKEv2 peer by host name in IKEv2 negotiation, and the initiator must use an IPsec policy rather than an IPsec profile.

Examples

Create an IKEv2 keychain named **key1**.

```
<Sysname> system-view
[Sysname] ikev2 keychain key1
```

Create an IKEv2 peer named **peer1**.

```
[Sysname-ikev2-keychain-key1] peer peer1
```

Specify host name **test** of the IKEv2 peer.

```
[Sysname-ikev2-keychain-key1-peer-peer1] hostname test
```

Related commands

ikev2 keychain

peer

identity

Use **identity** to specify the ID of an IKEv2 peer.

Use **undo identity** to restore the default.

Syntax

identity { **address** { *ipv4-address* | **ipv6** { *ipv6-address* } } | **fqdn** *fqdn-name* | **email** *email-string* | **key-id** *key-id-string* }

undo identity

Default

The IKEv2 peer's ID is not specified.

Views

IKEv2 peer view

Predefined user roles

network-admin

context-admin

Parameters

ipv4-address: Specifies the IPv4 address of the peer.

ipv6 *ipv6-address*: Specifies the IPv6 address of the peer.

fqdn *fqdn-name*: Specifies the FQDN of the peer. The *fqdn-name* argument is a case-sensitive string of 1 to 255 characters, such as www.test.com.

email *email-string*: Specifies the email address of the peer. The *email-string* argument is a case-sensitive string of 1 to 255 characters in the format defined by RFC 822, such as esec@test.com.

key-id *key-id-string*: Specifies the remote gateway's key ID. The *key-id-string* argument is a case-sensitive string of 1 to 255 characters, and is usually a vendor-specific string for doing proprietary types of identification.

Usage guidelines

Only the responder can look up an IKEv2 peer by ID in IKEv2 negotiation. The initiator does not know the peer ID when initiating the IKEv2 negotiation, so it cannot use an ID for IKEv2 peer lookup.

Examples

Create an IKEv2 keychain named **key1**.

```
<Sysname> system-view
[Sysname] ikev2 keychain key1
```

Create an IKEv2 peer named **peer1**.

```
[Sysname-ikev2-keychain-key1] peer peer1
```

Specify IPv4 address 1.1.1.2 as the ID of the IKEv2 peer.

```
[Sysname-ikev2-keychain-key1-peer-peer1] identity address 1.1.1.2
```

Related commands

ikev2 keychain

peer

identity local

Use **identity local** to configure the local ID, the ID that the device uses to identify itself to the peer during IKEv2 negotiation..

Use **undo identity local** to restore the default.

Syntax

identity local { **address** { *ipv4-address* | **ipv6** *ipv6-address* } | **dn** | **email** *email-string* | **fqdn** *fqdn-name* | **key-id** *key-id-string* }

undo identity local

Default

No local ID is configured. The IP address of the interface to which the IPsec policy is applied is used as the local ID.

Views

IKEv2 profile view

Predefined user roles

network-admin

context-admin

Parameters

address { *ipv4-address* | **ipv6** *ipv6-address* }: Uses an IPv4 or IPv6 address as the local ID.

dn: Uses the DN in the local certificate as the local ID.

email *email-string*: Uses an email address as the local ID. The *email-string* argument is a case-sensitive string of 1 to 255 characters in the format defined by RFC 822, such as sec@abc.com.

fqdn *fqdn-name*: Uses an FQDN as the local ID. The *fqdn-name* argument is a case-sensitive string of 1 to 255 characters, such as www.test.com.

key-id *key-id-string*: Uses the device's key ID as the local ID. The *key-id-string* argument is a case-sensitive string of 1 to 255 characters, and is usually a vendor-specific string for doing proprietary types of identification.

Usage guidelines

Peers exchange local IDs for identifying each other in negotiation.

Examples

Create an IKEv2 profile named **profile1**.

```
<Sysname> system-view
[Sysname] ikev2 profile profile1
```

Use IP address 2.2.2.2 as the local ID.

```
[Sysname-ikev2-profile-profile1] identity local address 2.2.2.2
```

Related commands

context-admin

Parameters

group-name: Specifies an name for the IKEv2 IPv4 address pool. The *group-name* argument is a case-insensitive string of 1 to 63 characters.

start-ipv4-address end-ipv4-address: Specifies an IPv4 address range. The *start-ipv4-address* argument specifies the start IPv4 address. The *end-ipv4-address* argument specifies the end IPv4 address.

mask: Specifies the IPv4 address mask.

mask-length: Specifies the length of the IPv4 address mask.

Usage guidelines

An IKE IPv4 address pool can contain a maximum of 8192 IPv4 addresses.

Follow these guidelines when you delete IKEv2 IPv4 address pools:

- To delete all IPv4 address pools with a designated group name, use the **undo ikev2 address-group** *group-name* command.
- To delete an IPv4 address pool that contains only one IP address, use the **undo ikev2 address-group** *group-name start-ipv4-address* command.
- To delete a specific IPv4 address pool, use the **ikev2 address-group** *group-name start-ipv4-address end-ipv4-address* command.
- If the IPv4 address pool with the specified name and address range does not exist, no address group will be deleted.

Examples

Configure an IKEv2 IPv4 address pool with name **ipv4group**, address range 1.1.1.1 to 1.1.1.2, and mask 255.255.255.0.

```
<Sysname> system-view
[Sysname] ikev2 address-group ipv4group 1.1.1.1 1.1.1.2 255.255.255.0
```

Configure an IKEv2 IPv4 address pool with name **ipv4group**, address range 1.1.1.1 to 1.1.1.2, and mask length 32.

```
<Sysname> system-view
[Sysname] ikev2 address-group ipv4group 1.1.1.1 1.1.1.2 32
```

Delete IKEv2 IPv4 address pool **ipv4group** with address range 1.1.1.1 to 1.1.1.2.

```
<Sysname> system-view
[Sysname] undo ikev2 address-group ipv4group 1.1.1.1 1.1.1.2
```

ikev2 cookie-challenge

Use **ikev2 cookie-challenge** to enable the cookie challenging feature.

Use **undo ikev2 cookie-challenge** to disable the cookie challenging feature.

Syntax

ikev2 cookie-challenge *number*

undo ikev2 cookie-challenge

Default

The cookie challenging feature is disabled.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

number: Specifies the threshold for triggering the cookie challenging feature. The value range for this argument is 0 to 1000 half-open IKE SAs.

Usage guidelines

When an IKEv2 responder maintains a threshold number of half-open IKE SAs, it starts the cookie challenging mechanism. The responder generates a cookie and includes it in the response sent to the initiator. If the initiator initiates a new IKE_SA_INIT request that carries the correct cookie, the responder considers the initiator valid and proceeds with the negotiation. If the carried cookie is incorrect, the responder terminates the negotiation.

This feature can protect the responder against DoS attacks which aim to exhaust the responder's system resources by using a large number of IKE_SA_INIT requests with forged source IP addresses.

Examples

Enable the cookie challenging feature and set the threshold to 450.

```
<Sysname> system-view
[Sysname] ikev2 cookie-challenge 450
```

ikev2 dpd

Use **ikev2 dpd** to configure global IKEv2 DPD.

Use **undo ikev2 dpd** to disable global IKEv2 DPD.

Syntax

ikev2 dpd interval *interval* [**retry** *seconds*] { **on-demand** | **periodic** }

undo ikev2 dpd interval

Default

The global IKEv2 DPD feature is disabled.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

interval *interval*: Specifies a DPD triggering interval in the range of 10 to 3600 seconds.

retry *seconds*: Specifies the DPD retry interval in the range of 2 to 60 seconds. The default is 5 seconds.

on-demand: Triggers DPD on demand. The device triggers DPD if it has IPsec traffic to send and has not received any IPsec packets from the peer for the specified interval.

periodic: Triggers DPD at regular intervals. The device triggers DPD at the specified interval.

Usage guidelines

DPD is triggered periodically or on-demand. As a best practice, use the on-demand mode when the device communicates with a large number of IKEv2 peers. For an earlier detection of dead peers, use the periodic triggering mode, which consumes more bandwidth and CPU.

The triggering interval must be longer than the retry interval, so that the device will not trigger a new round of DPD during a DPD retry.

You can configure IKEv2 DPD in both IKEv2 profile view and system view. The IKEv2 DPD settings in IKEv2 profile view apply. If you do not configure IKEv2 DPD in IKEv2 profile view, the IKEv2 DPD settings in system view apply.

Examples

Configure the device to trigger IKEv2 DPD if it has IPsec traffic to send and has not received any IPsec packets from the peer for 15 seconds.

```
<Sysname> system-view
[Sysname] ikev2 dpd interval 15 on-demand
```

Configure the device to trigger IKEv2 DPD every 15 seconds.

```
<Sysname> system-view
[Sysname] ikev2 dpd interval 15 periodic
```

dpd (IKEv2 profile view)

ikev2 ipv6-address-group

Use **ikev2 ipv6-address-group** to configure an IKEv2 IPv6 address pool for assigning IPv6 addresses to remote peers.

Use **undo ikev2 ipv6-address-group** to delete an IKEv2 IPv6 address pool.

Syntax

ikev2 ipv6-address-group *group-name* **prefix** *prefix/prefix-len* **assign-len** *assign-len*

undo ikev2 ipv6-address-group *group-name*

Default

No IKEv2 IPv6 address pools exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

group-name: Specifies a name for the IKEv2 IPv6 address pool. The *group-name* argument is a case-insensitive string of 1 to 63 characters.

prefix *prefix/prefix-len*: Specifies an IPv6 prefix in the format of *prefix*/*prefix length*. The value range for the *prefix-len* argument is 1 to 128.

assign-len *assign-len*: Specifies the assigned prefix length. The value range for the *assign-len* argument is 1 to 128, and the value must be greater than or equal to *prefix-len*. The difference between *assign-len* and *prefix-len* must be no more than 16.

Usage guidelines

Different from the IKEv2 IPv4 address pool, the device assigns an IPv6 subnet to a peer from the IKEv2 IPv6 address pool. The peer can use the assigned IPv6 subnet to assign IPv6 addresses to other devices.

IKEv2 IPv6 address pools cannot overlap with each other.

Examples

Configure an IKEv2 IPv6 address pool with name **ipv6group**, prefix 1:1::/64, and assigned prefix length 80.

```
<Sysname> system-view
[Sysname] ikev2 ipv6-address-group ipv6group prefix 1:1::/64 assign-len 80
```

Related commands

ikev2 keychain

Use **ikev2 keychain** to create an IKEv2 keychain and enter its view, or enter the view of an existing IKEv2 keychain.

Use **undo ikev2 keychain** to delete an IKEv2 keychain.

Syntax

ikev2 keychain *keychain-name*

undo ikev2 keychain *keychain-name*

Default

No IKEv2 keychains exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

keychain-name: Specifies a name for the IKEv2 keychain. The keychain name is a case-insensitive string of 1 to 63 characters and cannot contain a hyphen (-).

Usage guidelines

An IKEv2 keychain is required on both ends if either end uses preshared key authentication. The preshared key configured on both ends must be the same.

You can configure multiple IKEv2 peers in an IKEv2 keychain.

Examples

Create an IKEv2 keychain named **key1** and enter IKEv2 keychain view.

```
<Sysname> system-view
[Sysname] ikev2 keychain key1
[Sysname-ikev2-keychain-key1]
```

ikev2 nat-keepalive

Use **ikev2 nat-keepalive** to set the NAT keepalive interval.

Use **undo ikev2 nat-keepalive** to restore the default.

Syntax

ikev2 nat-keepalive *seconds*

undo ikev2 nat-keepalive

Default

The NAT keepalive interval is 10 seconds.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

seconds: Specifies the NAT keepalive interval in seconds, in the range of 5 to 3600.

Usage guidelines

This command takes effect when the device resides in the private network behind a NAT device. The device must send NAT keepalive packets regularly to its peer to keep the NAT session alive, so that the peer can access the device.

The NAT keepalive interval must be shorter than the NAT session lifetime.

Examples

Set the NAT keepalive interval to 5 seconds.

```
<Sysname> system-view
[Sysname] ikev2 nat-keepalive 5
```

ikev2 policy

Use **ikev2 policy** to create an IKEv2 policy and enter its view, or enter the view of an existing IKEv2 policy.

Use **undo ikev2 policy** to delete an IKEv2 policy.

Syntax

ikev2 policy *policy-name*

undo ikev2 policy *policy-name*

Default

An IKEv2 policy named **default** exists, which uses the default IKEv2 proposal and matches any local addresses.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

policy-name: Specifies a name for the IKEv2 policy. The policy name is a case-insensitive string of 1 to 63 characters.

Usage guidelines

Each end must have an IKEv2 policy for the IKE_SA_INIT exchange. The initiator looks up an IKEv2 policy by the IP address of the interface to which the IPsec policy is applied and the VPN instance to which the interface belongs. The responder looks up an IKEv2 policy by the IP address of the interface that receives the IKEv2 packet and the VPN instance to which the interface belongs. An IKEv2 policy uses IKEv2 proposals to define the encryption algorithms, integrity protection algorithms, PRF algorithms, and DH groups to be used for negotiation.

You can configure multiple IKEv2 policies. An IKEv2 policy must have a minimum of one IKEv2 proposal. Otherwise, the policy is incomplete.

If the initiator uses an IPsec policy that is bound to a source interface, the initiator looks up an IKEv2 policy by the IP address of the source interface.

You can set priorities to adjust the match order of IKEv2 policies that have the same match criteria.

If no IKEv2 policy is configured, the default IKEv2 policy is used. You cannot enter the view of the default IKEv2 policy, nor modify it.

Examples

Create an IKEv2 policy named **policy1** and enter IKEv2 policy view.

```
<Sysname> system-view
[Sysname] ikev2 policy policy1
[Sysname-ikev2-policy-policy1]
```

Related commands

display ikev2 policy

ikev2 profile

Use **ikev2 profile** to create an IKEv2 profile and enter its view, or enter the view of an existing IKEv2 profile.

Use **undo ikev2 profile** to delete an IKEv2 profile.

Syntax

ikev2 profile *profile-name*

undo ikev2 profile *profile-name*

Default

No IKEv2 profiles exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

profile-name: Specifies a name for the IKEv2 profile. The profile name is a case-insensitive string of 1 to 63 characters.

Usage guidelines

An IKEv2 profile contains the IKEv2 SA parameters that are not negotiated, such as the identity information and authentication methods of the peers, and the matching criteria for profile lookup.

Examples

Create an IKEv2 profile named **profile1** and enter IKEv2 profile view.

```
<Sysname> system-view
[Sysname] ikev2 profile profile1
[Sysname-ikev2-profile-profile1]
```

Related commands

display ikev2 profile

ikev2 proposal

Use **ikev2 proposal** to create an IKEv2 proposal and enter its view, or enter the view of an existing IKEv2 proposal.

Use **undo ikev2 proposal** to delete an IKEv2 proposal.

Syntax

ikev2 proposal *proposal-name*

undo ikev2 proposal *proposal-name*

Default

An IKEv2 proposal named **default** exists.

The default IKEv2 proposal has the lowest priority and uses the following settings:

- **Encryption algorithm**—AES-CBC-128 and 3DES.

- **Integrity protection algorithm**—HMAC-SHA1 and HMAC-MD5.
- **PRF algorithm**—HMAC-SHA1 and HMAC-MD5.
- **DH group**—Group 5 and group 2.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

proposal-name: Specifies a name for the IKEv2 proposal. The proposal name is a case-insensitive string of 1 to 63 characters and cannot be **default**.

Usage guidelines

An IKEv2 proposal contains security parameters used in IKE_SA_INIT exchanges, including the encryption algorithms, integrity protection algorithms, PRF algorithms, and DH groups.

An IKEv2 proposal must have a minimum of one set of security parameters, including one encryption algorithm, one integrity protection algorithm, one PRF algorithm, and one DH group.

In an IKEv2 proposal, you can specify multiple parameters of the same type. The parameters of different types combine and form multiple sets of security parameters. If you want to use only one set of security parameters, configure only one set of security parameters for the IKEv2 proposal.

Examples

Create an IKEv2 proposal named **prop1**. Specify encryption algorithm AES-CBC-128, integrity protection algorithm SHA1, PRF algorithm SHA1, and DH group 2.

```
<Sysname> system-view
[Sysname] ikev2 proposal prop1
[Sysname-ikev2-proposal-prop1] encryption aes-cbc-128
[Sysname-ikev2-proposal-prop1] integrity sha1
[Sysname-ikev2-proposal-prop1] prf sha1
[Sysname-ikev2-proposal-prop1] dh group2
```

Related commands

inside-vrf

Use **inside-vrf** to specify an inside VPN instance.

Use **undo inside-vrf** to restore the default.

Syntax

inside-vrf *vrf-name*

undo inside-vrf

Default

No inside VPN instance is specified. The internal and external networks are in the same VPN instance. The device forwards protected data to this VPN instance.

Views

IKEv2 profile view

Predefined user roles

network-admin

context-admin

Parameters

vrf-name: Specifies the VPN instance to which the protected data belongs. The *vrf-name* argument represents the VPN instance name, a case-sensitive string of 1 to 31 characters.

Usage guidelines

This command determines where the device should forward received IPsec packets after it de-encapsulates them. If you configure this command, the device looks for a route in the specified VPN instance to forward the packets. If you do not configure this command, the internal and external networks are in the same VPN instance. The device looks for a route in this VPN instance to forward the packets.

The inside VPN instance specified in an IKEv2 profile takes effect only on IPsec policies that use the IKEv2 profile. It does not take effect on IPsec profiles that use the IKEv2 profile.

Examples

Create an IKEv2 profile named **profile1**.

```
<Sysname> system-view
[Sysname] ikev2 profile profile1
```

Specify inside VPN instance **vpn1**.

```
[Sysname-ikev2-profile-profile1] inside-vrf vpn1
```

integrity

Use **integrity** to specify integrity protection algorithms for an IKEv2 proposal.

Use **undo integrity** to restore the default.

Syntax

integrity { **aes-xcbc-mac** | **md5** | **sha1** | **sha256** | **sha384** | **sha512** } *

undo integrity

Default

No integrity protection algorithm is specified for an IKEv2 proposal.

Views

IKEv2 proposal view

Predefined user roles

network-admin

context-admin

Parameters

aes-xcbc-mac: Uses the HMAC-AES-XCBC-MAC algorithm.

md5: Uses the HMAC-MD5 algorithm.

sha1: Uses the HMAC-SHA1 algorithm.

sha256: Uses the HMAC-SHA256 algorithm.

sha384: Uses the HMAC-SHA384 algorithm.

sha512: Uses the HMAC-SHA512 algorithm.

Usage guidelines

You must specify a minimum of one integrity protection algorithm for an IKEv2 proposal. Otherwise, the proposal is incomplete and useless. You can specify multiple integrity protection algorithms for an IKEv2 proposal. An algorithm specified earlier has a higher priority.

Examples

Create an IKEv2 proposal named **prop1**.

```
<Sysname> system-view
[Sysname] ikev2 proposal prop1
```

Specify HMAC-SHA1 and HMAC-MD5 as the integrity protection algorithms, with HMAC-SHA1 preferred.

```
[Sysname-ikev2-proposal-prop1] integrity sha1 md5
```

Related commands

ikev2 proposal

keychain

Use **keychain** to specify an IKEv2 keychain for preshared key authentication.

Use **undo keychain** to restore the default.

Syntax

keychain *keychain-name*

undo keychain

Default

No IKEv2 keychain is specified for an IKEv2 profile.

Views

IKEv2 profile view

Predefined user roles

network-admin

context-admin

Parameters

keychain-name: Specifies an IKEv2 keychain by its name. The keychain name is a case-insensitive string of 1 to 63 characters and cannot contain a hyphen (-).

Usage guidelines

An IKEv2 keychain is required on both ends if either end uses preshared key authentication. You can specify only one IKEv2 keychain for an IKEv2 profile.

You can specify the same IKEv2 keychain for different IKEv2 profiles.

Examples

Create an IKEv2 profile named **profile1**.

```
<Sysname> system-view
[Sysname] ikev2 profile profile1
```

Specify IKEv2 keychain **keychain1**.

```
[Sysname-ikev2-profile-profile1] keychain keychain1
```

ikev2 keychain

match local (IKEv2 profile view)

Use **match local** to specify a local interface or a local IP address to which an IKEv2 profile can be applied.

Use **undo match local** to remove a local interface or a local IP address to which an IKEv2 profile can be applied.

Syntax

match local address { *interface-type interface-number* | *ipv4-address* | **ipv6** *ipv6-address* }

undo match local address { *interface-type interface-number* | *ipv4-address* | **ipv6** *ipv6-address* }

Default

An IKEv2 profile can be applied to any local interface or IP address.

Views

IKEv2 profile view

Predefined user roles

network-admin

context-admin

Parameters

address: Specifies a local interface or IP address to which an IKEv2 profile can be applied.

interface-type interface-number: Specifies a local interface by its type and number. It can be any Layer 3 interface.

ipv4-address: Specifies the IPv4 address of a local interface.

ipv6 *ipv6-address*: Specifies the IPv6 address of a local interface.

Usage guidelines

Use this command to specify which address or interface can use the IKEv2 profile for IKEv2 negotiation. The interface is the interface that receives IKEv2 packets. The IP address is the IP address of the interface that receives IKEv2 packets.

An IKEv2 profile configured earlier has a higher priority. To give an IKEv2 profile that is configured later a higher priority, you can configure the **priority** command or this command for the profile. For example, suppose you configured IKEv2 profile A before configuring IKEv2 profile B, and you configured the **match remote identity address range 2.2.2.1 2.2.2.100** command for IKEv2 profile A and the **match remote identity address range 2.2.2.1 2.2.2.10**

command for IKEv2 profile B. For the local interface with the IP address 3.3.3.3 to negotiate with the peer 2.2.2.6, IKEv2 profile A is preferred because IKEv2 profile A was configured earlier. To use IKEv2 profile B, you can use this command to restrict the application scope of IKEv2 profile B to IPv4 address 3.3.3.3.

You can specify multiple applicable local interfaces or IP addresses for an IKEv2 profile.

Examples

Create an IKEv2 profile named **profile1**.

```
<Sysname> system-view
[Sysname] ikev2 profile profile1
```

Apply IKEv2 profile **profile1** to the interface whose IP address is 2.2.2.2.

```
[Sysname-ikev2-profile-profile1] match local address 2.2.2.2
```

Parameters

interface-type interface-number: Specifies a local interface by its type and number. It can be any Layer 3 interface.

ipv4-address: Specifies the IPv4 address of a local interface.

ipv6 *ipv6-address*: Specifies the IPv6 address of a local interface.

Usage guidelines

IKEv2 policies with this command configured are looked up before those that do not have this command configured.

Examples

Configure IKEv2 policy **policy1** to match local address 3.3.3.3.

```
<Sysname> system-view
[Sysname] ikev2 policy policy1
[Sysname-ikev2-policy-policy1] match local address 3.3.3.3
```

Related commands

display ikev2 policy

match vrf

match remote

Use **match remote** to configure a peer ID that an IKEv2 profile matches.

Use **undo match remote** to delete a peer ID that an IKEv2 profile matches.

Syntax

match remote { **certificate** *policy-name* | **identity** { **address** { { *ipv4-address* [*mask* | *mask-length*] | **range** *low-ipv4-address high-ipv4-address* } | **ipv6** { *ipv6-address* [*prefix-length*] | **range** *low-ipv6-address high-ipv6-address* } } | **fqdn** *fqdn-name* | **email** *email-string* | **key-id** *key-id-string* } }

undo match remote { **certificate** *policy-name* | **identity** { **address** { { *ipv4-address* [*mask* |*mask-length*] | **range** *low-ipv4-address high-ipv4-address* } | **ipv6** { *ipv6-address* [*prefix-length*] | **range** *low-ipv6-address high-ipv6-address* } } | **fqdn** *fqdn-name* | **email** *email-string* | **key-id** *key-id-string* } }

Default

No matching peer ID is configured for the IKEv2 profile.

Views

IKEv2 profile view

Predefined user roles

network-admin

context-admin

Parameters

certificate *policy-name*: Uses the information in the peer's digital certificate as the peer ID for IKEv2 profile matching. The *policy-name* argument specifies a certificate-based access control policy by its name, a case-insensitive string of 1 to 31 characters.

identity: Uses the specified information as the peer ID for IKEv2 profile matching. The specified information is configured on the peer by using the **identity local** command.

- **address** *ipv4-address* [*mask* | *mask-length*]: Uses an IPv4 host address or an IPv4 subnet address as the peer ID for IKEv2 profile matching. The value range for the *mask-length* argument is 0 to 32, and the default is 32.
- **address range** *low-ipv4-address high-ipv4-address*: Uses a range of IPv4 addresses as the peer ID for IKEv2 profile matching. The end address must be higher than the start address.
- **address ipv6** *ipv6-address* [*prefix-length*]: Uses an IPv6 host address or an IPv6 subnet address as the peer ID for IKEv2 profile matching. The value range for the *prefix-length* argument is 0 to 128, and the default is 128.

- **address ipv6 range** *low-ipv6-address high-ipv6-address*: Uses a range of IPv6 addresses as the peer ID for IKEv2 profile matching. The end address must be higher than the start address.
- **fqdn** *fqdn-name*: Uses the peer's FQDN as the peer ID for IKEv2 profile matching. The *fqdn-name* argument is a case-sensitive string of 1 to 255 characters, such as www.test.com.
- **email** *email-string*: Uses peer's email address as the peer ID for IKEv2 profile matching. The *email-string* argument is a case-sensitive string of 1 to 255 characters in the format defined by RFC 822, such as sec@abc.com.
- **key-id** *key-id-string*: Uses the peer's key ID as the peer ID for IKEv2 profile matching. The *key-id-string* argument is a case-sensitive string of 1 to 255 characters, and is usually a vendor-specific string for doing proprietary types of identification.

Usage guidelines

The device compares the received peer ID with the peer IDs configured in local IKEv2 profiles. If a match is found, it uses the IKEv2 profile with the matching peer ID for IKEv2 negotiation.

If the device has the **match remote**, **match vrf**, and **match local address** commands configured, it uses the IKEv2 profile that matches all the criteria configured by the commands.

To make sure only one IKEv2 profile is matched for a peer, do not configure the same peer ID for two or more IKEv2 profiles. If you configure the same peer ID for two or more IKEv2 profiles, which IKEv2 profile is selected for IKEv2 negotiation is unpredictable.

You can configure an IKEv2 profile to match multiple peer IDs. A peer ID configured earlier has a higher priority.

Examples

Create an IKEv2 profile named **profile1**.

```
<Sysname> system-view
[Sysname] ikev2 profile profile1
```

Configure the IKEv2 profile to match the peer ID that is FQDN name www.test.com.

```
[Sysname-ikev2-profile-profile1] match remote identity fqdn www.test.com
```

Configure the IKEv2 profile to match the peer ID that is IP address 10.1.1.1.

```
[Sysname-ikev2-profile-profile1]match remote identity address 10.1.1.1
```

Related commands

identity local

match local address

match vrf

match vrf (IKEv2 policy view)

Use **match vrf** to specify a VPN instance that an IKEv2 policy matches.

Use **undo match vrf** to restore the default.

Syntax

match vrf { **name** *vrf-name* | **any** }

undo match vrf

Default

No VPN instance is specified, and the IKEv2 policy matches all local IP addresses in the public network.

Views

IKEv2 policy view

Predefined user roles

network-admin

context-admin

Parameters

name *vrf-name*: Specifies a VPN instance by its name, a case-sensitive string of 1 to 31 characters.

any: Specifies the public network and all VPN instances.

Usage guidelines

Each end must have an IKEv2 policy for the IKE_SA_INIT exchange. The initiator looks up an IKEv2 policy by the IP address of the interface to which the IPsec policy is applied and the VPN instance to which the interface belongs. The responder looks up an IKEv2 policy by the IP address of the interface that receives the IKEv2 packet and the VPN instance to which the interface belongs.

IKEv2 policies with this command configured are looked up before those that do not have this command configured.

Examples

Create an IKEv2 policy named **policy1**.

```
<Sysname> system-view
[Sysname] ikev2 policy policy1
```

Configure the IKEv2 policy to match VPN instance **vpn1**.

```
[Sysname-ikev2-policy-policy1] match vrf name vpn1
```

Related commands

display ikev2 policy

match local address

match vrf (IKEv2 profile view)

Use **match vrf** to specify a VPN instance for an IKEv2 profile.

Use **undo match vrf** to restore the default.

Syntax

match vrf { **name** *vrf-name* | **any** }

undo match vrf

Default

The IKEv2 profile belongs to the public network.

Views

IKEv2 profile view

Predefined user roles

network-admin

context-admin

Parameters

name *vrf-name*: Specifies a VPN instance by its name, a case-sensitive string of 1 to 31 characters.

any: Specifies the public network and all VPN instances.

Usage guidelines

If an IKEv2 profile belongs to a VPN instance, only interfaces in the VPN instance can use the IKEv2 profile for IKEv2 negotiation. The VPN instance is the VPN instance to which the interface that receives IKEv2 packets belongs. If you specify the **any** keyword, interfaces in any VPN instance can use the IKEv2 profile for IKEv2 negotiation.

Examples

Create an IKEv2 profile named **profile1**.

```
<Sysname> system-view
[Sysname] ikev2 profile profile1
```

Specify **vrf1** as the VPN instance that the IKEv2 profile belongs to.

```
[Sysname-ikev2-profile-profile1] match vrf name vrf1
```

Related commands

match remote

nat-keepalive

Use **nat-keepalive** to set the NAT keepalive interval.

Use **undo nat-keepalive** to restore the default.

Syntax

nat-keepalive *seconds*

undo nat-keepalive

Default

The NAT keepalive interval set in system view is used.

Views

IKEv2 profile view

Predefined user roles

network-admin

context-admin

Parameters

seconds: Specifies the NAT keepalive interval in seconds, in the range of 5 to 3600.

Usage guidelines

This command takes effect when the device resides in the private network behind a NAT device. The device must send NAT keepalive packets regularly to its peer to keep the NAT session alive, so that the peer can access the device.

The NAT keepalive interval must be shorter than the NAT session lifetime.

Examples

Create an IKEv2 profile named **profile1**.

```
<Sysname> system-view
```

```
[Sysname] ikev2 profile profile1
```

Set the NAT keepalive interval to 1200 seconds.

```
[Sysname-ikev2-profile-profile1]nat-keepalive 1200
```

Related commands

peer

Use **peer** to create an IKEv2 peer and enter its view, or enter the view of an existing IKEv2 peer.

Use **undo peer** to delete an IKEv2 peer.

Syntax

peer *name*

undo peer *name*

Default

No IKEv2 peers exist.

Views

IKEv2 keychain view

Predefined user roles

network-admin

context-admin

Parameters

name: Specifies a name for the IKEv2 peer. The peer name is a case-insensitive string of 1 to 63 characters.

Usage guidelines

An IKEv2 peer contains a preshared key and the criteria for looking up the peer. The criteria for peer lookup includes the peer's host name, IP address, IP address range, and ID. The IKEv2 negotiation initiator uses the peer's host name, IP address, or IP address range to look up its peer. The responder uses the peer's IP address, IP address range, or ID to look up its peer.

Examples

Create an IKEv2 keychain named **key1** and enter IKEv2 keychain view.

```
<Sysname> system-view
[Sysname] ikev2 keychain key1
```

Create an IKEv2 peer named **peer1**.

```
[Sysname-ikev2-keychain-key1] peer peer1
```

Related commands

address

hostname

identity

ikev2 keychain

pre-shared-key

Use **pre-shared-key** to configure a preshared key.

Use **undo pre-shared-key** to delete a preshared key.

Syntax

pre-shared-key [**local** | **remote**] { **ciphertext** | **plaintext** } *string*

undo pre-shared-key [**local** | **remote**]

Default

No preshared key exists.

Views

IKEv2 peer view

Predefined user roles

network-admin

context-admin

Parameters

local: Specifies a preshared key for certificate signing.

remote: Specifies a preshared key for certificate authentication.

ciphertext: Specifies a preshared key in encrypted form.

plaintext: Specifies a preshared key in plaintext form. For security purposes, the key specified in plaintext form will be stored in encrypted form.

string: Specifies the preshared key. The key is case sensitive. Its plaintext form is a string of 1 to 128 characters and its encrypted form is a string of 1 to 201 characters.

Usage guidelines

If you specify the **local** or **remote** keyword, you configure an asymmetric key. If you specify neither the **local** nor the **remote** keyword, you configure a symmetric key.

To delete a key by using the **undo** command, you must specify the correct key type. For example, if you configure a key by using the **pre-shared-key local** command, you cannot delete the key by using the **undo pre-shared-key** or **undo pre-shared-key remote** command.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

- On the initiator:

  # Create an IKEv2 keychain named **key1**.

  ```
  <Sysname> system-view
  [Sysname] ikev2 keychain key1
  ```

  # Create an IKEv2 peer named **peer1**.

  ```
  [Sysname-ikev2-keychain-key1] peer peer1
  ```

  # Configure **111-key** as the symmetric plaintext preshared key.

  ```
  [Sysname-ikev2-keychain-key1-peer-peer1] pre-shared-key plaintext 111-key
  [Sysname-ikev2-keychain-key1-peer-peer1] quit
  ```

  # Create an IKEv2 peer named **peer2**.

  ```
  [Sysname-ikev2-keychain-key1] peer peer2
  ```

Configure asymmetric plaintext preshared keys. The key for certificate signing is **111-key-a** and the key for certificate authentication is **111-key-b**.

```
[Sysname-ikev2-keychain-key1-peer-peer2] pre-shared-key local plaintext 111-key-a
[Sysname-ikev2-keychain-key1-peer-peer2] pre-shared-key remote plaintext 111-key-b
```

- On the responder:

  # Create an IKEv2 keychain named **telecom**.

```
<Sysname> system-view
[Sysname] ikev2 keychain telecom
```

  # Create an IKEv2 peer named **peer1**.

```
[Sysname-ikev2-keychain-telecom] peer peer1
```

  # Configure **111-key** as the symmetric plaintext preshared key.

```
[Sysname-ikev2-keychain-telecom-peer-peer1] pre-shared-key plaintext 111-key
[Sysname-ikev2-keychain-telecom-peer-peer1] quit
```

  # Create an IKEv2 peer named **peer2**.

```
[Sysname-ikev2-keychain-telecom] peer peer2
```

  # Configure asymmetric plaintext preshared keys. The key for certificate signing is **111-key-b** and the key for certificate authentication is **111-key-a**.

```
[Sysname-ikev2-keychain-telecom-peer-peer2] pre-shared-key local plaintext
111-key-b
[Sysname-ikev2-keychain-telecom-peer-peer2] pre-shared-key remote plaintext
111-key-a
```

Related commands

ikev2 keychain

peer

prf

Use **prf** to specify pseudo-random function (PRF) algorithms for an IKEv2 proposal.

Use **undo prf** to restore the default.

Syntax

prf { **aes-xcbc-mac** | **md5** | **sha1** | **sha256** | **sha384** | **sha512** } *

undo prf

Default

An IKEv2 proposal uses the integrity protection algorithms as the PRF algorithms.

Views

IKEv2 proposal view

Predefined user roles

network-admin

context-admin

Parameters

aes-xcbc-mac: Uses the HMAC-AES-XCBC-MAC algorithm.

md5: Uses the HMAC-MD5 algorithm.

sha1: Uses the HMAC-SHA1 algorithm.

sha256: Uses the HMAC-SHA256 algorithm.

sha384: Uses the HMAC-SHA384 algorithm.

sha512: Uses the HMAC-SHA512 algorithm.

Usage guidelines

You can specify multiple PRF algorithms for an IKEv2 proposal. An algorithm specified earlier has a higher priority.

Examples

Create an IKEv2 proposal named **prop1**.

```
<Sysname> system-view
[Sysname] ikev2 proposal prop1
```

Specify HMAC-SHA1 and HMAC-MD5 as the PRF algorithms, with HMAC-SHA1 preferred.

```
[Sysname-ikev2-proposal-prop1] prf sha1 md5
```

Related commands

ikev2 proposal

integrity

priority (IKEv2 policy view)

Use **priority** to set a priority for an IKEv2 policy.

Use **undo priority** to restore the default.

Syntax

priority *priority*

undo priority

Default

The priority of an IKEv2 policy is 100.

Views

IKEv2 policy view

Predefined user roles

network-admin

context-admin

Parameters

priority: Specifies the priority of the IKEv2 policy, in the range of 1 to 65535. A smaller number represents a higher priority.

Usage guidelines

The priority set by this command can only be used to adjust the match order of IKEv2 policies.

Examples

Set the priority to 10 for IKEv2 policy **policy1**.

```
<Sysname> system-view
[Sysname] ikev2 policy policy1
[Sysname-ikev2-policy-policy1] priority 10
```

Related commands

Parameters

priority: Specifies the priority of the IKEv2 profile, in the range of 1 to 65535. A smaller number represents a higher priority.

Usage guidelines

The priority set by this command can only be used to adjust the match order of IKEv2 profiles.

Examples

Set the priority to 10 for IKEv2 profile **profile1**.

```
<Sysname> system-view
[Sysname] ikev2 profile profile1
[Sysname-ikev2-profile-profile1] priority 10
```

proposal

Use **proposal** to specify an IKEv2 proposal for an IKEv2 policy.

Use **undo proposal** to remove an IKEv2 proposal from an IKEv2 policy.

Syntax

proposal *proposal-name*

undo proposal *proposal-name*

Default

No IKEv2 proposal is specified for an IKEv2 policy.

Views

IKEv2 policy view

Predefined user roles

network-admin

context-admin

Parameters

proposal-name: Specifies an IKEv2 proposal by its name, a case-insensitive string of 1 to 63 characters.

Usage guidelines

You can specify multiple IKEv2 proposals for an IKEv2 policy. A proposal specified earlier has a higher priority.

Examples

Specify IKEv2 proposal **proposal1** for IKEv2 policy **policy1**.

```
<Sysname> system-view
[Sysname] ikev2 policy policy1
[Sysname-ikev2-policy-policy1] proposal proposal1
```

Related commands

display ikev2 policy

ikev2 proposal

reset ikev2 sa

Use **reset ikev2 sa** to delete IKEv2 SAs.

Syntax

reset ikev2 sa [[{ **local** | **remote** } { *ipv4-address* | **ipv6** *ipv6-address* } [**vpn-instance** *vpn-instance-name*]] | **tunnel** *tunnel-id*] [**fast**]

Views

User view

Predefined user roles

network-admin

context-admin

Parameters

local: Deletes IKEv2 SAs for a local IP address.

remote: Deletes IKEv2 SAs for a remote IP address.

ipv4-address: Specifies a local or remote IPv4 address.

ipv6 *ipv6-address*: Specifies a local or remote IPv6 address.

vpn-instance *vpn-instance-name*: Deletes IKEv2 SAs in a VPN instance. The *vpn-instance-name* argument represents the VPN instance name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command deletes IKEv2 SAs for the public network.

tunnel *tunnel-id*: Deletes IKEv2 SAs for an IPsec tunnel. The *tunnel-id* argument specifies an IPsec tunnel by its ID in the range of 1 to 2000000000.

fast: Notifies the peers of the deletion and deletes IKEv2 SAs directly before receiving the peers' responses. If you do not specify this keyword, the device notifies the peers of the deletion and deletes IKEv2 SAs after it receives the peers' responses.

Usage guidelines

Deleting an IKEv2 SA will also delete the child SAs negotiated through the IKEv2 SA.

If you do not specify any parameters, this command deletes all IKEv2 SAs and the child SAs negotiated through the IKEv2 SAs.

Examples

Display information about IKEv2 SAs.

```
<Sysname> display ikev2 sa
     Tunnel ID          Local             Remote             Status
  ----------------------------------------------------------------------
     1                  1.1.1.1/500       1.1.1.2/500        EST
     2                  2.2.2.1/500       2.2.2.2/500        EST
  Status:
  IN-NEGO: Negotiating, EST: Established, DEL: Deleting
```

Delete the IKEv2 SA whose remote IP address is 1.1.1.2.

```
<Sysname> reset ikev2 sa remote 1.1.1.2
```

Display information about IKEv2 SAs again. Verify that the IKEv2 SA is deleted.

```
<Sysname> display ikev2 sa
     Tunnel ID          Local             Remote             Status
  ----------------------------------------------------------------------
     2                  2.2.2.1/500       2.2.2.2/500        EST
  Status:
  IN-NEGO: Negotiating, EST: Established, DEL: Deleting
```

Related commands

`display ikev2 sa`

reset ikev2 statistics

Use **`reset ikev2 statistics`** to clear IKEv2 statistics.

Syntax

`reset ikev2 statistics`

context-admin

Examples

Clear IKEv2 statistics.

```
<Sysname> reset ikev2 statistics
```

Related commands

`display ikev2 statistics`

sa duration

Use **sa duration** to set the IKEv2 SA lifetime.

Use **undo sa duration** to restore the default.

Syntax

sa duration *seconds*

undo sa duration

Default

The IKEv2 SA lifetime is 86400 seconds.

Views

IKEv2 profile view

Predefined user roles

network-admin

context-admin

Parameters

seconds: Specifies the IKEv2 SA lifetime in seconds, in the range of 120 to 86400.

Usage guidelines

An IKEv2 SA can be used for subsequent IKEv2 negotiations before its lifetime expires, saving a lot of negotiation time. However, the longer the lifetime, the higher the possibility that attackers collect enough information and initiate attacks.

Two peers can have different IKEv2 SA lifetime settings, and they do not perform lifetime negotiation. The peer with a shorter lifetime always initiates the rekeying.

Examples

Create an IKEv2 profile named **profile1**.

```
<Sysname> system-view
[Sysname] ikev2 profile profile1
```

Set the IKEv2 SA lifetime to 1200 seconds.

```
[Sysname-ikev2-profile-profile1] sa duration 1200
```

Related commands

display ikev2 profile

Contents

ADVPN commands

VAM server commands

The following compatibility matrixes show the support of hardware platforms for VAM server:

Models	VAM server compatibility
NFNX5-HD6480, NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB1780, NFNX3-HDB3080	Yes
NFNX3-HDB1180, NFNX3-HDB1480, NFNX3-HDB680, NFNX3-HDB1080	No

authentication-algorithm

Use **authentication-algorithm** to specify the algorithms for VAM protocol packet authentication and their priorities.

Use **undo authentication-algorithm** to restore the default.

Syntax

authentication-algorithm { **aes-xcbc-mac** | **md5** | **none** | **sha-1** | **sha-256** } *

undo authentication-algorithm

Default

SHA-1 is used for protocol packet authentication.

Views

ADVPN domain view

Predefined user roles

network-admin

context-admin

Parameters

aes-xcbc-mac: Uses the AES-XCBC-MAC authentication algorithm.

md5: Uses the MD5 authentication algorithm.

none: Performs no authentication.

sha-1: Uses the SHA-1 authentication algorithm.

sha-256: Uses the SHA-256 authentication algorithm.

Usage guidelines

The VAM server and client use SHA-1 for connection request and response packet authentication, and use the negotiated algorithms for negotiation acknowledgment and subsequent VAM protocol packet authentication.

An authentication algorithm specified earlier by using this command has a higher priority during algorithm negotiation between a VAM server and a client. The VAM server compares its algorithms

in descending order of priority with the algorithms sent by the client, and sends the matching algorithm with the highest priority to the client.

The configuration of this command does not affect registered VAM clients. It applies to subsequently registered VAM clients.

Examples

Specify the authentication algorithms as MD5, SHA-1, and SHA-256 in descending order of priority for ADVPN domain 1.

```
<Sysname> system-view
[Sysname] vam server advpn-domain 1
[Sysname-vam-server-domain-1] authentication-algorithm md5 sha-1 sha-256
```

authentication-method

Use **authentication-method** to specify an authentication mode that the VAM server uses to authenticate clients.

Use **undo authentication-method** to restore the default.

Syntax

authentication-method { **none** | { **chap** | **pap** } [**domain** *isp-name*] }

undo authentication-method

Default

The authentication method is CHAP, and the default domain is used.

Views

ADVPN domain view

Predefined user roles

network-admin

context-admin

Parameters

none: Performs no authentication on clients.

chap: Performs CHAP authentication.

pap: Performs PAP authentication.

domain *isp-name*: Specifies an ISP domain for authentication. The *isp-name* argument is a case-insensitive string of 1 to 255 characters. It cannot include back slashes (\), vertical bars (|), slashes (/), colons (:), asterisks (*), question marks (?), quotation marks ("), left angle brackets (<), right angle brackets (>), and at signs (@). If you do not specify this option, the default domain is used for authentication.

Usage guidelines

If the specified ISP domain does not exist, the authentication will fail.

A newly configured authentication method does not affect registered VAM clients. It applies to subsequently registered VAM clients.

Examples

Configure the VAM server to use CHAP to authenticate clients.

```
<Sysname> system-view
[Sysname] vam server advpn-domain 1
```

```
[Sysname-vam-server-domain-1] authentication-method chap
```

display vam server address-map

Use **display vam server address-map** to display IPv4 private-public address mapping information for VAM clients registered with the VAM server.

Syntax

display vam server address-map [**advpn-domain** *domain-name* [**private-address** *private-ip-address*]] [**verbose**]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

advpn-domain *domain-name*: Displays IPv4 address mapping information for VAM clients in the specified ADVPN domain. The *domain-name* argument is a case-insensitive string of 1 to 31 characters that can include only letters, digits, and dots (.). If you do not specify this option, the command displays address mapping information for VAM clients in all ADVPN domains.

private-address *private-ip-address*: Displays IPv4 address mapping information for the VAM client with the specified private IPv4 address. If you do not specify this option, the command displays mapping information for VAM clients in the specified domain or all ADVPN domains.

verbose: Displays detailed address mapping information. If you do not specify this keyword, the command displays brief address mapping information.

Examples

Display IPv4 address mapping information for VAM clients in all ADVPN domains.

```
<Sysname> display vam server address-map

Table 2 Command output

Field	Description
Private address	Private address that the VAM client has registered with the VAM server.
Type	VAM client type: **Hub** or **Spoke**.
Hub group	Hub group to which the VAM client belongs.
Holding time	Duration time that elapses since the VAM client successfully registered with the server, in the format of xH yM zS.
Link protocol	Link layer protocol used by the VAM client for ADVPN tunnel establishment: • **UDP**. • **GRE**. • **IPsec-UDP**. • **IPsec-GRE**.
Public address	VAM client's public IP address that has been NATed.
Public port	VAM client's ADVPN port number that has been NATed. This field is displayed when the **Link protocol** is **UDP** or **IPsec-UDP**.
Registered address	Public address that the VAM client has registered with the VAM server.

Field	Description
Registered port	ADVPN port number that the VAM client has registered with the VAM server. This field is displayed when the **Link protocol** is **UDP** or **IPsec-UDP**.
IPsec address	IP address used by the VAM client for IPsec tunnel establishment. This field is displayed when the **Link protocol** is **IPsec-UDP** or **IPsec-GRE**.
IPsec port	UDP port number used by the VAM client for IPsec tunnel establishment. This field is displayed when the **Link protocol** is **IPsec-UDP** or **IPsec-GRE**.
Behind NAT	Whether NAT traversal is used: **No** or **Yes**.

Related commands

reset vam server address-map

display vam server ipv6 address-map

Use **display vam server ipv6 address-map** to display IPv6 private-public address mapping information for VAM clients registered with the VAM server.

Syntax

display vam server ipv6 address-map [**advpn-domain** *domain-name* [**private-address** *private-ipv6-address*]] [**verbose**]

Parameters

advpn-domain *domain-name*: Displays IPv6 address mapping information for VAM clients in the specified ADVPN domain. The *domain-name* argument is a case-insensitive string of 1 to 31 characters that can include only letters, digits, and dots (.). If you do not specify this option, the command displays address mapping information for VAM clients in all ADVPN domains.

private-address *private-ipv6-address*: Displays IPv6 address mapping information for the VAM client with the specified private IPv6 address. If you do not specify this option, the command displays mapping information for VAM clients in the specified domain or all ADVPN domains.

verbose: Displays detailed address mapping information. If you do not specify this keyword, the command displays brief address mapping information.

Examples

Display IPv6 address mapping information for VAM clients in all ADVPN domains.

```
<Sysname> display vam server ipv6 address-map
ADVPN domain name: 1
Total private address mappings: 2
Group      Private address       Public address         Type   NAT  Holding time
```

```
1          1000::1:0:0:1         2001::1               Hub    No   0H 13M 34S
2          1000::2:0:0:1         220.181.111.85        Spoke  Yes  0H 4M 21S

ADVPN domain name: 2
Total private address mappings: 0

ADVPN domain name: 3
Total private address mappings: 1
Group      Private address       Public address        Type   NAT  Holding time
1          1003::1:0:0:1         3001::1               Hub    No   0H 0M 2S

ADVPN domain name: 4
Total private address mappings: 1
Group      Private address       Public address        Type   NAT  Holding time
1          1004::1:0:0:1         202.108.231.125       Hub    No   1H 8M 22S

ADVPN domain name: 5
Total private address mappings: 1

Table 4 Command output

Field	Description
Private address	Private address that the VAM client has registered with the VAM server.
Link local address	Link local address that the VAM client has registered with the VAM server.
Type	VAM client type: **Hub** or **Spoke**.
Hub group	Hub group to which the VAM client belongs.
Holding time	Duration time that elapses since the VAM client successfully registered with the server, in the format of xH yM zS.
Link protocol	Link layer protocol used by the VAM client for ADVPN tunnel establishment: • **UDP**. • **GRE**. • **IPsec-UDP**. • **IPsec-GRE**.
Public address	VAM client's public IP address that has been NATed.
Public port	VAM client's ADVPN port number that has been NATed. This field is displayed when the **Link protocol** is **UDP** or **IPsec-UDP**.
Registered address	Public address that the VAM client has registered with the VAM server.
Registered port	ADVPN port number that the VAM client has registered with the VAM server. This field is displayed when the **Link protocol** is **UDP** or **IPsec-UDP**.
IPsec address	IP address used by the VAM client for IPsec tunnel establishment. This field is displayed when the **Link protocol** is **IPsec-UDP** or **IPsec-GRE**.
IPsec port	UDP port number used by the VAM client for IPsec tunnel establishment. This field is displayed when the **Link protocol** is **IPsec-UDP** or **IPsec-GRE**.
Behind NAT	Whether NAT traversal is used: **No** or **Yes**.

Field	Description
Server status	Whether the VAM server is enabled: **Enabled** or **Disabled**.
Holding time	Duration time that elapses after the VAM service is enabled, in the format of xH yM zS.

Related commands

reset vam server statistics

encryption-algorithm

Use **encryption-algorithm** to specify the algorithms for VAM protocol packet encryption and their priorities.

Use **undo encryption-algorithm** to restore the default.

Syntax

encryption-algorithm { **3des-cbc** | **aes-cbc-128** | **aes-cbc-192** | **aes-cbc-256** | **aes-ctr-128** | **aes-ctr-192** | **aes-ctr-256** | **des-cbc** | **none** } *

undo encryption-algorithm

Default

The following encryption algorithms are available (in descending order of priority):

- AES-CBC-256
- AES-CBC-192
- AES-CBC-128
- AES-CTR-256
- AES-CTR-192
- AES-CTR-128
- 3DES-CBC

- DES-CBC

Views

ADVPN domain view

Predefined user roles

network-admin

context-admin

Parameters

3des-cbc: Uses the 3DES-CBC encryption algorithm.

aes-cbc-128: Uses the AES-CBC encryption algorithm, with a key length of 128 bits.

aes-cbc-192: Uses the AES-CBC encryption algorithm, with a key length of 192 bits.

aes-cbc-256: Uses the AES-CBC encryption algorithm, with a key length of 256 bits.

aes-ctr-128: Uses the AES-CTR encryption algorithm, with a key length of 128 bits.

aes-ctr-192: Uses the AES-CTR encryption algorithm, with a key length of 192 bits.

aes-ctr-256: Uses the AES-CTR encryption algorithm, with a key length of 256 bits.

des-cbc: Uses the DES-CBC encryption algorithm.

none: Performs no encryption.

Usage guidelines

The VAM server and client use AES-CBC-128 for connection request and response packet encryption, and use the negotiated algorithms for negotiation acknowledgment and subsequent VAM protocol packet encryption.

An encryption algorithm specified earlier by using this command has a higher priority during algorithm negotiation between a VAM server and a client. The VAM server compares its algorithms in descending order of priority with the algorithms sent by the client, and sends the matching algorithm with the highest priority to the client.

The configuration of this command does not affect registered VAM clients. It applies to subsequently registered VAM clients.

Examples

Specify the encryption algorithms as AES-CBC-128 and 3DES-CBC for ADVPN domain 1, where AES-CBC-128 has a higher priority.

```
<Sysname> system-view
[Sysname] vam server advpn-domain 1
[Sysname-vam-server-domain-1] encryption-algorithm aes-cbc-128 3des-cbc
```

hub ipv6 private-address

Use **hub ipv6 private-address** to configure a hub private IPv6 address in a hub group.

Use **undo hub ipv6 private-address** to remove a hub private IPv6 address from a hub group.

Syntax

hub ipv6 private-address *private-ipv6-address* [**public-address** { *public-ipv4-address* | *public-ipv6-address* } [**advpn-port** *port-number*]]

undo hub ipv6 private-address *private-ipv6-address*

Default

No hub private IPv6 address is configured.

Views

Hub group view

Predefined user roles

network-admin

context-admin

Parameters

*private-ipv6-address*s: Specifies the private IPv6 address of a hub. The address must be a global unicast address.

public-address: Specifies the public address of the hub. If you do not specify this keyword, the VAM server uses the public address registered by the hub.

public-ipv4-address: Specifies the public IPv4 address of the hub. The address must be a unicast address.

public-ipv6-address: Specifies the public IPv6 address of the hub. The address must be a global unicast address.

advpn-port *port-number*: Specifies the ADVPN port number of the hub, in the range of 1025 to 65535. If you do not specify this option, the VAM server uses the port number registered by the hub.

Usage guidelines

For a hub to traverse a NAT gateway, configure a static mapping between the hub's registered public address/ADVPN port number and a NATed address/port number on the NAT gateway. To use this command to add the hub to a hub group, specify the NATed address and port number as the public address and ADVPN port number.

You can configure multiple hub private IPv6 addresses for a hub group.

If you execute this command multiple times for a private IPv6 address, the most recent configuration takes effect.

Examples

Add a hub to hub group 1 in ADVPN domain 1 with private IPv6 address 1000::1:0:0:1, public IPv6 address 2001::1, and ADVPN port number 8000.

```
<Sysname> system-view
[Sysname] vam server advpn-domain 1
[Sysname-vam-server-domain-1] hub-group 1
[Sysname-vam-server-domain-1-hub-group-1] hub ipv6 private-address 1000::1:0:0:1
public-address 2001::1 advpn-port 8000
```

hub private-address

Use **hub private-address** to configure a hub private IPv4 address in a hub group.

Use **undo hub private-address** to remove a hub private IPv4 address from a hub group.

Syntax

hub private-address *private-ip-address* [**public-address** { *public-ipv4-address* | *public-ipv6-address* } [**advpn-port** *port-number*]]

undo hub private-address *private-ip-address*

Default

No hub private IPv4 address is configured.

Views

Hub group view

Predefined user roles

network-admin

context-admin

Parameters

private-ip-address: Specifies the private IPv4 address of a hub. The address must be a unicast address.

public-address: Specifies the public address of the hub. If you do not specify this keyword, the VAM server uses the public address registered by the hub.

public-ipv4-address: Specifies the public IPv4 address of the hub. The address must be a unicast address.

public-ipv6-address: Specifies the public IPv6 address of the hub. The address must be a global unicast address.

advpn-port *port-number*: Specifies the ADVPN port number of the hub, in the range of 1025 to 65535. If you do not specify this option, the VAM server uses the port number registered by the hub.

Usage guidelines

For a hub to traverse a NAT gateway, configure a static mapping between the hub's registered public address/ADVPN port number and a NATed address/port number on the NAT gateway. To use this command to add the hub to a hub group, specify the NATed address and port number as the public address and ADVPN port number.

You can configure a maximum of four hub private IPv4 addresses for a hub group.

If you execute this command multiple times for a private IPv4 address, the most recent configuration takes effect.

Examples

Add a hub to hub group 1 in ADVPN domain 1 with private IPv4 address 10.1.1.1, public IPv4 address 123.0.0.1, and ADVPN port number 8000.

```
<Sysname> system-view
[Sysname] vam server advpn-domain 1
[Sysname-vam-server-domain-1] hub-group 1
[Sysname-vam-server-domain-1-hub-group-1] hub private-address 10.1.1.1 public-address
123.0.0.1 advpn-port 8000
```

hub-group

Use **hub-group** to create a hub group and enter its view, or enter the view of an existing hub group.

Use **undo hub-group** to delete a hub group.

Syntax

hub-group *group-name*

undo hub-group *group-name*

Default

No hub groups exist.

Views

ADVPN domain view

Predefined user roles

network-admin

context-admin

Parameters

group-name: Specifies a group by its name. A group name is a case-insensitive string of 1 to 31 characters that can include only letters, digits, and dots (.).

Usage guidelines

Hub groups apply to large ADVPN networks. You can classify spokes to different hub groups, and specify one or more hubs for each group.

When a VAM client registers with the VAM server, the VAM server selects a hub group for the client as follows:

1. The server matches the private address of the client against the private addresses of hubs in different hub groups in lexicographic order.
2. If a match is found, the server assigns the client to the hub group as a hub.
3. If no match is found, the server matches the client's private address against the private addresses of spokes in different hub groups in lexicographic order.
4. If a match is found, the server assigns the client to the hub group as a spoke.
5. If no match is found, the registration fails.

The VAM server only assigns hub information in the matching hub group to the client. The client only establishes permanent ADVPN tunnels to the hubs in the matching hub group.

Examples

Create hub group 1 in ADVPN domain 1, and enter hub group view.

```
<Sysname> system-view
[Sysname] vam server advpn-domain 1
[Sysname-vam-server-domain-1] hub-group 1
[Sysname-vam-server-domain-1-hub-group-1]
```

keepalive

Use **keepalive** to set a keepalive interval and a maximum number of keepalive retries for VAM clients.

Use **undo keepalive** to restore the default.

Syntax

keepalive interval *interval* **retry** *retries*

undo keepalive

Default

The keepalive interval is 180 seconds and the maximum number of keepalive retries is 3.

Views

ADVPN domain view

Predefined user roles

network-admin

context-admin

Parameters

interval *interval*: Specifies the keepalive interval in the range of 5 to 65535 seconds.

retry *retries*: Specifies the maximum number of keepalive retries, in the range of 1 to 6.

Usage guidelines

The VAM server assigns the configured keepalive parameters to clients in the ADVPN domain.

A client sends keepalives to the server at the specified interval. If a client receives no responses from the server after maximum keepalive attempts (keepalive retries + 1), the client stops sending keepalives. If the VAM server receives no keepalives from a client before the timeout timer expires, the server removes information about the client and logs off the client. The timeout time is the product of the keepalive interval and keepalive attempts.

Newly configured keepalive parameters do not affect registered VAM clients. They apply to subsequently registered clients.

If a device configured with dynamic NAT exists between the VAM server and VAM clients, configure the keepalive interval to be shorter than the aging time of NAT entries.

Configure proper values for the keepalive parameters depending on the network condition.

Examples

Set the keepalive interval for VAM clients in ADVPN domain 1 to 30 seconds, and the maximum number of keepalive retries to 5.

```
<Sysname> system-view
[Sysname] vam server advpn-domain 1
[Sysname-vam-server-domain-1] keepalive interval 30 retry 5
```

pre-shared-key (ADVPN domain view)

Use **pre-shared-key** to configure a preshared key for the VAM server.

Use **undo pre-shared-key** to remove the configuration.

Syntax

pre-shared-key { **cipher** | **simple** } *string*

undo pre-shared-key

Default

No preshared key is configured.

Views

ADVPN domain view

Predefined user roles

network-admin

context-admin

Parameters

cipher: Specifies a preshared key in encrypted form.

simple: Specifies a preshared key in plaintext form. For security purposes, the key specified in plaintext form will be stored in encrypted form.

string: Specifies the preshared key. Its plaintext form is a case-sensitive string of 1 to 31 characters. Its encrypted form is a case-sensitive string of 1 to 73 characters.

Usage guidelines

The preshared key is used to generate initial encryption and authentication keys during connection initialization. It is also used to generate encryption and authentication keys for subsequent packets if encryption and authentication are needed.

The VAM server and all clients in an ADVPN domain must have the same preshared key.

Examples

Set the key to **123** in plaintext form for the VAM server in ADVPN domain 1.

```
<Sysname> system-view
[Sysname] vam server advpn-domain 1
[Sysname-vam-server-domain-1] pre-shared-key simple 123
```

Related commands

pre-shared-key (VAM client view)

reset vam server address-map

Use **reset vam server address-map** to clear IPv4 private-public address mapping information for VAM clients registered with the VAM server.

Syntax

reset vam server address-map [**advpn-domain** *domain-name* [**private-address** *private-ip-address*]]

Views

User view

Predefined user roles

network-admin

context-admin

Parameters

advpn-domain *domain-name*: Clears IPv4 address mapping information for VAM clients in the specified ADVPN domain. The *domain-name* argument is a case-insensitive string of 1 to 31 characters that can include only letters, digits, and dots (.). If you do not specify this option, the command clears address mapping information for VAM clients in all ADVPN domains.

private-address *private-ip-address*: Clears IPv4 address mapping information for the VAM client with the specified private IPv4 address. If you do not specify this option, the command clears address mapping information for VAM clients in the specified domain or all ADVPN domains.

Usage guidelines

CAUTION:

When this command is executed, the system sends an error notification to VAM clients that have registered the private IPv4 addresses and logs off the clients.

Executing this command also clears IPv4 private network information for the private IPv4 addresses.

Examples

Clear IPv4 address mapping information for clients in all ADVPN domains.

```
<Sysname> reset vam server address-map
```

Clear IPv4 address mapping information for clients in ADVPN domain 1.

```
<Sysname> reset vam server address-map advpn-domain 1
```

Clear IPv4 address mapping information for the client with private IPv4 address 10.0.0.1 in ADVPN domain 1.

```
<Sysname> reset vam server address-map advpn-domain 1 private-address 10.0.0.1
```

Related commands

display vam server address-map

reset vam server ipv6 address-map

Use **reset vam server ipv6 address-map** to clear IPv6 private-public address mapping information for VAM clients registered with the VAM server.

Syntax

reset vam server ipv6 address-map [**advpn-domain** *domain-name* [**private-address** *private-ipv6-address*]]

Views

User view

Predefined user roles

network-admin

context-admin

Parameters

advpn-domain *domain-name*: Clears IPv6 address mapping information for VAM clients in the specified ADVPN domain. The *domain-name* argument is a case-insensitive string of 1 to 31 characters that can include only letters, digits, and dots (.). If you do not specify this option, the command clears address mapping information for VAM clients in all ADVPN domains.

private-address *private-ipv6-address*: Clears IPv6 address mapping information for the VAM client with the specified private IPv6 address. If you do not specify this option, the command clears address mapping information for VAM clients in the specified domain or all ADVPN domains.

Usage guidelines

CAUTION:

When this command is executed, the system sends an error notification to VAM clients that have registered the private IPv6 addresses and logs off the clients.

Executing this command also clears IPv6 private network information for the private IPv6 addresses.

Examples

Clear IPv6 address mapping information for clients in all ADVPN domains.

```
<Sysname> reset vam server ipv6 address-map
```

Clear IPv6 address mapping information for clients in ADVPN domain 1.

```
<Sysname> reset vam server ipv6 address-map advpn-domain 1
```

Clear IPv6 address mapping information for the client with private IPv6 address 1000::1:0:0:1 in ADVPN domain 1.

```
<Sysname> reset vam server ipv6 address-map advpn-domain 1 private-address 1000::1:0:0:1
```

Related commands

display vam server ipv6 address-map

reset vam server statistics

Use **reset vam server statistics** to clear ADVPN domain statistics on the VAM server.

Syntax

reset vam server statistics [**advpn-domain** *domain-name*]

Views

User view

Predefined user roles

network-admin

context-admin

Parameters

advpn-domain *domain-name*: Clears statistics for the specified ADVPN domain. The *domain-name* argument is a case-insensitive string of 1 to 31 characters that can include only letters, digits, and dots (.). If you do not specify this option, the command clears statistics for all ADVPN domains on the server.

Examples

Clear statistics for ADVPN domain **abc**.

```
<Sysname> reset vam server statistics advpn-domain abc
```

Clear statistics for all ADVPN domains.

```
<Sysname> reset vam server statistics
```

Related commands

display vam server statistics

retry interval

Use **retry interval** to set the retry timer for the VAM server.

Use **undo retry interval** to restore the default.

Syntax

retry interval *interval*

undo retry interval

Default

The retry timer is 5 seconds.

Views

ADVPN domain view

Predefined user roles

network-admin

context-admin

Parameters

interval: Specifies the retry timer in the range of 3 to 30 seconds.

Usage guidelines

The VAM server starts the retry timer after it sends a request to a client. If the server receives no response from the client before the retry timer expires, the server resends the request. The server stops sending the request after receiving a response from the client or after the timeout timer (product of the keepalive interval and keepalive attempts) expires.

Examples

Set the retry timer to 20 seconds for the VAM server in ADVPN domain 1.

```
<Sysname> system-view
[Sysname] vam server advpn-domain 1
[Sysname-vam-server-domain-1] retry interval 20
```

server enable

Use **server enable** to enable the VAM server for an ADVPN domain.

Use **undo server enable** to disable the VAM server for an ADVPN domain.

Syntax

server enable

undo server enable

Default

The VAM server is disabled for an ADVPN domain.

Views

ADVPN domain view

Predefined user roles

network-admin

context-admin

Usage guidelines

You can also execute the **vam server enable** command in system view to enable the VAM server for one or all ADVPN domains.

Examples

Enable the VAM server for ADVPN domain 1.

```
<Sysname> system-view
[Sysname] vam server advpn-domain 1
[Sysname-vam-server-domain-1] server enable
```

Related commands

vam server enable

shortcut interest

Use **shortcut interest** to specify an ACL to control establishing IPv4 spoke-to-spoke tunnels.

Use **undo shortcut interest** to restore the default.

Syntax

shortcut interest { **acl** { *acl-number* | **name** *acl-name* } **all** }

undo shortcut interest

Default

Spokes are not allowed to establish direct tunnels.

Views

Hub group view

Predefined user roles

network-admin

context-admin

Parameters

acl: Specifies an ACL to control establishing IPv4 spoke-to-spoke tunnels.

acl-number: Specifies an IPv4 ACL by its number:

- 2000 to 2999 for IPv4 basic ACLs.
- 3000 to 3999 for IPv4 advanced ACLs.

name *acl-name*: Specifies an ACL by its name. An ACL name is a case-insensitive string of 1 to 63 characters. It must start with an English letter and to avoid confusion, it cannot be **all**.

all: Allows establishing IPv4 spoke-to-spoke tunnels between all spokes in different hub groups.

Usage guidelines

The VAM server assigns the specified ACL to an online hub. When receiving an IPv4 spoke-to-spoke packet from a spoke, the hub sends a redirect packet to the spoke if **all** is specified or if the packet matches an ACL rule. Then, the spoke sends the VAM server the destination address of the packet, obtains the remote spoke information, and establishes a direct tunnel to the remote spoke.

After a spoke-spoke tunnel is established, the spokes directly exchange packets.

When you specify an IPv4 ACL, follow these guidelines:

- If the ACL does not exist, the configuration does not take effect. The hub does not send any redirect packets to the spoke.
- If the ACL is an IPv4 basic ACL, this command supports only rules that match source addresses.
- If the ACL is an IPv4 advanced ACL, this command supports rules that match protocol numbers, source/destination addresses, and source/destination ports. It does not support rules that exclude a source/destination port.
- If the ACL contains an unsupported rule, the rule does not take effect.

Examples

Specify ACL 3000 to control establishing IPv4 spoke-to-spoke tunnels.

```
<Sysname> system-view
[Sysname] vam server advpn-domain 1
[Sysname-vam-server-domain-1] hub-group 1
[Sysname-vam-server-domain-1-hub-group-1] shortcut interest acl 3000
```

shortcut ipv6 interest

Use **shortcut ipv6 interest** to specify an ACL to control establishing IPv6 spoke-to-spoke tunnels.

Use **undo shortcut ipv6 interest** to restore the default.

Syntax

shortcut ipv6 interest { **acl** { *ipv6-acl-number* | **name** *ipv6-acl-name* } **all** }

undo shortcut ipv6 interest

Default

Spokes are not allowed to establish direct tunnels.

Views

Hub group view

Parameters

acl: Specifies an ACL to control establishing IPv6 spoke-to-spoke tunnels.

ipv6-acl-number: Specifies an IPv6 ACL by its number:

- 2000 to 2999 for IPv6 basic ACLs.
- 3000 to 3999 for IPv6 advanced ACLs.

name *ipv6-acl-name*: Specifies an IPv6 ACL by its name. An IPv6 ACL name is a case-insensitive string of 1 to 63 characters. It must start with an English letter and to avoid confusion, it cannot be **all**.

all: Allows establishing IPv6 spoke-to-spoke tunnels between all spokes in different hub groups.

Usage guidelines

The VAM server assigns the specified ACL to an online hub. When receiving an IPv6 spoke-to-spoke packet from a spoke, the hub sends a redirect packet to the spoke if **all** is specified or if the packet matches an ACL rule. Then, the spoke sends the destination address of the packet to the VAM server, obtains the remote spoke information, and establishes a direct tunnel to the remote spoke.

After a spoke-spoke tunnel is established, the spokes directly exchange packets.

When you specify an IPv6 ACL, follow these guidelines:

- If the ACL does not exist, the configuration does not take effect. The hub does not send any redirect packets to the spoke.
- If the ACL is an IPv6 basic ACL, this command supports only rules that match source addresses.
- If the ACL is an IPv6 advanced ACL, this command supports rules that match protocol numbers, source/destination addresses, and source/destination ports. It does not support rules that exclude a source/destination port.
- If the ACL contains an unsupported rule, the rule does not take effect.

Examples

Specify ACL 3000 to control establishing IPv6 spoke-to-spoke tunnels.

```
<Sysname> system-view
[Sysname] vam server advpn-domain 1
[Sysname-vam-server-domain-1] hub-group 1
[Sysname-vam-server-domain-1-hub-group-1] shortcut ipv6 interest acl 3000
```

spoke ipv6 private-address

Use **spoke ipv6 private-address** to configure a spoke private IPv6 address range in a hub group.

Use **undo ipv6 spoke private-address** to delete a spoke private IPv6 address range in a hub group.

Syntax

spoke ipv6 private-address { **network** *prefix prefix-length* | **range** *start-ipv6-address end-ipv6-address* }

undo spoke ipv6 private-address { **network** *prefix prefix-length* | **range** *start-ipv6-address end-ipv6-address* }

Default

No spoke private IPv6 address range is configured.

Views

Hub group view

Predefined user roles

network-admin

context-admin

Parameters

network *prefix prefix-length*: Specifies a prefix and prefix length. The value range for *prefix-length* is 0 to 128.

range *start-ipv6-address end-ipv6-address*: Specifies a start IPv6 address and an end IPv6 address.

Usage guidelines

If you specify a prefix and prefix length, the system automatically transforms them to a start address and an end address.

You can configure multiple spoke private IPv6 address ranges in a hub group. The ranges are listed from low to high.

The spoke private IPv6 address range to be deleted must be the same as the configured one.

Examples

Configure a spoke private IPv6 address range in IPv6 network address format as 1000::/64 for hub group 1.

```
<Sysname> system-view
[Sysname] vam server advpn-domain 1
[Sysname-vam-server-domain-1] hub-group 1
[Sysname-vam-server-domain-1-hub-group-1] spoke ipv6 private-address network 1000:: 64
```

spoke private-address

Use **spoke private-address** to configure a spoke private IPv4 address range in a hub group.

Use **undo spoke private-address** to delete a spoke private IPv4 address range in a hub group.

Syntax

spoke private-address { **network** *ip-address* { *mask-length* | *mask* } | **range** *start-ipv4-address end-ipv4-address* }

undo spoke private-address { **network** *ip-address* { *mask-length* | *mask* } | **range** *start-ipv4-address end-ipv4-address* }

Default

No spoke private IPv4 address range is configured.

Views

Hub group view

Predefined user roles

network-admin

context-admin

Parameters

network *ip-address* { *mask-length* | *mask* }: Specifies an IPv4 address and its mask length (or mask). The value range for *mask-length* is 0 to 32.

range *start-address end-address*: Specifies a start IPv4 address and an end IPv4 address.

Usage guidelines

If you specify an IPv4 address and its mask length (or mask), the system automatically transforms them to a start address and an end address.

You can configure multiple spoke private IPv4 address ranges in a hub group. The ranges are listed from low to high.

The spoke private IPv4 address range to be deleted must be the same as the configured one.

Examples

Configure a spoke private IPv4 address range in IPv4 network address format as 1.1.1.0/24 for hub group 1.

```
<Sysname> system-view
[Sysname] vam server advpn-domain 1
[Sysname-vam-server-domain-1] hub-group 1
[Sysname-vam-server-domain-1-hub-group-1] spoke private-address network 1.1.1.0
255.255.255.0
```

vam server advpn-domain

Use **vam server advpn-domain** to create an ADVPN domain and enter its view, or enter the view of an existing ADVPN domain.

Use **undo vam server advpn-domain** to remove an ADVPN domain.

Syntax

vam server advpn-domain *domain-name* [**id** *domain-id*]

undo vam server advpn-domain *domain-name*

Default

No ADVPN domains exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

domain-name: Specifies an ADVPN domain by its name. An ADVPN domain name is a case-insensitive string of 1 to 31 characters that can include only letters, digits, and dots (.).

id *domain-id*: Specifies the ID of an ADVPN domain, in the range of 1 to 65535.

Usage guidelines

An ADVPN domain ID is required only when you create the ADVPN domain.

You must specify a unique domain ID for an ADVPN domain.

Examples

Create ADVPN domain 1 with domain ID 1, and enter its view.

```
<Sysname> system-view
[Sysname] vam server advpn-domain 1 id 1
[Sysname-vam-server-domain-1]
```

vam server enable

Use **vam server enable** to enable the VAM server for ADVPN domains.

Use **undo vam server enable** to disable the VAM server for ADVPN domains.

Syntax

vam server enable [**advpn-domain** *domain-name*]

undo vam server enable [**advpn-domain** *domain-name*]

Default

The VAM server is disabled for an ADVPN domain.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

advpn-domain *domain-name*: Enables the VAM server for the specified ADVPN domain. The *domain-name* argument is a case-insensitive string of 1 to 31 characters that can include only letters, digits, and dots (.). If you do not specify this option, the command enables the VAM server for all ADVPN domains.

Usage guidelines

You can also execute the **server enable** command in ADVPN domain view to enable the VAM server for an ADVPN domain.

Examples

Enable the VAM server for all ADVPN domains.

```
<Sysname> system-view
[Sysname] vam server enable
```

Enable the VAM server for ADVPN domain 1.

```
<Sysname> system-view
[Sysname] vam server enable advpn-domain 1
```

Related commands

server enable

vam server listen-port

Use **vam server listen-port** to set the port number of the VAM server.

Use **undo vam server listen-port** to restore the default.

Syntax

vam server listen-port *port-number*

undo vam server listen-port

Default

The port number of the VAM server is 18000.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

port-number: Specifies the port number in the range of 1025 to 65535.

Usage guidelines

The port number of the VAM server must be the same as the port configured on the VAM clients.

Examples

Set the port number to 10000.

```
<Sysname> system-view
[Sysname] vam server listen-port 10000
```

Related commands

VAM client commands

advpn-domain

Use **advpn-domain** to specify an ADVPN domain for a VAM client.

Use **undo advpn-domain** to remove the ADVPN domain.

Syntax

advpn-domain *domain-name*

undo advpn-domain

Default

No ADVPN domain is specified for a VAM client.

Views

VAM client view

Predefined user roles

network-admin

context-admin

Parameters

domain-name: Specifies an ADVPN domain by its name. An ADVPN domain name is a case-insensitive string of 1 to 31 characters that can include only letters, digits, and dots (.).

Usage guidelines

An ADVPN domain can contain multiple VAM clients.

Examples

Specify ADVPN domain 100 for VAM client **abc**.

```
<Sysname> system-view
[Sysname] vam client name abc
[Sysname-vam-client-abc] advpn-domain 100
```

client enable

Use **client enable** to enable a VAM client.

Use **undo client enable** to disable a VAM client.

Syntax

client enable

undo client enable

Default

The VAM client is disabled.

Views

VAM client view

Predefined user roles

network-admin

context-admin

Usage guidelines

You can also execute the **vam client enable** command in system view to enable one or all VAM clients.

Examples

Enable VAM client **abc**.

```
<Sysname> system-view
[Sysname] vam client name abc
[Sysname-vam-client-abc] client enable
```

Related commands

vam client enable

display vam client fsm

Use **display vam client fsm** to display FSM information for VAM clients.

Syntax

display vam client fsm [**name** *client-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

name *client-name*: Displays FSM information for the specified VAM client. The *client-name* argument is a case-insensitive string of 1 to 63 characters that can include only letters, digits, and dots (.). If you do not specify this option, the command displays FSM information for all VAM clients.

Usage guidelines

This command only displays the configured parameters and dynamically obtained information.

Examples

Display FSM information for all VAM clients.

```
<Sysname> display vam client fsm

Table 8 Command output

Field	Description
Status	VAM client status: **Enabled** or **Disabled**.

Field	Description
Primary server	Public address of the primary VAM server.
Private address	Private address that the VAM client has registered with the VAM server.
Interface	ADVPN tunnel interface for the VAM client.
Current state	Current state of the VAM client: • **Offline**. • **Init**. • **Reg**. • **Online**. • **Dumb**.
Client type	VAM client type: • **Hub**. • **Spoke**. • **Unknown**.
Holding time	Duration time since the VAM client stayed in its current state, in the format of xH yM zS.
Encryption algorithm	Negotiated encryption algorithm.
Authentication algorithm	Negotiated authentication algorithm.
Keepalive	Keepalive interval (in seconds) and number of retransmissions configured on the VAM server.
Secondary server	Public address of the secondary VAM server.

Related commands

`reset vam client fsm`

display vam client shortcut interest

Use **`display vam client shortcut interest`** to display IPv4 spoke-to-spoke tunnel establishment rules for VAM clients.

Syntax

`display vam client shortcut interest` [**`name`** *`client-name`*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

`name` *`client-name`*: Displays IPv4 spoke-to-spoke tunnel establishment rules for the specified VAM client. The *`client-name`* argument is a case-insensitive string of 1 to 63 characters that can include only letters, digits, and dots (.). If you do not specify this option, the command displays IPv4 spoke-to-spoke tunnel establishment rules for all VAM clients.

Usage guidelines

The VAM server assigns the rules for establishing IPv4 spoke-to-spoke tunnels only to hubs. If the specified VAM client is a spoke, the number of rules is displayed as 0.

Examples

Display IPv4 spoke-to-spoke tunnel establishment rules for all VAM clients.

```
<Sysname> display vam client shortcut interest
Client name      : abc
ADVPN domain name: 1
Client type      : Spoke
ACL rules        : 0

Client name      : hub
ADVPN domain name: 2
Client type      : Hub
ACL rules        : 2
  Rule 1: Permit
    Protocol   : 6 (TCP)
    Source     : Address 0.0.0.0-255.255.255.255, port 0-65535
    Destination: Address 192.168.114.100-192.168.114.200, port 10000-20000
  Rule 2: Deny
    Protocol   : 0 (IP)
    Source     : Address 0.0.0.0-255.255.255.255, port 0-65535
    Destination: Address 0.0.0.0-255.255.255.255, port 0-65535

Client name      : spoke
ADVPN domain name: 3
Client type      : Unknown
ACL rules        : 0
```

Display IPv4 spoke-to-spoke tunnel establishment rules for VAM client **abc**.

```
<Sysname> display vam client shortcut interest name abc
Client name      : abc
ADVPN domain name: 1
Client type      : Spoke
ACL rules        : 0
```

Table 9 Command output

Field	Description
Client type	VAM client type: • **Hub**. • **Spoke**. • **Unknown**.
ACL rules	Number of ACL rules received by the VAM client.
Rule *n*: *Operation*	*n* represents the number of an ACL rule. Rule operation: • **Permit**—Allows the spokes to establish direct tunnels. • **Deny**—Disallows the spokes to establish direct tunnels. • **Discard**—Discards packets.

Field	Description
Protocol	Matching protocol number.
Source	Matching source IP address range and port number range.
Destination	Matching destination IP address range and port number range.

display vam client shortcut ipv6 interest

Use **display vam client shortcut ipv6 interest** to display IPv6 spoke-to-spoke tunnel establishment rules for VAM clients.

Syntax

display vam client shortcut ipv6 interest [**name** *client-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

name *client-name*: Displays IPv6 spoke-to-spoke tunnel establishment rules for the specified VAM client. The *client-name* argument is a case-insensitive string of 1 to 63 characters that can include only letters, digits, and dots (.). If you do not specify this option, the command displays IPv6 spoke-to-spoke tunnel establishment rules for all VAM clients.

Usage guidelines

The VAM server assigns the rules for establishing IPv6 spoke-to-spoke tunnels only to hubs. If the specified VAM client is a spoke, the number of rules is displayed as 0.

Examples

Display IPv6 spoke-to-spoke tunnel establishment rules for all VAM clients.

```
<Sysname> display vam client shortcut ipv6 interest
Client name      : abc
ADVPN domain name: 1
Client type      : Spoke
ACL rules        : 0

Client name      : hub
ADVPN domain name: 2
Client type      : Hub
ACL rules        : 2
  Rule 1: Permit
    Protocol                : TCP
    Start source address    : 0::0
    End source address      : FFFF:FFFF:FFFF:FFFF:FFFF:FFFF:FFFF:FFFF
    Start source port       : 0
```

```
    End source port          : 65535
    Start destination address: 2000::0
    End destination address  : 2000:1::0
    Start destination port   : 0
    End destination port     : 65535
  Rule 2: Deny
    Protocol                 : All
    Start source address     : 0::0
    End source address       : FFFF:FFFF:FFFF:FFFF:FFFF:FFFF:FFFF:FFFF
    Start source port        : 0
    End source port          : 65535
    Start destination address: 0::0
    End destination address  : FFFF:FFFF:FFFF:FFFF:FFFF:FFFF:FFFF:FFFF
    Start destination port   : 0
    End destination port     : 65535

Client name      : spoke
ADVPN domain name:
Client type      : Unknown
ACL rules        : 0
```

Display IPv6 spoke-to-spoke tunnel establishment rules for VAM client **abc**.

```
<Sysname> display vam client shortcut ipv6 interest name abc
Client name      : spoke
ADVPN domain name:
Client type      : Unknown
ACL rules        : 0
```

Table 10 Command output

Field	Description
Client type	VAM client type: • **Hub**. • **Spoke**. • **Unknown**.
ACL rules	Number of ACL rules received by the VAM client.
Rule *n*: *operation*	*n* represents the number of an ACL rule. Rule operation: • **Permit**—Allows the spokes to establish direct tunnels. • **Deny**—Disallows the spokes to establish direct tunnels. • **Discard**—Discards packets.
Protocol	Matching protocol number.
Start source address	Matching start address of the source IPv6 address range.
End source address	Matching end address of the source IPv6 address range.
Start source port	Matching start port number of the source port number range.
End source port	Matching end port number of the source port number range.
Start destination address	Matching start address of the destination IPv6 address range.
End destination address	Matching end address of the destination IPv6 address range.

Field	Description
Start destination port	Matching start port number of the destination port number range.
End destination port	Matching end port number of the destination port number range.

display vam client statistics

Use **display vam client statistics** to display VAM client statistics.

Syntax

display vam client statistics [**name** *client-name*]

Views

Any view

Table 11 Command output

Field	Description
Status	VAM client status: **Enabled** or **Disabled**.
Primary server	Public address or domain name of the primary VAM server.
Secondary server	Public address or domain name of the secondary VAM server.

Related commands

reset vam client statistics

dumb-time

Use **dumb-time** to set the dumb timer for a VAM client.

Use **undo dumb-time** to restore the default.

Syntax

dumb-time *time-interval*

undo dumb-time

Default

The dumb timer for a VAM client is 120 seconds.

Views

VAM client view

Predefined user roles

network-admin

context-admin

Parameters

time-interval: Specifies the dumb timer in the range of 10 to 600 seconds.

Usage guidelines

A VAM client starts the dumb timer after the timeout timer expires. The client does not process any packets during the dumb time. When the dumb timer expires, the client sends a new connection request to the VAM server.

Examples

Set the dumb timer to 100 seconds.

```
<Sysname> system-view
[Sysname] vam client name abc
[Sysname-vam-client-abc] dumb-time 100
```

pre-shared-key (VAM client view)

Use **pre-shared-key** to configure a preshared key for a VAM client.

Use **undo pre-shared-key** to remove the configuration.

Syntax

pre-shared-key { **cipher** | **simple** } *string*

undo pre-shared-key

Default

No preshared key is configured for a VAM client.

Views

VAM client view

Predefined user roles

network-admin

context-admin

Parameters

cipher: Specifies a preshared key in encrypted form.

simple: Specifies a preshared key in plaintext form. For security purposes, the key specified in plaintext form will be stored in encrypted form.

string: Specifies the preshared key. Its plaintext form is a case-sensitive string of 1 to 31 characters. Its encrypted form is a case-sensitive string of 1 to 73 characters.

Usage guidelines

The preshared key is used to generate initial encryption and authentication keys during connection initialization. It is also used to generate encryption and authentication keys for subsequent packets if encryption and authentication are needed.

All VAM clients and the VAM server in an ADVPN domain must have the same preshared key.

Examples

Set the key to **123** in plaintext form for VAM client **abc**.

```
<Sysname> system-view
[Sysname] vam client name abc
[Sysname-vam-client-abc] pre-shared-key simple 123
```

Related commands

User view

Predefined user roles

network-admin

Parameters

name *client-name*: Resets the FSM for the specified VAM client. The *client-name* argument is a case-insensitive string of 1 to 63 characters that can include only letters, digits, and dots (.). If you do not specify this option, the command resets FSMs for all VAM clients.

Usage guidelines

CAUTION:

After you use the **reset vam client fsm** command to reset the FSM for a VAM client, the client will immediately try to come online.

Examples

Reset the FSM for VAM client **abc**.

```
<Sysname> reset vam client fsm name abc
```

Reset FSMs for all VAM clients.

```
<Sysname> reset vam client fsm
```

Related commands

display vam client fsm

reset vam client ipv6 fsm

Use **reset vam client ipv6 fsm** to reset FSMs for IPv6 VAM clients.

Syntax

reset vam client ipv6 fsm [**name** *client-name*]

Views

User view

Predefined user roles

network-admin

context-admin

Parameters

name *client-name*: Clears statistics for the specified VAM client. The *client-name* argument is a case-insensitive string of 1 to 63 characters that can include only letters, digits, and dots (.). If you do not specify this option, the command clears statistics for all VAM clients.

Examples

Clear statistics for VAM client **abc**.

```
<Sysname> reset vam client statistics name abc
```

Clear statistics for all VAM clients.

```
<Sysname> reset vam client statistics
```

Related commands

display vam client statistics

retry

Use **retry** to set the retry interval and retry number for a VAM client.

Use **undo retry** to restore the default.

Syntax

retry interval *interval* **count** *retries*

undo retry

Default

The retry interval is 5 seconds and the retry number is 3.

Views

VAM client view

Predefined user roles

network-admin

context-admin

Parameters

interval *interval*: Specifies the retry interval in the range of 3 to 30 seconds.

count *retries*: Specifies the number of retries, in the range of 1 to 6.

Usage guidelines

After a VAM client sends a request to the server, it resends the request if it does not receive any responses within the retry interval. If the client fails to receive a response after maximum attempts (retry times + 1), the client determines that the server is unreachable.

The *retry-times* setting does not apply to register and update requests. The client sends those requests at the retry interval until it goes offline.

Examples

Set the retry interval to 20 seconds and the retry number to 4 for VAM client **abc**.

```
<Sysname> system-view
[Sysname] vam client name abc
[Sysname-vam-client-abc] retry interval 20 count 4
```

server primary

Use **server primary** to specify a primary VAM server for a VAM client.

Use **undo server primary** to restore the default.

Syntax

server primary { **ip-address** *ipv4-address* | **ipv6-address** *ipv6-address* | **name** *host-name* } [**port** *port-number*]

undo server primary

Default

No primary VAM server is specified.

Views

VAM client view

Predefined user roles

network-admin

context-admin

Parameters

ip-address *ipv4-address*: Specifies a public IPv4 address for the primary VAM server. The address must be a unicast address.

ipv6-address *ipv6-address*: Specifies a public IPv6 address for the primary VAM server. The address must be a global unicast address.

name *host-name*: Specifies a domain name for the primary VAM server. It is a dot-separated, case-insensitive string that can include letters, digits, hyphens (-), and underscores (_). The domain name can include a maximum of 253 characters, and each separated string includes no more than 63 characters.

port *port-number*: Specifies a port number for the primary VAM server, in the range of 1025 to 65535. The default is 18000.

Usage guidelines

If you execute this command multiple times, the most recent configuration takes effect.

The port number of a VAM server must be the same as the port number configured on the VAM server by using the **vam server listen-port** command.

If the specified primary and secondary VAM servers have the same address or name, only the primary VAM server takes effect.

Examples

Specify the domain name of the primary VAM server as **abc.com** and port number as **2000** for VAM client **abc**.

```
<Sysname> system-view
[Sysname] vam client name abc
[Sysname-vam-client-abc] server primary name abc.com port 2000
```

Specify the public IP address of the primary VAM server as **1.1.1.1** and port number as **2000** for VAM client **abc**.

```
<Sysname> system-view
[Sysname] vam client name abc
[Sysname-vam-client-abc] server primary ip-address 1.1.1.1 port 2000
```

Specify the public IPv6 address of the primary VAM server as **1001::1** and port number as **2000** for VAM client **abc**.

```
<Sysname> system-view
[Sysname] vam client name abc
[Sysname-vam-client-abc] server primary ipv6-address 1001::1 port 2000
```

Related commands

server secondary

server secondary

Use **server secondary** to specify a secondary VAM server for a VAM client.

Use **undo server secondary** to restore the default.

Syntax

server secondary { **ip-address** *ipv4-address* | **ipv6-address** *ipv6-address* | **name** *host-name* } [**port** *port-number*]

undo server secondary

Default

No secondary VAM server is specified.

Views

VAM client view

Predefined user roles

network-admin

context-admin

Parameters

ip-address *ipv4-address*: Specifies a public IPv4 address for the secondary VAM server. The address must be a unicast address.

ipv6-address *ipv6-address*: Specifies a public IPv6 address for the secondary VAM server. The address must be a global unicast address.

name *host-name*: Specifies a domain name of a secondary VAM server. It is a dot-separated, case-insensitive string that can include letters, digits, hyphens (-), and underscores (_). The domain name can include a maximum of 253 characters, and each separated string includes no more than 63 characters.

port *port-number*: Specifies a port number for the secondary VAM server, in the range of 1025 to 65535. The default is 18000.

Usage guidelines

If you execute this command multiple times, the most recent configuration takes effect.

The port number of a VAM server must be the same as the port number configured on the VAM server by using the **vam server listen-port** command.

If the specified primary and secondary VAM servers have the same address or name, only the primary VAM server takes effect.

Examples

Specify the domain name of the secondary VAM server as **abc.com** and port number as **2000** for VAM client **abc**.

```
<Sysname> system-view
```

```
[Sysname] vam client name abc
[Sysname-vam-client-abc] server secondary name abc.com port 2000
```

Specify the public IP address of the secondary VAM server as **1.1.1.2** and port number as **3000** for VAM client **abc**.

```
<Sysname> system-view
[Sysname] vam client name abc
[Sysname-vam-client-abc] server secondary ip-address 1.1.1.2 port 3000
```

Specify the public IPv6 address of the primary VAM server as **1001::2** and port number as **3000** for VAM client **abc**.

```
<Sysname> system-view
[Sysname] vam client name abc
[Sysname-vam-client-abc] server secondary ipv6-address 1001::2 port 3000
```

user

Use **user** to configure a username and password for a VAM client.

Use **undo user** to restore the default.

Syntax

user *username* **password** { **cipher** | **simple** } *string*

undo user

Default

No username or password is configured.

Views

VAM client view

Predefined user roles

network-admin

context-admin

Parameters

username: Specifies a username. The username is a case-sensitive string of 1 to 253 characters. It cannot include slashes (/), back slashes (\), colons (:), asterisks (*), question marks (?), left angle brackets (<), right angle brackets (>), quotation marks ("), vertical bars (|), and at signs (@).

password: Specifies a password.

cipher: Specifies a password in encrypted form.

simple: Specifies a password in plaintext form. For security purposes, the password specified in plaintext form will be stored in encrypted form.

string: Specifies the password. Its plaintext form is a case-sensitive string of 1 to 63 characters. Its encrypted form is a case-sensitive string of 1 to 117 characters.

Usage guidelines

You can configure only one username for a VAM client.

Examples

Configure the username as **user** and password as **user** in plaintext form for VAM client **abc**.

```
<Sysname> system-view
[Sysname] vam client name abc
[Sysname-vam-client-abc] user user password simple user
```

vam client enable

Use **vam client enable** to enable VAM clients.

Use **undo vam client enable** to disable VAM clients.

Syntax

vam client enable [**name** *client-name*]

undo vam client enable [**name** *client-name*]

Default

The VAM client is disabled.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

name *client-name*: Enables the specified VAM client. The *client-name* argument is a case-insensitive string of 1 to 63 characters that can include only letters, digits, and dots (.). If you do not specify this option, the command enables all VAM clients.

Usage guidelines

You can also execute the **client enable** command in VAM client view to enable a VAM client.

Examples

Enable all VAM clients.

```
<Sysname> system-view
[Sysname] vam client enable
```

Enable VAM client **abc**.

```
<Sysname> system-view
[Sysname] vam client enable name abc
```

Related commands

client enable

vam client name

Use **vam client name** to create a VAM client and enter its view, or enter the view of an existing VAM client.

Use **undo vam client name** to remove a VAM client.

Syntax

vam client name *client-name*

undo vam client name *client-name*

Default

No VAM clients exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

client-name: Specifies a VAM client by its name. A VAM client name is a case-insensitive string of 1 to 63 characters that can include only letters, digits, and dots (.).

Examples

Create VAM client **abc** and enter its view.

```
<Sysname> system-view
[Sysname] vam client name abc
[Sysname-vam-client-abc]
```

ADVPN tunnel commands

advpn group

Use **advpn group** to configure an ADVPN group name.

Use **undo advpn group** to restore the default.

Syntax

advpn group *group-name*

undo advpn group

Default

No ADVPN group name is configured.

Views

Tunnel interface view

Predefined user roles

network-admin

context-admin

Parameters

group-name: Specifies the ADVPN group name. The group name is a case-insensitive string of 1 to 63 characters that can include only letters, digits, and dots (.).

Usage guidelines

This command must be used on the tunnel interface of a spoke. The spoke sends the ADVPN group name in a hub-spoke tunnel establishment request to a hub. The hub looks for an ADVPN group-to-QoS policy mapping that matches the ADVPN group name. If a matching mapping is found, the hub applies the QoS policy in the mapping to the hub-spoke tunnel. If no match is found, the hub does not apply a QoS policy to the hub-spoke tunnel.

If you modify the ADVPN group name after the tunnel is established, the spoke will inform the hub of the modification. The hub will look for an ADVPN group-to-QoS policy mapping that matches the new ADVPN group name and apply the QoS policy in the new mapping.

As a best practice, do not configure an ADVPN group name and apply a QoS policy on the same tunnel interface.

Examples

Configure **aaa** as the ADVPN group name.

```
<Sysname> system-view
[Sysname] interface tunnel1 mode advpn gre
[Sysname-Tunnel1] advpn group aaa
```

advpn ipv6 network

Use **advpn ipv6 network** to configure a private IPv6 network for an IPv6 ADVPN tunnel interface.

Use **undo advpn ipv6 network** to remove a private IPv6 network from an IPv6 ADVPN tunnel interface.

Syntax

advpn ipv6 network *prefix prefix-length* [**preference** *preference-value*]

undo advpn ipv6 network *prefix prefix-length*

Default

No private IPv6 network is configured.

Views

Tunnel interface view

Predefined user roles

network-admin

context-admin

Parameters

prefix prefix-length: Specifies the prefix and prefix length of the private IPv6 network address. The value range for *prefix-length* is 0 to 128.

preference *preference-value*: Specifies a preference for the route to the private network, in the range of 1 to 255. The default is 8.

Usage guidelines

This command is available only for IPv6 ADVPN tunnel interfaces.

Each VAM client registers the private networks for an ADVPN tunnel with the VAM server. If another VAM client receives a packet with the destination address resolved as a registered private address, the VAM server sends the registered VAM client information to the client.

This command takes effect on a tunnel interface that has been configured with an IPv6 address and bound to a VAM client by using the **vam ipv6 client** command.

You can configure multiple private IPv6 networks for a tunnel interface.

Set the preference of the private network route to be higher than other dynamic routing protocols, and lower than static routing. A higher preference value represents a lower priority.

Examples

Configure private IPv6 network 1001::/64 for Tunnel 1, and set the route preference to 20.

```
<Sysname> system-view
[Sysname] interface tunnel 1 mode advpn udp ipv6
[Sysname-Tunnel1] advpn ipv6 network 1001:: 64 preference 20
```

Related commands

vam ipv6 client

advpn logging enable

Use **advpn logging enable** to enable ADVPN logging.

Use **undo advpn logging enable** to disable ADVPN logging.

Syntax

advpn logging enable

undo advpn logging enable

Default

ADVPN logging is disabled.

Views

System view

Predefined user roles

network-admin

context-admin

Usage guidelines

This command enables the device to generate logs for the ADVPN module and send the logs to the information center of the device. For the logs to be output correctly, you must also configure the information center on the device. For more information about information center configuration, see *Network Management and Monitoring Configuration Guide*.

Examples

Enable ADVPN logging.

```
<Sysname> system-view
[Sysname] advpn logging enable
```

advpn map group

Use **advpn map group** to configure a mapping between an ADVPN group and a QoS policy.

Use **undo advpn map group** to delete a mapping between an ADVPN group and a QoS policy.

Syntax

advpn map group *group-name* **qos-policy** *policy-name* **outbound**

undo advpn map group *group-name*

Default

No ADVPN group-to-QoS policy mappings are configured.

Views

Tunnel interface view

Predefined user roles

network-admin

context-admin

Parameters

group-name: Specifies the ADVPN group name. The group name is a case-insensitive string of 1 to 63 characters that can include only letters, digits, and dots (.).

qos-policy *policy-name*: Specifies the QoS policy name, a case-sensitive string of 1 to 31 characters.

outbound: Applies the QoS policy to the outbound direction.

Usage guidelines

This command must be used on the tunnel interface of a hub. After receiving a hub-spoke tunnel establishment request from a spoke, the hub looks for an ADVPN group-to-QoS policy mapping that matches the ADVPN group name carried in the request. If a matching mapping is found, the hub applies the QoS policy in the mapping to the hub-spoke tunnel.

You can configure multiple ADVPN group-to-QoS policy mappings on a tunnel interface.

You can map multiple ADVPN groups to a QoS policy. You can map an ADVPN group to only one QoS policy.

As a best practice, do not configure an ADVPN group-to-QoS policy mapping and apply a QoS policy on the same tunnel interface.

Examples

Configure a mapping between ADVPN group **aaa** and QoS policy **bbb** on **Tunnel1**.

```
<Sysname> system-view
[Sysname] interface Tunnel1 mode advpn gre
[Sysname-Tunnel1] advpn map group aaa qos-policy bbb outbound
```

advpn network

Use **advpn network** to configure a private IPv4 network for an IPv4 ADVPN tunnel interface.

Use **undo advpn network** to remove a private IPv4 network from an IPv4 ADVPN tunnel interface.

Syntax

advpn network *ip-address* { *mask-length* | *mask* } [**preference** *preference-value*]

undo advpn network *ip-address* { *mask-length* | *mask* }

Default

No private IPv4 network is configured.

Views

Tunnel interface view

Predefined user roles

network-admin

context-admin

Parameters

ip-address: Specifies the private IPv4 network address.

mask-length: Specifies the mask length of the private IPv4 network address, in the range of 0 to 32.

mask: Specifies the mask of the private IPv4 network address.

preference *preference-value*: Specifies a preference for the route to the private network, in the range of 1 to 255. The default is 8.

Usage guidelines

This command is available only for IPv4 ADVPN tunnel interfaces.

Each VAM client registers the private networks for an ADVPN tunnel with the VAM server. If another VAM client receives a packet with the destination address resolved as a registered private address, the VAM server sends the registered VAM client information to the client.

This command takes effect on a tunnel interface that has been configured with an IPv4 address and bound to a VAM client by using the **vam client** command.

You can configure multiple private IPv4 networks for a tunnel interface.

Set the preference of the private network route to be higher than other dynamic routing protocols, and lower than static routing. A higher preference value represents a lower priority.

Examples

Configure private IPv4 network 10.0.5.0 with mask 255.255.255.0 for Tunnel 1, and set the route preference to 20.

```
<Sysname> system-view
[Sysname] interface tunnel 1 mode advpn udp
[Sysname-Tunnel1] advpn network 10.0.5.0 255.255.255.0 preference 20
```

Related commands

vam client

advpn session dumb-time

Use **advpn session dumb-time** to set the dumb time for an ADVPN tunnel interface.

Use **undo advpn session dumb-time** to restore the default.

Syntax

advpn session dumb-time *time-interval*

undo advpn session dumb-time

Default

The dumb time is 120 seconds.

Views

Tunnel interface view

Predefined user roles

network-admin

context-admin

Parameters

time-interval: Specifies the dumb time in the range of 10 to 600 seconds.

Usage guidelines

This command is available only for ADVPN tunnel interfaces.

The new dumb time setting only applies to subsequently established tunnels.

Examples

Set the dumb time to 100 seconds.

```
<Sysname> system-view
[Sysname] interface tunnel 1 mode advpn udp
[Sysname-Tunnel1] advpn session dumb-time 100
```

advpn session idle-time

Use **advpn session idle-time** to set the idle timeout time for a spoke-spoke ADVPN tunnel.

Use **undo advpn session idle-time** to restore the default.

Syntax

advpn session idle-time *time-interval*

undo advpn session idle-time

Default

The idle timeout time is 600 seconds.

Views

Tunnel interface view

Predefined user roles

network-admin

context-admin

Parameters

time-interval: Specifies the idle timeout time in the range of 60 to 65535 seconds.

Usage guidelines

This command is available only for ADVPN tunnel interfaces.

The new idle timeout setting applies to both established and subsequently established spoke-spoke tunnels.

If no data is forwarded along a spoke-spoke tunnel during the idle timeout time, the tunnel will be removed automatically.

Examples

Set the idle timeout time to 800 seconds.

```
<Sysname> system-view
[Sysname] interface tunnel 1 mode advpn udp
[Sysname-tunnel1] advpn session idle-time 800
```

advpn source-port

Use **advpn source-port** to set the source UDP port number for ADVPN packets.

Use **undo advpn source-port** to restore the default.

Syntax

advpn source-port *port-number*

undo advpn source-port

Default

The source UDP port number is 18001.

Views

Tunnel interface view

Predefined user roles

network-admin

context-admin

Parameters

port-number: Specifies the UDP port number in the range of 1025 to 65535.

Usage guidelines

This command is available only for UDP-encapsulated ADVPN tunnels.

If the **vam client** command configured on the tunnel interface has the **compatible** keyword, the tunnel interface must have a different source UDP port number than other tunnel interfaces.

Examples

Set the source UDP port number to 6000.

```
<Sysname> system-view
[Sysname] interface tunnel 1 mode advpn udp
[Sysname-Tunnel1] advpn source-port 6000
```

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

interface tunnel *number*: Specifies an ADVPN tunnel interface by its tunnel interface number. The value range for the *number* argument is 0 to 1023. If you do not specify a tunnel interface, this command displays ADVPN group-to-QoS policy mappings for all ADVPN tunnel interfaces.

group *group-name*: Specifies an ADVPN group by its name. If you do not specify an ADVPN group, this command displays ADVPN group-to-QoS policy mappings for all ADVPN groups.

Examples

Display ADVPN group-to-QoS policy mappings for all ADVPN tunnel interfaces.

```
<Sysname> display advpn group-qos-map
Interface: Tunnel1
  ADVPN group: group1
  QoS policy: policy1
  Session list:
     Private address         Public address
     10.0.0.3                 192.168.180.136
     10.0.1.4                 192.168.180.137

  ADVPN group: bb
  QoS policy: bb-policy
  No sessions match the ADVPN group-to-QoS policy mapping.

Interface: Tunnel2
  ADVPN group: group2
  QoS policy: policy2
  Session list:
    Private address         Public address
    20.0.0.3                 200::3
```

Table 12 Command output

Field	Description
Interface	ADVPN tunnel interface.
ADVPN group	ADVPN group name.
QoS policy	QoS policy to which the ADVPN group is mapped.
Session list	List of ADVPN tunnels that use the QoS policy on the tunnel interface.
Private address	Private address of the ADVPN tunnel peer.
Public address	Public address of the ADVPN tunnel peer.
No sessions match the ADVPN group-to-QoS policy mapping	No ADVPN tunnels match the ADVPN group-to-QoS policy mapping on the tunnel interface.

Private address	Private address of the ADVPN tunnel peer.
Public address	Public address of the ADVPN tunnel peer.
Port	Port number of the ADVPN tunnel peer.
Type	ADVPN tunnel type: • **H-H**—Both the local end and the remote end are hubs. • **H-S**—The local end is a hub and the remote end is a spoke. • **S-H**—The local end is a spoke and the remote end is a hub. • **S-S**—Both the local end and the remote end are spokes.
State	ADVPN tunnel state: • **Success**—The tunnel has been successfully established. • **Establishing**—The tunnel is being established. • **Dumb**—The tunnel failed to be established and is now quiet.
Holding time	Duration time since the tunnel stayed in the current state, in the format of xH yM zS.

Display detailed information about all IPv6 ADVPN tunnels.

Table 14 Command output

Field	Description
Interface	ADVPN tunnel interface.
Client name	Name of the VAM client bound to the tunnel interface.
Link protocol	Link layer protocol for the ADVPN tunnel: • **UDP**. • **GRE**. • **IPsec-UDP**. • **IPsec-GRE**.
Number of sessions	Number of ADVPN tunnels established on the tunnel interface.
Private address	Private address of the ADVPN tunnel peer.
Public address	Public address of the ADVPN tunnel peer.
ADVPN port	UDP port number for the ADVPN tunnel when the link layer protocol is **UDP** or **IPsec-UDP**.
SA's SPI	SPIs for the inbound and outbound SAs when link layer protocol is **IPsec-UDP** or **IPsec-GRE**.
Session type	ADVPN tunnel type: • **Hub-Hub**—Both the local end and the remote end are hubs. • **Hub-Spoke**—The local end is a hub and the remote end is a spoke. • **Spoke-Hub**—The local end is a spoke and the remote end is a hub. • **Spoke-Spoke**—Both the local end and the remote end are spokes.
State	ADVPN tunnel state: • **Success**—The tunnel has been successfully established. • **Establishing**—The tunnel is being established. • **Dumb**—The tunnel failed to be established and is now quiet.
Holding time	Duration time since the tunnel stayed in the current state, in the format of xH yM zS.

Field	Description
Input	Statistics for incoming packets, including the numbers of all packets, data packets, control packets, multicast packets, and erroneous packets.
Output	Statistics for outgoing packets, including the numbers of all packets, data packets, control packets, multicast packets, and erroneous packets.

Related commands

reset advpn ipv6 session

display advpn session

Use **display advpn session** to display IPv4 ADVPN tunnel information.

Syntax

display advpn session [**interface tunnel** *number* [**private-address** *private-ip-address*]] [**verbose**]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

interface tunnel *number*: Displays information about IPv4 ADVPN tunnels on an IPv4 ADVPN tunnel interface specified by the interface number. If you do not specify this option, the command displays information about all IPv4 ADVPN tunnels.

private-address *private-ip-address*: Displays information about the IPv4 ADVPN tunnel with the specified peer private IPv4 address. If you do not specify this option, the command displays information about the specified IPv4 ADVPN tunnel or all IPv4 ADVPN tunnels.

verbose: Displays detailed IPv4 ADVPN tunnel information. If you do not specify this keyword, the command displays brief IPv4 ADVPN tunnel information.

Examples

Display brief information about all IPv4 ADVPN tunnels.

```
<Sysname> display advpn session

Table 16 Command output

Field	Description
Interface	ADVPN tunnel interface.
Client name	Name of the VAM client bound to the tunnel interface.
Link protocol	Link layer protocol for the ADVPN tunnel: • **UDP**. • **GRE**. • **IPsec-UDP**. • **IPsec-GRE**.
Number of sessions	Number of ADVPN tunnels established on the tunnel interface.
Private address	Private address of the ADVPN tunnel peer.
Public address	Public address of the ADVPN tunnel peer.
ADVPN port	UDP port number for the ADVPN tunnel when the link layer protocol is **UDP** or **IPsec-UDP**.
SA's SPI	SPIs for the inbound and outbound SAs when link layer protocol is **IPsec-UDP** or **IPsec-GRE**.
Behind NAT	Whether NAT traversal is used.
Session type	ADVPN tunnel type: • **Hub-Hub**—Both the local end and the remote end are hubs. • **Hub-Spoke**—The local end is a hub and the remote end is a spoke. • **Spoke-Hub**—The local end is a spoke and the remote end is a hub. • **Spoke-Spoke**—Both the local end and the remote end are spokes.
State	ADVPN tunnel state: • **Success**—The tunnel has been successfully established. • **Establishing**—The tunnel is being established. • **Dumb**—The tunnel failed to be established and is now quiet.
Holding time	Duration time since the tunnel stayed in the current state, in the format of xH yM zS.
ADVPN group	ADVPN group name.
Outbound QoS policy	QoS policy to which the ADVPN group is mapped.
Input	Statistics for incoming packets, including the numbers of all packets, data packets, control packets, multicast packets, and erroneous packets.
Output	Statistics for outgoing packets, including the numbers of all packets, data packets, control packets, multicast packets, and erroneous packets.

Related commands

`reset advpn session`

display advpn session count

Use **`display advpn session count`** to display the number of ADVPN sessions in different states.

Syntax

display advpn session count

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Examples

Display the number of ADVPN sessions in different states.

```
<Sysname> display advpn session count
Total ADVPN sessions: 7
IPv4 sessions: 3
  Success: 3
  Establishing: 0
  Dumb: 0
IPv6 sessions: 4
  Success: 4
  Establishing: 0
  Dumb: 0
```

Table 17 Command output

Field	Description
IPv4 sessions:	Number of ADVPN sessions in IPv4 private networks.
IPv6 sessions:	Number of ADVPN sessions in IPv6 private networks.
Success	Number of ADVPN sessions that have been successfully established.
Establishing	Number of ADVPN sessions that are being established.
Dumb	Number of ADVPN sessions that failed to be established and are now quiet.

keepalive

Use **keepalive** to set the keepalive interval and the maximum number of keepalive attempts for an ADVPN tunnel interface.

Use **undo keepalive** to restore the default.

Syntax

keepalive interval *interval* **retry** *retries*

undo keepalive

Default

The keepalive interval is 180 seconds, and the maximum number of keepalive attempts is 3.

Views

Tunnel interface view

Predefined user roles

network-admin

context-admin

Parameters

interval *interval*: Sets the keepalive interval in the range of 1 to 32767 seconds.

retry *retries*: Sets the maximum number of keepalive attempts, in the range of 1 to 255.

Usage guidelines

This command is available only for ADVPN tunnel interfaces.

If no keepalives is received before the timeout timer (product of the keepalive interval and keepalive attempts) expires, the tunnel will be removed automatically.

The keepalive interval and the maximum number of keepalive attempts must be the same on the tunnel interfaces in an ADVPN domain.

After this command is executed, the keepalive timer does not start immediately. It starts until the ADVPN tunnel is established.

Examples

Set the keepalive interval to 20 seconds and the maximum number of keepalive attempts to 5.

```
<Sysname> system-view
[Sysname] interface tunnel 1 mode advpn udp
[Sysname-Tunnel1] keepalive interval 20 retry 5
```

reset advpn ipv6 session

Use **reset advpn ipv6 session** to delete IPv6 ADVPN tunnels.

Syntax

reset advpn ipv6 session [**interface tunnel** *number* [**private-address** *private-ipv6-address*]]

Views

User view

Predefined user roles

network-admin

context-admin

Parameters

interface tunnel *number*: Deletes IPv6 ADVPN tunnels on an IPv6 ADVPN tunnel interface specified by the interface number. If you do not specify this option, the command deletes all IPv6 ADVPN tunnels.

private-address *private-ipv6-address*: Deletes the IPv6 ADVPN tunnel with the specified peer private IPv6 address. If you do not specify this option, the command deletes the specified IPv6 ADVPN tunnel or all IPv6 ADVPN tunnels.

Usage guidelines

If the remote tunnel end is a hub in the same group as the local end, the tunnel will be re-established after it is deleted.

Examples

Delete all IPv6 ADVPN tunnels.

```
<Sysname> reset advpn ipv6 session
```

Delete IPv6 ADVPN tunnels on Tunnel 1.

```
<Sysname> reset advpn ipv6 session interface tunnel 1
```

Delete the IPv6 ADVPN tunnel with peer private IPv6 address 1000::1 on Tunnel 1.

```
<Sysname> reset advpn ipv6 session interface tunnel 1 private-address 1000::1
```

Related commands

display advpn ipv6 session

reset advpn ipv6 session statistics

Use **reset advpn ipv6 session statistics** to clear statistics for IPv6 ADVPN tunnels.

Syntax

reset advpn ipv6 session statistics [**interface tunnel** *number* [**private-address** *private-ipv6-address*]]

Views

User view

Predefined user roles

network-admin

context-admin

Parameters

interface tunnel *number*: Clears statistics for IPv6 ADVPN tunnels on an IPv6 ADVPN tunnel interface specified by the interface number. If you do not specify this option, the command clears statistics for all IPv6 ADVPN tunnels.

private-address *private-ipv6-address*: Clears statistics for the IPv6 ADVPN tunnel with the specified peer private IPv6 address. If you do not specify this option, the command clears statistics for the specified IPv6 ADVPN tunnel or all IPv6 ADVPN tunnels.

Examples

Clear statistics for all IPv6 ADVPN tunnels.

```
<Sysname> reset advpn ipv6 session statistics
```

Clear statistics for IPv6 ADVPN tunnels on Tunnel 1.

```
<Sysname> reset advpn ipv6 session statistics interface tunnel 1
```

Clear statistics for the IPv6 ADVPN tunnel with peer private IPv6 address 1::1 on Tunnel 1.

```
<Sysname> reset advpn ipv6 session statistics interface tunnel 1 private-address 1::1
```

reset advpn session

Use **reset advpn session** to delete IPv4 ADVPN tunnels.

Syntax

reset advpn session [**interface tunnel** *number* [**private-address** *private-ip-address*]]

Views

User view

Predefined user roles

network-admin

context-admin

Parameters

interface tunnel *number*: Deletes IPv4 ADVPN tunnels on an IPv4 ADVPN tunnel interface specified by the interface number. If you do not specify this option, the command deletes all IPv4 ADVPN tunnels.

private-address *private-ip-address*: Deletes the IPv4 ADVPN tunnel with the specified peer private IPv4 address. If you do not specify this option, the command deletes the specified IPv4 ADVPN tunnel or all IPv4 ADVPN tunnels.

Usage guidelines

If the remote tunnel end is a hub in the same group as the local end, the tunnel will be re-established after it is deleted.

Examples

Delete all IPv4 ADVPN tunnels.

```
<Sysname> reset advpn session
```

Delete IPv4 ADVPN tunnels on Tunnel 1.

```
<Sysname> reset advpn session interface tunnel 1
```

Delete the IPv4 ADVPN tunnel with peer private IPv4 address 169.254.0.1 on Tunnel 1.

```
<Sysname> reset advpn session interface tunnel 1 private-address 169.254.0.1
```

Related commands

display advpn session

reset advpn session statistics

Use **reset advpn session statistics** to clear statistics for IPv4 ADVPN tunnels.

Syntax

reset advpn session statistics [**interface tunnel** *number* [**private-address** *private-ip-address*]]

Views

User view

Predefined user roles

network-admin

context-admin

Parameters

interface tunnel *number*: Clears statistics for IPv4 ADVPN tunnels on an IPv4 ADVPN tunnel interface specified by the interface number. If you do not specify this option, the command clears statistics for all IPv4 ADVPN tunnels.

private-address *private-ip-address*: Clears statistics for the IPv4 ADVPN tunnel with the specified peer private IPv4 address. If you do not specify this option, the command clears statistics for the specified IPv4 ADVPN tunnel or all IPv4 ADVPN tunnels.

Examples

Clear statistics for all IPv4 ADVPN tunnels.

```
<Sysname> reset advpn session statistics
```

Clear statistics for IPv4 ADVPN tunnels on Tunnel 1.

```
<Sysname> reset advpn session statistics interface tunnel 1
```

Clear statistics for the IPv4 ADVPN tunnel with peer private IPv4 address 169.254.0.1 on Tunnel 1.

```
<Sysname> reset advpn session statistics interface tunnel 1 private-address 169.254.0.1
```

vam client

Use **vam client** to bind a VAM client to an IPv4 ADVPN tunnel interface.

Use **undo vam client** to remove the binding.

Syntax

vam client *client-name* [**compatible advpn0**]

undo vam client

Default

No VAM client is bound to an IPv4 ADVPN tunnel interface.

Views

Tunnel interface view

Predefined user roles

network-admin

context-admin

Parameters

client-name: Specifies a VAM client by its name. A VAM client name is a case-insensitive string of 1 to 63 characters that can include only letters, digits, and dots (.).

compatible advpn0: Specifies ADVPN V0 packet format. If you do not specify this keyword, packets are not compatible with ADVPN V0 format.

Usage guidelines

This command is available only for IPv4 ADVPN tunnel interfaces.

After a VAM client is bound to an IPv4 ADVPN tunnel interface, the client registers IPv4 private networks for the tunnel interface with the VAM server.

A VAM client can be bound to only one IPv4 ADVPN tunnel interface.

The **compatible** keyword is required if a device that supports only ADVPN V0 packet format exists in the hub group for the bound VAM client. After the **compatible** keyword is specified, make sure the tunnel interface has a unique source UDP port number on the device.

Examples

Bind VAM client **abc** to IPv4 ADVPN tunnel interface Tunnel 1.

```
<Sysname> system-view
[Sysname] interface tunnel 1 mode advpn udp
[Sysname-Tunnel1] vam client abc
```

Related commands

advpn source-port

vam ipv6 client

vam ipv6 client

Use **vam ipv6 client** to bind a VAM client to an IPv6 ADVPN tunnel interface.

Use **undo vam ipv6 client** to remove the binding.

Syntax

vam ipv6 client *client-name*

undo vam ipv6 client

Default

No VAM client is bound to an IPv6 ADVPN tunnel interface.

Views

Predefined user roles

network-admin

context-admin

Parameters

client-name: Specifies a VAM client by its name. A VAM client name is a case-insensitive string of 1 to 63 characters that can include only letters, digits, and dots (.).

Usage guidelines

This command is available only for IPv6 ADVPN tunnel interfaces.

After a VAM client is bound to an IPv6 ADVPN tunnel interface, the client registers IPv6 private networks for the tunnel interface with the VAM server.

A VAM client can be bound to only one IPv6 ADVPN tunnel interface.

Examples

Bind VAM client **abc** to IPv6 ADVPN tunnel interface Tunnel 1.

```
<Sysname> system-view
[Sysname] interface tunnel 1 mode advpn udp ipv6
[Sysname-Tunnel1] vam ipv6 client abc
```

Related commands

vam client

Contents

Tunneling commands

bandwidth

Use **bandwidth** to set the expected bandwidth for an interface.

Use **undo bandwidth** to restore the default.

Syntax

bandwidth *bandwidth-value*

undo bandwidth

Default

The expected bandwidth (in kbps) is the interface maximum rate divided by 1000.

Views

Tunnel interface view

Predefined user roles

network-admin

context-admin

Parameters

bandwidth-value: Specifies the expected bandwidth, in the range of 1 to 400000000 kbps.

Usage guidelines

The expected bandwidth for an interface affects the link costs.

For more information, see OSPF, OSPFv3, and IS-IS in *Layer 3—IP Routing Configuration Guide*.

Examples

Set the expected bandwidth for Tunnel 1 to 100 kbps.

```
<Sysname> system-view
[Sysname] interface tunnel 1
[Sysname-Tunnel1] bandwidth 100
```

default

Use **default** to restore the default settings for a tunnel interface.

Syntax

default

Views

Tunnel interface view

Predefined user roles

network-admin

context-admin

Usage guidelines

CAUTION:

The **default** command might interrupt ongoing network services. Make sure you are fully aware of the impact of this command when you use it on a live network.

This command might fail to restore the default settings for some commands for reasons such as command dependencies or system restrictions. Use the **display this** command in interface view to identify these commands. Use their **undo** forms or follow the command reference to restore their default settings. If your restoration attempt still fails, follow the error message instructions to resolve the problem.

Examples

Restore the default settings of Tunnel 1.

```
<Sysname> system-view
[Sysname] interface tunnel 1
[Sysname-Tunnel1] default
```

description

Use **description** to configure the description of an interface.

Use **undo description** to restore the default.

Syntax

description *text*

undo description

Default

The description of a tunnel interface is **Tunnel***number* **Interface**, for example, **Tunnel1 Interface**.

Views

Tunnel interface view

Predefined user roles

network-admin

context-admin

Parameters

text: Specifies a description, a case-sensitive string of 1 to 255 characters.

Usage guidelines

Configure descriptions for different interfaces for identification and management purposes.

You can use the **display interface** command to display the configured interface description.

Examples

Configure the description of Tunnel 1 as **tunnel1**.

```
<Sysname> system-view
[Sysname] interface tunnel 1
[Sysname-Tunnel1] description tunnel1
```

Related commands

display interface tunnel

destination

Use **destination** to specify the destination address of a tunnel.

Use **undo destination** to restore the default.

Syntax

destination { *ipv4-address* | *ipv6-address* | **dhcp-alloc** *interface-type interface-number* }

undo destination

Default

No tunnel destination address is configured.

Views

Tunnel interface view

Predefined user roles

network-admin

context-admin

Parameters

ipv4-address: Specifies the tunnel destination IPv4 address.

ipv6-address: Specifies the tunnel destination IPv6 address.

dhcp-alloc *interface-type interface-number*: Specifies an interface by its type and number to obtain AFTR's IPv6 address from DHCPv6 packets.

Usage guidelines

For a manual tunnel, you must configure the destination address. For an automatic tunnel, you do not need to configure the destination address.

The tunnel destination address must be the address of the receiving interface on the tunnel peer. It is used as the destination address of tunneled packets.

The destination address of a tunnel at the local end must be the source address of the tunnel at the peer end. The source address of the tunnel at the local end must be the destination address of the tunnel at the peer end.

Do not specify the same tunnel source and destination addresses for different tunnels on the same device.

For a B4 router to automatically establish a DS-Lite tunnel with an AFTR, configure DHCPv6 client, IPv6 DNS client, and the **destination dhcp-alloc** command on the B4 router. In addition, make sure a DHCPv6 server and an IPv6 DNS server (for dynamic DNS) exist in the network.

After receiving a DHCPv6 packet from the interface specified by the **destination dhcp-alloc** command, the B4 router performs the following operations:

1. Obtains the domain name of the AFTR from the packet.
2. Sends a name query to the IPv6 DNS server to obtain the AFTR's IPv6 address.

   The server resolves the domain name to the IPv6 address of AFTR.

For more information about DHCPv6 server, DHCPv6 client, and IPv6 DNS, see *Layer 3—IP Services Configuration Guide*.

Examples

Interface GigabitEthernet 1/0/1 on Sysname 1 uses IP address 193.101.1.1 and interface GigabitEthernet 1/0/1 on Sysname 2 uses IP address 192.100.1.1. Configure the tunnel source address as 193.101.1.1 and tunnel destination address as 192.100.1.1 for tunnel 1 on Sysname 1.

```
<Sysname1> system-view
[Sysname1] interface tunnel 1 mode gre
[Sysname1-Tunnel1] source 193.101.1.1
[Sysname1-Tunnel1] destination 192.100.1.1
```

Configure the tunnel source address as 192.100.1.1 and tunnel destination address as 193.101.1.1 for tunnel 1 on Sysname 2.

```
<Sysname2> system-view
[Sysname2] interface tunnel 1 mode gre
[Sysname2-Tunnel1] source 192.100.1.1
[Sysname2-Tunnel1] destination 193.101.1.1
```

Parameters

interface tunnel *number*: Specifies an existing tunnel interface by its number. If you do not specify a 6RD tunnel interface, this command displays information about all existing 6RD tunnel interfaces.

Examples

Display information about 6RD tunnel interface Tunnel 1.

```
<Sysname> display 6rd interface tunnel 1
Interface           : Tunnel1
  Tunnel source     : 10.11.12.13
  6RD status        : Operational
    IPv6 prefix     : 2001:1000::/32
    IPv4 prefix     : 10.0.0.0/8
    IPv4 suffix     : 0.0.0.0/0
    BR address      : 10.11.12.1
    Delegated prefix: 2001:1000:B0C:D00::/56
```

Display information about all 6RD tunnel interfaces.

```
<Sysname> display 6rd
Interface           : Tunnel0
  Tunnel source     : 0.0.0.0
  6RD status        : Not operational
    IPv6 prefix     : 2002:1000::/32

Interface           : Tunnel1
  Tunnel source     : 10.11.12.13
  6RD status        : Operational
    IPv6 prefix     : 2001:1000::/32
    IPv4 prefix     : 10.0.0.0/8
    IPv4 suffix     : 0.0.0.0/0
    BR address      : 10.11.12.1
    Delegated prefix: 2001:1000:B0C:D00::/56
```

Table 1 Command output

Field	Description
Interface	Tunnel interface.
Tunnel source	Source address of the tunnel. If a source interface is specified, this field displays the IP address of the source interface. If no source address or source interface is specified, or the specified source interface has no IP address, this field displays **0.0.0.0**.
6RD status	6RD configuration status: • **Operational**—6RD configuration is available. • **Not operational**—6RD configuration is not available. This field displays **Operational** when the tunnel source address and 6RD prefix are configured.
IPv6 prefix	6RD prefix and its length. If no 6RD prefix is configured, this field displays **Not configured**.
IPv4 prefix	IPv4 prefix and its length. If the prefix length is not configured, this field displays **0.0.0.0/0**.
IPv4 suffix	IPv4 suffix and its length. If the suffix length is not configured, this field displays **0.0.0.0/0**.

Field	Description
BR address	IP address of the BR router. If no BR address is configured, this field displays **Not configured**.
Delegated prefix	6RD delegated prefix calculated based on the 6RD configuration. This field is empty if the 6RD status is **Not operational**.

context-operator

Parameters

prefix *ipv6-prefix*: Specifies a 6RD delegated prefix.

interface tunnel *number*: Specifies an existing tunnel interface by its number.

Usage guidelines

After this command is executed, the system displays the 6RD tunnel destination address calculated by the specified 6RD delegated prefix and 6RD configuration on the tunnel interface. The 6RD configuration includes the 6RD prefix/prefix length, IPv4 prefix/prefix length, and IPv4 suffix/suffix length.

Examples

Display the 6RD tunnel destination address calculated by the 6RD delegated prefix 2001:1000:0101:0100:: and 6RD configuration on Tunnel 1.

```
<Sysname> display 6rd destination prefix 2001:1000:0101:0100:: interface tunnel 1
Interface       : Tunnel1
```

```
Delegated prefix: 2001:1000:101:100::
Destination     : 10.1.1.1
```

context-operator

Parameters

destination *ipv4-address*: Specifies a 6RD tunnel destination address.

interface tunnel *number*: Specifies an existing tunnel interface by its number.

Usage guidelines

After this command is executed, the system displays the 6RD delegated prefix calculated by the specified 6RD tunnel destination address and 6RD configuration on the tunnel interface. The 6RD configuration includes the 6RD prefix/prefix length, IPv4 prefix/prefix length, and IPv4 suffix/suffix length. The 6RD delegated prefix calculated on the peer tunnel interface must be the same as the 6RD delegated prefix configured on the local device.

Examples

Display the 6RD delegated prefix calculated by the 6RD tunnel destination address 10.1.1.1 and 6RD configuration on Tunnel 1.

```
<Sysname> display 6rd prefix destination 10.1.1.1 interface tunnel 1
Interface       : Tunnel1
Destination     : 10.1.1.1
Delegated Prefix: 2001:1000:101:100::
```

Total B4 addresses: 2
```

Table 4 Command output

Field	Description
B4 address	IPv6 address of the B4 router.
Tunnel ID	Tunnel ID that the IPv6 address of the B4 router maps to.
Tunnel interface	ID of the tunnel interface on the DS-Lite tunnel to which the mapping belongs. When the tunnel to which the mapping belongs is removed or a tunnel with the same ID but different mode is created, this field displays hyphens (--).
Idle time	Remaining time in minutes for the mapping between the IPv6 address of the B4 router and tunnel ID. When the mapping ages out but is still used by a session, this field displays hyphens (--).
Total B4 addresses	Number of IPv6 addresses of the B4 routers.

display interface tunnel

Use **display interface tunnel** to display tunnel interface information.

Syntax

display interface [**tunnel** [*number*]] [**brief** [**description** | **down**]]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

tunnel [*number*]: Specifies a tunnel interface. The *number* argument specifies the tunnel interface number. The specified tunnel interface must have been created. If you do not specify the **tunnel** keyword, this command displays information about all interfaces on the device. If you specify the **tunnel** keyword without the *number* argument, this command displays information about all existing tunnel interfaces.

brief: Displays brief interface information. If you do not specify this keyword, the command displays detailed interface information.

description: Displays complete interface descriptions. If you do not specify this keyword, the command displays only the first 27 characters of interface descriptions.

down: Displays information about interfaces in the physical state of DOWN and the causes. If you do not specify this keyword, the command displays information about interfaces in all states.

Examples

Display detailed information about Tunnel 1.

```
<Sysname> display interface tunnel 1
Tunnel1
```

```
Current state: UP
Line protocol state: UP
Description: Tunnel1 Interface
Bandwidth: 64kbps
Maximum transmission unit: 1476
Internet address: 10.1.2.1/24 (primary)
Tunnel source 1.1.1.1, destination 2.2.2.2
Tunnel keepalive enabled, Period(100 s), Retries(254)
Tunnel TOS 0xC8, Tunnel TTL 255
Tunnel protocol/transport GRE/IP
    GRE key disabled
    Checksumming of GRE packets disabled
Last clearing of counters: Never
Last 300 seconds input rate: 0 bytes/sec, 0 bits/sec, 0 packets/sec
Last 300 seconds output rate: 0 bytes/sec, 0 bits/sec, 0 packets/sec
Input: 0 packets, 0 bytes, 0 drops
Output: 0 packets, 0 bytes, 0 drops
```

Table 5 Command output

Field	Description
Tunnel1	Information about the tunnel interface Tunnel 1.
Current state	Physical link state of the tunnel interface: • **Administratively DOWN**—The interface has been shut down by using the **shutdown** command. • **DOWN**—The interface is administratively up, but its physical state is down (possibly because no physical link exists or the link has failed). • **UP**—The interface is both administratively and physically up.
Line protocol state	Data link layer state of the interface. The state is determined through automatic parameter negotiation at the data link layer. • **UP**—The data link layer protocol is up. • **UP (spoofing)**—The data link layer protocol is up, but the link is an on-demand link or does not exist. This attribute is typical of null interfaces and loopback interfaces. • **DOWN**—The data link layer protocol is down.
Description	Description of the tunnel interface.
Bandwidth	Expected bandwidth of the tunnel interface.
Maximum transmission unit	MTU of the tunnel interface.
Internet protocol processing: Disabled	The tunnel interface is not assigned an IP address and cannot process IP packets.

Field	Description
Internet address: *ip-address*/*mask-length* (*Type*)	IP address of the interface and type of the address in parentheses. Possible IP address types include: • **Primary**—Manually configured primary IP address. • **Sub**—Manually configured secondary IP address. If the interface has both primary and secondary IP addresses, the primary IP address is displayed. If the interface has only secondary IP addresses, the lowest secondary IP address is displayed. • **DHCP-allocated**—DHCP allocated IP address. For more information, see DHCP client configuration in *Layer 3—IP Services Configuration Guide*. • **BOOTP-allocated**—BOOTP allocated IP address. For more information, see BOOTP client configuration in *Layer 3—IP Services Configuration Guide*. • **PPP-negotiated**—IP address assigned by a PPP server during PPP negotiation. For more information, see PPP configuration in *Layer 2—WAN Access Configuration Guide*. • **Unnumbered**—IP address borrowed from another interface. • **MAD**—IP address assigned to an IRF member device for MAD on the interface. For more information, see IRF configuration in *Virtual Technologies Configuration Guide*.
Tunnel source	Source address of the tunnel. If a source interface is specified, this field also displays the source interface in parentheses.
destination	Destination address of the tunnel.
Tunnel keepalive enabled, Period(50 s), Retries(3)	GRE keepalive is enabled. In this example, the keepalive interval is 50 seconds and the keepalive number is 3.
Tunnel TOS	ToS of tunneled packets.
Tunnel TTL	TTL of tunneled packets.
Tunnel protocol/transport	Tunnel mode and transport protocol: • **GRE/IP**—GRE/IPv4 tunnel mode. • **GRE/IPv6**—GRE/IPv6 tunnel mode. • **GRE P2MP**—GRE/IPv4 P2MP tunnel mode. • **GRE P2MP/IPv6**—GRE/IPv6 P2MP tunnel mode. • **GRE_ADVPN/IP**—GRE-encapsulated IPv4 ADVPN tunnel mode. • **GRE_ADVPN/IPv6**—GRE-encapsulated IPv6 ADVPN tunnel mode. • **UDP_ADVPN/IP**—UDP-encapsulated IPv4 ADVPN tunnel mode. • **UDP_ADVPN/IPv6**—UDP-encapsulated IPv6 ADVPN tunnel mode. • **IP/IP**—IPv4 over IPv4 tunnel mode. • **IPv6**—IPv6 tunnel mode. • **IPv6/IP**—IPv6 over IPv4 manual tunnel mode. • **IPv6/IP 6to4**—IPv6 over IPv4 6to4 tunnel mode. • **IPv6/IP auto-tunnel**—Automatic IPv6 over IPv4 tunnel mode. • **IPv6/IP ISATAP**—IPv6 over IPv4 ISATAP tunnel mode. • **DSLITE**—DS-Lite tunnel mode on the AFTR.
GRE key disabled	No GRE tunnel interface key is configured.
Checksumming of GRE packets disabled	The GRE packet checksum feature is disabled.

Field	Description
Source port number is 18001	The source port number is 18001 in ADVPN packets sent by the UDP-encapsulated ADVPN tunnel interface.
Last clearing of counters	Last time when counters were cleared.
Last 300 seconds input rate: 0 bytes/sec, 0 bits/sec, 0 packets/sec	Average input rate in the last 300 seconds.
Last 300 seconds output rate: 0 bytes/sec, 0 bits/sec, 0 packets/sec	Average output rate in the last 300 seconds.
Input: 0 packets, 0 bytes, 0 drops	Total input packets, total input bytes, and total input packets dropped. Input packets are counted after hardware or software de-encapsulation.
Output: 0 packets, 0 bytes, 0 drops	Total output packets, total output bytes, and total output packets dropped. Output packets are counted before hardware or software encapsulation.

Display brief information about Tunnel 1.

```
<Sysname> display interface tunnel 1 brief
Brief information on interfaces in route mode:
Link: ADM - administratively down; Stby - standby

```

Table 6 Command output

Field	Description
Interface	Abbreviated interface name.

Field	Description
Link	Physical link state of the interface: • **UP**—The interface is physically up. • **DOWN**—The interface is physically down. • **ADM**—The interface has been shut down by using the **shutdown** command. To restore the physical state of the interface, use the **undo shutdown** command. • **Stby**—The interface is a backup interface in standby state. To see the primary interface, use the **display interface-backup state** command.
Protocol	Data link layer protocol state of the interface: • **UP**—The data link layer protocol of the interface is up. • **DOWN**—The data link layer protocol of the interface is down. • **UP(s)**—The data link layer protocol of the interface is up, but the link is an on-demand link or does not exist. The **(s)** attribute represents the spoofing flag. This value is typical of null interfaces and loopback interfaces.
Primary IP	Primary IP address of the interface. This field displays two hyphens (**--**) if the interface does not have an IP address.
Description	Description of the interface.
Cause	Cause for the physical link state of an interface to be **DOWN**: • **Administratively**—The interface has been manually shut down by using the **shutdown** command. To restore the physical state of the interface, use the **undo shutdown** command. • **Not connected**—The tunnel is not established.

Related commands

destination

interface tunnel

source

ds-lite enable

Use **ds-lite enable** to enable DS-Lite tunneling on an interface.

Use **undo ds-lite enable** to disable DS-Lite tunneling on an interface.

Syntax

ds-lite enable

undo ds-lite enable

Default

DS-Lite tunneling is disabled on an interface.

Views

Interface view

Predefined user roles

network-admin

context-admin

Usage guidelines

Use this command on the AFTR's interface connected to the public IPv4 network, so the AFTR can forward IPv4 packets to the B4 router through the DS-Lite tunnel.

You cannot enable DS-Lite tunneling on a DS-Lite tunnel interface on the AFTR.

Examples

Enable DS-Lite tunneling on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] ds-lite enable
```

interface tunnel

Use **interface tunnel** to create a tunnel interface, specify the tunnel mode, and enter tunnel interface view, or enter the view of an existing tunnel interface.

Use **undo interface tunnel** to delete a tunnel interface.

Syntax

interface tunnel *number* [**mode** { **advpn** { **gre** | **udp** } [**ipv6**] | **ds-lite-aftr** | **gre** [**ipv6**] | **gre-p2mp** [**ipv6**] | **ipsec** [**ipv6**] | **ipv4-ipv4** | **ipv6** | **ipv6-ipv4** [**6rd** | **6to4** | **auto-tunnel** | **isatap**] }]

undo interface tunnel *number*

Default

No tunnel interfaces exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

number: Specifies the number of the tunnel interface. The value range is 0 to 1023. The number of tunnel interfaces that can be created is restricted by the total number of interfaces and the memory.

mode advpn gre: Specifies the GRE-encapsulated IPv4 ADVPN tunnel mode.

The following compatibility matrixes show the support of hardware platforms for the **mode advpn gre** parameter:

Models	Parameter compatibility
NFNX5-HD6480, NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB1780, NFNX3-HDB3080, NFNX3-HDB680, NFNX3-HDB1080	Yes
NFNX3-HDB1180, NFNX3-HDB1480	No

mode advpn udp: Specifies the UDP-encapsulated IPv4 ADVPN tunnel mode.

The following compatibility matrixes show the support of hardware platforms for the **mode advpn udp** parameter:

Models	Parameter compatibility
NFNX5-HD6480, NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB1780, NFNX3-HDB3080, NFNX3-HDB680, NFNX3-HDB1080	Yes
NFNX3-HDB1180, NFNX3-HDB1480	No

`mode advpn gre ipv6`: Specifies the GRE-encapsulated IPv6 ADVPN tunnel mode.

The following compatibility matrixes show the support of hardware platforms for the **`mode advpn gre ipv6`** parameter:

Models	Parameter compatibility
NFNX5-HD6480, NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB1780, NFNX3-HDB3080, NFNX3-HDB680, NFNX3-HDB1080	Yes
NFNX3-HDB1180, NFNX3-HDB1480	No

`mode advpn udp ipv6`: Specifies the UDP-encapsulated IPv6 ADVPN tunnel mode.

The following compatibility matrixes show the support of hardware platforms for the **`mode advpn udp ipv6`** parameter:

Models	Parameter compatibility
NFNX5-HD6480, NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB1780, NFNX3-HDB3080, NFNX3-HDB680, NFNX3-HDB1080	Yes
NFNX3-HDB1180, NFNX3-HDB1480	No

`mode ds-lite-aftr`: Specifies the DS-Lite tunnel mode on the AFTR.

`mode gre`: Specifies the GRE/IPv4 tunnel mode.

`mode gre ipv6`: Specifies the GRE/IPv6 tunnel mode.

`mode gre-p2mp`: Specifies the GRE/IPv4 P2MP tunnel mode.

The following compatibility matrixes show the support of hardware platforms for the **`mode gre-p2mp`** parameter:

Models	Parameter compatibility
NFNX5-HD6480, NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB1780, NFNX3-HDB3080	Yes
NFNX3-HDB1180, NFNX3-HDB1480, NFNX3-HDB680, NFNX3-HDB1080	No

`mode gre-p2mp ipv6`: Specifies the GRE/IPv6 P2MP tunnel mode.

The following compatibility matrixes show the support of hardware platforms for the **`mode gre-p2mp ipv6`** parameter:

Models	Parameter compatibility
NFNX5-HD6480, NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB1780, NFNX3-HDB3080	Yes

NFNX3-HDB1180, NFNX3-HDB1480, NFNX3-HDB680, NFNX3-HDB1080	No

mode ipsec: Specifies the IPsec/IPv4 tunnel mode.

The following compatibility matrixes show the support of hardware platforms for the **mode ipsec** parameter:

Models	Parameter compatibility
NFNX5-HD6480, NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB1780, NFNX3-HDB3080, NFNX3-HDB680, NFNX3-HDB1080	Yes
NFNX3-HDB1180, NFNX3-HDB1480	No

mode ipsec ipv6: Specifies the IPsec/IPv6 tunnel mode.

The following compatibility matrixes show the support of hardware platforms for the **mode ipsec ipv6** parameter:

Models	Parameter compatibility
NFNX5-HD6480, NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB1780, NFNX3-HDB3080, NFNX3-HDB680, NFNX3-HDB1080	Yes
NFNX3-HDB1180, NFNX3-HDB1480	No

mode ipv4-ipv4: Specifies the IPv4 over IPv4 tunnel mode.

mode ipv6: Specifies the IPv6 tunnel mode. Set this mode for IPv4 over IPv6 manual and IPv6 over IPv6 tunnels.

mode ipv6-ipv4: Specifies the IPv6 over IPv4 manual tunnel mode.

mode ipv6-ipv4 6rd: Specifies the 6RD tunnel mode.

The following compatibility matrixes show the support of hardware platforms for the 6RD tunnel mode parameter:

Models	Parameter compatibility
NFNX5-HD6480, NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB1780, NFNX3-HDB3080, NFNX3-HDB1180, NFNX3-HDB1480	No
NFNX3-HDB680, NFNX3-HDB1080	Yes

mode ipv6-ipv4 6to4: Specifies the 6to4 tunnel mode.

mode ipv6-ipv4 auto-tunnel: Specifies the IPv4-compatible IPv6 automatic tunnel mode.

mode ipv6-ipv4 isatap: Specifies the ISATAP tunnel mode.

Usage guidelines

To create a new tunnel interface, you must specify the tunnel mode in this command. To enter the view of an existing tunnel interface, you do not need to specify the tunnel mode.

A tunnel interface number is locally significant. The tunnel interfaces on the two ends of a tunnel can use the same or different interface numbers.

On IPv4 and IPv6 VXLAN tunnel interfaces and VXLAN-DCI tunnel interfaces, IP addresses (assigned by **ip address** and **ipv6 address** commands) are meaningless. As a best practice, do not assign IP addresses to those types of tunnel interfaces.

Examples

Create GRE/IPv4 tunnel interface Tunnel 1 and enter tunnel interface view.

```
<Sysname> system-view
[Sysname] interface tunnel 1 mode gre
[Sysname-Tunnel1]
```

Related commands

destination

display interface tunnel

source

mtu

Use **mtu** to set the MTU on a tunnel interface.

Use **undo mtu** to restore the default.

Syntax

mtu *size*

undo mtu

Default

If the tunnel interface has never been up, the MTU is 64000 bytes.

If the tunnel interface is up, its MTU is identical to the outgoing interface's MTU minus the length of the tunnel headers. The outgoing interface is automatically obtained through routing table lookup based on the tunnel destination address.

Views

Tunnel interface view

Predefined user roles

network-admin

context-admin

Parameters

size: Specifies the MTU, in the range of 100 to 64000 bytes.

Usage guidelines

After you configure an MTU for a tunnel interface, the configured MTU applies regardless of the tunnel interface status (up/down) and the outgoing interface MTU.

To avoid fragmentation after tunnel encapsulation, set the tunnel interface MTU no greater than the value of the outgoing interface MTU minus the length of the tunnel headers.

Examples

Set the MTU on Tunnel 1 to 1000 bytes.

```
<Sysname> system-view
[Sysname] interface tunnel 1
[Sysname-Tunnel1] mtu 1000
```

Related commands

display interface tunnel

reset counters interface tunnel

Use **reset counters interface tunnel** to clear tunnel interface statistics.

Syntax

reset counters interface [**tunnel** [*number*]]

Views

User view

Predefined user roles

network-admin

context-admin

Parameters

tunnel [*number*]: Specifies a tunnel interface. The *number* argument specifies the tunnel interface number. If you do not specify the **tunnel** keyword, this command clears statistics for all interfaces. If you specify the **tunnel** keyword without the *number* argument, this command clears statistics for all tunnel interfaces.

Usage guidelines

Use this command to clear old statistics so you can observe new traffic statistics on a tunnel interface.

Examples

Clear statistics for Tunnel 1.

```
<Sysname> reset counters interface tunnel 1
```

Related commands

display interface tunnel

shutdown

Use **shutdown** to shut down a tunnel interface.

Use **undo shutdown** to bring up a tunnel interface.

Syntax

shutdown

undo shutdown

Default

A tunnel interface is not administratively down.

Views

Tunnel interface view

Predefined user roles

network-admin

context-admin

Usage guidelines

This command disconnects all links set up on the interface. Make sure you fully understand the impact of the command on your network.

Examples

Shut down Tunnel 1.

```
<Sysname> system-view
[Sysname] interface tunnel 1
[Sysname-Tunnel1] shutdown
```

Related commands

display interface tunnel

source

Use **source** to specify the source address or source interface of a tunnel.

Use **undo source** to restore the default.

Syntax

source { *ipv4-address* | *ipv6-address* | *interface-type interface-number* }

undo source

Default

No source address or source interface is specified for a tunnel.

Views

Tunnel interface view

Predefined user roles

network-admin

context-admin

Parameters

ipv4-address: Specifies the tunnel source IPv4 address.

ipv6-address: Specifies the tunnel source IPv6 address.

interface-type interface-number: Specifies the source interface by its type and number. The interface must be up and must have an IP address.

Usage guidelines

The specified source address or the address of the specified source interface is used as the source address of tunneled packets. To display the configured tunnel source address, use the **display interface tunnel** command.

Do not specify the same tunnel source and destination addresses for different tunnels on the same device.

The destination address of a tunnel at the local end must be the source address of the tunnel at the peer end. The source address of the tunnel at the local end must be the destination address of the tunnel at the peer end.

If you execute this command multiple times, the most recent configuration takes effect.

You cannot specify the tunnel interface of the DS-Lite tunnel on the AFTR as the source interface.

Examples

Specify GigabitEthernet 1/0/1 as the source interface of Tunnel 1.

```
<Sysname> system-view
[Sysname] interface tunnel 1 mode gre
[Sysname-Tunnel1] source gigabitethernet 1/0/1
```

Specify 192.100.1.1 as the source address of Tunnel 1.

```
<Sysname> system-view
[Sysname] interface tunnel 1 mode gre
[Sysname-Tunnel1] source 192.100.1.1
```

Related commands

`destination`

`display interface tunnel`

`interface tunnel`

tunnel 6rd br

Use **`tunnel 6rd br`** to specify a BR address for a 6RD tunnel.

Use **`undo tunnel 6rd br`** to restore the default.

Syntax

`tunnel 6rd br` *`ipv4-address`*

`undo tunnel 6rd br`

The following compatibility matrixes show the support of hardware platforms for this command:

Models	Command compatibility
NFNX5-HD6480, NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB1780, NFNX3-HDB3080, NFNX3-HDB1180, NFNX3-HDB1480	No
NFNX3-HDB680, NFNX3-HDB1080	Yes

Default

No BR address is specified for a 6RD tunnel.

Views

Tunnel interface view

Predefined user roles

network-admin

context-admin

Parameters

`ipv4-address`: Specifies the BR address (IPv4 address of a 6RD BR router), in dotted decimal notation.

Usage guidelines

Use this command on a 6RD CE. For a 6RD network to communicate with a non-6RD network over a 6RD tunnel, you must specify the BR address on the 6RD CE.

All the 6RD CEs and 6RD BR routers in a 6RD network must have the same IPv4 prefix and suffix. Make sure the BR address and the tunnel source address have the same IPv4 prefix and suffix.

Examples

Specify the BR address as 10.11.12.13 on Tunnel 1.

```
<Sysname> system-view
[Sysname] interface tunnel 1 mode ipv6-ipv4 6rd
[Sysname-Tunnel1] tunnel 6rd br 10.11.12.13
```

Related commands

display 6rd

tunnel 6rd ipv4

Use **tunnel 6rd ipv4** to specify a prefix length and a suffix length for a 6RD tunnel source address.

Use **undo tunnel 6rd ipv4** to restore the default.

Syntax

tunnel 6rd ipv4 { **prefix-length** *length* | **suffix-length** *length* } *

undo tunnel 6rd ipv4

The following compatibility matrixes show the support of hardware platforms for this command:

Models	Command compatibility
NFNX5-HD6480, NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB1780, NFNX3-HDB3080, NFNX3-HDB1180, NFNX3-HDB1480	No
NFNX3-HDB680, NFNX3-HDB1080	Yes

Default

All 32 bits of the IPv4 tunnel source address are used to create the 6RD delegated prefix.

Views

Tunnel interface view

Predefined user roles

network-admin

context-admin

Parameters

prefix-length *length*: Specifies the prefix length in the range of 0 to 31.

suffix-length *length*: Specifies the suffix length in the range of 0 to 31.

Usage guidelines

All 6RD tunnel interfaces in a 6RD network must be configured with the same IPv4 prefix length and suffix length.

You can specify a prefix length, a suffix length, both prefix and suffix lengths, or neither. The device will remove the prefix and suffix bits from the tunnel source address and embed the left bits of the address to the 6RD delegated prefix. If neither a prefix length nor a suffix length is specified, all 32 bits of the IPv4 tunnel source address will be embedded in the 6RD delegated prefix.

Examples

Specify both the prefix length and suffix length as 8 on Tunnel 1.

```
<Sysname> system-view
[Sysname] interface tunnel 1 mode ipv6-ipv4 6rd
[Sysname-Tunnel1] tunnel 6rd ipv4 prefix-length 8 suffix-length 8
```

Related commands

display 6rd

display 6rd destination

display 6rd prefix

tunnel 6rd prefix

Use **tunnel 6rd prefix** to configure the 6RD prefix for a 6RD tunnel.

Use **undo tunnel 6rd prefix** to restore the default.

Syntax

tunnel 6rd prefix *ipv6-prefix/prefix-length*

undo tunnel 6rd prefix

The following compatibility matrixes show the support of hardware platforms for this command:

Models	Command compatibility
NFNX5-HD6480, NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB1780, NFNX3-HDB3080, NFNX3-HDB1180, NFNX3-HDB1480	No
NFNX3-HDB680, NFNX3-HDB1080	Yes

Default

No 6RD prefix is configured for a 6RD tunnel.

Views

Tunnel interface view

Predefined user roles

network-admin

context-admin

Parameters

ipv6-prefix/prefix-length: Specifies the IPv6 prefix and its length. The value range for the prefix length is 1 to 127.

Usage guidelines

A 6RD delegated prefix contains a 6RD prefix and all or part of the bits in the IPv4 tunnel source address.

All tunnels in a 6RD network must have the same 6RD prefix.

Examples

Configure the 6RD prefix as 2001:1000::/32 on Tunnel 1.

```
<Sysname> system-view
[Sysname] interface tunnel 1 mode ipv6-ipv4 6rd
```

```
[Sysname-Tunnel1] tunnel 6rd prefix 2001:1000::/32
```

Related commands

display 6rd

display 6rd destination

display 6rd prefix

tunnel dfbit enable

Use **tunnel dfbit enable** to set the Don't Fragment (DF) bit for tunneled packets.

Use **undo tunnel dfbit enable** to restore the default.

Syntax

tunnel dfbit enable

undo tunnel dfbit enable

Default

The DF bit is not set for tunneled packets.

Views

Tunnel interface view

Predefined user roles

network-admin

context-admin

Usage guidelines

To avoid fragmentation and delay, set the DF bit for tunneled packets. Make sure the path MTU is larger than the tunneled packet length. To avoid discarding tunneled packets whose length is larger than the path MTU, do not set the DF bit.

This command is not supported on a GRE/IPv6 tunnel interface and an IPv6 tunnel interface.

Examples

Set the DF bit for tunneled packets on Tunnel 1.

```
<Sysname> system-view
[Sysname] interface tunnel 1 mode gre
[Sysname-Tunnel1] tunnel dfbit enable
```

tunnel discard ipv4-compatible-packet

Use **tunnel discard ipv4-compatible-packet** to enable dropping IPv6 packets that use IPv4-compatible IPv6 addresses.

Use **undo tunnel discard ipv4-compatible-packet** to restore the default.

Syntax

tunnel discard ipv4-compatible-packet

undo tunnel discard ipv4-compatible-packet

Default

IPv6 packets that use IPv4-compatible IPv6 addresses are not dropped.

Views

System view

Predefined user roles

network-admin

context-admin

Usage guidelines

This command enables the device to check the source and destination IPv6 addresses of the de-encapsulated IPv6 packets from a tunnel. If a packet uses an IPv4-compatible IPv6 address as the source or destination address, the device discards the packet.

Examples

Enable dropping IPv6 packets that use IPv4-compatible IPv6 addresses.

```
<Sysname> system-view
[Sysname] tunnel discard ipv4-compatible-packet
```

tunnel tos

Use **tunnel tos** to set the ToS of tunneled packets.

Use **undo tunnel tos** to restore the default.

Syntax

tunnel tos { **copy-inner-tos** | *tos-value* }

undo tunnel tos

Default

For VXLAN tunneled packets, the ToS is 0.

For non-VXLAN tunneled packets, the ToS is the same as the ToS of the original packets.

Views

Tunnel interface view

Predefined user roles

network-admin

context-admin

Parameters

copy-inner-tos: Configures tunneled packets to use the ToS of the original packets. This keyword is supported only by VXLAN tunnels.

tos-value: Specifies the ToS of tunneled packets, in the range of 0 to 255.

Usage guidelines

After you execute this command, all the tunneled packets of different services sent on the tunnel interface will use the same configured ToS. For more information about ToS, see *ACL and QoS Configuration Guide*.

Examples

Set the ToS of tunneled packets to 20 on Tunnel 1.

```
<Sysname> system-view
[Sysname] interface tunnel 1 mode gre
[Sysname-Tunnel1] tunnel tos 20
```

Configure VXLAN tunnel interface Tunnel 2 to use the ToS of the original packets as the ToS of tunneled packets.

```
<Sysname> system-view
[Sysname] interface tunnel 2 mode vxlan
[Sysname-Tunnel2] tunnel tos copy-inner-tos
```

Related commands

display interface tunnel

tunnel ttl

Use **tunnel ttl** to set the Time to Live (TTL) of tunneled packets.

Use **undo tunnel ttl** to restore the default.

Syntax

tunnel ttl *ttl-value*

undo tunnel ttl

Default

The TTL of tunneled packets is 255.

Views

Tunnel interface view

Predefined user roles

network-admin

context-admin

Parameters

ttl-value: Specifies the TTL of tunneled packets, in the range of 1 to 255.

Usage guidelines

The TTL determines the maximum number of hops that the tunneled packets can pass. When the TTL expires, the tunneled packets are discarded to avoid loops.

Examples

Set the TTL of tunneled packets to 100 on Tunnel 1.

```
<Sysname> system-view
[Sysname] interface tunnel 1 mode gre
[Sysname-Tunnel1] tunnel ttl 100
```

Related commands

display interface tunnel

tunnel vpn-instance

Use **tunnel vpn-instance** to specify a VPN instance for the destination address of a tunnel interface.

Use **undo tunnel vpn-instance** to restore the default.

Syntax

tunnel vpn-instance *vpn-instance-name*

undo tunnel vpn-instance

Default

The destination address of a tunnel interface belongs to the public network.

Views

Tunnel interface view

Predefined user roles

network-admin

context-admin

Parameters

vpn-instance-name: Specifies a VPN instance by its name, a case-sensitive string of 1 to 31 characters.

Usage guidelines

After this command is executed, the device looks up the routing table of the specified VPN instance to forward tunneled packets on the tunnel interface.

For a tunnel interface to come up, the tunnel source and destination must belong to the same VPN instance. To specify a VPN instance for the tunnel source, use the **ip binding vpn-instance** command on the tunnel source interface.

Examples

Specify VPN instance **vpn10** for the tunnel destination on Tunnel 1.

```
<Sysname> system-view
[Sysname] ip vpn-instance vpn10
[Sysname-vpn-instance-vpn10] route-distinguisher 1:1
[Sysname-vpn-instance-vpn10] vpn-target 1:1
[Sysname-vpn-instance-vpn10] quit
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] ip binding vpn-instance vpn10
[Sysname-GigabitEthernet1/0/1] ip address 1.1.1.1 24
[Sysname-GigabitEthernet1/0/1] quit
[Sysname] interface tunnel 1 mode gre
[Sysname-Tunnel1] source gigabitethernet 1/0/1
[Sysname-Tunnel1] destination 1.1.1.2
[Sysname-Tunnel1] tunnel vpn-instance vpn10
```

Related commands

ip binding vpn-instance (*VPN Instance Command Reference*)

GRE commands

display gre p2mp tunnel-table interface tunnel

Use **display gre p2mp tunnel-table interface tunnel** to display dynamic tunnel entry information for a GRE P2MP tunnel interface.

Syntax

display gre p2mp tunnel-table interface tunnel *number* [**ipv4** | **ipv6**]

The following compatibility matrixes show the support of hardware platforms for this command:

Models	Command compatibility
NFNX5-HD6480, NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB1780, NFNX3-HDB3080	Yes
NFNX3-HDB1180, NFNX3-HDB1480, NFNX3-HDB680, NFNX3-HDB1080	No

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

number: Specifies an existing GRE P2MP tunnel interface by its interface number.

ipv4: Specifies dynamic IPv4 tunnel entries.

ipv6: Specifies dynamic IPv6 tunnel entries.

Usage guidelines

If you do not specify the **ipv4** keyword or the **ipv6** keyword, this command displays all dynamic tunnel entries for a GRE P2MP tunnel interface.

Examples

Display all dynamic tunnel entries for GRE P2MP tunnel interface **Tunnel 0**.

```
<Sysname> display gre p2mp tunnel-table interface tunnel 0
Total number:2
Dest Addr               Mask/Prefix Len Tunnel Dest Addr        Gre Key   Aging
10.0.0.1                255.255.255.255 20.0.0.1                          10
10::1                   64              20.0.0.2                          5
```

Display dynamic IPv4 tunnel entries for GRE P2MP tunnel interface **Tunnel 0**.

```
<Sysname> display gre p2mp tunnel-table interface tunnel 0 ipv4
Total number:1
Dest Addr               Mask/Prefix Len Tunnel Dest Addr        Gre Key   Aging
100.0.0.1               255.255.255.255  20.0.0.1                         9
```

Display dynamic IPv6 tunnel entries for GRE P2MP tunnel interface **Tunnel 0**.

```
<Sysname> display gre p2mp tunnel-table interface tunnel 0 ipv6
Total number:1
Dest Addr             Mask/Prefix Len Tunnel Dest Addr        Gre Key   Aging
100::1                128                   20::2                       3
```

Table 1 Command output

Field	Description
Total number	Total number of GRE P2MP dynamic tunnel entries.
Dest Addr	Network address of the branch network.
Mask/Prefix Len	Address mask or prefix length of the branch network.
Tunnel Dest Addr	Destination address of the tunnel.
Gre Key	GRE key, which indicates the priority of the dynamic tunnel entry. This field does not display anything if the tunnel destination end does not have a GRE key.
Aging	Remaining lifetime of the entry, in seconds.

display gre p2mp tunnel-table statistics

Use **display gre p2mp tunnel-table statistics** to display packet statistics of static tunnel entries for a GRE P2MP tunnel interface.

Syntax

display gre p2mp tunnel-table statistics interface tunnel *number* [**vpn-instance** *vpn-instance-name*] [**branch-network-address** *branch-network-address* { *mask* | *mask-length* }]

The following compatibility matrixes show the support of hardware platforms for this command:

Models	Command compatibility
NFNX5-HD6480, NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB1780, NFNX3-HDB3080	Yes
NFNX3-HDB1180, NFNX3-HDB1480, NFNX3-HDB680, NFNX3-HDB1080	No

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

interface tunnel *number*: Specifies an existing GRE P2MP tunnel interface by its interface number.

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name. The *vpn-instance-name* argument is a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command displays packet statistics of static tunnel entries on the public network for the specified GRE P2MP tunnel interface.

branch-network-address *branch-network-address*: Specifies an IPv4 branch network address. If you do not specify this option, the command displays packets statistics of static tunnel entries for all IPv4 branch networks of the specified scope.

mask: Specifies the mask of the branch network address, in dotted decimal notation.

mask-length: Specifies the mask length of the branch network address, in the range of 0 to 32.

Usage guidelines

If you do not specify any parameters, this command displays packet statistics of all static tunnel entries on the public network for the specified GRE P2MP tunnel interface.

Examples

Display packet statistics of all static tunnel entries on the public network for GRE P2MP tunnel interface **Tunnel 1**.

```
<Sysname> display gre p2mp tunnel-table statistics interface tunnel 1

VPN-instance name: -       Map entries: 2

Branch network address    : 192.168.11.1/32
Tunnel destination address: 11.1.1.1
Checksum value            : 192.168.20.1
  Input:
    0 packets, 0 bytes, 0 drops
  Output:
    0 packets, 0 bytes, 0 drops

Branch network address    : 192.168.12.1/32
Tunnel destination address: 11.1.1.1
Checksum value            : 192.168.20.2
  Input:
    0 packets, 0 bytes, 0 drops
  Output:
    0 packets, 0 bytes, 0 drops
```

Table 2 Command output

Field	Description
VPN-instance name	VPN instance of the branch networks. If the branch networks belong to the public network, this field displays a hyphen (-).
Map entries	Total number of GRE P2MP tunnel mapping entries.
Branch network address	IPv4 address and mask of a branch network.
Tunnel destination address	A destination address of the tunnel.
Checksum value	Value to fill in the **checksum** field. The system does not display the **Checksum value** field if no value is specified to fill in the **checksum** field.

Field	Description
Input: 0 packets, 0 bytes, 0 drops	Incoming traffic statistics: • Number of incoming packets. • Number of incoming bytes. • Number of dropped packets.
Output: 0 packets, 0 bytes, 0 drops	Outgoing traffic statistics: • Number of outgoing packets. • Number of outgoing bytes. • Number of dropped packets.

gre checksum

Use **gre checksum** to enable GRE checksum.

Use **undo gre checksum** to disable GRE checksum.

Syntax

gre checksum

undo gre checksum

Default

GRE checksum is disabled.

Views

Tunnel interface view

Predefined user roles

network-admin

context-admin

Usage guidelines

GRE checksum verifies packet integrity.

You can enable or disable GRE checksum at each end of a tunnel as needed. After GRE checksum is enabled, the sender does the following:

- Calculates the checksum for the GRE header and the payload.
- Sends the packet containing the checksum information to the peer.

The receiver calculates the checksum for the received packet and compares it with that carried in the packet. If the checksums are the same, the receiver processes the packet. If the checksums are different, the receiver discards the packet.

If a packet carries a GRE checksum, the receiver checks the checksum whether or not the receiver is enabled with GRE checksum.

Examples

Enable GRE checksum.

```
<Sysname> system-view
[Sysname] interface tunnel 2 mode gre
[Sysname-Tunnel2] gre checksum
```

gre key

Use **gre key** to configure a key for a GRE tunnel interface.

Use **undo gre key** to restore the default.

Syntax

gre key *key*

undo gre key

Default

No key is configured for a GRE tunnel interface.

Views

Tunnel interface view

Predefined user roles

network-admin

context-admin

Parameters

key: Specifies the key for the GRE tunnel interface, in the range of 0 to 4294967295.

Usage guidelines

Both ends of a GRE point-to-point tunnel must have the same key or no key.

Do not configure any GRE key on a GRE P2MP tunnel interface. You can configure GRE keys on the point-to-point tunnel interfaces in the branch networks. The GRE keys not only check for the validity of packets received on the tunnel interfaces but also indicate the priorities of dynamic tunnels. The GRE P2MP tunnel end prefers the branch tunnel that has the highest priority to forward traffic.

Do not use this command together with the **gre vpc enable** command on the same tunnel interface.

Examples

Configure the GRE key as 123 for the GRE tunnel interface Tunnel 2.

```
<Sysname> system-view
[Sysname] interface tunnel 2 mode gre
[Sysname-Tunnel2] gre key 123
```

gre p2mp aging-time

Use **gre p2mp aging-time** to specify an aging timer for dynamic tunnel entries of a GRE P2MP tunnel interface.

Use **undo gre p2mp aging-time** to restore the default.

Syntax

gre p2mp aging-time *aging-time*

undo gre p2mp aging-time

The following compatibility matrixes show the support of hardware platforms for this command:

Models	Command compatibility
NFNX5-HD6480, NFNX3-HDB3280, NFNX5-T6280,	Yes

Models	Command compatibility
NFNX5-HD5280, NFNX3-HDB1780, NFNX3-HDB3080	
NFNX3-HDB1180, NFNX3-HDB1480, NFNX3-HDB680, NFNX3-HDB1080	No

Default

The aging timer is 5 seconds.

Views

Tunnel interface view

Predefined user roles

network-admin

context-admin

Parameters

aging-time: Specifies an aging timer in the range of 1 to 86400 seconds.

Usage guidelines

This command is applicable only to GRE P2MP tunnel interfaces.

If the headquarters gateway does not receive any packets from a branch when the aging timer expires, it deletes the dynamic tunnel entry of that branch.

Set an appropriate aging timer depending on the network condition. A shorter timer might cause forwarding failure to an actual reachable network. A longer timer cannot quickly update dynamic tunnel entries.

Examples

Set the aging timer to 10 seconds for dynamic tunnel entry on GRE P2MP tunnel interface **Tunnel 0**.

```
<Sysname> system-view
[Sysname] interface tunnel 0 mode gre-p2mp
[Sysname-Tunnel0] gre p2mp aging-time 10
```

gre p2mp backup-interface

Use **gre p2mp backup-interface** to specify a backup interface for a GRE P2MP tunnel interface.

Use **undo gre p2mp backup-interface** to restore the default.

Syntax

gre p2mp backup-interface tunnel *number*

undo gre p2mp backup-interface

The following compatibility matrixes show the support of hardware platforms for this command:

Models	Command compatibility
NFNX5-HD6480, NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB1780, NFNX3-HDB3080	Yes
NFNX3-HDB1180, NFNX3-HDB1480, NFNX3-HDB680, NFNX3-HDB1080	No

Default

No backup interface is configured for a GRE P2MP tunnel interface.

Views

Tunnel interface view

Predefined user roles

network-admin

context-admin

Parameters

tunnel *number*: Specifies a tunnel interface by its interface number. The tunnel interface must exist on the device and must be a GRE/IPv4 or GRE/IPv6 tunnel interface.

Usage guidelines

This command is applicable only to GRE P2MP tunnel interfaces.

When the device cannot find a matching GRE P2MP dynamic tunnel entry to forward traffic, it forwards the traffic to the backup gateway through the backup interface. Services (for example, NetStream and NAT) on the backup interface do not take effect on the traffic. The service configuration on the primary GRE P2MP tunnel interface is used for the traffic.

Examples

Specify tunnel interface **Tunnel 100** as the backup interface of GRE P2MP tunnel interface **Tunnel 0**.

```
<Sysname> system-view
[Sysname] interface tunnel 0 mode gre-p2mp
[Sysname-Tunnel0] gre p2mp backup-interface tunnel 100
```

gre p2mp branch-network-mask

Use **gre p2mp branch-network-mask** to specify the network mask or mask length for IPv4 branch networks or specify the prefix length for IPv6 branch networks on a GRE P2MP tunnel interface.

Use **undo gre p2mp branch-network-mask** to restore the default.

Syntax

gre p2mp branch-network-mask { *mask* | *mask-length* | **ipv6** *prefix-length* }

undo gre p2mp branch-network-mask [**ipv6**]

The following compatibility matrixes show the support of hardware platforms for this command:

Models	Command compatibility
NFNX5-HD6480, NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB1780, NFNX3-HDB3080	Yes
NFNX3-HDB1180, NFNX3-HDB1480, NFNX3-HDB680, NFNX3-HDB1080	No

Default

The IPv4 address mask is 255.255.255.255 (the mask length is 32) and the IPv6 address prefix length is 128 for branch networks.

Views

Tunnel interface view

Predefined user roles

network-admin

context-admin

Parameters

mask: Specifies the IPv4 address mask, in dotted decimal notation.

mask-length: Specifies the IPv4 address mask length, in the range of 0 to 32.

ipv6 *prefix-length*: Specifies the IPv6 address prefix length, in the range of 0 to 128.

Usage guidelines

This command is applicable only to GRE P2MP tunnel interfaces.

This command enables a GRE P2MP tunnel interface to use the same network mask or prefix length to create dynamic tunnel entries for branch networks. One branch has only one dynamic tunnel entry.

To ensure successful packet forwarding, make sure all branch networks have the same network mask or prefix length, which is the same as that specified by this command.

Examples

Specify the IPv4 branch network mask as 255.255.255.0 for GRE P2MP dynamic tunnel entries on tunnel interface **Tunnel 0**.

```
<Sysname> system-view
[Sysname] interface tunnel 0 mode gre-p2mp
[Sysname-Tunnel0] gre p2mp branch-network-mask 255.255.255.0
```

gre p2mp nexthop-learning

Use **gre p2mp nexthop-learning** to enable next hop host route learning.

Use **undo gre p2mp nexthop-learning** to disable next hop host route learning.

Syntax

gre p2mp nexthop-learning

undo gre p2mp nexthop-learning

The following compatibility matrixes show the support of hardware platforms for this command:

Models	Command compatibility
NFNX5-HD6480, NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB1780, NFNX3-HDB3080	Yes
NFNX3-HDB1180, NFNX3-HDB1480, NFNX3-HDB680, NFNX3-HDB1080	No

Default

Next hop host route learning is disabled.

Views

Tunnel interface view.

Predefined user roles

network-admin

context-admin

Usage guidelines

This command is supported only on GRE/IPv4 P2MP tunnel interfaces.

The headquarters gateway uses the same branch network mask to create tunnel entries for all branch networks. If some branch network addresses are in the same subnet, the headquarters gateway will learn the same destination address for these branch networks in the tunnel entries. In this case, the headquarters cannot establish BGP neighbors with these branches.

To resolve this issue, enable next hop host route learning on the headquarters gateway. This feature enables the gateway to learn destination addresses with the 32-bit mask when it establishes a BGP neighbor relationship with peers that are in the same subnet.

Examples

Enable next hop host route learning on GRE/IPv4 P2MP tunnel interface **Tunnel 0**.

```
<Sysname> system-view
[Sysname] interface tunnel 0 mode gre-p2mp
[Sysname-Tunnel0] gre p2mp nexthop-learning
```

Related commands

gre p2mp branch-network-mask

gre p2mp-template (system view)

Use **gre p2mp-template** to create a GRE P2MP tunnel template and enter its view, or enter the view of an existing GRE P2MP tunnel template.

Use **undo gre p2mp-template** to delete a GRE P2MP tunnel template.

Syntax

gre p2mp-template *template-name*

undo gre p2mp-template *template-name*

The following compatibility matrixes show the support of hardware platforms for this command:

Models	Command compatibility
NFNX5-HD6480, NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB1780, NFNX3-HDB3080	Yes
NFNX3-HDB1180, NFNX3-HDB1480, NFNX3-HDB680, NFNX3-HDB1080	No

Default

No GRE P2MP tunnel templates exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

template-name: Specifies a name for the GRE P2MP tunnel template, a case-sensitive string of 1 to 31 characters.

Examples

Create a GRE P2MP tunnel template named **aa** and enter its view.

```
<Sysname> system-view
[Sysname] gre p2mp-template aa
[Sysname-p2mp-template-aa]
```

Related commands

map

gre p2mp-template (tunnel interface view)

Use **gre p2mp-template** to apply a GRE P2MP tunnel template to a GRE P2MP tunnel interface.

Use **undo gre p2mp-template** to restore the default.

Syntax

gre p2mp-template *template-name*

undo gre p2mp-template

The following compatibility matrixes show the support of hardware platforms for this command:

Models	Command compatibility
NFNX5-HD6480, NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB1780, NFNX3-HDB3080	Yes
NFNX3-HDB1180, NFNX3-HDB1480, NFNX3-HDB680, NFNX3-HDB1080	No

Default

No GRE P2MP tunnel template is applied to a GRE P2MP tunnel interface.

Views

Tunnel interface view

Predefined user roles

network-admin

context-admin

Parameters

template-name: Specifies a GRE P2MP tunnel template by its name, a case-sensitive string of 1 to 31 characters.

Usage guidelines

A GRE P2MP tunnel interface can use only one GRE P2MP tunnel template. If you execute this command multiple times, the most recent configuration takes effect.

Examples

Apply GRE P2MP tunnel template **aa** to GRE P2MP tunnel interface **Tunnel 1**.

```
<Sysname> system-view
[Sysname] interface tunnel 1 mode gre-p2mp
```

```
[Sysname-Tunnel1] gre p2mp-template aa
```

Related commands

gre p2mp-template (system view)

keepalive

Use **keepalive** to enable GRE keepalive and set the keepalive interval and the keepalive number.

Use **undo keepalive** to disable GRE keepalive.

Syntax

keepalive [*interval* [*times*]]

undo keepalive

Default

GRE keepalive is disabled.

Views

Tunnel interface view

Predefined user roles

network-admin

context-admin

Parameters

interval: Specifies the keepalive interval, in the range of 1 to 32767 seconds. The default value is 10.

times: Specifies the keepalive number, in the range of 1 to 255. The default value is 3.

Usage guidelines

This command enables the tunnel interface to send keepalive packets at the specified interval. If the device receives no response from the peer within the timeout time, it shuts down the local tunnel interface. The device brings the local tunnel interface up if it receives a keepalive acknowledgment packet from the peer. The timeout time is the result of multiplying the keepalive interval by the keepalive number.

The device always acknowledges the keepalive packets it receives whether or not GRE keepalive is enabled.

GRE/IPv6 mode tunnel interfaces do not support this command.

Examples

Enable GRE keepalive, set the keepalive interval to 20 seconds, and set the keepalive number to 5.

```
<Sysname> system-view
[Sysname] interface tunnel 2 mode gre
[Sysname-Tunnel2] keepalive 20 5
```

map

Use **map** to configure a tunnel mapping entry in a GRE P2MP tunnel template.

Use **undo map** to delete a tunnel mapping entry from a GRE P2MP tunnel template.

Syntax

map [**vpn-instance** *vpn-instance-name*] **branch-network-address** *branch-network-address* { *mask* | *mask-length* } **tunnel-destination** *tunnel-dest-address* [**checksum-fill** *checksum-value*]

undo map [**vpn-instance** *vpn-instance-name*] **branch-network-address** *branch-network-address* { *mask* | *mask-length* } [**tunnel-destination** *tunnel-dest-address*]

The following compatibility matrixes show the support of hardware platforms for this command:

Models	Command compatibility
NFNX5-HD6480, NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB1780, NFNX3-HDB3080	Yes
NFNX3-HDB1180, NFNX3-HDB1480, NFNX3-HDB680, NFNX3-HDB1080	No

Default

No tunnel mapping entries are configured in a GRE P2MP tunnel template.

Views

GRE P2MP tunnel template view

Predefined user roles

network-admin

context-admin

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name. The *vpn-instance-name* argument is a case-sensitive string of 1 to 31 characters. If the branch network address belongs to a private network, you must specify this option. If the branch network address belongs to the public network, do not specify this option.

branch-network-address *branch-network-address*: Specifies an IPv4 branch network address.

mask: Specifies the mask of the branch network IPv4 address, in dotted decimal notation.

mask-length: Specifies the mask length of the branch network IPv4 address, in the range of 0 to 32.

tunnel-destination *tunnel-dest-address*: Specifies the tunnel destination IPv4 address.

checksum-fill *checksum-value*: Specifies an IPv4 address to fill in the **checksum** field of the GRE header. The IPv4 address is in dotted decimal notation. If you do not specify this option, the device does not fill in the **checksum** field of the GRE header.

Usage guidelines

The tunnel mapping entries in the tunnel template are static tunnel entries.

You can repeat this command to configure multiple tunnel mapping entries for a GRE P2MP tunnel template. Each entry defines a mapping between a branch network address and a tunnel destination address. One branch network address can be mapped to only one tunnel destination address.

If a branch network contains VMs that have multiple users, fill the IPv4 address of the destination VM to the **checksum** field for correct forwarding of a GRE packet. Specify the **checksum-fill**

checksum-value option depending on your network. Incorrect usage of the option will cause GRE checksum failures.

Examples

In GRE P2MP tunnel template **aa**, configure a tunnel mapping entry. The branch network address is 192.168.0.11 and the mask length is 32, the tunnel destination address is 10.108.113.71, and the IPv4 address to fill in the **checksum** field is 192.168.20.1.

```
<Sysname> system-view
[Sysname] gre p2mp-template aa
[Sysname-p2mp-template-aa] map branch-network-address 192.168.0.11 32 tunnel-destination
10.108.113.71 checksum-fill 192.168.20.1
```

Related commands

gre p2mp-template (system view)

reset gre p2mp tunnel-table

Use **reset gre p2mp tunnel-table** to clear dynamic tunnel entry information for a GRE P2MP tunnel interface.

Syntax

reset gre p2mp tunnel-table interface tunnel *number* [**destination** { *dest-address* | **ipv6** *dest-ipv6-address* } **tunnel-destination** { *tunnel-dest-address* | **ipv6** *tunnel-dest-address* }]

The following compatibility matrixes show the support of hardware platforms for this command:

Models	Command compatibility

Predefined user roles

network-admin

context-admin

Parameters

interface tunnel *number*: Specifies a GRE P2MP tunnel interface by its interface number.

destination { *dest-address* | **ipv6** *dest-ipv6-address* }: Specifies an IPv4 or IPv6 branch network address of the specified GRE P2MP tunnel interface.

tunnel-destination { *tunnel-dest-address* | **ipv6** *tunnel-dest-address* }: Specifies a tunnel destination IPv4 or IPv6 address.

Usage guidelines

If you do not specify a branch network address or a tunnel destination address, this command clears all dynamic tunnel entries for the specified GRE P2MP tunnel interface.

Examples

Clear all dynamic tunnel entries for GRE P2MP tunnel interface **Tunnel 0**.

```
<Sysname> reset gre p2mp tunnel-table interface tunnel 0
```

Clear a dynamic tunnel entry of which the branch network is 10.0.0.1 and the tunnel destination is 20.0.0.1 on GRE P2MP tunnel interface **Tunnel 0**.

```
<Sysname> reset gre p2mp tunnel-table interface tunnel 0 destination 10.0.0.1
tunnel-destination 20.0.0.1
```

Related commands

display gre p2mp tunnel-table interface tunnel

reset gre p2mp tunnel-table statistics

Use **reset gre p2mp tunnel-table statistics** to clear packet statistics of static tunnel entries for a GRE P2MP tunnel interface.

Syntax

network-admin

context-admin

Parameters

interface tunnel *number*: Specifies an existing GRE P2MP tunnel interface by its interface number.

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name. The *vpn-instance-name* argument is a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command clears packet statistics of static tunnel entries on the public network for the specified GRE P2MP tunnel interface.

branch-network-address *branch-network-address*: Specifies a branch network IPv4 address. If you do not specify this option, the command clears packet statistics of static tunnel entries for all IPv4 branch networks of the specified scope.

mask: Specifies the mask of the branch network address, in dotted decimal notation.

mask-length: Specifies the mask length of the branch network address, in the range of 0 to 32.

Usage guidelines

If you do not specify any parameters, this command clears packet statistics of all static tunnel entries on the public network for the specified GRE P2MP tunnel interface.

Examples

Clear packet statistics of all static tunnel entries on the public network for GRE P2MP tunnel interface **Tunnel 1**.

```
<Sysname> reset gre p2mp tunnel-table statistics interface tunnel 1
```

Related commands

display gre p2mp tunnel-table statistics

tunnel route-static

Use **tunnel route-static** to configure the preference of static routes for a GRE P2MP tunnel interface.

Use **undo tunnel route-static** to restore the default.

Syntax

tunnel route-static [**preference** *preference-value*]

undo tunnel route-static

The following compatibility matrixes show the support of hardware platforms for this command:

Models	Command compatibility
NFNX5-HD6480, NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB1780, NFNX3-HDB3080	Yes
NFNX3-HDB1180, NFNX3-HDB1480, NFNX3-HDB680, NFNX3-HDB1080	No

Default

The preference of static routes is 60 for a GRE P2MP tunnel interface.

Views

Tunnel interface view

Predefined user roles

network-admin

context-admin

Parameters

preference *preference-value*: Specifies a preference value in the range of 1 to 255. The default value is 60, which is not affected by the **ip route-static default-preference** command.

Usage guidelines

A GRE P2MP tunnel interface automatically issues reachable static routes according to the tunnel mapping entries configured in the GRE P2MP tunnel template applied to the interface. This command takes effect on these static routes.

Examples

Set the preference of static routes to 3 for GRE P2MP tunnel interface **Tunnel 1**.

```
<Sysname> system-view
[Sysname] interface tunnel 1 mode gre-p2mp
[Sysname-Tunnel1] tunnel route-static preference 3
```

Related commands

`display ip routing-table protocol` (*Layer 3—IP Routing Command Reference*)

Contents

L2TP commands

allow l2tp

Use **allow l2tp** to configure an L2TP network server (LNS) to accept Layer 2 Tunneling Protocol (L2TP) tunneling requests from an L2TP access concentrator (LAC), and to specify a VT interface for tunnel setup.

Use **undo allow** to restore the default.

Syntax

allow l2tp virtual-template *virtual-template-number* [**remote** *remote-name*]

undo allow

Default

An LNS denies L2TP tunneling requests from any LACs.

Views

L2TP group view

Predefined user roles

network-admin

context-admin

Parameters

virtual-template *virtual-template-number*: Specifies a VT interface by its number. The value range for the *virtual-template-number* argument is 1 to 1024. An LNS dynamically creates virtual access (VA) interfaces based on the configuration of a VT interface. Each VA interface is used to carry data for a different L2TP session.

remote *remote-name*: Specifies the name of the tunnel peer (LAC) initiating tunneling requests, a case-sensitive string of 1 to 31 characters.

Usage guidelines

The **allow l2tp** command is available only on L2TP groups in LNS mode.

Make sure the specified name of the tunnel peer is consistent with the local name configured on the LAC.

If you execute this command multiple times for an L2TP group, the most recent configuration takes effect.

For L2TP group 1, if you do not specify the **remote** *remote-name* option, an LNS accepts tunneling requests from any LACs. In this case, L2TP group 1 acts as the default L2TP group. For L2TP groups other than L2TP group 1, the **remote** *remote-name* option must be configured.

The **allow l2tp** command is available only on LNSs.

- When an LAC that initiates a tunneling request is the tunnel peer configured in an L2TP group, the LNS uses the tunnel parameters configured in this group for tunnel setup.
- When the LAC is not the tunnel peer configured in any L2TP group, the LNS performs one of the following operations:
  - Uses the tunnel parameters for the default L2TP group if it exists.
  - Fails to set up a tunnel with the LAC if the default L2TP group does not exist.

As a best practice, configure a default L2TP group on the LNS in the following cases:

- LACs (such as hosts with Windows 2000 Beta 2 installed) include blank local names in their tunneling requests.
- The LNS sets up tunnels with multiple LACs by using the same tunnel parameters.

Examples

Specify L2TP group 1 as the default L2TP group, and specify Virtual-Template 1 for tunnel setup. For L2TP group 2, configure the LNS to accept the L2TP tunneling request initiated by the peer (LAC) named **aaa**, and specify Virtual-Template 2 for tunnel setup.

```
<Sysname> system-view
[Sysname] l2tp-group 1 mode lns
[Sysname-l2tp1] allow l2tp virtual-template 1
[Sysname-l2tp1] quit
[Sysname] l2tp-group 2 mode lns
[Sysname-l2tp2] allow l2tp virtual-template 2 remote aaa
```

Related commands

tunnel name

bandwidth

Use **bandwidth** to set the expected bandwidth for an interface.

Use **undo bandwidth** to restore the default.

Syntax

bandwidth *bandwidth-value*

undo bandwidth

Default

The expected bandwidth (in kbps) is interface baudrate divided by 1000.

Views

Virtual PPP interface view

Predefined user roles

network-admin

context-admin

Parameters

bandwidth-value: Specifies the expected bandwidth in the range of 1 to 400000000 kbps.

Usage guidelines

The expected bandwidth of an interface affects the link costs in OSPF, OSPFv3, and IS-IS. For more information, see *Layer 3—IP Routing Configuration Guide*.

Examples

Set the expected bandwidth of Virtual-PPP 10 to 100 kbps.

```
<Sysname> system-view
[Sysname] interface virtual-ppp 10
[Sysname-Virtual-PPP10] bandwidth 100
```

default

Use **default** to restore the default settings for a virtual PPP interface.

Syntax

default

Views

Virtual PPP interface view

Predefined user roles

network-admin

context-admin

Usage guidelines

CAUTION:
The **default** command might interrupt ongoing network services. Make sure you are fully aware of the impact of this command when you execute it on a live network.

This command might fail to restore the default settings for some commands for reasons such as command dependencies or system restrictions. Use the **display this** command in interface view to identify these commands. Use the **undo** forms of these commands or follow the command reference to individually restore their default settings. If your restoration attempt still fails, follow the error message instructions to resolve the problem.

Examples

Restore the default settings for Virtual-PPP 10.

```
<Sysname> system-view
[Sysname] interface virtual-ppp 10
[Sysname-Virtual-PPP10] default
```

description

Use **description** to configure the description of an interface.

Use **undo description** to restore the default.

Syntax

description *text*

undo description

Default

The description of an interface is the *interface-name* plus **Interface**. For example, the default description of Virtual-PPP254 is **Virtual-PPP254 Interface**.

Views

Virtual PPP interface view

Predefined user roles

network-admin

context-admin

Parameters

text: Specifies the interface description, a case-sensitive string of 1 to 255 characters.

Examples

Set the description of Virtual-PPP 10 to **virtual-interface**.

```
<Sysname> system-view
[Sysname] interface virtual-ppp 10
[Sysname-Virtual-PPP10] description virtual-interface
```

display interface virtual-ppp

Use **display interface virtual-ppp** to display information about virtual PPP interfaces.

Syntax

display interface [**virtual-ppp** [*interface-number*]] [**brief** [**description** | **down**]]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

virtual-ppp [*interface-number*]: Specifies an existing virtual PPP interface by its number in the range of 0 to 255. If you do not specify the **virtual-ppp** keyword, this command displays information about all interfaces. If you specify the **virtual-ppp** keyword but you do not specify an interface, this command displays information about all virtual PPP interfaces.

brief: Displays brief interface information. If you do not specify this keyword, the command displays detailed interface information.

description: Displays complete interface descriptions. If you do not specify this keyword, the command displays only the first 27 characters of each interface description.

down: Displays information about the interfaces in physically down state and the causes. If you do not specify this keyword, the command displays information about interfaces in any state.

Examples

Display detailed information about Virtual-PPP 10.

```
<Sysname> display interface virtual-ppp 10
Virtual-PPP10
Current state: Administratively DOWN
Line protocol state: DOWN
Description: Virtual-PPP10 Interface
Bandwidth: 100000kbps
Maximum transmission unit: 1500
Hold timer: 10 seconds, retry times: 5
Internet address: 10.0.0.1/24 (primary)
Link layer protocol: PPP
```

```
LCP: initial
Physical: L2TP, baudrate: 100000000 bps
Last clearing of counters: Never
Last 300 seconds input rate: 0 bytes/sec, 0 bits/sec, 0 packets/sec
Last 300 seconds output rate: 0 bytes/sec, 0 bits/sec, 0 packets/sec
Input: 154 packets, 1880 bytes, 0 drops
Output: 155 packets, 1875 bytes, 0 drops
```

Table 1 Command output

Field	Description
Current state	Physical link state of the interface: • **Administratively DOWN**—The interface has been shut down by using the **shutdown** command. • **DOWN**—The interface is administratively up, but its physical state is down (possibly because no physical link exists or the link has failed). • **UP**—The interface is up both administratively and physically.
Line protocol state	Data link layer state of the interface. The state is determined through automatic parameter negotiation at the data link layer. • **UP**—The data link layer protocol is up. • **UP (spoofing)**—The data link layer protocol is up, but the link is an on-demand link or does not exist. This attribute is typical of null interfaces and loopback interfaces. • **DOWN**—The data link layer protocol is down.
Bandwidth	Expected bandwidth of the interface.
Hold timer	Interval in seconds for the interface to send keepalive packets.
retry times	Maximum number of keepalive retransmission attempts. A link is removed after the maximum number of retransmission attempts is reached.
Internet protocol processing: Disabled	The interface is not assigned an IP address and cannot process IP packets.

Field	Description
Internet address: *ip-address*/*mask-length* (*Type*)	IP address of the interface and type of the address in parentheses. Possible IP address types include: • **Primary**—Manually configured primary IP address. • **Sub**—Manually configured secondary IP address. If the interface has both primary and secondary IP addresses, the primary IP address is displayed. If the interface has only secondary IP addresses, the lowest secondary IP address is displayed. • **DHCP-allocated**—DHCP allocated IP address. For more information, see DHCP client configuration in *Layer 3—IP Services Configuration Guide*. • **BOOTP-allocated**—BOOTP allocated IP address. For more information, see BOOTP client configuration in *Layer 3—IP Services Configuration Guide*. • **PPP-negotiated**—IP address assigned by a PPP server during PPP negotiation. For more information, see PPP configuration in *Layer 2—WAN Access Configuration Guide*. • **Unnumbered**—IP address borrowed from another interface. • **MAD**—IP address assigned to an IRF member device for MAD on the interface. For more information, see IRF configuration in *Virtual Technologies Configuration Guide*.
Link layer protocol	Link layer protocol of the interface: PPP.
Physical	Physical type of the interface: L2TP.
baudrate	Baud rate of the interface.
Last clearing of counters	Time when the **reset counters interface** command was last used to clear the interface statistics. This field displays **Never** if the **reset counters interface** command has never been used on the interface since device startup.
Last 300 seconds input rate: 0 bytes/sec, 0 bits/sec, 0 packets/sec	Average rate of inbound traffic in the last 300 seconds.
Last 300 seconds output rate: 0 bytes/sec, 0 bits/sec, 0 packets/sec	Average rate of outbound traffic in the last 300 seconds.
Input: 154 packets, 1880 bytes, 0 drops	Total number of inbound packets, total number of inbound bytes, and total number of dropped inbound packets.
Output: 155 packets, 1875 bytes, 0 drops	Total number of outbound packets, total number of outbound bytes, and total number of dropped outbound packets.

Display summary information about virtual PPP interface Virtual-PPP 10.

```
<Sysname> display interface virtual-ppp 10 brief
Brief information on interfaces in route mode:
Link: ADM - administratively down; Stby - standby
Protocol: (s) - spoofing
Interface            Link Protocol Primary IP         Description
VPPP10               ADM  DOWN     10.0.0.1
```

Display information about the virtual PPP interfaces in physically down state and the causes.

```
<Sysname> display interface virtual-ppp brief down
Brief information on interfaces in route mode:
Link: ADM - administratively down; Stby - standby
```

```
Interface            Link Cause
VPPP9                ADM  Administratively
VPPP10               ADM  Administratively
VPPP12               ADM  Administratively
```

Display summary information about virtual PPP interface Virtual-PPP 10, including the complete interface description.

```
<Sysname> display interface Virtual-PPP 10 brief description
Brief information on interfaces in route mode:
Link: ADM - administratively down; Stby - standby
Protocol: (s) - spoofing
Interface            Link Protocol Primary IP         Description
VPPP10               ADM  DOWN     10.0.0.1
```

Table 2 Command output

Field	Description
Brief information on interfaces in route mode	Summary information about Layer 3 interfaces.
Interface	Abbreviated interface name.
Link	Physical link state of the interface: • **UP**—The interface is physically up. • **DOWN**—The interface is physically down. • **ADM**—The interface has been shut down by using the **shutdown** command. To restore the physical state of the interface, use the **undo shutdown** command. • **Stby**—The interface is a backup interface in standby state. To see the primary interface, use the **display interface-backup state** command.
Protocol	Data link layer protocol state of the interface: • **UP**—The data link layer protocol of the interface is up. • **DOWN**—The data link layer protocol of the interface is down. • **UP(s)**—The data link layer protocol of the interface is up, but the link is an on-demand link or does not exist. The **(s)** attribute represents the spoofing flag. This value is typical of null interfaces and loopback interfaces.
Primary IP	Primary IP address of the interface. This field displays two hyphens (**--**) if the interface does not have an IP address.
Description	Description of the interface.
Cause	Cause for the physical link state of an interface to be **DOWN**: • **Administratively**—The interface has been manually shut down by using the **shutdown** command. To restore the physical state of the interface, use the **undo shutdown** command. • **Not connected**—No physical connection exists (possibly because the network cable is disconnected or faulty).

display l2tp session

Use **display l2tp session** to display information about L2TP sessions.

Syntax

display l2tp session [**statistics**]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

`statistics`: Displays statistics for L2TP sessions.

Examples

Display statistics for L2TP sessions.

```
<Sysname> display l2tp session statistics
Total number of sessions: 1
```

Display information about L2TP sessions.

```
<Sysname> display l2tp session
LocalSID      RemoteSID      LocalTID      State
89            36245          10878         Established
```

Table 3 Command output

Field	Description
LocalSID	Local session ID.
RemoteSID	Remote session ID.
LocalTID	Local tunnel ID.
State	Session state: • **Idle**. • **Wait-tunnel**—Waits for the tunnel to be established. • **Wait-reply**—Waits for an Incoming-Call-Reply (ICRP) message indicating the call is accepted. • **Wait-connect**—Waits for an Incoming-Call-Connected (ICCN) message. • **Established**.

display l2tp session temporary

Use **`display l2tp session temporary`** to display information about temporary L2TP sessions.

Syntax

`display l2tp session temporary`

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Examples

Display information about temporary L2TP sessions.

```
<Sysname> display l2tp session temporary
Total number of temporary sessions: 6
LocalSID    RemoteSID    LocalTID    State
2298        0            19699       Wait-tunnel
42805       0            19699       Wait-tunnel
17777       0            19699       Wait-tunnel
58284       0            19699       Wait-tunnel
33256       0            19699       Wait-tunnel
8228        0            19699       Wait-tunnel
```

Table 4 Command output

Field	Description
LocalSID	Local session ID.
RemoteSID	Remote session ID.
LocalTID	Local tunnel ID.
State	Session state: • **Idle**. • **Wait-tunnel**—Waits for the tunnel to be established. • **Wait-reply**—Waits for an ICRP message indicating the call is accepted. • **Wait-connect**—Waits for an ICCN message.

display l2tp tunnel

Use **`display l2tp tunnel`** to display information about L2TP tunnels.

Syntax

`display l2tp tunnel` [**`statistics`**]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

`statistics`: Displays statistics for L2TP tunnels.

Examples

Display statistics for L2TP tunnels.

```
<Sysname> display l2tp tunnel statistics
Total number of tunnels: 1
```

Display information about L2TP tunnels.

```
<Sysname> display l2tp tunnel
LocalTID RemoteTID State         Sessions RemoteAddress    RemotePort RemoteName
10878    21        Established   1        20.1.1.2         1701       lns
```

Table 5 Command output

Field	Description
LocalTID	Local tunnel ID.
RemoteTID	Remote tunnel ID.
State	Tunnel state: • **Idle**. • **Wait-reply**. • **Wait-connect**. • **Established**. • **Stopping**.
Sessions	Number of sessions within the tunnel.
RemoteAddress	IP address of the peer.
RemotePort	UDP port number of the peer.
RemoteName	Name of the tunnel peer.

Related commands

`reset l2tp tunnel`

display l2tp va-pool

Use **`display l2tp va-pool`** to display information about L2TP VA pools.

Syntax

`display l2tp va-pool` [**`dynamic`**]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

`dynamic`: Displays information about dynamic L2TP VA pools. If you do not specify this keyword, this command displays information about static L2TP VA pools.

Examples

Display information about static L2TP VA pools.

```
<Sysname> display l2tp va-pool
VT interface          Size      Unused      State
Virtual-Template1     1000      900         Normal
```

Display information about dynamic L2TP VA pools.

```
<Sysname> display l2tp va-pool dynamic
VT interface          Size      Unused      State
Virtual-Template1     128       96          Normal
```

Table 6 Command output

Field	Description
VT interface	VT interface that uses the VA pool.
Size	VA pool capacity set for L2TP users.
Unused	VA pool capacity available for L2TP users.
State	Current state of the VA pool: • **Creating**—The VA pool is being created. • **Destroying**—The VA pool is being removed. • **Normal**—The VA pool has been created.

Related commands

`l2tp virtual-template va-pool`

interface virtual-ppp

Use **`interface virtual-ppp`** to create a virtual PPP interface and enter its view, or enter the view of an existing virtual PPP interface.

Use **`undo interface virtual-ppp`** to delete a virtual PPP interface.

Syntax

`interface virtual-ppp` *`interface-number`*

`undo interface virtual-ppp` *`interface-number`*

Default

No virtual PPP interface exists.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

`interface-number`: Specifies a virtual PPP interface by its number in the range of 0 to 255.

Usage guidelines

A virtual PPP interface is required on the LAC for establishing an LAC-auto-initiated L2TP tunnel.

Examples

Create Virtual-PPP 10 and enter its view.

```
<Sysname> system-view
[Sysname] interface virtual-ppp 10
[Sysname-Virtual-PPP10]
```

ip dscp

Use **ip dscp** to set the DSCP value of L2TP packets.

Use **undo ip dscp** to restore the default.

Syntax

ip dscp *dscp-value*

undo ip dscp

Default

The DSCP value of L2TP packets is 0.

Views

L2TP group view

Predefined user roles

network-admin

context-admin

Parameters

dscp-value: Specifies the DSCP value of L2TP packets, in the range of 0 to 63.

Usage guidelines

The DSCP field is the IP ToS byte. This field marks the priority of IP packets for forwarding. This command sets the DSCP value for the IP packet when L2TP encapsulates a PPP frame into an IP packet.

Examples

Set the DSCP value of L2TP packets to 50.

```
<Sysname> system-view
[Sysname] l2tp-group 1 mode lac
[Sysname-l2tp1] ip dscp 50
```

l2tp enable

Use **l2tp enable** to enable L2TP.

Use **undo l2tp enable** to disable L2TP.

Syntax

l2tp enable

undo l2tp enable

Default

L2TP is disabled.

Views

System view

Predefined user roles

network-admin

context-admin

Usage guidelines

For L2TP configurations to take effect, you must enable L2TP.

Examples

Enable L2TP.

```
<Sysname> system-view
[Sysname] l2tp enable
```

l2tp icrq-limit

Use **l2tp icrq-limit** to set the maximum number of incoming call request (ICRQ) packets that the LNS can process per second.

Use **undo l2tp icrq-limit** to restore the default.

Syntax

l2tp icrq-limit *number*

undo l2tp icrq-limit

Default

The maximum number of ICRQ packets that the LNS can process per second is not limited.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

number: Specifies the ICRQ packet processing limit in the range of 1 to 1000.

Usage guidelines

To avoid device performance degradation and make sure the LNS can process ICRQ requests correctly, use this command to adjust the ICRQ packet processing rate limit.

Examples

Set the maximum number of ICRQ packets that the LNS can process per second to 200.

```
<Sysname> system-view
[Sysname] l2tp icrq-limit 200
```

l2tp tsa-id

Use **l2tp tsa-id** to set the TSA ID for the L2TP tunnel switching (LTS) device and enable L2TP loop detection on the LTS device.

Use **undo l2tp tsa-id** to restore the default.

Syntax

l2tp tsa-id *tsa-id*

undo l2tp tsa-id

Default

The TSA ID of the LTS device is not set, and L2TP loop detection is disabled on the LTS device.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

tsa-id: Specifies a TSA ID that uniquely identifies the LTS device. This argument is a case-sensitive string of 1 to 64 characters.

Usage guidelines

The LTS device compares the configured TSA ID with each TSA ID Attribute Value Pair (AVP) in a received ICRQ packet for loop detection.

- If a match is found, a loop exists. The LTS immediately tears down the session.
- If no match is found, the LTS performs the following operations:
  a. Encapsulates the configured TSA ID into a new TSA ID AVP.
  b. Appends the new TSA ID AVP to the packet.
  c. Sends the packet to the next hop LTS.

To avoid loop detection errors, make sure the TSA ID of each LTS device is unique.

Examples

Set the TSA ID of the LTS device to **lts0**, and enable L2TP loop detection on the LTS device.

```
<Sysname> system-view
[Sysname] l2tp tsa-id lts0
```

l2tp user-ip-conflict offline

Use **l2tp user-ip-conflict offline** to allow a new L2TP user to come online and log out an old L2TP user when the IP addresses of the two user conflict.

Use **undo l2tp user-ip-conflict** to restore the default.

Syntax

l2tp user-ip-conflict offline

undo l2tp user-ip-conflict

Default

A new L2TP user cannot come online and an old L2TP user keeps online when the IP addresses of the two user conflict.

Views

System view

Predefined user roles

network-admin

context-admin

Usage guidelines

When the IP addresses of a new L2TP user and an old L2TP user conflict, you can select to forbid the new user from coming online or log out the old user.

This command takes effect only on IPv4 L2TP users on LNSs.

Examples

Allow a new L2TP user to come online and log out an old L2TP user when the IP addresses of the two user conflict.

```
<Sysname> system-view
[Sysname] l2tp user-ip-conflict offline
```

l2tp virtual-template va-pool

Use **l2tp virtual-template va-pool** to create a static VA pool.

Use **undo l2tp virtual-template va-pool** to delete a static VA pool.

Syntax

l2tp virtual-template *template-number* **va-pool** *va-volume*

undo l2tp virtual-template *template-number* **va-pool**

Default

No static VA pool exists.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

virtual-template *template-number*: Specifies an existing VT interface by its number to use the static VA pool.

va-pool *va-volume*: Specifies the maximum number of VA interfaces contained in the static VA pool, in the range of 1 to 65534.

Usage guidelines

The LNS creates a VA interface for an L2TP session to exchange packets with the LAC, and it deletes the VA interface when the user goes offline. Creating and deleting VA interfaces take time. If a large number of users are coming online or going offline, the performance of L2TP connection establishment and termination will be degraded.

You can configure a VA pool to improve the performance. A VA pool contains a group of VA interfaces. The LNS selects a VA interface from the pool for a requesting user and places the interface back to the VA pool when the user goes offline. This mechanism speeds up the establishment and termination of L2TP connections.

L2TP supports the following types of VA pools:

- **Static VA pool**—VA pool manually created by using the **l2tp virtual-template va-pool** command.
- **Dynamic VA pool**—VA pool automatically created by the device.

When an L2TP user comes online, the device select a VA interface for the user in the following order:

1. VA interfaces in the static VA pool.
2. VA interfaces in the dynamic VA pool.

If no static VA pool is configured for a VT interface or the static VA pool configured for a VT interface is exhausted, the following rules apply when a new L2TP user comes online:

- If no dynamic VA pool is created for the VT interface, the device first creates a dynamic VA pool containing 128 VA interfaces for the VT interface. Then, the device allocates a VA interface in the dynamic VA pool to the user.
- If a dynamic VA pool with more than 64 available VA interfaces exists for the VT interface, the device will allocate a VA interface in the dynamic VA pool to the user.
- If a dynamic VA pool with less than 64 available VA interfaces exists for the VT interface, the device adds 128 VA interfaces to the dynamic VA pool. Then, the device allocates a VA interface in the dynamic VA pool to the user.

The VA pool occupies certain memory resources. When the device memory is large or the user scale is stable, as a best practice, create a static VA pool of a suitable capacity. When the device memory is small or the user scale is uncertain, as a best practice, use a dynamic VA pool. In this case, the device can automatically create a dynamic VA pool with the number of VA interfaces at the step of 128 according to the network user scale.

For a VA pool, follow these restrictions and guidelines:

- Static VA pool
  - A VT interface can be associated with only one static VA pool. To change the capacity of a static VA pool, delete the previous configuration, and reconfigure the static VA pool.
  - Creating or deleting a static VA pool takes time. During the process of creating or deleting a static VA pool, users can come online or go offline, but the static VA pool does not take effect.
  - The system might create a static VA pool that contains VA interfaces less than the specified number because of insufficient resources. In this case, you can use the **display l2tp va-pool** command to view the number of available VA interfaces and current state of the static VA pool.
  - Create a static VA pool with an appropriate capacity, because a static VA pool occupies much system memory.
  - Deleting a static VA pool does not log off the users who are using VA interfaces in the static VA pool.
- Dynamic VA pool
  - A dynamic VA pool is automatically created by the device. It cannot be manually configured, modified, or deleted.
  - The device automatically deletes VA interfaces that are not used for a long period of time from the dynamic VA pool to release the memory resources.

Examples

Create a static VA pool with a capacity of 1000 VA interfaces for Virtual-template 2.

```
<Sysname> system-view
[Sysname] l2tp virtual-template 2 va-pool 1000
```

Related commands

display l2tp va-pool

l2tp-auto-client

Use **l2tp-auto-client** to trigger an LAC to automatically establish an L2TP tunnel.

Use **undo l2tp-auto-client** to delete the automatically established L2TP tunnel.

Syntax

l2tp-auto-client l2tp-group *group-number*

undo l2tp-auto-client

Default

An LAC does not automatically establish an L2TP tunnel.

Views

Virtual PPP interface view

Predefined user roles

network-admin

context-admin

Parameters

l2tp-group *group-number*: Specifies an L2TP group by its number in the range of 1 to 65535. The LAC uses tunnel parameters of the L2TP group to establish the tunnel.

Usage guidelines

For this command to take effect, the L2TP group specified in this command must be an existing one in LAC mode.

An L2TP tunnel automatically established in LAC-auto-initiated mode exists until you delete the tunnel by using the **undo l2tp-auto-client** or **undo l2tp-group** *group-number* command.

Examples

Trigger the LAC to automatically establish an L2TP tunnel by using the tunnel parameters of L2TP group 10.

```
<Sysname> system-view
[Sysname] interface virtual-ppp 1
[Sysname-Virtual-PPP1] l2tp-auto-client l2tp-group 10
```

Related commands

l2tp-group

l2tp-group

Use **l2tp-group** to create an L2TP group and enter its view, or enter the view of an existing L2TP group.

Use **undo l2tp-group** to delete an L2TP group.

Syntax

l2tp-group *group-number* [**mode** { **lac** | **lns** }]

undo l2tp-group *group-number*

Default

No L2TP group exists.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

group-number: Specifies an L2TP group by its number in the range of 1 to 65535.

mode: Specifies a mode for the L2TP group.

lac: Specifies the LAC mode.

lns: Specifies the LNS mode.

Usage guidelines

To create a new L2TP group, you must specify the **mode** keyword. To enter the view of an existing L2TP group, you do not need to specify this keyword.

In L2TP group view, you can configure L2TP tunnel parameters, such as tunnel authentication and flow control.

A device can have L2TP groups in both LAC and LNS modes at the same time.

Examples

Create L2TP group 2 in LAC mode, and enter its view.

```
<Sysname> system-view
[Sysname] l2tp-group 2 mode lac
[Sysname-l2tp2]
```

Related commands

allow l2tp

lns-ip

user

lns-ip

Use **lns-ip** to specify LNS IP addresses or domain names on an LAC.

Use **undo lns-ip** to remove the specified LNS IP addresses or domain names on an LAC.

Syntax

lns-ip { *ip-address* | **host-name** *name* }&<1-5>

undo lns-ip

Default

No LNS IP addresses or domain names are specified on an LAC.

Views

L2TP group view

Predefined user roles

network-admin

context-admin

Parameters

ip-address: Specifies LNS IP addresses.

host-name *name*: Specifies LNS host names (domain names). A domain name is a dot (.) separated list of strings, for example, example.com. Each string cannot exceed 63 characters. A domain name cannot exceed 253 characters, including dots (.). A domain name is case-insensitive, and each string can contain letters, digits, hyphens (-), underscores (_), and dots (.).

&<1-5> indicates that you can enter a maximum of five IP addresses or domain names.

Usage guidelines

When the IP address of an LNS is fixed, you can specify the LNS IP address by using the **lns-ip** *ip-address* command. When the IP address of an LNS is not fixed, you can specify the LNS domain name by using the **lns-ip host-name** command. In this case, the LAC will deliver the domain name to the DNS module for processing. Then, the LAC can initiate an L2TP tunneling request to the LNS according to the returned IP address. For more information about DNS, see *Layer 3—IP Services Configuration Guide*.

The LAC initiates an L2TP tunneling request to its specified LNSs consecutively in their configuration order until it receives an acknowledgment from an LNS. The LNS then becomes the tunnel peer.

The **lns-ip** command is available only on L2TP groups in LAC mode.

If you execute this command multiple times for an L2TP group, the most recent configuration takes effect.

Examples

Specify the LNS IP address as 202.1.1.1.

```
<Sysname> system-view
[Sysname] l2tp-group 1 mode lac
[Sysname-l2tp1] lns-ip 202.1.1.1
```

Specify the LNS domain name as example.com.

```
<Sysname> system-view
[Sysname] l2tp-group 1 mode lac
[Sysname-l2tp1] lns-ip host-name example.com
```

mandatory-chap

Use **mandatory-chap** to force the LNS to perform CHAP authentication for users.

Use **undo mandatory-chap** to restore the default.

Syntax

mandatory-chap

undo mandatory-chap

Default

An LNS does not perform CHAP authentication for users.

Views

L2TP group view

Predefined user roles

network-admin

context-admin

Usage guidelines

The LNS uses the LAC as an authentication proxy. The LAC sends the LNS all user authentication information from users and the authentication method configured on the LAC itself. The LNS then checks the user validity according to the received information and the locally configured authentication method.

When mandatory CHAP authentication is configured, a user who depends on an LAC to initiate tunneling requests is authenticated by both the LAC and the LNS for increased security. Some users might not support the authentication on the LNS. In this situation, do not configure this command, because CHAP authentication on the LNS will fail.

This command is available only on L2TP groups in LNS mode.

This command takes effect only on NAS-initiated L2TP tunnels.

The **mandatory-lcp** command takes precedence over this command. If both commands are configured for an L2TP group, the LNS performs LCP renegotiation with the user.

Examples

Force the LNS to perform CHAP authentication for users.

```
<Sysname> system-view
[Sysname] l2tp-group 1 mode lns
[Sysname-l2tp1] mandatory-chap
```

Related commands

mandatory-lcp

mandatory-lcp

Use **mandatory-lcp** to force an LNS to perform LCP negotiation with users.

Use **undo mandatory-lcp** to restore the default.

Syntax

mandatory-lcp

undo mandatory-lcp

Default

An LNS does not perform LCP negotiation with users.

Views

L2TP group view

Predefined user roles

network-admin

context-admin

Usage guidelines

By default, to establish a NAS-initiated tunnel, the user performs LCP negotiation with the LAC. If the negotiation succeeds, the LAC initiates a tunneling request and sends the negotiation results (including authentication information) to the LNS. Then, the LNS determines whether the user is valid based on the information received instead of performing LCP renegotiation with the user.

If you do not expect the LNS to accept LCP negotiation parameters, configure this command to perform an LCP negotiation between the LNS and the user. In this case, the information sent by the LAC will be ignored.

Some users might not support LCP negotiation. In this case, do not configure this command because LCP negotiation will fail.

This command is available only on L2TP groups in LNS mode.

This command takes effect only on NAS-initiated L2TP tunnels.

This command takes precedence over the **mandatory-chap** command. If both commands are configured for an L2TP group, the LNS performs LCP negotiation with the user.

Examples

Force an LNS to perform LCP negotiation with users.

```
<Sysname> system-view
```

```
[Sysname] l2tp-group 1 mode lns
[Sysname-l2tp1] mandatory-lcp
```

Related commands

mandatory-chap

mtu

Use **mtu** to set the MTU size of an interface.

Use **undo mtu** to restore the default.

Syntax

mtu *size*

undo mtu

Default

The MTU size of a virtual PPP interface is 1500 bytes.

Views

Virtual PPP interface view

Predefined user roles

network-admin

context-admin

Parameters

size: Specifies the MTU size in bytes. The value range is 128 to 1500.

Usage guidelines

The MTU size of an interface affects the fragmentation and reassembly of IP packets on the interface.

For the configured MTU size to take effect, you must execute the **shutdown** command and then the **undo shutdown** command on the interface.

Examples

Set the MTU size of Virtual-PPP 10 to 1400 bytes.

```
<Sysname> system-view
[Sysname] interface virtual-ppp 10
[Sysname-Virtual-PPP10] mtu 1400
```

reset counters interface virtual-ppp

Use **reset counters interface virtual-ppp** to clear the statistics for virtual PPP interfaces.

Syntax

reset counters interface [**virtual-ppp** [*interface-number*]]

Views

User view

Predefined user roles

network-admin

context-admin

Parameters

virtual-ppp [*interface-number*]: Specifies a virtual PPP interface by its number in the range of 0 to 255. If you specify neither **virtual-ppp** nor *interface-number*, this command clears the statistics for all interfaces. If you specify **virtual-ppp** but not *interface-number*, this command clears the statistics for all virtual PPP interfaces. If you specify both **virtual-ppp** and *interface-number*, this command clears the statistics for the specified virtual PPP interface.

Usage guidelines

Use this command to clear history statistics if you want to collect traffic statistics for a specific time period.

Examples

Clear the statistics for Virtual-PPP 10.

```
<Sysname> reset counters interface virtual-ppp 10
```

reset l2tp tunnel

Use **reset l2tp tunnel** to disconnect tunnels and all sessions within the tunnels.

Syntax

reset l2tp tunnel { **id** *tunnel-id* | **name** *remote-name* }

Views

User view

Predefined user roles

network-admin

context-admin

Parameters

id *tunnel-id*: Specifies a tunnel by its local ID in the range of 1 to 65535.

name *remote-name*: Specifies L2TP tunnels by the tunnel peer name, a case-sensitive string of 1 to 31 characters.

Usage guidelines

When the number of user connections is 0 or a network fault occurs, you can disconnect the L2TP tunnel by using this command on either the LAC or LNS. After the tunnel is disconnected, all sessions within it are disconnected.

If you specify a tunnel peer name, all tunnels with the tunnel peer name will be disconnected. If no tunnel with the tunnel peer name exists, nothing happens.

A tunnel disconnected by force can be re-established when a client makes a call.

Examples

Disconnect all tunnels with the tunnel peer name of **aaa**.

```
<Sysname> reset l2tp tunnel name aaa
```

Related commands

display l2tp tunnel

shutdown

Use **shutdown** to shut down a virtual PPP interface.

Use **undo shutdown** to bring up a virtual PPP interface.

Syntax

shutdown

undo shutdown

Default

A virtual PPP interface is up.

Views

Virtual PPP interface view

Predefined user roles

network-admin

context-admin

Usage guidelines

Executing this command to shut down an interface will make L2TP based on this interface become unavailable. As a best practice, make sure you fully understand the impact before executing this command.

Examples

Shut down Virtual-PPP 10.

```
<Sysname> system-view
[Sysname] interface virtual-ppp 10
[Sysname-Virtual-PPP10] shutdown
```

source-ip

Use **source-ip** to configure the source IP address of L2TP tunnel packets.

Use **undo source-ip** to restore the default.

Syntax

source-ip *ip-address*

undo source-ip

Default

The source IP address of L2TP tunnel packets is the IP address of the egress interface.

Views

L2TP group view

Predefined user roles

network-admin

context-admin

Parameters

ip-address: Specifies the source IP address of L2TP tunnel packets.

Usage guidelines

This command is available only on an L2TP group in LAC mode.

For high availability, as a best practice, use the IP address of a loopback interface as the source IP address of L2TP tunnel packets.

Examples

Configure the source IP address of L2TP tunnel packets as **2.2.2.2**.

```
<Sysname> system-view
[Sysname] l2tp-group 1 mode lac
[Sysname-l2tp1] source-ip 2.2.2.2
```

timer-hold

Use **timer-hold** to set the keepalive interval.

Use **undo timer-hold** to restore the default.

Syntax

timer-hold *seconds*

undo timer-hold

Default

The keepalive interval is 10 seconds.

Views

Virtual PPP interface view

Predefined user roles

network-admin

context-admin

Parameters

seconds: Specifies the interval at which the LAC or the LNS sends keepalive packets, in the range of 0 to 32767 seconds.

Usage guidelines

A virtual PPP interface sends keepalive packets at keepalive intervals to detect the availability of the peer. If the interface fails to receive keepalive packets when the keepalive retry limit is reached, it determines that the link fails and reports a link layer down event.

To set the keepalive retry limit, use the **timer-hold retry** command.

On a slow link, increase the keepalive interval to prevent false shutdown of the interface. This situation might occur when keepalive packets are delayed because a large packet is being transmitted on the link.

Examples

Set the keepalive interval to 20 seconds for Virtual-PPP 10.

```
<Sysname> system-view
[Sysname] interface virtual-ppp 10
[Sysname-Virtual-PPP10] timer-hold 20
```

Related commands

timer-hold retry

timer-hold retry

Use **timer-hold retry** to set the keepalive retry limit.

Use **undo timer-hold retry** to restore the default.

Syntax

timer-hold retry *retries*

undo timer-hold retry

Default

The keepalive retry limit is 5.

Views

Virtual PPP interface view

Predefined user roles

network-admin

context-admin

Parameters

retries: Specifies the maximum number of keepalive attempts in the range of 1 to 255.

Usage guidelines

A virtual PPP interface sends keepalive packets at keepalive intervals to detect the availability of the peer. If the interface fails to receive keepalive packets when the keepalive retry limit is reached, it determines that the link fails and reports a link layer down event.

To set the keepalive interval, use the **timer-hold** command.

On a slow link, increase the keepalive retry limit to prevent false shutdown of the interface. This situation might occur when keepalive packets are delayed because a large packet is being transmitted on the link.

Examples

Set the keepalive retry limit to 10 for Virtual-PPP 10.

```
<Sysname> system-view
[Sysname] interface virtual-ppp 10
[Sysname-Virtual-PPP10] timer-hold retry 10
```

Related commands

timer-hold

tunnel authentication

Use **tunnel authentication** to enable L2TP tunnel authentication.

Use **undo tunnel authentication** to disable L2TP tunnel authentication.

Syntax

tunnel authentication

undo tunnel authentication

Default

L2TP tunnel authentication is enabled.

Views

L2TP group view

Predefined user roles

network-admin

context-admin

Usage guidelines

Tunnel authentication prevents the local end from establishing L2TP tunnels with illegal remote ends.

You can enable tunnel authentication on both sides or either side.

To ensure a successful tunnel establishment when tunnel authentication is enabled on both sides or either side, set the same non-null key on the LAC and the LNS. To set the tunnel authentication key, use the **tunnel password** command.

When neither side is enabled with tunnel authentication, the key settings of the LAC and the LNS do not affect the tunnel establishment.

For tunnel security, enable tunnel authentication.

Examples

Enable L2TP tunnel authentication.

```
<Sysname> system-view
[Sysname] l2tp-group 1 mode lns
[Sysname-l2tp1] tunnel authentication
```

Related commands

tunnel password

tunnel avp-hidden

Use **tunnel avp-hidden** to enable transferring AVP data in hidden mode.

Use **undo tunnel avp-hidden** to restore the default.

Syntax

tunnel avp-hidden

undo tunnel avp-hidden

Default

AVP data is transferred over the tunnel in plaintext mode.

Views

L2TP group view

Predefined user roles

network-admin

context-admin

Usage guidelines

L2TP uses AVPs to transmit tunnel negotiation parameters, session negotiation parameters, and user authentication information. This feature can hide sensitive AVP data, such as user passwords. This feature encrypts AVP data with the key configured by using the **tunnel password** command before transmission.

The **tunnel avp-hidden** command can be configured for L2TP groups in both LAC and LNS modes. However, it does not take effect on L2TP groups in LNS mode.

For this command to take effect, you must enable tunnel authentication by using the **tunnel authentication** command.

Examples

Enable transferring AVP data in hidden mode.

```
<Sysname> system-view
[Sysname] l2tp-group 1 mode lac
[Sysname-l2tp1] tunnel avp-hidden
```

Related commands

tunnel authentication

tunnel password

tunnel flow-control

Use **tunnel flow-control** to enable L2TP session flow control.

Use **undo tunnel flow-control** to disable L2TP session flow control.

Syntax

tunnel flow-control

undo tunnel flow-control

Default

L2TP session flow control is disabled.

Views

L2TP group view

Predefined user roles

network-admin

context-admin

Usage guidelines

This feature adds sequence numbers to transmitted packets and uses them to reorder packets arriving out of order and to detect lost packets.

This feature takes effect on both sent and received L2TP data messages. The L2TP sessions support this feature if either the LAC or LNS is enabled with this feature.

When the device acts as an LAC, a change in the flow control status on the LNS causes the same change in the flow control status of L2TP sessions. When the device acts as an LNS, a change in the flow control status on the LAC does not affect the flow control status of L2TP sessions.

Examples

Enable L2TP session flow control.

```
<Sysname> system-view
[Sysname] l2tp-group 1 mode lac
[Sysname-l2tp1] tunnel flow-control
```

tunnel name

Use **tunnel name** to specify the local tunnel name.

Use **undo tunnel name** to restore the default.

Syntax

tunnel name *name*

undo tunnel name

Default

The local tunnel name is the device name. For more information about the device name, see *Fundamentals Configuration Guide*.

Views

L2TP group view

Predefined user roles

network-admin

context-admin

Parameters

name: Specifies the local tunnel name, a case-sensitive string of 1 to 31 characters.

Examples

Specify the local tunnel name as **itsme**.

```
<Sysname> system-view
[Sysname] l2tp-group 1 mode lns
[Sysname-l2tp1] tunnel name itsme
```

Related commands

sysname (*Fundamentals Command Reference*)

tunnel password

Use **tunnel password** to configure the key for tunnel authentication.

Use **undo tunnel password** to restore the default.

Syntax

tunnel password { **cipher** | **simple** } *string*

undo tunnel password

Default

No key is configured for tunnel authentication.

Views

L2TP group view

Predefined user roles

network-admin

context-admin

Parameters

cipher: Specifies a password in encrypted form.

simple: Specifies a password in plaintext form. For security purposes, the password specified in plaintext form will be stored in encrypted form.

string: Specifies the password. Its plaintext form is a case-sensitive string of 1 to 16 characters. Its encrypted form is a case-sensitive string of 1 to 53 characters.

Usage guidelines

For this command to take effect, you must enable tunnel authentication by using the **tunnel authentication** command.

For the tunnel authentication key change to take effect, change the tunnel authentication key before tunnel negotiation is performed.

Examples

Configure the key for tunnel authentication to a plaintext key **yougotit**.

```
<Sysname> system-view
[Sysname] l2tp-group 1 mode lac
[Sysname-l2tp1] tunnel password simple yougotit
```

Related commands

tunnel authentication

tunnel timer hello

Use **tunnel timer hello** to set the Hello interval.

Use **undo tunnel timer hello** to restore the default.

Syntax

tunnel timer hello *hello-interval*

undo tunnel timer hello

Default

The Hello interval is 60 seconds.

Views

L2TP group view

Predefined user roles

network-admin

context-admin

Parameters

hello-interval: Specifies the interval at which the LAC or the LNS sends Hello packets, in the range of 60 to 1000 seconds.

Usage guidelines

The device sends Hello packets at the set interval. This prevents the L2TP tunnels and sessions from being removed due to timeouts.

You can set different Hello intervals for the LNS and LAC.

Examples

Set the Hello interval to 90 seconds.

```
<Sysname> system-view
[Sysname] l2tp-group 1 mode lac
[Sysname-l2tp1] tunnel timer hello 90
```

tunnel window receive

Use **tunnel window receive** to set the receiving window size for an L2TP tunnel.

Use **undo tunnel window receive** to restore the default.

Syntax

tunnel window receive *size*

undo tunnel window receive

Default

The receiving window size for an L2TP tunnel is 1024.

Views

L2TP group view

Predefined user roles

network-admin

context-admin

Parameters

size: Specifies the receiving window size in the range of 1 to 5000. It is the number of packets that can be buffered at the local end.

Usage guidelines

To enable the device to process a larger number of disordered packets, use this command to enlarge the receiving window size for an L2TP tunnel.

The device uses a receiving window to reorder disordered packets based on packet sequence numbers.

If the sequence number of a packet is within the receiving window but does not equal the minimum value of the window, the device performs the following operations:

3. The device buffers the packet.
4. The minimum value and maximum value of the receiving window increment by one.
5. The device continues to check the next arriving packet.

If the sequence number of a packet equals the minimum value of the receiving window, the device performs the following operations:

1. The device processes the packet.
2. The minimum value and maximum value of the receiving window increment by one.
3. The device checks buffered packets for a packet with the sequence number equal to the new minimum value of the receiving window.
4. If no required packet is found, the device checks the next arriving packet.

If the sequence number of a packet is not within the receiving window, the device drops the packet.

In the L2TP tunnel establishment process, the device uses the value specified in L2TP group view as the receiving window size.

Changing the receiving window size after an L2TP tunnel is established does not affect the established L2TP tunnel.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Set the receiving window size for L2TP group 1 to 128.

```
<Sysname> system-view
[Sysname] l2tp-group 1 mode lac
[Sysname-l2tp1] tunnel window receive 128
```

Related commands

tunnel window send

tunnel window send

Use **tunnel window send** to set the sending window size for an L2TP tunnel.

Use **undo tunnel window send** to restore the default.

Syntax

tunnel window send *size*

undo tunnel window send

Default

The sending window size for an L2TP tunnel is 0, which means using the value of the receiving window size carried in messages sent by the peer end in the tunnel establishment process.

Views

L2TP group view

Predefined user roles

network-admin

context-admin

Parameters

size: Specifies the sending window size for an L2TP tunnel, in the range of 0 to 1024. It is the maximum number of packets the device can send to a peer end when the device receives no response from the peer end. If the messages from the peer end carry no receiving window size in the tunnel establishment process, the sending window size for the device is 4.

Usage guidelines

The packet processing capability of a peer end might mismatch the receiving window size of the peer end in some networks. For example, the actual packet processing capability of the peer end is 10, but the receiving window size of the peer end is 20. To ensure stable L2TP services, you can adjust the sending window size for the device to match the actual packet processing capability of the peer end.

The sending window size set in L2TP group view is obtained in the L2TP tunnel establishment process.

- If the sending window size is 0, the device uses the default sending window size.
- If the sending window size is not 0, the device uses the specified value as the sending window size.

Changing the sending window size after an L2TP tunnel is established does not affect the established L2TP tunnel.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Set the sending window size for L2TP group 1 to 128.

```
<Sysname> system-view
[Sysname] l2tp-group 1 mode lac
[Sysname-l2tp1] tunnel window send 128
```

Related commands

tunnel window receive

user

Use **user** to configure the condition for the LAC to initiate tunneling requests.

Use **undo user** to restore the default.

Syntax

user { **domain** *domain-name* | **fullusername** *user-name* }

undo user

Default

No condition is configured for the LAC to initiate tunneling requests.

Views

L2TP group view

Predefined user roles

network-admin

context-admin

Parameters

domain *domain-name*: Configures the LAC to initiate tunneling requests to the LNS when the domain name of a user matches a configured domain name. The *domain-name* argument represents the domain name of the user and is a case-insensitive string of 1 to 24 characters.

fullusername *user-name*: Configures the LAC to initiate tunneling requests to the LNS when the username of a user matches a configured full username. The *domain-name* argument represents the username of the user and is a case-sensitive string of 1 to 255 characters.

Usage guidelines

The LAC initiates tunneling requests to the LNS only when the domain name or the username of a user matches a configured domain name or a configured full username.

This command is available only on L2TP groups in LAC mode.

If you execute this command multiple times for an L2TP group, the most recent configuration takes effect.

Examples

Configure the LAC to initiate tunneling requests to the LNS when the username of the user is **test@dm1**.

```
<Sysname> system-view
[Sysname] l2tp-group 1 mode lac
[Sysname-l2tp1] user fullusername test@dm1
```

vpn-instance

Use **vpn-instance** to assign a tunnel peer to a VPN.

Use **undo vpn-instance** to restore the default.

Syntax

vpn-instance *vpn-instance-name*

undo vpn-instance

Default

A tunnel peer belongs to the public network.

Views

L2TP group view

Predefined user roles

network-admin

context-admin

Parameters

vpn-instance-name: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters.

Usage guidelines

This command enables the device to transmit L2TP control messages and data messages in the specified VPN by searching the routing table in that VPN.

When one L2TP endpoint is in a VPN, assign the peer endpoint to the VPN for correct packet forwarding between the two endpoints.

The tunnel peer and the physical port connecting to the tunnel peer should belong to the same VPN. The VPN to which this physical port belongs is configured by using the **ip binding vpn-instance** command.

The specified VPN must already exist.

Examples

Assign the tunnel peer to VPN **vpn1**.

```
<Sysname>system-view
[Sysname] l2tp-group 1 mode lac
[Sysname-l2tp1] vpn-instance vpn1
```

Related commands

NSFOCUS Firewall Series

NF Internet Access Behavior Management

Command Reference

NSFOCUS Technologies, Inc.

Document version: 6W600-20230221

Preface

This command reference describes the commands for configuring Internet access behavior management features, including:bandwidth management, application audit and management and NetShare control.

This preface includes the following topics about the documentation:

- Audience.
- Conventions.

Audience

This documentation is intended for:

- Network planners.
- Field technical support and servicing engineers.
- Network administrators.

Conventions

The following information describes the conventions used in the documentation.

Command conventions

Convention	Description
Boldface	**Bold** text represents commands and keywords that you enter literally as shown.
Italic	*Italic* text represents arguments that you replace with actual values.
[ ]	Square brackets enclose syntax choices (keywords or arguments) that are optional.
{ x | y | ... }	Braces enclose a set of required syntax choices separated by vertical bars, from which you select one.
[x | y | ...]	Square brackets enclose a set of optional syntax choices separated by vertical bars, from which you select one or none.
{ x | y | ... } *	Asterisk marked braces enclose a set of required syntax choices separated by vertical bars, from which you select a minimum of one.
[x | y | ...] *	Asterisk marked square brackets enclose optional syntax choices separated by vertical bars, from which you select one choice, multiple choices, or none.
&<1-n>	The argument or keyword and argument combination before the ampersand (&) sign can be entered 1 to n times.
#	A line that starts with a pound (#) sign is comments.

GUI conventions

Convention	Description
Boldface	Window names, button names, field names, and menu items are in Boldface. For example, the **New User** window opens; click **OK**.
>	Multi-level menus are separated by angle brackets. For example, **File** > **Create** > **Folder**.

Symbols

Convention	Description
WARNING!	An alert that calls attention to important information that if not understood or followed can result in personal injury.
CAUTION:	An alert that calls attention to important information that if not understood or followed can result in data loss, data corruption, or damage to hardware or software.
IMPORTANT:	An alert that calls attention to essential information.
NOTE:	An alert that contains additional or supplementary information.
TIP:	An alert that provides helpful information.

Network topology icons

Convention	Description
	Represents a generic network device, such as a router, switch, or firewall.
	Represents a routing-capable device, such as a router or Layer 3 switch.
	Represents a generic switch, such as a Layer 2 or Layer 3 switch, or a router that supports Layer 2 forwarding and other Layer 2 features.
	Represents an access controller, a unified wired-WLAN module, or the access controller engine on a unified wired-WLAN switch.
	Represents an access point.
	Represents a wireless terminator unit.
	Represents a wireless terminator.
	Represents a mesh access point.
	Represents omnidirectional signals.
	Represents directional signals.
	Represents a security product, such as a firewall, UTM, multiservice security gateway, or load balancing device.
	Represents a security module, such as a firewall, load balancing, NetStream, SSL VPN, IPS, or ACG module.

Examples provided in this document

Examples in this document might use devices that differ from your device in hardware model, configuration, or software version. It is normal that the port numbers, sample output, screenshots, and other information in the examples differ from what you have on your device.

Contents

Bandwidth management commands

action

Use **action** to specify an action for a traffic rule.

Use **undo action** to restore the default.

Syntax

action { **deny** | **none** | **qos profile** *profile-name* }

undo action

Default

The action for a traffic rule is **none**.

Views

Traffic rule view

Predefined user roles

network-admin

context-admin

Parameters

deny: Drops matching packets.

none: Allows matching packets to pass through without bandwidth management.

qos profile *profile-name*: Specifies a traffic profile by its name to limit the rate of matching packets. The profile name is a case-insensitive string of 1 to 63 characters.

Usage guidelines

If a packet matches a traffic rule, the device performs the action specified in the traffic rule on the packet.

Examples

Create a traffic rule named **rule1**, and apply traffic profile **profile1** to the traffic rule.

```
<Sysname> system-view
[Sysname] traffic-policy
[Sysname-traffic-policy] rule name rule1
[Sysname-traffic-policy-rule-rule1] action qos profile profile1
```

Related commands

profile name

rule name

all-traffic-control enable

Use **all-traffic-control enable** to enable bandwidth management for traffic flows of the IP layer and upper layers.

Use **undo all-traffic-control enable** to restore the default.

Syntax

all-traffic-control enable

undo all-traffic-control enable

Default

Bandwidth management is performed only for traffic flows of Layer 4 and upper layers.

Views

Traffic policy view

Predefined user roles

network-admin

context-admin

Usage guidelines

Use this command when there is a large number of IP traffic flows in the network.

Examples

Enable bandwidth management for traffic flows of the IP layer and upper layers.

```
<Sysname> system-view
[Sysname] traffic-policy
[Sysname-traffic-policy] all-traffic-control enable
```

application

Use **application** to configure application or application group as a match criterion.

Use **undo application** to delete an application or application group match criterion.

Syntax

application { **app** *application-name* | **app-group** *application-group-name* }

undo application { **app** *application-name* | **app-group** *application-group-name* }

Default

No application or application group is used as a match criterion.

Views

Traffic rule view

Predefined user roles

network-admin

context-admin

Parameters

app *application-name*: Specifies an application by its name, a case-insensitive string of 1 to 63 characters.

app-group *application-group-name*: Specifies an application group by its name, a case-insensitive string of 1 to 63 characters.

Usage guidelines

You can configure multiple applications or application groups for a traffic rule to match packets.

This command enables the device to manage bandwidth by application type, such as email, P2P, IM, and web browsing.

If you specify a user-defined application that uses DCCP, SCTP, or UDP-Lite as the transport layer protocol, the application is not limited by bandwidth management. For information about user-defined applications, see *Security Configuration Guide*.

Examples

Configure **P2P_General_TCP_Communications** as a match criterion for traffic rule **rule1**.

```
<Sysname> system-view
[Sysname] traffic-policy
[Sysname-traffic-policy] rule name rule1
[Sysname-traffic-policy-rule-rule1] application app P2P_General_TCP_Communications
```

port-mapping (*Security Command Reference*)

bandwidth

Use **bandwidth** to set the total guaranteed bandwidth or maximum bandwidth in a traffic profile.

Use **undo bandwidth** to delete the total guaranteed bandwidth or maximum bandwidth setting of a traffic profile.

Syntax

bandwidth { **downstream** | **total** | **upstream** } { **guaranteed** | **maximum** } *bandwidth-value*

undo bandwidth { **downstream** | **total** | **upstream** } { **guaranteed** | **maximum** }

Default

The total guaranteed bandwidth and maximum bandwidth are not set in a traffic profile.

Views

Traffic profile view

Predefined user roles

network-admin

context-admin

Parameters

downstream: Specifies downstream traffic (traffic from a server to a client).

total: Specifies both downstream traffic and upstream traffic.

upstream: Specifies upstream traffic (traffic from a client to a server).

guaranteed: Specifies the guaranteed bandwidth.

maximum: Specifies the maximum bandwidth. The maximum bandwidth must be greater than or equal to the guaranteed bandwidth.

bandwidth-value: Specifies the bandwidth value in the range of 8 to 100000000 kbps.

Usage guidelines

When you specify traffic profiles for parent and child traffic rules, following these restrictions and guidelines:

- The maximum bandwidth for the child traffic rule must be smaller than or equal to that for the parent traffic rule.
- The guaranteed bandwidth for a child traffic rule must be smaller than or equal to that for the parent traffic rule.
- The traffic profiles cannot be the same for the child and parent traffic rules.

An interface with small default expected bandwidth might experience traffic loss if the following conditions exist:

- There is a large amount of traffic on the interface.
- The interface uses the default expected bandwidth.

To avoid traffic loss, implicitly set the expected bandwidth to a large value for such an interface. For example, you can set the expected bandwidth of a tunnel interface to a value greater than 64 kbps (the default) if there is a large amount of traffic on the interface.

Examples

In traffic profile **profile1**, set both upstream and downstream maximum bandwidth to 10000 kbps, and set both upstream and downstream guaranteed bandwidth to 5000 kbps.

```
<Sysname> system-view
[Sysname] traffic-policy
[Sysname-traffic-policy] profile name profile1
[Sysname-traffic-policy-profile-profile1] bandwidth upstream maximum 10000
[Sysname-traffic-policy-profile-profile1] bandwidth downstream maximum 10000
[Sysname-traffic-policy-profile-profile1] bandwidth upstream guaranteed 5000
[Sysname-traffic-policy-profile-profile1] bandwidth downstream guaranteed 5000
```

bandwidth average enable

Use **bandwidth average enable** to enable dynamic and even allocation for maximum bandwidth.

Use **undo bandwidth average enable** to disable dynamic and even allocation for maximum bandwidth.

Syntax

bandwidth average enable

undo bandwidth average enable

Default

Dynamic and even allocation for maximum bandwidth is disabled.

Views

Traffic profile view

Predefined user roles

network-admin

context-admin

Usage guidelines

This command allows the device to dynamically and evenly allocate the total maximum bandwidth among all online IP addresses.

This command can be enabled only after you set the total maximum bandwidth.

Examples

Enable dynamic and even allocation for maximum bandwidth in traffic profile **profile1**.

```
<Sysname> system-view
[Sysname] traffic-policy
[Sysname-traffic-policy] profile name profile1
[Sysname-traffic-policy-profile-profile1] bandwidth total maximum 10000
[Sysname-traffic-policy-profile-profile1] bandwidth average enable
```

Related commands

bandwidth { **downstream** | **total** | **upstream** } **maximum**

bandwidth { per-ip | per-user }

Use **bandwidth** { **per-ip** | **per-user** } to set the per-IP or per-user maximum or guaranteed bandwidth for a traffic profile.

Use **undo bandwidth** { **per-ip** | **per-user** } to delete the per-IP or per-user maximum or guaranteed bandwidth setting of a traffic profile.

Syntax

bandwidth { **downstream** | **total** | **upstream** } { **guaranteed** | **maximum** } { **per-ip** | **per-user** } *bandwidth-value*

undo bandwidth { **downstream** | **total** | **upstream** } { **guaranteed** | **maximum** } { **per-ip** | **per-user** }

Default

The per-IP or per-user maximum bandwidth and guaranteed bandwidth are not set in a traffic profile.

Views

Traffic profile view

Predefined user roles

network-admin

context-admin

Parameters

downstream: Specifies downstream traffic (traffic from a server to a client).

total: Specifies both downstream traffic and upstream traffic.

upstream: Specifies upstream traffic (traffic from a client to a server).

guaranteed: Sets the guaranteed bandwidth.

maximum: Sets the maximum bandwidth.

per-ip: Sets the per-IP bandwidth.

per-user: Sets the per-user bandwidth.

bandwidth-value: Specifies the bandwidth value in the range of 8 to 100000000 kbps.

Usage guidelines

This command allows you to manage bandwidth at finer granularity.

The per-IP or per-user maximum bandwidth cannot be greater than the total maximum bandwidth.

The per-IP or per-user guaranteed bandwidth cannot be greater than the total guaranteed bandwidth.

The per-IP or per-user guaranteed bandwidth cannot be greater than the per-IP or per-user maximum bandwidth.

Examples

In traffic profile **profile1**, set both upstream and downstream per-IP maximum bandwidth to 10000 kbps.

```
<Sysname> system-view
[Sysname] traffic-policy
[Sysname-traffic-policy] profile name profile1
[Sysname-traffic-policy-profile-profile1] bandwidth upstream maximum per-ip 10000
[Sysname-traffic-policy-profile-profile1] bandwidth downstream maximum per-ip 10000
```

per-ip total traffic-quota per-ip monthly

Use **per-ip total traffic-quota per-ip monthly** to set the per-IP monthly traffic quota.

Use **undo total traffic-quota per-ip monthly** to restore the default.

Syntax

bandwidth total traffic-quota per-ip monthly *quota-value*

undo bandwidth total traffic-quota per-ip monthly

Default

The amount of traffic used by an IP address per month is not limited.

Views

Traffic profile view

Predefined user roles

network-admin

context-admin

Parameters

quota-value: Specifies the per-IP monthly traffic quota in the range of 1 to 1000000000 KB.

Usage guidelines

This command limits the total amount traffic (uplink and downlink) used by an IP address per month. When the traffic used by an IP address reaches the traffic quota, the device drops packets from the IP address.

Examples

In traffic profile **prof1**, set the per-IP monthly traffic quota to 5000 KB.

```
<Sysname> system-view
[Sysname] traffic-policy
[Sysname-traffic-policy] profile name prof1
[Sysname-traffic-policy-profile-prof1] bandwidth total traffic-quota per-ip monthly 5000
```

connection-limit count

Use **connection-limit count** to set the connection count limit for a traffic profile.

Use **undo connection-limit count** to delete the connection count limit setting of a traffic profile.

Syntax

connection-limit count { **per-rule** | **per-ip** | **per-user** } *connection-number*

undo connection-limit count { **per-rule** | **per-ip** | **per-user** }

Default

No connection count limit is set for a traffic profile.

Views

Traffic profile view

Predefined user roles

network-admin

context-admin

Parameters

per-rule: Specifies the total connection count limit (count limit for the traffic rule associated with the traffic profile).

per-ip: Specifies the per-IP connection count limit.

per-user: Specifies the per-user connection count limit.

connection-number: Specifies the maximum number of connections allowed, in the range of 1 to 12000000.

Usage guidelines

The per-IP or per-user connection count limit cannot be greater than the total connection count limit.

You cannot set both per-IP and per-user connection count limits for one traffic profile.

Examples

In traffic profile **profile1**, set the total connection count limit to 1000.

```
<Sysname> system-view
[Sysname] traffic-policy
[Sysname-traffic-policy] profile name profile1
[Sysname-traffic-policy-profile-profile1] connection-limit count per-rule 1000
```

In traffic profile **profile1**, set the per-IP connection count limit to 500.

```
<Sysname> system-view
[Sysname] traffic-policy
[Sysname-traffic-policy] profile name profile1
[Sysname-traffic-policy-profile-profile1] connection-limit count per-ip 500
```

connection-limit rate

Use **connection-limit rate** to set the connection rate limit for a traffic profile.

Use **undo connection-limit rate** to delete the connection rate limit setting of a traffic profile.

Syntax

connection-limit rate { **per-rule** | **per-ip** | **per-user** } *connection-rate*

undo connection-limit rate { **per-rule** | **per-ip** | **per-user** }

Default

No connection rate limit is set for a traffic profile.

Views

Traffic profile view

Predefined user roles

network-admin

context-admin

Parameters

per-rule: Specifies the total connection rate limit (rate limit for the traffic rule associated with the traffic profile).

per-ip: Specifies the per-IP connection rate limit.

per-user: Specifies the per-user connection rate limit.

connection- rate: Specifies the maximum connection rate in the range of 1 to 12000000 connections per second.

Usage guidelines

The per-IP or per-user connection rate limit cannot be greater than the total connection rate limit.

You cannot set both per-IP and per-user connection rate limits for one traffic profile.

Examples

In traffic profile **profile1**, set the total connection rate limit to 1000 connections per second.

```
<Sysname> system-view
[Sysname] traffic-policy
[Sysname-traffic-policy] profile name profile1
[Sysname-traffic-policy-profile-profile1] connection-limit rate per-rule 1000
```

In traffic profile **profile1**, set the per-IP connection rate limit to 500 connections per second.

```
<Sysname> system-view
[Sysname] traffic-policy
[Sysname-traffic-policy] profile name profile1
[Sysname-traffic-policy-profile-profile1] connection-limit rate per-user 500
```

destination-address

Use **destination-address** to configure a destination IP address object group as a match criterion.

Use **undo destination-address** to remove a destination IP address object group as a match criterion.

Syntax

destination-address address-set *object-group-name*

undo destination-address address-set *object-group-name*

Default

No destination IP address object group is used as a match criterion.

Views

Traffic rule view

Predefined user roles

network-admin

context-admin

Parameters

object-group-name: Specifies an IPv4 or IPv6 address object group by its name, a case-insensitive string of 1 to 63 characters.

Usage guidelines

This command is used to match the packets with the destination IP addresses in the specified address object group. You can specify multiple address object groups for a traffic rule to match destination IP addresses of packets.

Before rolling back configuration by using the **configuration replace file** *filename* command, check the address object group configuration in the traffic rule in the configuration file. The address object group configuration fails to be rolled back if two address object groups have the same name but are of different types (IPv4/IPv6).

Examples

Configure IPv4 address object group **obgroup2** for traffic rule **rule1** to match destination IPv4 addresses of packets.

```
<Sysname> system-view
[Sysname] traffic-policy
[Sysname-traffic-policy] rule name rule1
[Sysname-traffic-policy-rule-rule1] destination-address address-set obgroup2
```

Related commands

object-group (*Security Command Reference*)

destination-zone

Use **destination-zone** to configure a destination security zone as a match criterion.

Use **undo destination-zone** to delete a destination security zone match criterion.

Syntax

destination-zone *destination-zone-name*

undo destination-zone *destination-zone-name*

Default

No destination security zone is used as a match criterion.

Views

Traffic rule view

Predefined user roles

network-admin

context-admin

Parameters

destination-zone-name: Specifies a destination zone by its name, a case-insensitive string of 1 to 31 characters.

Examples

Configure destination security zone **zone2** as a match criterion for traffic rule **rule1**.

```
<Sysname> system-view
[Sysname] traffic-policy
[Sysname-traffic-policy] rule name rule1
[Sysname-traffic-policy-rule-rule1] destination-zone zone2
```

Related commands

security-zone name (*Security Command Reference*)

disable

Use **disable** to disable a traffic rule.

Use **undo disable** to enable a traffic rule.

Syntax

disable

undo disable

Default

A traffic rule is enabled.

Views

Traffic rule view

Predefined user roles

network-admin

context-admin

Usage guidelines

If a traffic rule is not used, use this command to disable it. A disabled traffic rule does not participate in traffic matching. You can copy, rename, and move a disabled traffic rule.

Examples

Disable traffic rule **rule1**.

```
<Sysname> system-view
[Sysname] traffic-policy
[Sysname-traffic-policy] rule name rule1
[Sysname-traffic-policy-rule-rule1] disable
```

display traffic-policy statistics bandwidth

Use **display traffic-policy statistics bandwidth** to display traffic statistics for traffic rules.

Syntax

display traffic-policy statistics bandwidth { **downstream** | **total** | **upstream** } { **per-ip** { **ipv4** [*ipv4-address*] | **ipv6** [*ipv6-address*] } **rule** *rule-name* | **per-rule** [**name** *rule-name*] | **per-user** [**user** *user-name*] **rule** *rule-name* } [**slot** *slot-number*]

Views

Any view

network-admin

network-operator

context-admin

context-operator

Parameters

downstream: Displays downstream traffic statistics.

total: Displays the sum of downstream traffic statistics and upstream traffic statistics.

upstream: Displays upstream traffic statistics.

per-ip: Displays per-IP traffic statistics.

ipv4: Displays per-IP traffic statistics for IPv4 addresses.

ipv4-address: Specifies an IPv4 address. If you do not specify an IPv4 address, this command displays per-IP traffic statistics for all IPv4 addresses of the specified traffic rule.

ipv6: Displays per-IP traffic statistics for IPv6 addresses. Non-default vSystems do not support this parameter.

ipv6-address: Specifies an IPv6 address. If you do not specify an IPv6 address, this command displays per-IP traffic statistics for all IPv6 addresses of the specified traffic rule.

rule *rule-name*: Specifies a traffic rule by its name, a case-insensitive string of 1 to 63 characters.

per-rule: Displays per-rule traffic statistics.

name *rule-name*: Specifies a traffic rule by its name, a case-insensitive string of 1 to 63 characters. If you do not specify a traffic rule, this command displays per-rule traffic statistics for all traffic rules.

per-user: Displays per-user traffic statistics.

user *user-name*: Specifies a user by its name, a case-insensitive string of 1 to 55 characters. If you do not specify a user, this command displays per-user traffic statistics for all users of the specified traffic rule.

rule *rule-name*: Specifies a traffic rule by its name, a case-insensitive string of 1 to 63 characters.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays traffic statistics for all member devices.

Usage guidelines

You can identify whether a traffic rule works as configured by displaying the traffic statistics for the traffic rule.

Examples

Display per-rule upstream traffic statistics for traffic rule **traffic-rule**.

```
<Sysname> display traffic-policy statistics bandwidth upstream per-rule name traffic-rule
Slot 1:
Codes: PP(Passed Packets), PB(Passed Bytes), DP(Dropped Packets), DB(Dropped Bytes),

context-operator

Parameters

per-ip: Displays per-IP connection limit statistics.

ipv4: Displays per-IP connection limit statistics for IPv4 addresses.

ipv4-address: Specifies an IPv4 address. If you do not specify an IPv4 address, this command displays connection limit statistics for all IPv4 addresses of the specified traffic rule.

ipv6: Displays per-IP connection limit statistics for IPv6 addresses.

ipv6-address: Specifies an IPv6 address. If you do not specify an IPv6 address, this command displays connection limit statistics for all IPv6 addresses of the specified traffic rule.

rule *rule-name*: Specifies a traffic rule by its name, a case-insensitive string of 1 to 63 characters.

per-rule: Displays per-rule connection limit statistics.

name *rule-name*: Specifies a traffic rule by its name, a case-insensitive string of 1 to 63 characters. If you do not specify a traffic rule, this command displays per-rule connection limit statistics for all traffic rules.

per-user: Displays per-user connection limit statistics.

user *user-name*: Specifies a user by its name, a case-insensitive string of 1 to 55 characters. If you do not specify a user, this command displays per-user connection limit statistics for all users of the specified traffic rule.

rule *rule-name*: Specifies a traffic rule by its name, a case-insensitive string of 1 to 63 characters.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays connection limit statistics for all member devices.

Usage guidelines

You can identify whether a traffic rule works as configured by displaying the connection limit statistics for the traffic rule.

Examples

Display per-rule connection limit statistics for traffic rule **traffic-rule**.

```
<Sysname> display traffic-policy statistics connection-limit per-rule name traffic-rule
Slot 1:
Codes: CC(Current Connection), RC(Rejective Connection), CL(Current Limit), RRC(Rate
Rejective Connection), RR(Rejective Rate), PR(Pass Rate)

-------------------------------------------------------------------------------
---
```

Table 3 Command output

Field	Description
Hit	Number of times that a rule is matched.

dscp

Use **dscp** to configure a DSCP priority as a match criterion.

Use **undo dscp** to remove all DSCP priority match criteria.

Syntax

dscp *dscp-value*

undo dscp *dscp-value*

Default

No DSCP priority is used as a match criterion.

Views

Traffic rule view

Predefined user roles

network-admin

context-admin

Parameters

dscp-value: Specifies a DSCP priority, which can only be a keyword in Table 4.

Table 4 Keyword-value map

Keyword	DSCP value (binary)	DSCP value (decimal)
default	000000	0
af11	001010	10
af12	001100	12
af13	001110	14
af21	010010	18
af22	010100	20
af23	010110	22
af31	011010	26
af32	011100	28
af33	011110	30
af41	100010	34
af42	100100	36
af43	100110	38
cs1	001000	8
cs2	010000	16

Keyword	DSCP value (binary)	DSCP value (decimal)
cs3	011000	24
cs4	100000	32
cs5	101000	40
cs6	110000	48
cs7	111000	56
ef	101110	46

Examples

Configure DSCP priority **af11** as a match criterion in traffic rule **rule1**.

```
<Sysname> system-view
[Sysname] traffic-policy
[Sysname-traffic-policy] rule name rule1
[Sysname-traffic-policy-rule-rule1] dscp af11
```

ipv6 extension-header

Use **ipv6 extension-header** to configure the IPv6 extension header attribute as a match criterion.

Use **undo ipv6 extension-header** to delete an extension header match criterion.

Syntax

ipv6 extension-header { **authentication** | **destination** | **encapsulating** | **fragment** | **hop-by-hop** | **routing** }

undo ipv6 extension-header

Default

The IPv6 extension header attribute is not used as a match criterion.

Views

Traffic rule view

Predefined user roles

network-admin

context-admin

Parameters

nonzero: Specifies the Authentication header.

destination: Specifies the Destination Options header.

encapsulating: Specifies the Encapsulating Security Payload header.

fragment: Specifies the Fragment header.

hop-by-hop: Specifies the Hop-by-Hop Options header.

routing: Specifies the Routing header.

Usage guidelines

This command enables the device to perform bandwidth management on the IPv6 packets with the specified extension header. For more information about extension headers, see RFC 2460.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Configure the Destination Options header as a match criterion in traffic rule **rule1**.

```
<Sysname> system-view
[Sysname] traffic-policy
[Sysname-traffic-policy] rule name rule1
[Sysname-traffic-policy-rule-rule1] ipv6 extension-header destination
```

Related commands

ipv6 flow-label

ipv6 flow-label

Use **ipv6 flow-label** to configure the IPv6 flow label attribute as a match criterion.

Use **undo ipv6 flow-label** to delete a flow label match criterion.

Syntax

ipv6 flow-label { **nonzero** | **zero** }

undo ipv6 flow-label

Default

The IPv6 flow label attribute is not used as a match criterion.

Views

Traffic rule view

Predefined user roles

network-admin

context-admin

Parameters

nonzero: Specifies non-zero IPv6 flow labels.

zero: Specifies the zero IPv6 flow label.

Usage guidelines

The **Flow Label** field in IPv6 packet headers is used to identify packets of a flow. This command enables the device to perform bandwidth management on the IPv6 packets with the specified flow label value. For more information about the **Flow Label** field, see RFC 2460.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Configure a flow label value of zero as a match criterion in traffic rule **rule1**.

```
<Sysname> system-view
[Sysname] traffic-policy
[Sysname-traffic-policy] rule name rule1
[Sysname-traffic-policy-rule-rule1] ipv6 flow-label zero
```

per-ip bandwidth-threshold max-value

Use **per-ip bandwidth-threshold max-value** to set the per-IP static maximum bandwidth threshold.

Use **undo per-ip bandwidth-threshold max-value** to restore the default.

Syntax

per-ip bandwidth-threshold max-value *max-value*

undo per-ip bandwidth-threshold max-value

Default

The per-IP static maximum bandwidth threshold is not set.

Views

Traffic profile view

Predefined user roles

network-admin

context-admin

Parameters

max-value: Specifies the maximum bandwidth threshold in the range of 8 to 1000000000 kbps.

Usage guidelines

When the device detects that the traffic rate of an IP address exceeds the maximum bandwidth threshold, it sends logs to the log host by using the fast log output feature.

If you configure both the per-IP static maximum bandwidth threshold and the per-IP dynamic threshold learning feature, the following rules apply:

- Before the device learns the average traffic rate, it uses the static maximum bandwidth threshold.
- After the device learns the average traffic rate, it uses the average traffic rate multiplied by the maximum tolerance value as the maximum bandwidth threshold.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

In traffic profile **news**, set the per-IP static maximum bandwidth threshold to 50000 kbps.

```
<Sysname> system-view
[Sysname] traffic-policy
[Sysname-traffic-policy] profile name news
[Sysname-traffic-policy-profile-news] per-ip bandwidth-threshold max-value 50000
```

Use **undo per-ip bandwidth-threshold min-value** to restore the default.

Syntax

per-ip bandwidth-threshold min-value *min-value*

undo per-ip bandwidth-threshold min-value

Default

The per-IP static minimum bandwidth threshold is not set.

Views

Traffic profile view

Predefined user roles

network-admin

context-admin

Parameters

min-value: Specifies the minimum bandwidth threshold in the range of 8 to 100000000 kbps.

Usage guidelines

When the device detects that the traffic rate of an IP address falls below the minimum bandwidth threshold, it sends logs to the log host by using the fast log output feature.

If you configure both the per-IP static minimum bandwidth threshold and the per-IP dynamic threshold learning feature, the following rules apply:

- Before the device learns the average traffic rate, it uses the static minimum bandwidth threshold.
- After the device learns the average traffic rate, it uses the average traffic rate multiplied by the minimum tolerance value as the minimum bandwidth threshold.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

In traffic profile **news**, set the per-IP static minimum bandwidth threshold to 500 kbps.

```
<Sysname> system-view
[Sysname] traffic-policy
[Sysname-traffic-policy] profile name news
[Sysname-traffic-policy-profile-news] per-ip bandwidth-threshold min-value 500
```

Use **undo per-ip bandwidth-threshold-detect enable** to disable per-IP bandwidth threshold detection.

Syntax

per-ip bandwidth-threshold-detect enable

undo per-ip bandwidth-threshold-detect enable

Default

Per-IP bandwidth threshold detection is disabled.

Views

Traffic profile view

Predefined user roles

network-admin

context-admin

Usage guidelines

This command enables the device to monitor the traffic rates based on source IP addresses in real time to identify the maximum rate and minimum rate of each IP address.

Examples

In traffic profile **news**, enable per-IP bandwidth threshold detection.

```
<Sysname> system-view
[Sysname] traffic-policy
[Sysname-traffic-policy] profile name news
[Sysname-traffic-policy-profile-news] per-ip bandwidth-threshold-detect enable
```

per-ip bandwidth-threshold-learn duration

Use **per-ip bandwidth-threshold-learn duration** to set the learning duration for per-IP dynamic threshold learning.

Use **undo per-ip bandwidth-threshold-learn duration** to restore the default.

Syntax

per-ip bandwidth-threshold-learn duration *duration-value*

undo per-ip bandwidth-threshold-learn duration

Default

The learning duration is 1440 minutes.

Views

Traffic profile view

Predefined user roles

network-admin

context-admin

Parameters

duration-value: Specifies the learning duration in the range of 8 to 10080 minutes.

Usage guidelines

After per-IP bandwidth threshold detection is enabled, the device measures the traffic rates over a user-configured duration and calculates an average rate. As a best practice, set the learning duration to be longer than 1440 minutes for the device to learn the traffic for no less than a whole day. After a learning duration ends, for the device to learn traffic again, disable and then re-enable dynamic threshold learning. The device will clear the previous learning results and perform a new learning process based on the same duration.

If you modify the duration during the learning process, the device starts a new learning process with the new duration.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

In traffic profile **news**, set the learning duration for per-IP dynamic threshold learning to 2880 minutes.

```
<Sysname> system-view
[Sysname] traffic-policy
[Sysname-traffic-policy] profile name news
[Sysname-traffic-policy-profile-news] per-ip bandwidth-threshold-learn duration 2880
```

Use **undo per-ip bandwidth-threshold-learn enable** to disable per-IP dynamic bandwidth threshold learning.

Syntax

per-ip bandwidth-threshold-learn enable

undo per-ip bandwidth-threshold-learn enable

Default

Per-IP dynamic bandwidth threshold learning is disabled.

Views

Traffic profile view

Predefined user roles

network-admin

context-admin

Usage guidelines

Dynamic bandwidth threshold learning is useful if you do not know the traffic patterns in a network and cannot determine appropriate bandwidth thresholds. With this feature enabled, the device measures the traffic rates over a user-configured duration and calculates an average rate. Then, the device obtains the minimum and maximum bandwidth thresholds by using the average rate multiplied by the minimum and maximum tolerance values.

If you configure both static bandwidth thresholds and the dynamic threshold learning feature for a traffic profile, the following rules apply:

- Before the device learns the average traffic rate, it uses the static bandwidth thresholds.
- After the device learns the average traffic rate, it uses the dynamic bandwidth thresholds.

Examples

In traffic profile **news**, enable per-IP dynamic bandwidth threshold learning.

```
<Sysname> system-view
[Sysname] traffic-policy
[Sysname-traffic-policy] profile name news
[Sysname-traffic-policy-profile-news] per-ip bandwidth-threshold-learn enable
```

Use **per-ip bandwidth-threshold-learn tolerance max-value** to set the maximum tolerance value for per-IP dynamic bandwidth threshold learning.

Use **undo per-ip bandwidth-threshold-learn tolerance max-value** to restore the default.

Syntax

per-ip bandwidth-threshold-learn tolerance max-value *max-value*

undo per-ip bandwidth-threshold-learn tolerance max-value

Default

The maximum tolerance value is not set.

Views

Traffic profile view

Predefined user roles

network-admin

context-admin

Parameters

max-value: Specifies the maximum tolerance value in the range of 1 to 4000, in percentage.

Usage guidelines

The per-IP dynamic threshold learning feature uses the learned average traffic rate to multiply the maximum tolerance value to obtain the maximum bandwidth threshold. If you also configure a static maximum bandwidth threshold for the traffic profile, the dynamic maximum bandwidth threshold is used after the average traffic rate is learned.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

In traffic profile **news**, set the maximum tolerance value for per-IP dynamic bandwidth threshold learning to 200.

```
<Sysname> system-view
[Sysname] traffic-policy
[Sysname-traffic-policy] profile name news
[Sysname-traffic-policy-profile-news] per-ip bandwidth-threshold-learn tolerance
max-value 200
```

per-ip bandwidth-threshold-learn tolerance min-value

Use **per-ip bandwidth-threshold-learn tolerance min-value** to set the minimum tolerance value for per-IP dynamic bandwidth threshold learning.

Use **undo per-ip bandwidth-threshold-learn tolerance min-value** to restore the default.

Syntax

per-ip bandwidth-threshold-learn tolerance min-value *min-value*

undo per-ip bandwidth-threshold-learn tolerance min-value

Default

The minimum tolerance value is not set.

Views

Traffic profile view

Predefined user roles

network-admin

context-admin

Parameters

min-value: Specifies the minimum tolerance value in the range of 1 to 4000, in percentage.

Usage guidelines

The per-IP dynamic threshold learning feature uses the learned average traffic rate to multiply the minimum tolerance value to obtain the minimum bandwidth threshold. If you also configure a static minimum bandwidth threshold for the traffic profile, the dynamic minimum bandwidth threshold is used after the average traffic rate is learned.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

In traffic profile **news**, set the minimum tolerance value for per-IP dynamic bandwidth threshold learning to 50.

```
<Sysname> system-view
[Sysname] traffic-policy
[Sysname-traffic-policy] profile name news
[Sysname-traffic-policy-profile-news] per-ip bandwidth-threshold-learn tolerance
min-value 50
```

Related commands

action

profile reference-mode

Use **profile reference-mode** to set the reference mode for a traffic profile.

Use **undo profile reference-mode** to restore the default.

Syntax

profile reference-mode { **per-rule** | **rule-shared** }

undo profile reference-mode

Default

The reference mode for a traffic profile is **per-rule**.

Views

Traffic profile view

Predefined user roles

network-admin

context-admin

Parameters

per-rule: Specifies that each traffic rule that uses the traffic profile can reach the bandwidth limits and connection limits specified in the profile.

rule-shared: Specifies that all traffic rules that use the traffic profile share the bandwidth limits and connection limits specified in the profile.

Usage guidelines

After a traffic profile is specified for a traffic rule, the bandwidth limits and connection limits in the profile take effect. The reference mode for a traffic profile can be **per-rule** or **rule-shared**.

Examples

Set the reference mode to **rule-shared** for traffic profile **profile1**.

```
<Sysname> system-view
[Sysname] traffic-policy
[Sysname-traffic-policy] profile name profile1
[Sysname-traffic-policy-profile-profile1] profile reference-mode rule-shared
```

profile rename

Use **profile rename** to rename a traffic profile.

Syntax

profile rename *old-name new-name*

Views

Traffic policy view

Parameters

old-name: Specifies the old name of the traffic profile, a case-insensitive string of 1 to 63 characters.

new-name: Specifies a new name for the traffic profile, a case-insensitive string of 1 to 63 characters. The new name cannot be an existing traffic profile name.

Examples

Create a traffic profile named **profile1**, and rename traffic profile **profile1** as **profile2**.

```
<Sysname> system-view
[Sysname] traffic-policy
[Sysname-traffic-policy] profile name profile1
[Sysname-traffic-policy-profile-profile1] quit
[Sysname-traffic-policy] profile rename profile1 profile2
```

remark dscp

Use **remark dscp** to mark the DSCP priority for packets of a traffic profile.

Use **undo remark dscp** to restore the default.

Syntax

remark dscp *dscp-value*

undo remark dscp

Default

The DSCP priority for packets of a traffic profile is not marked.

Views

Traffic profile view

Predefined user roles

network-admin

context-admin

Parameters

dscp-value: Specifies a DSCP priority, which can only be a keyword in Table 4.

Usage guidelines

Network devices can classify traffic by using DSCP priorities and provide different treatment for packets with different DSCP priorities.

Examples

Mark DSCP priority **af22** for packets of traffic profile **profile1**.

```
<Sysname> system-view
[Sysname] traffic-policy
[Sysname-traffic-policy] profile name profile1
[Sysname-traffic-policy-profile-profile1] remark dscp af22
```

reset traffic-policy statistics bandwidth

Use **reset traffic-policy statistics bandwidth** to clear traffic statistics for traffic rules.

Syntax

reset traffic-policy statistics bandwidth { **downstream** | **total** | **upstream** } { **per-ip** { **ipv4** [*ipv4-address*] | **ipv6** [*ipv6-address*] } **rule** *rule-name* | **per-rule** [**name** *rule-name*] | **per-user** [**user** *user-name*] **rule** *rule-name* } [**slot** *slot-number*]

Views

User view

Predefined user roles

network-admin

context-admin

Parameters

downstream: Specifies downstream traffic.

total: Specifies both downstream traffic and upstream traffic.

upstream: Specifies upstream traffic.

per-ip: Clears per-IP traffic statistics.

ipv4: Clears per-IP traffic statistics for IPv4 addresses.

ipv4-address: Specifies an IPv4 address. If you do not specify an IPv4 address, this command clears per-IP traffic statistics for all IPv4 addresses of the specified traffic rule.

ipv6: Clears per-IP traffic statistics for IPv6 addresses. Non-default vSystems do not support this parameter.

ipv6-address: Specifies an IPv6 address. If you do not specify an IPv6 address, this command clears per-IP traffic statistics for all IPv6 addresses of the specified traffic rule.

rule *rule-name*: Specifies a traffic rule by its name, a case-insensitive string of 1 to 63 characters.

per-rule: Clears per-rule traffic statistics.

name *rule-name*: Specifies a traffic rule by its name, a case-insensitive string of 1 to 63 characters. If you do not specify a traffic rule, this command clears per-rule traffic statistics for all traffic rules.

per-user: Clears per-user traffic statistics.

user *user-name*: Specifies a user by its name, a case-insensitive string of 1 to 55 characters. If you do not specify a user, this command clears per-user traffic statistics for all users of the specified traffic rule.

rule *rule-name*: Specifies a traffic rule by its name, a case-insensitive string of 1 to 63 characters.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command clears traffic statistics for all member devices.

Examples

Clear per-rule upstream traffic statistics for traffic rule **traffic-rule** on a slot.

```
<Sysname> reset traffic-policy statistics bandwidth upstream per-rule name traffic-rule
slot 1
```

reset traffic-policy statistics connection-limit

Use **reset traffic-policy statistics connection-limit** to clear connection limit statistics.

Syntax

reset traffic-policy statistics connection-limit { **per-ip** { **ipv4** [*ipv4-address*] | **ipv6** [*ipv6-address*] } **rule** *rule-name* | **per-rule** [**name** *rule-name*] | **per-user** [**user** *user-name*] **rule** *rule-name* } } [**slot** *slot-number*]

Views

User view

Predefined user roles

network-admin

Parameters

per-ip: Clears per-IP connection limit statistics.

ipv4: Clears per-IP connection limit statistics for IPv4 addresses.

ipv4-address: Specifies an IPv4 address. If you do not specify an IPv4 address, this command clears connection limit statistics for all IPv4 addresses of the specified traffic rule.

ipv6: Clears per-IP connection limit statistics for IPv6 addresses.

ipv6-address: Specifies an IPv6 address. If you do not specify an IPv6 address, this command clears connection limit statistics for all IPv6 addresses of the specified traffic rule.

rule *rule-name*: Specifies a traffic rule by its name, a case-insensitive string of 1 to 63 characters.

per-rule: Clears per-rule connection limit statistics.

name *rule-name*: Specifies a traffic rule by its name, a case-insensitive string of 1 to 63 characters. If you do not specify a traffic rule, this command clears per-rule connection limit statistics for all traffic rules.

per-user: Clears per-user connection limit statistics.

user *user-name*: Specifies a user by its name, a case-insensitive string of 1 to 55 characters. If you do not specify a user, this command clears per-user connection limit statistics for all users of the specified traffic rule.

rule *rule-name*: Specifies a traffic rule by its name, a case-insensitive string of 1 to 63 characters.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command clears connection limit statistics for all member devices.

Examples

Clear per-rule connection limit statistics for traffic rule **traffic-rule** on a slot.

```
<Sysname> reset traffic-policy statistics connection-limit per-rule name traffic-rule
slot 1
```

reset traffic-policy statistics rule-hit

Use **reset traffic-policy statistics rule-hit** to clear rule-hit statistics.

Syntax

reset traffic-policy statistics rule-hit [**rule** *rule-name*] [**slot** *slot-number*]

Views

User view

Predefined user roles

network-admin

context-admin

Parameters

rule *rule-name*: Specifies a traffic rule by its name, a case-insensitive string of 1 to 63 characters. If you do not specify a traffic rule, this command clears rule-hit statistics for all traffic rules.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command clears rule-hit statistics for all member devices.

Examples

Clear rule-hit statistics for traffic rule **traffic-rule** on a slot.

```
<Sysname> reset traffic-policy statistics rule-hit rule traffic-rule slot 1
```

rule

Use **rule** to create a traffic rule and enter its view, or enter the view of an existing traffic rule.

Use **undo rule** to delete a traffic rule.

Syntax

rule *rule-id*

rule [*rule-id*] **name** *rule-name* [**parent** *parent-rule-name*]

undo rule { *rule-id* | **name** *rule-name* }

Default

No traffic rule exists.

Views

Traffic policy view

Predefined user roles

network-admin

context-admin

Parameters

rule-id: Specifies an ID for the traffic rule, in the range of 1 to 65534. If you do not specify a rule ID, the system assigns the unused ID next to the ID used last time. If the rule ID to be assigned is greater than 65534, the system assigns the smallest available rule ID.

rule-name: Specifies a name for the traffic rule, a case-insensitive string of 1 to 63 characters. You must specify a rule name when creating a traffic rule.

parent *parent-rule-name*: Specifies a parent traffic rule by its name, a case-insensitive string of 1 to 63 characters. To successfully create the traffic rule, make sure the parent traffic rule already exists.

Usage guidelines

You can configure multiple traffic rules in the traffic policy. For a traffic rule, you can configure match criteria to match packets and specify the traffic profile to apply to matching packets. The device matches traffic rules in their order of appearance on the device. When a traffic rule is matched, the matching process ends and the device applies the traffic profile for the traffic rule to the traffic. If no traffic rule is matched, the device forwards the traffic.

For a new traffic rule to inherit the match criteria of an existing traffic rule, specify the existing traffic rule as the parent of the new traffic rule.

A level-4 rule cannot act as a parent rule

You can specify a parent traffic rule only when creating a traffic rule. You cannot add or modify a parent traffic rule for an existing traffic rule.

Examples

Create a traffic rule with ID 111 and name **rule1** and enter traffic rule view.

```
<Sysname> system-view
[Sysname] traffic-policy
[Sysname-traffic-policy] rule 111 name rule1
[Sysname-traffic-policy-rule-111-rule1]
```

rule copy

Use **rule copy** to copy a traffic rule.

Syntax

rule copy *rule-name new-rule-name*

Views

Traffic policy view

Predefined user roles

network-admin

context-admin

Parameters

rule-name: Specifies a traffic rule to be copied by its name, a case-insensitive string of 1 to 63 characters.

new-rule-name: Specifies a name for the new traffic rule, a case-insensitive string of 1 to 63 characters. The new name cannot be an existing traffic profile name.

Usage guidelines

If a traffic rule to be created is similar to an existing traffic rule, create the traffic rule by copying the existing traffic rule and then modify it. The new traffic rule is placed next to the copied traffic rule.

If a traffic rule to be copied has child traffic rules, only the parent traffic rule is copied.

Examples

Create a traffic rule named **rule2** by copying traffic rule **rule1**.

```
<Sysname> system-view
[Sysname] traffic-policy
[Sysname-traffic-policy] rule copy rule1 rule2
```

rule move

Use **rule move** to move a traffic rule to a new position.

Syntax

rule move *rule-name1* { **after** *rule-name2* | **before** [*rule-name2*] }

Views

Traffic policy view

Predefined user roles

network-admin

context-admin

Parameters

rule-name1: Specifies a traffic rule to be moved by its name, a case-insensitive string of 1 to 63 characters. The traffic rule can be a parent or child traffic rule.

after: Moves the specified traffic rule to the position after a target traffic rule.

before: Moves the specified traffic rule to the position before a target traffic rule. If you do not specify the *rule-name2* argument, the specified traffic rule is moved to the front of the traffic policy.

rule-name2: Specifies the target traffic rule by its name, a case-insensitive string of 1 to 63 characters.

Usage guidelines

The device matches traffic with traffic rules in their order of appearance on the device. When a traffic rule is matched, the matching process ends and the device applies the traffic profile specified for the traffic rule to the traffic. If no traffic rule is matched, the device forwards the traffic.

To ensure reasonable, precise bandwidth management, configure traffic rules in ascending order of granularity. If the traffic rules are not in ascending order of granularity, you can use the **rule move** command to change the position of them.

You can move child traffic rules only within their parent traffic rule.

Examples

Create two traffic rules named **rule1** and **rule2**, and move **rule1** to the position after **rule2**.

```
<Sysname> system-view
[Sysname] traffic-policy
[Sysname-traffic-policy] rule name rule1
[Sysname-traffic-policy-rule-rule1] quit
[Sysname-traffic-policy] rule name rule2
[Sysname-traffic-policy-rule-rule2] quit
[Sysname-traffic-policy] rule move rule1 after rule2
```

rule rename

Use **rule rename** to rename a traffic rule.

Syntax

rule rename *old-rule-name new-rule-name*

Views

Traffic policy view

Predefined user roles

network-admin

context-admin

Parameters

old-rule-name: Specifies the old name of the traffic rule, a case-insensitive string of 1 to 63 characters.

new-rule-name: Specifies a new name for the traffic rule, a case-insensitive string of 1 to 63 characters. The new name cannot be an existing traffic profile name.

Examples

Create a traffic rule named **rule1**, and rename traffic rule **rule1** as **rule2**.

```
<Sysname> system-view
[Sysname] traffic-policy
[Sysname-traffic-policy] rule name rule1
[Sysname-traffic-policy-rule-rule1] quit
[Sysname-traffic-policy] rule rename rule1 rule2
```

service

Use **service** to configure a service object group as a match criterion.

Use **undo service** to delete a service object group match criterion.

Syntax

service *object-group-name*

undo service [*object-group-name*]

Default

No service object group is used as a match criterion.

Views

Traffic rule view

Predefined user roles

network-admin

context-admin

Parameters

object-group-name: Specifies a service object group by its name, a case-insensitive string of 1 to 63 characters.

Usage guidelines

You can specify multiple service object groups for a traffic rule to match packets.

The **undo service** command removes all service object groups from match criteria if you do not specify a service object group or specify the system-defined service object group **any**.

Examples

Specify predefined service object group **ftp** for traffic rule **rule1** to match packets.

```
<Sysname> system-view
[Sysname] traffic-policy
[Sysname-traffic-policy] rule name rule1
[Sysname-traffic-policy-rule-rule1] service ftp
```

source-address

Use **source-address** to configure a source IP address object group as a match criterion.

Use **undo source-address** to delete a source IP address object group as a match criterion.

Syntax

source-address address-set *object-group-name*

undo source-address address-set *object-group-name*

Default

No source IP address object group is used as a match criterion.

Views

Traffic rule view

Predefined user roles

network-admin

context-admin

Parameters

object-group-name: Specifies an IPv4 or IPv6 address object group by its name, a case-insensitive string of 1 to 63 characters.

Usage guidelines

This command is used to match the packets with the source IP addresses in the specified address object group. You can specify multiple address object groups for a traffic rule to match source IP addresses of packets.

Before rolling back configuration by using the **configuration replace file** *filename* command, check the address object group configuration in the traffic rule in the configuration file. The address object group configuration fails to be rolled back if two address object groups have the same name but are of different types (IPv4/IPv6).

Examples

Specify IPv4 address object group **obgroup1** for traffic rule **rule1** to match source IPv4 addresses of packets.

```
<Sysname> system-view
[Sysname] traffic-policy
[Sysname-traffic-policy] rule name rule1
[Sysname-traffic-policy-rule-rule1] source-address address-set obgroup1
```

Syntax

statistics rule-hit enable

undo statistics rule-hit enable

Default

Rule-hit statistics collection is disabled.

Views

Traffic policy view

Predefined user roles

network-admin

context-admin

Usage guidelines

This command enables the device to collect rule-hit statistics. To view the statistics, use the **display traffic-policy statistics rule-hit** command.

This command affects device performance. As a best practice, configure this command only if you need to view statistics.

Examples

Enable rule-hit statistics collection.

```
<Sysname> system-view
[Sysname] traffic-policy
[Sysname-traffic-policy] statistics rule-hit enable
```

Related commands

display traffic-policy statistics rule-hit

tcp mss

Use **tcp mss** to set the TCP maximum segment size (MSS).

Use **undo tcp mss** to restore the default.

Syntax

tcp mss *mss-value*

undo tcp mss

Default

The TCP MSS is not set.

Views

Traffic profile view

Predefined user roles

network-admin

context-admin

Parameters

mss-value: Specifies the TCP MSS in the range of 128 to 9158 bytes.

Usage guidelines

The MSS specifies the maximum size of TCP segments that the peer device can send to the local device. It is negotiated during TCP connection establishment. When establishing a TCP connection, the local device advertises the MSS to the peer device. The peer device does not send TCP packets greater than the MSS. For TCP packets that exceed the MSS, the peer device fragments them before sending them.

This command takes effect only on new TCP connections and does not take effect on existing TCP connections.

This command takes effect only on IP packets. If MPLS is configured, do not set the MSS.

If you configure the MSS in both traffic profile view and interface view, the smaller MSS value takes effect.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Set the TCP MSS to 128 bytes for traffic profile **profile1**.

```
<Sysname> system-view
[Sysname] traffic-policy
[Sysname-traffic-policy] profile name profile1
[Sysname-traffic-policy-profile–profile1] tcp mss 128
```

Related commands

tcp mss (*Layer 3—IP Services Command Reference*)

terminal

Use **terminal** to configure a terminal as a match criterion.

Use **undo terminal** to delete a terminal match criterion.

Syntax

terminal *terminal-name*

undo terminal *terminal-name*

Default

No terminal is used as a match criterion.

Views

Traffic rule view

Predefined terminal roles

network-admin

context-admin

Parameters

terminal-name: Specifies a terminal by its name, a case-insensitive string of 1 to 63 characters. The names **invalid** and **other** are not supported.

Usage guidelines

You can execute this command multiple times to specify multiple terminals for a traffic rule to match packets.

Examples

Configure terminal **terminaltest** as a match criterion in traffic rule **news**.

```
<Sysname> system-view
[Sysname] traffic-policy
[Sysname-traffic-policy] rule name news
[Sysname-traffic-policy-rule-news] terminal terminaltest
```

Related commands

terminal-group

terminal-group

Use **terminal-group** to configure a terminal group as a match criterion.

Use **undo terminal-group** to delete a terminal group match criterion.

Syntax

terminal-group *group-name*

undo terminal-group *group-name*

Default

No terminal group is used as a match criterion.

Views

Traffic rule view

Predefined terminal-group roles

network-admin

context-admin

Parameters

group-name: Specifies a terminal group by its name, a case-insensitive string of 1 to 63 characters. The names **invalid** and **other** are not supported.

Usage guidelines

You can execute this command multiple times to specify multiple terminal groups for a traffic rule to match packets.

Examples

Configure terminal group **terminalgrouptest** as a match criterion in traffic rule **news**.

```
<Sysname> system-view
[Sysname] traffic-policy
[Sysname-traffic-policy] rule name news
[Sysname-traffic-policy-rule-news] terminal-group terminalgrouptest
```

Related commands

terminal

time-range

Use **time-range** to specify a time range during which a traffic rule is in effect.

Use **undo time-range** to restore the default.

Syntax

time-range *time-range-name*

undo time-range

Default

A traffic rule is in effect at any time.

Views

Traffic rule view

Predefined user roles

network-admin

context-admin

Parameters

time-range-name: Specifies a time range by its name, a case-insensitive string of 1 to 32 characters.

Examples

Specify time range **work-time** for traffic rule **rule1**.

```
<Sysname> system-view
[Sysname] traffic-policy
[Sysname-traffic-policy] rule name rule1
[Sysname-traffic-policy-rule-rule1] time-range work-time
```

Related commands

time-range (*ACL and QoS Command Reference*)

traffic-policy

Use **traffic-policy** to enter traffic policy view.

Use **undo traffic-policy** to remove all traffic policy settings.

Syntax

traffic-policy

undo traffic-policy

Views

System view

Predefined user roles

network-admin

context-admin

Usage guidelines

In traffic policy view, you can create and manage traffic rules.

Examples

Enter traffic policy view.

```
<Sysname> system-view
[Sysname] traffic-policy
[Sysname-traffic-policy]
```

traffic-priority

Use **traffic-priority** to set the traffic priority for a traffic profile.

Use **undo traffic-priority** to restore the default.

Syntax

traffic-priority *priority-value*

undo traffic-priority

Default

The traffic priority is 1 for a traffic profile.

Views

Traffic profile view

Predefined user roles

network-admin

context-admin

Parameters

priority-value: Specifies the priority value in the range of 1 to 7. The larger the priority value, the higher the priority.

Usage guidelines

When an interface is congested with packets of multiple traffic profiles, packets with higher priority are sent first. Packets with the same priority have the same chance of being forwarded.

Examples

Set the traffic priority to 7 for traffic profile **profile1**.

```
<Sysname> system-view
[Sysname] traffic-policy
[Sysname-traffic-policy] profile name profile1
[Sysname-traffic-policy-profile-profile1] traffic-priority 7
```

Related commands

profile name

user

Use **user** to configure a username as a match criterion.

Use **undo user** to delete a username match criterion.

Syntax

user *user-name* [**domain** *domain-name*]

undo user *user-name* [**domain** *domain-name*]

Default

No username is used as a match criterion.

Views

Traffic rule view

Predefined user roles

network-admin

context-admin

Parameters

user-name: Specifies a username, a case-insensitive string of 1 to 55 characters. The username cannot be **a**, **al**, or **all**, and cannot contain the following special characters: backslashes (\), vertical bars (|), slash (/), colon (:), asterisks (*), question marks (?), left angle brackets (<), right angle brackets (>), and at signs (@).

domain *domain-name*: Matches the user in an identity domain. The *domain-name* argument represents the identity domain name, a case-insensitive string of 1 to 255 characters. The identity domain name cannot contain the following special characters: backslashes (\), vertical bars (|), slash (/), colon (:), asterisks (*), question marks (?), left angle brackets (<), right angle brackets (>), and at signs (@). If you do not specify this option, the system matches the user among users that do not belong to any identity domain. For more information about identity domains, see user identification in *Security Configuration Guide*.

Usage guidelines

A username corresponds to changing IP addresses. This command implements per-user bandwidth management and facilitates bandwidth management for mobile Internet users whose IP addresses change.

Examples

Configure username **managers** as a match criterion in traffic rule **rule1**.

```
<Sysname> system-view
[Sysname] traffic-policy
[Sysname-traffic-policy] rule name rule1
```

```
[Sysname-traffic-policy-rule-rule1] user managers
```

Configure username **user1** in identity domain **dpi** as a match criterion in traffic rule **myrule**.

```
<Sysname> system-view
[Sysname] traffic-policy
[Sysname-traffic-policy] rule name myrule
[Sysname-traffic-policy-rule-myrule] user user1 domain dpi
```

user-group

Use **`user-group`** to configure a user group as a match criterion.

Use **`undo user-group`** to delete a user group match criterion.

Syntax

`user-group` *`user-group-name`* [**`domain`** *`domain-name`*]

`undo user-group` *`user-group-name`* [**`domain`** *`domain-name`*]

Default

No user group is used as a match criterion.

Views

Traffic rule view

Predefined user roles

network-admin

context-admin

Parameters

`user-group-name`: Specifies a user group by its name, a case-insensitive string of 1 to 200 characters.

`domain` *`domain-name`*: Matches the user group in an identity domain. The *`domain-name`* argument represents the identity domain name, a case-insensitive string of 1 to 255 characters. The identity domain name cannot contain the following special characters: backslashes (\), vertical bars (|), slash (/), colon (:), asterisks (*), question marks (?), left angle brackets (<), right angle brackets (>), and at signs (@). If you do not specify this option, the system matches the user group among user groups that do not belong to any identity domain. For more information about identity domains, see user identification in *Security Configuration Guide*.

Usage guidelines

A user group corresponds to changing IP addresses. This command implements per-user-group bandwidth management and facilitates bandwidth management for mobile Internet users whose IP addresses change.

Examples

Configure user group **mak** as a match criterion in traffic rule **rule1**.

```
<Sysname> system-view
[Sysname] traffic-policy
```

```
[Sysname-traffic-policy] rule name rule1
[Sysname-traffic-policy-rule-rule1] user-group mak
```

Configure user group **usergroup1** in identity domain **dpi** as a match criterion in traffic rule **myrule**.

```
<Sysname> system-view
[Sysname] traffic-policy
[Sysname-traffic-policy] rule name myrule
[Sysname-traffic-policy-rule-myrule] user-group usergroup1 domain dpi
```

Application audit and management commands

This feature parses personal information from user packets and must be used for legitimate purposes.

application

Use **application** to configure an application or application group as a match criterion for an application audit and management policy.

Use **undo application** to delete an application or application group match criterion from an application audit and management policy.

Syntax

application { **app** *application-name* | **app-group** *application-group-name* }

undo application { **app** *application-name* | **app-group** *application-group-name* }

Default

No application or application group is used as a match criterion.

Views

Application audit and management policy view

Predefined user roles

network-admin

context-admin

Parameters

app *application-name*: Specifies an application by its name, a case-insensitive string of 1 to 63 characters.

app-group *application-group-name*: Specifies an application group by its name, a case-insensitive string of 1 to 63 characters.

Usage guidelines

You can configure this command only in an audit-free policy or deny policy.

You can configure this command multiple times to specify multiple applications or application groups.

Examples

Specify applications **app1** and **app2** and application groups **group1** and **group2** for policy **mypolicy2** to match packets.

```
<Sysname> system-view
[Sysname] uapp-control
[Sysname-uapp-control] policy name mypolicy2 deny
[Sysname-uapp-control-policy-mypolicy2] application app app1
[Sysname-uapp-control-policy-mypolicy2] application app app2
[Sysname-uapp-control-policy-mypolicy2] application app-group group1
[Sysname-uapp-control-policy-mypolicy2] application app-group group2
```

description

Use **description** to set a description for a keyword group.

Use **undo description** to restore the default.

Syntax

description *text*

undo description

Default

No description exists for a keyword group.

Views

Keyword group view

Predefined user roles

network-admin

context-admin

Parameters

text: Specifies a description, a case-sensitive string of 1 to 255 characters.

Examples

Set the description to **account limit** for keyword group **mykeywordgroup**.

```
<Sysname> system-view
[Sysname] uapp-control
[Sysname-uapp-control] keyword-group name mykeywordgroup
[Sysname-uapp-control-keyword-group-mykeywordgroup] description account limit
```

destination-address

Use **destination-address** to configure a destination IP address object group as a match criterion for an application audit and management policy.

Use **undo destination-address** to remove a destination IP address object group as a match criterion from an application audit and management policy.

Syntax

destination-address { **ipv4** | **ipv6** } *object-group-name*

undo destination-address { **ipv4** | **ipv6** } *object-group-name*

Default

No destination IP address object group is used as a match criterion.

Views

Application audit and management policy view

Predefined user roles

network-admin

context-admin

Parameters

ipv4: Specifies an IPv4 address object group.

ipv6: Specifies an IPv6 address object group.

object-group-name: Specifies an existing address object group by its name, a case-insensitive string of 1 to 63 characters.

Usage guidelines

You can configure this command multiple times to specify multiple IPv4 or IPv6 address object groups.

Examples

Specify IPv4 address object groups **obgroup3** and **obgroup4** for policy **mypolicy1** to match destination IPv4 addresses of packets.

```
<Sysname> system-view
[Sysname] uapp-control
[Sysname-uapp-control] policy name mypolicy1 audit
[Sysname-uapp-control-policy-mypolicy1] destination-address ipv4 obgroup3
[Sysname-uapp-control-policy-mypolicy1] destination-address ipv4 obgroup4
```

Related commands

object-group (*Security Command Reference*)

destination-zone

Use **destination-zone** to configure a destination security zone as a match criterion for an application audit and management policy.

Use **undo destination-zone** to delete a destination security zone match criterion from an application audit and management policy.

Syntax

destination-zone *destination-zone-name*

undo destination-zone *destination-zone-name*

Default

No destination security zone is used as a match criterion.

Views

Application audit and management policy view

Predefined user roles

network-admin

context-admin

Parameters

destination-zone-name: Specifies a destination security zone by its name, a case-insensitive string of 1 to 31 characters.

Usage guidelines

You can configure this command multiple times to specify multiple destination security zones.

Examples

Specify destination security zones **zone3** and **zone4** for policy **mypolicy1** to match packets.

```
<Sysname> system-view
[Sysname] uapp-control
[Sysname-uapp-control] policy name mypolicy1 audit
[Sysname-uapp-control-policy-mypolicy1] destination-zone zone3
[Sysname-uapp-control-policy-mypolicy1] destination-zone zone4
```

Related commands

security-zone name (*Security Command Reference*)

disable

Use **disable** to disable an application audit and management policy.

Use **undo disable** to enable an application audit and management policy.

Syntax

disable

undo disable

Default

An application audit and management policy is enabled.

Views

Application audit and management policy view

Predefined user roles

network-admin

context-admin

Usage guidelines

If an application audit and management policy is not used, use this command to disable it. A disabled policy does not participate in traffic matching. You can copy, rename, and move a disabled policy.

Examples

Disable application audit and management policy **mypolicy1**.

```
<Sysname> system-view
[Sysname] uapp-control
[Sysname-uapp-control] policy name mypolicy1
[Sysname-uapp-control-policy-mypolicy1] disable
```

keyword

Use **keyword** to add a keyword to a keyword group.

Use **undo keyword** to delete a keyword from a keyword group.

Syntax

keyword *keyword-value*

undo keyword *keyword-value*

Default

No keywords exist in a keyword group.

Views

Keyword group view

Predefined user roles

network-admin

context-admin

Parameters

keyword-value: Specifies a keyword, a case-sensitive string of 1 to 63 characters.

Examples

Add keyword **keywordname** to keyword group **mykeywordgroup**.

```
<Sysname> system-view
[Sysname] uapp-control
[Sysname-uapp-control] keyword-group name mykeywordgroup
[Sysname-uapp-control-keyword-group-mykeywordgroup] keyword keywordname
```

keyword-group name

Use **keyword-group name** to create a keyword group and enter its view, or enter the view of an existing keyword group.

Use **undo keyword-group name** to delete a keyword group.

Syntax

keyword-group name *keyword-group-name*

undo keyword-group name *keyword-group-name*

Default

No keyword groups exist.

Views

Application audit and management view

Predefined user roles

network-admin

context-admin

Parameters

keyword-group-name: Specifies a keyword group by its name, a case-insensitive string of 1 to 63 characters.

Examples

Create a keyword group named **mykeywordgroup** and enter its view.

```
<Sysname> system-view
[Sysname] uapp-control
[Sysname-uapp-control] keyword-group name mykeywordgroup
[Sysname-uapp-control-keyword-group-mykeywordgroup]
```

policy copy

Use **policy copy** to copy an application audit and management policy.

Syntax

policy copy *policy-name new-policy-name*

Default

No application audit and management policies exist.

Views

Application audit and management view

Predefined user roles

network-admin

context-admin

Parameters

policy-name: Specifies an application audit and management policy to be copied by its name, a case-insensitive string of 1 to 63 characters.

new-policy-name: Specifies a name for the new application audit and management policy, a case-insensitive string of 1 to 63 characters.

Usage guidelines

If an application audit and management policy to be created is similar to an existing policy, create the policy by copying the existing policy and then modify it.

Examples

Create an application audit and management policy named **policy2** by copying policy **policy1**.

```
<Sysname> system-view
[Sysname] uapp-control
[Sysname-uapp-control] policy copy policy1 policy2
```

policy default-action

Use **policy default-action** to configure the default action for application audit and management policies.

Syntax

policy default-action { **deny** | **permit** }

Default

The default action for application audit and management policies is **permit**.

Views

Application audit and management view

Predefined user roles

network-admin

context-admin

Parameters

deny: Drops packets.

permit: Allows packets to pass.

Usage guidelines

If a packet does not match any application audit and management policy, the device applies the default action to the packet.

Examples

Configure the default action as **deny** for application audit and management policies.

```
<Sysname> system-view
[Sysname] uapp-control
[Sysname-uapp-control] policy default-action deny
```

policy move

Use **policy move** to move an application audit and management policy to a new position.

Syntax

policy move *policy-name1* { **after** *policy-name2* | **before** [*policy-name2*] }

Views

Application audit and management view

Predefined user roles

network-admin

context-admin

Parameters

policy-name1: Specifies an application audit and management policy to be moved by its name, a case-insensitive string of 1 to 63 characters. The traffic rule can be a parent or child traffic rule.

after: Moves the specified policy to the position after a target policy.

before: Moves the specified policy to the position before a target policy. If you do not specify the *policy-name2* argument, the specified policy is moved before all policies.

policy-name2: Specifies the target policy by its name, a case-insensitive string of 1 to 63 characters.

Examples

Create two application audit and management policies named **policy1** and **policy2**, and move **policy1** to the position after **policy2**.

```
<Sysname> system-view
[Sysname] uapp-control
[Sysname-uapp-control] policy name policy1 audit
[Sysname-uapp-control-policy-policy1] quit
[Sysname-uapp-control] policy name policy2 audit
[Sysname-uapp-control-policy-policy2] quit
[Sysname-uapp-control] policy move policy1 after policy2
```

policy name

Use **policy name** to create an application audit and management policy and enter its view, or enter the view of an existing policy.

Use **undo policy name** to delete an application audit and management policy.

Syntax

policy name *policy-name* [**audit** | **deny** | **noaudit**]

undo policy name *policy-name*

Default

No application audit and management policies exist.

Views

Application audit and management view

Predefined user roles

network-admin

context-admin

Parameters

policy-name: Specifies a name for the application audit and management policy, a case-insensitive string of 1 to 63 characters. The name must be globally unique.

audit: Creates an audit policy.

deny: Creates a deny policy.

noaudit: Creates an audit-free policy.

Usage guidelines

You must specify the policy type when creating a policy. Application audit and management policies have the following types:

- **Audit policy**—Audits packets that meet match criteria in the policy.
- **Audit-free policy**—Does not audit packets that meet match criteria in the policy.
- **Deny policy**—Drops packets that meet match criteria in the policy.

The **application** command can be configured only in an audit-free policy or deny policy.

The following commands can be configured only in an audit policy:

- **rule**.
- **rule default-action**.
- **rule match-method**.

Examples

Create an application audit and management policy named **mypolicy1** and enter its view.

```
<Sysname> system-view
[Sysname] uapp-control
[Sysname-uapp-control] policy name mypolicy1 audit
[Sysname-uapp-control-policy-mypolicy1]
```

policy rename

Use **policy rename** to rename an application audit and management policy.

Syntax

policy rename *old-policy-name new-policy-name*

Views

Application audit and management view

Predefined user roles

network-admin

context-admin

Parameters

old-policy-name: Specifies the old name of the policy, a case-insensitive string of 1 to 63 characters.

new-policy-name: Specifies a new name for the policy, a case-insensitive string of 1 to 63 characters.

Examples

Create an application audit and management policy named **policy1**, and rename the policy as **policy2**.

```
<Sysname> system-view
[Sysname] uapp-control
[Sysname-uapp-control] policy name policy1 audit
[Sysname-uapp-control-policy-policy1] quit
[Sysname-uapp-control] policy rename policy1 policy2
```

rule

Use **rule** to configure an audit rule.

Use **undo rule** to delete an audit rule.

Syntax

rule *rule-id* { **app** *app-name* | **app-category** *app-category-name* | **any** } **behavior** { *behavior-name* | **any** } **bhcontent** { *bhcontent-name* | **any** } { **keyword** { **equal** | **exclude** | **include** | **unequal** } { *keyword-group-name* | **any** } | **integer** { **equal** | **greater** | **greater-equal** | **less** | **less-equal** | **unequal** } { *number* } } **action** { **deny** | **permit** } [**audit-logging**]

rule *rule-id* { **email-bomb-defense** [**interval** *interval* **max-number** *email-number*] | **email-send-restriction** } * **action** { **deny** | **permit** } [**audit-logging**]

undo rule *rule-id*

Default

No audit rules exist.

Views

Application audit and management policy view

Predefined user roles

network-admin

context-admin

Parameters

rule-id: Specifies a rule ID in the range of 1 to 64.

app *app-name*: Audits an application specified by its name.

app-category *app-category-name*: Audits an application category specified by its name.

any: Audits all applications and application categories.

behavior *behavior-name*: Audits a behavior specified by its name.

behavior any: Audits all behaviors.

bhcontent *bhcontent-name*: Audits a behavior content specified by its name.

bhcontent any: Audits all behavior contents.

keyword: Matches behavior contents by a string-type keyword.

- **equal**: Matches behavior contents that are the same as the keyword.
- **exclude**: Matches behavior contents that do not include the keyword.
- **include**: Matches behavior contents that include the keyword.
- **unequal**: Matches behavior contents that are different from the keyword.

keyword-group-name: Specifies a keyword group by its name.

any: Audits all behavior contents of an application or application category.

integer: Matches behavior contents by a number.

- **equal**: Matches behavior contents that are equal to the number.
- **greater**: Matches behavior contents that are greater than the number.
- **greater-equal**: Matches behavior contents that are greater than or equal to the number.
- **less**: Matches behavior contents that are smaller than the number.
- **less-equal**: Matches behavior contents that are smaller than or equal to the number.
- **unequal**: Matches behavior contents that are not equal to the number.

number: Specifies a number in the range of 0 to 4294967295.

action: Specifies the action to take on packets that match the audit rule.

- **deny**: Denies matching packets.
- **permit**: Allows matching packets to pass.

audit-logging: Generates audit logs for packets that match the audit rule. If you do not specify this keyword, audit logs are not generated for packets that match the audit rule.

email-bomb-defense: Configures email bomb prevention.

interval *interval*: Specifies the detection time in the range of 1 to 5 minutes. The default is 1 minute.

max-number *email-number*: Specifies the maximum number of emails that can be received from the same user during the detection time.

email-send-restriction: Enables preventing users from sending emails to users of a different domain.

Usage guidelines

After a packet matches all match criteria in an application audit and management policy, the device performs a finer audit on the packet.

- If a packet matches all items in an audit rule, the action in the audit rule is taken on the packet.
- If a packet matches only the specified application or application category in an audit rule, the packet is allowed to pass through.
- If a packet does not match the specified application or application category in an audit rule, the default action for audit rules is taken on the packet.

This command can be configured only in an audit policy.

For WeChat and QQ, specific messages cannot be audited.

An audit rule provices the following functions:

- **General auditing**—Performs granular control on user behaviors.
- **Email protection**—Detects incoming emails, counts emails based on recipients, and protects recipients from attacks. Specifically, you can configure the following functions:
  - **Limit email sending**—Prevents users from sending emails to users of a different domain. For example, the user at user1@abc.com cannot receive emails from the user at user2@123.com.
  - **Prevent email bombing**—Protects recipients from being overwhelmed by large numbers of emails from the same sender during a short period of time.

Examples

Create an application audit and management policy named **mypolicy1**.

```
<Sysname> system-view
[Sysname] uapp-control
[Sysname-uapp-control] policy name mypolicy1 audit
```

Create an audit rule that allows login packets from accounts that include keyword 0 in the IM application group, generating audit logs.

```
[Sysname-uapp-control-policy-mypolicy1] rule 1 app-category IM behavior Login bhcontent
Account keyword include mykeywd2 action deny audit-logging
```

Create an audit rule that enables email bombing prevention, with the permit action and logging action specified.

```
[Sysname-uapp-control-policy-mypolicy1] rule 2 email-bomb-defense interval 1 max-number
5 action permit audit-logging
```

Create an audit rule that enables email sending limitation, with the permit action and logging action specified.

```
[Sysname-uapp-control-policy-mypolicy1] rule 3 email-send-restriction action permit
audit-logging
```

Related commands

keyword

keyword-group name

rule default-action

Use **rule default-action** to configure the default action for audit rules in an application audit and management policy.

Syntax

rule default-action { **deny** | **permit** }

Default

The default action for audit rules is **permit**.

Views

Application audit and management policy view

Predefined user roles

network-admin

context-admin

Parameters

deny: Drops packets.

permit: Allows packets to pass.

Usage guidelines

If a packet does not match the application or application category in any audit rule, the device applies the default action to the packet.

Examples

Configure the default action as **deny** for audit rules in policy **mypolicy1**.

```
<Sysname> system-view
[Sysname] uapp-control
[Sysname-uapp-control] policy name mypolicy1 audit
[Sysname-uapp-control-policy-mypolicy1] rule default-action deny
```

rule match-method

Use **rule match-method** to configure the match mode for audit rules in an application audit and management policy.

Syntax

rule match-method { **all** | **in-order** }

Default

The match mode for audit rules is **in-order**.

Views

Application audit and management policy view

Predefined user roles

network-admin

context-admin

Parameters

all: Specifies the **all** match mode.

in-order: Specifies the **in-order** match mode.

Usage guidelines

In the **in-order** match mode, the device compares packets with audit rules in ascending order of rule ID. When a packet matches a rule, the device stops the match process and performs the action defined in the rule.

In the **all** match mode, the device compares packets with audit rules in ascending order of rule ID.

- If a packet matches a rule with the permit action, all subsequent rules continue to be matched.

  The device takes the action with higher priority on matching packets. The deny action has higher priority than the permit action.
- If a packet matches a rule with the deny action, the device stops the match process and performs the deny action.

Examples

Configure the match mode as **all** for audit rules in policy **mypolicy1**.

```
<Sysname> system-view
```

```
[Sysname] uapp-control
[Sysname-uapp-control] policy name mypolicy1 audit
[Sysname-uapp-control-policy-mypolicy1] rule match-method all
```

service

Use **service** to configure a service object group as a match criterion for an application audit and management policy.

Use **undo service** to delete a service object group match criterion from an application audit and management policy.

Syntax

service *service-name*

undo service [*service-name*]

Default

No service object group is used as a match criterion.

Views

Application audit and management policy view

Predefined user roles

network-admin

context-admin

Parameters

service-name: Specifies an existing service object group by its name, a case-insensitive string of 1 to 63 characters.

Usage guidelines

You can configure this command multiple times to specify multiple service object groups.

The **undo service** command removes all service object groups from match criteria if you do not specify a service object group or specify the system-defined service object group **any**.

Examples

Specify service object groups **dns-tcp** and **dns-udp** for policy **mypolicy1** to match packets.

```
<Sysname> system-view
[Sysname] uapp-control
[Sysname-uapp-control] policy name mypolicy1 audit
[Sysname-uapp-control-policy-mypolicy1] service dns-tcp
[Sysname-uapp-control-policy-mypolicy1] service dns-udp
```

source-address

Use **source-address** to configure a source IP address object group as a match criterion for an application audit and management policy.

Use **undo source-address** to remove a source IP address object group as a match criterion from an application audit and management policy.

Syntax

source-address { **ipv4** | **ipv6** } *object-group-name*

undo source-address { **ipv4** | **ipv6** } *object-group-name*

Default

No source IP address object group is used as a match criterion.

Views

Application audit and management policy view

Predefined user roles

network-admin

context-admin

Parameters

ipv4: Specifies an IPv4 address object group.

ipv6: Specifies an IPv6 address object group.

object-group-name: Specifies an existing address object group by its name, a case-insensitive string of 1 to 63 characters.

Usage guidelines

You can configure this command multiple times to specify multiple IPv4 or IPv6 address object groups.

Examples

Specify IPv4 address object groups **obgroup1** and **obgroup2** for policy **mypolicy1** to match source IPv4 addresses of packets.

```
<Sysname> system-view
[Sysname] uapp-control
[Sysname-uapp-control] policy name mypolicy audit
[Sysname-uapp-control-policy-mypolicy] source-address ipv4 obgroup1
[Sysname-uapp-control-policy-mypolicy] source-address ipv4 obgroup2
```

uapp-control

Use **uapp-control** to enter application audit and management view.

Use **undo uapp-control** to remove all application audit and management policy settings.

Syntax

uapp-control

undo uapp-control

Views

System view

Predefined user roles

network-admin

context-admin

Usage guidelines

In application audit and management view, you can create, copy, move, and rename application audit and management policies. You can also create keyword groups in this view.

Application audit and management policies have the following types:

- Audit policy.
- Audit-free policy.
- Deny policy.

Audit-free policies and deny policies provide application audit and management at a coarse level of granularity. Audit policies provide more granular application audit and management.

Examples

Enter application audit and management view.

```
<Sysname> system-view
[Sysname] uapp-control
[Sysname-uapp-control]
```

user

Use **user** to configure a user as a match criterion for an application audit and management policy.

Use **undo user** to delete a user match criterion from an application audit and management policy.

Syntax

user *user-name* [**domain** *domain-name*]

undo user *user-name* [**domain** *domain-name*]

Default

No user is used as a match criterion.

Views

Application audit and management policy view

Predefined user roles

network-admin

context-admin

Parameters

user-name: Specifies an identity user by its name, a case-sensitive string of 1 to 55 characters. The username cannot be **a**, **al**, or **all**, and cannot contain the following special characters: \ | / : * ? < > @.

domain *domain-name*: Matches the user in an identity domain. The *domain-name* argument represents the identity domain name, a case-insensitive string of 1 to 255 characters. The domain name cannot contain the following special characters: \ | / : * ? < > @. If you do not specify this option, the system matches the user among users that do not belong to any identity domain. For more information about identity domains, see user identification in *Security Configuration Guide*.

Usage guidelines

You can configure this command multiple times to specify multiple users.

Examples

Specify users **managers1** and **managers2** for policy **mypolicy1** to match packets.

```
<Sysname> system-view
[Sysname] uapp-control
[Sysname-uapp-control] policy name mypolicy1 audit
[Sysname-uapp-control-policy-mypolicy1] user managers1
[Sysname-uapp-control-policy-mypolicy1] user managers2
```

Configure user **managers1** in identity domain **dpi** for policy **mypolicy1** to match packets.

```
<Sysname> system-view
[Sysname] uapp-control
[Sysname-uapp-control] policy name mypolicy1 audit
[Sysname-uapp-control-policy-mypolicy1] user managers1 domain dpi
```

Related commands

user-identity enable (*Security Command Reference*)

user-group

Use **user-group** to configure a user group as a match criterion for an application audit and management policy.

Use **undo user-group** to delete a user group match criterion from an application audit and management policy.

Syntax

user-group *user-group-name* [**domain** *domain-name*]

undo user-group *user-group-name* [**domain** *domain-name*]

Default

No user group is used as a match criterion.

Views

Application audit and management policy view

Predefined user roles

network-admin

context-admin

Parameters

user-group-name: Specifies an identity user group by its name, a case-insensitive string of 1 to 200 characters.

domain *domain-name*: Matches the user group in an identity domain. The *domain-name* argument represents the identity domain name, a case-insensitive string of 1 to 255 characters. The domain name cannot contain the following special characters: \ | / : * ? < > @.If you do not specify this option, the system matches the user group among user groups that do not belong to any identity domain. For more information about identity domains, see user identification in *Security Configuration Guide*.

Usage guidelines

You can configure this command multiple times to specify multiple user groups.

Examples

Specify user groups **group1** and **group2** for policy **mypolicy1** to match packets.

```
<Sysname> system-view
[Sysname-uapp-control] policy name mypolicy1 audit
[Sysname-uapp-control-policy-mypolicy1] user-group group1
[Sysname-uapp-control-policy-mypolicy1] user-group group2
```

Configure user group **group1** in identity domain **dpi** for policy **mypolicy1** to match packets.

```
<Sysname> system-view
[Sysname] uapp-control
[Sysname-uapp-control] policy name mypolicy1 audit
[Sysname-uapp-control-policy-mypolicy1] user-group group1 domain dpi
```

Related commands

user-identity enable (*Security Command Reference*)

Contents

NetShare control commands

action

Use **action** to specify the NetShare control action to take when the number of terminals sharing an IP address exceeds the limit.

Use **undo action** to restore the default.

Syntax

action { **freeze** *freeze-time* | **permit** } [**logging**]

undo action

Default

A NetShare control policy uses the **permit** action.

Views

NetShare control policy view

Predefined user roles

network-admin

context-admin

Parameters

freeze: Freezes the shared IP address so all packets sourced from the IP address will be dropped.

freeze-time: Specifies the time period that an IP address will be frozen, in minutes. The value range for this argument is 2 to 720.

permit: Permits the packets sourced from the IP address to pass through.

logging: Logs the NetShare control event.

Usage guidelines

A NetShare control policy analyzes packets to track the number of terminals sharing the same source IP address. If the number of terminals sharing an IP address exceeds the limit set by using the **per-ip-shared max-terminals** command, the device will take the NetShare control action in the policy.

Examples

Specify the **freeze** action and set the freezing time to 10 minutes in NetShare control policy **abc**.

```
<Sysname> system-view
[Sysname] netshare-control
[Sysname-netshare-control] policy name abc
[Sysname-netshare-control-policy-abc] action freeze 10
```

Related commands

per-ip-shared max-terminals

application-inspect enable

Use **application-inspect enable** to enable APR-based detection.

Use **undo application-inspect enable** to disable APR-based detection.

Syntax

application-inspect enable

undo application-inspect enable

Default

APR-based detection is enabled.

Views

NetShare control policy view

Predefined user roles

network-admin

context-admin

Usage guidelines

APR-based NetShare detection uses the APR signature library to inspect only specific applications, such as QQ and WeChat. If an application is encrypted, APR-based NetShare detection cannot inspect it. As a best practice, enable APR-based detection only when explicitly required, because the detection might degrade the device performance.

You can enable both APR-based detection and IPID trail tracking to detect NetShare behaviors.

Examples

Enable APR-based detection in NetShare control policy **share**.

```
<Sysname> system-view
[Sysname] netshare-control
[Sysname-netshare-control] policy name share
[Sysname-netshare-control-policy-share] application-inspect enable
```

Related commands

ipid-trail enable

description

Use **description** to configure a description for a NetShare control policy.

Use **undo description** to restore the default.

Syntax

description *text*

undo description

Default

No description is configured for a NetShare control policy.

Views

NetShare control policy view

Predefined user roles

network-admin

context-admin

Parameters

text: Configures a description, a case-sensitive string of 1 to 127 characters.

Examples

Configure a description for NetShare control policy **abc**.

```
<Sysname> system-view
[Sysname] netshare-control
[Sysname-netshare-control] policy name abc
[Sysname-netshare-control-policy-abc] description The Netshare Management
```

destination-address

Use **destination-address** to set a destination address filtering criterion in a NetShare control policy.

Use **undo destination-address** to remove a destination address filtering criterion from a NetShare control policy.

Syntax

destination-address { **ipv4** | **ipv6** } *object-group-name*

undo destination-address { **ipv4** | **ipv6** } *object-group-name*

Default

A NetShare control policy does not contain any destination address filtering criterion.

Views

NetShare control policy view

Predefined user roles

network-admin

context-admin

Parameters

ipv4: Specifies an IPv4 address object group.

ipv6: Specifies an IPv6 address object group.

object-group-name: Specifies an address object group by its name, a case-insensitive string of 1 to 31 characters.

Usage guidelines

You can execute this command multiple times in a NetShare control policy to set multiple destination address filtering criteria. A packet passes the destination address filtering if it matches any of the configured destination address filtering criteria.

Examples

Set IPv4 address object group **obgroup2** as a destination address filtering criterion in NetShare control policy **abc**.

```
<Sysname> system-view
[Sysname] netshare-control
[Sysname-netshare-control] policy name abc
[Sysname-netshare-control-policy-abc] destination-address ipv4 obgroup2
```

Related commands

object-group (*Security Command Reference*)

destination-zone

Use **destination-zone** to set a destination security zone filtering criterion in a NetShare control policy.

Use **undo destination-zone** to remove a destination security zone filtering criterion from a NetShare control policy.

Syntax

destination-zone *destination-zone-name*

undo destination-zone *destination-zone-name*

Default

A NetShare control policy does not contain any destination security zone filtering criterion.

Views

NetShare control policy view

Predefined user roles

network-admin

context-admin

Parameters

destination-zone-name: Specifies a destination security zone by its name, a case-insensitive string of 1 to 31 characters.

Usage guidelines

You can execute this command multiple times in a NetShare control policy to set multiple destination security zone filtering criteria. A packet passes the destination security zone filtering if it matches any of the configured destination security zone filtering criteria.

Examples

Set security zone **zone2** as a destination security zone filtering criterion in NetShare control policy **abc**.

```
<Sysname> system-view
[Sysname] netshare-control
[sysname-netshare-control] policy name abc
[sysname-netshare-control-policy-abc] destination-zone zone2
```

Related commands

security-zone name (*Security Command Reference*)

disable

Use **disable** to disable a NetShare control policy.

Use **undo disable** to enable a NetShare control policy.

Syntax

disable

undo disable

Default

A NetShare control policy is enabled.

Views

NetShare control policy view

Predefined user roles

network-admin

context-admin

Usage guidelines

The device supports only one NetShare control policy.

After you disable the NetShare control policy, the NetShare control feature becomes invalid.

Examples

Disable NetShare control policy **abc**.

```
<Sysname> system-view
[Sysname] netshare-control
[Sysname-netshare-control] policy name abc
[Sysname-netshare-control-policy-abc] disable
```

display netshare-control

Use **display netshare-control** to display NetShare control information about shared IP addresses.

Syntax

display netshare-control [{ **ipv4** | **ipv6** } *ip-address* | **status** { **frozen** | **unfrozen** }] [**slot** *slot-number*]

Views

Any

Predefined user roles

network-admin

context-admin

Parameters

ipv4: Specifies the IPv4 address type.

ipv6: Specifies the IPv6 address type.

ip-address: Displays NetShare control information about the specified IP address.

status: Specifies the status of the IP addresses to be displayed.

frozen: Displays NetShare control information about frozen IP addresses.

unfrozen: Displays NetShare control information about unfrozen IP addresses.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays information for all member devices.

Usage guidelines

This command displays information about detected IP addresses that are shared by multiple terminals.

Examples

Displays all shared IP addresses in frozen state.

```
<Sysname> display netshare-control status frozen
Slot 1:
  Total frozen shared IP addresses: 2

  IP address     VPN instance  Policy   Terminals   Status    Remaining time  User
  192.168.1.18   vpn1          P1       3           Frozen    20 min          abc
  12.12.12.1     -             P1       4           Frozen    10 min          kwq123
```

Table 1 Command output

Field	Description
Total frozen shared IP addresses	Total number of shared IP address in frozen state.
IP address	Shared IP address.
VPN instance	VPN instance to which the IP address belongs. This field displays a hyphen (-) if the IP address is on the public network.
Policy	Name of the NetShare control policy.
Terminals	Number of terminals sharing the IP address.
Status	Status of the shared IP address: **frozen** or **unfrozen**.
Remaining time	Remaining time before the IP address will be released from the frozen IP address list.
User	User name.

freeze

Use **freeze** to manually freeze an IP address.

Syntax

freeze { **ipv4** | **ipv6** } *ip-address* [**vpn-instance** *vpn-instance-name*] **time** *freeze-time*

Views

NetShare control configuration view

Predefined user roles

network-admin

context-admin

Parameters

ipv4: Specifies the IPv4 address type.

ipv6: Specifies the IPv6 address type.

ip-address: Specifies the IP address to freeze.

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If the IP address is on the public network, do not specify this option.

freeze-time: Specifies the time period that the IP address will be frozen, in minutes. The value range is 5 to 720.

Usage guidelines

Use this command to manually freeze an IP address that is shared by terminals. This command is not available for IP addresses that are already on frozen IP address list.

To view the shared IP addresses that can be manually frozen, use the **display netshare-control** command.

Examples

Manually freeze IP address 12.12.12.1 for 15 minutes.

```
<Sysname> system-view
[Sysname] netshare-control
[Sysname-netshare-control] freeze ipv4 12.12.12.1 time 15
```

Related commands

display netshare-control

unfreeze

ipid-trail enable

Use **ipid-trail enable** to enable IPID trail tracking.

Use **undo ipid-trail enable** to disable IPID trail tracking.

Syntax

ipid-trail enable

undo ipid-trail enable

Default

IPID trail tracking is disabled.

Views

NetShare control policy view

Predefined user roles

network-admin

context-admin

Usage guidelines

By default, the device uses the Application Recognition (APR) feature to detect NetShare behaviors. APR-based detection applies only to a limited set of applications in the APR signature library. You can enable IPID trail tracking to meet the NetShare control requirements of various application scenarios.

IPID trail tracking tracks the values of the IPID fields in packets to detect NetShare behaviors. Packets sent by the same host contain incremented IPID values of a unique sequential pattern that starts at a random number. NetShare control tracks the IPID values of packets sourced from the same IP address. In a time period, if the IPID values in the packets belong to the same unique sequential pattern, only one terminal is using the IP address. If the IPID values belong to different sequential patterns, the source IP address is shared by multiple terminals.

You can enable both APR-based detection and IPID trail tracking to detect NetShare behaviors.

IPID trail tracking might degrade the device performance. Enable it only when explicitly required.

IPID trail tracking supports detecting the terminals that are running the Windows system, and detecting packets in which values of the IPID fields change regularly. Mobile terminals are not supported.

IPID trail tracking supports detecting IPv4 packets.

Examples

Enable IPID trail tracking in NetShare control policy **abc**.

```
<Sysname> system-view
[Sysname] netshare-control
[Sysname-netshare-control] policy name abc
[Sysname-netshare-control-policy-abc] ipid-trail enable
```

per-ip-shared max-terminals

Use **`per-ip-shared max-terminals`** to set the maximum number of terminals that can share an IP address.

Use **`undo per-ip-shared max-terminals`** to restore the default.

Syntax

`per-ip-shared max-terminals` *number*

`undo per-ip-shared max-terminals`

Default

The number of terminals that can share an IP address is not limited.

Views

NetShare control policy view

Predefined user roles

network-admin

context-admin

Parameters

number: Sets the maximum number of terminals that can share an IP address. The value range is 1 to 15. If you set the value to 1, one IP address can be used by only one terminal.

Usage guidelines

If the number of terminals sharing an IP address exceeds the limit, the device will take the NetShare control action set by using the **action** command in the NetShare control policy.

Examples

Set the maximum number of terminals that can share an IP address to 3 in NetShare control policy **abc**.

```
<sysname> system-view
[sysname] netshare-control
[sysname-netshare-control] policy name abc
[sysname-netshare-control-policy-abc] per-ip-shared max-terminals 3
```

action

policy name

Use **policy name** to create a NetShare control policy and enter its view, or enter the view of an existing NetShare control policy.

Use **undo policy name** to delete a NetShare control policy.

Syntax

policy name *policy-name*

undo policy name *policy-name*

Default

No NetShare control policy exists.

Views

NetShare control configuration view

Predefined user roles

network-admin

context-admin

Parameters

policy-name: Specify a name for the NetShare control policy, a case-insensitive string of 1 to 63 characters.

Usage guidelines

The device supports only one NetShare control policy.

In the NetShare control policy, you can configure the following items:

- The following types of criteria to filter the packets to be analyzed by the NetShare control policy:
  - Source IP address.
  - Destination IP address.
  - Source security zone.

    - Destination security zone.
    - User.
    - User group.
- Maximum number of terminals that can share an IP address.
- Action to take when the number of terminals sharing an IP address exceeds the limit.

Examples

Create NetShare control policy **abc** and enter its view.

```
<Sysname> system-view
[Sysname] netshare-control
[Sysname-netshare-control] policy name abc
[Sysname-netshare-control-policy-abc]
```

Parameters

user-group-name: Specify a user group by its name, a case-sensitive string of 1 to 32 characters.

domain *domain-name*: Specifies the name of the identity domain to which the user group belongs. The identity domain name is a case-insensitive string of 1 to 255 characters which cannot contain question marks (?). If the user group does not belong to any identity domains, do not specify this option. For more information about identity domains, see user identification configuration in *Security Configuration Guide*.

Usage guidelines

You can execute this command multiple times in a NetShare control policy to set multiple user group filtering criteria. A packet passes the user group filtering if it matches any of the configured user group filtering criteria.

Examples

Set user group **group1** as a user group filtering criterion in NetShare control policy **abc**.

```
<sysname> system-view
[sysname] netshare-control
[sysname-netshare-control] policy name abc
[sysname-netshare-control-policy-abc] user-group group1
```

NSFOCUS Firewall Series

NF Load Balancing

Command Reference

NSFOCUS Technologies, Inc.

Document version: 6W600-20230221

Preface

This command reference describes the commands for configuring load balancing.

This preface includes the following topics about the documentation:

- Audience.
- Conventions.

Audience

This documentation is intended for:

- Network planners.
- Field technical support and servicing engineers.
- Network administrators.

Conventions

The following information describes the conventions used in the documentation.

Command conventions

Convention	Description
Boldface	**Bold** text represents commands and keywords that you enter literally as shown.
Italic	*Italic* text represents arguments that you replace with actual values.
[ ]	Square brackets enclose syntax choices (keywords or arguments) that are optional.
{ x | y | ... }	Braces enclose a set of required syntax choices separated by vertical bars, from which you select one.
[x | y | ...]	Square brackets enclose a set of optional syntax choices separated by vertical bars, from which you select one or none.
{ x | y | ... } *	Asterisk marked braces enclose a set of required syntax choices separated by vertical bars, from which you select a minimum of one.
[x | y | ...] *	Asterisk marked square brackets enclose optional syntax choices separated by vertical bars, from which you select one choice, multiple choices, or none.
&<1-n>	The argument or keyword and argument combination before the ampersand (&) sign can be entered 1 to n times.
#	A line that starts with a pound (#) sign is comments.

GUI conventions

Convention	Description
Boldface	Window names, button names, field names, and menu items are in Boldface. For example, the **New User** window opens; click **OK**.
>	Multi-level menus are separated by angle brackets. For example, **File** > **Create** > **Folder**.

Symbols

Convention	Description
WARNING!	An alert that calls attention to important information that if not understood or followed can result in personal injury.
CAUTION:	An alert that calls attention to important information that if not understood or followed can result in data loss, data corruption, or damage to hardware or software.
IMPORTANT:	An alert that calls attention to essential information.
NOTE:	An alert that contains additional or supplementary information.
TIP:	An alert that provides helpful information.

Network topology icons

Convention	Description
	Represents a generic network device, such as a router, switch, or firewall.
	Represents a routing-capable device, such as a router or Layer 3 switch.
	Represents a generic switch, such as a Layer 2 or Layer 3 switch, or a router that supports Layer 2 forwarding and other Layer 2 features.
	Represents an access controller, a unified wired-WLAN module, or the access controller engine on a unified wired-WLAN switch.
	Represents an access point.
	Represents a wireless terminator unit.
	Represents a wireless terminator.
	Represents a mesh access point.
	Represents omnidirectional signals.
	Represents directional signals.
	Represents a security product, such as a firewall, UTM, multiservice security gateway, or load balancing device.
	Represents a security module, such as a firewall, load balancing, NetStream, SSL VPN, IPS, or ACG module.

Examples provided in this document

Examples in this document might use devices that differ from your device in hardware model, configuration, or software version. It is normal that the port numbers, sample output, screenshots, and other information in the examples differ from what you have on your device.

Contents

Load balancing commands

The following compatibility matrixes show the support of hardware platforms for server load balancing:

Models	Server load balancing compatibility
NFNX5-HD6480, NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB1780, NFNX3-HDB3080, NFNX3-HDB1180, NFNX3-HDB1480	Yes
NFNX3-HDB680, NFNX3-HDB1080	No

activate (link group view)

Use **activate** to set the criteria to determine whether a link group is available.

Use **undo activate** to restore the default.

Syntax

activate lower *lower-percentage* **upper** *upper-percentage*

undo activate

Default

A link group is available when a minimum of one link is available.

Views

Link group view

Predefined user roles

network-admin

context-admin

Parameters

lower *lower-percentage*: Specifies the lower percentage value in the range of 1 to 99.

upper *upper-percentage*: Specifies the upper percentage value in the range of 1 to 99. The upper percentage value must be greater than or equal to the lower percentage value.

Usage guidelines

When the percentage of available links in a primary link group is smaller than the lower percentage value, the primary link group becomes unavailable. Then the backup link group takes over. When the percentage of available links in a primary link group is greater than the upper percentage value, the primary link group becomes available again to process services.

If no backup link group is configured on the virtual server, this configuration does not take effect.

Examples

Set the lower percentage value to 20 and upper percentage value to 80 for the link group **lg**.

```
<Sysname> system-view
[Sysname] loadbalance link-group lg
[Sysname-lb-lgroup-lg] activate lower 20 upper 80
```

activate (server farm view)

Use **activate** to set the criteria to determine whether a server farm is available.

Use **undo activate** to restore the default.

Syntax

activate lower *lower-percentage* **upper** *upper-percentage*

undo activate

Default

A server farm is available when a minimum of one real server is available.

Views

Server farm view

Predefined user roles

network-admin

context-admin

Parameters

lower *lower-percentage*: Specifies the lower percentage value in the range of 1 to 99. When the percentage of available real servers in the primary server farm is lower than the lower percentage value, the primary server farm becomes unavailable. Then the backup server farm takes over.

upper *upper-percentage*: Specifies the upper percentage value in the range of 1 to 99. The upper percentage value must be higher than or equal to the lower percentage value. When the percentage of available real servers in the primary server farm is higher than the upper percentage value, the primary server farm becomes available again to process services.

Usage guidelines

If no backup server farm is configured on the virtual server, this configuration does not take effect.

Examples

Set the lower percentage value to 20 and upper percentage value to 80 for the server farm **sf**.

```
<Sysname> system-view
[Sysname] server-farm sf
[Sysname-sfarm-sf] activate lower 20 upper 80
```

Related commands

default server-farm

application-mode enable

Use **application-mode enable** to configure a TCP virtual server to operate at Layer 7.

Use **undo application-mode enable** to restore the default.

Syntax

application-mode enable

undo application-mode enable

Default

A TCP virtual server operates at Layer 4.

Views

TCP virtual server view

Predefined user roles

network-admin

context-admin

Examples

Configure TCP virtual server **vs** to operate at Layer 7.

```
<Sysname> system-view
[Sysname] virtual-server vs type tcp
[Sysname-vs-tcp-vs] application-mode enable
```

argument

Use **argument** to configure user-defined information for a custom-monitoring LB probe template.

Use **undo argument** to restore the default.

Syntax

argument *text*

undo argument

Default

No user-defined information is configured for a custom-monitoring LB probe template.

Views

Custom-monitoring LB probe template view

Predefined user roles

network-admin

context-admin

Parameters

text: Specifies an information text, a case-sensitive string of 1 to 255 characters. The string can contain spaces and cannot contain quotation marks (").

Usage guidelines

When executing the script file used for custom monitoring, the device transfers the information text to the script file as a parameter.

You can configure multiple arguments separated by spaces as the user-defined information.

Examples

In custom-monitoring LB probe template **test_external**, configure user-defined information as **abc 123 456**.

```
<Sysname> system-view
[Sysname] loadbalance probe-template external-monitor test_external
[Sysname-lbpt-external-monitor-test_external] argument abc 123 456
```

arp-nd interface (SNAT address pool view)

Use **arp-nd interface** to specify an interface for sending gratuitous ARP packets and ND packets.

Use **undo arp-nd interface** to disable an interface from sending gratuitous ARP packets and ND packets.

Syntax

arp-nd interface *interface-type interface-number*

undo arp-nd interface *interface-type interface-number*

Default

No interface is specified for sending gratuitous ARP packets and ND packets. No interface can send gratuitous ARP packets or ND packets.

Views

SNAT address pool view

Predefined user roles

network-admin

context-admin

Parameters

*interface-type interface-numbe*r: Specifies an interface by its type and number.

Usage guidelines

You can execute this command multiple times to specify multiple interfaces for one SNAT address pool.

Examples

For SNAT address pool **lbsp**, specify GigabitEthernet 1/0/1 as the interface for sending gratuitous ARP packets and ND packets.

```
<Sysname> system-view
[Sysname] loadbalance snat-pool lbsp
[Sysname-lbsnat-pool-lbsp] arp-nd interface gigabitethernet 1/0/1
```

arp-nd interface (virtual server view)

Use **arp-nd interface** to specify an interface for sending gratuitous ARP packets and ND packets.

Use **undo arp-nd interface** to disable an interface from sending gratuitous ARP packets and ND packets.

Syntax

arp-nd interface *interface-type interface-number*

undo arp-nd interface *interface-type interface-number*

Default

No interface is specified for sending gratuitous ARP packets and ND packets. No interface can send gratuitous ARP packets or ND packets.

Views

Virtual server view

Predefined user roles

network-admin

context-admin

Parameters

*interface-type interface-numbe*r: Specifies an interface by its type and number.

Usage guidelines

You can execute this command multiple times to specify multiple interfaces for one virtual server.

Examples

For virtual server **vs3**, specify GigabitEthernet 1/0/1 as the interface for sending gratuitous ARP packets and ND packets.

```
<Sysname> system-view
[Sysname] virtual-server vs3 type ip
[Sysname-vs-ip-vs3] arp-nd interface gigabitethernet 1/0/1
```

auto-alloc address

Use **auto-alloc address** to enable the device to automatically obtain the IP address of a DNS server.

Use **undo auto-alloc address** to disable the device from automatically obtaining the IP address of a DNS server.

Syntax

auto-alloc address

undo auto-alloc address

Default

The device is disabled from automatically obtaining the IP address of a DNS server.

Views

DNS server view

Predefined user roles

network-admin

context-admin

Usage guidelines

This command is mutually exclusive with the **ip address** and **ipv6 address** commands.

Before configuring this command, you must configure the **router interface** command. Otherwise, the IP address of the DNS server cannot be obtained.

If the device obtains multiple DNS server IP addresses, it uses the smallest available IP address.

Examples

Enable the device to automatically obtain the IP address of DNS server **ds1**.

```
<Sysname> system-view
[Sysname] loadbalance dns-server ds1
[Sysname-lb-ds-ds1] auto-alloc address
```

Related commands

display loadbalance dns-server

auto-shutdown recovery-time

Use **auto-shutdown recovery-time** to set the automatic recovery time for intelligent monitoring.

Use **undo auto-shutdown recovery-time** to restore the default.

Syntax

auto-shutdown recovery-time *recovery-time*

undo auto-shutdown recovery-time

Default

The automatic recovery time is 0 minutes.

Views

Server farm view

Predefined user roles

network-admin

context-admin

Parameters

recovery-time: Specifies the automatic recovery time in the range of 0 to 15300 minutes. The value of 0 means that a server farm member placed in Auto shutdown state does not automatically recover.

Usage guidelines

Use this command to enable automatic recovery for a real server that is shut down by intelligent monitoring.

If health monitoring is not configured, a recovered real server is set to Unknown state.

If health monitoring is configured and succeeds, a recovered real server is set to Active state. If health monitoring fails, a recovered real server is set to Probe-failed state.

Examples

Set the automatic recovery time to 5 minutes for server farm **sf**.

```
<Sysname> system-view
[Sysname] server-farm sf
[Sysname-sfarm-sf] auto-shutdown recovery-time 5
```

bandwidth busy-protection enable (transparent DNS proxy view)

Use **bandwidth busy-protection enable** to enable the link protection feature for a transparent DNS proxy.

Use **undo bandwidth busy-protection enable** to disable the link protection feature for a transparent DNS proxy.

Syntax

bandwidth busy-protection enable

undo bandwidth busy-protection enable

Default

The link protection feature is disabled for a transparent DNS proxy.

Views

Transparent DNS proxy view

Predefined user roles

network-admin

context-admin

Usage guidelines

This command enables a transparent DNS proxy to select a DNS server from the DNS server pool based on the link bandwidth ratio. If the bandwidth ratio of a link exceeds the specified value, the corresponding DNS server is not selected.

If the link bandwidth ratio of all DNS servers in the DNS server pool exceeds the specified value, the link protection feature is automatically disabled. If the link bandwidth ratio of any DNS server drops below the specified value, the link protection feature is automatically enabled, and the corresponding DNS server is selected.

Examples

Enable the link protection feature for transparent DNS proxy **dns-proxy1**.

```
<Sysname> system-view
[Sysname] loadbalance dns-proxy dns-proxy1
[Sysname-lb-dp-udp-dns-proxy1] bandwidth busy-protection enable
```

Related commands

bandwidth busy-rate (link view)

bandwidth busy-protection enable (virtual server pool view)

Use **bandwidth busy-protection enable** to enable the link protection feature for a virtual server pool.

Use **undo bandwidth busy-protection enable** to disable the link protection feature for a virtual server pool.

Syntax

bandwidth busy-protection enable

undo bandwidth busy-protection enable

Default

The link protection feature is disabled for a virtual server pool.

Views

Virtual server pool view

Predefined user roles

network-admin

context-admin

Usage guidelines

This command enables a virtual server pool to select a virtual server based on the link bandwidth ratio. If the bandwidth ratio of a link is exceeded, the virtual server is not selected.

Examples

Enable the link protection feature for the virtual server pool **local-pool**.

```
<Sysname> system-view
[Sysname] loadbalance virtual-server-pool local-pool
[Sysname-lb-vspool-local-pool] bandwidth busy-protection enable
```

Related commands

bandwidth busy-rate (link view)

bandwidth busy-protection enable (virtual server view)

Use **bandwidth busy-protection enable** to enable the link protection feature.

Use **undo bandwidth busy-protection enable** to disable the link protection feature.

Syntax

bandwidth busy-protection enable

undo bandwidth busy-protection enable

Default

The link protection feature is disabled.

Views

Virtual server view

Predefined user roles

network-admin

context-admin

Usage guidelines

The link protection feature limits packets that exceed the bandwidth busy rate in the inbound or outbound direction of a link. When a link is busy in only the outbound direction, new traffic (traffic that does not match any sticky entry) is not distributed to the link. However, existing traffic is still distributed to the link. When a link is busy in only the inbound direction, new traffic can be distributed to the link.

When a link becomes busy in at least one direction, the link state becomes busy. When a link is not busy in both directions, the link sate is normal.

The link protection feature takes effect only when bandwidth statistics collection by interfaces is enabled.

Examples

Enable the link protection feature for the IP-type virtual server **vs3**.

```
<Sysname>system-view
[Sysname] virtual-server vs3 type ip
[Sysname-vs-ip-vs3] bandwidth busy-protection enable
```

Related commands

bandwidth interface statistics enable

bandwidth busy-rate

Use **bandwidth busy-rate** to set the bandwidth ratio for an LB link.

Use **undo bandwidth busy-rate** to restore the default.

Syntax

bandwidth [**inbound** | **outbound**] **busy-rate** *busy-rate-number* [**recovery** *recovery-rate-number*]

undo bandwidth [**inbound** | **outbound**] **busy-rate**

Default

The bandwidth ratio is 70.

Views

LB link view

Predefined user roles

network-admin

context-admin

Parameters

inbound: Specifies the inbound bandwidth ratio.

outbound: Specifies the outbound bandwidth ratio.

busy-rate-number: Specifies bandwidth ratio in the range of 1 to 100.

recovery *recovery-rate-number*: Specifies bandwidth recovery ratio in the range of 1 to 100. By default, if the bandwidth ratio is greater than 10, the bandwidth recovery ratio equals the bandwidth ratio minus 10; if the bandwidth ratio is smaller than or equal to 10, the bandwidth recovery ratio equals the bandwidth ratio.

Usage guidelines

If the bandwidth of an LB link exceeds the maximum expected bandwidth multiplied by the bandwidth ratio, the LB link is busy and will not be selected. If the bandwidth of the LB link drops below the maximum expected bandwidth multiplied by the bandwidth recovery ratio, the LB link participates in scheduling again.

If you do not specify the **inbound** or **outbound** keyword, this command sets the total bandwidth ratio.

The bandwidth ratio equals the current bandwidth divided by the maximum bandwidth of the LB link. If the maximum bandwidth is not limited, the supported maximum bandwidth is used for calculating the bandwidth ratio.

The bandwidth recovery ratio must be smaller than or equal to the bandwidth ratio of an LB link.

This command takes effect only on new sessions and does not take effect on existing sessions.

Examples

Set the total bandwidth ratio and bandwidth recovery ratio for the LB link **lk1** to 90 and 85.

```
<Sysname> system-view
[Sysname] loadbalance link lk1
[Sysname-lb-link-link1] bandwidth busy-rate 90 recovery 85
```

Related commands

display loadbalance link

max-bandwidth (link view)

bandwidth interface statistics enable

Use **bandwidth interface statistics enable** to enable bandwidth statistics collection by interfaces.

Use **undo bandwidth interface statistics enable** to disable bandwidth statistics collection by interfaces.

Syntax

bandwidth interface statistics enable

undo bandwidth interface statistics enable

Default

Bandwidth statistics collection by interfaces is disabled.

Views

Virtual server view

Predefined user roles

network-admin

context-admin

Examples

Enable bandwidth statistics collection by interfaces for the IP-type virtual server **vs3**.

```
<Sysname> system-view
[Sysname] virtual-server vs3 type ip
[Sysname-vs-ip-vs3] bandwidth interface statistics enable
```

bandwidth weight

Use **bandwidth weight** to set the bandwidth weight for proximity calculation.

Use **undo bandwidth weight** to restore the default.

Syntax

bandwidth { **inbound** | **outbound** } **weight** *bandwidth-weight*

undo bandwidth { **inbound** | **outbound** } **weight**

Default

The inbound or outbound bandwidth weight for proximity calculation is 100.

Views

Proximity view

Predefined user roles

network-admin

context-admin

Parameters

inbound: Specifies the inbound bandwidth weight.

outbound: Specifies the outbound bandwidth weight.

bandwidth-weight: Specifies the bandwidth weight for proximity calculation, in the range of 0 to 255. A larger value indicates a higher bandwidth weight.

Examples

Set the inbound bandwidth weight for proximity calculation to 200.

```
<Sysname> system-view
[Sysname] loadbalance proximity
[Sysname-lb-proximity] bandwidth inbound weight 200
```

Set the outbound bandwidth weight for proximity calculation to 200.

```
<Sysname> system-view
[Sysname] loadbalance proximity
[Sysname-lb-proximity] bandwidth outbound weight 200
```

busy-action

Use **busy-action** to configure the action to take when a server farm is busy.

Use **undo busy-action** to restore the default.

Syntax

busy-action { **drop** | **enqueue length** *length* **timeout** *timeout-value* | **force** }

undo busy-action

Default

The default action is **drop**.

Views

Server farm view

Predefined user roles

network-admin

context-admin

Parameters

drop: Stops assigning client requests to the server farm.

enqueue: Assigns new client requests to a wait queue.

length *length*: Specifies the maximum number of client requests allowed in the wait queue, in the range of 1 to 100000. When the queue is full, new client requests are dropped.

timeout *timeout-value*: Specifies the aging time for the wait queue, in the range of 1 to 60 seconds.

force: Forcibly assigns client requests to all real servers in the server farm.

Usage guidelines

For the **drop** action, if the LB policy for the server farm contains the action of matching the next rule, the device compares client requests with the next rule. Otherwise, the device drops the client requests.

Examples

Configure the action to take when a server farm is busy as **force**.

```
<Sysname> system-view
[Sysname] server-farm sf
```

```
[Sysname-sfarm-sf] busy-action force
```

busy-action continue

Use **busy-action continue** to configure the action of matching the next rule when all links or DNS servers are busy.

Use **undo busy-action** to restore the default.

Syntax

busy-action continue

undo busy-action

Default

The device assigns packets to links or DNS servers regardless of whether they are busy.

Views

Link-generic LB action view

DNS server LB action view

Predefined user roles

network-admin

context-admin

Usage guidelines

This command enables the device to match the next rule when all links or DNS servers are busy.

Examples

Configure link-generic LB action **a1** to match the next rule when all links or DNS servers are busy.

```
<Sysname> system-view
[Sysname] loadbalance action a1 type link-generic
[Sysname-lba-link-generic-a1] busy-action continue
```

case-insensitive

Use **case-insensitive** to disable case sensitivity for matching character strings.

Use **undo case-insensitive** to restore the default.

Syntax

case-insensitive

undo case-insensitive

Default

Case sensitivity is enabled for matching character strings.

Views

HTTP parameter profile view

Predefined user roles

network-admin

context-admin

Usage guidelines

This command affects the following content:

- HTTP header value, HTTP cookie name and value, and URL for matching classes.
- Header value, URL, and key value used for generating sticky entries for the HTTP header sticky method.
- Cookie name and value and key value used for generating sticky entries for the cookie get sticky method.

Examples

Disable case sensitivity for the HTTP-type parameter profile **pp1**.

```
<Sysname> system-view
[Sysname] parameter-profile pp1 type http
[Sysname-para-http-pp1] case-insensitive
```

check all-packet

Use **check all-packet** to enable checking for all packets.

Use **undo check all-packet** to restore the default.

Syntax

check all-packet

undo check all-packet

Default

Checking for all packets is disabled.

Views

HTTP cookie sticky group view

HTTP passive sticky group view

Predefined user roles

network-admin

context-admin

Usage guidelines

If the sticky method is cookie get, use this command to get cookies from all HTTP response packets. If this command is not executed, the device gets only the Set-Cookie from the first response packet of a connection.

If the sticky method is cookie rewrite, use this command to rewrite cookies in all HTTP response packets. If this command is not executed, the device rewrites only the Set-Cookie in the first response packet of a connection.

If the sticky method is cookie insert, use this command to insert cookies to all HTTP response packets. If this command is not executed, the device inserts only the Set-Cookie to the first response packet of a connection.

If the sticky method is HTTP passive, use this command to generate sticky entries from all HTTP response packets. If this command is not executed, the device generates sticky entries only from the first response packet of a connection.

Examples

Enable checking for all packets in the HTTP cookie sticky group **sg3**.

```
<Sysname> system-view
```

```
[Sysname] sticky-group sg3 type http-cookie
[Sysname-sticky-http-cookie-sg3] check all-packet
```

check-url

Use **check-url** to configure a URL regular expression to match URLs for an HTTP passive LB probe template.

Use **undo check-url** to remove the URL regular expression configuration.

Syntax

check-url *url*

undo check-url *url*

Default

No URL regular expression is configured.

Views

HTTP passive LB probe template view

Predefined user roles

network-admin

context-admin

Parameters

url: Specifies a URL regular expression, a case-insensitive string of 1 to 255 characters. The string cannot contain question marks (?).

Usage guidelines

If an HTTP request carries one of the specified URLs, the device examines whether a URL error occurs in the HTTP response.

You can configure a maximum of 10 URL regular expressions for one HTTP passive LB probe template.

Examples

Configure **www.abc.com** as a matching URL for HTTP passive LB probe template **tplt**.

```
<Sysname> system-view
[Sysname] loadbalance probe-template http-passive tplt
[Sysname-lbpt-http-passive-tplt] check-url www.abc.com
```

class

Use **class** to specify an LB action for the specified LB class.

Use **undo class** to delete an LB class.

Syntax

class *class-name* [**insert-before** *before-class-name* | **insert-after** [*after-class-name*]] **action** *action-name*

undo class *class-name*

Default

No LB action is specified for the LB class.

Views

LB policy view

Predefined user roles

network-admin

context-admin

Parameters

class-name: Specifies an LB class by its name, a case-insensitive string of 1 to 63 characters.

insert-before: Inserts the target class before an LB class (which must already be referenced by the current LB policy).

before-class-name: Specifies an LB class by its name, a case-insensitive string of 1 to 63 characters.

insert-after: Inserts the target class after an LB class (which must already be referenced by the current LB policy).

after-class-name: Specifies an LB class by its name, a case-insensitive string of 1 to 63 characters.

action-name: Specifies an LB action by its name, a case-insensitive string of 1 to 63 characters.

Usage guidelines

This command sets an LB action for packets matching the specified LB class.

If you specify both the **insert-before** and **insert-after** keywords, the command inserts the target LB class after all LB classes.

You can specify an LB action for different LB classes.

A DNS LB policy can reference DNS LB actions only; a generic LB policy can reference generic LB classes and generic LB actions only. This rule does not apply to HTTP LB policies.

Examples

Specify the LB action **lba1** for the LB class **lbc1** in the generic LB policy **lbp1**, and insert **lbc1** before the LB class **lbc0**.

```
<Sysname> system-view
[Sysname] loadbalance policy lbp1 type generic
[Sysname-lbp-generic-lbp1] class lbc1 insert-before lbc0 action lba1
```

compression level

Use **compression level** to set the compression level for response packets.

Use **undo compression level** to restore the default.

Syntax

compression level *level*

undo compression level

Default

The compression level for response packets is 1.

Views

HTTP-compression parameter profile view

Predefined user roles

network-admin

context-admin

Parameters

level: Specifies the compression level in the range of 1 to 9. A larger value indicates a lower compression speed and a higher compression ratio.

Examples

Create the HTTP-compression parameter profile **pa1**, and set the compression level to 6.

```
<Sysname> system-view
[Sysname] parameter-profile pa1 type http-compress
[Sysname-para-http-compress-pa1] compression level 6
```

connection-limit max (link group member view)

Use **connection-limit max** to set the maximum number of connections of a link group member.

Use **undo connection-limit max** to restore the default.

Syntax

connection-limit max *max-number*

undo connection-limit max

Default

The maximum number of connections of a link is 0, which means the number is not limited.

Views

Link group member view

Predefined user roles

network-admin

context-admin

Parameters

max-number: Specifies the maximum number of connections, in the range of 0 to 4294967295. If the value of this argument takes 0, the number is not limited.

Examples

Set the maximum number of connections of the link group member **lk1** to 10000.

```
<Sysname> system-view
[Sysname] loadbalance link-group lg
[Sysname-lb-lgroup-lg] link lk1
[Sysname-lb-lgroup-lg-#member#-lk1] connection-limit max 10000
```

connection-limit max (link view)

Use **connection-limit max** to set the maximum number of connections of a link.

Use **undo connection-limit max** to restore the default.

Syntax

connection-limit max *max-number*

undo connection-limit max

Default

The maximum number of connections of a link is 0, which means the number is not limited.

Views

Link view

Predefined user roles

network-admin

context-admin

Parameters

max-number: Specifies the maximum number of connections, in the range of 0 to 4294967295. If the value of this argument takes 0, the number is not limited.

Usage guidelines

This command takes effect only on new sessions and does not take effect on existing sessions.

Examples

Set the maximum number of connections of the link **lk** to 10000.

```
<Sysname> system-view
[Sysname] loadbalance link lk
[Sysname-lb-link-lk] connection-limit max 10000
```

connection-limit max (real server view)

Use **connection-limit max** to set the maximum number of connections of a real server.

Use **undo connection-limit max** to restore the default.

Syntax

connection-limit max *max-number*

undo connection-limit max

Default

The maximum number of connections of a real server is 0, which means the number is not limited.

Views

Real server view

Predefined user roles

network-admin

context-admin

Parameters

max-number: Specifies the maximum number of connections, in the range of 0 to 4294967295. If the value of this argument takes 0, the number is not limited.

Usage guidelines

This command takes effect only on new sessions and does not take effect on existing sessions.

Examples

Set the maximum number of connections of the real server **rs** to 10000.

```
<Sysname> system-view
[Sysname] real-server rs
[Sysname-rserver-rs] connection-limit max 10000
```

connection-limit max (server farm member view)

Use **connection-limit max** to set the maximum number of connections of a server farm member.

Use **undo connection-limit max** to restore the default.

Syntax

connection-limit max *max-number*

undo connection-limit max

Default

The maximum number of connections of a link is 0, which means the number is not limited.

Views

Server farm member view

Predefined user roles

network-admin

context-admin

Parameters

max-number: Specifies the maximum number of connections, in the range of 0 to 4294967295. If the value of this argument takes 0, the number is not limited.

Examples

Set the maximum number of connections of the server farm member **rs1** to 10000.

```
<Sysname> system-view
[Sysname] server-farm sf
[Sysname-sfarm-sf] real-server rs1 port 80
[Sysname -sfarm-sf-#member#-rs1-port-80] connection-limit max 10000
```

connection-limit max (virtual server view)

Use **connection-limit max** to set the maximum number of connections of a virtual server.

Use **undo connection-limit max** to restore the default.

Syntax

connection-limit max *max-number*

undo connection-limit max

Default

The maximum number of connections of a virtual server is 0, which means the number is not limited.

Views

Virtual server view

Predefined user roles

network-admin

context-admin

Parameters

max-number: Specifies the maximum number of connections, in the range of 0 to 4294967295. If the value of this argument takes 0, the number is not limited.

Usage guidelines

This command takes effect only on new sessions and does not take effect on existing sessions.

Examples

Set the maximum number of connections for the IP-type virtual server **vs3** to 10000.

```
<Sysname> system-view
[Sysname] virtual-server vs3 type ip
[Sysname-vs-ip-vs3] connection-limit max 10000
```

connection-sync enable (transparent DNS proxy view)

Use **connection-sync enable** to enable session extension information synchronization for a transparent DNS proxy.

Use **undo connection-sync enable** to disable session extension information synchronization for a transparent DNS proxy.

Syntax

connection-sync enable

undo connection-sync enable

Default

Session extension information synchronization is disabled for a transparent DNS proxy.

Views

Transparent DNS proxy view

Predefined user roles

network-admin

context-admin

Usage guidelines

This command can back up session information to ensure service continuity during a master and backup switchover in hot backup mode.

Examples

Enable session extension information synchronization for the transparent DNS proxy **dns_proxy1**.

```
<Sysname>system-view
[Sysname] loadbalance dns-proxy dns-proxy1
[Sysname-lb-dp-udp-dns-proxy1] connection-sync enable
```

connection-sync enable (virtual server view)

Use **connection-sync enable** to enable session extension information synchronization for a virtual server.

Use **undo connection-sync enable** to disable session extension information synchronization for a virtual server.

Syntax

connection-sync enable

undo connection-sync enable

Default

Session extension information synchronization is disabled for a virtual server.

Views

Virtual server view

Predefined user roles

network-admin

context-admin

Usage guidelines

This command is not supported by the virtual servers of the HTTP type.

Examples

Enable session extension information synchronization for the IP-type virtual server **vs3**.

```
<Sysname>system-view
[Sysname] virtual-server vs3 type ip
[Sysname-vs-ip-vs3] connection-sync enable
```

content (HTTP content sticky group view)

Use **content** to configure the HTTP entity sticky method.

Use **undo content** to delete the HTTP entity sticky method.

Syntax

content [**offset** *offset*] [**start** *start-string*] [**end** *end-string* | **length** *length*]

undo content

Default

No sticky methods exist.

Views

HTTP entity sticky group view

Predefined user roles

network-admin

context-admin

Parameters

offset *offset*: Specifies the offset value of the entity based on the start of the HTTP packet, in the range of 0 to 1000 bytes. The default is 0.

start *start-string*: Specifies the regular expression that marks the start of the entity, a case-sensitive string of 1 to 127 characters starting from the *offset* value. The string cannot contain question marks (?).

end *end-string*: Specifies the regular expression that marks the end of the entity, a case-sensitive string of 1 to 127 characters starting from the *start-string* value. The string cannot contain question marks (?).

length *length*: Specifies the length of the entity, in the range of 0 to 1000 bytes. The default is 0, which indicates all lengths.

Usage guidelines

Use this command to obtain the HTTP entity information used to generate sticky entries based on the *offset*, *start-string*, *end-string*, and *length* values. The *start-string* and *end-string* values are not included in the sticky entry information.

The HTTP entity sticky method applies only to contents within the entity. The HTTP entity sticky method does not apply to chunk and multipart entity content.

The HTTP entity sticky method is not supported by the virtual servers of the fast HTTP type.

Examples

Configure the HTTP entity sticky method for the HTTP entity sticky group **sg2**: Starting from the 30th byte of start of the HTTP packet, use the 20-byte HTTP entity with **abc** as the start string to generate sticky entries.

```
<Sysname> system-view
[Sysname] sticky-group sg2 type http-content
[Sysname-sticky-http-content-sg2] content offset 30 start abc length 20
```

content (HTTP passive sticky group view)

Use **content** to configure the HTTP passive entity sticky method.

Use **undo content** to delete the HTTP passive entity sticky method.

Syntax

content { **get** | **match** } *id* **start** *start-string* { **end** *end-string* | **length** *length* }

undo content { **get** | **match** } *id*

Default

No sticky methods exist.

Views

HTTP passive sticky group view

Predefined user roles

network-admin

context-admin

Parameters

get: Obtains the specified string in the HTTP response entity, which is used to generate a sticky entry.

match: Obtains the specified string in the HTTP request entity, which is used to match a sticky entry.

id: Specifies the string ID in the range of 1 to 4.

start *start-string*: Specifies the regular expression that marks the start of the entity, a case-sensitive string of 1 to 127 characters. The string cannot contain question marks (?).

end *end-string*: Specifies the regular expression that marks the end of the entity, a case-sensitive string of 1 to 127 characters starting from the *start-string* value. The string cannot contain question marks (?).

length *length*: Specifies the length of the entity, in the range of 0 to 1000 bytes. The default is 0, which indicates all lengths.

Usage guidelines

The *start-string* and *end-string* values are not included in the sticky entry information.

Both the **content get** and **content match** commands are required for an HTTP passive sticky method.

The device obtains the content information of an incoming HTTP request based on the **content match** command and obtains the content information of an incoming HTTP response based on the **content get** command. If the content information of the HTTP request matches the content information of the HTTP response, the device generates a sticky entry based on the content information of the HTTP response. Subsequent HTTP requests that match the sticky entry are forwarded according to the sticky entry.

The following rules apply to use of the **content match** and **content get** commands:

- You can execute a maximum of four **content get** commands and four **content match** commands for one HTTP passive sticky method.
- A number of *n* strings that are obtained based on *n* **content get** commands generates 2^n-1 strings in ascending order of string IDs. If the string obtained based on the **content match** command matches any one of these generated strings, the match is successful.
- A number of *n* strings that are obtained based on *n* **content match** commands combine as one string in ascending order of string IDs.

For example, three **content get** commands are executed with string IDs 1, 2, and 3. The device obtains three strings a, b, and c in the HTTP response header, generates seven strings a, b, c, ab, ac, bc, and abc, and generates seven sticky entries. Then, three **content match** commands are executed with string IDs 2, 3, and 4. The device obtains three strings a, b, and c in the HTTP request header and generates one string abc. If the string matches one of the seven strings, the device generates a sticky entry based on the string abc. Subsequent HTTP requests that match the sticky entry are forwarded according to the sticky entry.

Examples

Configure the HTTP passive sticky method for the HTTP passive sticky group **sg2**: Obtain the 20-byte HTTP entity string starting with **abc** in the HTTP response. If the string matches the 20-byte HTTP entity string starting with **xxx** in the HTTP request, the device generates a sticky entry based on the string obtained from the HTTP response.

```
<Sysname> system-view
[Sysname] sticky-group sg2 type http-passive
[Sysname-sticky-http-passive-sg2] content get 1 start abc length 20
[Sysname-sticky-http-passive-sg2] content match 1 start xxx length 20
```

Related commands

display sticky-group

header (HTTP passive sticky group view)

content length-threshold

Use **content length-threshold** to set the minimum length of HTTP response content for compression.

Use **undo content length-threshold** to restore the default.

Syntax

content length-threshold *length*

undo content length-threshold

Default

The minimum length of HTTP response content for compression is 1024 bytes.

Views

HTTP-compression parameter profile view

Predefined user roles

network-admin

context-admin

Parameters

length: Specifies the minimum length of HTTP response content for compression, in the range of 0 to 4294967295 bytes.

Usage guidelines

If an HTTP response packet contains the Content-Length header, the packet content is compressed only when its length reaches the minimum length of HTTP response content for compression. If the HTTP response packet does not contain the Content-Length header, the configuration does not take effect. The packet content is compressed regardless of its length.

Examples

Create the HTTP-compression parameter profile **http1**, and set the minimum length of HTTP response content for compression to 2000 bytes.

```
<Sysname> system-view
[Sysname] parameter-profile http1 type http-compression
[Sysname-para-http-compression-http1] content length-threshold 2000
```

content maxparse-length

Use **content maxparse-length** to set the maximum length of HTTP entities that can be parsed.

Use **undo content maxparse-length** to restore the default.

Syntax

content maxparse-length *length*

undo content maxparse-length

Default

The maximum length of HTTP entities that can be parsed is 4096.

Views

HTTP parameter profile view

Predefined user roles

network-admin

context-admin

Parameters

length: Specifies the maximum length of HTTP entities that can be parsed, in the range of 1 to 65535 bytes.

Usage guidelines

This command is not supported by the virtual servers of the fast HTTP type.

Examples

Set the maximum length of HTTP entities that can be parsed to 8192 for the HTTP parameter profile **pp1**.

```
<Sysname> system-view
[Sysname] parameter-profile pp1 type http
[Sysname-para-http-pp1] content maxparse-length 8192
```

content request-max-length

Use **content request-max-length** to set the maximum size of the HTTP content.

Use **undo content request-max-length** to restore the default.

Syntax

content request-max-length *length*

undo content request-max-length

Default

The size of the HTTP content is not limited.

Views

HTTP parameter profile view

Predefined user roles

network-admin

context-admin

Parameters

length: Specifies the maximum size of the HTTP content, in the range of 1 to 4294967295 bytes.

Usage guidelines

If the size of the HTTP content in an HTTP request exceeds the specified maximum size, the device discards the HTTP request.

Examples

Set the maximum size of the HTTP content to 1000 for the HTTP parameter profile **h1**.

```
<Sysname> system-view
[Sysname] parameter h1 type http
[Sysname-para-http-h1] content request-max-length 1000
```

content rewrite

Use **content rewrite** to rewrite the content of HTTP responses.

Use **undo content rewrite** to restore the default.

Syntax

content rewrite value *value* **replace** *replace-string*

undo content rewrite

Default

The content of HTTP responses is not rewritten.

Views

HTTP LB action view

Predefined user roles

network-admin

context-admin

Parameters

value *value*: Specifies the HTTP packet content to be rewritten, a case-sensitive string of 1 to 127 characters. The string cannot contain question marks (?).

replace *replace-string*: Specifies the content after rewrite, a case-sensitive string of 1 to 127 characters.

Usage guidelines

This command applies only to the HTTP response packets in the format of text/*.

The rewrite operation is not performed in either of the following situations:

- A regular expression is used to match the content before rewrite, and the content before rewrite exceeds 4096 bytes in size.
- The content after rewrite exceeds 4096 bytes in size.

If you specify the *replace-string* argument as %[1-9], the matching packet content *value* will be replaced by the content in the corresponding pair of brackets. For example, if you execute the **content rewrite value** (Wel)(co)(me) **replace** %2 command, the content **Welcome** will be replaced by the content **co** in the second pair of brackets.

If you execute the **content rewrite** command multiple times, the most recent configuration takes effect.

Examples

Create the HTTP LB action named **replace**, and replace the content **2000::1** in HTTP response packets with **2.3.4.5**.

```
<Sysname> system-view
[Sysname] loadbalance action replace type http
[Sysname-lba-http-replace] content rewrite value 2000::1 replace 2.3.4.5
```

cookie (protection rule view)

Use **cookie** to configure a cookie-based protection threshold.

Use **undo cookie** to restore the default.

Syntax

cookie *cookie-name* **request-threshold** *threshold*

undo cookie

Default

No cookie-based protection threshold is configured.

Views

Protection rule view

Predefined user roles

network-admin

context-admin

Parameters

cookie-name: Specifies an HTTP cookie by its name, a case-sensitive string of 1 to 63 characters. The cookie name cannot contain brackets ({ }, ( ), [ ], < >), at sign (@), comma (,), semicolon (;), colon (:), backslash (\), quotation mark ("), slash (/), question mark (?), equal sign (=), space character (SP), and horizontal tab (HT). Additionally, the cookie name cannot contain ASCII codes that are less than or equal to 31 and greater than or equal to 127.

request-threshold *threshold*: Specifies a request threshold in the range of 1 to 4294967295.

Usage guidelines

If the number of times that a user accesses a protected URL exceeds the request threshold during the protection period, the protection action is taken. The device determines whether requests belong to the same user based on the following elements:

- **Cookie**—Requests with the same cookie value for the cookie specified in this command belong to the same user.
- **Source IP address**—Requests with the same source IP address belong to the same user.

If you configure both a cookie-based request threshold and a source-IP-based request threshold, the protection action is taken when either threshold is exceeded.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

In protection rule 5, configure the cookie name as **jsessionid** and the request threshold as 2.

```
<Sysname> system-view
[Sysname] loadbalance protection-policy p1
[Sysname-lbpp-http-p1] rule 5
[Sysname-lbpp-http-p1-rule-5] cookie jsessionid request-threshold 2
```

Related commands

cookie (sticky group view)

Use **cookie** to configure the HTTP cookie sticky method.

Use **undo cookie** to restore the default.

Syntax

cookie { **get name** *cookie-name* [**offset** *offset*] [**start** *start-string*] [**end** *end-string* | **length** *length*] | { **insert** [**domain** *domain-name*] [**path** *path*] [**httponly**] [**secure**] | **rewrite** } [**name** *cookie-name*] [**httponly**] [**secure**] }

undo cookie { **get** | **insert** | **rewrite** }

Default

No HTTP cookie sticky methods exist.

Views

HTTP cookie sticky group view

Predefined user roles

network-admin

context-admin

Parameters

get: Specifies the cookie get sticky method that gets the Set-Cookie field in the HTTP response packets sent by the server.

cookie-name: Specifies an HTTP cookie by its name, a case-sensitive string of 1 to 63 characters.

offset *offset*: Specifies the offset value based on the start of the cookie value, in the range of 0 to 1000 bytes. The default is 0.

start *start-string*: Specifies the regular expression that marks the start of the cookie, a case-sensitive string of 1 to 127 characters starting from the *offset* value. The string cannot contain question marks (?).

end *end-string*: Specifies the regular expression that marks the end of the cookie, a case-sensitive string of 1 to 127 characters starting from the *start-string* value. The string cannot contain question marks (?).

length *length*: Specifies the length of the cookie, in the range of 0 to 1000 bytes. The default is 0, which indicates all lengths.

insert: Specifies the cookie insert sticky method that inserts the Set-Cookie field to the HTTP response packets sent by the server.

rewrite: Specifies the cookie rewrite sticky method that rewrites the Set-Cookie field in the HTTP response packets sent by the server.

name *cookie-name*: Specifies an HTTP cookie by its name, a case-sensitive string of 1 to 63 characters. The default name is X-LB.

domain *domain-name*: Specifies a domain name indicating the hosts to which the cookie will be sent, a case-sensitive string of 1 to 255 characters. If you do not specify this option, the cookie will be sent to only the host where it is created.

path *path*: Specifies a path indicating the paths to which the cookie will be sent, a case-sensitive string of 1 to 255 characters. If you do not specify this option, the cookie will be sent to every path (the root directory **/** applies).

httponly: Specifies that the cookie cannot be accessed by scripts. If you do not specify this keyword, the cookie can be accessed by scripts.

secure: Specifies that the cookie can be transmitted over only HTTPS connections. If you do not specify this keyword, the cookie can be transmitted over any connections.

Usage guidelines

Use the **cookie get** command to obtain the HTTP cookie information used to generate sticky entries based on the *offset*, *start-string*, *end-string*, and *length* values. The *start-string* and *end-string* values are not included in the sticky entry information.

If the sticky method is cookie rewrite, the Set-Cookie field of the specified cookie must be available in the HTTP response packets sent by the server. The system modifies only the cookie name and value in the Set-Cookie field without modifying other attributes such as Expires.

If the sticky method is cookie insert or cookie rewrite and the timeout timer for sticky entries is 0, the system adds the Expires field after the inserted or rewritten value. If the HTTP response packets sent by the server carry this attribute, the load balancing module does not modify the attribute. Instead, it adds the user-configured Expires information after the value. As a best practice, do not carry any timeout attribute in the Set-Cookie header on the server when you configure the cookie rewrite sticky method.

The **domain** *domain-name* option specifies the hosts to which the cookie will be sent. Suppose a client can visit hosts **example.com**, **www.example.com**, and **www.corp.example.com**. If you specify **example.com** for the **domain** *domain-name* option, the client includes the cookie when sending HTTP requests to any one of the three hosts. If you specify **www.corp.example.com** for the **domain** *domain-name* option, the client includes the cookie only when sending HTTP requests to **www.corp.example.com**.

The **path** *path* option limits the scope of the cookie to a set of paths. Suppose a client can visit folders **www.example.com/a** and **www.example.com/b**. If you specify **www.example.com** for the **domain** *domain-name* option and **/a** for the **path** *path* option, the client includes the cookie only when sending HTTP requests to **www.example.com/a**.

The **httponly** option prevents attackers from obtaining cookie information by using scripts.

The **secure** option makes sure the cookie is transmitted over an HTTPS connection. For an HTTP connection, the cookie is not transmitted.

Examples

Configure the cookie get sticky method for the HTTP cookie sticky group **sg3**: Starting from the 10th byte of start of the HTTP packet, use the 32-byte HTTP cookie named **user** to generate sticky entries.

```
<Sysname> system-view
[Sysname] sticky-group sg3 type http-cookie
[Sysname-sticky-http-cookie-sg3] cookie get name user offset 10 length 32
```

Configure the cookie insert sticky method for the HTTP cookie sticky group **sg3**.

```
<Sysname> system-view
[Sysname] sticky-group sg3 type http-cookie
[Sysname-sticky-http-cookie-sg3] cookie insert
```

cookie secondary name

Use **cookie secondary name** to specify the name of the secondary cookie to be searched in the URI.

Use **undo cookie secondary name** to restore the default.

Syntax

cookie secondary name *value*

undo cookie secondary name

Default

The name of the secondary cookie to be searched in the URI is not specified.

Views

HTTP cookie sticky group view

Predefined user roles

network-admin

context-admin

Parameters

value: Specifies the name of the secondary cookie, a case-sensitive token string of 1 to 63 characters excluding brackets ({ }, ( ),[ ], < >), at sign (@), comma (,), semicolon (;), colon (:), backslash (\), quotation mark ("), slash (/), question mark (?), equal sign (=), space character (SP), and horizontal tab (HT). The character string also excludes ASCII codes that are less than or equal to 31 and greater than or equal to 127.

Usage guidelines

This command applies only to the cookie get sticky method. Executing this command enables the system to locate the secondary cookie in the URI when it fails to locate the specified cookie in the HTTP request packet header.

Examples

Specify the name of the secondary cookie to be searched in the URI as **sid** for the HTTP cookie sticky group **sg3**.

```
<Sysname> system-view
[Sysname] sticky-group sg3 type http-cookie
[Sysname-sticky-http-cookie-sg3] cookie secondary name sid
```

cost

Use **cost** to set the link cost for proximity calculation.

Use **undo cost** to restore the default.

Syntax

cost *cost-value*

undo cost

Default

The link cost for proximity calculation is 0.

Views

Link view

Predefined user roles

network-admin

context-admin

Parameters

cost-value: Specifies the link cost for proximity calculation, in the range of 0 to 10240.

Examples

Set the link cost for proximity calculation to 200 for the link **lk1**.

```
<Sysname> system-view
[Sysname] loadbalance link lk1
[Sysname-lb-link-lk1] cost 200
```

cost weight

Use **cost weight** to set the cost weight for proximity calculation.

Use **undo cost weight** to restore the default.

Syntax

cost weight *cost-weight*

undo cost weight

Default

The cost weight for proximity calculation is 100.

Views

Proximity view

Predefined user roles

network-admin

context-admin

Parameters

cost-weight: Specifies the cost weight for proximity calculation, in the range of 0 to 255. A larger value indicates a higher cost weight.

Examples

Set the cost weight for proximity calculation to 200.

```
<Sysname> system-view
[Sysname] loadbalance proximity
[Sysname-lb-proximity] cost weight 200
```

customlog content

Use **customlog content** to configure the content to be output by using the fast log output feature.

Use **undo customlog content** to restore the default.

Syntax

customlog content *content-value*

undo customlog content

Default

No content is output by using the fast log output feature.

Views

HTTP virtual server view

Predefined user roles

network-admin

context-admin

Parameters

content-value: Specifies the log content to be output, a case-sensitive string of 1 to 255 characters. To enter multiple variables, separate them by semicolons. The device supports the following variables:

- **%{is}**—Source IP address in HTTP requests.
- **%{ps}**—Source port number in HTTP requests.
- **%{id}**—Destination IP address in HTTP requests.
- **%{pd}**—Destination port number in HTTP requests.
- **%{sis}**—Source IP address in HTTP responses.
- **%{sps}**—Source port number in HTTP responses.
- **%{sid}**—Destination IP address in HTTP responses.
- **%{spd}**—Destination port number in HTTP responses.
- **%{vsn}**—Virtual server name.
- **%{sfn}**—Server farm name.
- **%{reqtmstamp}**—HTTP request timestamp.
- **%{uri}**—HTTP URI.
- **%{ver}**—HTTP version number.
- **%{args}**—HTTP access parameters.
- **%{method}**—HTTP request method.
- **%{xff}**—IP address of XFF (X-Forwarded-For).
- **%{ctype}**—Content-Type field in HTTP requests.
- **%{clen}**—Content-Length field in HTTP requests.
- **%{ref}**—Referer header field in HTTP requests.
- **%{ua}**—User-Agent header field in HTTP requests.
- **%{host}**—Host header field in HTTP requests.
- **%{path}**—Path in HTTP requests.
- **%{reqsz}**—HTTP request size in bytes.
- **%{reqtm}**—HTTP request duration in milliseconds. The duration is from time when the device receives an HTTP request to the time when the device receives the HTTP response.
- **%{rspclen}**—Content-Type field in HTTP responses.
- **%{reqsz}**—HTTP response size in bytes.
- **%{rsptm}**—HTTP response duration in milliseconds. The duration is from the time when the device receives an HTTP response to the time when the device finishes sending out the HTTP response.
- **%{stscode}**—HTTP response status code.
- **%{reqbsz}**—Body size of HTTP requests, in bytes.
- **%{rspbsz}**—Body size of HTTP responses received by the device from the server, in bytes.
- **%{rspsntbsz}**—Body size of HTTP responses sent from the device to the client, in bytes.
- **%{cookie_***cookie-name*—HTTP cookie. The cookie name cannot contain brackets ({ }, ( ), [ ], < >), at sign (@), comma (,), semicolon (;), colon (:), backslash (\), quotation mark ("), slash (/), question mark (?), equal sign (=), space character (SP), and horizontal tab (HT).

Additionally, the cookie name cannot contain ASCII codes that are less than or equal to 31 and greater than or equal to 127. You can specify multiple cookies.

Usage guidelines

After you execute this command, the device sends the specified content to the log host by using the fast log output feature.

Before executing this command, you must enable fast log output for load balancing and configure fast log output parameters.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

For HTTP virtual server **vs**, output the source IP address and source port number in HTTP requests by using the fast log output feature.

```
<Sysname> system-view
[Sysname] virtual-server vs type http
[Sysname-vs-http-vs] customlog content %{is};%{ps}
```

default dns-server-pool

Use **default dns-server-pool** to specify the default (primary) DNS server pool for a transparent DNS proxy.

Use **undo default dns-server-pool** to restore the default.

Syntax

default dns-server-pool *pool-name* [**sticky** *sticky-name*]

undo default dns-server-pool

Default

No default DNS server pool is specified for a transparent DNS proxy.

Views

Transparent DNS proxy view

Predefined user roles

network-admin

context-admin

Parameters

pool-name: Specifies a primary DNS server pool by its name, a case-insensitive string of 1 to 63 characters.

sticky *sticky-name*: Specifies a sticky group by its name, a case-insensitive string of 1 to 63 characters. If you do not specify a sticky group, the DNS server pool does not correspond to any sticky group.

Usage guidelines

If you execute the **default dns-server-pool** command multiple times, the most recent configuration takes effect.

Examples

Specify the primary DNS server pool **dns-pool1** and the sticky group **st1** for the transparent DNS proxy **dns-proxy1**.

```
<Sysname> system-view
[Sysname] loadbalance dns-proxy dns-proxy1
[Sysname-lb-dp-udp-dns-proxy1] default dns-server-pool dns-pool1 sticky st1
```

default link-group

Use **default link-group** to specify the default (primary) link group.

Use **undo default link-group** to restore the default.

Syntax

default link-group *link-group-name* [**backup** *backup-link-group-name*] [**sticky** *sticky-name*]

undo default link-group

Default

No default link group is specified.

Views

Link-IP virtual server view

Predefined user roles

network-admin

context-admin

Parameters

link-group-name: Specifies a primary link group by its name, a case-insensitive string of 1 to 63 characters.

backup *backup-link-group-name*: Specifies a backup link group by its name, a case-insensitive string of 1 to 63 characters.

sticky *sticky-name*: Specifies a sticky group by its name, a case-insensitive string of 1 to 63 characters.

Usage guidelines

When the primary link group is available (contains links), the virtual server forwards packets through the primary link group. When the primary link group is not available, the virtual server forwards packets through the backup link group.

Examples

Specify the primary link group **link1**, the backup link group **link2**, and the sticky group **sg1** for the link-IP-type virtual server **vs3**.

```
<Sysname> system-view
[Sysname] virtual-server vs3 type link-ip
[Sysname-vs-link-ip-vs3] default link-group link1 backup link2 sticky sg1
```

default server-farm

Use **default server-farm** to specify the default (primary) server farm.

Use **undo default server-farm** to restore the default.

Syntax

default server-farm *server-farm-name* [**backup** *backup-server-farm-name*] [**sticky** *sticky-name* [**backup** *backup-sticky-name*]]

undo default server-farm

Default

No default server farm is specified.

Views

Fast HTTP virtual server view

HTTP virtual server view

IP virtual server view

TCP virtual server view

UDP virtual server view

Predefined user roles

network-admin

context-admin

Parameters

server-farm-name: Specifies a primary server farm by its name, a case-insensitive string of 1 to 63 characters.

backup *backup-server-farm-name*: Specifies a backup server farm by its name, a case-insensitive string of 1 to 63 characters.

sticky *sticky-name*: Specifies a primary sticky group by its name, a case-insensitive string of 1 to 63 characters.

backup *backup-sticky-name*: Specifies a backup sticky group by its name, a case-insensitive string of 1 to 63 characters. This option is supported only by HTTP virtual servers and RADIUS virtual servers.

Usage guidelines

When the primary server farm is available (contains real servers), the virtual server forwards packets through the primary server farm. When the primary server farm is not available, the virtual server forwards packets through the backup server farm.

If you specify both a primary sticky group and a backup sticky group, the device generates both primary sticky entries and backup sticky entries. If packets do not match primary sticky entries, backup sticky entries will apply.

The device generates backup sticky entries for only the following sticky group combinations:

- RADIUS-type primary sticky group and port-address-type backup sticky group.
- HTTP cookie-type primary sticky group and port-address-type backup sticky group.
- HTTP cookie-type primary sticky group and HTTP passive-type backup sticky group.

Examples

Specify the primary server farm **sf**, the backup server farm **sfb**, and the sticky group **sg1** for the IP-type virtual server **vs3**.

```
<Sysname> system-view
[Sysname] virtual-server vs3 type ip
[Sysname-vs-ip-vs3] default server-farm sf backup sfb sticky sg1
```

default-class action

Use **default-class action** to specify the default LB action.

Use **undo default-class** to restore the default.

Syntax

default-class action *action-name*

undo default-class

Default

No default LB action is specified.

Views

LB policy view

Predefined user roles

network-admin

context-admin

Parameters

action-name: Specifies an LB action by its name, a case-insensitive string of 1 to 63 characters.

Usage guidelines

This command sets the default LB action for packets that fail to match any LB class.

A DNS LB policy can reference DNS LB actions only; a generic LB policy can reference generic LB actions only. This rule does not apply to HTTP LB policies.

Examples

Specify the default LB action **lba1** for the generic LB policy **lbp1**.

```
<Sysname> system-view
[Sysname] loadbalance policy lbp1 type generic
[Sysname-lbp-generic-lbp1] default-class action lba1
```

description

Use **description** to configure a description.

Use **undo description** to restore the default.

Syntax

description *text*

undo description

Default

No description is configured.

Parameters

text: Specifies a description, a case-sensitive string of 1 to 127 characters.

Examples

Configure the description **LB action LBA1** for the generic LB action **lba1**.

```
<Sysname> system-view
[Sysname] loadbalance action lba1 type generic
[Sysname-lba-generic-lba1] description LB action LBA1
```

destination-ip object-group

Use **destination-ip object-group** to specify a destination IP address object group for address translation.

Use **undo destination-ip object-group** to restore the default.

Syntax

destination-ip object-group *object-group-name*

undo destination-ip object-group

Default

All packets matching a virtual server are translated.

Views

SNAT global policy view

Predefined user roles

network-admin

context-admin

Parameters

object-group-name: Specifies a destination IP address object group by its name, a case-insensitive string of 1 to 31 characters.

Usage guidelines

If you specify a destination IP address object group, the device performs SNAT on only packets with a matching destination IP address. For information about configuring an IP address object group, see object group configuration in *Security Configuration Guide*.

Examples

Specify destination IP address object group **obj1** for SNAT global policy **sn1**.

```
<Sysname> system-view
[Sysname] loadbalance snat-global-policy sn1
[Sysname-lb-snat-gp-sn1] destination-ip object-group obj1
```

Table 1 Command output

Field	Description
LB action	LB action name.
Description	Description for the LB action.
Type	LB action type: • DNS. • Generic. • HTTP. • Link-generic. • RADIUS.
State	LB action state: • Active. • Inactive.
Forward type	Packet forwarding mode of the LB action: • **Drop**—Discards packets. • **Drop(FIN-close)**—Closes TCP connections by sending FIN packets (applicable to generic and HTTP LB actions). • **Drop(RST-close)**—Closes TCP connections by sending RST packets (applicable to generic and HTTP LB actions). • **Forward**—Forwards packets. • **Server farm**—Forwards packets through the server farm (applicable to generic, HTTP, and RADIUS LB actions). • **Link group**—Forwards packets through the link group (applicable to link-generic LB actions). • **DNS server pool**—Forwards packets through the DNS server pool (applicable to DNS LB actions). • **Skip current DNS proxy** (applicable to DNS LB actions).

Field	Description
	• **Redirect**—Redirects packets. • **Response**—Responds to client requests by using a file.
Server farm	Primary server farm name. **(in use)** indicates the server farm is in use. This field is displayed only when the packet forwarding mode is **server farm**.
Backup server farm	Backup server farm name. **(in use)** indicates the server farm is in use. This field is displayed only when the packet forwarding mode is **server farm**.
Link group	Default link group name. **(in use)** indicates the link group is in use.
Backup link group	Backup link group name. **(in use)** indicates the link group is in use.
Sticky	Primary sticky group name. This field is displayed only when the packet forwarding mode is **server farm** or **DNS server pool**.
Backup sticky	Backup sticky group name. This field is displayed only when the packet forwarding mode is **server farm** and the LB action type is **HTTP** or **RADIUS**.
IP ToS	ToS field value of IP packets.
Fallback-action	Action taken upon load balancing failure: • **None**—Does not take any action. • **Continue**—Matches the next rule. • **Response**—Responds to client requests by using a file. • **Drop(FIN-close)**—Closes TCP connections by sending FIN packets (applicable to generic and HTTP LB actions). • **Drop(RST-close)**—Closes TCP connections by sending RST packets (applicable to generic and HTTP LB actions).
Busy-action	Action taken upon busyness: • **Continue**—Matches the next rule. • **Force**—Assigns packets to links or DNS servers regardless of whether they are busy.
SSL client policy	SSL client policy name. This field is displayed for HTTP LB actions only.
Content rewrite	HTTP content rewrite configuration: • **Value**—Specifies the HTTP packet content to be rewritten. • **Replacement**—Specifies the content after rewrite. This field is displayed only for an HTTP-type LB action.
Redirect relocation	Redirection URL. This field is displayed only for HTTP-type LB actions.
Redirect return-code	Status code in the redirection packets. This field is displayed only for HTTP-type LB actions.
Header delete	Deletes the HTTP header. • **Name**—Name of the HTTP packet header. • **Direction**—Specifies HTTP requests, HTTP responses, or both. This field is displayed only when the **`header delete`** command is configured.
Header insert	Inserts the HTTP header. • **Name**—Name of the HTTP packet header. • **Value**—Content of the HTTP packet header. • **Direction**—Specifies HTTP requests, HTTP responses, or both. This field is displayed only when the **`header insert`** command is configured.
Header rewrite	Rewrites the HTTP header. • **Name**—Name of the HTTP packet header. • **Value**—Content of the HTTP packet header to be rewritten.

Field	Description
	• **Replacement**—Content after rewrite. • **Direction**—Specifies HTTP requests, HTTP responses, or both. This field is displayed only when the **header rewrite** command is configured.
SSL URL rewrite	Rewrites the URL in the Location header of HTTP response packets sent by the server. • **Value**—Regular expression for the location header URL. • **Clear port**—HTTP port number to be rewritten. • **SSL port**—SSL port number after rewrite. This field is displayed only when the **ssl url rewrite** command is configured.
DNS server pool	DNS server pool name. This field is displayed only when the packet forwarding mode is **DNS server pool**.
Response file	Responds to client requests by using an uncompressed file.
File name	Name of the uncompressed file.
URL	URL path used to match client requests.
Response zip file	Responds to client requests by using a compressed file.
Zip file name	Name of the compressed file.
Working path	Working path used to match client requests.
Raw file name	Response file used upon load balancing failure.
TCP payload rewrite	Rewrite the TCP payload: • **Value**—Content of the TCP packet header to be rewritten. • **Replacement**—Content after rewrite. • **Direction**—Specifies TCP requests, TCP responses, or both. This field is displayed only when the **payload rewrite** command is configured.

display loadbalance alg

Use **display loadbalance alg** to display the ALG status for all protocols.

Syntax

display loadbalance alg

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Examples

Display the ALG status for all protocols.

```
<Sysname> display loadbalance alg
LB ALG:
  DNS         : Enable
```

```
  FTP          : Enable
  H323         : Disabled
  ICMP-ERROR   : Enable
  ILS          : Disabled
  MGCP         : Disabled
  NBT          : Disabled
  PPTP         : Enable
  RSH          : Disabled
  RTSP         : Enable
  SCCP         : Disabled
  SIP          : Disabled
  SQLNET       : Disabled
  TFTP         : Disabled
  XDMCP        : Disabled
```

display loadbalance class

Use **display loadbalance class** to display LB class information.

Syntax

display loadbalance class [**name** *class-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

name *class-name*: Specifies an LB class by its name, a case-insensitive string of 1 to 63 characters. If you do not specify this option, the command displays information about all LB classes.

Examples

Display information about all LB classes.

```
<Sysname> display loadbalance class
LB class: lbc1
  Description:
  Type: HTTP
  Match type: Match-all
  Match rule:
    match 1 source ip address 1.2.3.0 24
    match 2 source ipv6 address 1::2
    match 3 cookie abc value 123
    match 4 header def value 12
    match 5 method ext xde
    match 6 method rfc CONNECT
    match 7 class cla2
```

```
    match 8 url 2q3
    match 9 acl ipv4 number 2000
    match 10 acl ipv6 number 2001
    match 11 acl ipv4 name aaa
    match 12 acl ipv6 name bbb
    match 13 isp name isp1

LB class: lbc2
  Description:
  Type: Generic
  Match type: Match-any
  Match rule:
    match 1 class cla2
    match 2 source ip address 1.2.23.0 24
    match 3 source ipv6 address 1::12
    match 4 acl ipv4 number 3000
    match 5 acl ipv6 number 3001
    match 6 acl ipv4 name ccc
    match 7 acl ipv6 name ddd
    match 8 isp name isp2
    match 9 payload orcl

LB class: lbc3
  Description:
  Type: Link-generic
  Match type: Match-any
  Match rule:
    match 1 class cla3
    match 2 source ip address 1.2.3.0 24
    match 3 source ipv6 address 1::12
    match 4 acl ipv4 number 3002
    match 5 acl ipv6 number 3003
    match 6 acl ipv4 name ccc
    match 7 acl ipv6 name ddd
    match 8 isp name isp2
    match 9 user u1
    match 10 user-group lb-group
    match 11 interface GE1/0/1

LB class: lbc4
  Description:
  Type: DNS
  Match type: Match-any
  Match rule:
    match 1 class cla2
    match 2 source ip address 1.2.3.0 24
    match 3 source ipv6 address 1::12
    match 4 acl ipv4 number 3002
```

```
    match 5 acl ipv6 number 3003
    match 6 acl ipv4 name ccc
    match 7 acl ipv6 name ddd
    match 8 destination ip address 1.2.3.0 24
    match 9 destination ipv6 address 1::12
    match 10 domain-name www.nsfocus.com.cn

LB class: lbc5
  Description:
  Type: MySQL
  Match type: Match-any
  Match rule:
    match 1 class cla2
    match 2 source ip address 1.2.3.0 24
    match 3 source ipv6 address 1::12
    match 4 acl ipv4 number 3002
    match 5 acl ipv6 number 3003
    match 6 acl ipv4 name ccc
    match 7 acl ipv6 name ddd
    match 8 sql select
```

Table 2 Command output

Field	Description
LB class	LB class name.
Description	Description for the LB class.
Type	LB class type: • DNS. • Generic. • HTTP. • Link-generic. • MySQL. • RADIUS.
Match type	Match type for the LB class: • **Match-all**—Requires matching all rules of the LB class. • **Match-any**—Requires matching any rule of the LB class.
Match rule	Match rules for the LB class.

display loadbalance connections

Use **display loadbalance connections** to display information about Layer 7 LB TCP connections.

Syntax

display loadbalance connections [**client-side**{ **ipv4** | **ipv6** } [**cs-client-ip** *ip-address* [**cs-client-port** *port-number*]] [**cs-server-ip** *ip-address* [**cs-server-port** *port-number*]] [**state** { **closed** | **close_wait** | **closing** | **established** | **fin_wait_1** | **fin_wait_2** | **last_ack** | **listening** | **syn_received** | **syn_sent** | **time_wait** }]] [**server-side** { **ipv4** | **ipv6** }

[**ss-client-ip** *ip-address* [**ss-client-port** *port-number*]] [**ss-server-ip** *ip-address* [**ss-server-port** *port-number*]] [**state** { **closed** | **close_wait** | **closing** | **established** | **fin_wait_1** | **fin_wait_2** | **last_ack** | **listening** | **syn_received** | **syn_sent** | **time_wait** }]] [**slot** *slot-number*] [**verbose**]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

client-side: Displays client-side connections.

server-side: Displays server-side connections.

ipv4: Specifies IPv4 connections.

ipv6: Specifies IPv6 connections.

cs-client-ip *ip-address*: Specifies a client by its IP address on the client side.

cs-client-port *port-number*: Specifies the port number of the client on the client side, in the range of 0 to 65535. 0 means any port number.

ss-client-ip *ip-address*: Specifies a client by its IP address on the server side.

ss-client-port *port-number*: Specifies the port number of the client on the server side, in the range of 0 to 65535. 0 means any port number.

cs-server-ip *ip-address*: Specifies a server by its IP address on the client side.

cs-server-port *port-number*: Specifies the port number of the server on the client side, in the range of 0 to 65535. 0 means any port number.

ss-server-ip *ip-address*: Specifies a server by its IP address on the server side.

ss-server-port *port-number*: Specifies the port number of the server on the server side, in the range of 0 to 65535. 0 means any port number.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays information about Layer 7 LB TCP connections for all member devices.

state { **closed** | **close_wait** | **closing** | **established** | **fin_wait_1** | **fin_wait_2** | **last_ack** | **listening** | **syn_received** | **syn_sent** | **time_wait** }: Specifies TCP connections by connection state. If you do not specify this parameter, the command displays information about TCP connections in each state.

verbose: Displays detailed information about TCP connections. If you do not specify this keyword, the command displays brief information.

Usage guidelines

If you do not specify any parameters, this command displays information about all Layer 7 LB TCP connections.

Examples

Display brief information about all Layer 7 LB TCP connections.

```
<Sysname> display loadbalance connections
```

```
Client side:                        State        Server side:                       State
192.168.56.1    <--> 8.8.8.8/80    ESTAB        192.168.56.1   <--> 2.2.2.2/80   ESTB
/50168                                          /1026
Any             <-->Any            CLOSED       192.168.56.1   <--> 2.2.2.2/80   TIMEWT
                                                /1027
Total sessions: 3
```

Display detailed information about all Layer 7 LB TCP connections.

```
<Sysname> display loadbalance connections verbose

Table 3 Command output

Field	Description
State	TCP connection state: • **LISTEN**. • **SYNSNT**—SYN_SENT. • **SYNRCV**—SYN_RECEIVED. • **ESTB**—ESTABLISHED. • **FINWT1**—FIN_WAIT_1.

Field	Description
	• **FINWT2**—FIN_WAIT_2. • **CLOWAT**—CLOSE_WAIT. • **CLOSING**. • **LASACK**—LAST_ACK. • **TIMEWT**—TIME_WAIT. • **CLOSED**. For more information about these states, see RFC 793.
Start time	Time when the TCP connection was established.

display loadbalance dns-cache

Use **display loadbalance dns-cache** to display DNS cache information.

Syntax

display loadbalance dns-cache [**vpn-instance** *vpn-instance-name*] [**domain-name** *domain-name*] [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command displays DNS cache information for the public network.

domain-name *domain-name*: Specifies a domain name, a case-insensitive string of 1 to 63 characters. If you do not specify this option, the command displays DNS cache information for all domain names.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays DNS cache information for all member devices.

Usage guidelines

DNS cache information records mappings between domain names and IP addresses.

Examples

Display all DNS cache information.

```
<Sysname> display loadbalance dns-cache
Slot 1:
Domain name: www.aaa.com
Aging time: 20 min
IPv4 addresses: 6.3.5.2
                4.5.6.3
                192.169.41.8
```

```
IPv6 addresses: 4:4:4::7

Domain name: www.bbb.com
Aging time: 20 min
IPv4 addresses: 5.5.5.5
                3.4.5.9
```

display loadbalance dns-listener

Use **display loadbalance dns-listener** to display DNS listener information.

Syntax

display loadbalance dns-listener [**name** *listener-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

name *listener-name*: Specifies a DNS listener by its name, a case-insensitive string of 1 to 63 characters. If you do not specify this option, the command displays information about all DNS listeners.

Usage guidelines

This command can display the service state, IPv4 address, port number, and fallback method.

Examples

Display information about the DNS listener **listener1**.

```
<Sysname> display loadbalance dns-listener name listener1
DNS listener name: listener1
  Service state: Enabled
  IPv4 address: 1.1.1.2
  Port: 53
  IPv6 address: --
  IPv6 Port: 53
  Fallback: Reject
  VPN instance:
```

Table 4 Command output

Field	Description
Service state	DNS listener state: • Enabled. • Disabled.
IPv4 address	IPv4 address of the DNS listener.
Port	Port number of the DNS listener.

Field	Description
IPv6 address	IPv6 address of the DNS listener.
IPv6 Port	IPv6 port number of the DNS listener.
Fallback	Processing method when the DNS listener fails to find the server to respond to the DNS request: • **dns-proxy**—Responds to the DNS request through the DNS proxy. • **No-response**—Does not respond to the DNS request. • **Reject**—Sends a DNS reject packet.
VPN instance	VPN instance to which the DNS listener belongs.

display loadbalance dns-listener statistics

Use **display loadbalance dns-listener statistics** to display DNS listener statistics.

Syntax

display loadbalance dns-listener statistics [**name** *dns-listener-name*] [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

name *dns-listener-name*: Specifies a DNS listener by its name, a case-insensitive string of 1 to 63 characters. If you do not specify this option, the command displays statistics for all DNS listeners.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays DNS listener statistics for all member devices.

Examples

Display statistics for the DNS listener **dl**.

```
<Sysname> display loadbalance dns-listener statistics name dl
DNS listener: dl
Total:
  Received requests: 100
  Received valid requests: 70
  Unresponded requests: 10
  Rejected requests: 20
  Proxy requests: 0
  ------------------------------------------------
  RCVR - Received requests, RVR - Received valid requests,
  UR - Unresponded requests, RJTR - Rejected requests, PR - Proxy requests
  Type        RCVR        RVR       UR          RJTR         PR
```

```
A           50          50          0           0           0
AAAA        0           0           0           0           0
MX          10          5           5           0           0
NS          20          5           5           10          0
CNAME       10          5           0           5           0
SOA         10          5           0           5           0
PTR         0           0           0           0           0
TXT         10          5           0           5           0
SRV         0           0           0           0           0
```

Table 5 Command output

Field	Description
Proxy requests	Number of responses to DNS requests through transparent DNS proxies.
Type	DNS request type: • **A**—IPv4 host address. • **AAAA**—IPv6 host address. • **CNAME**—Canonical name. • **MX**—Mail exchanger. • **NS**—Name server. • **PTR**—Pointer. • **SOA**—Start of authority. • **SRV**—Service. • **TXT**—Text.

display loadbalance dns-map

Use **display loadbalance dns-map** to display DNS mapping information.

Syntax

display loadbalance dns-map [**name** *dns-map-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

dns-map-name: Specifies a DNS mapping by its name, a case-insensitive string of 1 to 63 characters. If you do not specify this argument, the command displays information about all DNS mappings.

Usage guidelines

Use this command to view the service state, domain name, and virtual server pool for DNS mappings.

Examples

Display information about the DNS mapping **dm1**.

```
<Sysname> display loadbalance dns-map name dm1
DNS mapping name: dm1
  Service state: Enabled
  TTL: 3600s
  Domain name list: www.nsfocus.domain.com.cn
  Virtual server pool: pool1
```

Table 6 Command output

Field	Description
Service state	DNS mapping state: • Enabled. • Disabled.
TTL	TTL, in seconds, to cache DNS records for DNS responses.
Domain name list	Domain name of the DNS mapping.
Virtual server pool	Virtual server pool used by the DNS mapping.

display loadbalance dns-map statistics

Use **display loadbalance dns-map statistics** to display DNS mapping statistics.

Syntax

display loadbalance dns-map statistics [**name** *dns-map-name*] [**slot** *slot-number*]

Views

Any view

context-operator

Parameters

name *dns-map-name*: Specifies a DNS mapping by its name, a case-insensitive string of 1 to 63 characters. If you do not specify this option, the command displays statistics for all DNS mappings.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays DNS mapping statistics for all member devices.

Examples

Display statistics for the DNS mapping **dm**.

```
<Sysname> display loadbalance dns-map statistics name dm
DNS map: dm
Matched DNS requests: 100
```

Table 7 Command output

Field	Description
DNS map	DNS mapping name.
Matched DNS requests	Number of DNS requests matching the DNS mapping.

display loadbalance dns-proxy

Use **display loadbalance dns-proxy** to display transparent DNS proxy information.

Syntax

display loadbalance dns-proxy [**brief** | **name** *dns-proxy-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

brief: Displays brief transparent DNS proxy information. If you do not specify this keyword, the command displays detailed transparent DNS proxy information.

name *dns-proxy-name*: Specifies a transparent DNS proxy by its name, a case-insensitive string of 1 to 63 characters. If you do not specify this option, the command displays information about all transparent DNS proxies.

Examples

Display brief information about all transparent DNS proxies.

```
<Sysname> display loadbalance dns-proxy brief
DNS proxy     State       Type    VPN instance    IP address     Port
dns-proxy1    Active      UDP                     1.2.3.0/24     53
dns-proxy2    Inactive    UDP                     --             5353
```

Display information about transparent DNS proxy **dns-proxy1**.

```
<Sysname> display loadbalance dns-proxy name dns-proxy1
DNS proxy: dns-proxy1
  Type: UDP
  State: Active
  Service state: Enabled
  VPN instance:
  IPv4 address: 1.2.3.0/24
  IPv6 address: --
  Port: 53
  DNS server pool: dns-pool1
  Sticky: st
```

```
LB policy: dns-policy1
Connection synchronization: Enabled
Sticky synchronization: Enabled
Bandwidth busy protection: Disabled
```

Table 8 Command output

Field	Description
DNS proxy	Transparent DNS proxy name.
Type	Transparent DNS proxy type. Only UDP is supported.
State	Transparent DNS proxy state: • **Active**—The transparent DNS proxy is available. • **Inactive**—The transparent DNS proxy is unavailable for any reason except that the transparent DNS proxy feature is disabled. • **Inactive (disabled)**—The transparent DNS proxy is unavailable because the transparent DNS proxy feature is disabled.
Service state	Transparent DNS proxy state: **Enabled** or **Disabled**.
DNS server pool	Default DNS server pool used by the transparent DNS proxy.
Sticky	Sticky group used by the transparent DNS proxy.
Connection synchronization	Session extension information synchronization state: **Enabled** or **Disabled**.
Sticky synchronization	Sticky entry synchronization state: **Enabled** or **Disabled**.
Bandwidth busy protection	Link protection state: **Enabled** or **Disabled**.

display loadbalance dns-proxy statistics

Use **display loadbalance dns-proxy statistics** to display transparent DNS proxy statistics.

Syntax

display loadbalance dns-proxy statistics [**name** *dns-proxy-name*] [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

name *dns-proxy-name*: Specifies a transparent DNS proxy by its name, a case-insensitive string of 1 to 63 characters. If you do not specify this option, the command displays statistics for all transparent DNS proxies.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays transparent DNS proxy statistics for all member devices.

Examples

Display statistics for the transparent DNS proxy **dns-proxy1**.

```
<Sysname> display loadbalance dns-proxy statistics name dns-proxy1
DNS proxy: dns-proxy1
Received requests: 100
Dropped requests: 2
Received responses: 98
Dropped responses: 0
```

Table 9 Command output

Field	Description
DNS proxy	Transparent DNS proxy name.
Received requests	Number of DNS requests received by the transparent DNS proxy.
Dropped requests	Number of DNS requests dropped by the transparent DNS proxy.
Received responses	Number of DNS responses received by the transparent DNS proxy.
Dropped responses	Number of DNS responses dropped by the transparent DNS proxy.

display loadbalance dns-query

Use **display loadbalance dns-query** to display information about the domain names queried by external link proxy.

Syntax

display loadbalance dns-query [**vpn-instance** *vpn-instance-name*] [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command displays domain name information for the public network.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays domain name information for all member devices.

Examples

Display information about the domain names queried by external link proxy.

```
<Sysname> display loadbalance dns-query
Slot 1:
```

```
VPN instance: vpn1
  Domain name      DNS server
  www.a.com        1.2.3.4
  www.b.com        2.2.3.4
Slot 2:
VPN instance: vpn2
  Domain name      DNS server
  www.c.com        3.2.3.4
  www.d.com        4.2.3.4
```

Table 10 Command output

Field	Description
Domain name	Domain name being queried.
DNS server	IP address of the DNS server.

display loadbalance dns-server

Use **display loadbalance dns-server** to display DNS server information or DNS server pool member information.

Syntax

display loadbalance dns-server [**brief** | **name** *dns-server-name*]

display loadbalance dns-server dns-server-pool *dns-server-pool-name* [**name** *dns-server-name* **port** *port-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

brief: Displays brief DNS server information. If you do not specify this keyword, the command displays detailed DNS server information.

name *dns-server-name*: Displays detailed information about a DNS server. The *dns-server-name* argument specifies a DNS server by its name, a case-insensitive string of 1 to 63 characters.

dns-server-pool *dns-server-pool-name*: Displays information about members of a DNS server pool. The *dns-server-pool-name* argument specifies a DNS server pool by its name, a case-insensitive string of 1 to 63 characters.

dns-server *dns-server-name* **port** *port-number*: Displays information about a DNS server pool member. The *dns-server-name* argument specifies a DNS server pool member by its name, a case-insensitive string of 1 to 63 characters. The *port-number* argument specifies the port number of the DNS server pool member, in the range of 0 to 65535. If you do not specify this option, the command displays information about all members of a DNS server pool.

Usage guidelines

If you do not specify any parameter, the command displays detailed information about all DNS servers.

If the device obtains multiple DNS server IP addresses, it uses the smallest available IP address.

If no health monitoring method is specified, the device determines that all obtained DNS server IP addresses are available. If a health monitoring method is specified, the device determines that only the DNS server IP addresses that pass health monitoring are available.

Examples

Display brief information about all DNS servers.

```
<Sysname> display loadbalance dns-server brief
(*) – Auto-alloc address using
DNS server   Address             Port    Link         State         DNS server pool
ds1          10.150.100.100(*)   0       link1        Active        dns_pool
ds2          20.150.100.100      5353    link2        Probe-failed  dns_pool
ds3          --                  0       link3        Inactive      dns_pool
ds4          --(*)               0       link3        Inactive      dns_pool
```

Display detailed information about DNS server **ds1**.

```
<Sysname> display loadbalance dns-server name ds1
(*) – Auto-alloc address using
dns-server: ds1
  Description:
  State: Active
  VPN instance: --
  Auto-alloc address: Enabled
  IPv4 address: 10.150.100.100(*)
                10.160.100.1
                10.154.60.2
  IPv6 address: --

  Port: 0 (port number in original packet)

  Weight: 100
  Priority: 4
  Probe information:
    Probe success criteria: All
    Probe method      State
    t4                Succeeded
```

Display information about all members of DNS server pool **dsp1**.

```
<Sysname> display loadbalance dns-server dns-server-pool dsp1
DNS server pool: dsp1
  dns-server: ds1
    Description: DNS server 1
    Parent state: Inactive
    State: Inactive
    Port: 0 (port number in original packet)
    Weight: 2
```

```
  Priority: 2
  Probe success criteria: All
    Probe method                    State
    icmp                            Failed

dns-server: rs2
  Description: DNS server 2
  Parent state: Inactive
  State: Inactive
  Port: 53
  Weight: 100
  Priority: 4
  Probe information:
    Probe success criteria: All
    Probe method                    State
    DNS                             Failed
```

Table 11 Command output

Field	Description
DNS server	DNS server name.
Address	IP address of the DNS server. The asterisk (*) indicates that the IP address is automatically obtained and is being used. If all obtained IP addresses are unavailable, this field displays --(*). If no IP address is obtained and no IP address is manually configured, this field displays two hyphens (--).
Link	Link of the DNS server.
Parent state/State	DNS server state/DNS server pool member state: • **Active**—The DNS server is available. • **Busy**—The DNS server is busy. When the DNS server is in **Active** state and enabled with the link protection feature, this field displays **Busy** if the maximum expected bandwidth is reached. • **Inactive**—The DNS server is unavailable, because the configuration is not complete or the server is not referenced. • **Probe-failed**—Health monitoring has failed. • **Unknown**—Health monitoring is not configured.
Description	Description for the DNS server.
Auto-alloc address	Whether the device is enabled to automatically obtain the IP address of a DNS server: **Disabled** or **Enabled**.
IPv4 address	IPv4 address of the DNS server.
IPv6 address	IPv6 address of the DNS server.
Port	Port number of the DNS server. 0 means the port number in the packet is used.
Weight	Weight of the DNS server.
Priority	Priority of the DNS server.
Probe information	Detailed health monitoring information for the DNS server.
Probe success criteria	Health monitoring success criteria for the DNS server: • **All**—Health monitoring succeeds only when all the specified health monitoring methods succeed. • **At least**—Health monitoring succeeds when a specified minimum number of

Field	Description
	health monitoring methods succeed.
Probe method	Name of the NQA template used by the health monitoring method.
State	State of the health monitoring method: • **Failed**—Health monitoring has failed. • **In progress**—Health monitoring is in progress. • **Invalid**—Health monitoring is unavailable (because the configuration of the NQA template is not complete), or the DNS server is unavailable. • **Succeeded**—Health monitoring has succeeded.

display loadbalance dns-server statistics

Use **display loadbalance dns-server statistics** to display DNS server statistics or DNS server pool member statistics.

Syntax

display loadbalance dns-server statistics [**name** *dns-server-name*] [**slot** *slot-number*]

display loadbalance dns-server statistics dns-server-pool *dns-server-pool-name* [**name** *dns-server-name* **port** *port-number*] [**slot** *slot-number*]

context-operator

Parameters

name *dns-server-name*: Specifies a DNS server by its name, a case-insensitive string of 1 to 63 characters. If you do not specify this option, the command displays statistics for all DNS servers.

dns-server-pool *dns-server-pool-name*: Displays statistics for members of a DNS server pool. The *dns-server-pool-name* argument specifies a DNS server pool by its name, a case-insensitive string of 1 to 63 characters.

dns-server *dns-server-name* **port** *port-number*: Displays statistics for a DNS server pool member. The *dns-server-name* argument specifies a DNS server pool member by its name, a case-insensitive string of 1 to 63 characters. The *port-number* argument specifies the port number of the DNS server pool member, in the range of 0 to 65535. If you do not specify this option, the command displays statistics for all members of a DNS server pool.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays DNS server statistics for all member devices.

Examples

Display statistics for the DNS server **ds1**.

```
<Sysname> display loadbalance dns-server statistics name ds1
DNS server: ds1
```

```
Received requests: 100
Send requests: 98
Dropped requests: 2
Received responses: 98
Send responses: 98
Dropped responses: 0
```

Display statistics for all members of DNS server pool **dsp1**.

```
<Sysname> display loadbalance dns-server statistics dns-server-pool dsp1
DNS server pool: dsp1
DNS server (port: 20): ds1
Received requests: 100
Dropped requests: 2
Sent responses: 98
Dropped responses: 0

DNS server (port: 28): ds2
Received requests: 100
Dropped requests: 0
Sent responses: 100
Dropped responses: 0
```

Table 12 Command output

Field	Description
DNS server	DNS server name.
Received requests	Number of DNS requests received by the DNS server.
Send requests	Number of DNS requests sent by the DNS server.
Dropped requests	Number of DNS requests dropped by the DNS server.
Received responses	Number of DNS responses received by the DNS server.
Send responses	Number of DNS responses sent by the DNS server.
Dropped responses	Number of DNS responses dropped by the DNS server.

display loadbalance dns-server-pool

Use **display loadbalance dns-server-pool** to display DNS server pool information.

Syntax

display loadbalance dns-server-pool [**brief** | **name** *pool-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

brief: Displays brief DNS server pool information. If you do not specify this keyword, the command displays detailed DNS server pool information.

name *pool-name*: Displays detailed information about a DNS server pool. The *pool-name* argument specifies a DNS server pool by its name, a case-insensitive string of 1 to 63 characters.

Usage guidelines

If you do not specify any parameter, the command displays detailed information about all DNS server pools.

Examples

Display brief information about all DNS server pools.

```
<Sysname> display loadbalance dns-server-pool brief
Predictor: RR - Round robin, RD - Random,
           BW - Bandwidth, MBW - Max bandwidth,
           IBW - Inbound bandwidth, OBW - Outbound bandwidth,
           MIBW - Max inbound bandwidth, MOBW - Max outbound bandwidth,
           HASH(SIP) - Hash address source IP,
           HASH(DIP) - Hash address destination IP,
           HASH(SIP-PORT) - Hash address source IP-port
DNS server pool    Predictor     Total    Active
dns-pool           RR            3        2
dns-pool1          RR            0        0
dns-pool2          RD            3        0
```

Display detailed information about DNS server pool **dns-pool**.

```
<Sysname> display loadbalance dns-server-pool name dns-pool
DNS server pool: dns-pool
Description:
Predictor: Round robin
Selected server: Enabled
Min servers: 3
  Max servers: 5
Probe information:
  Probe success criteria: At-least 2
  Probe method: t4
Total DNS servers: 3
Active DNS servers: 0
DNS server list:
Name        State         Address          port    Link        Weight   Priority
ds1         Active        10.150.100.100   0       link1       100      4
ds2         Probe-failed  20.150.100.100   5353    link2       100      4
ds3         Inactive      --               0       link3       100      4
```

Table 13 Command output

Field	Description
Predictor	Scheduling algorithm of the DNS server pool: • **RR**—Weighted round robin algorithm.

Field	Description
	• **RD**—Random algorithm. • **BW**—Bandwidth algorithm. • **IBW**—Inbound bandwidth algorithm. • **OBW**—Outbound bandwidth algorithm. • **MBW**—Maximum bandwidth algorithm. • **MIBW**—Maximum inbound bandwidth algorithm. • **MOBW**—Maximum outbound bandwidth algorithm. • **HASH(SIP)**—Hash algorithm based on source IP address. • **HASH(DIP)**—Hash algorithm based on destination IP address. • **HASH(SIP-PORT)**—Hash algorithm based on source IP address and port number.
DNS server pool	DNS server pool name.
Total	Total number of DNS servers.
Active	Number of active DNS servers.
Description	Description for the DNS server pool.
Selected server	State of DNS server limit to participate in scheduling: disabled or enabled. If the state is enabled, the following fields are displayed: • **Min servers**—Minimum number of DNS servers that can participate in scheduling. • **Max servers**—Maximum number of DNS servers that can participate in scheduling.
Probe information	Detailed health monitoring information for the DNS server pool.
Probe success criteria	Health monitoring success criteria for the DNS server pool: • **All**—Health monitoring succeeds only when all the specified health monitoring methods succeed. • **At least**—Health monitoring succeeds when a specified minimum number of health monitoring methods succeed.
Probe method	Name of the NQA template used by the health monitoring method.
Total DNS servers	Total number of DNS servers.
Active DNS servers	Number of active DNS servers.
Name	DNS server name.
State	DNS server state: • **Active**—The DNS server is available. • **Busy**—The DNS server is busy. When the DNS server is in **Active** or **Ramp** state and enabled with link protection, this field displays **Busy** if the maximum expected bandwidth is reached. • **Inactive**—The DNS server is unavailable, because the configuration is not complete or the server is not referenced. • **Probe-failed**—Health monitoring has failed.
Address	IP address of the DNS server. The asterisk (*) indicates that the IP address is automatically obtained and is being used. If all obtained IP addresses are unavailable, this field displays --(*). If no IP address is obtained and no IP address is manually configured, this field displays two hyphens (--).
Port	Port number of the DNS server.
Link	Name of the link corresponding to the DNS server.
Weight	Weight of the DNS server.

Field	Description
Priority	Priority of the DNS server.

display loadbalance external-monitor log

Use **display loadbalance external-monitor log** to display the log information for custom monitoring.

Syntax

display loadbalance external-monitor log

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Examples

Display the log information for custom monitoring.

```
<Sysname> display loadbalance external-monitor log
The external monitor probe state of (server farm sf, real server rs, port: 3306) template
mysql-template changed to successful.
The external monitor probe state of (server farm sf2, real server rs2, port: 3306) template
mysql-template changed to failed.
```

display loadbalance hot-backup statistics

Use **display loadbalance hot-backup statistics** to display LB hot backup statistics.

Syntax

display loadbalance hot-backup statistics [**slot** *slot-number*]

Views

  SesResFail : 0
  SesUpdate  : 0
```

Table 14 Command output

Field	Description
TryAdd	Message for adding sticky entries.
TryDel	Message for deleting sticky entries.
AckDel	Message for acknowledging the deletion of sticky entries.
AckOK	Message indicating the sticky entries that can be deleted.
AckNO	Message indicating the sticky entries that cannot be deleted.
NotSpt	Message indicating the unsupported sticky entries.
StiSnd	Number of sent sticky entries.
StiRcv	Number of received sticky entries.
StiSndFail	Number of sticky entry sending failures.
StiRcvFail	Number of sticky entry receiving failures.
MsgSnd	Number of sent messages.
MsgRcv	Number of received messages.
MsgSndFail	Number of message sending failures.
MsgRcvFail	Number of message receiving failures.
MAllocFail	Number of memory application failures.
SesBkTotal	Number of session backups.
SesBkFail	Number of session backup failures.
SesResTotal	Number of session restorations.
SesResFail	Number of session restoration failures.
SesUpdate	Number of session updates.

display loadbalance isp

Use **display loadbalance isp** to display ISP information.

Syntax

display loadbalance isp [**ip** *ipv4-address* | **ipv6** *ipv6-address* | **name** *isp-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

ip *ipv4-address*: Specifies an IPv4 address. If you do not specify this option, the command displays information about all ISPs.

ipv6 *ipv6-address*: Specifies an IPv6 address. If you do not specify this option, the command displays information about all ISPs.

name *isp-name*: Specifies an ISP by its name, a case-insensitive string of 1 to 63 characters. If you do not specify this option, the command displays information about all ISPs.

Usage guidelines

If you do not specify any parameters, this command displays information about all ISPs.

Examples

Display information about all ISPs.

```
<Sysname> display loadbalance isp
(*) - User-defined object
Last successful auto update time: 04:09:00 UTC Fri 03/16/2012
Last auto update time: 04:09:00 UTC Fri 03/16/2012
Last auto update result: Successful
  ISP update count: 1

LB ISP: isp1
    Whois maintainer object name:
        MAINT-CHINANET
    Description: ISP1
    IPv4 address/Mask length: --
    IPv6 address/Prefix length: --

LB ISP: isp2(*)
    Description:
    IPv4 address/Mask length:
        1.2.3.0/32(*)           1.2.3.4/32              3.3.3.6/32(*)
        192.168.6.131/32(*)     192.168.195.189/32(*)
    IPv6 address/Prefix length:
```

```
        1::2/128
        FFFF:FFFF:FFFF:FFFF:FFFF:FFFF:FFFF:FFFF/128(*)
```

Display information about the ISP corresponding to the IP address 1.2.3.0.

```
<Sysname> display loadbalance isp ip 1.2.3.0
ISP name            Source                  IPv4 address/Mask length
isp2                user-set                1.2.3.0/28
isp2                user-set                1.2.3.0/29
isp2                user-set                1.2.3.0/30
isp2                file-load               1.2.3.0/31
                    auto-update
isp2                user-set                1.2.3.0/32
                    file-load
```

Display information about the ISP corresponding to the IPv6 address 1::1234.

```
<Sysname> display loadbalance isp ipv6 1::1234
ISP name            Source                  IPv6 address/Prefix length
isp2                user-set                1::1234/126
isp2                user-set                1::1234/127
isp2                file-load               1::1234/128
```

Table 15 Command output

Field	Description
(*) - User-defined object	**(*)** indicates that the ISP information is manually configured. If the ISP information is also imported from a file, **(*)** is not displayed.
Last successful auto update time	Time of the most recent successful update.
Last auto update time	Time of the most recent update.
Last auto update result	Result of the most recent auto update: • Successful. • Failed to connect to WHOIS server. • Connection failed. • Failed to query DNS (which means failed to send DNS requests).
ISP update count	Number of ISPs in the most recent update.
LB ISP	ISP name.
Description	Description for the ISP.
Source	Source of the ISP: • **user-set**—Manually configured. • **file-load**—Imported from a file. • **auto-update**—ISP auto update.

display loadbalance limit-policy

Use **display loadbalance limit-policy** to display LB connection limit policy information.

Syntax

display loadbalance limit-policy [**name** *policy-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

policy-name: Specifies an LB connection limit policy by its name, a case-insensitive string of 1 to 63 characters.

Examples

Display information about the LB connection limit policy **lptest**.

```
<Sysname> display loadbalance limit-policy name lptest
Limit-policy: lptest
  Description:
  Limit rule:
limit lptest acl 3000 amount 10 10
```

display loadbalance link

Use **display loadbalance link** to display LB link information or link group member information.

Syntax

display loadbalance link [**brief** | **name** *link-name*]

display loadbalance link link-group *link-group-name* [**name** *link-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

brief: Displays brief information about all LB links. If you do not specify this keyword, the command displays detailed LB link information.

name *link-name*: Displays detailed information about the specified LB link. The *link-name* argument specifies an LB link name, a case-insensitive string of 1 to 63 characters.

link-group *link-group-name*: Displays information about members of a link group. The *link-group-name* argument specifies a link group by its name, a case-insensitive string of 1 to 63 characters.

name *link-name*: Displays information about a link group member. The *link-name* argument specifies a link group member by its name, a case-insensitive string of 1 to 63 characters. If you do not specify this option, the command displays information about all members of a link group.

Usage guidelines

If you do not specify the **brief** keyword or the **name** *link-name* option, the command displays detailed information about all LB links.

Examples

Display brief information about all LB links.

```
<Sysname> display loadbalance link brief
Link         Router IP/Interface    State        VPN instance     Link group
Lk1          192.168.1.1            Busy         vpn1             lg
Lk2          192.168.2.1            Active       vpn1             lg
Lk3          Dialer0                Inactive     vpn1             lg
```

Display detailed information about the LB link **lk**.

```
<Sysname> display loadbalance link name lk
Link: lk
  Description: lk
  State: Busy
  VPN instance: vpn1 (Inherit)
  Inherit VPN: Enabled
  Router IP: 1.2.3.4
  Router IPv6: --

```

Table 16 Command output

Field	Description
Link	LB link name.
Router IP/Interface	Gateway IP address or outgoing interface of the LB link.
Parent state/State	LB link state/Link group member state: • **Active**—The LB link is available. • **Busy**—The LB link is busy. • **Inactive**—The LB link is unavailable, because the configuration is not complete, the LB link is not referenced, or the virtual server is not enabled. • **Probe-failed**—Health monitoring has failed. • **Ramp**—Ramp-up phase of slow online. • **Shutdown**—The LB link is shut down. • **Standby**—Standby phase of slow online. • **Unknown**—Health monitoring is not configured.
VPN instance	VPN instance of the LB link. • **Config**—Manually configured. • **Inherit**—Inherited.
Link group	Link group to which the LB link belongs.
Description	Description for the LB link.
Inherit VPN	State of VPN instance inheritance: **Enabled** or **Disabled**.
IPv4 address state	IPv4 address state of the LB link: • **Active**—An available IPv4 address is obtained through the outgoing interface of the LB link. • **Inactive**—No available IPv4 address is obtained through the outgoing interface of the LB link. This field is displayed only if an outgoing interface is specified for an LB link.
IPv6 address state	IPv6 address state of the link: • **Active**—An available IPv6 address is obtained through the outgoing interface of the LB link. • **Inactive**—No available IPv6 address is obtained through the outgoing interface of the LB link. This field is displayed only if an outgoing interface is specified for an LB link.
Weight	Weight of the LB link.
Priority	Priority of the LB link.

Field	Description
Cost	Cost for proximity calculation.
Slow shutdown	Slow offline state of the LB link: • Disabled. • Enabled.
Connection limit	Maximum number of connections for the LB link.
Connection rate limit	Maximum number of connections per second for the LB link.
Rate limit	Rate limit of the LB link.
Connections	Maximum number of connections per second for the LB link.
Bandwidth	Maximum bandwidth for the LB link in kbps.
Inbound bandwidth	Maximum inbound bandwidth for the LB link in kbps.
Outbound bandwidth	Maximum outbound bandwidth for the LB link in kbps.
Bandwidth busy	Bandwidth ratio.
Max bandwidth	Maximum expected bandwidth for the LB link in kbps.
Max inbound bandwidth	Maximum inbound expected bandwidth for the LB link in kbps.
Max outbound bandwidth	Maximum outbound expected bandwidth for the LB link in kbps.
Busy rate	Bandwidth ratio for the LB link.
Inbound busy rate	Inbound bandwidth ratio for the LB link.
Outbound busy rate	Outbound bandwidth ratio for the LB link.
Busy recovery rate	Bandwidth recovery ratio for the LB link.
Inbound busy recovery rate	Inbound bandwidth recovery ratio for the LB link.
Outbound busy recovery rate	Outbound bandwidth recovery ratio for the LB link.
Probe information	Detailed health monitoring information for the LB link.
Probe success criteria	Health monitoring success criteria for the LB link: • **All**—Health monitoring succeeds only when all the specified health monitoring methods succeed. • **At least**—Health monitoring succeeds when a specified minimum number of health monitoring methods succeed.
Probe method	Name of the NQA template used by the health monitoring method.
State	State of the health monitoring method: • **Failed**—Health monitoring has failed. • **In progress**—Health monitoring is in progress. • **Invalid**—Health monitoring is unavailable (because the configuration of the NQA template is not complete), or the real server is unavailable. • **Succeeded**—Health monitoring has succeeded.

display loadbalance link out-interface statistics

Use **display loadbalance link out-interface statistics** to display link outbound interface statistics.

Syntax

display loadbalance link out-interface statistics [**name** *link-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

name *link-name*: Specifies a link by its name, a case-insensitive string of 1 to 63 characters. If you do not specify this option, the command displays outbound interface statistics for all links.

Usage guidelines

If the link outbound interface is a logical interface, the rate statistics are calculated based on the interface traffic.

Examples

Display outbound interface statistics for the link **lk1**.

```
<Sysname> display loadbalance link out-interface statistics name lk1
Loadbalance link: lk1
Input rate: 1524 bps
  Output rate: 90 bps
```

Table 17 Command output

Field	Description
Loadbalance link	LB link name.
Input rate	Input rate of the outbound interface in bps.
Output rate	Output rate of the outbound interface in bps.

display loadbalance link statistics

Use **display loadbalance link statistics** to display link statistics or link group member statistics.

Syntax

display loadbalance link statistics [**name** *link-name*] [**slot** *slot-number*]

display loadbalance link statistics link-group *link-group-name* [**name** *link-name*] [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

name *link-name*: Specifies a link by its name, a case-insensitive string of 1 to 63 characters.

link-group *link-group-name*: Displays statistics for members of a link group. The *link-group-name* argument specifies a link group by its name, a case-insensitive string of 1 to 63 characters.

name *link-name*: Displays statistics for a link group member. The *link-name* argument specifies a link group member by its name, a case-insensitive string of 1 to 63 characters. If you do not specify this option, the command displays statistics for all members of a link group.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays link statistics for all member devices.

Examples

Display statistics for the link **lk1**.

```
<Sysname> display loadbalance link statistics name lk1
Loadbalance link: lk1
  Total connections: 1798
  Active connections: 788
  Max connections: 803
    recorded at 11:02:49 on Tue May 21 2019
  Connections per second: 157
  Max connections per second: 163
    recorded at 11:02:49 on Tue May 21 2019
  Downstream traffic: 333332 bytes
  Upstream traffic: 472054 bytes
  Throughput: 4396 bps
  Inbound throughput: 1214 bps
  Outbound throughput: 3128 bps
  Max throughput: 4564 bps
    recorded at 11:02:49 on Tue May 21 2019
  Max inbound throughput: 1214 bps
    recorded at 11:02:49 on Tue May 21 2019
  Max outbound throughput: 3320 bps
    recorded at 11:02:49 on Tue May 21 2019
  Received packets: 1798
  Sent packets: 0
  Dropped packets: 0
  Packet loss rate: 10
```

Display statistics for all members of link group **lg**.

```
<Sysname> display loadbalance link statistics link-group lg
Loadbalance link group: lg
  Loadbalance link: lk1
    Total connections: 0
```

```
  Active connections: 0
  Max connections: 0
    recorded at 11:02:49 on Tue May 21 2019
  Connections per second: 0
  Max connections per second: 0
    recorded at 11:02:49 on Tue May 21 2019
  Downstream traffic: 0 bytes
  Upstream traffic: 0 bytes
  Throughput: 0 bps
  Inbound throughput: 0 bps
  Outbound throughput: 0 bps
  Max throughput: 0 bps
    recorded at 11:02:49 on Tue May 21 2019
  Max inbound throughput: 0 bps
    recorded at 11:02:49 on Tue May 21 2019
  Max outbound throughput: 0 bps
    recorded at 11:02:49 on Tue May 21 2019
  Received packets: 0
  Sent packets: 0
  Dropped packets: 0

Loadbalance link: lk2
  Total connections: 0
  Active connections: 0
  Max connections: 0
    recorded at 11:02:49 on Tue May 21 2019
  Connections per second: 0
  Max connections per second: 0

  Inbound throughput: 0 bps
  Outbound throughput: 0 bps
  Max throughput: 0 bps
    recorded at 11:02:49 on Tue May 21 2019
  Max inbound throughput: 0 bps
    recorded at 11:02:49 on Tue May 21 2019
  Max outbound throughput: 0 bps
    recorded at 11:02:49 on Tue May 21 2019
  Received packets: 0
  Sent packets: 0
  Dropped packets: 0
```

Table 18 Command output

Field	Description
Loadbalance link	Link name.
Total connections	Total number of connections.

Field	Description
Active connections	Number of active connections.
Max connections	Maximum number of connections.
Connections per second	Number of connections per second.
Max connections per second	Maximum number of connections per second.
Downstream traffic	Downstream traffic (in bytes) received by the LB device.
Upstream traffic	Upstream traffic (in bytes) sent by the LB device.
Throughput	Total packet throughput in bps.
Inbound throughput	Inbound packet throughput in bps.
Outbound throughput	Outbound packet throughput in bps.
Max throughput	Maximum packet throughput in bps.
Max inbound throughput	Maximum inbound packet throughput in bps.
Max outbound throughput	Maximum outbound packet throughput in bps.
Received packets	Number of received packets.
Sent packets	Number of sent packets.
Dropped packets	Number of dropped packets.
Packet loss rate	Packet loss ratio of the link.

display loadbalance link-group

Use **display loadbalance link-group** to display link group information.

Syntax

display loadbalance link-group [**brief** | **name** *link-group-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

brief: Displays brief information about all link groups. If you do not specify this keyword, the command displays detailed link group information.

name *link-group-name*: Specifies a link group by its name, a case-insensitive string of 1 to 63 characters. If you do not specify this option, the command displays information about all link groups.

Usage guidelines

If you do not specify any parameters, the command displays detailed information about all link groups.

A link is displayed as unavailable if the link group configuration is not complete, the link group is not referenced, or the virtual server is not enabled. This does not mean that the link is not available.

Examples

Display brief information about all link groups.

```
<Sysname> display loadbalance link-group brief
Predictor: RR - Round robin, RD - Random, LC - Least connection,
           BW – Bandwidth, MBW – Max bandwidth,
           IBW – Inbound bandwidth, OBW – Outbound bandwidth,
           MIBW – Max inbound bandwidth, MOBW – Max outbound bandwidth,
           HASH(SIP) - Hash address source IP,
           HASH(DIP) - Hash address destination IP,
           HASH(SIP-PORT) - Hash address source IP-port
NAT/SNAT: Y - Enabled, N - Disabled

Link group       Predictor    NAT   SNAT  Total  Active
lg               RR           Y     N     3      3
```

Display detailed information about all link groups.

```
<Sysname> display loadbalance link-group
Link group: lg1
  Description:
  Predictor: Hash address
  Proximity: Disabled
  NAT: Enabled
  SNAT pool:
  Failed action: Keep
  Active threshold: Enabled
    Lower: 80
    Upper: 90
  Slow-online: Enabled
  Standby time: 5s
  Ramp-up time: 10s
  Selected link: Enabled
    Min link: 100
    Max link: 600
  Probe information:
    Probe success criteria: All
    Probe method:
    aaa
    ddd
  Total link: 1
  Active link: 1
  Link list:
  Name             State         VPN instance    Router IP    Weight    Priority
  Link1            Inactive      vpn1            1.2.3.4      4         100
```

Table 19 Command output

Field	Description
Link group	Link group name.
Description	Description for the link group.
Predictor	Scheduling algorithm of the link group: • **RR**—Weighted round robin algorithm. • **RD**—Random algorithm. • **LC**—Weighted least connection algorithm. • **BW**—Bandwidth algorithm. • **IBW**—Inbound bandwidth algorithm. • **OBW**—Outbound bandwidth algorithm. • **MBW**—Maximum bandwidth algorithm. • **MIBW**—Maximum inbound bandwidth algorithm. • **MOBW**—Maximum outbound bandwidth algorithm. • **HASH(SIP)**—Hash algorithm based on source IP address. • **HASH(DIP)**—Hash algorithm based on destination IP address. • **HASH(SIP-PORT)**—Hash algorithm based on source IP address and port number.
Proximity	Proximity state of the link group: • Disabled. • Enabled.
NAT	NAT state of the link group: • Disabled. • Enabled.
SNAT pool	Name of the SNAT address pool referenced by the link group.
Failed action	Fault processing method of the link group: • **Keep**—Keeps existing connections. • **Reschedule**—Redirects connections. • **Reset**—Terminates existing connections.
Active threshold	State of the criteria to determine that the link group is available: disabled or enabled. If the state is enabled, the following fields are displayed: • **Lower**—Lower percentage value. • **Upper**—Upper percentage value.
Slow-online	State of the slow online feature: disabled or enabled. If the state is enabled, the following fields are displayed: • Standby time. • Ramp-up time.
Selected link	State of link limit to participate in scheduling: disabled or enabled. If the state is enabled, the following fields are displayed: • **Min server**—Minimum number of links that participate in scheduling. • **Max server**—Maximum number of links that participate in scheduling.
Probe success criteria	Health monitoring success criteria for the link group: • **All**—Health monitoring succeeds only when all the specified health monitoring methods succeed. • **At least X**—Health monitoring succeeds when a minimum of *X* health monitoring methods succeed.
Probe method	Name of the NQA template used by the health monitoring method.

Field	Description
Total link	Total number of links.
Active link	Number of active links.
Name	Link name.
State	Link state: • **Active**—The link is available. • **Busy**—The link is busy. When the link is in **Active** or **Ramp** state and enabled with bandwidth statistics collection and link protection, this field displays **Busy** if the maximum expected bandwidth is reached. • **Inactive**—The link is unavailable, because the configuration is not complete, the link is not referenced, or the virtual server is not enabled. • **Probe-failed**—Health monitoring has failed. • **Ramp**—Ramp-up phase of slow online. • **Shutdown**—The link is shut down. • **Standby**—Standby phase of slow online.
VPN instance	VPN instance of the link.
Router IP	IPv4 and IPv6 addresses of the link.
Weight	Weight of the link.
Priority	Priority of the link.

display loadbalance local-dns-server parse-fail-record

Use **display loadbalance local-dns-server parse-fail-record** to display DNS request parse failures.

Syntax

display loadbalance local-dns-server parse-fail-record [**type** { **a** | **aaaa** | **cname** | **mx** | **ns** | **soa** | **srv** | **txt** }] [**domain** *domain-name*] | **ptr** [**ip address** { *ipv4-address* | *ipv6-address* }]] [**vpn-instance** *vpn-instance-name*] [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

type { **a** | **aaaa** | **cname** | **mx** | **ns** | **ptr** | **soa** | **srv** | **txt** }: Specifies a DNS request type. If you do not specify a DNS request type, this command displays DNS request parse failures for all DNS request types.

domain *domain-name*: Specifies a domain name, a case-insensitive, dot-separated string of 1 to 254 characters for an absolute domain name or 1 to 253 characters for a relative domain name. Each dot-separated label in the domain name can contain a maximum of 63 characters. If you do not specify a domain name, this command displays DNS request parse failures for all domain names.

ip address { *ipv4-address* | *ipv6-address* }: Specifies an IP address used for reverse DNS. If you do not specify this option, the command displays DNS request parse failures for all IP addresses.

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command displays DNS request parse failures for the public network.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays DNS request parse failures for all member devices.

Examples

Display all DNS request parse failures.

```
<Sysname> display loadbalance local-dns-server parse-fail-record
Slot 0:
  ID Time        Type  SIP/Port  DIP/Port   VN instance Domain       Failure cause

```

Table 20 Command output

Field	Description
ID	Failure record ID.
Time	Time when the device received a DNS request.
Type	Resource record type: • **A**—IPv4 host address. • **AAAA**—IPv6 host address. • **CNAME**—Canonical name. • **MX**—Mail exchanger. • **NS**—Name server. • **PTR**—Pointer. • **SOA**—Start of authority. • **SRV**—Service. • **TXT**—Text.
SIP/Port	Source IP address and port number of a DNS request.
DIP/Port	Destination IP address and port number of a DNS request.
Failure cause	Failure cause for DNS request parsing:

Field	Description
	• **--**—Parsing succeeded. • No matched DNS listener. • No matched DNS mapping. • No matched virtual server pool. • No matched DNS zone. • Failed to get buffer. • No matched record. • No enough memory resource. • Failed to parse domain. • Failed to find DNS listener by ID. • No scheduling content. • **Scheduling failed**—The scheduling content exists, but scheduling failed. • No matched virtual server member.

display loadbalance policy

Use **display loadbalance policy** to display LB policy information.

Syntax

display loadbalance policy [**name** *policy-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

name *policy-name*: Specifies an LB policy by its name, a case-insensitive string of 1 to 63 characters. If you do not specify this option, the command displays information about all LB policies.

Examples

Display information about all LB policies.

```
<Sysname> display loadbalance policy
LB policy: lbp1
  Description:
  Type: Generic
  Class: lbc1
   Action: lba1
  Default action: lba0

LB policy: lbp2
  Description:
  Type: HTTP
  Default action:
```

```
LB policy: lbp3
  Description:
  Type: Link-generic
  Class: lbc3
  Action: lba3
  Default action: lba3

LB policy: lbp4
  Description:
  Type: DNS
  Class: lbc4
  Action: lba4
  Default action: lba4

LB policy: lbp5
  Description:
  Type: MySQL
  Class: lbc5
  Action: lba5
  Default action: lba5
```

Table 21 Command output

Field	Description
LB policy	LB policy name.
Description	Description for the LB policy.
Type	LB policy type: • DNS. • Generic. • HTTP. • Link-generic. • MySQL. • RADIUS.
Class	LB class for the LB policy.
Action	LB action for the LB class.
Default class action	Default LB action.

display loadbalance probe-template

Use **display loadbalance probe-template** to display LB probe template information.

Syntax

display loadbalance probe-template [**name** *template-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

name *template-name*: Specifies an LB probe template by its name, a case-insensitive string of 1 to 32 characters. If you do not specify this option, the command displays information about all LB probe templates.

Examples

Display information about all LB probe templates.

```
<Sysname> display loadbalance probe-template
Load balancing probe template: rst1
  Description:
  Type: tcp-rst
  Monitoring interval: 20 sec
  RST threshold: 10
  Protection action: auto-shutdown

Load balancing probe template: zero2
  Description:
  Type: tcp-zero-window
  Monitoring interval: 30 sec
  Zero-window threshold: 20
  Protection action: busy
    Probe interval: 30 sec
    Probe times: 3

Load balancing probe template: icmp1
  Description:
  Type: icmp
  Timeout: 3 sec
  Frequency: 300
  Load balancing probe template: http1
  Description:
  Type: http-passive
  Monitoring interval: 1 sec
  Abnormal-url threshold: 10000
  Timeout: 30 sec
  URL list:
    aaa
  Status code list:
    404

Load balancing probe template: test_external
  Description:
  Type: external-monitor
```

```
External script: http.sh
Monitoring interval: 5 sec
Timeout: 6 sec
Argument: 192.168.1.123
Environment variable list:
  Name               Value
  Test3              /opt/lib
  Test4              /usr/bin
```

Table 22 Command output

Field	Description
Load balancing probe template	LB probe template name.
Description	Description for the LB probe template.
Type	LB probe template type: • **external-monitor**—Custom monitoring. • **http-passive**. • **icmp**. • **tcp-rst**. • **tcp-zero-window**.
Monitoring interval	Monitoring time. During the monitoring time, the system counts the number of RST packets or zero-window packets sent by each server farm member in a server farm. This field is displayed only for a custom-monitoring, HTTP passive, TCP-RST, or TCP zero-window LB probe template.
RST threshold	Maximum number of RST packets a real server can send. This field is displayed only for a TCP-RST LB probe template.
Zero-window threshold	Maximum percentage of zero-window packets a real server can send. This field is displayed only for a TCP zero-window LB probe template.
Protection action	Action to take when the RST or zero-window packet threshold is reached: **Auto-shutdown** or **Busy**. This field is displayed only for a TCP-RST or TCP zero-window LB probe template.
Probe interval	Interval to probe the real server in busy state. This field is displayed only for a TCP-RST or TCP zero-window LB probe template.
Probe times	Maximum number of times for probing the real server in busy state. If the number of probe times is reached, the real server is automatically shut down. This field is displayed only for a TCP-RST or TCP zero-window LB probe template.
Timeout	Timeout time for probe responses, HTTP responses, or custom monitoring probe packet responses. This field is displayed only for an ICMP LB probe template, HTTP passive, or custom-monitoring LB probe template.
Frequency	Probe interval for an LB probe template. This field is displayed only for an ICMP LB probe template or HTTP passive LB probe template.
Abnormal-url threshold	Upper limit of URL error times. This field is displayed only for an HTTP passive LB probe template.
URL list	List of URLs to check for an HTTP passive LB probe template This field is displayed only for an HTTP passive LB probe template.

Field	Description
Status code list	List of response status codes to check for an HTTP passive LB probe template This field is displayed only for an HTTP passive LB probe template.
External script	Script file used by a custom-monitoring LB probe template. This field is displayed only for a custom-monitoring LB probe template.
Argument	User-defined information for a custom-monitoring LB probe template. This field is displayed only for a custom-monitoring LB probe template.
Environment variables list	Environment variable list for a custom-monitoring LB probe template. This field is displayed only for a custom-monitoring LB probe template.
Name	Environment variable name. This field is displayed only for a custom-monitoring LB probe template.
Value	Environment variable value. This field is displayed only for a custom-monitoring LB probe template.

Related commands

reset real-server statistics

display loadbalance process-limit

Use **display loadbalance process-limit** to display the maximum number of processes allowed to be started for custom monitoring.

Syntax

display loadbalance process-limit

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Examples

Display the maximum number processes allowed to be started for custom monitoring.

```
<Sysname> display loadbalance process-limit
Loadbalance process-limit: 200
```

display loadbalance protection-policy

Use **display loadbalance protection-policy** to display the configuration of protection policies.

Syntax

display loadbalance protection-policy [**name** *policy-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

name *policy-name*: Specifies a protection policy by its name, a case-insensitive string of 1 to 63 characters. If you do not specify a protection policy, this command displays the configuration of all protection policies.

Examples

Display the configuration of all protection policies.

```
<Sysname> display loadbalance protection-policy
Policy name: p1
  Description:
  Type: HTTP
  Protection action: verify js
  Rule ID: 3
    URL: /index.php
    Protection period: 2
    Method                    Threshold
    Cookie (Jsessionid)       20
    Source IP                 10
  Rule ID: 5
    URL: /test.php
    Protection period: 20
    Method                    Threshold
    Cookie (A1B2C3D4)         20
```

Table 23 Command output

Field	Description
Protection action	Protection action: • **warning**—Generates a log message. • **drop**—Drops requests. • **verify (insert header)**—Performs cookie verification by inserting an HTTP header. • **verify (js)**—Performs cookie verification by inserting a JS script.
URL	Protected URL.
Method	Threshold type: • **Cookie (xxx)**—Cookie-based threshold (cookie name). • **Source IP**—- Source-IP-based threshold.

display loadbalance proximity

Use **display loadbalance proximity** to display proximity entry information.

Syntax

display loadbalance proximity [**vpn-instance** *vpn-instance-name*] [**ip** [*ipv4-address*] | **ipv6** [*ipv6-address*]] [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify this option, the command displays proximity entry information for the public network.

ip [*ipv4-address*]: Displays IPv4 proximity entry information. If you specify the *ipv4-address* argument, this command displays detailed information about the proximity entry corresponding to the IPv4 address. If you do not specify the *ipv4-address* argument, this command displays brief information about all IPv4 proximity entries.

ipv6 [*ipv6-address*]: Displays IPv6 proximity entry information. If you specify the *ipv6-address* argument, this command displays detailed information about the proximity entry corresponding to the IPv6 address. If you do not specify the *ipv6-address* argument, this command displays brief information about all IPv6 proximity entries.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays proximity information for all member devices.

Usage guidelines

If you do not specify the **vpn-instance**, **ip**, or **ipv6** keyword, this command displays brief information about all IPv4 and IPv6 proximity entries.

Examples

Display brief information about all IPv4 and IPv6 proximity entries for the public network.

```
<Sysname> display loadbalance proximity
(*) – Real server object
Slot :1
  IPv4 address/Mask length       Timeout     Best link  RTT      Dynamic weight
  ------------------------------------------------------------------------------
  1.2.3.0/24                     59          lk1        1        170
  1.2.15.0/24                    58          lk2        2        170
  IPv6 address/Prefix length     Timeout     Best link  RTT      Dynamic weight
  ------------------------------------------------------------------------------
  11:22::/96                     40          lk1        3        200
```

Display detailed information about the proximity entry corresponding to the IP address 1.2.3.1 for the public network.

```
<Sysname> display loadbalance proximity ip 1.2.3.1
```

```
(*) – Real server object
IPv4 address/Mask length: 1.2.3.0/24
Timeout: 40
Link list/RTT:
  lk1/1
  lk2/3
```

Display detailed information about the proximity entry corresponding to the IPv6 address 11:22:: for the VPN instance **vpn1**.

```
<Sysname> display loadbalance proximity vpn-instance vpn1 ipv6 11:22::
(*) – Real server object
IPv6 address/Prefix length: 11:22::/96
Timeout: 34
Link list/RTT:
  lk1/2
  lk2/3
```

Table 24 Command output

Field	Description
Slot	Card for which proximity entry information is displayed.
Timeout	Remaining time of the proximity entries, in seconds.
Link list	Links for the proximity entry. They are listed in descending priority order.
RTT	Network delay for the link in milliseconds.

display loadbalance reverse-zone

Use **display loadbalance reverse-zone** to display DNS reverse zone information.

Syntax

display loadbalance reverse-zone { **ip** [*ipv4-address mask-length*] | **ipv6** [*ipv6-address prefix-length*] }

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

ip: Displays IPv4 DNS reverse zone information.

ipv4-address mask-length: Specifies an IPv4 address and the mask length. The mask length is in the range of 0 to 32. If you do not specify this argument, the command displays all IPv4 DNS reverse zone information.

ipv6: Displays IPv6 DNS reverse zone information.

ipv6-address prefix-length: Specifies an IPv6 address and the prefix length. The prefix length is in the range of 0 to 128. If you do not specify this argument, the command displays all IPv6 DNS reverse zone information.

Examples

Display all IPv4 DNS reverse zone information.

```
<Sysname> display loadbalance reverse-zone ip
Reverse zone: 10.1.1.0/24
Record list:
Type      TTL      RDATA
PTR       3600     1.1.1.2  a.mail.nsfocus.com.cn
PTR       2700     1.1.1.3  b.mail.nsfocus.com.cn
```

Display all IPv6 DNS reverse zone information.

```
<Sysname> display loadbalance reverse-zone ipv6
Reverse zone: 1::/64
Record list:
Type      TTL     RDATA
PTR       3600    1::1  a.mail.nsfocus.com.cn
PTR       2700    1::2  b.mail.nsfocus.com.cn
```

Table 25 Command output

Field	Description
Reverse zone	IPv4/IPv6 address and mask/prefix length of the DNS reverse zone.
Record list	List of resource records.
Type	Resource record type (only PTR is supported).
TTL	TTL of the resource record, in seconds.
RDATA	Resource data.

display loadbalance snat-global-policy

Use **display loadbalance snat-global-policy** to display SNAT global policy information.

Syntax

display loadbalance snat-global-policy [**name** *policy-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

name *policy-name*: Specifies a SNAT global policy by its name, a case-insensitive string of 1 to 63 characters. If you do not specify this option, the command displays information about all SNAT global policies.

Examples

Display information about all SNAT global policies.

```
<Sysname> display loadbalance snat-global-policy
Policy name: lbsnat1
  Description:
  State: Active
  Priority: 0
  VPN instance:
  Source IP object group: src-obj
  Destination IP object group: dst-obj
  Service object group: proto-obj
  Translation mode: snat-pool sp

Policy name: lbsnat2
  Description:
  State: Inactive(disable)
  Priority: 0
  VPN instance:
  Source IP object group: src-obj
  Destination IP object group:
  Service object group:
  Translation mode: auto-map
```

Table 26 Command output

Field	Description
State	State of the SNAT global policy: • **Active**—The SNAT global policy is enabled and available. • **Inactive**—The SNAT global policy is enabled but unavailable. • **Inactive (disabled)**—The SNAT global policy is disabled and unavailable.

display loadbalance snat-pool

Use **display loadbalance snat-pool** to display SNAT address pool information.

Syntax

display loadbalance snat-pool [**name** *pool-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

name *pool-name*: Specifies a SNAT address pool by its name, a case-insensitive string of 1 to 63 characters. If you do not specify this option, the command displays information about all SNAT address pools.

Examples

Display information about all SNAT address pools.

```
<Sysname> display loadbalance snat-pool
SNAT pool: lbsp1
  Description:
  VPN instance: VPN1
  IPv4 range:
    Start address                   End address
    202.110.10.5                    202.110.10.10
    202.110.20.10                   202.110.20.15
  IPv6 range:
    Start address                   End address
    2002::2                         2002::100
    2002::200                       2002::300
  ARP/ND interfaces:
    GigabitEthernet1/0/1
    GigabitEthernet1/0/3

SNAT pool: lbsp2
  Description:
  VPN instance: VPN1
  IPv4 range:
    Start address                   End address
    203.110.10.10                   203.110.10.15
  IPv6 range:
    Start address                   End address
    2003::2                         2003::100
  ARP/ND interfaces:
    GigabitEthernet1/0/2
```

Table 27 Command output

Field	Description
SNAT pool	SNAT address pool name.
Description	Description for the SNAT address pool.
VPN instance	VPN instance to which the SNAT address pool belongs.
IPv4 range	IPv4 address range.
IPv6 range	IPv6 address range.
ARP/ND interfaces	Interfaces from which gratuitous ARP packets and ND packets are sent out.

display loadbalance virtual-server total-statistics

Use **display loadbalance virtual-server total-statistics** to display cumulative statistics for all virtual servers.

Syntax

display loadbalance virtual-server total-statistics [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays cumulative statistics for all virtual servers on all member devices.

Usage guidelines

This command displays the cumulative connection statistics for all virtual servers. If you execute the **reset virtual-server** command for a virtual server, the statistical values are affected.

Examples

Display cumulative statistics for all virtual servers.

```
<Sysname> display loadbalance virtual-server total-statistics
Slot 1:
  Total connections: 0
  Active connections: 0
  Connections per second: 0

Slot 2:
  Total connections: 0
  Active connections: 0
  Connections per second: 0
```

Table 28 Command output

Field	Description
Total connections	Total number of connections.
Active connections	Number of active connections.
Connections per second	Number of connections per second.

display loadbalance virtual-server-pool

Use **display loadbalance virtual-server-pool** to display virtual server pool information.

Syntax

display loadbalance virtual-server-pool [**brief** | **name** *pool-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

brief: Displays brief information about all virtual server pools.

name *pool-name*: Displays detailed information about the specified virtual server pool.

Usage guidelines

If you do not specify the **brief** keyword or the **name** *pool-name* option, the command displays detailed information about all virtual server pools.

Examples

Display brief information about all virtual server pools.

```
<Sysname> display loadbalance virtual-server-pool brief
Predictor: RR - Round robin, RD - Random, LC - Least connection,
           TOP - Topology, PRO – Proximity
           BW - Bandwidth, MBW - Max bandwidth,
           IBW - Inbound bandwidth, OBW - Outbound bandwidth,
           MIBW - Max inbound bandwidth, MOBW - Max outbound bandwidth,
           HASH(SIP) - Hash address source IP,
           HASH(DIP) - Hash address destination IP,
           HASH(SIP-PORT) - Hash address source IP-port
VSpool           Pre    Alt    Fbk    BWP     Total    Active
vsp              RR     LC            Enabled  0        0
vpp              RR                   Enabled  0        0
vsp1             RD     TOP           Enabled  3        0
```

Display detailed information about the virtual server pool **local-pool**.

```
<Sysname> display loadbalance virtual-server-pool name local-pool
Virtual-server pool: local-pool
  Predictor:
   Preferred RD
   Alternate TOP
   Fallback  --
Bandwidth busy-protection: Disabled
Total virtual servers: 3
Active virtual servers: 0
Virtual server list:
Name      State     Address       Port     Weight  Link
vs1       Active    192.168.1.1   0        150     ct-link1
vs2       Active    192.167.1.1   0        120     ct-link2
```

```
vs3       Active    192.169.1.1   0        80      cnc-link
Virtual IP address list:
Address        State      Weight  Link
10.0.1.1       Active     150     ct-link1
10.1.1.1       Active     120     ct-link2
10.2.1.1       Active     80      cnc-link
Virtual IPv6 address list:
Address        State      Weight  Link
9::5           Active     150     ct-link1
9::6           Active     120     ct-link2
9::7           Active     80      cnc-link
```

Table 29 Command output

Field	Description
Virtual-server pool	Virtual server pool name.
Predictor	Scheduling algorithm of the virtual server pool.
Bandwidth busy-protection	Link protection feature state for the virtual server pool: • Disabled. • Enabled.
Name	Name of the virtual server.
State	Virtual server state: • **Active**—The virtual server is available. • **Busy**—The virtual server is busy. When the virtual server is in **Active** state and enabled with the link protection feature, this field displays **Busy** if the maximum expected bandwidth is reached. • **Inactive**—The virtual server is unavailable, because the configuration is not complete or the associated LB link is unavailable.
Address	IP address of the virtual server or virtual IP address.
Port	Port number of the virtual server.
Weight	Weight of the virtual server or virtual IP address.
Link	LB link used by the virtual server.

display loadbalance zone

Use **display loadbalance zone** to display DNS forward zone information.

Syntax

display loadbalance zone [**name** *domain-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

name *domain-name*: Specifies a domain name. It is a dot-separated, case-insensitive string that can include letters, digits, hyphens (-), underscores (_), and dots (.). The domain name can include a maximum of 253 characters, and each separated string includes no more than 63 characters. If you do not specify a domain name, this command displays DNS forward zone information for all domain names.

Examples

Display all DNS forward zone information.

```
<Sysname> display loadbalance zone
Zone: abc.com
  TTL: 3600s
  SOA:
    Primary name server: ns1.abc.com
    Responsible mail: root.ns1.abc.com
    Serial: 11812
    Retry: 14400s
    Expire: 604800s
    Min TTL: 86400s
  Record list:
    Type    TTL        RDATA
    NS      3600s      ns1.abc.com
    NS      4200s      ns2.abc.com
    NS      4200s      a.abc.com       ns2.abc.com
    MX      3600s      a.mail.abc.com  10
    MX      2700s      b.mail.abc.com  20
    CNAME   5000s      a.test.abc.com  abc1.abc.com
    CNMAE   3600s      b.test.abc.com  abc2.abc.com
    TXT     5000s      v=spf1 include:spf.abcmail.abc.com.cn -all
    SRV     --       _ http._tcp.example.com. www.example.com 5 10 80
```

Table 30 Command output

Field	Description
Zone	Domain name of the DNS forward zone.
TTL	TTL of the resource record in the DNS forward zone, in seconds.
SOA	Start of Authority (SOA) information.
Responsible mail	Email address of the domain administrator.
Serial	Domain serial number.
Retry	Retry interval in seconds.
Expire	Expiration time in seconds.
Min TTL	Minimum TTL in seconds.
Record list	List of resource records.
Type	Resource record type: • **MX**—Mail exchange record. • **CNAME**—Canonical name record. • **NS**—Name server record.

Field	Description
	• **SRV**—Service location record. • **TXT**—Text record.
TTL	TTL of the resource record, in seconds.
RDATA	Resource data.

display parameter-profile

Use **display parameter-profile** to display parameter profile information.

Syntax

display parameter-profile [**name** *parameter-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

name *parameter-name*: Specifies a parameter profile by its name, a case-insensitive string of 1 to 63 characters. If you do not specify this option, the command displays information about all parameter profiles.

Examples

Display information about all parameter profiles.

```
<Sysname> display parameter-profile
Parameter profile: pp1
  Description:
  Type: IP
  IP ToS: 20

Parameter profile: pp2
  Description:
  Type: TCP
  Exceed MSS: Allow
  TCP window size: 65535
  TCP connection idle-timeout: 10
  Time-wait timeout: 5
  Keepalive idle-timeout: 300
  Keepalive retransmission interval: 3
  Keepalive retransmission count: 5
  SYN retransmission-timeout: 5
  Fin-wait1 timeout: 6
  Fin-wait2 timeout: 10
```

```
  Src-addr-option:
    Option number: 29
    Encoding: string
  TCP option insert:
    Option number: 28
    Value: src-ip
    Encoding: string
  TCP option remove:
    Option number: 8
  TCP option remove:
    Option number: 5

Parameter profile: pp3
  Description:
  Type: HTTP
  Rebalance per request: Enabled
  Server connection reuse: Enabled
  Case insensitive: Enabled
  Header modify per request: Enabled
  Content maximum parse length: 8192
  Header maximum parse length: 8192
  Secondary cookie delimiters: !@#$
  Secondary cookie start: ?
  Encrypted cookie name: cookie1
  Header exceed length: Drop

Parameter profile: compress
  Description:
  Type: HTTP compression
  Compression level: 1
  Prefer method: Gzip
  Content length threshold: 1024
  Memory size: 8KB
  Window size: 16KB
  Header Insert: Enabled
  Header Delete: Enabled
  Request version all: Disabled
  Rule 1: Permit url abc

Parameter profile: urlstat
  Description:
  Type: HTTP-statistics
  Node: bank1
    Description:
    rule 1 url url1
    rule 2 url url2
  Node: bank2
    Description:
```

```
    rule 1 url url3
    rule 2 url url4
  Object group name:
    ObjGrp1
    ObjGrp2

Parameter profile: pp4
  Description:
  Type: OneConnect
  Max reuse times: 1000
  Idle time: 10000
  IPv4 source mask length: 24
  IPv6 source prefix length: 120

Parameter profile: pp5
  Description:
  Type: TCP-application
  Match-buffer-time: 5
  Match-buffer-size: 4096
  Match-buffer-end: YY

Parameter profile: pp6
  Description:
  Type: MySQL
  Pool size: 2000
  Server connection reuse: Enabled
  Max reuse times: 1000
  Idle time: 10000 sec
  IPv4 source mask length: 24
  IPv6 source prefix length: 120
```

Table 31 Command output

Field	Description
Parameter profile	Parameter profile name.
Description	Description for the parameter profile.
Type	Parameter profile type: • IP. • HTTP. • HTTP-compression. • HTTP statistics. • MySQL. • OneConnect. • TCP. • TCP-application.
IP ToS	ToS field of the IP packets sent to the server.
Exceed MSS	Action to take on the segments that exceed the MSS in the HTTP requests sent by the client: • **Allow**—Allows the segments to exceed the MSS.

Field	Description
	• **Drop**—Discards the segments that exceed the MSS.
Rebalance per request	Whether or not to enable load balancing for each HTTP request.
Pool size	Size of the MySQL connection pool.
Server connection reuse	Whether or not to reuse the connection between the LB device and the server.
Header modify per request	Whether or not to perform the insert, delete, or modify operation for the header of each HTTP request or response packet.
Case insensitive	Whether or not to enable case sensitivity for matching character strings.
Content maximum parse length	Maximum length of the HTTP entities that can be parsed.
Header maximum parse length	Maximum length of the HTTP headers that can be parsed.
Secondary cookie delimiters	Delimiters that can separate secondary cookies in URLs.
Secondary cookie start	Start delimiter for secondary cookies in URLs.
Encrypted cookie name	Cookie enabled with encryption.
Header exceed length	Action to take on the HTTP requests or responses when their packet headers exceed the maximum length: • **Continue**—Continues to perform load balancing. • **Drop**—Stops performing load balancing, discards the packet, and terminates the connection.
TCP window size	Maximum local window size for TCP connections.
TCP connection idle-timeout	Idle timeout time for TCP connections, in seconds.
Time-wait timeout	TIME_WAIT state timeout time for TCP connections, in seconds.
Keepalive idle-timeout	Idle timeout time for sending TCP keepalive packets.
Keepalive retransmission interval	Retransmission interval for TCP keepalive packets.
Keepalive retransmission count	Retransmission times for TCP keepalive packets.
SYN retransmission-timeout	Retransmission timeout time for TCP SYN packets
Fin-wait1 timeout	FIN-WAIT-1 state timeout time for TCP connections.
Fin-wait2 timeout	FIN-WAIT-2 state timeout time for TCP connections.
Node	Statistics node name and all URL match rules configured for the statistics node.
Object group name	IP address object groups used by the HTTP statistics parameter profile.
Max reuse times	Maximum number of times a TCP connection can be reused.
Idle time	Idle timeout time for TCP connections, in seconds.
IPv4 source mask length	Mask length for connection reuse.
IPv6 source prefix length	Prefix length for connection reuse.

Field	Description
Match-buffer-time	Buffering period for TCP payload matching, in seconds.
Match-buffer-size	Maximum buffering size for TCP payload matching.
Match-buffer-end	Buffering end string for TCP payload matching.
Src-addr-option	TCP option for SNAT address translation.
Option number	TCP option number
Encoding	Encoding mode for the TCP option: • **binary**. • **string**.
TCP option insert	Inserts contents into a TCP option.
Value	Contents to insert into the TCP option
TCP option remove	Removes a TCP option.

display real-server

Use **display real-server** to display real server information or server farm member information.

Syntax

display real-server [**brief** | **name** *real-server-name*]

display real-server server-farm *server-farm-name* [**name** *real-server-name port port-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

brief: Displays brief real server information. If you do not specify this keyword, the command displays detailed real server information.

name *real-server-name*: Displays information about the specified real server. The *real-server-name* argument specifies a real server name, a case-insensitive string of 1 to 63 characters. If you do not specify this option, the command displays information about all real servers.

server-farm *server-farm-name*: Displays information about members of a server farm. The *server-farm-name* argument specifies a server farm by its name, a case-insensitive string of 1 to 63 characters.

name *real-server-name* **port** *port-number*: Displays information about a server farm member. The *real-server-name* argument specifies a server farm member by its name, a case-insensitive string of 1 to 63 characters. The *port-number* argument specifies the port number of the server farm member, in the range of 0 to 65535. If you do not specify this option, the command displays information about all members of a server farm.

Examples

Display brief information about all real servers.

```
<Sysname> display real-server brief
Real server      Address              Port  State     VPN instance     Server farm
rs1              192.168.1.1          0     Active    vpn1             sf
rs2              192.168.1.2          0     Busy                       sf
rs3              192.168.1.3          0     Active                     sf
```

Display detailed information about the real server **rs**.

```
<Sysname> display real-server name rs
Real server: rs
  Description: Real server RS
  State: Active
  VPN instance:
  Inherit VPN: Enable
  IPv4 address: 1.1.1.1
  IPv6 address: 1001::1
  Port: 0 (port number in original packet)
  Server farm: sf
  Weight: 150
  Priority: 3
  Cost: 100
  Slow shutdown: Enabled
  Connection limit: 10000
  Rate limit:
    Connections: 10000
    Bandwidth: 10000 kbps
    Inbound bandwidth: 5000 kbps
    Outbound bandwidth: 5000 kbps
  Bandwidth busy:
    Max bandwidth: 10000 kbps
    Max inbound bandwidth: 5000 kbps
    Max outbound bandwidth: 5000 kbps
    Busy rate: 80
    Inbound busy rate: 70
    Outbound busy rate: 60
    Busy recovery rate: 60
    Inbound busy recovery rate: 60
    Outbound busy recovery rate: 60
  Probe log: Enabled
  Probe information:
    Dynamic weight: 1
    SNMPDCA busy state: Normal
    Probe success criteria: All
    Probe method                   State
    t4                             Succeeded
    External-monitor method        State
    test_external                  Succeeded
    test_external2                 Succeeded
```

Display information about all members of server farm **sf**.

```
<Sysname> display real-server server-farm sf
Server farm: sf
  Real server: rs1
    Description: real server 1
    Parent state: Inactive
    State: Inactive
    Port: 2
    Weight: 2
    Priority: 2
    Slow shutdown: Disabled
    Connection limit: --
    Connection rate limit: --
    Probe log: Enabled
    Probe information:
      Probe success criteria: All
      Probe method                      State
      icmp                              Failed
      External-monitor method         State
      test_external                   Succeeded
      test_external2                  Succeeded

  Real server: rs2
    Description: real server 2
    Parent state: Inactive
    State: Inactive
    Port: 80
    Weight: 100
    Priority: 4
    Slow shutdown: Disabled
    Connection limit: --
    Connection rate limit: --
    Probe log: Enabled
    Probe information:
      Probe success criteria: All
      Probe method                      State
      tcp                               Failed
    Variable information:
      Variable name: variable
      Variable value: 2
```

Table 32 Command output

Field	Description
Real server	Real server name.
Address	IPv4 address of the real server.
Port	Port number of the real server. 0 means the port number in the packet is used.
Parent state/State	Real server state/Server farm member state:

Field	Description
	• **Active**—The real server is available. • **Busy**—The real server is busy. When the real server is in **Active** or **Ramp** state and enabled with bandwidth statistics collection and link protection, this field displays **Busy** if the maximum expected bandwidth is reached. • **Inactive**—The real server is unavailable, because the configuration is not complete, the server is not referenced, or the virtual server is not enabled. • **Probe-failed**—Health monitoring has failed. • **Ramp**—Ramp-up phase of slow online. • **Shutdown**—The real server is shut down. • **Standby**—Standby phase of slow online. • **Unknown**—Health monitoring is not configured. • **Auto shutdown**—The real server is automatically shut down when the RST or zero-window packet threshold is reached or the number of probe times is reached.
VPN instance	VPN instance to which the real server belongs.
Inherit VPN	VPN instance inheritance: **Enabled** or **Disabled**.
Server farm	Server farm of the real server.
Description	Description for the real server.
IPv4 address	IPv4 address of the real server.
IPv6 address	IPv6 address of the real server.
Weight	Weight of the real server.
Priority	Priority of the real server.
Cost	Cost for proximity calculation.
Slow shutdown	Slow offline state of the real server: • Disabled. • Enabled.
Connection limit	Maximum number of connections for the real server.
Connection rate limit	Maximum number of connections per second for the real server.
Rate limit	Rate limit of the real server.
Connections	Maximum number of connections per second for the real server.
Bandwidth	Maximum bandwidth for the real server in kbps.
Inbound bandwidth	Maximum uplink bandwidth for the real server in kbps.
Outbound bandwidth	Maximum downlink bandwidth for the real server in kbps.
Max bandwidth	Maximum expected bandwidth for the real server in kbps.
Max inbound bandwidth	Maximum uplink expected bandwidth for the real server in kbps.
Max outbound bandwidth	Maximum downlink expected bandwidth for the real server in kbps.
Busy rate	Bandwidth ratio for the real server.
Inbound busy rate	Inbound bandwidth ratio for the real server.
Outbound busy rate	Outbound bandwidth ratio for the real server.
Busy recovery rate	Bandwidth recovery ratio for the real server.

Field	Description
Inbound busy recovery rate	Inbound bandwidth recovery ratio for the real server.
Outbound busy recovery rate	Outbound bandwidth recovery ratio for the real server.
Dynamic weight	Dynamic weight calculated by using the dynamic round robin algorithm. This field displays a weight value only if the dynamic round robin algorithm is used. If any other algorithm is used, this field displays two hyphens (**--**).
SNMPDCA busy state	Busy state obtained by using the dynamic round robin algorithm: **Normal** or **Busy**. If the dynamic round robin algorithm is not used, this field displays two hyphens (**--**).
Probe log	Health monitoring logging state of the real server: • Disabled. • Enabled.
Probe success criteria	Health monitoring success criteria for the real server: • **All**—Health monitoring succeeds only when all the specified health monitoring methods succeed. • **At least X**—Health monitoring succeeds when a minimum of *X* health monitoring methods succeed.
Probe method	Name of the NQA template used by the health monitoring method.
State	State of the health monitoring method (custom monitoring or NQA): • **Failed**—Health monitoring has failed. • **In progress**—Health monitoring is in progress. • **Invalid**—Health monitoring is unavailable (because the configuration of the NQA template is not complete), or the real server is unavailable. • **Succeeded**—Health monitoring has succeeded.
External-monitor method	Custom monitoring method.

display real-server statistics

Use **display real-server statistics** to display real server statistics or server farm member statistics.

Syntax

display real-server statistics [**name** *real-server-name*] [**slot** *slot-number*]

display real-server statistics server-farm *server-farm-name* [**name** *real-server-name* **port** *port-number*] [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

name *real-server-name*: Specifies a real server by its name, a case-insensitive string of 1 to 63 characters. If you do not specify this option, the command displays statistics for all real servers.

server-farm *server-farm-name*: Displays statistics for members of a server farm. The *server-farm-name* argument specifies a server farm by its name, a case-insensitive string of 1 to 63 characters.

name *real-server-name* **port** *port-number*: Displays statistics for a server farm member. The *real-server-name* argument specifies a server farm member by its name, a case-insensitive string of 1 to 63 characters. The *port-number* argument specifies the port number of the server farm member, in the range of 0 to 65535. If you do not specify this option, the command displays statistics for all members of a server farm.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays real server statistics for all member devices.

Examples

Display statistics for the real server **rs**.

```
<Sysname> display real-server statistics name rs
Real server: rs
  Total connections: 1798
  Active connections: 788
  Max connections: 803
    recorded at 11:02:49 on Tue May 21 2019
  Connections per second: 157
  Max connections per second: 163
    recorded at 11:02:49 on Tue May 21 2019
  Server input: 333332 bytes
  Server output: 472054 bytes
  Throughput: 4396 bps
  Inbound throughput: 1214 bps
  Outbound throughput: 3128 bps
  Max throughput: 4564 bps
    recorded at 11:02:49 on Tue May 21 2019
  Max inbound throughput: 1214 bps
    recorded at 11:02:49 on Tue May 21 2019
  Max outbound throughput: 3320 bps
    recorded at 11:02:49 on Tue May 21 2019
  Received packets: 1798
  Sent packets: 0
  Dropped packets: 0
  Received packets per second: 0
  Sent packets per second: 0
  Received requests: 0
  Dropped requests: 0
  Sent responses: 0
  Dropped responses: 0
  Connection failures: 1
  Busy state: Busy
```

Display statistics for all members of server farm **sf**.

```
<Sysname> display real-server statistics server-farm sf
```

```
Server farm: sf
  Real server: rs1
    Total connections: 0
    Active connections: 0
    Max connections: 0
      recorded at 11:02:49 on Tue May 21 2019

Max RST probe protection times: 9
Zero-window packet percentage: 10
Max zero-window packet percentage: 50
Zero-window probe protection times: 2
Max zero-window probe protection times: 8
Abnormal URL times: 10
Max abnormal URL times: 20
```

Table 33 Command output

Field	Description
Real server	Real server name.
Total connections	Total number of connections.
Active connections	Number of active connections.
Max connections	Maximum number of connections.
Connections per second	Number of connections per second.
Max connections per second	Maximum number of connections per second.
Server input	Traffic (in bytes) received by the server.
Server output	Traffic (in bytes) sent by the server.
Throughput	Total packet throughput in bps.
Inbound throughput	Inbound packet throughput in bps.
Outbound throughput	Outbound packet throughput in bps.
Max throughput	Maximum packet throughput in bps.

Field	Description
Max inbound throughput	Maximum inbound packet throughput in bps.
Max outbound throughput	Maximum outbound packet throughput in bps.
Received packets	Number of received packets.
Sent packets	Number of sent packets.
Dropped packets	Number of dropped packets.
Received requests	Number of received HTTP request packets. This field is displayed only for Layer 7 real servers.
Dropped requests	Number of dropped HTTP request packets. This field is displayed only for Layer 7 real servers.
Sent responses	Number of sent HTTP response packets. This field is displayed only for Layer 7 real servers.
Dropped responses	Number of dropped HTTP response packets. This field is displayed only for Layer 7 real servers.
Connection failures	Number of connection establishment failures.
Busy state	Real server state: • **--**—Unavailable. • **Normal**. • **Busy**.
RST packets	Number of RST packets sent by the real server during the monitoring time.
Max RST packets	Maximum number of RST packets sent by the real server during the monitoring time.
RST probe protection times	Number of probe times for the RST LB probe template.
Max RST probe protection times	Maximum number of probe times for the RST LB probe template.
Zero-window packet percentage	Percentage of zero-window packets sent by the real server during the monitoring time.
Max zero-window packet percentage	Maximum percentage of zero-window packets sent by the real server during the monitoring time.
Zero-window probe protection times	Number of probe times for the zero-window LB probe template.
Max zero-window probe protection times	Maximum number of probe times for the zero-window LB probe template.
Abnormal URL times	Number of URL error times during the current monitoring time during the monitoring time.
Max abnormal URL times	Maximum number of URL error times during the monitoring time.

Related commands

`reset real-server statistics`

display server-farm

Use **`display server-farm`** to display server farm information.

Syntax

display server-farm [**brief** | **name** *server-farm-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

brief: Displays brief server farm information. If you do not specify this keyword, the command displays detailed server farm information.

name *server-farm-name*: Displays information about the specified server farm. The *server-farm-name* argument specifies a server farm name, a case-insensitive string of 1 to 63 characters. If you do not specify this option, the command displays information about all server farms.

Examples

Display brief information about all server farms.

```
<Sysname> display server-farm brief
Predictor: RR - Round robin, RD - Random, LC - Least connection,
           BW – Bandwidth, MBW – Max bandwidth,
           IBW – Inbound bandwidth, OBW – Outbound bandwidth,
           MIBW – Max inbound bandwidth, MOBW – Max outbound bandwidth,
           HASH(SIP) - Hash address source IP,
           HASH(DIP) - Hash address destination IP,
           HASH(SIP-PORT) - Hash address source IP-port
           LT - Least time, DRR - Dynamic round robin
           CARP(SIP) - CARP address source IP
           CARP(DIP) - CARP address destination IP
           CARP(SIP-PORT) - CARP address source IP-port
           CARP(HTTP) - CARP HTTP payload
           HASH(HTTP) - Hash HTTP payload
NAT/SNAT: Y - Enabled, N - Disabled

Server farm       Predictor       NAT  SNAT  Total  Active
sf                RR              Y    N     3      3
```

Display detailed information about all server farms.

```
<Sysname> display server-farm
Server farm: sf1
  Description:
  Predictor: Hash address
  Proximity: Disabled
  NAT: Enabled
  SNAT mode: snat-pool sp
  Failed action: Keep
```

```
Active threshold: Enabled
  Lower: 80
  Upper: 90
Slow-online: Enabled
Standby time: 5s
Ramp-up time: 10s
Selected server: Enabled
  Min server: 100
  Max server: 600
Busy action: Enqueue
  Queue length: 11
  Queue timeout: 12
Probe information:
  Probe success criteria: All
  Probe method:
  aaa
  bbb
  ccc
TCP RST probe template: aaa
TCP zero-window probe template: bbb
HTTP passive probe template: ccc
Auto-shutdown recovery time: 30
Total real server: 1
Active real server: 1
Real server list:
Name      State         VPN instance     Address    Port  Weight Priority  LT-weight
rs1       Inactive                       1.2.3.4    0     4      100       50
rs2       Auto shutdown                  1.2.3.4    0     4      100       50
```

Table 34 Command output

Field	Description
Server farm	Server farm name.
Predictor	Scheduling algorithm of the server farm: • **RR**—Weighted round robin algorithm. • **RD**—Random algorithm. • **LC**—Weighted least connection algorithm. • **BW**—Bandwidth algorithm. • **IBW**—Inbound bandwidth algorithm. • **OBW**—Outbound bandwidth algorithm. • **MBW**—Maximum bandwidth algorithm. • **MIBW**—Maximum inbound bandwidth algorithm. • **MOBW**—Maximum outbound bandwidth algorithm. • **HASH(SIP)**—Hash algorithm based on source IP address. • **HASH(DIP)**—Hash algorithm based on destination IP address. • **HASH(SIP-PORT)**—Hash algorithm based on source IP address and port number. • **LT**—Least time algorithm. • **DRR**—Dynamic round robin algorithm. • **CARP(SIP)**—CARP hash algorithm based on source IP address.

Field	Description
	• **CARP(DIP)**—CARP hash algorithm based on destination IP address. • **CARP(SIP-PORT)**—CARP hash algorithm based on source IP address and port number. • **CARP(HTTP)**—CARP hash algorithm based on HTTP content. • **HASH(HTTP)**—Hash algorithm based on HTTP content.
NAT	NAT state of the server farm: • **N**—Disabled. • **Y**—Enabled.
SNAT	SNAT state of the server farm: • **N**—Disabled. • **Y**—Enabled.
Total	Total number of real servers.
Active	Number of active real servers.
Description	Description for the server farm.
Proximity	Proximity state of the server farm: • Disabled. • Enabled.
NAT	NAT state of the server farm: • **Disabled**—NAT is not configured. • **Enabled**. • **Disabled (no license)**—NAT is disabled because of lack of license.
SNAT mode	SNAT translation mode: • **auto-map**—Automatic mapping mode. • **tcp-option**—TCP option mode. • **snat-pool**—SNAT pool mode, which uses the SNAT address pool (specified by its name) to perform address translation.
Failed action	Fault processing method of the server farm: • **Keep**—Keeps existing connections. • **Reschedule**—Redirects connections. • **Reset**—Terminates existing connections.
Active threshold	State of the criteria to determine that the server farm is available: disabled or enabled. If the state is enabled, the following fields are displayed: • **Lower**—Lower percentage value. • **Upper**—Upper percentage value.
Slow-online	State of the slow online feature: disabled or enabled. If the state is enabled, the following fields are displayed: • Standby time. • Ramp-up time.
Selected server	State of real server limit to participate in scheduling: disabled or enabled. If the state is enabled, the following fields are displayed: • **Min server**—Minimum number of real servers that participate in scheduling. • **Max server**—Maximum number of real servers that participate in scheduling.
Probe success criteria	Health monitoring success criteria for the real server: • **All**—Health monitoring succeeds only when all the specified health monitoring methods succeed. • **At least**—Health monitoring succeeds when a specified minimum number of health monitoring methods succeed.

Field	Description
Busy action	Action to take when the server farm is busy: • **Drop**. • **Enqueue**. • **Force**.
Queue length	This field is displayed only if the busy action is **Enqueue**.
Queue timeout	This field is displayed only if the busy action is **Enqueue**.
Probe method	Name of the NQA template used by the health monitoring method.
Total real server	Total number of real servers.
Active real server	Number of active real servers.
Name	Real server name.
State	Real server state: • **Active**—The real server is available. • **Busy**—The real server is busy. When the real server is in **Active** or **Ramp** state and enabled with bandwidth statistics collection and link protection, this field displays **Busy** if the maximum expected bandwidth is reached. • **Inactive**—The real server is unavailable, because the configuration is not complete, the server is not referenced, or the virtual server is not enabled. • **Probe-failed**—Health monitoring has failed. • **Ramp**—Ramp-up phase of slow online. • **Shutdown**—The real server is shut down. • **Standby**—Standby phase of slow online. • **Unknown**—Health monitoring is not configured. • **Auto shutdown**—The real server is automatically shut down when the RST or zero-window packet threshold is reached or the number of probe times is reached.
Address	IPv4 and IPv6 addresses of the real server.
Port	Port number of the real server.
Weight	Weight of the real server.
Priority	Priority of the real server.
LT-weight	Weight calculated by using the least time algorithm. This field displays a weight value only if the least time algorithm is used. If any other algorithm is used, this field displays two hyphens (**--**).
TCP RST probe template	TCP-RST LB probe template referenced by the server farm. This field is displayed only if a TCP-RST LB probe template is referenced.
TCP zero-window probe template	TCP zero-window LB probe template referenced by the server farm. This field is displayed only if a TCP zero-window LB probe template is referenced.
HTTP passive probe template	HTTP passive LB probe template referenced by the server farm. This field is displayed only if an HTTP passive LB probe template is referenced.
Auto-shutdown recovery time	Automatic recovery time for intelligent monitoring, in minutes.

display sticky dns-proxy

Use **display sticky dns-proxy** to display sticky entry information for transparent DNS proxies.

Syntax

display sticky dns-proxy [**dns-proxy-name** *dns-proxy-name*] [**class** { *class-name* | **default-class** } | **client-addr** { *ipv4-address* | *ipv6-address* } | **dns-server-addr** { *ipv4-address* | *ipv6-address* } | **dns-server-pool** *pool-name* | **dns-server-port** *port-number* | **key** *sticky-key*] * [**brief**] [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

dns-proxy *dns-proxy-name*: Specifies a transparent DNS proxy by its name, a case-insensitive string of 1 to 63 characters. If you do not specify this option, the command displays sticky entry information for all transparent DNS proxies.

class { *class-name* | **default-class** }: Specifies an LB class by its name, a case-insensitive string of 1 to 63 characters, or specifies the default LB class.

client-addr { *ipv4-address* | *ipv6-address* }: Specifies a client by its IPv4 or IPv6 address.

dns-server-addr { *ipv4-address* | *ipv6-address* }: Specifies a DNS server by its IPv4 or IPv6 address.

dns-server-pool *pool-name*: Specifies a DNS server pool by its name, a case-insensitive string of 1 to 63 characters.

dns-server-port *port-number*: Specifies a DNS server port number in the range of 0 to 65535.

key *sticky-key*: Specifies a key value, a case-sensitive string of 1 to 36 characters.

brief: Displays brief information about sticky entries. If you do not specify this keyword, the command displays detailed information about sticky entries.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays sticky entry information for all member devices.

Examples

Display detailed sticky entry information for all transparent DNS proxies.

```
<Sysname> display sticky dns-proxy
  DNS proxy name: dsp1
  DNS server pool name: dns-pool
  Class: cl
  Sticky type: Address-port
  Sticky method: Source IP
```

```
  Sticky key: 3.0.0.13
  DNS proxy addr: 33.44.1.1:80
  DNS server addr: 7.0.0.7:80
  Client addr: 3.0.0.1
  Timeout: 100 sec
  Expiration time: 58 sec
```

Display brief sticky entry information for all transparent DNS proxies.

```
<Sysname> display sticky dns-proxy brief
Sticky type      Sticky method   Sticky key        DNS proxy      DNS server addr
Address-port     Src IP          3.0.0.13          dsp1           7.0.0.7:80
Address-port     Src IP          3.0.0.15          dsp2           7.0.0.8:80
```

Table 35 Command output

Field	Description
Sticky group name	Name of the sticky group that generates the sticky entries.
Sticky method	Sticky method corresponding to the sticky entries: • **Src IP**—Source IPv4 address sticky method. • **Src IPv6**—Source IPv6 address sticky method. • **Src IP and port**—Source IPv4 address + source port sticky method. • **Src IPv6 and port**—Source IPv6 address + source port sticky method. • **Dst IP**—Destination IPv4 address sticky method. • **Dst IPv6**—Destination IPv6 address sticky method. • **Dst IP and port**—Destination IPv4 address + destination port sticky method. • **Dst IPv6 and port**—Destination IPv6 address + destination port sticky method. • **Both IP**—Source IPv4 address + destination IPv4 address sticky method. • **Both IPv6**—Source IPv6 address + destination IPv6 address sticky method. • **Both IP and port**—Source IPv4 address + source port + destination IPv4 address + destination port sticky method. • **Both IPv6 and port**—Source IPv6 address + source port + destination IPv6 address + destination port sticky method.
Sticky key	Key value corresponding to the sticky entry.
Timeout	Configured timeout time for sticky entries, in seconds.
Expiration time	Remaining lifetime of the sticky entry, in seconds.

display sticky statistics

Use **display sticky statistics** to display sticky entry statistics

Syntax

display sticky statistics [**dns-proxy** | **virtual-server**] [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

dns-proxy: Dispalys sticky entry statistics for transparent DNS proxies.

virtual-server: Displays sticky entry statistics for virtual servers.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays sticky entry statistics for all member devices.

Usage guidelines

If you do not specify the **dns-proxy** or **virtual-server** keyword, this command displays statistics for all sticky entries.

Examples

Display sticky entry statistics for virtual servers.

```
<Sysname> display sticky statistics virtual-server
Virtual server:
Total sticky entries for all sticky types: 27000
  Sticky type     Sticky method     Total sticky entries     Synced sticky entries
  Address-port                      12000                    120
                  Src IP            100                      10
                  Src IPv6          100                      10
                  Dst IP            100                      10
                  Dst IPv6          100                      10
                  Both IP           100                      10
                  Both IPv6         100                      10
                  Src IP port       100                      10
                  Src IPv6 port     100                      10
                  Dst IP port       100                      10
                  Dst IPv6 port     100                      10
                  Both IP port      100                      10
                  Both IPv6 port    100                      10
  HTTP header                       5000                     50
                  HTTP version      100                      10

```

Table 36 Command output

Field	Description
Sticky method	Sticky method corresponding to the sticky entries: • **Src IP**—Source IPv4 address sticky method. • **Src IPv6**—Source IPv6 address sticky method. • **Src IP and port**—Source IPv4 address + source port sticky method. • **Src IPv6 and port**—Source IPv6 address + source port sticky method. • **Dst IP**—Destination IPv4 address sticky method. • **Dst IPv6**—Destination IPv6 address sticky method. • **Dst IP and port**—Destination IPv4 address + destination port sticky method. • **Dst IPv6 and port**—Destination IPv6 address + destination port sticky method. • **Both IP**—Source IPv4 address + destination IPv4 address sticky method. • **Both IPv6**—Source IPv6 address + destination IPv6 address sticky method. • **Both IP and port**—Source IPv4 address + source port + destination IPv4 address + destination port sticky method. • **Both IPv6 and port**—Source IPv6 address + source port + destination IPv6 address + destination port sticky method. • **HTTP URL**—HTTP URL based sticky method. • **HTTP header name**—HTTP header name based sticky method. • **HTTP version**—HTTP version based sticky method. • **HTTP host**—HTTP host based sticky method. • **HTTP method**—HTTP Request-Method based sticky method. • **HTTP content**—HTTP entity sticky method. • **Cookie get**—HTTP cookie get sticky method. • **Payload**—HTTP or UDP payload sticky method. • **HTTP passive**—HTTP passive sticky method. • **Payload passive**—UDP payload passive sticky method. • **TCP payload**—TCP payload sticky method. • **RADIUS IP**—Sticky method based on the Framed-IP-Address attribute of RADIUS packets. • **RADIUS ID**—Sticky method based on the specified attribute of RADIUS packets. • **SIP Call-ID**—Sticky method based on the Call-ID header field of SIP packets. • **SSL session ID**—SSL sticky method based on SSL session ID.

Field	Description
Synced sticky entries	Number of sticky entries synchronized from other devices or other cards on the local deivce.

display sticky virtual-server

Use **display sticky virtual-server** to display sticky entry information for virtual servers.

Syntax

display sticky virtual-server [**virtual-server-name** *virtual-server-name*] [[**link** { **ip** *ipv4-address* | **ipv6** *ipv6-address* | **interface** { *interface-type interface-number* | *interface-name* } } | **link-group** *link-group-name*] * | [**real-server-addr** { *ipv4-address* | *ipv6-address* } | **real-server-port** *port-number* | **server-farm** *server-farm-name* | **text** *text*] *] [**class** { *class-name* | **default-class** } | **client-addr** { *ipv4-address* | *ipv6-address* } | **sticky-type** { **address-port** | **http-content** | **http-cookie** | **http-header** | **http-passive** | **payload** | **radius** | **sip** | **ssl** | **tcp-payload** | **udp-passive** } [**key** *sticky-key*]] * [**brief**] [**slot** *slot-number*]

Parameters

virtual-server *virtual-server-name*: Specifies a virtual server by its name, a case-insensitive string of 1 to 63 characters. If you do not specify this option, the command displays sticky entry information for all virtual servers.

link { **ip** *ipv4-address* | **ipv6** *ipv6-address* | **interface** { *interface-type interface-number* | *interface-name* } }: Specifies a link by its IPv4 address, IPv6 address, or output interface.

link-group *link-group-name*: Specifies a link group by its name, a case-insensitive string of 1 to 63 characters.

real-server-addr { *ipv4-address* | *ipv6-address* }: Specifies a real server by its IPv4 or IPv6 address.

real-server-port *port-number*: Specifies a real server port number in the range of 0 to 65535.

server-farm *server-farm-name*: Specifies a server farm by its name, a case-insensitive string of 1 to 63 characters.

text *text*: Specifies a text string to match. The string is case sensitive and can contain 1 to 63 characters.

class { *class-name* | **default-class** }: Specifies an LB class by its name, a case-insensitive string of 1 to 63 characters, or specifies the default LB class.

client-addr { *ipv4-address* | *ipv6-address* }: Specifies a client by its IPv4 or IPv6 address.

sticky-type { **address-port** | **http-content** | **http-cookie** | **http-header** | **http-passive** | **payload** | **radius** | **sip** | **ssl** | **tcp-payload** | **udp-passive** }: Specifies a sticky group type.

key *sticky-key*: Specifies a key value, a case-sensitive string of 1 to 36 characters. If you do not specify key value, this command displays sticky entries for all key values.

brief: Displays brief information about sticky entries. If you do not specify this keyword, the command displays detailed information about sticky entries.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays sticky entry information for all member devices.

Examples

Display detailed sticky entry information for all virtual servers.

```
<Sysname> display sticky virtual-server
  Virtual server name: vs
  Server farm name: sf
  Class: cla
  Sticky type: Address-port
  Sticky method: Source IP
  Sticky key: 3.0.0.13
  Virtual server addr: 33.44.1.1:80
  Real server addr: 7.0.0.7:80
  Client addr: 3.0.0.13
  Timeout: 100 sec
  Expiration time: 58 sec

----------------------------------------
  Virtual server name: vs1
  Server farm name: sf_http
  Class: Default Class
  Sticky type: HTTP header
  Sticky method: HTTP header name
  Sticky key: cb3bae31bb1c443fbf3db8889055f2fe
  Text: a1b2c3d4e5
  Virtual server addr: 33.44.1.2:80
  Real server addr: 7.0.0.7:80
  Client addr: 3.0.0.13
  Timeout: 100 sec
  Expiration time: 58 sec

----------------------------------------
  Virtual server name: vs2
  Link group name: lg
  Class: cl2
  Sticky type: Address-port
  Sticky method: Source IP
  Sticky key: 3.0.0.15
  Virtual server addr: 0.0.0.0:0
  link: 20.1.1.1
  Client addr: 3.0.0.15
```

```
  Timeout: 100 sec
  Expiration time: 58 sec
```

Display brief sticky entry information for all virtual servers.

```
<Sysname> display sticky virtual-server brief
Sticky type    Sticky method    Sticky key      Virtual server      Real-server/link
Address-port   Src IP           3.0.0.13        vs                  7.0.0.7:80
Address-port   Src IP           3.0.0.15        vs2                 20.1.1.1
```

Table 37 Command output

Field	Description
Sticky group name	Name of the sticky group that generates the sticky entries.
Sticky method	Sticky method corresponding to the sticky entries: • **Src IP**—Source IPv4 address sticky method. • **Src IPv6**—Source IPv6 address sticky method. • **Src IP and port**—Source IPv4 address + source port sticky method. • **Src IPv6 and port**—Source IPv6 address + source port sticky method. • **Dst IP**—Destination IPv4 address sticky method. • **Dst IPv6**—Destination IPv6 address sticky method. • **Dst IP and port**—Destination IPv4 address + destination port sticky method. • **Dst IPv6 and port**—Destination IPv6 address + destination port sticky method. • **Both IP**—Source IPv4 address + destination IPv4 address sticky method. • **Both IPv6**—Source IPv6 address + destination IPv6 address sticky method. • **Both IP and port**—Source IPv4 address + source port + destination IPv4 address + destination port sticky method. • **Both IPv6 and port**—Source IPv6 address + source port + destination IPv6 address + destination port sticky method. • **HTTP URL**—HTTP URL based sticky method. • **HTTP header name**—HTTP header name based sticky method. • **HTTP version**—HTTP version based sticky method. • **HTTP host**—HTTP host based sticky method. • **HTTP method**—HTTP Request-Method based sticky method. • **HTTP content**—HTTP entity sticky method. • **Cookie get**—HTTP cookie get sticky method. • **Payload**—HTTP or UDP payload sticky method. • **HTTP passive**—HTTP passive sticky method. • **Payload passive**—UDP payload passive sticky method. • **TCP payload**—TCP payload sticky method. • **Framed-IP-Address**—Sticky method based on the Framed-IP-Address attribute of RADIUS packets. • **User-Name**—Sticky method based on the User-Name attribute of RADIUS packets. • **Code=***attribute-code*—Sticky method based on the attribute (specified by *attribute-code*) of RADIUS packets. • **SIP Call-ID**—Sticky method based on the Call-ID header field of SIP packets. • **SSL session ID**—SSL sticky method based on SSL session ID.
Sticky key	Key value corresponding to the sticky entry.
Timeout	Configured timeout time for sticky entries, in seconds. **indefinite** indicates not aging.
Expiration time	Remaining lifetime of the sticky entry, in seconds.

display sticky-group

Use **display sticky-group** to display sticky group information.

Syntax

display sticky-group [**name** *group-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

name *group-name*: Specifies a sticky group by its name, a case-insensitive string of 1 to 63 characters. If you do not specify this option, the command displays information about all sticky groups.

Examples

Display information about all sticky groups.

```
<Sysname> display sticky-group
Sticky group: sg1
  Description:
  Timeout: 60
  Override limit: Disabled
  Stickiness-over-busyness: Enabled
  Matching across services: Enabled
  Matching across virtual servers: Enabled
  Sticky group type: Address-port
    Method: Both IP and port
      Mask: 32

Sticky group: sg2
  Description:
  Timeout: 60
  Override limit: Disabled
  Stickiness-over-busyness: Enabled
  Sticky group type: HTTP header
    Method: HTTP header name
      Name: accept-encoding
      Offset: 4
      Start: gzip
      Length: 10

Sticky group: sg3
  Description:
  Timeout: 60
```

```
  Override limit: Disabled
  Stickiness-over-busyness: Enabled
  Sticky group type: RADIUS
    Method: User-Name

Sticky group: sg4
  Description:
  Timeout: 86400
  Override limit: Disabled
  Stickiness-over-busyness: Disabled
  Sticky group type: HTTP cookie
    Method: HTTP cookie insert
      Name: X-LB
      Domain: test.com
      Path: /test1
      HttpOnly: Enabled
      Secure: Enabled
  Check all packets: Disabled
```

Table 38 Command output

Field	Description
Sticky group	Sticky group name.
Description	Description for the sticky group.
Timeout	Timeout time for sticky entries in seconds. The value **Infinite** indicates that sticky entries never age out.
Override limit	Whether the feature of ignoring the limits for sessions that match sticky entries is enabled: **Enabled** or **Disabled**.
Stickiness-over-busyness	Whether the stickiness-over-busyness feature is enabled: **Enabled** or **Disabled**.
Sticky group type	Sticky group type: • **Address-port**—Address and port. • **HTTP content**—HTTP entity. • **HTTP cookie**. • **HTTP header**. • **HTTP passive**. • **Payload**—HTTP or UDP payload. • **RADIUS**. • **SIP**. • **SSL**. • **UDP passive**. • **TCP payload**.

Table 39 Detailed information for sticky groups

Sticky group type	Field	Description
Address-port	Method	Sticky method: • **Source IP**—Source IPv4 address sticky method. • **Source IPv6**—Source IPv6 address sticky method.

Sticky group type	Field	Description
		• **Source IP and port**—Source IPv4 address + source port sticky method. • **Source IPv6 and port**—Source IPv6 address + source port sticky method. • **Destination IP**—Destination IPv4 address sticky method. • **Destination IPv6**—Destination IPv6 address sticky method. • **Destination IP and port**—Destination IPv4 address + destination port sticky method. • **Destination IPv6 and port**—Destination IPv6 address + destination port sticky method. • **Both IP**—Source IPv4 address + destination IPv4 address sticky method. • **Both IPv6**—Source IPv6 address + destination IPv6 address sticky method. • **Both IP and port**—Source IPv4 address + source port + destination IPv4 address + destination port sticky method. • **Both IPv6 and port**—Source IPv6 address + source port + destination IPv6 address + destination port sticky method.
	Mask	Mask length for the sticky method. This field is displayed only for IPv4 sticky methods.
	Prefix	Prefix length for the sticky method. This field is displayed only for IPv6 sticky methods.
HTTP content	Offset	Offset value of the entity based on the start of the HTTP packet.
	Start	Regular expression that marks the start of the entity.
	End	Regular expression that marks the end of the entity. Either this field or the **Length** field is displayed, but not both of them.
	Length	Length of the entity. Either this field or the **End** field is displayed, but not both of them.
HTTP cookie	Method	Sticky method: • **HTTP cookie insert**—Cookie insert sticky method. • **HTTP cookie rewrite**—Cookie rewrite sticky method. • **HTTP cookie get**—Cookie get sticky method. This field is displayed only for the HTTP cookie sticky method.
	Name	HTTP cookie name. This field is displayed only for the HTTP cookie sticky method.
	Domain	Domain scope of the cookie. This field is displayed only for the HTTP cookie insert sticky method.
	Path	Path scope of the cookie. This field is displayed only for the HTTP cookie insert sticky method.
	Offset	Offset value based on the start of the cookie value. This field is displayed only for the cookie insert sticky method.
	Start	Regular expression that marks the start of the cookie. This field is displayed only for the cookie insert sticky

Sticky group type	Field	Description
		method.
	End	Regular expression that marks the end of the cookie. Either this field or the **Length** field is displayed, but not both of them. This field is displayed only for the cookie insert sticky method.
	Length	Length of the cookie. Either this field or the **End** field is displayed, but not both of them. This field is displayed only for the cookie insert sticky method.
	Cookie secondary name	Name of the secondary cookie to be searched in the URI. This field is displayed only for the cookie insert sticky method.
	HttpOnly	HttpOnly attribute of the cookie. This field is displayed only for the HTTP cookie insert or cookie rewrite sticky method.
	Secure	Secure attribute of the cookie. This field is displayed only for the HTTP cookie insert or cookie rewrite sticky method.
	Check all packets	Whether or not to enable checking for all packets.
HTTP header	Method	Sticky method: • **HTTP host**—HTTP host based sticky method. • **HTTP header name**—HTTP header name based sticky method. • **HTTP method**—HTTP Request-Method based sticky method. • **HTTP URL**—HTTP URL based sticky method. • **HTTP version**—HTTP version based sticky method. This field is displayed only for the HTTP header sticky method.
	Name	HTTP header name. This field is displayed only for the HTTP header name based sticky method.
	Offset	Offset value of the HTTP header based on the start of the HTTP packet. This field is displayed only for the HTTP host or URL based sticky method.
	Start	Regular expression that marks the start of the HTTP header. This field is displayed only for the HTTP host or URL based sticky method.
	End	Regular expression that marks the end of the HTTP header. Either this field or the **Length** field is displayed, but not both of them. This field is displayed only for the HTTP host or URL based sticky method.
	Length	Length of the HTTP header. Either this field or the **End** field is displayed, but not both of them. This field is displayed only for the HTTP host or URL based sticky method.
Payload	Offset	Offset value of the HTTP or UDP payload based on the start of the HTTP packet.
	Start	Regular expression that marks the start of the HTTP or UDP payload.
	End	Regular expression that marks the end of the HTTP or UDP payload. Either this field or the **Length** field is

Sticky group type	Field	Description
		displayed, but not both of them. .
	Length	Length of the HTTP or UDP payload. Either this field or the **End** field is displayed, but not both of them.
RADIUS	Method	Sticky method: • **Framed-IP-Address**—Sticky method based on the Framed-IP-Address attribute of RADIUS packets. • **User-Name**—Sticky method based on the User-Name attribute of RADIUS packets. • **Code=***attribute-code*—Sticky method based on the attribute (specified by *attribute-code*) of RADIUS packets. This field is not displayed if no RADIUS attribute based sticky method is specified.
SIP	Method	Sticky method, which can only be **SIP Call-ID** (SIP sticky method based on the Call-ID header field of SIP packets).
SSL	Method	Sticky method, which can only be **SSL session ID** (SSL sticky method based on SSL session ID). This field is displayed only for the SSL sticky method based on SSL session ID.
HTTP passive	Method	Sticky method: • **HTTP header name**—HTTP header name sticky method. • **HTTP URL**—HTTP URL sticky method. • **HTTP content**—HTTP content sticky method.
	Get	Obtains the specified string in HTTP responses.
	Match	Matches the specified string in HTTP requests.
	Name	HTTP header name. This field is displayed only for the HTTP header name based sticky method.
	Start	Regular expression that marks the start of the HTTP header.
	End	Regular expression that marks the end of the HTTP header. Either this field or the **Length** field is displayed, but not both of them.
	Length	Length of the HTTP header. Either this field or the **End** field is displayed, but not both of them.
UDP passive	Get	Obtains the specified string in UDP responses.
	Match	Matches the specified string in UDP requests.
	Start	Regular expression that marks the start of the UDP payload.
	End	Regular expression that marks the end of the UDP payload. Either this field or the **Length** field is displayed, but not both of them.
	Length	Length of the UDP payload. Either this field or the **End** field is displayed, but not both of them.
TCP payload	Offset	Offset value of the TCP payload based on the start of the TCP packet.
	Start	Regular expression that marks the start of the TCP payload.

Sticky group type	Field	Description
	End	Regular expression that marks the end of the TCP payload. Either this field or the **Length** field is displayed, but not both of them.
	Length	Length of the TCP payload. Either this field or the **End** field is displayed, but not both of them.

display virtual-server

Use **display virtual-server** to display virtual server information.

Syntax

display virtual-server [**brief** | **name** *virtual-server-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

brief: Displays brief virtual server information. If you do not specify this keyword, the command displays detailed virtual server information.

name *virtual-server-name*: Displays information about the specified virtual server. The *virtual-server-name* argument specifies a virtual server name, a case-insensitive string of 1 to 63 characters. If you do not specify this option, the command displays information about all virtual servers.

Examples

Display brief information about all virtual servers.

```
<Sysname> display virtual-server brief
Virtual server   State    Type      VPN instance     Virtual address     Port
vs1              Inactive IP        vpn1             192.168.21.148/32   80
                                                     1111:2222:3333:4444
                                                     :5555:6666:7777:888
                                                     8/128
vs2              Active   HTTP                       61.159.4.100/32     8080
vs3              Active   LINK-IP                    51.139.4.100/32     0
vs4              Active   MySQL                      12.139.5.132/32     3306
```

Display detailed information about all virtual servers.

```

Table 40 Command output

Field	Description
Virtual server	Virtual server name.
State	Virtual server state: • **Active**—The virtual server is available. • **Inactive**—The virtual server is unavailable for any reason other than lack of license and disabled virtual server. • **Inactive (no license)**—The virtual server is unavailable because of lack of license. • **Inactive (disabled)**—The virtual server is unavailable because the virtual server is disabled.
Type	Virtual server type: Fast HTTP, HTTP, IP, MySQL, RADIUS, TCP, UDP, or link-IP.
VPN instance	Name of the VPN instance to which the virtual server belongs.
Virtual address	IPv4 address and mask of the virtual server.
Port	Port number of the virtual server. 0 means any port.
Description	Description of the virtual server.
Virtual IPv4 address	IPv4 address and mask of the virtual server.
Virtual IPv6 address	IPv6 address and prefix of the virtual server.
Primary server farm	Default primary server farm name. **(in use)** indicates the server farm is in use.
Backup server farm	Default backup server farm name. **(in use)** indicates the server farm is in use.
Primary link group	Default primary link group name. **(in use)** indicates the link group is in use.
Backup link group	Default backup link group name. **(in use)** indicates the link group is in use.
Primary sticky	Default primary sticky group name.
Backup sticky	Backup sticky group name. This field is displayed only for HTTP and RADIUS virtual servers.
LB policy	LB policy referenced by the virtual server.
HTTP parameter profile	HTTP parameter profile referenced by the virtual server. This field is displayed only if an HTTP parameter profile is configured.
IP parameter profile	IP parameter profile referenced by the virtual server. This field is displayed only if an IP parameter profile is configured.

Field	Description
TCP parameter profile	TCP parameter profile referenced by the virtual server. This field is displayed only if a TCP parameter profile is configured.
TCP parameter profile (client-side)	Client-side TCP parameter profile referenced by the virtual server. This field is displayed only if a client-side TCP parameter profile is configured.
TCP parameter profile (server-side)	Server-side TCP parameter profile referenced by the virtual server. This field is displayed only if a server-side TCP parameter profile is configured.
OneConnect parameter profile	OneConnect parameter profile referenced by the virtual server. This field is displayed only if a OneConnect parameter profile is configured.
HTTP-statistics parameter profile	HTTP statistics parameter profile referenced by the virtual server. This field is displayed only if an HTTP statistics parameter profile is configured.
TCP-Application parameter profile	TCP-application parameter profile referenced by the virtual server. This field is displayed only if a TCP-application parameter profile is configured.
MySQL parameter profile	MySQL parameter profile referenced by the virtual server. This field is displayed only if a MySQL parameter profile is configured.
DPI application profile	DPI application profile referenced by the virtual server. This field is displayed only if a DPI application profile is configured.
UDP per-packet	State of the per-packet load balancing for UDP traffic: • Disabled. • Enabled. This field is displayed only for UDP virtual servers.
Connection limit	Maximum number of connections of the virtual server.
Rate limit	Rate limit of the virtual server.
Connections	Maximum number of connections per second of the virtual server.
Bandwidth	Maximum bandwidth for the virtual server in kbps.
Inbound bandwidth	Maximum inbound bandwidth for the virtual server in kbps.
Outbound bandwidth	Maximum outbound bandwidth for the virtual server in kbps.
SSL server policy	SSL server policy name. This field is displayed only for HTTP-type virtual servers.
SSL server policies with SNI list	List of SSL server policies with SNIs. This field is displayed only for TCP-type and HTTP-type virtual servers.
Server name indication	Server name indication. This field is displayed only for TCP-type and HTTP-type virtual servers.
SSL client policy	SSL client policy name. This field is displayed only for HTTP-type virtual servers.
Redirect relocation	Redirection URL. This field is displayed only for HTTP-type virtual servers.
Redirect return-code	Status code in the redirection packets. This field is displayed only for HTTP-type virtual servers.
VRRP IPv4 Info	Information about the IPv4 VRRP group bound to the virtual server.
VRRP IPv4 VRID	Virtual router ID of the IPv4 VRRP group bound to the virtual server.
Interface	Interface on which the VRRP group bound to the virtual server is created.
VRRP IPv6 Info	Information about the IPv6 VRRP group bound to the virtual server.
VRRP IPv4 VRID	Virtual router ID of the IPv6 VRRP group bound to the virtual server.
Sticky	Sticky group for the virtual server. This field is displayed only for HTTP-type

Field	Description
	virtual servers.
Connection synchronization	Session extension information synchronization state: **Enabled** or **Disabled**. This field is not displayed for HTTP-type virtual servers.
Sticky synchronization	Sticky entry synchronization state: **Enabled** or **Disabled**.
Bandwidth busy protection	Link protection state: **Enabled** or **Disabled**.
Interface bandwidth statistics	Bandwidth statistics collection by interfaces: Disabled or Enabled.
Route advertisement	IP address advertisement for the virtual server: Disabled or Enabled.
Application-Mode	Layer 7 operating mode for the virtual server: Disabled or Enabled. This field is displayed only for a TCP virtual server.
ARP/ND interfaces	Interfaces from which gratuitous ARP packets and ND packets are sent out.
Version	MySQL database version. This field is displayed only for a MySQL virtual server.
User list	List of users logged in to the MySQL database. This field is displayed only for a MySQL virtual server.
Username	Username used to log in to the MySQL database. This field is displayed only for a MySQL virtual server.
Read server farm	Read server farm referenced by the MySQL virtual server. This field is displayed only for a MySQL virtual server.
Read sticky group	Sticky group associated with the read server farm. This field is displayed only for a MySQL virtual server.
Write server farm	Write server farm referenced by the MySQL virtual server. This field is displayed only for a MySQL virtual server.
Write sticky group	Sticky group associated with the write server farm. This field is displayed only for a MySQL virtual server.
Customlog content	Content output by using the fast log output feature. This field is displayed only for an HTTP virtual server.
HTTP protection policy	HTTP protection policy referenced by the virtual server.
External-link proxy	External link proxy state: **Disabled** or **Enabled**.
External-link inject URI	URI of external link proxy.
External-link inject domain suffix	Domain name suffix of external link proxy.
External-link SNAT pool	SNAT address pool of external link proxy.
External-link domain name whitelist	Whitelist of external link proxy.

display virtual-server statistics

Use **`display virtual-server statistics`** to display virtual server statistics.

Syntax

display virtual-server statistics [**name** *virtual-server-name*] [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

name *virtual-server-name*: Specifies a virtual server by its name, a case-insensitive string of 1 to 63 characters. If you do not specify this option, the command displays statistics of all virtual servers.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays virtual server statistics for all member devices.

Usage guidelines

The virtual server statistics collection interval is 200 milliseconds and is not configurable.

Examples

Display statistics for the virtual server **vs**.

```
<Sysname> display virtual-server statistics name vs
Virtual server: vs
  Total connections: 979
  Active connections: 618
  Max connections: 661
    recorded at 11:02:49 on Tue May 21 2019
  Connections per second: 146
  Max connections per second: 156
    recorded at 11:02:49 on Tue May 21 2019
  Client input: 333332 bytes
  Client output: 472054 bytes
  Throughput: 4088 bps
  Inbound throughput: 1214 bps
  Outbound throughput: 2874 bps
  Max throughput: 4368 bps
    recorded at 11:02:49 on Tue May 21 2019
  Max inbound throughput: 1214 bps
    recorded at 11:02:49 on Tue May 21 2019
  Max outbound throughput: 3154 bps
    recorded at 11:02:49 on Tue May 21 2019
  Received packets: 979
  Sent packets: 0
  Dropped packets: 0
  Received packets per second: 0
  Sent packets per second: 0
```

```
Received requests: 0
```

Table 41 Command output

Field	Description
Virtual server	Virtual server name.
Total connections	Total number of connections.
Active connections	Number of active connections.
Max connections	Maximum number of connections.
Connections per second	Number of connections per second.
Max connections per second	Maximum number of connections per second.
Client input	Traffic (in bytes) received from the client.
Client output	Traffic (in bytes) sent to the client.
Throughput	Total packet throughput in bps.
Inbound throughput	Inbound packet throughput in bps.
Outbound throughput	Outbound packet throughput in bps.
Max throughput	Maximum packet throughput in bps.
Max throughput	Maximum inbound packet throughput in bps.
Max throughput	Maximum outbound packet throughput in bps.
Received packets	Number of received packets.
Sent packets	Number of packets sent by the virtual server to the client.
Dropped packets	Number of dropped packets.
Received requests	Number of received HTTP request packets. This field is displayed only for HTTP-type virtual servers.
Dropped requests	Number of dropped HTTP request packets. This field is displayed only for HTTP-type virtual servers.
Sent responses	Number of sent HTTP response packets. This field is displayed only for HTTP-type virtual servers.
Dropped responses	Number of dropped HTTP response packets. This field is displayed only for HTTP-type virtual servers.

Related commands

reset virtual-server statistics

dns-server (DNS server pool view)

Use **dns-server** to create a DNS server pool member and enter its view, or enter the view of an existing DNS server pool member.

Use **undo dns-server** to delete a DNS server pool member.

Syntax

dns-server *dns-server-name* **port** *port-number*

undo dns-server *dns-server-name* **port** *port-number*

Default

No DNS server pool members exist.

Views

DNS server pool view

Predefined user roles

network-admin

context-admin

Parameters

dns-server-name: Specifies a DNS server pool member name, a case-insensitive string of 1 to 63 characters.

port-number: Specifies the port number of the DNS server pool member, in the range of 0 to 65535.

Usage guidelines

You can use one of the following methods to add a member to a DNS server pool:

- Use the **dns-server** command in DNS server pool view. NSFOCUS recommends using this method.
- Use the **dns-server-pool** command in DNS server view.

You cannot use both methods to add a member with the same DNS server name and port number to a DNS server pool.

Examples

Add DNS server pool member **ds1** and enter DNS server pool member view.

```
<Sysname> system-view
[Sysname] loadbalance dns-server-pool dsp1
[Sysname-lb-dspool-dsp1] dns-server ds1 port 10
[Sysname-lb-dspool-dsp1-#member#-ds1-port-10]
```

Related commands

dns-server-pool (DNS server view)

dns-server-pool (DNS server view)

Use **dns-server-pool** to specify a DNS server pool for a DNS server.

Use **undo dns-server-pool** to restore the default.

Syntax

dns-server-pool *pool-name*

undo dns-server-pool

Default

A DNS server does not belong to any DNS server pool.

Views

DNS server view

Predefined user roles

network-admin

context-admin

Parameters

pool-name: Specifies a DNS server pool by its name, a case-insensitive string of 1 to 63 characters.

Usage guidelines

You can specify a DNS server pool that has not been created.

Examples

Specify DNS server pool **dns-pool1** for DNS server **ds1**.

```
<Sysname> system-view
[Sysname] loadbalance dns-server ds1
[Sysname-lb-ds-ds1] dns-server-pool dns-pool1
```

Related commands

display loadbalance dns-server

dns-server-pool (LB action view)

Use **dns-server-pool** to specify a DNS server pool for guiding packet forwarding.

Use **undo dns-server-pool** to restore the default.

Syntax

dns-server-pool *pool-name* [**sticky** *sticky-name*]

undo dns-server-pool

Default

No DNS server pool is specified for guiding packet forwarding.

Views

DNS LB action view

Predefined user roles

network-admin

context-admin

Parameters

pool-name: Specifies a DNS server pool by its name, a case-insensitive string of 1 to 63 characters.

sticky *sticky-name*: Specifies a sticky group by its name, a case-insensitive string of 1 to 63 characters. If you do not specify a sticky group, the DNS server pool does not correspond to any sticky group.

Usage guidelines

This command is mutually exclusive with the **forward all** or **skip current-dns-proxy** command. If you configure one command, the other command (if configured) is automatically cancelled.

Examples

Specify the DNS server pool **dsp** and the sticky group **sg1** for DNS LB action **lba1**.

```
<Sysname> system-view
[Sysname] loadbalance action lba1 type dns
```

```
[Sysname-lba-dns-lba1] dns-server-pool dsp sticky st1
```

Related commands

forward all

domain-name

Use **domain-name** to specify a domain name for a DNS mapping.

Use **undo domain-name** to delete a domain name from a DNS mapping.

Syntax

domain-name *domain-name*

undo domain-name *domain-name*

Default

No domain name is specified for a DNS mapping.

Views

DNS mapping view

Predefined user roles

network-admin

context-admin

Parameters

domain-name: Specifies a domain name, a case-insensitive string of 1 to 253 characters. Each dot-separated label in the domain name can contain a maximum of 63 characters. The domain name can contain letters, digits, hyphens (-), underscores (_), dots (.), and wildcards (asterisks and question marks). Dots cannot be used as the start and end characters.

Usage guidelines

You can specify multiple domain names for a DNS mapping.

When you use wildcards (asterisks and question marks) in a domain name, follow these guidelines:

- An asterisk (*) can substitute a character string.
- A question mark (?) can substitute any single character except for dot (.).

Examples

Specify two domain names for the DNS mapping **dm1**.

```
<Sysname> system-view
[Sysname] loadbalance dns-map dm1
[Sysname-lb-dm-dm1] domain-name www.aaa.domain.com
[Sysname-lb-dm-dm1] domain-name ???.aaa.*.com
```

dpi-app-profile

Use **dpi-app-profile** to specify a DPI application profile for the virtual server.

Use **undo dpi-app-profile** to restore the default.

Syntax

dpi-app-profile *app-profile-name*

undo dpi-app-profile

Default

No DPI application profile is specified for a virtual server.

Views

IP/TCP/UDP/Link IP/HTTP virtual server view

Predefined user roles

network-admin

context-admin

Parameters

app-profile-name: Specifies a DPI application profile by its name, a case-insensitive string of 1 to 63 characters. For more information about DPI application profiles, see DPI engine in *DPI Configuration Guide*.

Usage guidelines

By specifying a DPI application profile, you can apply DPI services to the traffic of a virtual server. For more information about DPI services, see *DPI Configuration Guide*.

Examples

Specify DPI application profile **profile_1** for IP-type virtual server **vs**.

```
<Sysname> system-view
[Sysname] virtual-server vs type ip
[Sysname-vs-ip-vs] dpi-app-profile profile_1
```

Related commands

app-profile (*DPI Command Reference*)

display virtual-server

encrypt-cookie

Use **encrypt-cookie** to encrypt a cookie.

Use **undo encrypt-cookie** to remove the encryption for a cookie.

Syntax

encrypt-cookie name *cookie-name* **key** { **cipher** | **simple** } *string*

undo encrypt-cookie name *cookie-name*

Default

No cookie is encrypted.

Views

HTTP parameter profile view

Predefined user roles

network-admin

context-admin

Parameters

name *cookie-name*: Specifies a cookie by its name, a case-sensitive string of 1 to 63 characters.

key: Specifies a key used to encrypt the cookie.

cipher: Specifies a key in ciphertext form.

simple: Specifies a key in plaintext form. For security purposes, the key specified in plaintext form will be stored in ciphertext form.

string: Specifies the key. Its plaintext form is a case-sensitive string of 1 to 31 characters. Its ciphertext form is a case-sensitive string of 1 to 73 characters.

Usage guidelines

After you execute this command, the device encrypts the **Set-Cookie** field in HTTP responses to prevent personal information from being revealed. When a client request contains an encrypted cookie, the device decrypts the cookie before sending the request to the server.

Examples

For HTTP parameter profile **p1**, encrypt cookie **cookie1** with encryption key **123456**.

```
<Sysname> system-view
[Sysname] parameter-profile p1 type http
[Sysname-para-http-p1] encrypt-cookie name cookie1 key simple 123456
```

env-variables

Use **env-variables** to configure an environment variable for custom monitoring.

Use **undo env-variables** to delete an environment variable for custom monitoring.

Syntax

env-variables *variable-name* **value** *variable-value*

undo env-variables *variable-name*

Default

No environment variables are configured for custom monitoring.

Views

Custom-monitoring LB probe template view

Predefined user roles

network-admin

context-admin

Parameters

variable-name: Specifies the environment variable name, a case-sensitive string of 1 to 63 characters. The name can contain spaces.

value *variable-value*: Specifies an environment variable value, a case-sensitive string of 1 to 255 characters. The name can contain spaces and cannot contain quotation marks (").

Usage guidelines

You can specify the environment to execute the custom script file by configuring an environment variable.

You can configure a maximum of 16 environment variables.

Examples

In custom-monitoring LB probe template **test_external**, configure an environment variable with name **env** and value **/var/tmp**.

```
<Sysname> system-view
[Sysname] loadbalance probe-template external-monitor test_external
```

```
[Sysname-lbpt-external-monitor-test_external] env-variables env value /var/tmp
```

exceed-mss

Use **exceed-mss** to specify the action to take on the segments that exceed the MSS in the HTTP requests sent by the client.

Use **undo exceed-mss** to restore the default.

Syntax

exceed-mss { **allow** | **drop** }

undo exceed-mss

Default

The device allows the segments to exceed the MSS in the HTTP requests sent by the client.

Views

TCP parameter profile view

Predefined user roles

network-admin

context-admin

Parameters

allow: Allows the segments to exceed the MSS.

drop: Discards the segments that exceed the MSS.

Examples

For the TCP parameter profile **pp3**, specify the **drop** action for the segments that exceed the MSS in the HTTP requests sent by the client.

```
<Sysname> system-view
[Sysname] parameter-profile pp3 type tcp
[Sysname-para-tcp-pp3] exceed-mss drop
```

expire

Use **expire** to set the expiration time for SOA resource records.

Use **undo expire** to restore the default.

Syntax

expire *expire-time*

undo expire

Default

The expiration time is 86400 seconds.

Views

SOA view

Predefined user roles

network-admin

context-admin

Parameters

expire-time: Specifies the expiration time in the range of 500 to 4294967295 seconds.

Usage guidelines

The expiration time for SOA resource records is the amount of time that the secondary DNS server can work after it loses contact with the primary DNS server.

Examples

Set the expiration time for SOA resource records to 7 days for DNS forward zone **abc.com**.

```
<Sysname> system-view
[Sysname] loadbalance zone abc.com
[Sysname-lb-zone-abc.com] soa
[Sysname-lb-zone-abc.com-soa] expire 604800
```

Related commands

display loadbalance zone

external-link inject-domain-suffix

Use **external-link inject-domain-suffix** to configure the domain name suffix for external link proxy.

Use **undo external-link inject-domain-suffix** to delete the domain name suffix for external link proxy.

Syntax

external-link inject-domain-suffix *domain-suffix*

undo external-link inject-domain-suffix

Default

No domain name suffix is configured for external link proxy.

Views

HTTP virtual server view

Predefined user roles

network-admin

context-admin

Parameters

domain-suffix: Specifies the domain name suffix for rewriting domain names of external links. This argument is a case-insensitive, dot-separated string of 1 to 254 characters. Each dot-separated label in the domain name can contain a maximum of 63 characters. The domain name can contain letters, digits, hyphens (-), underscores (_), and dots (.).

Usage guidelines

If DNS packet link selection is performed by inbound link load balancing, make sure the domain name suffixes in DNS mappings are the same as those on the external link proxy.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Configure the domain name suffix as **b.com** for external link proxy on HTTP virtual server **vs**.

```
<Sysname> system-view
[Sysname] virtual-server vs http
```

```
[Sysname-vs-http-vs] external-link inject-domain-suffix b.com
```

Related commands

display virtual-server

external-link inject-uri

external-link proxy enable

external-link inject-uri

Use **external-link inject-uri** to configure the URI for external link proxy.

Use **undo external-link inject-uri** to delete the URI for external link proxy.

Syntax

external-link inject-uri *string*

undo external-link inject-uri

Default

No URI is configured for external link proxy.

Views

HTTP virtual server view

Predefined user roles

network-admin

context-admin

Parameters

string: Specifies the URI for rewriting domain names of external links. This argument is a case-insensitive string of 1 to 63 characters. The URI can contain letters, digits, hyphens (-), and underscores (_), and cannot contain dots (.).

Usage guidelines

Use this command to rewrite domain names of external links. Upon receiving a response from the IPv6 site server, the LB device rewrites the IPv4 external link in the response by adding the specified parameters to the associated domain name. The parameters include the URI, domain name suffix, and virtual server port number. Suppose the domain name of the original external link is **http://www.aaa.com**, URI is **proxy**, domain name suffix is **bbb.com**, and virtual server port number is **8080**. The external link domain name after rewrite is **http://www.aaa.com.proxy.bbb.com:8080**. Upon receiving a DNS request containing this modified domain name, the LB device performs the following operations:

1. Extracts the original domain name.
2. Requests the associated IPv4 resource on behalf of the IPv6 client.
3. Returns the obtained IPv4 resource to the IPv6 client.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Configure the URI as **proxy** for external link proxy on HTTP virtual server **vs**.

```
<Sysname> system-view
[Sysname] virtual-server vs http
[Sysname-vs-http-vs] external-link inject-uri proxy
```

Related commands

display virtual-server

external-link inject-domain-suffix

external-link proxy enable

external-link proxy enable (LB action view)

Use **external-link proxy enable** to enable external link proxy.

Use **undo external-link proxy enable** to disable external link proxy.

Syntax

external-link proxy enable

undo external-link proxy enable

Default

External link proxy is disabled.

Views

HTTP LB action view

Predefined user roles

network-admin

context-admin

Usage guidelines

To perform external link proxy for a traffic class instead of all traffic of a virtual server, enable external link proxy in an HTTP LB action. Additionally, configure external link proxy parameters in the view of the virtual server and specify the LB policy for the virtual server.

The external link proxy action does not take effect when any of the following actions is also configured:

- A forwarding LB action (except specifying server farms).
- Specifying a response file used upon load balancing failure.

Examples

Enable external link proxy for HTTP LB action **a1**.

```
<Sysname> system-view
[Sysname] loadbalance action a1 type http
[Sysname-lba-http-a1] external-link proxy enable
```

Related commands

external-link inject-domain-suffix

external-link inject-uri

external-link proxy enable (virtual sever view)

Use **external-link proxy enable** to enable external link proxy.

Use **undo external-link proxy enable** to disable external link proxy.

Syntax

external-link proxy enable

undo external-link proxy enable

Default

External link proxy is disabled.

Views

HTTP virtual server view

Predefined user roles

network-admin

context-admin

Usage guidelines

This command enables the LB device to operate as a proxy to request IPv4 resources on behalf of IPv6 clients. External link proxy operates as follows:

1. The LB device receives an IPv6 DNS request containing an IPv4 link, and sends the request to the IPv6 site server.
2. Upon receiving a response from the server, the LB device returns a script file with the external link rewritten as configured to the client.
3. The client executes the script file, modifies the external link domain name as instructed, and then sends another DNS request containing the modified domain name.
4. Upon receiving the request, the LB device extracts the original domain name and requests the associated IPv4 resource on behalf of the client.
5. The LB device returns the obtained IPv4 resource to the client.

Examples

Enable external link proxy for HTTP virtual server **vs**.

```
<Sysname> system-view
[Sysname] virtual-server vs http
[Sysname-vs-http-vs] external-link proxy enable
```

Related commands

display virtual-server

external-link snat-pool

Use **external-link snat-pool** to specify the SNAT address pool for external link proxy.

Use **undo external-link snat-pool** to restore the default.

Syntax

external-link snat-pool *pool-name*

undo external-link snat-pool

Default

No SNAT address pool is specified for external link proxy.

Views

HTTP virtual server view

Predefined user roles

network-admin

context-admin

Parameters

pool-name: Specifies a SNAT address pool by its name, a case-insensitive string of 1 to 63 characters.

Usage guidelines

To request an IPv4 resource as an external link proxy, the LB device will choose an IP address from the specified SNAT pool. The LB device uses this IP address as the client IP address to initiate a request on behalf of the IPv6 client.

If you do not specify a SNAT address pool, the LB device uses the IP address of the output interface to the server as the client IP address.

Examples

Specify the SNAT address pool as **spool1** for external link proxy on HTTP virtual server **vs**.

```
<Sysname> system-view
[Sysname] virtual-server vs http
[Sysname-vs-http-vs] external-link snat-pool spool1
```

Related commands

display virtual-server

loadbalance snat-pool

external-link whitelist domain

Use **external-link whitelist domain** to add a domain name to the whitelist for external link proxy.

Use **undo external-link whitelist domain** to delete a domain name from the whitelist for external link proxy.

Syntax

external-link whitelist domain *domain-name*

undo external-link whitelist domain *domain-name*

Default

No domain names are added to the whitelist for external link proxy.

Views

HTTP virtual server view

Predefined user roles

network-admin

context-admin

Parameters

domain-name: Specifies a domain name, a case-insensitive, dot-separated string of 1 to 254 characters. Each dot-separated label in the domain name can contain a maximum of 63 characters. The domain name can contain letters, digits, hyphens (-), underscores (_), and dots (.).

Usage guidelines

The LB device does not rewrite the external links containing any domain names in the whitelist. You can add specific domain names (for example, those of the IPv6 external links in the IPv6 site) to the whitelist.

Examples

Add domain name **a.com** to the whitelist for external link proxy on HTTP virtual server **vs**.

```
<Sysname> system-view
[Sysname] virtual-server vs http
[Sysname-vs-http-vs] external-link whitelist domain a.com
```

Related commands

display virtual-server

external-script

Use **external-script** to specify a script file used for custom monitoring.

Use **undo external-script** to restore the default.

Syntax

external-script *file-name*

undo external-script

Default

No script file is specified for custom monitoring.

Views

Custom-monitoring LB probe template view

Predefined user roles

network-admin

context-admin

Parameters

file-name: Specifies a script file by its name, a case-insensitive string of 1 to 255 characters.

Usage guidelines

The device detects the state of real severs according to the detection contents in the script file.

Before specifying a script file, upload the file to the device.

The device supports specifying only script files with the **.py** suffix.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

In custom-monitoring LB probe template **test_external**, use script file **test.py** for custom monitoring.

```
<Sysname> system-view
[Sysname] loadbalance probe-template external-monitor test-external
[Sysname-lbpt-external-monitor-test-external] external-script test.py
```

fail-action (link group view)

Use **fail-action** to specify the fault processing method for a link group.

Use **undo fail-action** to restore the default.

Syntax

fail-action { **keep** | **reschedule** | **reset** }

undo fail-action

Default

The fault processing method is to keep existing connections.

Views

Link group view

Predefined user roles

network-admin

context-admin

Parameters

keep: Keeps the connection with the failed link. Keeping or terminating the connection depends on the timeout mechanism of the protocol.

reschedule: Redirects the connection to another available link in the link group.

reset: Terminates the connection with the failed link by sending RST packets (for TCP packets) or ICMP unreachable packets (for other types of packets).

Usage guidelines

The fault processing method applies when the link that processes packets fails.

Examples

Specify the fault processing method for the link group **lg** as **reschedule**.

```
<Sysname> system-view
[Sysname] loadbalance link-group lg
[Sysname-lb-lgroup-lg] fail-action reschedule
```

fail-action (server farm view)

Use **fail-action** to specify the fault processing method for a server farm.

Use **undo fail-action** to restore the default.

Syntax

fail-action { **keep** | **reschedule** | **reset** }

undo fail-action

Default

The fault processing method is to keep existing connections.

Views

Server farm view

Predefined user roles

network-admin

context-admin

Parameters

keep: Keeps the connection with the failed real server. Keeping or terminating the connection depends on the timeout mechanism of the protocol.

reschedule: Redirects the connection to another available real server in the server farm.

reset: Terminates the connection with the failed real server by sending RST packets (for TCP packets) or ICMP unreachable packets (for other types of packets).

Usage guidelines

The fault processing method applies when the real server that processes packets fails.

Examples

Specify the fault processing method for the server farm **sf** as **reschedule**.

```
<Sysname> system-view
[Sysname] server-farm sf
[Sysname-sfarm-sf] fail-action reschedule
```

fallback

Use **fallback** to specify a processing method for DNS mapping search failure.

Use **undo fallback** to restore the default.

Syntax

fallback { **dns-proxy** | **no-response** | **reject** }

undo fallback

Default

A DNS listener sends a DNS reject packet for DNS mapping search failure.

Views

DNS listener view

Predefined user roles

network-admin

context-admin

Parameters

dns-proxy: Responds to DNS requests through a transparent DNS proxy.

no-response: Does not respond to DNS requests.

reject: Sends a DNS reject packet.

Examples

Specify the processing method for DNS mapping search failure as **no-response**.

```
<Sysname> system-view
[Sysname] loadbalance dns-listener ct-listener
[Sysname-lb-dl-ct-listener] fallback no-response
```

fallback-action close

Use **fallback-action close** to configure the method of closing TCP connections upon failure to find a real server.

Use **undo fallback-action** to restore the default.

Syntax

fallback-action close { **fin** | **rst** }

undo fallback-action

Default

Packets are dropped when no real servers are available for the current LB action.

Views

Generic/HTTP LB action view

Predefined user roles

network-admin

context-admin

Parameters

fin: Closes TCP connections by sending FIN packets.

rst: Closes TCP connections by sending RST packets.

Usage guidelines

This command enables the device to close TCP connections matching the LB policy by sending FIN or RST packets if the device fails to find a real server according to the LB action.

Examples

In HTTP LB action **a1**, configure the method of closing TCP connections by sending RST packets.

```
<Sysname> system-view
[Sysname] loadbalance action a1 type http
[Sysname-lba-http-a1] fallback-action close rst
```

fallback-action continue

Use **fallback-action continue** to match the next rule upon failure to find an available server.

Use **undo fallback-action** to restore the default.

Syntax

fallback-action continue

undo fallback-action

Default

Packets are dropped when no servers are available for the current LB action.

Views

LB action view

Predefined user roles

network-admin

context-admin

Usage guidelines

This command enables packets to match the next rule in an LB policy when no servers are available for the current LB action.

This command does not apply to SIP virtual servers.

Examples

Match the next rule upon failure to find a real server for the HTTP LB action **a1**.

```
<Sysname> system-view
[Sysname] loadbalance action a1 type http
[Sysname-lba-http-a1] fallback-action continue
```

Match the next rule upon failure to find a DNS server for the DNS LB action **a2**.

```
<Sysname> system-view
[Sysname] loadbalance action a2 type dns
[Sysname-lba-dns-a2] fallback-action continue
```

fallback-action response raw-file

Use **fallback-action response raw-file** to specify a response file used upon load balancing failure.

Use **undo fallback-action** to restore the default.

Syntax

fallback-action response raw-file *raw-filename*

undo fallback-action

Default

Packets are discarded upon load balancing failure.

Views

HTTP LB action view

Predefined user roles

network-admin

context-admin

Parameters

raw-filename: Specifies a response file by its name, a case-insensitive string of 1 to 255 characters.

Usage guidelines

This command enables the device to respond to client requests when the device fails to find an available real server or fails to find the response file specified in the **response** command. The response file specified in the **fallback-action response raw-file** command must contain a complete HTTP packet and cannot contain only the HTTP content.

The **fallback-action response raw-file** command and the **fallback-action continue** command are mutually exclusive.

Examples

Specify the **301.raw** file as the response file used upon load balancing failure.

```
<Sysname> system-view
```

```
[Sysname] loadbalance action a_http type http
[Sysname-lba-http-a_http] fallback-action response raw-file 301.raw
```

context-admin

Parameters

interval: Specifies the probe interval in the range of 5 to 604800 seconds.

Usage guidelines

This command specifies the interval for sending probe packets.

Examples

Set the probe interval to 3600 seconds for ICMP probe template **icmptplt**.

```
<Sysname> system-view
[Sysname] loadbalance probe-template icmp icmptplt
[Sysname-lb-pt-icmp-icmptplt] frequency 3600
```

header (HTTP header sticky group view)

Use **header** to configure the HTTP header sticky method.

Use **undo header** to restore the default.

Syntax

header { { { **host** | **name** *header-name* | **url** } [**offset** *offset*] [**start** *start-string*] [**end** *end-string* | **length** *length*] } | **request-method** | **version** }

undo header

Default

No HTTP header sticky methods exist.

Views

HTTP header sticky group view

Predefined user roles

network-admin

context-admin

Parameters

host: Specifies the HTTP host based sticky method.

name *header-name*: Specifies the HTTP header name based sticky method. The *header-name* argument is a case-insensitive string of 1 to 63 characters.

url: Specifies the HTTP URL based sticky method.

offset *offset*: Specifies the offset value of the HTTP header based on the start of the HTTP packet, in the range of 0 to 1000 bytes. The default is 0.

start *start-string*: Specifies the regular expression that marks the start of the HTTP header, a case-sensitive string of 1 to 127 characters starting from the *offset* value. The string cannot contain question marks (?).

end *end-string*: Specifies the regular expression that marks the end of the HTTP header, a case-sensitive string of 1 to 127 characters starting from the *start-string* value. The string cannot contain question marks (?).

length *length*: Specifies the length of the HTTP header, in the range of 0 to 1000 bytes. The default is 0, which indicates all lengths.

request-method: Specifies the HTTP Request-Method based sticky method.

version: Specifies the HTTP version based sticky method.

Usage guidelines

Use this command to obtain the HTTP header information used to generate sticky entries based on the *offset*, *start-string*, *end-string*, and *length* values. The *start-string* and *end-string* values are not included in the sticky entry information.

Examples

Configure the HTTP header sticky method for the HTTP header sticky group **sg4**: Specify the HTTP host based sticky method.

```
<Sysname> system-view
[Sysname] sticky-group sg4 type http-header
[Sysname-sticky-http-header-sg4] header host
```

header (HTTP passive sticky group view)

Use **header** to configure the HTTP header passive sticky method.

Use **undo header** to delete the HTTP header passive sticky method.

Syntax

header { **get** *id* **name** *header-name* | **match** *id* { **name** *header-name* | **url** } } **start** *start-string* { **end** *end-string* | **length** *length* }

undo { **get** | **match** } *id*

Default

No HTTP header passive sticky methods exist.

Views

HTTP passive sticky group view

Predefined user roles

network-admin

context-admin

Parameters

get: Obtains the specified string in the HTTP response header, which is used to generate an HTTP header passive sticky entry.

match: Obtains the specified string in the HTTP request header, which is used to match an HTTP header passive sticky entry.

id: Specifies the string ID in the range of 1 to 4.

name *header-name*: Specifies the HTTP header name based sticky method. The *header-name* argument is a case-insensitive string of 1 to 63 characters.

url: Specifies the HTTP URL based sticky method.

start *start-string*: Specifies the regular expression that marks the start of the HTTP header or URL, a case-sensitive string of 1 to 127 characters. The string cannot contain question marks (?).

end *end-string*: Specifies the regular expression that marks the end of the HTTP header or URL, a case-sensitive string of 1 to 127 characters. The string cannot contain question marks (?).

length *length*: Specifies the length of the HTTP header or URL, in the range of 0 to 1000 bytes. The default is 0, which indicates all lengths.

Usage guidelines

The *start-string* and *end-string* values are not included in the sticky entry information.

Both the **header get** and **header match** commands are required for an HTTP header passive sticky method.

The device obtains the header or URL information of an incoming HTTP request based on the **header match** command and obtains the header information of an incoming HTTP response based on the **header get** command. If the header or URL information of the HTTP request matches the header information of the HTTP response, the device generates a sticky entry based on the header information of the HTTP response. Subsequent HTTP requests that match the sticky entry are forwarded according to the sticky entry.

The following rules apply to use of the **header match** and **header get** commands:

- You can execute a maximum of four **header get** commands and four **header match** commands for one HTTP passive sticky method.
- A number of *n* strings that are obtained based on *n* **header get** commands generates 2^n-1 strings in ascending order of string IDs. If the string obtained based on the **header match** command matches any one of these generated strings, the match is successful.
- A number of *n* strings that are obtained based on *n* **header match** commands combine as one string in ascending order of string IDs.

For example, three **header get** commands are executed with string IDs 1, 2, and 3. The device obtains three strings a, b, and c in the HTTP response header, generates seven strings a, b, c, ab, ac, bc, and abc, and generates seven sticky entries. Then, three **header match** commands are executed with string IDs 2, 3, and 4. The device obtains three strings a, b, and c in the HTTP request header and generates one string abc. If the string matches one of the seven strings, the device generates a sticky entry based on the string abc. Subsequent HTTP requests that match the sticky entry are forwarded according to the sticky entry.

Examples

Configure the HTTP passive sticky method for the HTTP passive sticky group **sg4**: Obtain the string between **callid** and **&** in the URL of the HTTP request. If the string matches the string between **phone-number** and **&** in HTTP response header **x-forward-callid**, the device generates a sticky entry based on the string between **phone-number** and **&**.

```
<Sysname> system-view
[Sysname] sticky-group sg4 type http-passive
[Sysname-sticky-http-passive-sg4] header get 1 name x-forward-callid start phone-number end &
[Sysname-sticky-http-passive-sg4] header match 1 url start callid end &
```

Related commands

content (HTTP passive sticky group view)

display sticky-group

header call-id

Use **header call-id** to configure the SIP call ID sticky method.

Use **undo header call-id** to restore the default.

Syntax

header call-id

undo header call-id

Default

No sticky methods exist.

Views

SIP sticky group view

Predefined user roles

network-admin

context-admin

Usage guidelines

The SIP call ID sticky method allows the device to generate sticky entries based on the Call-ID header field in SIP messages. Packets with the same call ID are assigned to the same real server.

Examples

Configure the SIP call ID sticky method for the SIP sticky group **sg6**.

```
<Sysname> system-view
[Sysname] sticky-group sg6 type sip
[Sysname-sticky-sip-sg6] header call-id
```

header delete

Use **header delete** to delete the HTTP header.

Use **undo header delete** to keep the HTTP header.

Syntax

header delete { **both** | **request** | **response** } **name** *header-name*

undo header delete { **both** | **request** | **response** } **name** *header-name*

Default

The HTTP header is kept.

Views

HTTP LB action view

Predefined user roles

network-admin

context-admin

Parameters

both: Specifies both the HTTP request and response packets.

request: Specifies the HTTP request packets.

response: Specifies the HTTP response packets.

name *header-name*: Specifies the name of the HTTP packet header, including standard and user-defined headers that must match the header in the packet. The *header-name* argument is a case-insensitive string of 1 to 63 characters excluding brackets ({ }, ( ),[ ], < >), at sign (@), comma (,), semicolon (;), colon (:), backslash (\), quotation mark ("), slash (/), question mark (?), equal sign (=), space character (SP), and horizontal tab (HT). The character string also excludes ASCII codes that are less than or equal to 31 and greater than or equal to 127. You can enter a question mark (?) to obtain a list of standard header names. For more information about the header names, see RFC 4229.

Usage guidelines

This command deletes the specified header from HTTP packets.

Examples

Delete the header named **host** from HTTP request packets for the HTTP LB action **lba2**.

```
<Sysname> system-view
[Sysname] loadbalance action lba2 type http
[Sysname-lba-http-lba2] header delete request name host
```

header delete request accept-encoding

Use **header delete request accept-encoding** to delete the Accept-Encoding header from HTTP requests.

Use **undo header delete request accept-encoding** to keep the Accept-Encoding header in HTTP requests.

Syntax

header delete request accept-encoding

undo header delete request accept-encoding

Default

The LB device deletes the Accept-Encoding header from HTTP requests.

Views

HTTP-compression parameter profile view

Predefined user roles

network-admin

context-admin

Usage guidelines

This command enables the LB device to delete the Accept-Encoding header from the HTTP request before sending it to the server. If the response packet sent by the server matches the specified match rule, the LB device compresses the packet before sending it to the requesting client. If the HTTP request sent by the client does not contain the Accept-Encoding header, the LB device does not compress the response packet regardless of whether this command is executed.

By default, the LB device does not modify request packets. If the response packet sent by the server is compressed, the LB device sends the packet to the requesting client without compressing it. If the response packet sent by the server is not compressed and matches the specified match rule, the LB device compresses the packet before sending it to the requesting client.

Examples

Create the HTTP-compression parameter profile **http1**, and delete the Accept-Encoding header from HTTP requests.

```
<Sysname> system-view
[Sysname] parameter-profile http1 type http-compression
[Sysname-para-http-compression-http1] header delete request accept-encoding
```

header exceed-length

Use **header exceed-length** to specify the action to take on the HTTP requests or responses when their packet headers exceed the maximum length.

Use **undo header exceed-length** to restore the default.

Syntax

header exceed-length { **continue** | **drop** }

undo header exceed-length

Default

The system continues to perform load balancing for HTTP requests or responses when their packet headers exceed the maximum length.

Views

HTTP parameter profile view

Predefined user roles

network-admin

context-admin

Parameters

continue: Continues to perform load balancing.

drop: Stops performing load balancing, discards the packet, and terminates the connection.

Usage guidelines

This command is not supported by virtual servers of the fast HTTP type.

When the HTTP packet header length exceeds the processing capability of load balancing, the **drop** method applies.

Examples

For the HTTP parameter profile **pp1**, specify the **drop** action for the HTTP requests or responses with their packet headers exceeding the maximum length.

```
<Sysname> system-view
[Sysname] parameter-profile pp1 type http
[Sysname-para-http-pp1] header exceed-length drop
```

header insert

Use **header insert** to insert the HTTP header.

Use **undo header insert** to remove the configuration.

Syntax

header insert { **both** | **request** | **response** } **name** *header-name* **value** *value* [**encode** { **base64** | **url** }]

undo header insert { **both** | **request** | **response** } **name** *header-name*

Default

The HTTP header is not inserted.

Views

HTTP LB action view

Predefined user roles

network-admin

context-admin

Parameters

both: Specifies both the HTTP request and response packets.

request: Specifies the HTTP request packets.

response: Specifies the HTTP response packets.

name *header-name*: Specifies the name of the HTTP packet header, including standard and user-defined headers. The *header-name* argument is a case-sensitive string of 1 to 63 characters excluding brackets ({ }, ( ),[ ], < >), at sign (@), comma (,), semicolon (;), colon (:), backslash (\), quotation mark ("), slash (/), question mark (?), equal sign (=), space character (SP), and horizontal tab (HT). The character string also excludes ASCII codes that are less than or equal to 31 and greater than or equal to 127. You can enter a question mark (?) to obtain a list of standard header names. For more information about the header names, see RFC 4229.

value *value*: Specifies the header content to be inserted to the HTTP packet, a string of 1 to 255 characters. You can also specify the following replacement strings:

- **%is**—Source IP address in HTTP requests.
- **%ps**—Source port number in HTTP requests.
- **%id**—Destination IP address in HTTP requests.
- **%pd**—Destination port number in HTTP requests.
- **%sps**—Source port number in HTTP responses.
- **%spd**—Destination port number in HTTP responses.
- **%sis**—Source IP address in HTTP responses.
- **%sid**—Destination IP address in HTTP responses.
- **%{x509v}**—Certificate version.
- **%{x509snum}**—Certificate serial number.

- **%{x509sigalgo}**—Certificate signature algorithm.
- **%{x509issuer}**—Certificate issuer.
- **%{x509before}**—Certificate effective time.
- **%{x509after}**—Certificate expiration time.
- **%{x509sub}**—Certificate subject.
- **%{x509spktype}**—Public key type for the certificate subject.
- **%{x509spk}**—Public key for the certificate subject.
- **%{x509spkRSA}**—Length of the RSA public key for the certificate subject (this field is available only for an RSA public key).
- **%{x509hash}**—MD5 hash value of the client certificate.
- **%{dncn}**—Issuee.
- **%{dne}**—Email.
- **%{dno}**—Company/Organization.
- **%{dnou}**—Department.
- **%{dnc}**—Country.
- **%{dns}**—State/Province.
- **%{dnl}**—City.

encode { **base64** | **url** }: Specifies an encoding method for replacement strings. If you do not specify an encoding method, replacement strings are not encoded.

Usage guidelines

This command inserts the specified header to HTTP packets.

URL encoding encodes only special characters in replacement strings, for example, colons in IPv6 addresses. Base64 encoding encodes entire replacement strings.

Examples

Insert the header named **source** with source IP address and source port number as the content to HTTP request packets for the HTTP LB action **lba2**.

```
<Sysname> system-view
[Sysname] loadbalance action lba2 type http
[Sysname-lba-http-lba2] header insert request name source value %is:%ps
```

header insert response vary

Use **header insert response vary** to insert the Vary header into HTTP responses.

Use **undo header insert response vary** to remove the configuration.

Syntax

header insert response vary

undo header insert response vary

Default

The Vary header is inserted into HTTP responses.

Views

HTTP-compression parameter profile view

Predefined user roles

network-admin

context-admin

Usage guidelines

This command inserts the Vary header to HTTP responses and sets the header content to Accept-Encoding before sending them to the client. The command takes effect regardless of whether the response packets contain the Vary header or whether the packets are compressed.

Examples

Create the HTTP-compression parameter profile **http1**, and insert the Vary header into HTTP responses.

```
<Sysname> system-view
[Sysname] parameter-profile http1 type http-compression
[Sysname-para-http-compression-http1] header insert response vary
```

header maxparse-length

Use **header maxparse-length** to set the maximum length of HTTP headers that can be parsed.

Use **undo header maxparse-length** to restore the default.

Syntax

header maxparse-length *length*

undo header maxparse-length

Default

The maximum length of HTTP headers that can be parsed is 4096.

Views

HTTP parameter profile view

Predefined user roles

network-admin

context-admin

Parameters

length: Specifies the maximum length of HTTP headers that can be parsed, in the range of 1 to 65535 bytes.

Usage guidelines

This command is not supported by the virtual servers of the fast HTTP type.

Examples

Set the maximum length of HTTP headers that can be parsed to 8192 for the HTTP parameter profile **pp1**.

```
<Sysname> system-view
[Sysname] parameter-profile pp1 type http
[Sysname-para-http-pp1] header maxparse-length 8192
```

header modify per-request

Use **header modify per-request** to perform the insert, delete, or modify operation for the header of each HTTP request or response packet.

Use **undo header modify per-request** to restore the default.

Syntax

header modify per-request

undo header modify per-request

Default

The insert, delete, or modify operation is performed for the header of the first HTTP request or response packet of a connection.

Views

HTTP parameter profile view

Predefined user roles

network-admin

context-admin

Examples

For the HTTP parameter profile **pp1**, perform the insert, delete, or modify operation for the header of each HTTP request or response packet.

```
<Sysname> system-view
[Sysname] parameter-profile pp1 type http
[Sysname-para-http-pp1] header modify per-request
```

header rewrite

Use **header rewrite** to rewrite the HTTP header.

Use **undo header rewrite** to remove the configuration.

Syntax

header rewrite { **both** | **request** | **response** } **name** *header-name* **value** *value* **replace** *replace* [**encode** { **base64** | **url** }]

undo header rewrite { **both** | **request** | **response** } **name** *header-name*

Default

The HTTP header is not rewritten.

Views

HTTP LB action view

Predefined user roles

network-admin

context-admin

Parameters

both: Specifies both the HTTP request and response packets.

request: Specifies the HTTP request packets.

response: Specifies the HTTP response packets.

name *header-name*: Specifies the name of the HTTP packet header, including standard and user-defined headers that must match the header in the packet. The *header-name* argument is a case-insensitive string of 1 to 63 characters excluding brackets ({ }, ( ),[ ], < >), at sign (@), comma (,), semicolon (;), colon (:), backslash (\), quotation mark ("), slash (/), question mark (?), equal sign (=), space character (SP), and horizontal tab (HT). The character string also excludes ASCII codes that are less than or equal to 31 and greater than or equal to 127. You can enter a question mark (?) to obtain a list of standard header names. For more information about the header names, see RFC 4229.

value *value*: Specifies the HTTP packet header content to be rewritten, a case-sensitive string of 1 to 127 characters. The string cannot contain question marks (?).

replace *replace*: Specifies the content after rewrite, a case-sensitive string of 1 to 127 characters. You can also specify the following replacement strings:

- **%is**—Source IP address in HTTP requests.
- **%ps**—Source port number in HTTP requests.
- **%id**—Destination IP address in HTTP requests.
- **%pd**—Destination port number in HTTP requests.
- **%sps**—Source port number in HTTP responses.
- **%spd**—Destination port number in HTTP responses.
- **%sis**—Source IP address in HTTP responses.
- **%sid**—Destination IP address in HTTP responses.
- %{**x509v**}—Certificate version.
- %{**x509snum**}—Certificate serial number.
- %{**x509sigalgo**}—Certificate signature algorithm.
- %{**x509issuer**}—Certificate issuer.
- %{**x509before**}—Certificate effective time.
- %{**x509after**}—Certificate expiration time.
- %{**x509sub**}—Certificate subject.
- %{**x509spktype**}—Public key type for the certificate subject.
- %{**x509spk**}—Public key for the certificate subject.
- %{**x509spkRSA**}—Length of the RSA public key for the certificate subject (this field is available only for an RSA public key).
- %{**x509hash**}—MD5 hash value of the client certificate.
- %{**dncn**}—Issuee.
- %{**dne**}—Email.
- %{**dno**}—Company/Organization.
- %{**dnou**}—Department.
- %{**dnc**}—Country.
- %{**dns**}—State/Province.
- %{**dnl**}—City.

encode { **base64** | **url** }: Specifies an encoding method for replacement strings. If you do not specify an encoding method, replacement strings are not encoded.

Usage guidelines

This command rewrites the *value* setting of the specified header in HTTP packets to the *replace* setting.

URL encoding encodes only special characters in replacement strings, for example, colons in IPv6 addresses. Base64 encoding encodes entire replacement strings.

Examples

For the HTTP LB action **lba2**, rewrite the content **www.hello.com** of the header named **host** in HTTP request packets to **www.he.com.cn**.

```
<Sysname> system-view
[Sysname] loadbalance action lba2 type http
[Sysname-lba-http-lba2] header rewrite request name host value www\.(he)(llo)\.com
replace www.%1.com.cn encode url
```

header rewrite request url

Use **header rewrite request url** to rewrite the URL in HTTP requests.

Use **undo header rewrite request url** to restore the default.

Syntax

header rewrite request url value *value* **replace** *replace* [**encode** { **base64** | **url** }]

undo header rewrite request url

Default

The URL in HTTP requests is not rewritten.

Views

HTTP LB action view

Predefined user roles

network-admin

context-admin

Parameters

value *value*: Specifies the URL to be rewritten, a case-sensitive string of 1 to 127 characters. The string cannot contain question marks (?).

replace *replace*: Specifies the URL after rewrite, a case-sensitive string of 1 to 127 characters. You can also specify the following replacement strings:

- **%is**—Source IP address in HTTP requests.
- **%ps**—Source port number in HTTP requests.
- **%id**—Destination IP address in HTTP requests.
- **%pd**—Destination port number in HTTP requests.
- **%sps**—Source port number in HTTP responses.
- **%spd**—Destination port number in HTTP responses.
- **%sis**—Source IP address in HTTP responses.
- **%sid**—Destination IP address in HTTP responses.
- **%{x509v}**—Certificate version.

- %{**x509snum**}—Certificate serial number.
- %{**x509sigalgo**}—Certificate signature algorithm.
- %{**x509issuer**}—Certificate issuer.
- %{**x509before**}—Certificate effective time.
- %{**x509after**}—Certificate expiration time.
- %{**x509sub**}—Certificate subject.
- %{**x509spktype**}—Public key type for the certificate subject.
- %{**x509spk**}—Public key for the certificate subject.
- %{**x509spkRSA**}—Length of the RSA public key for the certificate subject (this field is available only for an RSA public key).
- %{**x509hash**}—MD5 hash value of the client certificate.
- %{**dncn**}—Issuee.
- %{**dne**}—Email.
- %{**dno**}—Company/Organization.
- %{**dnou**}—Department.
- %{**dnc**}—Country.
- %{**dns**}—State/Province.
- %{**dnl**}—City.

encode { **base64** | **url** }: Specifies an encoding method for replacement strings. If you do not specify an encoding method, replacement strings are not encoded.

Usage guidelines

This command rewrites the *value* setting in the HTTP request URL to the *replace* setting.

URL encoding encodes only special characters in replacement strings, for example, colons in IPv6 addresses. Base64 encoding encodes entire replacement strings.

Examples

For the HTTP LB action **lba2**, rewrite the URL **www.hello.com** in HTTP requests to **www.he.com.cn**.

```
<Sysname> system-view
[Sysname] loadbalance action lba2 type http
[Sysname-lba-http-lba2] header rewrite request url value www\.(he)(llo)\.com replace
www.%1.com.cn encode url
```

idle-time

Use **idle-time** to set the idle timeout time for TCP connections between the LB device and servers.

Use **undo idle-time** to restore the default.

Syntax

idle-time *idle-time*

undo idle-time

Default

The idle timeout time for TCP connections between the LB device and servers is 86400 seconds.

Views

OneConnect parameter profile view

MySQL parameter profile view

Predefined user roles

network-admin

context-admin

Parameters

idle-time: Specifies the idle timeout time in the range of 1 to 4294967295 seconds.

Usage guidelines

The idle timeout time is the amount of time that a TCP connection can stay idle before it is disconnected. After the TCP connection is disconnected, new connection requests trigger establishment of a new TCP connection.

Examples

In OneConnect parameter profile **ocp**, set the idle timeout time to 10000 seconds for TCP connections between the LB device and servers.

```
<Sysname> system-view
[Sysname] parameter-profile ocp type oneconnect
[Sysname-para-oneconnect-ocp] idle-time 10000
```

inherit vpn-instance disable (link view)

Use **inherit vpn-instance disable** to disable VPN instance inheritance for a link.

Use **undo inherit vpn-instance disable** to enable VPN instance inheritance for a link.

Syntax

inherit vpn-instance disable

undo inherit vpn-instance disable

Default

VPN instance inheritance is enabled for a link.

Views

Link view

Predefined user roles

network-admin

context-admin

Usage guidelines

When VPN instance inheritance is enabled, a link without a VPN instance specified inherits the VPN instance of the virtual server. When VPN instance inheritance is disabled, a link without a VPN instance specified belongs to the public network.

To specify a VPN instance for a link, use the **vpn-instance** *vpn-instance-name* command in link view.

You can display the VPN instance for a link by using the **display loadbalance link** command.

Examples

Disable VPN instance inheritance for link **lk1**.

```
<Sysname> system-view
[Sysname] loadbalance link lk1
[Sysname-lb-link-lk1] inherit vpn-instance disable
```

Related commands

display loadbalance link

vpn-instance (link view)

inherit vpn-instance disable (real server view)

Use **inherit vpn-instance disable** to disable VPN instance inheritance for a real server.

Use **undo inherit vpn-instance disable** to enable VPN instance inheritance for a real server.

Syntax

inherit vpn-instance disable

undo inherit vpn-instance disable

Default

VPN instance inheritance is enabled for a real server.

Views

Real server view

Predefined user roles

network-admin

context-admin

Usage guidelines

When VPN instance inheritance is enabled, a real server without a VPN instance specified inherits the VPN instance of its virtual server. When VPN instance inheritance is disabled, a real server without a VPN instance specified belongs to the public network.

To specify a VPN instance for a real server, use the **vpn-instance** command in real server view.

Examples

Disable VPN instance inheritance for real server **rs**.

```
<Sysname> system-view
[Sysname] real-server rs
[Sysname-rserver-rs] inherit vpn-instance disable
```

ip

Use **ip** to configure the IPv4 sticky method.

Use **undo ip** to restore the default.

Syntax

ip [**port**] { **both** | **destination** | **source** } [**mask** *mask-length*]

undo ip

Default

No IPv4 sticky method is configured.

Views

Sticky group view

Predefined user roles

network-admin

context-admin

Parameters

port: Specifies the sticky method as IPv4 address + port number. If you do not specify this keyword, the sticky method is IPv4 address.

both: Specifies the sticky method as source IPv4 address + destination IPv4 address (if you do not specify the **port** keyword), or source IPv4 address + source port number + destination IPv4 address + destination port number (if you specify the **port** keyword).

destination: Specifies the sticky method as destination IPv4 address if you do not specify the **port** keyword, or destination IPv4 address + destination port number if you specify the **port** keyword.

source: Specifies the sticky method as source IPv4 address if you do not specify the **port** keyword, or source IPv4 address + source port number if you specify the **port** keyword.

mask *mask-length*: Specifies the mask length for the sticky method.

Examples

Configure the sticky method for the address and port-based sticky group **sg1** as source IPv4 address.

```
<Sysname> system-view
[Sysname] sticky-group sg1 type address-port
[Sysname-sticky-address-port-sg1] ip source
```

Configure the sticky method for the address and port-based sticky group **sg1** as source IPv4 address + source port number.

```
<Sysname> system-view
[Sysname] sticky-group sg1 type address-port
[Sysname-sticky-address-port-sg1] ip port source
```

Related commands

ip address (DNS listener view)

Use **ip address** to specify an IPv4 address and a port number for a DNS listener.

Use **undo ip address** to restore the default.

Syntax

ip address *ipv4-address* [**port** *port-number*]

undo ip address

Default

No IPv4 address or port number is specified for a DNS listener.

Views

DNS listener view

Predefined user roles

network-admin

context-admin

Parameters

ipv4-address: Specifies an IPv4 address, which cannot be a loopback address, multicast address, broadcast address, or an address in the format of 0.X.X.X.

port-number: Specifies a port number in the range of 1 to 65535. The default port number is 53.

Usage guidelines

You can specify only one IPv4 address for a DNS listener. If you execute this command multiple times, the most recent configuration takes effect. A DNS listener without an IPv4 address configured does not process IPv4 DNS requests.

To ensure correct operation of inbound link load balancing when server load balancing is also enabled, do not specify the virtual server's IP address as the DNS listener's IP address.

Examples

Specify the IPv4 address for the DNS listener as **1.2.3.4** and port number as **8080**.

```
<Sysname> system-view
[Sysname] loadbalance dns-listener ct-listener
[Sysname-lb-dl-ct-listener] ip address 1.2.3.4 port 8080
```

Related commands

display loadbalance dns-listener

ip address (DNS server view)

Use **ip address** to specify an IPv4 address for a DNS server.

Use **undo ip address** to restore the default.

Syntax

ip address *ipv4-address*

undo ip address

Default

No IPv4 address is specified for a DNS server.

Views

DNS server view

Predefined user roles

network-admin

context-admin

Parameters

ipv4-address: Specifies an IPv4 address, which cannot be a loopback address, multicast address, broadcast address, or an address in the format of 0.X.X.X.

Usage guidelines

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Specify the IPv4 address for DNS server **ds1** as **1.2.3.4**.

```
<Sysname> system-view
[Sysname] loadbalance dns-server ds1
[Sysname-lb-ds-ds1] ip address 1.2.3.4
```

ip address (ISP view)

Use **ip address** to configure an IPv4 address for an ISP.

Use **undo ip address** to restore the default.

Syntax

ip address *ipv4-address* { *mask-length* | *mask* }

undo ip address *ipv4-address* { *mask-length* | *mask* }

Default

No IPv4 address is configured for an ISP.

Views

ISP view

Predefined user roles

network-admin

context-admin

Parameters

ipv4-address: Specifies an IPv4 address.

mask-length: Specifies the mask length for the IPv4 address, in the range of 0 to 32.

mask: Specifies the mask for the IPv4 address.

Examples

Configure the IPv4 address for the ISP **isp1** as **1.1.1.1**.

```
<Sysname> system-view
[Sysname] loadbalance isp name isp1
[Sysname-lbisp-isp1] ip address 1.1.1.1 24
```

ip address (real server view)

Use **ip address** to configure an IPv4 address for a real server.

Use **undo ip address** to restore the default.

Syntax

ip address *ipv4-address*

undo ip address

Default

No IPv4 address is configured for a real server.

Views

Real server view

Predefined user roles

network-admin

context-admin

Parameters

ipv4-address: Specifies an IPv4 address, which cannot be a loopback address, multicast address, broadcast address, or an address in the format of 0.X.X.X.

Examples

Configure the IPv4 address for the real server **rs** as **1.1.1.1**.

```
<Sysname> system-view
[Sysname] real-server rs
[Sysname-rserver-rs] ip address 1.1.1.1
```

ip address (transparent DNS proxy view)

Use **ip address** to specify an IPv4 address for a transparent DNS proxy.

Use **undo ip address** to restore the default.

Syntax

ip address *ipv4-address* [*mask-length* | *mask*]

undo ip address

Default

No IPv4 address is specified for a transparent DNS proxy.

Views

Transparent DNS proxy view

Predefined user roles

network-admin

context-admin

Parameters

ipv4-address: Specifies an IPv4 address, which cannot be a loopback address, multicast address, broadcast address, or an address in the format of 0.X.X.X.

mask-length: Specifies a mask length in the range of 0 to 32.

mask: Specifies a subnet mask.

Usage guidelines

A transparent DNS proxy processes a DNS request only when the destination IP address and port number of the DNS request match those of the transparent DNS proxy.

If server load balancing is configured, configure different IP addresses and port numbers for the transparent DNS proxy and the virtual server of the UDP type.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Specify the IPv4 address for transparent DNS proxy **dns-proxy1** as 1.2.3.4/24.

```
<Sysname> system-view
[Sysname] loadbalance dns-proxy dns_proxy1
[Sysname-lb-dp-udp-dns-proxy1] ip address 1.2.3.4 24
```

ip mask

Use **ip mask** to set the mask length for IPv4 proximity entries.

Use **undo ip mask** to restore the default.

Syntax

ip mask { *mask-length* | *mask* }

undo ip mask

Default

The mask length for IPv4 proximity entries is 24.

Views

Proximity view

Predefined user roles

network-admin

context-admin

Parameters

mask-length: Specifies the mask length for IPv4 proximity entries, in the range of 0 to 32. A value of 0 indicates the natural mask.

mask: Specifies the mask for IPv4 proximity entries.

Examples

Set the mask length for IPv4 proximity entries to 30.

```
<Sysname> system-view
[Sysname] loadbalance proximity
[Sysname-lb-proximity] ip mask 30
```

ip range

Use **ip range** to add an IPv4 address range to a SNAT address pool.

Use **undo ip range** to remove an IPv4 address range from a SNAT address pool.

Syntax

ip range start *start-ipv4-address* **end** *end-ipv4-address*

undo ip range start *start-ipv4-address* **end** *end-ipv4-address*

Default

An SNAT address pool does not contain IPv4 address ranges.

Views

SNAT address pool view

Predefined user roles

network-admin

context-admin

Parameters

start *start-ipv4-address*: Specifies the start IPv4 address.

end *end-ipv4-address*: Specifies the end IPv4 address, which must be greater than or equal to the start IPv4 address.

Usage guidelines

You can execute this command multiple times to add multiple IPv4 address ranges to a SNAT address pool. Each address range can have a maximum of 256 IPv4 addresses. No overlapping IPv4 addresses are allowed in the same SNAT address pool or different SNAT address pools.

If the SNAT address pool has an IP address on the same network as the IP address of the device interface connected to the server, you must execute the **arp-nd interface** command for the SNAT address pool. In the situation does not exist, you do not need to execute the **arp-nd interface** command.

Examples

Add IPv4 address range 1.1.1.1 to 1.1.1.100 to the SNAT address pool **lbsp**.

```
<Sysname> system-view
[Sysname] loadbalance snat-pool lbsp
[Sysname-lbsnat-pool-lbsp] ip range start 1.1.1.1 end 1.1.1.100
```

Related commands

arp-nd interface (SNAT address pool view)

loadbalance snat-pool

ip source mask

Use **ip source mask** to specify the IPv4 mask for connection reuse.

Use **undo ip source mask** to restore the default.

Syntax

ip source mask { *mask-length* | *mask* }

undo ip source mask

Default

The IPv4 mask for connection reuse is the natural mask.

Views

OneConnect parameter profile view

MySQL parameter profile view

Predefined user roles

network-admin

context-admin

Parameters

mask-length: Specifies the mask length in the range of 0 to 32. A value of 0 indicates the natural mask.

mask: Specifies the subnet mask in dotted decimal notation.

Usage guidelines

This command limits the network segment of clients that can reuse connections between the LB device and servers. If the client that initiates a connection request is in the same network segment as the idle TCP connection, the idle TCP connection is reused. If the client does not match this requirement, a new TCP connection is established.

Examples

In OneConnect parameter profile **ocp**, set the mask length for connection reuse to 24.

```
<Sysname> system-view
[Sysname] parameter-profile ocp type oneconnect
[Sysname-para-oneconnect-ocp] ip source mask 24
```

ipv6

Use **ipv6** to configure the IPv6 sticky method.

Use **undo ipv6** to restore the default.

Syntax

ipv6 [**port**] { **both** | **destination** | **source** } [**prefix** *prefix-length*]

undo ipv6

Default

No IPv6 sticky method is configured.

Views

Sticky group view

Predefined user roles

network-admin

context-admin

Parameters

port: Specifies the sticky method as IPv6 address + port number. If you do not specify this keyword, the sticky method is IPv6 address.

both: Specifies the sticky method as source IPv6 address + destination IPv6 address if you do not specify the **port** keyword, or source IPv6 address + source port number + destination IPv6 address + destination port number if you specify the **port** keyword.

destination: Specifies the sticky method as destination IPv6 address if you do not specify the **port** keyword, or destination IPv6 address + destination port number if you specify the **port** keyword.

source: Specifies the sticky method as source IPv6 address if you do not specify the **port** keyword, or source IPv6 address + source port number if you specify the **port** keyword.

prefix *prefix-length*: Specifies the prefix length for the sticky method.

Examples

Configure the sticky method for the address- and port-based sticky group **sg1** as source IPv6 address.

```
<Sysname> system-view
[Sysname] sticky-group sg1 type address-port
[Sysname-sticky-address-port-sg1] ipv6 source
```

Configure the sticky method for the address- and port-based sticky group **sg1** as source IPv6 address + source port number.

```
<Sysname> system-view
[Sysname] sticky-group sg1 type address-port
[Sysname-sticky-address-port-sg1] ipv6 port source
```

Related commands

ipv6 address (DNS listener view)

Use **ipv6 address** to configure an IPv6 address and a port number for a DNS listener.

Use **undo ipv6 address** to restore the default.

Syntax

ipv6 address *ipv6-address* [**port** *port-number*]

undo ipv6 address

Default

No IPv6 address or port number is configured for a DNS listener.

Views

DNS listener view

Predefined user roles

network-admin

context-admin

Parameters

ipv6-address: Specifies an IPv6 address, which cannot be a loopback address, IPv6 multicast address, link-local address, or all-zero address.

port *port-number*: Specifies a port number in the range of 1 to 65535. The default is 53.

Usage guidelines

A DNS listener can be configured with only one IPv6 address. A DNS listener without an IPv6 address configured does not process IPv6 DNS requests.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Configure the IPv6 address and port number for DNS listener **ct-listener** as 1001::1 and 64.

```
<Sysname> system-view
[Sysname] loadbalance dns-listener ct-listener
[Sysname-lb-dl-ct-listener] ipv6 address 1001::1 port 64
```

Related commands

display loadbalance dns-listener

ipv6 address (DNS server view)

Use **ipv6 address** to configure an IPv6 address for a DNS server.

Use **undo ipv6 address** to restore the default.

Syntax

ipv6 address *ipv6-address*

undo ipv6 address

Default

No IPv6 address is configured for a DNS server.

Views

DNS server view

Predefined user roles

network-admin

context-admin

Parameters

ipv6-address: Specifies an IPv6 address, which cannot be a loopback address, IPv6 multicast address, link-local address, or all-zero address.

Usage guidelines

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Configure the IPv6 address for DNS server **ds1** as 1001::1.

```
<Sysname> system-view
[Sysname] loadbalance dns-server ds1
[Sysname-lb-ds-ds1] ipv6 address 1001::1
```

ipv6 address (ISP view)

Use **ipv6 address** to configure an IPv6 address for an ISP.

Use **undo ipv6 address** to restore the default.

Syntax

ipv6 address *ipv6-address prefix-length*

undo ipv6 address *ipv6-address prefix-length*

Default

No IPv6 address is configured for an ISP.

Views

ISP view

Predefined user roles

network-admin

context-admin

Parameters

ipv6-address: Specifies an IPv6 address.

prefix-length: Specifies the prefix length for the IPv6 address, in the range of 1 to 128.

Examples

Configure the IPv6 address for the ISP **isp1** as 200::1.

```
<Sysname> system-view
[Sysname] loadbalance isp name isp1
[Sysname-lbisp-isp1] ipv6 address 200::1 100
```

ipv6 address (real server view)

Use **ipv6 address** to configure an IPv6 address for a real server.

Use **undo ipv6 address** to restore the default.

Syntax

context-admin

Parameters

ipv6-address: Specifies an IPv6 address, which cannot be a loopback address, IPv6 multicast address, link-local address, or all-zero address.

Examples

Configure the IPv6 address for the real server **rs** as 1001::1.

```
<Sysname> system-view
[Sysname] real-server rs
[Sysname-rserver-rs] ipv6 address 1001::1
```

ipv6 address (transparent DNS proxy view)

Use **ipv6 address** to configure an IPv6 address for a transparent DNS proxy.

Use **undo ipv6 address** to restore the default.

Syntax

ipv6 address *ipv6-address* [*prefix-length*]

undo ipv6 address

Default

No IPv6 address is configured for a transparent DNS proxy.

Views

Transparent DNS proxy view

Predefined user roles

network-admin

context-admin

Parameters

ipv6-address: Specifies an IPv6 address, which cannot be a loopback address, IPv6 multicast address, link-local address, or all-zero address (If the prefix length is 0, you can specify the all-zero address.).

prefix-length: Specifies a prefix length for the IPv6 address, in the range of 0 to 128.

Usage guidelines

A transparent DNS proxy processes a DNS request only when the destination IP address and port number of the DNS request match those of the transparent DNS proxy.

If server load balancing is configured, configure different IP addresses and port numbers for the transparent DNS proxy and the virtual server of the UDP type.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Configure the IPv6 address for transparent DNS proxy **dns-proxy1** as 1::2:3/112.

```
<Sysname> system-view
[Sysname] loadbalance dns-proxy dns-proxy1
[Sysname-lb-dp-udp-dns-proxy1] ipv6 address 1::2:3 112
```

ipv6 prefix

Use **ipv6 prefix** to configure the prefix length for IPv6 proximity entries.

Use **undo ipv6 prefix** to restore the default.

Syntax

ipv6 prefix *prefix-length*

undo ipv6 prefix

Default

The prefix length for IPv6 proximity entries is 96.

Views

Proximity view

Predefined user roles

network-admin

context-admin

Parameters

prefix-length: Specifies the prefix length for IPv6 proximity entries, in the range of 1 to 128.

Examples

Specify the prefix length for IPv6 proximity entries as 64.

```
<Sysname> system-view
[Sysname] loadbalance proximity
[Sysname-lb-proximity] ipv6 prefix 64
```

ipv6 range

Use **ipv6 range** to add an IPv6 address range to a SNAT address pool.

Use **undo ipv6 range** to remove an IPv6 address range from a SNAT address pool.

Syntax

Default

An SNAT address pool does not contain IPv6 address ranges.

Views

SNAT address pool view

Predefined user roles

network-admin

context-admin

Parameters

start *start-ipv6-address*: Specifies the start IPv6 address.

end *end-ipv6-address*: Specifies the end IPv6 address, which must be greater than or equal to the start IPv6 address.

Usage guidelines

You can execute this command multiple times to add multiple IPv6 address ranges to a SNAT address pool. Each address range can have a maximum of 10000 IPv6 addresses. No overlapping IPv6 addresses are allowed in the same SNAT address pool or different SNAT address pools.

If the SNAT address pool has an IP address on the same network as the IP address of the device interface connected to the server, you must execute the **arp-nd interface** command for the SNAT address pool. In the situation does not exist, you do not need to execute the **arp-nd interface** command.

Examples

Add IPv6 address range 1001::1 to 1001::100 to the SNAT address pool **lbsp**.

```
<Sysname> system-view
[Sysname] loadbalance snat-pool lbsp
[Sysname-lbsnat-pool-lbsp] ipv6 range start 1001::1 end 1001::100
```

Related commands

loadbalance snat-pool

ipv6 source prefix

Use **ipv6 source prefix** to specify the IPv6 prefix length for connection reuse.

Use **undo ipv6 source prefix** to restore the default.

Syntax

ipv6 source prefix *prefix-length*

undo ipv6 source prefix

Default

Client IPv6 addresses with a prefix length of 0 can reuse connections.

Views

OneConnect parameter profile view

MySQL parameter profile view

Predefined user roles

network-admin

context-admin

Parameters

prefix-length: Specifies the prefix length in the range of 0 to 128.

Usage guidelines

This command limits the network segment of clients that can reuse connections between the LB device and servers. If the client that initiates a connection request is in the same network segment as the idle TCP connection, the idle TCP connection is reused. If the client does not match this requirement, a new TCP connection is established.

Examples

In OneConnect parameter profile **ocp**, set the prefix length for connection reuse to 24.

```
<Sysname> system-view
[Sysname] parameter-profile ocp type oneconnect
[Sysname-para-oneconnect-ocp] ipv6 source prefix 24
```

isp

Use **isp** to add an ISP to a region.

Use **undo isp** to delete an ISP from a region.

Syntax

isp *isp-name*

undo isp *isp-name*

Default

A region does not contain any ISPs.

Views

Region view

Predefined user roles

network-admin

context-admin

Parameters

isp-name: Specifies an ISP by its name, a case-insensitive string of 1 to 63 characters.

Examples

Add the ISP **isp-ct** to the region **region-ct**.

```
<Sysname> system-view
[Sysname] loadbalance region region-ct
[Sysname-lb-region-region-ct] isp isp-ct
```

Related commands

loadbalance region

keepalive idle-timeout

Use **keepalive idle-timeout** to set the idle timeout time for sending keepalive packets.

Use **undo keepalive idle-timeout** to restore the default.

Syntax

keepalive idle-timeout *timeout-value*

undo keepalive idle-timeout

Default

The idle timeout time for sending keepalive packets is 1800 seconds.

Views

TCP parameter profile view

Predefined user roles

network-admin

context-admin

Parameters

timeout-value: Specifies the idle timeout time for sending keepalive packets, in the range of 1 to 65535 seconds.

Examples

Set the timeout time for sending keepalive packets to 5 seconds in the TCP parameter profile **profile**.

```
<Sysname> system-view
[Sysname] parameter-profile profile type tcp
[Sysname-para-tcp-profile] keepalive idle-timeout 5
```

Related commands

display parameter-profile

keepalive retransmission interval

Use **keepalive retransmission interval** to set the retransmission interval and retransmission times for keepalive packets.

Use **undo keepalive retransmission interval** to restore the default.

Syntax

keepalive retransmission interval *interval* **count** *count*

undo keepalive retransmission

Default

The retransmission interval is 10 seconds, and the retransmission times is 3.

Views

TCP parameter profile view

Predefined user roles

network-admin

context-admin

Parameters

interval: Specifies the retransmission interval for keepalive packets, in the range of 1 to 65535 seconds.

count: Specifies the retransmission times for keepalive packets, in the range of 1 to 65535.

Examples

Set the retransmission interval and retransmission times for keepalive packets to 5 seconds and 10, respectively, in the TCP parameter profile **profile**.

```
<Sysname> system-view
[Sysname] parameter-profile profile type tcp
[Sysname-para-tcp-profile] keepalive retransmission interval 5 count 10
```

Related commands

display parameter-profile

lb-limit-policy

Use **lb-limit-policy** to apply an LB connection limit policy to a virtual server.

Use **undo lb-limit-policy** to restore the default.

Syntax

lb-limit-policy *policy-name*

undo lb-limit-policy

Default

No LB connection limit policies are applied to a virtual server.

Views

Virtual server view

Predefined user roles

network-admin

context-admin

Parameters

policy-name: Specifies an LB connection limit policy by its name, a case-insensitive string of 1 to 63 characters.

Usage guidelines

Use this command to implement rate limit for user traffic.

This command takes effect only on new sessions and does not take effect on existing sessions.

Examples

Apply the LB connection limit policy **llp** to the HTTP-type virtual server **vs**.

```
<Sysname> system-view
[Sysname] virtual-server vs type http
[Sysname-vs-http-vs]lb-limit-policy llp
```

Related commands

loadbalance limit-policy

lb-policy (transparent DNS proxy view)

Use **lb-policy** to specify an LB policy to be referenced by a transparent DNS proxy.

Use **undo lb-policy** to restore the default.

Syntax

lb-policy *policy-name*

undo lb-policy

Default

No LB policy is referenced by a transparent DNS proxy.

Views

Transparent DNS proxy view

Predefined user roles

network-admin

context-admin

Parameters

policy-name: Specifies an LB policy by its name, a case-insensitive string of 1 to 63 characters.

Usage guidelines

By referencing an LB policy, a transparent DNS proxy implements load balancing for matching packets based on the packet contents.

A transparent DNS proxy can reference only a DNS policy template.

Examples

Specify the LB policy **dns-policy1** to be referenced by transparent DNS proxy **dns-proxy1**.

```
<Sysname> system-view
[Sysname] loadbalance dns-proxy dns-proxy1
[Sysname-lb-dp-udp-dns-proxy1] lb-policy dns-policy1
```

lb-policy (virtual server view)

Use **lb-policy** to specify an LB policy to be referenced by the specified virtual server.

Use **undo lb-policy** to restore the default.

Syntax

lb-policy *policy-name*

undo lb-policy

Default

No LB policy is referenced by a virtual server.

Views

Virtual server view

Predefined user roles

network-admin

context-admin

Parameters

policy-name: Specifies an LB policy by its name, a case-insensitive string of 1 to 63 characters.

Usage guidelines

By referencing an LB policy, the virtual server implements load balancing for matching packets based on the packet contents.

A virtual server can reference the policy template of the specified type. For example, a virtual server of the fast HTTP or HTTP type can reference a policy template of the generic type or HTTP type. A virtual server of the IP, SIP, TCP, or UDP type can reference a policy template of the generic type only.

Examples

Specify the LB policy **lbp1** to be referenced by the IP-type virtual server **vs3**.

```
<Sysname> system-view
[Sysname] virtual-server vs3 type ip
[Sysname-vs-ip-vs3] lb-policy lbp1
```

limit

Use **limit** to configure an LB connection limit rule.

Use **undo limit** to delete an LB connection limit rule.

Syntax

limit *limit-id* **acl** [**ipv6**] { *acl-number* | **name** *acl-name* } [**per-destination** | **per-service** | **per-source**] * **amount** *max-amount min-amount*

undo limit *limit-id*

Default

No rules are configured for an LB connection limit policy.

Views

LB connection limit policy view

Predefined user roles

network-admin

context-admin

Parameters

limit-id: Specifies an LB connection limit rule ID. The value range for this argument is 1 to 65535.

acl: Specifies an ACL to limit user connections of a specified user range.

ipv6: Specifies an IPv6 ACL. If you do not specify this keyword, the command uses an IPv4 ACL.

acl-number: Specifies the ACL number in the range of 2000 to 3999.

name *acl-name*: Specifies an ACL by its name.

per-destination: Limits user connections by destination IP address.

per-service: Limits user connections by service. Services are classified by transport layer protocol and service port number.

per-source: Limits user connections by source IP address.

max-amount: Specifies the upper limit of connections, in the range of 1 to 4294967295. When the number of connections in a specified range or for a certain type reaches the upper limit, the device does not accept new connection requests.

min-amount: Specifies the lower limit of connections, in the range of 1 to 4294967295. The *min-amount* must be equal to or smaller than the *max-amount*. The device accepts new connection requests only when the number of connections drops below the lower limit.

Usage guidelines

An LB connection limit policy can have multiple rules. You can specify an ACL, a type, and the upper and lower limits for each rule. You can specify one or more of the **per-destination**, **per-service**, and **per-source** keywords for the command. For example, you can specify both the **per-destination** and **per-source** keywords to limit user connections by destination address and source address of packets.

You must specify a different ACL for each rule in an LB connection limit policy.

If the **per-destination**, **per-service**, and **per-source** keywords are not specified, the command limits all user connections matching the specified ACL.

The rules in an LB connection limit policy are matched in ascending order of the rule IDs until a match is found.

When the specified ACL changes, the device uses a new LB connection limit policy to process existing connections again.

Examples

Configure rule **1** for the LB connection limit policy **1**. Use ACL 3000 to permit user connections sourced from the network 192.168.0.0/24, and set the upper and lower limits to 2000 and 1800 for the user connections by source and destination addresses.

```
<Sysname> system-view
[Sysname] acl advanced 3000
[Sysname-acl-ipv4-adv-3000] rule permit ip source 192.168.0.0 0.0.0.255
[Sysname-acl-ipv4-adv-3000] quit
[Sysname] loadbalance limit-policy 1
[Sysname-lb-limit-policy-1] limit 1 acl 3000 per-destination per-source amount 2000 1800
```

link (DNS server view)

Use **link** to associate a link with a DNS server.

Use **undo link** to restore the default.

Syntax

link *link-name*

undo link

Default

No link is associated with a DNS server.

Views

DNS server view

Predefined user roles

network-admin

context-admin

Parameters

link-name: Specifies a link by its name, a case-insensitive string of 1 to 63 characters.

Usage guidelines

A DNS server can be associated with only one link. A link can be associated with multiple DNS servers.

Examples

Associate link **link1** with DNS server **ds1**.

```
<Sysname> system-view
[Sysname] loadbalance dns-server ds1
[Sysname-lb-ds-ds1] link link1
```

link (link group view)

Use **link** to create a link group member and enter its view, or enter the view of an existing link group member.

Use **undo link** to delete a link group member.

Syntax

link *link-name*

undo link *link-name*

Default

No link group members exist.

Views

Link group view

Predefined user roles

network-admin

context-admin

Parameters

link-name: Specifies a link group member name, a case-insensitive string of 1 to 63 characters.

Usage guidelines

You can use one of the following methods to add a member to a link group:

- Use the **link** command in link group view. NSFOCUS recommends using this method.
- Use the **link-group** command in link view.

You cannot use both methods to add a member with the same link name to a link group.

Examples

Add link group member **lk1** and enter link group member view.

```
<Sysname> system-view
[Sysname] loadbalance link-group lg
[Sysname-lb-lgroup-lg] link lk1
[Sysname-lb-lgroup-lg-#member#-lk1]
```

Related commands

link-group (link view)

link-group (LB action view)

Use **link-group** to specify the primary link group.

Use **undo link-group** to restore the default.

Syntax

link-group *link-group-name* [**backup** *backup-link-group-name*] [**sticky** *sticky-name*]

undo link-group

Default

No primary link group is specified.

Views

LB action view

Predefined user roles

network-admin

context-admin

Parameters

link-group-name: Specifies a primary link group name, a case-insensitive string of 1 to 63 characters.

backup *backup-link-group-name*: Specifies a backup link group name, a case-insensitive string of 1 to 63 characters.

sticky *sticky-name*: Specifies the name of the sticky group corresponding to the link group. It is a case-insensitive string of 1 to 63 characters.

Usage guidelines

The **link-group** and **forward all** commands are mutually exclusive. If you configure one command, the other command (if configured) is automatically cancelled.

When the primary link group is available (contains links), packets are forwarded through the primary link group. When the primary link group is not available, packets are forwarded through the backup link group.

Examples

Specify the primary link group **lg**, the backup link group **lgb**, and the sticky group **sg1** for the link-generic LB action **lba1**.

```
<Sysname> system-view
[Sysname] loadbalance action lba1 type link-generic
[Sysname-lba-link-generic-lba1] server-farm sf backup sfb sticky sg1
```

Related commands

forward all

link-group (link view)

Use **link-group** to specify a link group for a link.

Use **undo link-group** to restore the default.

Syntax

link-group *link-group-name*

undo link-group

Default

A link does not belong to any link group.

Views

Link view

Predefined user roles

network-admin

context-admin

Parameters

link-group-name: Specifies a link group name, a case-insensitive string of 1 to 63 characters.

Usage guidelines

The device selects the best link from the matching link group to perform link load balancing.

Examples

Specify the link group **lkg1** for the link **lk1**.

```
<Sysname> system-view
[Sysname] loadbalance link lk1
[Sysname-lb-link-lk1] link-group lkg1
```

loadbalance action

Use **loadbalance action** to create an LB action and enter its view, or enter the view of an existing LB action.

Use **undo loadbalance action** to delete the specified LB action.

Syntax

loadbalance action *action-name* [**type** { **dns** | **generic** | **http** | **link-generic** | **radius** }]

undo loadbalance action *action-name*

Default

No LB actions exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

action-name: Specifies the LB action name, a case-insensitive string of 1 to 63 characters.

type { **dns** | **generic** | **http** | **link-generic** | **radius** }: Specifies an LB action type.

- **dns**: DNS load balancing action.

- **generic**: Generic server load balancing action.
- **http**: HTTP load balancing action.
- **link-generic**: Link load balancing action.
- **radius**: RADIUS load balancing action.

Usage guidelines

When you create an LB action, you must specify the LB action type. You can enter an existing LB action view without entering the type of the LB action.

You can create generic, HTTP, and RADIUS LB actions only if the device has licenses installed. For information about licensing, see license management in *Fundamentals Configuration Guide*.

Examples

Create the LB action **lba1** with the **generic** type, and enter LB action view.

```
<Sysname> system-view
[Sysname] loadbalance action lba1 type generic
[Sysname-lba-generic-lba1]
```

loadbalance alg

Use **loadbalance alg** to enable ALG for the specified protocols.

Use **undo loadbalance alg** to disable ALG for the specified protocols.

Syntax

loadbalance alg { **dns** | **ftp** | **h323** | **icmp-error** | **ils** | **mgcp** | **nbt** | **pptp** | **rsh** | **rtsp** | **sccp** | **sip** | **sqlnet** | **tftp** | **xdmcp** }

undo loadbalance alg { **dns** | **ftp** | **h323** | **icmp-error** | **ils** | **mgcp** | **nbt** | **pptp** | **rsh** | **rtsp** | **sccp** | **sip** | **sqlnet** | **tftp** | **xdmcp** }

Default

ALG is enabled for the DNS, FTP, PPTP, and RTSP protocols and ICMP error packets.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

dns: Specifies the DNS protocol.

ftp: Specifies the FTP protocol.

h323: Specifies the H.323 protocol.

icmp-error: Specifies the ICMP error packets.

ils: Specifies the Internet Locator Service (ILS) protocol.

mgcp: Specifies the Media Gateway Control Protocol (MGCP).

nbt: Specifies the NetBIOS over TCP/IP (NBT) protocol.

pptp: Specifies the Point-to-Point Tunneling Protocol (PPTP).

rsh: Specifies the Remote Shell (RSH) protocol.

rtsp: Specifies the Real Time Streaming Protocol (RTSP).

sccp: Specifies the Skinny Client Control Protocol (SCCP).

sip: Specifies the Session Initiation Protocol (SIP).

sqlnet: Specifies the SQLNET protocol.

tftp: Specifies the TFTP protocol.

xdmcp: Specifies the X Display Manager Control Protocol (XDMCP).

Usage guidelines

The ALG feature distributes parent and child sessions to the same link.

SIP fragmentation packets do not suppport ALG.

Examples

Enable ALG for TFTP.

```
<Sysname> system-view
[Sysname] loadbalance alg tftp
```

loadbalance alg all-enable

Use **loadbalance alg all-enable** to enable ALG for all protocols.

Use **loadbalance alg all-disable** to disable ALG for all protocols.

Syntax

loadbalance alg all-enable

loadbalance alg all-disable

Default

ALG is enabled for the DNS, FTP, PPTP, and RTSP protocols and ICMP error packets.

Views

System view

Predefined user roles

network-admin

context-admin

Examples

Enable ALG for all protocols.

```
<Sysname> system-view
[Sysname] loadbalance alg all-enable
```

loadbalance class

Use **loadbalance class** to create an LB class and enter its view, or enter the view of an existing LB class.

Use **undo loadbalance class** to delete the specified LB class.

Syntax

loadbalance class *class-name* [**type** { **dns** | **generic** | **http** | **link-generic** | **mysql** | **radius** } [**match-all** | **match-any**]]

undo loadbalance class *class-name*

Default

No LB classes exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

class-name: Specifies the LB class name, a case-insensitive string of 1 to 63 characters.

type { **dns** | **generic** | **http** | **link-generic** | **mysql** | **radius** }: Specifies an LB class type.

- **dns**: DNS load balancing class.
- **generic**: Generic server load balancing class.
- **http**: HTTP load balancing class.
- **link-generic**: Link load balancing class.
- **mysql**: MySQL load balancing class.
- **radius**: RADIUS load balancing class.

[**match-all** | **match-any**]: Requires matching all rules or any rule of the LB class. **match-all** is the default match mode.

Usage guidelines

When you create an LB class, you must specify an LB class type. You can enter an existing LB class view without entering the type of the LB class.

You can create generic, HTTP, MySQL, and RADIUS LB classes only if the device has licenses installed. For information about licensing, see license management in *Fundamentals Configuration Guide*.

Examples

Create the LB class **lbc1** with the generic type, and enter LB class view.

```
<Sysname> system-view
[Sysname] loadbalance class lbc1 type generic
[Sysname-lbc-generic-lbc1]
```

loadbalance dns-cache aging-time

Use **loadbalance dns-cache aging-time** to set the aging time for DNS cache entries.

Use **undo loadbalance dns-cache aging-time** to restore the default.

Syntax

loadbalance dns-cache aging-time *aging-time*

undo loadbalance dns-cache aging-time

Default

The aging time for DNS cache entries is 60 minutes.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

aging-time: Specifies the aging time for DNS cache entries, in the range of 1 to 1440 minutes.

Examples

Set the aging time for DNS cache entries to 100 minutes.

```
<Sysname> system-view
[Sysname] loadbalance dns-cache aging-time 100
```

loadbalance dns-listener

Use **loadbalance dns-listener** to create a DNS listener and enter its view, or enter the view of an existing DNS listener.

Use **undo loadbalance dns-listener** to delete a DNS listener.

Syntax

loadbalance dns-listener *dns-listener-name*

undo loadbalance dns-listener *dns-listener-name*

Default

No DNS listeners exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

dns-listener-name: Specifies the DNS listener name, a case-insensitive string of 1 to 63 characters.

Usage guidelines

A DNS listener listens for DNS requests on the LB device.

Examples

Create the DNS listener **ct-listener**, and enter DNS listener view.

```
<Sysname> system-view
[Sysname] loadbalance dns-listener ct-listener
[Sysname-lb-dl-ct-listener]
```

loadbalance dns-map

Use **loadbalance dns-map** to create a DNS mapping and enter its view, or enter the view of an existing DNS mapping.

Use **undo loadbalance dns-map** to delete a DNS mapping.

Syntax

loadbalance dns-map *dns-map-name*

undo loadbalance dns-map *dns-map-name*

Default

No DNS mappings exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

dns-map-name: Specifies the DNS mapping name, a case-insensitive string of 1 to 63 characters.

Usage guidelines

A DNS mapping maps a domain name to the IP address of a virtual server pool. A domain name can be mapped to only one virtual server pool.

Examples

Create the DNS mapping **dm1**, and enter DNS mapping view.

```
<Sysname> system-view
[Sysname] loadbalance dns-map dm1
[Sysname-lb-dm-dm1]
```

loadbalance dns-proxy

Use **loadbalance dns-proxy** to create a transparent DNS proxy and enter its view, or enter the view of an existing transparent DNS proxy.

Use **undo loadbalance dns-proxy** to delete a transparent DNS proxy.

Syntax

loadbalance dns-proxy *dns-proxy-name* **type udp**

undo loadbalance dns-proxy *dns-proxy-name*

Default

No transparent DNS proxies exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

dns-proxy-name: Specifies the transparent DNS proxy name, a case-insensitive string of 1 to 63 characters.

type udp: Specifies the transparent DNS proxy type as UDP.

Examples

Create the UDP transparent DNS proxy **dns-proxy1**, and enter UDP transparent DNS proxy view.

```
<Sysname> system-view
[Sysname] loadbalance dns-proxy dns-proxy1 type udp
[Sysname-lb-dp-udp-dns-proxy1]
```

Related commands

display loadbalance dns-proxy

loadbalance dns-server

Use **loadbalance dns-server** to create a DNS server and enter its view, or enter the view of an existing DNS server.

Use **undo loadbalance dns-server** to delete a DNS server.

Syntax

loadbalance dns-server *dns-server-name*

undo loadbalance dns-server *dns-server-name*

Default

No DNS servers exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

dns-server-name: Specifies the DNS server name, a case-insensitive string of 1 to 63 characters.

Examples

Create the DNS server **ds1**, and enter DNS server view.

```
<Sysname> system-view
[Sysname] loadbalance dns-server ds1
[Sysname-lb-ds-ds1]
```

loadbalance dns-server-pool

Use **loadbalance dns-server-pool** to create a DNS server pool and enter its view, or enter the view of an existing DNS server pool.

Use **undo loadbalance dns-server-pool** to delete a DNS server pool.

Syntax

loadbalance dns-server-pool *pool-name*

undo loadbalance dns-server-pool *pool-name*

Default

No DNS server pools exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

pool-name: Specifies the DNS server pool name, a case-insensitive string of 1 to 63 characters.

Examples

Create the DNS server pool **dns-pool1**, and enter DNS server pool view.

```
<Sysname> system-view
[Sysname] loadbalance dns-server-pool dns-pool1
[Sysname-lb-dspool-dns-pool1]
```

loadbalance isp auto-update enable

Use **loadbalance isp auto-update enable** to enable ISP auto update.

Use **undo loadbalance isp auto-update enable** to disable ISP auto update.

Syntax

loadbalance isp auto-update enable

undo loadbalance isp auto-update enable

Default

ISP auto update is disabled.

Views

System view

Predefined user roles

network-admin

context-admin

Usage guidelines

With ISP auto update enabled, the device regularly queries IP address information from the whois server according to the whois maintainer object of the ISP.

Examples

Enable ISP auto update.

```
<Sysname> system-view
[Sysname] loadbalance isp auto-update enable
```

Related commands

loadbalance isp auto-update frequency
loadbalance isp auto-update whois-server

loadbalance isp auto-update frequency

Use **loadbalance isp auto-update frequency** to configure the ISP auto update frequency.

Use **undo loadbalance isp auto-update frequency** to restore the default.

Syntax

loadbalance isp auto-update frequency { **per-day** | **per-week** | **per-month** }

undo loadbalance isp auto-update frequency

Default

The ISP auto update is performed once per week.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

per-day: Updates ISP address information once per day.

per-week: Updates ISP address information once per week.

per-month: Updates ISP address information once per month.

Usage guidelines

The specific update time is about 04:00:00 a.m. For the first auto update, the specific update time is 04:00:00 a.m on the next day.

Examples

Configure the ISP auto update frequency as per day.

```
<Sysname> system-view
[Sysname] loadbalance isp auto-update frequency per-day
```

Related commands

loadbalance isp auto-update enable

loadbalance isp auto-update whois-server

Use **loadbalance isp auto-update whois-server** to specify the whois server to be queried for ISP auto update.

Use **undo loadbalance isp auto-update whois-server** to restore the default.

Syntax

loadbalance isp auto-update whois-server { **domain** *domain-name* | **ip** *ip-address* }

undo loadbalance isp auto-update whois-server

Default

No whois server is specified for ISP auto update.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

domain *domain-name*: Specify a whois server by its domain name, a case-insensitive, dot-separated string of 1 to 253 characters (for example, example.com). Each dot-separated part in the domain name can contain a maximum of 63 characters. The domain name can contain letters, digits, hyphens (-), underscores (_), and periods (.).

ip *ip-address*: Specify a whois server by its IPv4 address.

Examples

Specify the whois server with IP address 20.1.1.1 for ISP auto update.

```
<Sysname> system-view
[Sysname] loadbalance isp auto-update whois-server ip 20.1.1.1
```

loadbalance isp file

Use **loadbalance isp file** to import an ISP file.

Use **undo loadbalance isp file** to delete an ISP file.

Syntax

loadbalance isp file *isp-file-name*

undo loadbalance isp file

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

isp-file-name: Specifies the ISP file name, a case-insensitive string of 1 to 255 characters.

Usage guidelines

The system keeps the imported information intact when detecting the following problems:

- The file does not exist.
- The file name is invalid.
- File decryption occurs.

If the system quits the import operation because of IP address parsing failure, the system performs the following operations:

- Clears the most recently imported information.
- Saves the information imported this time.

You cannot delete the imported ISP and its IPv4 or IPv6 address. If the manually configured and imported ISP information overlaps, you can delete the manually configured ISP information.

To perform an active/standby MPU switchover, make sure the standby MPU has the same ISP file as the active MPU.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Import the ISP file **isp2**.

```
<Sysname> system-view
[Sysname] loadbalance isp file isp2
```

loadbalance isp name

Use **loadbalance isp name** to create an ISP and enter its view, or enter the view of an existing ISP.

Use **undo loadbalance isp name** to delete the specified ISP.

Syntax

loadbalance isp name *isp-name*

undo loadbalance isp name *isp-name*

Default

No ISPs exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

isp-name: Specifies the ISP name, a case-insensitive string of 1 to 63 characters.

Examples

Create ISP **isp1**, and enter ISP view.

```
<Sysname> system-view
[Sysname] loadbalance isp name isp1
[Sysname-lbisp-isp1]
```

loadbalance limit-policy

Use **loadbalance limit-policy** to create an LB connection limit policy and enter its view, or enter the view of an existing LB connection limit policy.

Use **undo loadbalance limit-policy** to delete an LB connection limit policy.

Syntax

loadbalance limit-policy *policy-name*

undo loadbalance limit-policy *policy-name*

Default

No LB connection limit policies exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

policy-name: Specifies the LB connection limit policy name, a case-insensitive string of 1 to 63 characters.

Usage guidelines

Using an LB connection limit policy can limit the number of connections on the device. It helps prevent a large number of connections from consuming too many device system resources and server resources. In this way, internal network resources (hosts or servers) are protected, and device system resources can be used more appropriately.

Examples

Create the LB connection limit policy **llp**, and enter LB connection limit policy view.

```
<Sysname> system-view
[Sysname] loadbalance limit-policy llp
[Sysname-lb-limit-policy-llp]
```

loadbalance link

Use **loadbalance link** to create an LB link and enter its view, or enter the view of an existing LB link.

Use **undo loadbalance link** to delete an LB link.

Syntax

loadbalance link *link-name*

undo loadbalance link *link-name*

Default

No LB links exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

link-name: Specifies the LB link name, a case-insensitive string of 1 to 63 characters.

Usage guidelines

Each physical link connected to the external network corresponds to an LB link.

Examples

Create the LB link **lk1**, and enter LB link view.

```
<Sysname> system-view
[Sysname] loadbalance link lk1
[Sysname-lb-link-lk1]
```

loadbalance link-group

Use **loadbalance link-group** to create a link group and enter its view, or enter the view of an existing link group.

Use **undo loadbalance link-group** to delete a link group.

Syntax

loadbalance link-group *link-group-name*

undo loadbalance link-group *link-group-name*

Default

No link groups exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

link-group-name: Specifies the link group name, a case-insensitive string of 1 to 63 characters.

Usage guidelines

You can add links that contain similar functions to a link group to facilitate management.

Examples

Create the link group **lg**, and enter link group view.

```
<Sysname> system-view
[Sysname] loadbalance link-group lg
[Sysname-lb-lgroup-lg]
```

loadbalance local-dns-server parse-fail-record type

Use **loadbalance local-dns-server parse-fail-record type** to configure the types of DNS request parse failures to be recorded.

Use **undo loadbalance local-dns-server parse-fail-record type** to remove the configuration.

Syntax

loadbalance local-dns-server parse-fail-record type { **a** | **aaaa** | **all-disable** | **all-enable** | **cname** | **mx** | **ns** | **ptr** | **soa** | **srv** | **txt** }

undo loadbalance local-dns-server parse-fail-record type { **a** | **aaaa** | **cname** | **mx** | **ns** | **ptr** | **soa** | **srv** | **txt** }

Default

All types of DNS request parse failures are recorded.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

a: Specifies the A (host address) type.

aaaa: Specifies the AAAA type.

all-disable: Specifies no type.

all-enable: Specifies all types.

cname: Specifies the canonical name type.

mx: Specifies the mail exchanger type.

ns: Specifies the name server type.

ptr: Specifies the pointer type.

soa: Specifies the start of authority type.

srv: Specifies the service type.

txt: Specifies the text type.

Examples

Configure the A-type DNS request parse failures to be recorded.

```
<Sysname> system-view
[Sysname] loadbalance local-dns-server parse-fail-record type a
```

loadbalance local-dns-server parse-fail-record max-number

Use **loadbalance local-dns-server parse-fail-record max-number** to set the maximum number of DNS request parse failures to be recorded.

Use **undo loadbalance local-dns-server parse-fail-record max-number** to restore the default.

Syntax

loadbalance local-dns-server parse-fail-record max-number *max-number*

undo loadbalance local-dns-server parse-fail-record max-number

Default

The maximum number of DNS request parse failures to be recorded is 10000.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

max-number: Specifies the maximum number of DNS request parse failures to be recorded, in the range of 0 to 4294967295.

Examples

Set the maximum number of DNS request parse failures to be recorded to 600.

```
<Sysname> system-view
[Sysname] loadbalance local-dns-server parse-fail-record max-number 600
```

loadbalance local-dns-server schedule-test ip

Use **loadbalance local-dns-server schedule-test ip** to perform an IPv4 inbound link load balancing test for DNS resolution.

Syntax

loadbalance local-dns-server schedule-test ip [**vpn-instance** *vpn-instance-name*] **destination** *destination-address* [**destination-port** *destination-port*] **source** *source-address* **source-port** *source-port* **type** { { **a** | **aaaa** | **cname** | **mx** | **ns** | **soa** | **srv** | **txt** } **domain** *domain-name* | **ptr ip address** { *ipv4-address* | *ipv6-address* } } [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

context-admin

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify this option, the command is executed for the public network.

destination *destination-address*: Specifies the destination IPv4 address, the IPv4 address of the DNS listener.

destination-port *destination-port*: Specifies the destination port number in the range of 0 to 65535. The default is 53.

source *source-address*: Specifies the source IPv4 address.

source-port *source-port*: Specifies the source port number in the range of 0 to 65535.

type: Specifies a DNS request type.

a: Specifies the A (host address) type.

aaaa: Specifies the AAAA type.

cname: Specifies the canonical name type.

mx: Specifies the mail exchanger type.

ns: Specifies the name server type.

soa: Specifies the start of authority type.

srv: Specifies the service type.

txt: Specifies the text type.

domain *domain-name*: Specifies the domain name to be resolved, a case-insensitive, dot-separated string of 1 to 254 characters for an absolute domain name or 1 to 253 characters for a relative domain name. Each dot-separated label in the domain name can contain a maximum of 63 characters.

ptr: Specifies the pointer type, which is used to resolve an IP address into a domain name.

ip address { *ipv4-address* | *ipv6-address* }: Specifies the IP address to be resolved into a domain name.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command tests all member devices.

Examples

Perform an IPv4 inbound link load balancing test on A-type DNS requests.

```
<Sysname> loadbalance local-dns-server schedule-test ip destination 7.7.7.7
destination-port 53 source 2.2.2.2 source-port 5 type a domain www.aaa.com
Slot 0:
    Matched DNS listener: dl2
    Matched zone: --
    Matched DNS mapping: dm2
    Matched virtual server pool: vsp2
    Preferred scheduling algorithm: Round robin
    Alternative scheduling algorithm: --
    Fallback scheduling algorithm: --
    Preferred algorithm failure cause: --
    Alternative algorithm failure cause: --
    Fallback algorithm failure cause: --
    Selected virtual server: vs2
    Response type: Send response
    Failure cause: --
```

Perform an IPv4 inbound link load balancing test on MX-type DNS requests.

```
<Sysname> loadbalance local-dns-server schedule-test ip destination 7.7.7.7
destination-port 53 source 2.2.2.2 source-port 5 type mx domain www.aaa.com
Slot 0:
    Matched DNS listener: dl2
    Matched zone: nsfocus.com.cn
    Response type: Send response
    Failure cause: --
```

Perform an IPv4 inbound link load balancing test on PTR-type DNS requests.

```
<Sysname> loadbalance local-dns-server schedule-test ip destination 7.7.7.7
destination-port 53 source 2.2.2.2 source-port 5 type ptr ip address 1.2.3.4
Slot 0:
    Matched DNS listener: dl2
    Matched zone: 1.2.3.0/24
    Response type: Send response
    Failure cause: --
```

Table 42 Command output

Field	Description
Matched zone	Matched DNS zone. • For a PTR-type DNS request, this field displays the IP address of the DNS reverse zone. • For a DNS request other than the PTR type, this field displays the domain name of the DNS forward zone.
Preferred scheduling algorithm	Preferred scheduling algorithm: • Round robin. • Random. • Least connection.

Field	Description
	• Topology. • Proximity. • Bandwidth. • Inbound bandwidth. • Outbound bandwidth. • Max bandwidth. • Max inbound bandwidth. • Max outbound bandwidth. • Hash address source IP. • Hash address destination IP. • Hash address source IP-port.
Alternative scheduling algorithm	Alternative scheduling algorithm: • Round robin. • Random. • Least connection. • Topology. • Proximity. • Bandwidth. • Inbound bandwidth. • Outbound bandwidth. • Max bandwidth. • Max inbound bandwidth. • Max outbound bandwidth. • Hash address source IP. • Hash address destination IP. • Hash address source IP-port.
Fallback scheduling algorithm	Backup scheduling algorithm: • Round robin. • Random. • Least connection. • Topology. • Proximity. • Bandwidth. • Inbound bandwidth. • Outbound bandwidth. • Max bandwidth. • Max inbound bandwidth. • Max outbound bandwidth. • Hash address source IP. • Hash address destination IP. • Hash address source IP-port.
Preferred algorithm failure cause	Preferred algorithm failure cause: • **--**—Scheduling succeeded. • No scheduling content. • **Scheduling failed**—The scheduling content exists, but scheduling failed. • No matched virtual server member.
Alternative algorithm failure cause	Alternative algorithm failure cause: • **--**—Scheduling succeeded.

Field	Description
	• No scheduling content. • **Scheduling failed**—The scheduling content exists, but scheduling failed. • No matched virtual server member.
Fallback algorithm failure cause	Backup algorithm failure cause: • **--**—Scheduling succeeded. • No scheduling content. • **Scheduling failed**—The scheduling content exists, but scheduling failed. • No matched virtual server member.
Response type	Response type for a DNS request: • **Send response**—Replies with a DNS response. • **Send reject**—Replies with a DNS reject. • **No response**—Does not respond to the DNS request.
Failure cause	Failure cause for DNS request parsing: • **--**—Parsing succeeded. • No matched DNS listener. • No matched DNS mapping. • No matched virtual server pool. • No matched DNS zone. • Failed to get buffer. • No matched record. • No enough memory resource. • Failed to parse domain. • Failed to find DNS listener by ID. • No scheduling content. • **Scheduling failed**—The scheduling content exists, but scheduling failed. • No matched virtual server member.

loadbalance local-dns-server schedule-test ipv6

Use **loadbalance local-dns-server schedule-test ipv6** to perform an IPv6 inbound link load balancing test for DNS resolution.

Syntax

loadbalance local-dns-server schedule-test ipv6 [**vpn-instance** *vpn-instance-name*] **destination** *destination-address* [**destination-port** *destination-port*] **source** *source-address* **source-port** *source-port* **type** { { **a** | **aaaa** | **cname** | **mx** | **ns** | **soa** | **srv** | **txt** } **domain** *domain-name* | **ptr ip address** *ipv4-address* } [**slot** *slot-number*]

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify this option, the command is executed for the public network.

destination *destination-address*: Specifies the destination IPv6 address, the IPv6 address of the DNS listener.

destination-port *destination-port*: Specifies the destination port number in the range of 0 to 65535. The default is 53.

source *source-address*: Specifies the source IPv6 address.

source-port *source-port*: Specifies the source port number in the range of 0 to 65535.

type: Specifies a DNS request type.

a: Specifies the IPv4 host address type.

aaaa: Specifies the IPv6 host address type.

cname: Specifies the canonical name type.

mx: Specifies the mail exchanger type.

ns: Specifies the name server type.

soa: Specifies the start of authority type.

srv: Specifies the service type.

txt: Specifies the text type.

domain *domain-name*: Specifies the domain name to be resolved, a case-insensitive, dot-separated string of 1 to 254 characters for an absolute domain name or 1 to 253 characters for a relative domain name. Each dot-separated label in the domain name can contain a maximum of 63 characters.

ptr: Specifies the pointer type, which is used to resolve an IP address to a domain name.

ip address { *ipv4-address* | *ipv6-address* }: Specifies the IP address to be resolved to a domain name.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command tests all member devices.

Examples

Perform an IPv6 inbound link load balancing test on A-type DNS requests.

```
<Sysname> loadbalance local-dns-server schedule-test ipv6 destination 1::51 source 1::5
source-port 5 type a domain www.aaa.com
Slot 0:
    Matched DNS listener: dl2
    Matched zone: --
    Matched DNS mapping: dm2
    Matched virtual server pool: vsp2
    Preferred scheduling algorithm: Round robin
    Alternative scheduling algorithm: --
    Fallback scheduling algorithm: --
    Preferred algorithm failed cause: --
    Alternative algorithm failed cause: --
    Fallback algorithm failed cause: --
    Selected virtual server: vsa1
```

```
    Response type: Send response
    Failure cause: --
```

Perform an IPv6 inbound link load balancing test on MX-type DNS requests.

```
<Sysname> loadbalance local-dns-server schedule-test ipv6 destination 1::51
destination-port 953 source 1::5 source-port 5 type mx domain www.aaa.com
Slot 0:
    Matched DNS listener: dl2
    Matched zone: nsfocus.com.cn
    Response type: Send response
    Failure cause: --
```

Perform an IPv6 inbound link load balancing test on PTR-type DNS requests.

```
<Sysname> loadbalance local-dns-server schedule-test ipv6 destination 1::51 source 1::5
source-port 5 type ptr ip address 1.2.3.4
Slot 0:
    Matched DNS listener: dl2
    Matched zone: 1.2.3.0/24
    Response type: Send response
    Failure cause: --
```

Table 43 Command output

Field	Description
Matched zone	Matched DNS zone. • For a PTR-type DNS request, this field displays the IPv6 address of the DNS reverse zone. • For a DNS request other than the PTR type, this field displays the domain name of the DNS forward zone.
Preferred scheduling algorithm	Preferred scheduling algorithm: • Round robin. • Random. • Least connection. • Topology. • Proximity. • Bandwidth. • Inbound bandwidth. • Outbound bandwidth. • Max bandwidth. • Max inbound bandwidth. • Max outbound bandwidth. • Hash address source IP. • Hash address destination IP. • Hash address source IP-port.
Alternative scheduling algorithm	Alternative scheduling algorithm: • Round robin. • Random. • Least connection. • Topology. • Proximity. • Bandwidth. • Inbound bandwidth.

Field	Description
	• Outbound bandwidth. • Max bandwidth. • Max inbound bandwidth. • Max outbound bandwidth. • Hash address source IP. • Hash address destination IP. • Hash address source IP-port. • **--**—No alternative scheduling algorithm is configured.
Fallback scheduling algorithm	Backup scheduling algorithm: • Round robin. • Random. • Least connection. • Topology. • Proximity. • Bandwidth. • Inbound bandwidth. • Outbound bandwidth. • Max bandwidth. • Max inbound bandwidth. • Max outbound bandwidth. • Hash address source IP. • Hash address destination IP. • Hash address source IP-port. • **--**—No alternative scheduling algorithm is configured.
Preferred algorithm failure cause	Preferred algorithm failure cause: • **--**—Scheduling succeeded. • No scheduling content. • **Scheduling failed**—The scheduling content exists, but scheduling failed. • No matched virtual server member.
Alternative algorithm failure cause	Alternative algorithm failure cause: • **--**—Scheduling succeeded. • No scheduling content. • **Scheduling failed**—The scheduling content exists, but scheduling failed. • No matched virtual server member.
Fallback algorithm failure cause	Backup algorithm failure cause: • **--**—Scheduling succeeded. • No scheduling content. • **Scheduling failed**—The scheduling content exists, but scheduling failed. • No matched virtual server member.
Response type	Response type for a DNS request: • **Send response**—Replies with a DNS response. • **Send reject**—Replies with a DNS reject. • **No response**—Does not respond to the DNS request.
Failure cause	Failure cause for DNS request parsing: • **--**—Parsing succeeded. • No matched DNS listener.

Field	Description
	• No matched DNS mapping. • No matched virtual server pool. • No matched DNS zone. • Failed to get buffer. • Failed to get CONTEXT. • No matched record. • No enough memory resource. • Failed to parse domain. • Failed to find DNS listener by ID. • No scheduling content. • **Scheduling failed**—The scheduling content exists, but scheduling failed. • No matched virtual server member.

loadbalance log enable bandwidth-busy

Use **loadbalance log enable bandwidth-busy** to enable load balancing link busy state logging.

Use **undo loadbalance log enable bandwidth-busy** to disable load balancing link busy state logging.

Syntax

loadbalance log enable bandwidth-busy

undo loadbalance log enable bandwidth-busy

Default

Load balancing link busy state logging is disabled.

Views

System view

Predefined user roles

network-admin

context-admin

Usage guidelines

Load balancing link busy state logging records busy states for all links.

Examples

Enable load balancing link busy state logging.

```
<Sysname> system-view
[Sysname] loadbalance log enable bandwidth-busy
```

loadbalance log enable base

Use **loadbalance log enable base** to enable load balancing basic logging.

Use **undo loadbalance log enable base** to disable load balancing basic logging.

Syntax

loadbalance log enable base

undo loadbalance log enable base

Default

Load balancing basic logging is enabled.

Views

System view

Predefined user roles

network-admin

context-admin

Usage guidelines

Load balancing basic logging generates logs for the following events:

- The state of a real server, real server group, link, or link group changes.
- The health monitoring result of a real server or link changes.
- The number of connections on a real server, virtual server, or link reaches or drops below the upper limit.
- The connection establishment rate on a real server, virtual server, or link reaches or drops below the upper limit.
- A primary/backup server farm switchover occurs between server farms specified for a virtual server.
- A primary/backup link group switchover occurs between link groups specified for a virtual server.
- A primary/backup server farm switchover occurs between server farms specified for an LB action.
- A primary/backup link group switchover occurs between link groups specified for an LB action.

Examples

Enable load balancing basic logging.

```
<Sysname> system-view
[Sysname] loadbalance log enable base
```

loadbalance log enable link-flow

Use **loadbalance log enable link-flow** to enable load balancing link flow logging.

Use **undo loadbalance log enable link-flow** to disable load balancing link flow logging.

Syntax

loadbalance log enable link-flow

undo loadbalance log enable link-flow

Default

Load balancing link flow logging is disabled.

Views

System view

Predefined user roles

network-admin

context-admin

Usage guidelines

Use this command to enable logging for flows forwarded through all links.

Examples

Enable load balancing link flow logging.

```
<Sysname> system-view
[Sysname] loadbalance log enable link-flow
```

loadbalance log enable nat

Use **loadbalance log enable nat** to enable load balancing NAT logging.

Use **undo loadbalance log enable nat** to disable load balancing NAT logging.

Syntax

loadbalance log enable nat

undo loadbalance log enable nat

Default

Load balancing NAT logging is disabled.

Views

System view

Predefined user roles

network-admin

context-admin

Usage guidelines

Load balancing NAT logging records NAT session information, including IP address and port translation information and access information.

Load balancing NAT logs are exported as flow logs. To export load balancing NAT logs, you must also configure flow log settings.

For more information about flow logs, see *Network Management and Monitoring Configuration Guide*.

Examples

Enable load balancing NAT logging.

```
<Sysname> system-view
[Sysname] loadbalance log enable nat
```

loadbalance policy

Use **loadbalance policy** to create an LB policy and enter its view, or enter the view of an existing LB policy.

Use **undo loadbalance policy** to delete the specified LB policy.

Syntax

loadbalance policy *policy-name* [**type** { **dns** | **generic** | **http** | **link-generic** | **mysql** | **radius** }]

undo loadbalance policy *policy-name*

Default

No LB policies exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

policy-name: Specifies the LB policy name, a case-insensitive string of 1 to 63 characters.

type { **dns** | **generic** | **http** | **link-generic** | **mysql** | **radius** }: Specifies an LB policy type.

- **dns**: DNS load balancing policy.
- **generic**: Generic server load balancing policy.
- **http**: HTTP load balancing policy.
- **link-generic**: Link load balancing policy.
- **mysql**: MySQL load balancing policy.
- **radius**: RADIUS load balancing policy.

Usage guidelines

When you create an LB policy, you must specify the LB policy type. You can enter existing LB policy view without entering the type of the LB policy.

You can create generic, HTTP, MySQL, and RADIUS LB policies only if the device has licenses installed. For information about licensing, see license management in *Fundamentals Configuration Guide*.

Examples

Create the LB policy **lbp1** with the generic type, and enter LB policy view.

```
<Sysname> system-view
[Sysname] loadbalance policy lbp1 type generic
[Sysname-lbp-generic-lbp1]
```

loadbalance probe-template

Use **loadbalance probe-template** to create an LB probe template and enter its view, or enter the view of an existing LB probe template.

Use **undo loadbalance probe-template** to delete an LB probe template.

Syntax

loadbalance probe-template { **external-monitor** | **http-passive** | **icmp** | **tcp-rst** | **tcp-zero-window** } *template-name*

undo loadbalance probe-template { **external-monitor** | **http-passive** | **icmp** | **tcp-rst** | **tcp-zero-window** } *template-name*

Default

No LB probe templates exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

external-monitor: Specifies the custom-monitoring-type template.

http-passive: Specifies the HTTP-passive-type template.

icmp: Specifies the ICMP-type template.

tcp-rst: Specifies the TCP-RST template.

tcp-zero-window: Specifies the TCP zero-window template.

template-name: Specifies a template name, a case-insensitive string of 1 to 32 characters.

Usage guidelines

A server farm, a server farm member, or a real server can use a custom-monitoring LB probe template to detect the health state of each real server.

A server farm can use an HTTP passive LB probe template to count the number of URL error times by monitoring the responses of HTTP requests to each real server.

The proximity feature can use an ICMP LB probe template to start ICMP tests and identify the reachability of hosts according to received ICMP responses.

A server farm can use a TCP-RST or TCP zero-window LB probe template to count the number of RST packets or zero-window packets sent by each server farm member.

Examples

Create an LB probe template named **icmptplt**, and enter LB probe template view.

```
<Sysname> system-view
[Sysname] loadbalance probe-template icmp icmptplt
[Sysname-lbpt-icmp-icmptplt]
```

loadbalance process-limit

Use **loadbalance process-limit** to set the maximum number of processes allowed to be started for custom monitoring.

Use **undo loadbalance process-limit** to restore the default.

Syntax

loadbalance process-limit *number*

undo loadbalance process-limit

Default

Only one process can be started for custom monitoring.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

number: Specifies the maximum number of processes, in the range of 1 to 16.

Examples

Set the maximum number of processes allowed to be started for custom monitoring to 200.

```
<Sysname> system-view
[Sysname] loadbalance process-limit 200
```

Related commands

display loadbalance process-limit

loadbalance protection-policy

Use **loadbalance protection-policy** to create a protection policy and enter its view, or enter the view of an existing protection policy.

Use **undo loadbalance protection-policy** to delete a protection policy.

Syntax

loadbalance protection-policy *policy-name* [**type http**]

undo loadbalance protection-policy *policy-name*

Default

No protection policies exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

policy-name: Specifies a protection policy name, a case-insensitive string of 1 to 63 characters.

type http: Specifies the HTTP-type protection policy. When you create a protection policy, you must specify the policy type. You can enter the view of an existing protection policy without specifying the policy type.

Examples

Create an HTTP protection policy named **p1** and enter its view.

```
<Sysname> system-view
[Sysname] loadbalance protection-policy p1 type http
[Sysname-lbpp-http-p1]
```

loadbalance proximity

Use **loadbalance proximity** to create proximity and enter its view, or enter the view of the existing proximity.

Use **undo loadbalance proximity** to delete proximity view and clear all configuration in proximity view.

Syntax

loadbalance proximity [**vpn-instance** *vpn-instance-name*]

undo loadbalance proximity [**vpn-instance** *vpn-instance-name*]

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify this option, the command is executed for the public network.

Examples

Create and enter proximity view for the VPN instance **vpn1**.

```
<Sysname> system-view
[Sysname] loadbalance proximity vpn vpn1
[Sysname-lb-proximity-vpn1]
```

loadbalance region

Use **loadbalance region** to create a region and enter its view, or enter the view of an existing region.

Use **undo loadbalance region** to delete a region.

Syntax

loadbalance region *region-name*

undo loadbalance region *region-name*

Default

No regions exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

region-name: Specifies the region name, a case-insensitive string of 1 to 63 characters.

Usage guidelines

A region contains network segments corresponding to different ISPs.

Examples

Create the region **isp-ct**, and enter region view.

```
<Sysname> system-view
[Sysname] loadbalance region isp-ct
[Sysname-lb-region-isp-ct]
```

loadbalance reload external-link file

Use **loadbalance reload external-link file** to load an external link rewrite file.

Use **undo loadbalance reload external-link file** to remove the configuration.

Syntax

loadbalance reload external-link file *filename*

undo loadbalance reload external-link file

Default

No external link rewrite file is used.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

filename: Specifies a file by its complete name, a case-insensitive string of 1 to 256 characters.

Usage guidelines

If the file content has changed, you must reload the external link rewrite file to ensure it is effective.

Make sure the file format is supported by the client browser. As a best practice, use the JS script file.

Make sure the name of the external link rewrite file is different from the response file for HTTP requests.

Examples

Load external link rewrite file **/sub_lb_sw.js**.

```
<Sysname> system-view
[Sysname] loadbalance reload external-link file /sub_lb_sw.js
```

Related commands

external-link inject-domain-suffix

external-link inject-uri

external-link proxy enable

external-link whitelist domain

loadbalance reverse-zone

Use **loadbalance reverse-zone** to create a DNS reverse zone and enter its view, or enter the view of an existing DNS reverse zone.

Use **undo loadbalance reverse-zone** to delete a DNS reverse zone.

Syntax

loadbalance reverse-zone { **ip** *ipv4-address mask-length* | **ipv6** *ipv6-address prefix-length* }

undo loadbalance reverse-zone { **ip** *ipv4-address mask-length* | **ipv6** *ipv6-address prefix-length* }

Default

No DNS reverse zones exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

ip *ipv4-address mask-length*: Specifies an IPv4 address and mask length for the DNS reverse zone. The value range for the *mask-length* argument is 0 to 32.

ipv6 *ipv6-address prefix-length*: Specifies an IPv6 address and prefix length for the DNS reverse zone. The value range for the *prefix-length* argument is 0 to 128.

Examples

Create a DNS reverse zone with IPv4 address 10.11.2.0/24, and enter DNS reverse zone view.

```
<Sysname> system-view
[Sysname] loadbalance reverse-zone ip 10.11.2.0 24
[Sysname-lb-rzone-10.11.2.0/24]
```

Create a DNS reverse zone with IPv6 address 1001::0/64, and enter DNS reverse zone view.

```
<Sysname> system-view
[Sysname] loadbalance reverse-zone ipv6 1001::0 64
[Sysname-lb-rzone-1001::/64]
```

Related commands

display loadbalance reverse-zone

loadbalance schedule-test ip

Use **loadbalance schedule-test ip** to perform an IPv4 load balancing test.

Syntax

loadbalance schedule-test ip [**vpn-instance** *vpn-instance-name*] { **application http** { **message-file** *file-name* | **method** { **get** | **post** } **url** *url* [**header** *header*]&<1-10> [**content** *content-value*] } | **protocol** { *protocol-number* | **icmp** | **tcp** | **udp** } } **destination** *destination-address* **destination-port** *destination-port* **source** *source-address* **source-port** *source-port* [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

context-admin

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify this option, the command is executed for the public network.

application: Specifies an application to be tested.

http: Specifies the HTTP application.

message-file *file-name*: Specifies the file that contains HTTP packet contents. The file name is a case-insensitive string of 1 to 255 characters. The file size cannot exceed 5000 bytes.

method: Specifies an HTTP request method.

get: Specifies the GET method.

post: Specifies the POST method.

url *url*: Specifies a URL for the HTTP packet, a case-insensitive string of 1 to 255 characters. A URL can contain letters, digits, hyphens (-), underscores (_), and periods (.). The URL cannot contain consecutive periods.

[**header** *header*]&<1-10>: Specifies a space-separated list of up to 10 HTTP packet headers. A header is a case-sensitive string of 1 to 127 characters excluding question marks (?).

content *content-value*: Specifies the content of the HTTP packet body, a case-sensitive string of 1 to 255 characters excluding question marks (?).

protocol { *protocol-number* | **icmp** | **tcp** | **udp** }: Specifies a protocol by its number in the range of 0 to 255 or by its name. For ICMP (1), TCP (6), and UDP (17), you can enter the protocol number or protocol name.

destination *destination-address*: Specifies the destination IPv4 address.

destination-port *destination-port*: Specifies the destination port number in the range of 0 to 65535. This option is not supported by some protocols.

source *source-address*: Specifies the source IPv4 address.

source-port *source-port*: Specifies the source port number in the range of 0 to 65535. This option is not supported by some protocols.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command tests all member devices.

Examples

Perform an IPv4 load balancing test for the TCP protocol.

```
<Sysname> loadbalance schedule-test ip protocol tcp destination 7.7.7.7 destination-port
4 source 2.2.2.2 source-port 5
    Matched virtual server: vs2
    Matched default server farm: sf
    Forward type: Forwarding to real server
    Selected real server: rs2
        Scheduling algorithm: Predictor
```

Perform an IPv4 load balancing test for the TCP protocol.

```
<Sysname> loadbalance schedule-test ip protocol tcp destination 7.7.7.7 destination-port
4 source 2.2.2.2 source-port 5
    Matched virtual server: vs2
    Matched default link group: lg
    Forward type: Forwarding to link
    Selected link: link2
        Scheduling algorithm: Predictor
```

Table 44 Command output

Field	Description
Forward type	Forwarding mode: • **The destination address is not supported. Load balancing is not performed**. • **Matching HTTP virtual server is not supported**—An HTTP virtual server is matched. Load balancing is not supported. • **Forward all**—Forwards packets. • **Forwarding to real server**—Forwards packets to the real server. • **Forwarding to link**—Forwards packets to the link. • **Drop**—Drops packets. • **Redirect**—Redirects packets. • **Waiting**—Enqueues packets.
Drop reason	Packet drop reason: • Number of connections or bandwidth for the virtual server exceeded the limit. • No class matched and no valid default server farm/link group configured. • No valid real server/link in the server farm/link group. • Action is drop. • A sticky entry was matched but the number of connections or bandwidth for the real server/link exceeded the limit. • A class was matched but no valid server farm/link group exists in the action of the class. • The HTTP message is not valid. • The HTTP request line is not valid. • The HTTP header is not valid. • The chunk HTTP content is not valid. • The server farm is busy. • **Queue overflow** (which means the wait queue is full).
Scheduling algorithm	Scheduling algorithm used to select the real server or link: • **Predictor**—The real server or link is selected by using the scheduling algorithm. • **Sticky method**—The real server or link is selected by using the sticky method. • **Proximity**—The link is selected by using the proximity feature.

loadbalance schedule-test ipv6

Use **`loadbalance schedule-test ipv6`** to perform an IPv6 load balancing test.

Syntax

loadbalance schedule-test ipv6 [**vpn-instance** *vpn-instance-name*] { **application http** { **message-file** *file-name* | **method** { **get** | **post** } **url** *url* [**header** *header*]&<1-10> [**content** *content-value*] } | **protocol** { *protocol-number* | **icmpv6** | **tcp** | **udp** } } **destination** *destination-address* **destination-port** *destination-port* **source** *source-address* **source-port** *source-port* [**slot** *slot-number*]

```
<Sysname> loadbalance schedule-test ipv6 protocol icmpv6 destination 10::1 source 12::2
    Matched virtual server: vs2
    Matched default link group: lg
    Forward type: Forwarding to link
    Selected link: link2
        Scheduling algorithm: Predictor
```

Table 45 Command output

Field	Description
Forward type	Forwarding mode: • **The destination address is not supported. Load balancing is not performed**. • **Matching HTTP virtual server is not supported**—An HTTP virtual server is matched. Load balancing is not supported. • **Forward all**—Forwards packets. • **Forwarding to real server/link**—Forwards packets to the real server or link. • **Drop**—Drops packets. • **Redirect**—Redirects packets. • **Waiting**—Enqueues packets.
Drop reason	Packet drop reason: • Number of connections or bandwidth for the virtual server exceeded the limit. • No class matched and no valid default server farm/link group configured. • No valid real server/link in the server farm/link group. • Action is drop. • A sticky entry was matched but the number of connections or bandwidth for the real server/link exceeded the limit. • A class was matched but no valid server farm/link group exists in the action of the class. • The HTTP message is not valid. • The HTTP request line is not valid. • The HTTP header is not valid. • The chunk HTTP content is not valid. • The server farm is busy. • **Queue overflow** (which means the wait queue is full).
Scheduling algorithm	Scheduling algorithm used to select the real server or link: • **Predictor**—The real server or link is selected by using the scheduling algorithm. • **Sticky method**—The real server or link is selected by using the sticky method. • **Proximity**—The link is selected by using the proximity feature.

loadbalance snat-global-policy

Use **loadbalance snat-global-policy** to create a SNAT global policy and enter its view, or enter the view of an existing SNAT global policy.

Use **undo loadbalance snat-global-policy** to delete the specified SNAT global policy.

Syntax

loadbalance snat-global-policy *policy-name*

undo loadbalance snat-global-policy *policy-name*

Default

No SNAT global policies exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

policy-name: Specifies the SNAT global policy name, a case-insensitive string of 1 to 63 characters.

Examples

Create the SNAT global policy **sn1**, and enter SNAT global policy view.

```
<Sysname> system-view
[Sysname] loadbalance snat-global-policy sn1
[Sysname-lb-snat-gp-sn1]
```

Related commands

snat-mode

snat-pool (server farm view)

loadbalance snat-pool

Use **loadbalance snat-pool** to create a SNAT address pool and enter its view, or enter the view of an existing SNAT address pool.

Use **undo loadbalance snat-pool** to delete the specified SNAT address pool.

Syntax

loadbalance snat-pool *pool-name*

undo loadbalance snat-pool *pool-name*

Default

No SNAT address pools exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

pool-name: Specifies the SNAT address pool name, a case-insensitive string of 1 to 63 characters.

Examples

Create the SNAT address pool **lbsp**, and enter SNAT address pool view.

```
<Sysname> system-view
[Sysname] loadbalance snat-pool lbsp
[Sysname-lbsnat-pool-lbsp]
```

loadbalance test pcre

Use **loadbalance test pcre** to perform a PCRE regular expression match test and display the match result.

Syntax

loadbalance test pcre value *value* { **string** *string* | **file** *file-name* } [**offset** *offset*] [**case-insensitive**]

Views

Any view

Predefined user roles

network-admin

context-admin

Parameters

value *value*: Specifies a PCRE regular expression, a case-sensitive string of 1 to 255 characters excluding question marks (?).

string *string*: Specifies the string to be tested, a case-sensitive string of 1 to 255 characters.

file *file-name*: Specifies the file to be tested by its name, a case-insensitive string of 1 to 255 characters. The file size cannot exceed 5000 bytes.

offset *offset*: Specifies the offset from the content to be tested, in the range of 0 to 255 bytes. The default is 0.

case-insensitive: Enables case-insensitivity matching. If you do not specify this keyword, case-sensitivity matching applies.

Usage guidelines

If the specified string or file matches the PCRE regular expression multiple times, the device displays only the result of the first match.

For a string test, the device displays the match result in text strings. For a file test, the device displays the match result in both hexadecimal characters and text strings. Characters that cannot be displayed are represented as periods (.).

Examples

Perform a PCRE regular expression match test for string **ABCDAAaefg**.

```
<Sysname> loadbalance test pcre value aaa string ABCDAAaefg case-insensitive
Matched string content: AAa
```

Perform a PCRE regular expression match test for file **123.txt**.

```
<Sysname> loadbalance test pcre value dzckgjlfdsfdsfsdnfsdkjgnf file 123.txt
```

```
Matched file content:
64 7a 63 6b 67 6a 6c 66 64  73 66 64 73 66 73 64   dzckgjlf dsfdsfsd
6e 66 73 64 6b 6a 67 6e 66  64                     nfsdkjgn f
```

loadbalance test rewrite

Use **loadbalance test rewrite** to perform a regular-expression-based rewrite test and display the rewrite result.

Syntax

loadbalance test rewrite value *value* **replace** *replace-string* { **string** *string* | **file** *file-name* } [**offset** *offset*] [**case-insensitive**]

Views

context-admin

Parameters

value *value*: Specifies a regular expression to match the content to be rewritten, a case-sensitive string of 1 to 255 characters excluding question marks (?). You can also specify the following character strings:

- **%is**—Source IP address.
- **%ps**—Source port number.
- **%id**—Destination IP address.
- **%pd**—Destination port number.

replace *replace-string*: Specifies the content after rewrite, a case-sensitive string of 1 to 255 characters.

string *string*: Specifies the string to be tested, a case-sensitive string of 1 to 255 characters.

file *file-name*: Specifies the file to be tested by its name, a case-insensitive string of 1 to 255 characters. The file size cannot exceed 5000 bytes.

offset *offset*: Specifies the offset from the content to be tested, in the range of 0 to 255 bytes. The default is 0.

case-insensitive: Enables case-insensitivity matching. If you do not specify this keyword, case-sensitivity matching applies.

Usage guidelines

If the string or file to be tested matches the regular expression, the device replaces the matching content with the content after rewrite.

If the string or file matches the regular expression multiple times, the device displays only the rewrite result of the first match.

For a string test, the device displays the rewrite result in text strings. For a file test, the device displays the rewrite result in both hexadecimal characters and text strings. Characters that cannot be displayed are represented as periods (.).

Examples

Perform a rewrite test for string **ABCDAAaefg**.

```
<Sysname> loadbalance test rewrite value %id replace ip:%id,port:%pd string ABCDAAaefg
case-insensitive
Rewritten string content: ABCD172.0.0.1fg
```

Perform a rewrite test for file **123.txt**.

```
<Sysname> loadbalance test rewrite value dzckgjlfdsfdsfsdnfsdkjgnf replace
ip:%id,port:%pd file 123.txt
Rewritten file content:
66 67 73 2d 61 47 76 61 73  64 64 73 61 67 76 62   fgs-aGva sddsagvb

```

loadbalance virtual-server-pool

Use **loadbalance virtual-server-pool** to create a virtual server pool and enter its view, or enter the view of an existing virtual server pool.

Use **undo loadbalance virtual-server-pool** to delete a virtual server pool.

Syntax

loadbalance virtual-server-pool *pool-name*

undo loadbalance virtual-server-pool *pool-name*

Default

No virtual server pools exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

pool-name: Specifies the virtual server pool name, a case-insensitive string of 1 to 63 characters.

Usage guidelines

You can add virtual servers with similar functions to a virtual server pool to facilitate management.

Examples

Create the virtual server pool **local-pool**, and enter virtual server pool view.

```
<Sysname> system-view
[Sysname] loadbalance virtual-server-pool local-pool
[Sysname-lb-vspool-local-pool]
```

loadbalance zone

Use **loadbalance zone** to create a DNS forward zone and enter its view, or enter the view of an existing DNS forward zone.

Use **undo loadbalance zone** to delete a DNS forward zone.

Syntax

loadbalance zone *domain-name*

undo loadbalance zone *domain-name*

Default

No DNS forward zones exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

domain-name: Specifies a domain name for the DNS forward zone, a case-insensitive string of 1 to 253 characters. Each dot-separated part in the domain name can contain a maximum of 63 characters. The domain name can contain letters, digits, hyphens (-), underscores (_), and dots (.).

Examples

Create a DNS forward zone with domain name **abc.com**, and enter DNS forward zone view.

```
<Sysname> system-view
[Sysname] loadbalance zone abc.com
[Sysname-lb-zone-abc.com]
```

Related commands

display loadbalance zone

match

Use **match** to specify the proximity probe method for packets.

Use **undo match** to restore the default.

Syntax

match [*match-id*] **tcp** { **lb-probe** *lb-template* | **probe** *nqa-template* }

undo match *match-id*

Default

No proximity probe method is specified.

Views

Proximity view

Predefined user roles

network-admin

context-admin

Parameters

match-id: Specifies a proximity probe method by its ID in the range of 1 to 65535. If the rule does not exist, the command creates the proximity probe method. If the rule already exists, the command modifies the proximity probe method. If you do not specify this argument, the system automatically assigns an available rule ID with the smallest available ID.

tcp: Specifies TCP packets.

lb-probe *lb-template*: Specifies an LB probe template by its name, a case-insensitive string of 1 to 32 characters.

probe *nqa-template*: Specifies an NQA template by its name, a case-insensitive string of 1 to 32 characters.

Usage guidelines

If the **match** command is configured, the specified proximity probe method applies. If no packets match the type in the **match** command or the **match** command is not configured, the default proximity probe method specified by using the **match default** command applies.

You can specify only one proximity probe method for each type of packets.

If both the **match** command and the **match default** command are configured, specify the same template type in the two commands as a best practice for both templates to take effect. If you specify different template types, the NQA template does not take effect.

Examples

Create the ICMP-type NQA template **t4**, and specify the NQA template as the proximity probe method for TCP packets.

```
<Sysname> system-view
[Sysname] nqa template icmp t4
[Sysname-nqatplt-icmp-t4] quit
[Sysname] loadbalance proximity
[Sysname-lb-proximity] match tcp probe t4
```

Related commands

match default

match acl

Use **match class** to create an ACL match rule or modify an existing ACL match rule.

Use **undo match** to delete a match rule.

Syntax

match [*match-id*] **acl** [**ipv6**] { *acl-number* | **name** *acl-name* }

undo match *match-id*

Default

No match rules exist.

Views

LB class view

Predefined user roles

network-admin

context-admin

Parameters

match-id: Specifies a match rule by its ID in the range of 1 to 65535. If you do not specify this argument, the system automatically assigns an available rule ID with the smallest number.

ipv6: Specifies an IPv6 ACL. If you do not specify this keyword, the command creates an IPv4 ACL.

acl-number: Specifies the ACL number in the range of 2000 to 3999.

name *acl-name*: Specifies an ACL by its name, a case-insensitive string of 1 to 63 characters starting with a letter.

Usage guidelines

If the specified ACL does not exist, this rule is not matched.

You can create a maximum of 65535 match rules for an LB class.

Examples

Create an ACL match rule for the generic LB class **lbc1**.

```
<Sysname> system-view
[Sysname] loadbalance class lbc1 type generic
[Sysname-lbc-generic-lbc1] match acl 2000
```

match app-group

Use **match app-group** to create an application group match rule or modify an existing application group match rule.

Use **undo match app-group** to delete a match rule.

Syntax

match [*match-id*] **app-group** *group-name*

undo match *match-id*

Default

No match rules exist.

Views

Link-generic LB class view

Predefined user roles

network-admin

context-admin

Parameters

match-id: Specifies a match rule ID in the range of 1 to 65535. If you do not specify this argument, the system automatically assigns an available rule ID with the smallest number.

app-group *group-name*: Specifies an application group by its name, a case-insensitive string of 1 to 63 characters.

Usage guidelines

If the specified application group does not exist, the rule does not take effect.

Examples

Create an application group match rule for the link-generic LB class **lbc1**.

```
<Sysname> system-view
[Sysname] loadbalance class lbc1 type link-generic
```

```
[Sysname-lbc-link-generic-lbc1] match app-group http
```

Related commands

app-group (*Security Command Reference*)

match class

Use **match class** to create a match rule that references an LB class or modify an existing match rule that references an LB class.

Use **undo match** to delete a match rule.

Syntax

match [*match-id*] **class** *class-name*

undo match *match-id*

Default

An LB class does not have a match rule.

Views

LB class view

Predefined user roles

network-admin

context-admin

Parameters

match-id: Specifies a match rule by its ID in the range of 1 to 65535. If you do not specify this argument, the system automatically assigns an available rule ID with the smallest number.

class-name: Specifies an LB class by its name, a case-insensitive string of 1 to 63 characters, to be referenced by the match rule. The current LB class cannot be referenced.

Usage guidelines

A match rule cannot reference an LB class that has already been referenced.

You can create a maximum of 65535 match rules for an LB class.

Examples

Create a match rule that references the LB class **lbc2** for the generic LB class **lbc1**.

```
<Sysname> system-view
[Sysname] loadbalance class lbc1 type generic
[Sysname-lbc-generic-lbc1] match class lbc2
```

match content

Use **match content** to create an HTTP entity match rule or modify an existing HTTP entity match rule.

Use **undo match** to delete a match rule.

Syntax

match [*match-id*] **content** *content* [**offset** *offset*]

undo match *match-id*

Default

An LB class does not have a match rule.

Views

HTTP LB class view

Predefined user roles

network-admin

context-admin

Parameters

match-id: Specifies a match rule by its ID in the range of 1 to 65535. If you do not specify this argument, the system automatically assigns an available rule ID with the smallest number.

content *content*: Specifies the HTTP entity regular expression, a case-sensitive string of 1 to 255 characters. The string cannot contain question marks (?).

offset *offset*: Specifies the offset value of the HTTP entity based on the start of the HTTP packet, in the range of 0 to 1000 bytes. The default is 0.

Usage guidelines

If the entity of an HTTP packet after the offset value matches the specified regular expression, the packet matches the rule.

You can create a maximum of 65535 match rules for an LB class.

Examples

Create an HTTP entity match rule for the HTTP LB class **lbc2**: Specify the offset value as 10 and regular expression as **abc**.

```
<Sysname> system-view
[Sysname] loadbalance class lbc2 type http
[Sysname-lbc-http-lbc2] match content abc.* offset 10
```

match cookie

Use **match cookie** to create an HTTP cookie match rule or modify an existing HTTP cookie match rule.

Use **undo match** to delete a match rule.

Syntax

match [*match-id*] **cookie** *cookie-name* **value** *value*

undo match *match-id*

Default

An LB class does not have a match rule.

Views

HTTP LB class view

Predefined user roles

network-admin

context-admin

Parameters

match-id: Specifies a match rule by its ID in the range of 1 to 65535. If you do not specify this argument, the system automatically assigns an available rule ID with the smallest number.

cookie *cookie-name*: Specifies the name of the HTTP cookie, a case-sensitive string of 1 to 63 characters excluding brackets ({ }, ( ),[ ], < >), at sign (@), comma (,), semicolon (;), colon (:), backslash (\), quotation mark ("), slash (/), question mark (?), equal sign (=), space character (SP), and horizontal tab (HT). The character string also excludes ASCII codes that are less than or equal to 31 and greater than or equal to 127.

value *value*: Specifies the cookie value regular expression, a case-sensitive string of 1 to 255 characters. The string cannot contain question marks (?).

Usage guidelines

If an HTTP packet contains the specified cookie with the value matching the specified regular expression, the packet matches the rule.

You can create a maximum of 65535 match rules for an LB class.

Examples

Create an HTTP cookie match rule for the HTTP LB class **lbc2**: Specify the cookie name as **JSession-id** and cookie value regular expression as **abc**.

```
<Sysname> system-view
[Sysname] loadbalance class lbc2 type http
[Sysname-lbc-http-lbc2] match cookie JSession-id value abc.*
```

match default

Use **match default** to specify the default proximity probe method.

Use **undo match default** to restore the default.

Syntax

match default { **lb-probe** *lb-template* | **probe** *nqa-template* }

undo match default

Default

The default proximity probe method is not specified.

Views

Proximity view

Predefined user roles

network-admin

context-admin

Parameters

lb-probe *lb-template*: Specifies an LB probe template by its name, a case-insensitive string of 1 to 32 characters.

probe *nqa-template*: Specifies an NQA template by its name, a case-insensitive string of 1 to 32 characters.

Usage guidelines

If the **match** command is configured, the specified proximity probe method applies. If no packets match the type in the **match** command or the **match** command is not configured, the default proximity probe method applies.

If both the **match** command and the **match default** command are configured, you must specify the same template type (load balancing or NQA) in the two commands as a best practice for both templates to take effect. If you specify different template types, the NQA template does not take effect.

Examples

Create the ICMP-type NQA template **t4**, and specify the NQA template as the default proximity probe method.

```
<Sysname> system-view
[Sysname] nqa template icmp t4
[Sysname-nqatplt-icmp-t4] quit
[Sysname] loadbalance proximity
[Sysname-lb-proximity] match default probe t4
```

match destination

Use **match destination** to create a destination IP address match rule or modify an existing destination IP address match rule.

Use **undo match** to delete a match rule.

Syntax

match [*match-id*] **destination** { **ip address** *ipv4-address* [*mask-length* | *mask*] | **ipv6 address** *ipv6-address* [*prefix-length*] }

undo match *match-id*

Default

An LB class does not have a match rule.

Views

DNS/Link-generic LB class view

Predefined user roles

network-admin

context-admin

Parameters

match-id: Specifies a match rule by its ID in the range of 1 to 65535. If you do not specify this argument, the system automatically assigns an available rule ID with the smallest number.

ip address *ipv4-address*: Specifies an IPv4 address.

mask-length: Specifies a mask length in the range of 0 to 32. The default is 32.

mask: Specifies a subnet mask. The default is 255.255.255.255.

ipv6 address *ipv6-address*: Specifies an IPv6 address.

prefix-length: Specifies a prefix length in the range of 0 to 128. The default is 128.

Usage guidelines

You can create a maximum of 65535 match rules for an LB class.

Examples

Create a match rule to match destination IPv4 address 1.1.1.1/32 for the DNS LB class **lbc1**.

```
<Sysname> system-view
[Sysname] loadbalance class lbc1 type dns
[Sysname-lbc-dns-lbc1] match destination ip address 1.1.1.1
```

Create a match rule to match destination IPv4 address 1.1.1.1/32 for the link-generic LB class **lbc2**.

```
<Sysname> system-view
[Sysname] loadbalance class lbc2 type link-generic
[Sysname-lbc-link-generic-lbc2] match destination ip address 1.1.1.1
```

match destination domain-name

Use **match destination domain-name** to create a domain name match rule or modify an existing domain name match rule.

Use **undo match** to delete a match rule.

Syntax

match [*match-id*] **destination domain-name** *domain-name*

undo match *match-id*

Default

An LB class does not have a match rule.

Views

Link-generic LB class view

Predefined user roles

network-admin

context-admin

Parameters

match-id: Specifies a match rule by its ID in the range of 1 to 65535. If you do not specify this argument, the system automatically assigns an available rule ID with the smallest number.

domain-name: Specifies a domain name, a case-insensitive string of 1 to 253 characters. Each dot-separated part in the domain name can contain a maximum of 63 characters. The domain name can contain letters, digits, hyphens (-), underscores (_), dots (.), and wildcards (asterisks and question marks).

Usage guidelines

When you use wildcards (asterisks and question marks) in a domain name, follow these guidelines:

- The wildcards can substitute any characters except for dots (.).
- An asterisk (*) can substitute a character string.
- A question mark (?) can substitute a single character.

You can create a maximum of 65535 match rules for an LB class.

Examples

Create a domain name match rule for the link-generic LB class **lbc1** to match domain name **www.abc.com**.

```
<Sysname> system-view
[Sysname] loadbalance class lbc1 type link-generic
[Sysname-lbc-link-generic-lbc1] match destination domain-name www.aaa.com
```

match domain-name

Use **match domain-name** to create a domain name match rule or modify an existing domain name match rule.

Use **undo match** to delete a match rule.

Syntax

match [*match-id*] **domain-name** *domain-name*

undo match *match-id*

Default

An LB class does not have a match rule.

Views

DNS LB class view

Predefined user roles

network-admin

context-admin

Parameters

match-id: Specifies a match rule by its ID in the range of 1 to 65535. If you do not specify this argument, the system automatically assigns an available rule ID with the smallest number.

domain-name: Specifies a domain name, a case-insensitive string of 1 to 253 characters. Each dot-separated part in the domain name can contain a maximum of 63 characters. The domain name can contain letters, digits, hyphens (-), underscores (_), dots (.), and wildcards (asterisks and question marks).

Usage guidelines

When you use wildcards (asterisks and question marks) in a domain name, follow these guidelines:

- The wildcards can substitute any characters except for dots (.).
- An asterisk (*) can substitute a character string.
- A question mark (?) can substitute a single character.

You can create a maximum of 65535 match rules for an LB class.

Examples

Create a domain name match rule for DNS LB class **lbc1** to match domain name **www.abc.com**.

```
<Sysname> system-view
[Sysname] loadbalance class lbc1 type dns
[Sysname-lbc-dns-lbc1] match domain-name www.abc.com
```

match header

Use **match header** to create an HTTP header match rule or modify an existing HTTP header match rule.

Use **undo match** to delete a match rule.

Syntax

match [*match-id*] **header** *header-name* **value** *value*

undo match *match-id*

Default

An LB class does not have a match rule.

Views

HTTP LB class view

Predefined user roles

network-admin

context-admin

Parameters

match-id: Specifies a match rule by its ID in the range of 1 to 65535. If you do not specify this argument, the system automatically assigns an available rule ID with the smallest number.

header *header-name*: Specifies the name of the HTTP packet header, a case-insensitive string of 1 to 63 characters excluding brackets ({ }, ( ), [ ], < >), at sign (@), comma (,), semicolon (;), colon (:), backslash (\), quotation mark ("), slash (/), question mark (?), equal sign (=), space character (SP), and horizontal tab (HT). The character string also excludes ASCII codes that are less than or equal to 31 and greater than or equal to 127.

value *value*: Specifies the header value regular expression, a case-sensitive string of 1 to 255 characters. The string cannot contain question marks (?).

Usage guidelines

If an HTTP packet contains the specified header with the value matching the specified regular expression, the packet matches the rule.

You can create a maximum of 65535 match rules for an LB class.

Examples

Create an HTTP header match rule for the HTTP LB class **lbc2**: Specify the HTTP packet header name as **user-agent** and header value regular expression as **abcd**.

```
<Sysname> system-view
[Sysname] loadbalance class lbc2 type http
[Sysname-lbc-http-lbc2] match header user-agent value abcd
```

match interface

Use **match interface** to create an interface match rule or modify an existing interface match rule.

Use **undo match** to delete a match rule.

Syntax

match [*match-id*] **interface** *interface-type interface-number*

undo match *match-id*

Default

An LB class does not have a match rule.

Views

Generic/HTTP/Link-generic LB class view

Predefined user roles

network-admin

context-admin

Parameters

match-id: Specifies a match rule by its ID in the range of 1 to 65535. If you do not specify this argument, the system automatically assigns an available rule ID with the smallest number.

interface *interface-type interface-number*: Specifies an interface by its type and number. The interface type can be Layer 3 Ethernet interface and Layer 3 aggregate interface.

Usage guidelines

If the specified interface does not exist, the rule does not take effect.

Examples

Create an interface match rule for the link-generic LB class **lbc1** to match interface GigabitEthernet 1/0/0.

```
<Sysname> system-view
[Sysname] loadbalance class lbc1 type link-generic
[Sysname-lbc-link-generic-lbc1] match interface gigabitethernet 1/0/1
```

match isp

Use **match isp** to create an ISP match rule or modify an existing ISP match rule.

Use **undo match** to delete a match rule.

Syntax

match [*match-id*] **isp** *isp-name*

undo match *match-id*

Default

An LB class does not have a match rule.

Views

LB class view

Predefined user roles

network-admin

context-admin

Parameters

match-id: Specifies a match rule by its ID in the range of 1 to 65535. If you do not specify this argument, the system automatically assigns an available rule ID with the smallest number.

isp-name: Specifies an ISP name, a case-insensitive string of 1 to 63 characters.

Usage guidelines

If the specified ISP does not exist or is not configured with an IP network segment, this rule is not matched.

You can create a maximum of 65535 match rules for an LB class.

Examples

Create an ISP match rule for the generic LB class **lbc1**. Specify the ISP name as **isp1**.

```
<Sysname> system-view
[Sysname] loadbalance class lbc1 type generic
[Sysname-lbc-generic-lbc1] match isp isp1
```

match method

Use **match method** to create an HTTP method match rule or modify an existing HTTP method match rule.

Use **undo match** to delete a match rule.

Syntax

match [*match-id*] **method** { **ext** *ext-type* | **rfc** *rfc-type* }

undo match *match-id*

Default

An LB class does not have a match rule.

Views

HTTP LB class view

Predefined user roles

network-admin

context-admin

Parameters

match-id: Specifies a match rule by its ID in the range of 1 to 65535. If you do not specify this argument, the system automatically assigns an available rule ID with the smallest number.

ext *ext-type*: Specifies the extended type, a case-sensitive string of 1 to 63 characters excluding brackets ({ }, ( ),[ ], < >), at sign (@), comma (,), semicolon (;), colon (:), backslash (\), quotation mark ("), slash (/), question mark (?), equal sign (=), space character (SP), and horizontal tab (HT). The character string also excludes ASCII codes that are less than or equal to 31 and greater than or equal to 127.

rfc *rfc-type*: Specifies the RFC type to process the resources identified by the URI in HTTP request packets:

- **CONNECT**—Maintain the resources.
- **DELETE**—Delete the resources.
- **GET**—Request for the resources.
- **HEAD**—Request for the header of the response message of the resources.
- **OPTIONS**—Request to query the resources-related options and requirements supported by the server.
- **POST**—Add new data to the resources.
- **PUT**—Request the server to store the resource identified by the URI.

- **TRACE**—Request the server to return the request message it receives for test or diagnosis.

Usage guidelines

You can create a maximum of 65535 match rules for an LB class.

Examples

Create a packet matching method match rule with extended type **user** for the HTTP LB class **lbc2**.

```
<Sysname> system-view
[Sysname] loadbalance class lbc2 type http
[Sysname-lbc-http-lbc2] match method ext user
```

Create a packet matching method match rule with RFC type **CONNECT** for the HTTP LB class **lbc2**.

```
<Sysname> system-view
[Sysname] loadbalance class lbc2 type http
[Sysname-lbc-http-lbc2] match method rfc CONNECT
```

match payload

Use **match payload** to create a TCP payload match rule or modify an existing TCP payload match rule.

Use **undo match** to delete a match rule.

Syntax

match [*match-id*] **payload** *payload* [**case-insensitive**] [**not**]

undo match *match-id*

Default

An LB class does not have a match rule.

Views

Generic LB class view

Predefined user roles

network-admin

context-admin

Parameters

match-id: Specifies a match rule by its ID in the range of 1 to 65535. If you do not specify this argument, the system automatically assigns an available rule ID with the smallest number.

payload: Specifies the TCP payload regular expression, a case-sensitive string of 1 to 255 characters.

case-insensitive: Disables case sensitivity for matching character strings. If you do not specify this keyword, case sensitivity is enabled.

not: Negates the match rule. If you do not specify this keyword, the LB action is taken when the TCP payload regular expression is matched.

Usage guidelines

The device takes the corresponding LB action on TCP packets matching a TCP payload match rule. If you specify the **not** keyword for a TCP payload match rule, the device takes the corresponding LB action on TCP packets not matching the TCP payload match rule.

You can create a maximum of 65535 match rules for an LB class.

Examples

Create a match rule to match the payload **hello** for generic LB class **c1**.

```
<Sysname> system-view
[Sysname] loadbalance class c1 type generic
[Sysname-lbc-generic-c1] match payload hello
```

match radius-attribute

Use **match radius-attribute** to create a RADIUS attribute match rule or modify an existing RADIUS attribute match rule.

Use **undo match** to delete a match rule.

Syntax

match [*match-id*] **radius-attribute** { **code** *attribute-code* | **user-name** } **value** *attribute-value*

undo match *match-id*

Default

An LB class does not have a match rule.

Views

RADIUS LB class view

Predefined user roles

network-admin

context-admin

Parameters

match-id: Specifies a match rule by its ID in the range of 1 to 65535. If you do not specify this argument, the system automatically assigns an available rule ID with the smallest number.

code *attribute-code*: Specifies the code of the RADIUS attribute type, in the range of 1 to 255.

user-name: Specifies the RADIUS attribute type as **user-name** (code 1).

value *attribute-value*: Specifies the RADIUS attribute regular expression, a case-sensitive string of 1 to 255 characters.

Usage guidelines

You can create a maximum of 65535 match rules for an LB class.

Examples

Create a match rule to match usernames that contain **aaa** for RADIUS LB class **lbc1**.

```
<Sysname> system-view
[Sysname] loadbalance class lbc1 type radius
[Sysname-lbc-radius-lbc1] match radius-attribute user-name value aaa*
```

match source

Use **match source** to create a source IP address match rule or modify an existing source IP address match rule.

Use **undo match** to delete a match rule.

Syntax

match [*match-id*] **source** { **ip address** *ipv4-address* [*mask-length* | *mask*] | **ipv6 address** *ipv6-address* [*prefix-length*] }

undo match *match-id*

Default

An LB class does not have a match rule.

Views

LB class view

Predefined user roles

network-admin

context-admin

Parameters

match-id: Specifies a match rule by its ID in the range of 1 to 65535. If you do not specify this argument, the system automatically assigns an available rule ID with the smallest number.

source: Specifies the match rule type as source IP address.

ip address *ipv4-address*: Specifies an IPv4 address.

mask-length: Specifies a mask length in the range of 0 to 32. The default is 32.

mask: Specifies a subnet mask. The default is 255.255.255.255.

ipv6 address *ipv6-address*: Specifies an IPv6 address.

prefix-length: Specifies a prefix length in the range of 0 to 128. The default is 128.

Usage guidelines

You can create a maximum of 65535 match rules for an LB class.

Examples

Create a match rule that matches source IP address 1.1.1.1/32 for the generic LB class **lbc1**.

```
<Sysname> system-view
[Sysname] loadbalance class lbc1 type generic
[Sysname-lbc-generic-lbc1] match source ip address 1.1.1.1
```

match sql

Use **match sql** to create a MySQL statement match rule or modify an existing MySQL statement match rule.

Use **undo match** to delete a match rule.

Syntax

match [*match-id*] **sql** *sql* [**case-insensitive**] [**not**]

undo match *match-id*

Default

An LB class does not have a match rule.

Views

MySQL LB class view

Predefined user roles

network-admin

context-admin

Parameters

match-id: Specifies a match rule by its ID in the range of 1 to 65535. If you do not specify this argument, the system automatically assigns an available rule ID with the smallest number.

sql: Specifies a regular expression used to match MySQL statements, a case-sensitive string of 1 to 255 characters.

case-insensitive: Disables case sensitivity for matching character strings. If you do not specify this keyword, case sensitivity is enabled.

not: Specifies that the LB action is taken when the MySQL statement regular expression is not matched. If you do not specify this keyword, the LB action is taken when the MySQL statement regular expression is matched.

Usage guidelines

You can create a maximum of 65535 match rules for an LB class.

Examples

Create a match rule that matches MySQL statement **select** for the MySQL LB class **c1**.

```
<Sysname> system-view
[Sysname] loadbalance class c1 type mysql
[Sysname-lbc-mysql-lbc1] match sql select
```

match url

Use **match url** to create an HTTP URL match rule or modify an existing HTTP URL match rule.

Use **undo match** to delete a match rule.

Syntax

match [*match-id*] **url** *url*

undo match *match-id*

Default

An LB class does not have a match rule.

Views

HTTP LB class view

Predefined user roles

network-admin

context-admin

Parameters

match-id: Specifies a match rule by its ID in the range of 1 to 65535. If you do not specify this argument, the system automatically assigns an available rule ID with the smallest number.

url *url*: Specifies a URL regular expression, a case-sensitive string of 1 to 255 characters. The string cannot contain question marks (?).

Usage guidelines

You can create a maximum of 65535 match rules for an LB class.

Examples

Create an HTTP URL match rule with regular expression **.*.html** for the HTTP LB class **lbc2**.

```
<Sysname> system-view
[Sysname] loadbalance class lbc2 type http
[Sysname-lbc-http-lbc2] match url .*.html
```

match user

Use **match user** to create a user match rule or modify an existing user match rule.

Use **undo match** to delete a match rule.

Syntax

match [*match-id*] [**identity-domain** *domain-name*] **user** *user-name*

undo match *match-id*

Default

An LB class does not have a match rule.

Views

Generic/HTTP/Link-generic LB class view

Predefined user roles

network-admin

context-admin

Parameters

match-id: Specifies a match rule by its ID in the range of 1 to 65535. If you do not specify this argument, the system automatically assigns an available rule ID with the smallest number.

identity-domain *domain-name*: Matches the user in an identity domain. The *domain-name* argument represents the identity domain name, a case-insensitive string of 1 to 255 characters excluding question marks (?). If you do not specify this option, the system matches the user among users that do not belong to any identity domain.

user-name: Specifies a username, a case-sensitive string of 1 to 55 characters.

Usage guidelines

If the specified user does not exist, the rule does not take effect.

Examples

Create a user match rule for the link-generic LB class **lbc1** to match user **u1** in identity domain **domain1**.

```
<Sysname> system-view
[Sysname] loadbalance class lbc1 type link-generic
[Sysname-lbc-link-generic-lbc1] match identity-domain domain1 user u1
```

Related commands

display loadbalance class

match user-group

Use **match user-group** to create a user group match rule or modify an existing user group match rule.

Use **undo match** to delete a match rule.

Syntax

match [*match-id*] [**identity-domain** *domain-name*] **user-group** *user-group-name*

undo match *match-id*

Default

An LB class does not have a match rule.

Views

Generic/HTTP/Link-generic LB class view

Predefined user roles

network-admin

context-admin

Parameters

match-id: Specifies a match rule by its ID in the range of 1 to 65535. If you do not specify this argument, the system automatically assigns an available rule ID with the smallest number.

identity-domain *domain-name*: Matches the user group in an identity domain. The *domain-name* argument represents the identity domain name, a case-insensitive string of 1 to 255 characters excluding question marks (?). If you do not specify this option, the system matches the user group among user groups that do not belong to any identity domain.

user-group-name: Specifies a user group by its name, a case-insensitive string of 1 to 200 characters.

Usage guidelines

If the specified user group does not exist, the rule does not take effect.

Examples

Create a user group match rule for the link-generic LB class **lbc1** to match user group **lb-group** in identity domain **domain1**.

```
<Sysname> system-view
[Sysname] loadbalance class lbc1 type link-generic
[Sysname-lbc-link-generic-lbc1] match identity-domain domain1 user-group lb-group
```

Related commands

display loadbalance class

match version

Use **match version** to create an HTTP version match rule or modify an existing HTTP version match rule.

Use **undo match** to delete a match rule.

Syntax

match [*match-id*] **version** { **1.0** | **1.1** }

undo match *match-id*

Default

An LB class does not have a match rule.

Views

HTTP LB class view

Predefined user roles

network-admin

context-admin

Parameters

match-id: Specifies a match rule by its ID in the range of 1 to 65535. If you do not specify this argument, the system automatically assigns an available rule ID with the smallest number.

1.0: Specifies HTTP 1.0.

1.1: Specifies HTTP 1.1.

Usage guidelines

You can create a maximum of 65535 match rules for an LB class.

Examples

Create an HTTP version match rule with HTTP 1.0 for the HTTP LB class **lbc1**.

```
<Sysname> system-view
[Sysname] loadbalance class lbc1 type http
[Sysname-lbc-dns-lbc1] match version 1.0
```

match-across-service enable

Use **match-across-service enable** to enable sticky entry matching across services.

Use **undo match-across-service enable** to disable sticky entry matching across services.

Syntax

match-across-service enable

undo match-across-service enable

Default

Sticky entry matching across services is disabled.

Views

network-admin

context-admin

Usage guidelines

When the device fails to find matching a stikcy entry for traffic of a virtual server, this feature allows the device to match the sticky entries of other virtual servers with the same IP address as the current virtual server.

With this feature enabled, the device can distribute requests from the same client to different services of the same virtual server to the same server farm member.

Examples

In address-port sticky group **sg1**, enable sticky entry matching across services.

```
<Sysname> system-view
[Sysname] sticky-group sg1 type address-port
[Sysname-sticky-address-port-sg1] match-across-service enable
```

match-across-virtual-server enable

Use **match-across-virtual-server enable** to enable sticky entry matching across virtual servers.

Use **undo match-across-virtual-server enable** to disable sticky entry matching across virtual servers.

Syntax

match-across-virtual-server enable

undo match-across-virtual-server enable

Default

Sticky entry matching across virtual servers is disabled.

Views

<Sysname> system-view
[Sysname] sticky-group sg1 type address-port
[Sysname-sticky-address-port-sg1] match-across-virtual-server enable
```

match-buffer-end

Use **match-buffer-end** to configure the buffering end string for TCP payload matching.

Use **undo match-buffer-end** to restore the default.

Syntax

match-buffer-end *string*

undo match-buffer-end

Default

No buffering end string is configured.

Views

TCP-application parameter profile view

Predefined user roles

network-admin

context-admin

Parameters

string: Specifies a string that indicates the end of buffering, a case-insensitive string of 1 to 31 characters.

Usage guidelines

For the TCP payload match rule, the device buffers traffic from clients for TCP payload matching during the buffering period. The device stops buffering traffic when any of the following events occurs:

- The device receives the buffering end string from clients.
- The size of buffered data exceeds the specified buffering size.
- The buffered data matches the TCP payload match rule.

This command specifies the string that indicates the end of buffering for traffic received from clients.

Examples

In TCP-application parameter profile **p1**, configure the buffering end string as **over**.

```
<Sysname> system-view
[Sysname] parameter-profile p1 type tcp-application
[Sysname-para-tcp-application-p1] match-buffer-end over
```

Related commands

match-buffer-size

match-buffer-time

match-buffer-size

Use **match-buffer-size** to set the maximum buffering size for TCP payload matching.

Use **undo match-buffer-size** to restore the default.

Syntax

match-buffer-size *size*

undo match-buffer-size

Default

The maximum buffering size is 4096 bytes.

Views

TCP-application parameter profile view

Predefined user roles

network-admin

context-admin

Parameters

size: Specifies the maximum buffering size in the range of 1 to 4096 bytes.

Usage guidelines

For the TCP payload match rule, the device buffers traffic from clients for TCP payload matching during the buffering period. The device stops buffering traffic when any of the following events occurs:

- The device receives the buffering end string from clients.
- The size of buffered data exceeds the specified buffering size.
- The buffered data matches the TCP payload match rule.

This command specifies the maximum size of TCP data from clients that the device can buffer.

Examples

In TCP-application parameter profile **p1**, set the maximum buffering size to 2048 bytes for TCP payload matching.

```
<Sysname> system-view
[Sysname] parameter-profile p1 type tcp-application
[Sysname-para-tcp-application-p1] match-buffer-size 2048
```

Related commands

match-buffer-end

match-buffer-time

match payload

match-buffer-time

Use **match-buffer-time** to set the buffering period for TCP payload matching.

Use **undo match-buffer-time** to restore the default.

Syntax

match-buffer-time *time*

undo match-buffer-time

Default

The buffering period for TCP payload matching is 3 seconds.

Views

TCP-application parameter profile view

Predefined user roles

network-admin

context-admin

Parameters

time: Specifies the buffering period in the range of 1 to 5 seconds.

Usage guidelines

For the TCP payload match rule, the device buffers traffic from clients for TCP payload matching during the buffering period. The device stops buffering traffic when any of the following events occurs:

- The device receives the buffering end string from clients.

- The size of buffered data exceeds the specified buffering size.
- The buffered data matches the TCP payload match rule.

This command specifies the amount of time for the device to buffer TCP data sent by clients.

Examples

In TCP-application parameter profile **p1**, set the buffering period for TCP payload matching to 3 seconds.

```
<Sysname> system-view
[Sysname] parameter-profile p1 type tcp-application
[Sysname-para-tcp-application-p1] match-buffer-time 3
```

Related commands

match-buffer-end

match-buffer-size

match payload

max-bandwidth

Use **max-bandwidth** to set the maximum expected bandwidth of an LB link.

Use **undo max-bandwidth** to restore the default.

Syntax

max-bandwidth [**inbound** | **outbound**] *bandwidth-value* **kbps**

undo max-bandwidth [**inbound** | **outbound**]

Default

The maximum expected bandwidth of an LB link is not limited.

Views

Link view

Predefined user roles

network-admin

context-admin

Parameters

inbound: Specifies the maximum inbound expected bandwidth.

outbound: Specifies the maximum outbound expected bandwidth.

bandwidth-value: Specifies the maximum expected bandwidth in the range of 0 to 4294967295. The value 0 means the bandwidth is not limited.

kbps: Specifies the bandwidth unit as kbps.

Usage guidelines

If you do not specify the **inbound** or **outbound** keyword, the maximum expected bandwidth equals the inbound expected bandwidth plus the outbound expected bandwidth.

This command takes effect only on new sessions and does not take effect on existing sessions.

In addition to being used for link protection, the maximum expected bandwidth is used for remaining bandwidth calculation in the bandwidth algorithm, maximum bandwidth algorithm, and dynamic proximity algorithm.

Examples

Set the maximum expected bandwidth of the LB link **lk1** to 1 kbps.

```
<Sysname> system-view
[Sysname] loadbalance link lk1
[Sysname-lb-link-lk1] max-bandwidth 1 kbps
```

Set the maximum inbound expected bandwidth of the LB link **lk1** to 1 kbps.

```
<Sysname> system-view
[Sysname] loadbalance link lk1
[Sysname-lb-link-lk1] max-bandwidth inbound 1 kbps
```

Set the maximum outbound expected bandwidth of the LB link **lk1** to 1 kbps.

```
<Sysname> system-view
[Sysname] loadbalance link lk1
[Sysname-lb-link-lk1] max-bandwidth outbound 1 kbps
```

max-number

Use **max-number** to set the maximum number of proximity entries.

Use **undo max-number** to restore the default.

Syntax

max-number *number*

undo max-number

Default

The maximum number of proximity entries is 65535.

Views

Proximity view

Predefined user roles

network-admin

context-admin

Parameters

number: Specifies the maximum number of proximity entries, in the range of 0 to 10000000. The value 0 indicates that the maximum number of proximity entries is not limited.

Examples

Set the maximum number of proximity entries to 100.

```
<Sysname> system-view
[Sysname] loadbalance proximity
[Sysname-lb-proximity] max-number 100
```

max-reuse

Use **max-reuse** to set the maximum number of times that a TCP connection can be reused.

Use **undo max-reuse** to restore the default.

Syntax

max-reuse *reuse-number*

undo max-reuse

Default

A TCP connection can be reused for a maximum of 1000 times.

Views

OneConnect parameter profile view

MySQL parameter profile view

Predefined user roles

network-admin

context-admin

Parameters

reuse-number: Specifies the maximum number of reuse times, in the range of 1 to 4294967295.

Usage guidelines

After connection reuse is enabled, a TCP connection is not disconnected until the maximum number of reuse times is reached. After the TCP connection is disconnected, new connection requests trigger establishment of a new TCP connection.

Examples

In OneConnect parameter profile **ocp**, set the maximum number of reuse times to 10000.

```
<Sysname> system-view
[Sysname] parameter-profile ocp type oneconnect
[Sysname-para-oneconnect-ocp] max-reuse 10000
```

memory-size

Use **memory-size** to set the memory size used for compression.

Use **undo memory-size** to restore the default.

Syntax

memory-size *size*

undo memory-size

Default

The memory size used for compression is 8 KB.

Views

HTTP-compression parameter profile view

Predefined user roles

network-admin

context-admin

Parameters

size: Specifies the memory size in KB used for compression. The value can only be 1, 2, 4, 8, 16, 32, or 64.

Examples

Create the HTTP-compression parameter profile **pa1**, and set the memory size used for compression to 32 KB.

```
<Sysname> system-view
[Sysname] parameter-profile pa1 type http-compress
[Sysname-para-http-compress-pa1] memory-size 32
```

min-ttl

Use **min-ttl** to set the minimum TTL.

Use **undo min-ttl** to restore the default.

Syntax

min-ttl *ttl-value*

undo min-ttl

Default

The minimum TTL is 3600 seconds.

Views

SOA view

Predefined user roles

network-admin

context-admin

Parameters

ttl-value: Specifies the minimum TTL in the range of 0 to 4294967295 seconds.

Usage guidelines

The minimum TTL is the amount of time that resource records on the primary DNS server are cached on the secondary DNS server.

Examples

Set the minimum TTL to 1 day for DNS forward zone **abc.com**.

```
<Sysname> system-view
[Sysname] loadbalance zone abc.com
[Sysname-lb-zone-abc.com] soa
[Sysname-lb-zone-abc.com-soa] min-ttl 86400
```

Related commands

display loadbalance zone

monitor-interval

Use **monitor-interval** to set the monitoring time for an LB probe template.

Use **undo monitor-interval** to restore the default.

Syntax

monitor-interval *interval-time*

undo monitor-interval

Default

The monitoring time is 10 seconds for a TCP-RST or TCP zero-window LB probe template, 1 second for an HTTP passive LB probe template, and 5 seconds for a custom-monitoring LB probe template.

Views

HTTP passive LB probe template view

TCP-RST LB probe template view

TCP zero-window LB probe template view

Custom-monitoring LB probe template view

Predefined user roles

network-admin

context-admin

Parameters

interval-time: Specifies the monitoring time in the range of 5 to 255 seconds for a TCP-RST or TCP zero-window LB probe template, in the range of 1 to 5 seconds for an HTTP passive LB probe template, and in the range of 1 to 86400 seconds for a custom-monitoring LB probe template.

Usage guidelines

During the monitoring time, the system counts the number of RST packets or zero-window packets sent by each server farm member in a server farm.

During the monitoring time, the system monitors the responses of matching HTTP requests and counts the number of URL error times.

After a custom-monitoring LB probe template is specified, the system executes the custom script file during the monitoring time to detect the state of real servers.

Examples

In TCP RST LB probe template **rsttplt**, set the monitoring time to 60 seconds.

```
<Sysname> system-view
[Sysname] loadbalance probe-template tcp-rst rsttplt
[Sysname-lbpt-tcp-rst-rsttplt] monitor-interval 60
```

node

Use **node** to create a statistics node and enter its view, or enter the view of an existing statistics node.

Use **undo node** to delete the specified statistics node.

Syntax

node *node-name*

undo node *node-name*

Default

No statistics nodes exist.

Views

HTTP statistics parameter profile view

Predefined user roles

network-admin

context-admin

Parameters

node-name: Specifies the statistics node name, a case-insensitive string of 1 to 63 characters.

Usage guidelines

You can configure a maximum of 256 statistics nodes in one HTTP statistics parameter profile.

Examples

In HTTP statistics parameter profile **http1**, create statistics node **node1** and enter statistics node view.

```
<Sysname> system-view
[Sysname] parameter-profile http1 type http-statistics
[Sysname-para-http-statistics-http1] node node1
[Sysname-para-http-statistics-http1-node-node1]
```

override-limit enable

Use **override-limit enable** to ignore the limits for sessions that match sticky entries.

Use **undo override-limit enable** to remove the configuration.

Syntax

override-limit enable

undo override-limit enable

Default

The session limits apply to sessions that match sticky entries.

Views

Sticky group view

Predefined user roles

network-admin

context-admin

Usage guidelines

Use this command to ignore the following limits for sessions that match sticky entries:

- Bandwidth and connection parameters on real servers or links.
- Bandwidth ratios and maximum expected bandwidths for real servers or links.
- LB connection limit policies on virtual servers.

This command takes effect only on new sessions and does not take effect on existing sessions.

Examples

Ignore the limits for sessions that match sticky entries generated in the sticky group **st**.

```
<Sysname> system-view
[Sysname] sticky-group st type http-cookie
[Sysname-sticky-http-cookie-st] override-limit enable
```

packet-loss-rate weight

Use **packet-loss-rate weight** to set the packet loss ratio weight for proximity calculation.

Use **undo packet-loss-rate weight** to restore the default.

Syntax

packet-loss-rate weight *packet-loss-rate-weight*

undo packet-loss-rate weight

Default

The packet loss ratio weight for proximity calculation is 0.

Views

Proximity view

Predefined user roles

network-admin

context-admin

Parameters

packet-loss-rate-weight: Specifies the packet loss ratio weight in the range of 0 to 255. The greater the weight value, the higher the weight.

Usage guidelines

This command sets the weight of the packet loss ratio in calculating the link quality. The packet loss ratio is used to calculate the link quality only if the proximity feature is enabled or the link quality algorithm is configured. The proximity feature and the link quality algorithm are mutually exclusive.

Examples

Set the packet loss ratio weight for proximity calculation to 200.

```
<Sysname> system-view
[Sysname] loadbalance proximity
[Sysname-lb-proximity] packet-loss-rate weight 200
```

Related commands

predictor (link group view)

proximity enable (link group view)

parameter

Use **parameter** to specify a parameter profile to be referenced by a virtual server.

Use **undo parameter** to restore the default.

Syntax

parameter { **http** | **http-compression** | **http-statistics** | **ip** | **mysql** | **oneconnect** | **tcp** | **tcp-application** } *profile-name* [**client-side** | **server-side**]

undo parameter { **http** | **http-compression** | **http-statistics** | **ip** | **mysql** | **oneconnect** | **tcp** | **tcp-application** } [**client-side** | **server-side**]

Default

No parameter profile is referenced by a virtual server.

Views

Virtual server view

Predefined user roles

network-admin

context-admin

Parameters

{ **http** | **http-compression** | **http-statistics** | **ip** | **mysql** | **oneconnect** | **tcp** | **tcp-application** }: Specifies a parameter profile type, HTTP, HTTP-compression, HTTP statistics, IP, OneConnect, TCP, or TCP-application. The **http** and **tcp** keywords are supported by the virtual servers of the fast HTTP or HTTP type. The **http-compression**, **http-statistics**, and **oneconnect** keywords are supported only by the virtual servers of the HTTP type. The **mysql** keyword is supported only by MySQL virtual servers. The **tcp-application** keyword is supported only by TCP virtual servers operating at Layer 7.

profile-name: Specifies a parameter profile by its name, a case-insensitive string of 1 to 63 characters.

client-side: Specifies a client-side parameter profile.

server-side: Specifies a server-side parameter profile.

Usage guidelines

The virtual server references the parameter profile to implement analysis, processing, and optimization for service traffic.

The virtual servers of the RADIUS type can only reference the IP parameter profile.

A client-side parameter profile optimizes and processes TCP connections between the client and the device. A server-side parameter profile optimizes and processes TCP connections between the device and the server. Only TCP parameter profiles support the **client-side** and **server-side** keywords.

Examples

Specify the IP parameter profile **pp2** to be referenced by the IP-type virtual server **vs3**.

```
<Sysname> system-view
[Sysname] virtual-server vs3 type ip
[Sysname-vs-ip-vs3] parameter ip pp2
```

parameter-profile

Use **parameter-profile** to create a parameter profile and enter its view, or enter the view of an existing parameter profile.

Use **undo parameter-profile** to delete the specified parameter profile.

Syntax

parameter-profile *profile-name* [**type** { **http** | **http-compression** | **http-statistics** | **ip** | **mysql** | **oneconnect** | **tcp** | **tcp-application** }]

undo parameter-profile *profile-name*

Default

No parameter profiles exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

profile-name: Specifies a parameter profile name, a case-insensitive string of 1 to 63 characters.

type { **http** | **http-compression** | **http-statistics** | **ip** | **mysql** | **oneconnect** | **tcp** | **tcp-application** }: Specifies a parameter profile type, HTTP, HTTP-compression, HTTP statistics, IP, MySQL, OneConnect, TCP, or TCP-application. When you create a parameter profile, you must specify the parameter profile type. You can enter an existing parameter profile view without entering the parameter profile type.

Usage guidelines

You can configure advanced parameters through the parameter profile. The virtual server references the parameter profile to implement analysis, processing, and optimization for service traffic.

You can create HTTP, HTTP-compression, MySQL, HTTP statistics, OneConnect, or TCP-application parameter profiles only if the device has licenses installed. For information about licensing, see license management in *Fundamentals Configuration Guide*.

Examples

Create the IP parameter profile **pp2**, and enter parameter profile view.

```
<Sysname> system-view
[Sysname] parameter-profile pp2 type ip
[Sysname-para-ip-pp2]
```

payload (HTTP/UDP payload sticky group view)

Use **payload** to configure the HTTP or UDP payload sticky method.

Use **undo payload** to delete the HTTP or UDP payload sticky method.

Syntax

payload [**offset** *offset*] [**start** *start-string*] [**end** *end-string* | **length** *length*]

undo payload

Default

No sticky methods exist.

Views

HTTP/UDP payload sticky group view

Predefined user roles

network-admin

context-admin

Parameters

offset *offset*: Specifies the offset value of the HTTP or UDP payload based on the start of the HTTP or UDP packet, in the range of 0 to 1000 bytes. The default is 0.

start *start-string*: Specifies the regular expression that marks the start of the HTTP or UDP payload, a case-sensitive string of 1 to 127 characters starting from the *offset* value. The string cannot contain question marks (?).

end *end-string*: Specifies the regular expression that marks the end of the HTTP or UDP payload, a case-sensitive string of 1 to 127 characters starting from the *start-string* value. The string cannot contain question marks (?).

length *length*: Specifies the length of the HTTP or UDP payload, in the range of 0 to 1000 bytes. The default is 0, which indicates all lengths.

Usage guidelines

Use this command to obtain the HTTP or UDP payload information used to generate sticky entries based on the *offset*, *start-string*, *end-string*, and *length* values. The *start-string* and *end-string* values are not included in the sticky entry information.

This command is not supported by the virtual servers of the fast HTTP type.

Examples

Configure the HTTP payload sticky method for the HTTP payload sticky group **sg5**: Starting from the 10th byte of start of the HTTP packet, use the 20-byte HTTP payload to generate sticky entries.

```
<Sysname> system-view
[Sysname] sticky-group sg5 type payload
[Sysname-sticky-payload-sg5] payload offset 10 length 20
```

Configure the UDP payload sticky method for the UDP payload sticky group **sg6**: Starting from the 28th byte of start of the UDP packet, use the 6-byte UDP payload to generate sticky entries.

```
<Sysname> system-view
[Sysname] sticky-group sg6 type payload
[Sysname-sticky-payload-sg6] payload offset 28 length 6
```

payload (UDP passive sticky group view)

Use **payload** to configure the UDP payload passive sticky method.

Use **undo payload** to delete the UDP payload passive sticky method.

Syntax

payload { **get** | **match** } [**offset** *offset*] [**start** *start-string*] [**end** *end-string* | **length** *length*]

undo payload { **get** | **match** }

Default

No UDP payload passive sticky methods exist.

Views

UDP passive sticky group view

Predefined user roles

network-admin

context-admin

Parameters

get: Obtains the specified string in the UDP response payload, which is used to generate a UDP payload passive sticky entry.

match: Obtains the specified string in the UDP request payload, which is used to match a UDP payload passive sticky entry.

offset *offset*: Specifies the offset value of the UDP payload based on the start of the UDP packet, in the range of 0 to 1000 bytes. The default is 0.

start *start-string*: Specifies the regular expression that marks the start of the UDP payload, a case-sensitive string of 1 to 127 characters starting from the *offset* value. The string cannot contain question marks (?).

end *end-string*: Specifies the regular expression that marks the end of the UDP payload, a case-sensitive string of 1 to 127 characters starting from the *start-string* value. The string cannot contain question marks (?).

length *length*: Specifies the length of the UDP payload, in the range of 0 to 1000 bytes. The default is 0, which indicates all lengths.

Usage guidelines

Use the **payload get** command to obtain the UDP response payload information based on the *offset*, *start-string*, *end-string*, and *length* values. Use the **payload match** command to obtain the UDP request payload information based on those values.

The *start-string* and *end-string* values are not included in the sticky entry information.

Both the **payload get** and **payload match** commands are required for a UDP payload passive sticky method.

The device obtains the payload information of an incoming UDP request based on the **payload match** command and obtains the payload information of an incoming UDP response based on the **payload get** command. If the payload information of the UDP request matches the payload information of the UDP response, the device generates a sticky entry based on the payload information of the UDP response. Subsequent UDP requests that match the sticky entry are forwarded according to the sticky entry.

Examples

Configure the UDP payload passive sticky method for the UDP passive sticky group **sg5**: Obtain the 20-byte UDP payload string starting with **id** in the UDP response. If the obtained string matches the 20-byte UDP payload string starting with **id** in the UDP request, the device generates a sticky entry based on the string obtained from the UDP response.

```
<Sysname> system-view
[Sysname] sticky-group sg5 type udp-passive
[Sysname-sticky-udp-passive-sg5] payload get start id length 20
[Sysname-sticky-udp-passive-sg5] payload match start id length 20
```

payload rewrite

Use **payload rewrite** to rewrite the TCP payload.

Use **undo payload rewrite** to remove the configuration.

Syntax

payload rewrite { **both** | **request** | **response** } **value** *value* **replace** *replace-string*

undo payload rewrite { **both** | **request** | **response** } **value** *value*

Default

The TCP payload is not rewritten.

Views

Generic LB action view

Predefined user roles

network-admin

context-admin

Parameters

both: Specifies both the TCP request and response packets.

request: Specifies the TCP request packets.

response: Specifies the TCP response packets.

value *value*: Specifies the TCP packet header content to be rewritten, a case-sensitive string of 1 to 127 characters.

replace *replace-string*: Specifies the content after rewrite, a case-sensitive string of 1 to 127 characters. You can also specify the following replacement strings:

- **%[***variable***]**—Replaces the specified value with the variable associated with the server farm member. The *variable* is the variable name.
- **%[1-9]**—Replaces the specified value with the content in the corresponding parentheses of the specified value. For example, executing the **payload rewrite value** (Wel)(co)(me) **replace** %2 command will replace the string **Welcome** with **co** in the second pair of parentheses.

Usage guidelines

You can replace the specified value with the variable associated with the server farm member by specifying the replacement string **%[***variable***]**. For example, you can replace the string QMGR.S01 in the payload with QMGR.S0_1 by executing the following commands:

- **variable** var1 **value** _1 (in server farm member view).
- **payload rewrite request value** "QMGR.S01" **replace** QMGR.S01%[var1] (in generic LB action view).

For TCP virtual servers operating at Layer 7 (with the **application-mode enable** command configured), make sure the packet length before and after TCP payload rewrite is not greater than 2048 bytes. If this condition is not met, TCP payload rewrite might fail.

Examples

In generic LB action **lba1**, replace **QMGR.S01** in the payload of TCP requests with **QMGR.S01%[var1]**. **var1** is the name of the variable associated with the server farm member.

```
<Sysname> system-view
[Sysname] loadbalance action lba1 type generic
[Sysname-lba-generic-lba1] payload rewrite request value QMGR.S01 replace QMGR.S01%[var1]
```

Related commands

variable

pool-size

Use **pool-size** to set the maximum number of connections allowed in the MySQL connection pool.

Use **undo pool-size** to restore the default.

Syntax

pool-size *pool-size*

undo pool-size

Default

The maximum number of connections allowed in the MySQL connection pool is 1024.

Views

MySQL parameter profile view

Predefined user roles

network-admin

context-admin

Parameters

pool-size: Specifies the maximum number of connections allowed in the MySQL connection pool, in the range of 1 to 64000.

Usage guidelines

After MySQL data transfer is completed, the TCP connection is stored in a connection pool instead of being closed. For a new connection request, the device selects an available connection from the connection pool before attempting to open a new connection.

Examples

Set the maximum number of connections allowed in the MySQL connection pool to 2000 for the MySQL parameter profile **p1**.

```
<Sysname> system-view
[Sysname] parameter-profile p1 type mysql
[Sysname-para-mysql-p1] pool-size 2000
```

port (DNS server view)

Use **port** to configure the port number of a DNS server.

Use **undo port** to restore the default.

Syntax

port *port-number*

undo port

Default

The port number of a DNS server is 0.

Views

DNS server view

Predefined user roles

network-admin

context-admin

Parameters

port-number: Specifies a port number in the range of 0 to 65535. The value 0 means that the original port number is used.

Usage guidelines

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Specify the port number of DNS server **ds1** as **5353**.

```
<Sysname> system-view
[Sysname] loadbalance dns-server ds1
[Sysname-lb-ds-ds1] port 5353
```

port (real server view)

Use **port** to configure the port number of a real server.

Use **undo port** to restore the default.

Syntax

port *port-number*

undo port

Default

The port number of a real server is 0. (The original port number is used.)

Views

Real server view

Predefined user roles

network-admin

context-admin

Parameters

port-number: Specifies a port number in the range of 0 to 65535. 0 means the original port number is used.

Usage guidelines

This configuration takes effect only when you enable the NAT feature for the server farm.

Examples

Specify the port number of the real server **rs** as **8080**.

```
<Sysname> system-view
[Sysname] real-server rs
[Sysname-rserver-rs] port 8080
```

Related commands

transparent enable (server farm view)

port (transparent DNS proxy view)

Use **port** to configure the port number of a transparent DNS proxy.

Use **undo port** to restore the default.

Syntax

port *port-number*

undo port

Default

The port number of a transparent DNS proxy is 53.

Views

Transparent DNS proxy view

Predefined user roles

network-admin

context-admin

Parameters

port-number: Specifies a port number in the range of 1 to 65535.

Usage guidelines

A transparent DNS proxy processes a DNS request only when the destination IP address and port number of the DNS request matches those of the transparent DNS proxy.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Specify the port number of transparent DNS proxy **dns-proxy1** as **5353**.

```
<Sysname> system-view
[Sysname] loadbalance dns-proxy dns-proxy1
[Sysname-lb-dp-dns-proxy1] port 5353
```

Related commands

display loadbalance dns-proxy

port (virtual server view)

Use **port** to configure the port number of a virtual server.

Use **undo port** to restore the default.

Syntax

port { *port-number* [**to** *port-number*] } &<1-n>

undo port

Default

The port number is 0 (indicates any port) for the virtual server of the IP, RADIUS, TCP, or UDP type. The port number is 80 for the virtual server of the fast HTTP or HTTP type. The port number is 5060 for the virtual server of the SIP type.

Views

Virtual server view

Predefined user roles

network-admin

context-admin

Parameters

port-number [**to** *port-number*] &<1-n>: Specifies a space-separated list of up to *n* port number items. Each port number item specifies a port number or a range of port numbers in the form of *start-port-number* **to** *end-port-number*. For IP, RADIUS, TCP, and UDP virtual servers, the value range for the *port-number* argument is 0 to 65535 (0 means any port) and the value range for *n* is 1 to 32. For HTTP, fast HTTP, and SIP virtual servers, the value range for the *port-number* argument is 1 to 65535 and the value of *n* can only be 1.

Usage guidelines

If the virtual server has referenced an SSL policy, you must configure a non-default port number (typically 443) for the virtual server.

For a TCP virtual server operating at Layer 7 (with the **application-mode enable** command configured), you can configure a maximum of 200 port numbers through the **port** command.

Examples

Specify the port number of the IP-type virtual server **vs3** as **8080**.

```
<Sysname> system-view
[Sysname] virtual-server vs3 type ip
[Sysname-vs-ip-vs3] port 8080
```

Related commands

ssl-server-policy

predictor (DNS server pool view)

Use **predictor** to specify a scheduling algorithm for a DNS server pool.

Use **undo predictor** to restore the default.

Syntax

predictor hash address { **destination** | **source** | **source-ip-port** } [**mask** *mask-length*] [**prefix** *prefix-length*]

predictor { **random** | **round-robin** | { **bandwidth** | **max-bandwidth** } [**inbound** | **outbound**] }

undo predictor

Default

The scheduling algorithm for a DNS server pool is weighted round robin.

Views

DNS server pool view

Predefined user roles

network-admin

context-admin

Parameters

hash address: Specifies the hash algorithm based on the IP address.

destination: Specifies the hash algorithm based on the destination IP address.

source: Specifies the hash algorithm based on the source IP address.

source-ip-port: Specifies the hash algorithm based on the source IP address and port number.

mask *mask-length*: Specifies the mask length of the IPv4 address used in the hash algorithm. The value range for the *mask-length* argument is 0 to 32. The default is 32.

prefix *prefix-length*: Specifies the prefix length of the IPv6 address used in the hash algorithm. The value range for the *prefix-length* argument is 0 to 128. The default is 128.

random: Specifies the random algorithm, which randomly assigns DNS requests to DNS servers.

round-robin: Specifies the weighted round robin algorithm, which assigns DNS requests to DNS servers based on the weights of the DNS servers. A higher weight indicates more DNS requests will be assigned. The weight value used in this algorithm is configured in DNS server pool member view.

bandwidth: Specifies the bandwidth algorithm, which assigns DNS requests to DNS servers based on the weight and remaining bandwidth of the DNS servers. The weight value used in this algorithm is configured in DNS server view.

max-bandwidth: Specifies the maximum bandwidth algorithm, which always assigns DNS requests to the DNS server corresponding to the idle link with the largest remaining bandwidth.

inbound: Selects a DNS server based on the inbound bandwidth.

outbound: Selects a DNS server based on the outbound bandwidth.

Usage guidelines

If you do not specify the **inbound** or **outbound** keyword, the total bandwidth is used to select a DNS server.

In the bandwidth algorithm and maximum bandwidth algorithm, the remaining bandwidth is the maximum expected bandwidth minus the current bandwidth. If the maximum expected bandwidth is not configured, the remaining bandwidth is the maximum bandwidth of the link minus the current bandwidth.

Examples

Specify the scheduling algorithm as **random** for DNS server pool **dns-pool**.

```
<Sysname> system-view
[Sysname] loadbalance dns-server-pool dns-pool
[Sysname-lb-dspool-dns-pool] predictor random
```

Related commands

max-bandwidth (link view)

predictor (link group view)

Use **predictor** to specify a scheduling algorithm for a link group.

Use **undo predictor** to restore the default.

Syntax

Link-based:

predictor { **least-connection** | { **bandwidth** | **max-bandwidth** } [**inbound** | **outbound**] }

undo predictor

Link group member-based:

predictor hash address { **destination** | **source** | **source-ip-port** } [**mask** *mask-length*] [**prefix** *prefix-length*]

predictor { **least-connection member** | **random** | **round-robin** }

undo predictor

Default

The scheduling algorithm for a link group is weighted round robin.

Views

Link group view

Predefined user roles

network-admin

context-admin

Parameters

hash address: Performs the hash algorithm based on IP address.

destination: Performs the hash algorithm based on destination IP address.

source: Performs the hash algorithm based on source IP address.

source-ip-port: Performs the hash algorithm based on source IP address and port number.

mask *mask-length*: Specifies the IPv4 address mask length, in the range of 0 to 32. The default is 32.

prefix *prefix-length*: Specifies the IPv6 address prefix length, in the range of 0 to 128. The default is 128.

least-connection: Specifies the link-based weighted least connection algorithm. This algorithm always assigns new connections to the link with the fewest number of weighted active connections (the total number of active connections in all link groups divided by weight). The weight value used in this algorithm is configured in link view.

least-connection member: Specifies the link group member-based weighted least connection algorithm. This algorithm always assigns new connections to the link with the fewest number of weighted active connections (the number of active connections in the specified link group divided by weight). The weight value used in this algorithm is configured in link group member view.

random: Specifies the random algorithm, which randomly assigns new connections to links.

round-robin: Specifies the weighted round robin algorithm, which assigns new connections to links based on the weights of links. A higher weight indicates more new connections will be assigned. The weight value used in this algorithm is configured in link group member view.

bandwidth: Specifies the bandwidth algorithm, which assigns packets to links based on the weight multiplied by the remaining bandwidth of the links. The weight value used in this algorithm is configured in link view.

max-bandwidth: Specifies the maximum bandwidth algorithm, which always assigns packets to the idle link with the largest remaining bandwidth.

inbound: Selects a link based on the inbound bandwidth.

outbound: Selects a link based on the outbound bandwidth.

Usage guidelines

If you do not specify the **inbound** or **outbound** keyword, the total bandwidth is used to select a link.

In the bandwidth algorithm and maximum bandwidth algorithm, the remaining bandwidth is the maximum expected bandwidth minus the current bandwidth. If the maximum expected bandwidth is not configured, the remaining bandwidth is the maximum bandwidth of the link minus the current bandwidth.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Specify the scheduling algorithm **random** for the link group **lg**.

```
<Sysname> system-view
[Sysname] loadbalance link-group lg
[Sysname-lb-lgroup-lg] predictor random
```

Related commands

max-bandwidth (link view)

proximity enable (link group view)

rate-limit bandwidth (link view)

predictor (server farm view)

Use **predictor** to specify a scheduling algorithm for a server farm.

Use **undo predictor** to restore the default.

Syntax

Real server-based:

predictor { **dync-round-robin** | **least-connection** | **least-time** | { **bandwidth** | **max-bandwidth** } [**inbound** | **outbound**] }

undo predictor

Server farm member-based:

predictor hash [**carp**] **address** { **destination** | **source** | **source-ip-port** } [**mask** *mask-length*] [**prefix** *prefix-length*]

predictor hash [**carp**] **http** [**offset** *offset*] [**start** *start-string*] [[**end** *end-string*] | [**length** l*ength*]]

predictor { **least-connection member** | **least-time member** | **random** | **round-robin** | }

undo predictor

Default

The scheduling algorithm for a server farm is weighted round robin.

Views

Server farm view

Predefined user roles

network-admin

context-admin

Parameters

hash address: Performs the hash algorithm based on IP address.

carp: Specifies the Cache Array Routing Protocol (CARP) hash algorithm. When the number of available real servers changes, this protocol makes all available real servers have the smallest load changes.

destination: Performs the hash algorithm based on destination IP address.

source: Performs the hash algorithm based on source IP address.

source-ip-port: Performs the hash algorithm based on source IP address and port number.

mask *mask-length*: Specifies the IPv4 address mask length, in the range of 0 to 32. The default is 32.

prefix *prefix-length*: Specifies the IPv6 address prefix length, in the range of 0 to 128. The default is 128.

http: Performs the hash algorithm based on the HTTP content.

offset *offset*: Specifies the offset value based on the start of the HTTP content, in the range of 0 to 1000 bytes. The default is 0.

start *start-string*: Specifies the regular expression that marks the start of the HTTP content, a case-sensitive string of 1 to 127 characters starting from the *offset* value. The string cannot contain question marks (?).

end *end-string*: Specifies the regular expression that marks the end of the HTTP content, a case-sensitive string of 1 to 127 characters starting from the *start-string* value. The string cannot contain question marks (?).

length *length*: Specifies the length of the HTTP content, in the range of 0 to 1000 bytes. The default is 0, which indicates all lengths.

dync-round-robin: Specifies the dynamic round robin algorithm, which assigns new connections to real servers based on load weight values calculated by using the memory usage, CPU usage, and disk usage of the real servers. The smaller the load, the greater the weight value. A real server with a greater weight value is assigned more connections.

least-connection: Specifies the real server-based weighted least connection algorithm, which always assigns new connections to the real server with the fewest number of weighted active connections (the total number of active connections in all server farms divided by weight). The weight value used in this algorithm is configured in real server view.

least-connection member: Specifies the server farm member-based weighted least connection algorithm, which always assigns new connections to the server farm member with the fewest number of weighted active connections (the number of active connections in the specified server farm divided by weight). The weight value used in this algorithm is configured in server farm member view.

least-time: Specifies the least time algorithm, which assigns new connections to real servers based on load weight values calculated by using the response time of the real servers. The shorter the response time, the greater the weight value. A real server with a greater weight value is assigned more connections.

least-time member: Specifies the server farm member-based least time algorithm, which assigns new connections to server farm members based on load weight values calculated by using the response time of the server farm members. The shorter the response time, the greater the weight value. A server farm member with a greater weight value is assigned more connections.

random: Specifies the random algorithm, which randomly assigns new connections to real servers.

round-robin: Specifies the weighted round robin algorithm, which assigns new connections to real servers based on the weights of real servers. A higher weight indicates more new connections will be assigned. The weight value used in this algorithm is configured in server farm member view.

bandwidth: Specifies the bandwidth algorithm, which assigns packets to real servers based on the weight of the real servers and the bandwidth ratio. The weight value used in this algorithm is configured in real server view.

max-bandwidth: Specifies the maximum bandwidth algorithm, which always assigns packets to the idle real server with the largest remaining bandwidth.

inbound: Selects a real server based on the inbound bandwidth.

outbound: Selects a real server based on the outbound bandwidth.

Usage guidelines

The dynamic round robin algorithm can take effect only if you specify an SNMP-DCA NQA template. If no SNMP-DCA NQA template is specified, the non-weighted round robin algorithm is used. For more information about NQA templates, see NQA configuration in *Network Management and Monitoring Configuration Guide*.

If you do not specify the **inbound** or **outbound** keyword, the total bandwidth is used to select a real server.

In the bandwidth algorithm and maximum bandwidth algorithm, the remaining bandwidth is the maximum expected bandwidth minus the current bandwidth. If the maximum expected bandwidth is not configured, the remaining bandwidth is the maximum bandwidth of the real server minus the current bandwidth.

Examples

Specify the scheduling algorithm for the server farm **sf** as **random**.

```
<Sysname> system-view
[Sysname] server-farm sf
[Sysname-sfarm-sf] predictor random
```

Related commands

predictor (virtual server pool view)

Use **predictor** to specify a scheduling algorithm for a virtual server pool.

Use **undo predictor** to restore the default.

Syntax

predictor { **alternate** | **fallback** | **preferred** } { **least-connection** | **proximity** | **random** | **round-robin** | **topology** | { **bandwidth** | **max-bandwidth** } [**inbound** | **outbound**] | **hash address** { **source** | **source-ip-port** | **destination** } [**mask** *mask-length* | **prefix** *prefix-length*] }

undo predictor { **alternate** | **fallback** }

Default

The scheduling algorithm for a virtual server pool is weighted round robin. No alternative or backup scheduling algorithm is specified.

Views

Virtual server pool view

Predefined user roles

network-admin

context-admin

Parameters

alternate: Specifies the alternative scheduling algorithm.

fallback: Specifies the backup scheduling algorithm.

preferred: Specifies the preferred scheduling algorithm.

least-connection: Specifies the weighted least connection algorithm. This algorithm always assigns DNS requests to the virtual server with the fewest number of weighted active connections (the number of active connections divided by weight).

proximity: Specifies the dynamic proximity algorithm, which assigns DNS requests to virtual servers based on dynamic proximity entries.

random: Specifies the random algorithm, which randomly assigns DNS requests to virtual servers.

round-robin: Specifies the weighted round robin algorithm, which assigns DNS requests to virtual servers based on the weights of the virtual servers. A higher weight indicates more DNS requests will be assigned.

topology: Specifies the static proximity algorithm, which assigns DNS requests to virtual servers based on static proximity entries.

bandwidth: Specifies the bandwidth algorithm, which assigns DNS requests to virtual servers based on the weight of the virtual servers and the remaining bandwidth.

max-bandwidth: Specifies the maximum bandwidth algorithm, which always assigns DNS requests to the virtual server corresponding to the idle link with the largest remaining bandwidth.

inbound: Selects a virtual server based on the inbound bandwidth.

outbound: Selects a virtual server based on the outbound bandwidth.

hash address: Specifies the hash algorithm based on the IP address.

source: Specifies the hash algorithm based on the source IP address.

source-ip-port: Specifies the hash algorithm based on the source IP address and port number.

destination: Specifies the hash algorithm based on the destination IP address.

mask *mask-length*: Specifies the mask length of the IPv4 address used in the hash algorithm. The value range for the *mask-length* argument is 0 to 32. The default is 32.

prefix *prefix-length*: Specifies the prefix length of the IPv6 address used in the hash algorithm. The value range for the *prefix-length* argument is 0 to 128. The default is 128.

Usage guidelines

If you do not specify the **inbound** or **outbound** keyword, the total bandwidth is used to select a virtual server.

In the bandwidth algorithm and maximum bandwidth algorithm, the remaining bandwidth is the maximum expected bandwidth minus the current bandwidth. If the maximum expected bandwidth is not configured, the remaining bandwidth is the maximum bandwidth of the link minus the current bandwidth.

Examples

Specify the preferred scheduling algorithm for the virtual server pool **local-pool** as **random**, and alternative scheduling algorithm as **least-connection**.

```
<Sysname> system-view
[Sysname] loadbalance virtual-server-pool local-pool
[Sysname-lb-vspool-local-pool] predictor preferred random
[Sysname-lb-vspool-local-pool] predictor alternate least-connection
```

prefer-method

Use **prefer-method** to specify the preferred compression algorithm.

Use **undo prefer-method** to restore the default.

Syntax

prefer-method { **deflate** | **gzip** }

undo prefer-method

Default

The preferred compression algorithm is **gzip**.

Views

HTTP-compression parameter profile view

Predefined user roles

network-admin

context-admin

Parameters

deflate: Specifies the Deflate compression algorithm.

gzip: Specifies the default GNU zip compression algorithm.

Usage guidelines

If the client request supports the configured compression algorithm, the configured compression algorithm applies. If the client request does not support the configured compression algorithm, the compression algorithm contained in the request applies.

Examples

Create the HTTP-compression parameter profile **http1**, and specify the preferred compression algorithm as **deflate**.

```
<Sysname> system-view
[Sysname] parameter-profile http1 type http-compression
[Sysname-para-http-compression-http1] prefer-method deflate
```

primary-nameserver

Use **primary-nameserver** to configure the host name for the primary DNS server.

Use **undo primary-nameserver** to restore the default.

Syntax

primary-nameserver *host-name*

undo primary-nameserver

Default

No host name is configured for the primary DNS server.

Views

SOA view

Predefined user roles

network-admin

context-admin

Parameters

host-name: Specifies the host name for the primary DNS server, a case-insensitive and dot-separated string of up to 254 characters. The string can contain letters, digits, hyphens (-), underscores (_), and dots (.). Each dot-separated part can have a maximum of 63 characters.

Usage guidelines

The host name of the primary DNS server can be a relative domain name (does not end with a dot) or an absolute domain name (ends with a dot). For an absolute domain name, the host name is not automatically expanded and cannot exceed 254 characters. For a relative domain name, the current domain name is automatically appended to the host name. The host name plus the appended domain name cannot exceed 254 characters.

Examples

Configure the host name for the primary DNS server as **ns1.abc.com** for DNS forward zone **abc.com**.

```
<Sysname> system-view
[Sysname] loadbalance zone abc.com
[Sysname-lb-zone-abc.com] soa
[Sysname-lb-zone-abc.com-soa] primary-nameserver ns1.abc.com
```

Related commands

priority (DNS server pool member view)

Use **priority** to set the priority of a DNS server pool member.

Use **undo priority** to restore the default.

Syntax

priority *priority*

undo priority

Default

The priority of a DNS server pool member is 4.

Views

DNS server pool member view

Predefined user roles

network-admin

context-admin

Parameters

priority: Specifies the priority value in the range of 1 to 8. A greater value means a higher priority.

Usage guidelines

Typically, only the members with the highest priority in a DNS server pool participate in scheduling. If the number of such members is smaller than the required minimum number, more members are selected by priority in descending order. If the allowed maximum number is exceeded after members with a certain priority are added, only some of the members with that priority are added.

Use this command together with the **selected-server** command in DNS server pool view.

Examples

Set the priority of DNS server pool member **ds1** to **3**.

```
<Sysname> system-view
[Sysname] loadbalance dns-server-pool dsp1
[Sysname-lb-dspool-dsp1] dns-server ds1 port 10
```

```
[Sysname-dspool-dsp1-#member#-ds1-port-10] priority 3
```

Use **undo priority** to restore the default.

Syntax

priority *priority*

undo priority

Default

The priority of a link is 4.

Views

Link view

Predefined user roles

network-admin

context-admin

Parameters

priority: Specifies the priority value in the range of 1 to 8. A greater value means a higher priority.

Usage guidelines

Typically only the links with the highest priority participate in scheduling. If the number of such links is smaller than the required minimum number, more links are selected by priority in descending order.

Examples

Set the priority of the link **lk1** to **3**.

```
<Sysname> system-view
[Sysname] loadbalance link lk1
[Sysname-lb-link-lk1] priority 3
```

Related commands

selected-link

priority (real server view)

Use **priority** to set the priority of a real server.

Use **undo priority** to restore the default.

Syntax

priority *priority*

undo priority

Default

The priority of a real server is 4.

Views

Real server view

Predefined user roles

network-admin

context-admin

Parameters

priority: Specifies the priority value of the real server, in the range of 1 to 8. A greater value means a higher priority to be referenced.

Usage guidelines

Typically only the real servers with the highest priority participate in scheduling. If the number of such real servers is smaller than the required minimum number, more real servers are selected by priority in descending order.

Examples

Set the priority of the real server **rs** to **3**.

```
<Sysname> system-view
[Sysname] real-server rs
[Sysname-rserver-rs] priority 3
```

Related commands

selected-server

priority (server farm member view)

Use **priority** to set the priority of a server farm member.

Use **undo priority** to restore the default.

Syntax

priority *priority*

undo priority

Default

The priority of a server farm member is 4.

Views

Server farm member view

Predefined user roles

network-admin

context-admin

Parameters

priority: Specifies the priority value in the range of 1 to 8. A greater value means a higher priority.

Usage guidelines

Typically, only the members with the highest priority in a server farm participate in scheduling. If the number of such members is smaller than the required minimum number, more members are selected by priority in descending order. If the allowed maximum number is exceeded after members with a certain priority are added, only some of the members with that priority are added.

Use this command together with the **selected-server** command in server farm view.

Examples

Set the priority of server farm member **rs1** to **3**.

```
<Sysname> system-view
[Sysname] server-farm sf
[Sysname-sfarm-sf] real-server rs1 port 80
[Sysname-sfarm-sf-#member#-rs1-port-80] priority 3
```

Related commands

selected-server (server farm view)

priority (SNAT global policy view)

Use **priority** to set the priority of a SNAT global policy.

Use **undo priority** to restore the default.

Syntax

priority *priority*

undo priority

Default

The priority of a SNAT global policy is 0.

Views

SNAT global policy view

Predefined user roles

network-admin

context-admin

Parameters

priority: Specifies the priority value in the range of 0 to 65535. A greater value means a higher priority.

Usage guidelines

You can configure multiple SNAT global policies with different priorities. They are matched in descending order of priority values.

Examples

Set the priority of SNAT global policy **sn1** to **100**.

```
<Sysname> system-view
[Sysname] loadbalance snat-global-policy sn1
[Sysname-lb-snat-gp-sn1] priority 100
```

probe (DNS server pool member view)

Use **probe** to specify a health monitoring method for a DNS server pool member.

Use **undo probe** to restore the default.

Syntax

probe *template-name*

undo probe *template-name*

Default

No health monitoring method is specified for a DNS server pool member.

Views

DNS server pool member view

Predefined user roles

network-admin

context-admin

Parameters

template-name: Specifies an NQA template by its name, a case-insensitive string of 1 to 32 characters.

Usage guidelines

Use the **nqa template** command to create an NQA template to be referenced by the health monitoring method. The DNS server pool uses the parameters defined in the NQA template to detect the availability of the pool members.

The health monitoring method configuration in DNS server pool member view takes precedence over the configuration in DNS server pool view.

The health monitoring result for a DNS server affects the availability of a DNS server pool member. The health monitoring result for a DNS server pool member does not affect the availability of a DNS server.

Examples

Create the ICMP-type NQA template **t4**, and specify the health monitoring method for the DNS server pool member **ds1** as **t4**.

```
<Sysname> system-view
[Sysname] nqa template icmp t4
[Sysname-nqatplt-icmp-t4] quit
[Sysname] loadbalance dns-server-pool dsp1
[Sysname-lb-dspool-dsp1] dns-server ds1 port 10

Use **undo probe-template** to remove a custom-monitoring LB probe template from a server farm member.

Syntax

probe-template external-monitor *template-name*

undo probe-template external-monitor *template-name*

Default

No custom-monitoring probe template is specified for a server farm member.

Views

Server farm member view

Predefined user roles

network-admin

context-admin

Parameters

template-name: Specifies a custom-monitoring template by its name, a case-insensitive string of 1 to 32 characters.

Usage guidelines

This command can monitor a sever farm member by referencing a custom-monitoring LB probe template.

You can configure this command for all server farm members in server farm view or for a single server farm member in server farm member view. If you configure this command in both server farm view and server farm member view, the configuration in server farm member view takes effect.

The monitoring result of a real server affects the availability of a server farm member, but the monitoring result of a server farm member does not affect the availability of a real server.

Examples

Specify custom-monitoring LB probe template **test_external** for server farm member **rs1**.

```
<Sysname> system-view
[Sysname] server-farm sf
[Sysname-sfarm-sf] real-server rs1 port 80
[Sysname-sfarm-sf-#member#-rs1-port-80] probe-template external-monitor test_external
```

Related commands

loadbalance probe-template

probe-template (server farm view)

Use **probe-template** to specify an LB probe template for a server farm.

Use **undo probe-template** to remove an LB probe template for a server farm.

probe-template { **external-monitor** | **http-passive** | **tcp-rst** | **tcp-zero-window** } *template-name*

undo probe-template { **external-monitor** | **http-passive** | **tcp-rst** | **tcp-zero-window** }

Default

No LB probe template is specified for a server farm.

Views

Server farm view

Predefined user roles

network-admin

context-admin

Parameters

external-monitor: Specifies a custom-monitoring LB probe template.

http-passive: Specifies an HTTP passive LB probe template.

tcp-rst: Specifies a TCP-RST LB probe template.

tcp-zero-window: Specifies a TCP zero-window LB probe template.

template-name: Specifies the template name, a case-insensitive string of 1 to 32 characters.

Usage guidelines

This command can monitor all real severs in a server farm.

A server farm can reference only one HTTP passive LB probe template, one TCP-RST LB probe template, and one TCP zero-window LB probe template at the same time.

You can specify multiple custom-monitoring LB probe templates for a server farm.

Examples

Specify TCP-RST LB probe template **r1** for server farm **sf**.

```
<Sysname>system-view
[Sysname] server-farm sf
[Sysname-sfarm-sf] probe-template tcp-rst r1
```

Use **undo protect-action** to restore the default.

Syntax

protect-action { **auto-shutdown** | **busy** [**probe-interval** *interval*] [**probe-times** *times*] }

undo protect-action

Default

The protection action is to place a real server in busy state.

Views

TCP-RST LB probe template view

TCP zero-window LB probe template view

Predefined user roles

network-admin

context-admin

context-admin

Parameters

auto-shutdown: Automatically shuts down a real server.

busy: Places a real server in busy state.

probe-interval *interval*: Specifies the interval for probing the real server in busy state, in the range of 5 to 3600 seconds. The default is 30 seconds.

probe-times *times*: Specifies the maximum number of times for probing the real server in busy state, in the range of 0 to 255. The default is 0, which means that the number of probe times is not limited.

Usage guidelines

For the **busy** action, after placing a real server in busy state, the device starts probing the real server at the specified probe intervals. If the number of RST or zero-window packets sent does not reach the threshold in a probe interval, the real server is placed back in normal state. If threshold violation persists when the maximum probe times is reached, the system automatically shuts down the real server.

A real server that is shut down due to packet threshold violation or exceeded probe times will be restored to normal state immediately when the specified LB probe template is deleted.

If a real server is shut down due to packet threshold violation or exceeded probe times, you can restore the normal state of the real server as follows:

- Execute the **auto-shutdown recovery-time** command. The real server will be restored to normal state when the automatic recovery timer expires.
- Execute the **recover-from-auto-shutdown** command in real server view to restore the real server to normal state immediately.

Examples

In TCP-RST LB probe template **rsttplt**, configure the protection action as **busy**, set the probe interval to 30 seconds, and set the probe times to 3.

```
<Sysname>system-view
[Sysname] loadbalance probe-template tcp-rst rsttplt
[Sysname-lbpt-tcp-rst-rsttplt] protect-action busy probe-interval 30 probe-times 3
```

Related commands

recover-from-auto-shutdown (real server view)

protected-url

Use **protected-url** to configure the URLs to be protected.

Use **undo protected-url** to remove all protected URLs.

Syntax

protected-url *url*

undo protected-url

Default

No URLs are protected.

Views

Protection rule view

Predefined user roles

network-admin

context-admin

Parameters

url: Specifies a regular expression to match URLs, a case-sensitive string of 1 to 255 characters. The regular expression cannot contain question marks (?).

Usage guidelines

If the number of times that a user accesses a protected URL exceeds the request threshold during the protection period, the protection action is taken.

The device does not match the parameters in a URL and matches only the portion before the question mark (?).

If you execute this command multiple times, the most recent configuration takes effect.

Examples

In protection rule 5, configure www.aaa.com/index.html as a protected URL.

```
<Sysname>system-view
[Sysname] loadbalance protection-policy p1
[Sysname-lbpp-http-p1] rule 5
[Sysname-lbpp-http-p1-rule-5] protected-url www.aaa.com/index.html
```

Related commands

cookie (protection policy view)

protection-action

protection-action

Use **protection-action** to configure a protection action.

Use **undo protection-action** to restore the default.

Syntax

protection-action { **warning** | { **drop** | **verify** { **insert-header** | **js** } } } *

undo protection-action

Default

No protection action is configured.

Views

HTTP protection policy view

Predefined user roles

network-admin

context-admin

Parameters

warning: Generates a log message.

drop: Drops requests.

verify: Performs cookie verification on subsequent requests.

insert-header: Performs cookie verification by inserting an HTTP header.

js: Performs cookie verification by inserting a JS script.

Usage guidelines

The protection action is taken when protection rules in a protection policy are matched. The device supports the following protection actions:

- **Warning**—Generates a log message and sends it to the information center.
- **Drop**—Drops requests.
- **Verify cookie**—Returns a response carrying a cookie value to the client. If a subsequent request carries the returned cookie value, it passes the verification. If a subsequent request does not carry a cookie value or carries a different cookie value, it fails to pass the verification and is dropped. This protection action is useful in scenarios where attackers cannot insert cookie values into attack packets. The device supports returning a cookie value by inserting an HTTP header or a JS script.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

In HTTP protection policy **p1**, configure generating log messages and performing cookie verification by inserting an HTTP header as the protection actions.

```
<Sysname> system-view
[Sysname] loadbalance protection-policy p1 type http
[Sysname-lbpp-http-p1] protection-action warning verify insert-header
```

protection-period

Use **protection-period** to set the protection period.

Use **undo protection-period** to restore the default.

Syntax

protection-period *period*

undo protection-period

Default

The protection period is 120 seconds.

Views

Protection rule view

Predefined user roles

network-admin

context-admin

Parameters

period: Specifies a protection period in the range of 1 to 900 seconds.

Usage guidelines

If the number of times that a user accesses a protected URL exceeds the request threshold during the protection period, the protection action is taken.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

In protection rule 5, set the protection period to 5 seconds.

```
<Sysname> system-view
[Sysname] loadbalance protection-policy p1
[Sysname-lbpp-http-p1] rule 5
[Sysname-lbpp-http-p1-rule-5] protection-period 5
```

context-admin

Parameters

code *attribute-code*: Specifies the code of the RADIUS attribute type, in the range of 1 to 255.

framed-ip-address: Specifies the RADIUS attribute type as **framed-ip-address** (code 8).

user-name: Specifies the RADIUS attribute type as **user-name** (code 1).

Usage guidelines

The RADIUS attribute sticky method takes effect only on RADIUS packets.

Examples

Configure the RADIUS attribute sticky method for sticky group **s1** by specifying the RADIUS attribute type as **user-name**.

```
<Sysname> system-view
[Sysname] sticky-group s1 type radius
[Sysname-sticky-radius-s1] radius-attribute user-name
```

rate-limit bandwidth (link view)

Use **rate-limit bandwidth** to set the maximum bandwidth of a link.

Use **undo rate-limit bandwidth** to restore the default.

Syntax

rate-limit bandwidth [**inbound** | **outbound**] *bandwidth-value* **kbps**

undo rate-limit bandwidth [**inbound** | **outbound**]

Default

The maximum bandwidth of a link is not limited.

Views

Link view

Predefined user roles

network-admin

context-admin

Parameters

inbound: Specifies the maximum inbound bandwidth.

outbound: Specifies the maximum outbound bandwidth.

bandwidth-value: Specifies the maximum bandwidth in the range of 0 to 4294967295. The value 0 means the bandwidth is not limited.

kbps: Specifies the bandwidth unit as kbps.

Usage guidelines

If you do not specify the **inbound** or **outbound** keyword, the maximum bandwidth equals the inbound bandwidth plus the outbound bandwidth.

This command takes effect only on new sessions and does not take effect on existing sessions.

Examples

Set the maximum bandwidth of the link **lk1** to 1 kbps.

```
<Sysname> system-view
[Sysname] loadbalance link lk1
[Sysname-lb-link-lk1] rate-limit bandwidth 1 kbps
```

Set the maximum inbound bandwidth of the link **lk1** to 1 kbps.

```
<Sysname> system-view
[Sysname] loadbalance link lk1
[Sysname-lb-link-lk1] rate-limit bandwidth inbound 1 kbps
```

Set the maximum outbound bandwidth of the link **lk1** to 1 kbps.

```
<Sysname> system-view
[Sysname] loadbalance link lk1
[Sysname-lb-link-lk1] rate-limit bandwidth outbound 1 kbps
```

rate-limit bandwidth (real server view)

Use **rate-limit bandwidth** to set the maximum bandwidth of a real server.

Use **undo rate-limit bandwidth** to restore the default.

Syntax

rate-limit bandwidth [**inbound** | **outbound**] *bandwidth-value* **kbps**

undo rate-limit bandwidth [**inbound** | **outbound**]

Default

The maximum bandwidth of a real server is not limited.

Views

Real server view

Predefined user roles

network-admin

context-admin

Parameters

inbound: Specifies the maximum inbound bandwidth.

outbound: Specifies the maximum outbound bandwidth.

bandwidth-value: Specifies the maximum bandwidth in the range of 0 to 4294967295. The value 0 means the bandwidth is not limited.

kbps: Specifies the bandwidth unit as kbps.

Usage guidelines

If you do not specify the **inbound** or **outbound** keyword, the maximum bandwidth equals the inbound bandwidth plus the outbound bandwidth.

This command takes effect only on new sessions and does not take effect on existing sessions.

Examples

Set the maximum bandwidth of the real server **rs** to 1 kbps.

```
<Sysname> system-view
[Sysname] real-server rs
[Sysname-rserver-rs] rate-limit bandwidth 1 kbps
```

Set the maximum inbound bandwidth of the real server **rs** to 1 kbps.

```
<Sysname> system-view
[Sysname] real-server rs
[Sysname-rserver-rs] rate-limit bandwidth inbound 1 kbps
```

Set the maximum outbound bandwidth of the real server **rs** to 1 kbps.

```
<Sysname> system-view
[Sysname] real-server rs
[Sysname-rserver-rs] rate-limit bandwidth outbound 1 kbps
```

rate-limit bandwidth (virtual server view)

Use **rate-limit bandwidth** to set the maximum bandwidth of a virtual server.

Use **undo rate-limit bandwidth** to restore the default.

Syntax

rate-limit bandwidth [**inbound** | **outbound**] *bandwidth-value* **kbps**

undo rate-limit bandwidth [**inbound** | **outbound**]

Default

The maximum bandwidth of a virtual server is not limited.

Views

Virtual server view

Predefined user roles

network-admin

context-admin

Parameters

inbound: Specifies the maximum inbound bandwidth.

outbound: Specifies the maximum outbound bandwidth.

bandwidth-value: Specifies the maximum bandwidth in the range of 0 to 4294967295. The value 0 means the bandwidth is not limited.

kbps: Specifies the bandwidth unit as kbps.

Usage guidelines

If you do not specify the **inbound** or **outbound** keyword, the maximum bandwidth equals the inbound bandwidth plus the outbound bandwidth.

Examples

Set the maximum bandwidth of the IP-type virtual server **vs3** to 1 kbps.

```
<Sysname> system-view
[Sysname] virtual-server vs3 type ip
[Sysname-vs-ip-vs3] rate-limit bandwidth 1 kbps
```

Set the maximum inbound bandwidth of the IP-type virtual server **vs3** to 1 kbps.

```
<Sysname> system-view
[Sysname] virtual-server vs3 type ip
[Sysname-vs-ip-vs3] rate-limit bandwidth inbound 1 kbps
```

Set the maximum outbound bandwidth of the IP-type virtual server **vs3** to 1 kbps.

```
<Sysname> system-view
[Sysname] virtual-server vs3 type ip
[Sysname-vs-ip-vs3] rate-limit bandwidth outbound 1 kbps
```

rate-limit connection (link group member view)

Use **rate-limit connection** to set the maximum number of connections per second of a link group member.

Use **undo rate-limit connection** to restore the default.

Syntax

rate-limit connection *connection-number*

undo rate-limit connection

Default

The maximum number of connections per second of a link group member is 0.

Views

Link group member view

Predefined user roles

network-admin

context-admin

Parameters

connection-number: Specifies the maximum number of connections per second in the range of 0 to 4294967295. 0 means the number is not limited.

Examples

Set the maximum number of connections per second of the link group member **lk1** to 1000.

```
<Sysname> system-view
[Sysname] loadbalance link-group lg
[Sysname-lb-lgroup-lg] link lk1
[Sysname-lb-lgroup-lg-#member#-lk1] rate-limit connection 1000
```

rate-limit connection (link view)

Use **rate-limit connection** to set the maximum number of connections per second of a link.

Use **undo rate-limit connection** to restore the default.

Syntax

rate-limit connection *connection-number*

undo rate-limit connection

Default

The maximum number of connections per second of a link is 0.

Views

Link view

Predefined user roles

network-admin

context-admin

Parameters

connection-number: Specifies the maximum number of connections per second in the range of 0 to 4294967295. 0 means the number is not limited.

Usage guidelines

This command takes effect only on new sessions and does not take effect on existing sessions.

Examples

Set the maximum number of connections per second of the link **lk1** to 10000.

```
<Sysname> system-view
[Sysname] loadbalance link lk1
[Sysname-lb-link-lk1] rate-limit connection 10000
```

rate-limit connection (real server view)

Use **rate-limit connection** to set the maximum number of connections per second of a real server.

Use **undo rate-limit connection** to restore the default.

Syntax

rate-limit connection *connection-number*

undo rate-limit connection

Default

The maximum number of connections per second of a real server is 0.

Views

Real server view

Predefined user roles

network-admin

context-admin

Parameters

connection-number: Specifies the maximum number of connections per second in the range of 0 to 4294967295. 0 means the number is not limited.

Usage guidelines

This command takes effect only on new sessions and does not take effect on existing sessions.

Examples

Set the maximum number of connections per second of the real server **rs** to 10000.

```
<Sysname> system-view
[Sysname] real-server rs
[Sysname-rserver-rs] rate-limit connection 10000
```

rate-limit connection (server farm member view)

Use **rate-limit connection** to set the maximum number of connections per second of a server farm member.

Use **undo rate-limit connection** to restore the default.

Syntax

rate-limit connection *connection-number*

undo rate-limit connection

Default

The maximum number of connections per second of a server farm member is 0.

Views

Server farm member view

Predefined user roles

network-admin

context-admin

Parameters

connection-number: Specifies the maximum number of connections per second in the range of 0 to 4294967295. 0 means the number is not limited.

Examples

Set the maximum number of connections per second of the server farm member **rs1** to 1000.

```
<Sysname> system-view
[Sysname] server-farm sf
[Sysname-sfarm-sf] real-server rs1 port 80
[Sysname-sfarm-sf-#member#-rs1-port-80] rate-limit connection 1000
```

rate-limit connection (virtual server view)

Use **rate-limit connection** to set the maximum number of connections per second of a virtual server.

Use **undo rate-limit connection** to restore the default.

Syntax

rate-limit connection *connection-number*

undo rate-limit connection

Default

The maximum number of connections per second of a virtual server is 0.

Views

Virtual server view

Predefined user roles

network-admin

context-admin

Parameters

connection-number: Specifies the maximum number of connections per second in the range of 0 to 4294967295. 0 means the number is not limited.

Examples

Set the maximum number of connections per second of the IP-type virtual server **vs3** to 10000.

```
<Sysname> system-view
[Sysname] virtual-server vs3 type ip
[Sysname-vs-ip-vs3] rate-limit connection 10000
```

rate-limit http-request (real server view)

Use **rate-limit http-request** to set the maximum number of HTTP requests per second for a real server.

Use **undo rate-limit http-request** to restore the default.

Syntax

rate-limit http-request *request-number*

undo rate-limit http-request

Default

The maximum number of HTTP requests per second is 0 for a real server.

Views

Real server view

Predefined user roles

network-admin

context-admin

Parameters

request-number: Specifies the maximum number of HTTP requests per second, in the range of 0 to 4294967295. 0 means the number is not limited.

Examples

Set the maximum number of HTTP requests per second to 10000 for real server **rs**.

```
<Sysname> system-view
[Sysname] real-server rs
[Sysname-rserver-rs] rate-limit http-request 10000
```

rate-limit http-request (server farm member view)

Use **rate-limit http-request** to set the maximum number of HTTP requests per second for a server farm member.

Use **undo rate-limit http-request** to restore the default.

Syntax

rate-limit http-request *request-number*

undo rate-limit http-request

Default

The maximum number of HTTP requests per second is 0 for a server farm member.

Views

Server farm member view

Predefined user roles

network-admin

context-admin

Parameters

request-number: Specifies the maximum number of HTTP requests per second, in the range of 0 to 4294967295. 0 means the number is not limited.

Examples

Set the maximum number of HTTP requests per second to 10000 for server farm member **rs**.

```
<Sysname> system-view
[Sysname] server-farm sf
[Sysname-sfarm-sf] real-server rs1 port 80
[Sysname-sfarm-sf-#member#-rs1-port-80] rate-limit http-request 10000
```

readwrite-separation

Use **readwrite-separation** to enable read/write separation for the MySQL database.

Use **undo readwrite-separation** to disable read/write separation for the MySQL database.

Syntax

readwirte-separation read-server-farm *read-server-farm-name* [**read-sticky-group** *read-sticky-group-name*] **write-server-farm** *write-sever-farm-name* [**write-sticky-group** *write-sticky-group-name*]

undo readwrite-separation

Default

Read/write separation is disabled for the MySQL database.

Views

MySQL virtual server view

Predefined user roles

network-admin

context-admin

Parameters

read-server-farm *read-server-farm-name*: Specifies a read server farm by its name, a case-insensitive string of 1 to 63 characters.

read-sticky *read-sticky-group-name*: Specifies a sticky group for the read server farm by its name, a case-insensitive string of 1 to 63 characters.

write-server-farm *write-server-farm-name*: Specifies a write server farm by its name, a case-insensitive string of 1 to 63 characters.

write-sticky *write-sticky-group-name*: Specifies a sticky group for the write server farm by its name, a case-insensitive string of 1 to 63 characters.

Usage guidelines

Read/write separation allows read commands and write commands to be executed by the read server farm and write server farm, respectively, which helps reduce the impact of concurrent read/write requests on database performance.

Examples

Enable read/write separation for the MySQL database of MySQL virtual server **vs1**.

```
<Sysname> system-view
[Sysname] virtual-server vs1 type mysql
[Sysname-vs-mysql-vs1] readwrite-separation read-server-farm rd write-server-farm wr
```

real-server (server farm view)

Use **real-server** to create a server farm member and enter its view, or enter the view of an existing server farm member.

Use **undo real-server** to delete a server farm member.

Syntax

real-server *real-server-name* **port** *port-number*

undo real-server *real-server-name* **port** *port-number*

Default

No server farm members exist.

Views

Server farm view

Predefined user roles

network-admin

context-admin

Parameters

real-server-name: Specifies a server farm member by its name, a case-insensitive string of 1 to 63 characters.

port-number: Specifies the port number of the server farm member, in the range of 0 to 65535.

Usage guidelines

You can use one of the following methods to add a member to a server farm:

- Use the **real-server** command in server farm view. NSFOCUS recommends using this method.
- Use the **server-farm** command in real server view.

You cannot use both methods to add a member with the same real server name and port number to a server farm.

Examples

Add server farm member **rs1** and enter server farm member view.

```
<Sysname> system-view
[Sysname] server-farm sf
[Sysname-sfarm-sf] real-server rs1 port 80
[Sysname-sfarm-sf-#member#-rs1-port-80]
```

Related commands

server-farm (real server view)

real-server (system view)

Use **real-server** to create a real server and enter its view, or enter the view of an existing real server.

Use **undo real-server** to delete the specified real server.

Syntax

real-server *real-server-name*

undo real-server *real-server-name*

Default

No real servers exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

real-server-name: Specifies the real server name, a case-insensitive string of 1 to 63 characters.

Usage guidelines

You can configure this command only if the device has licenses installed. For information about licensing, see license management in *Fundamentals Configuration Guide*.

Examples

Create real server **rs** and enter real server view.

```
<Sysname> system-view
[Sysname] real-server rs
[Sysname-rserver-rs]
```

rebalance per-request

Use **rebalance per-request** to enable load balancing for each HTTP request.

Use **undo rebalance per-request** to restore the default.

Syntax

rebalance per-request

undo rebalance per-request

Default

Load balancing applies to the first HTTP request of a connection. Other HTTP requests are processed in the same way.

Views

HTTP parameter profile view

Predefined user roles

network-admin

context-admin

Examples

Enable load balancing for each HTTP request in the HTTP parameter profile **pp1**.

```
<Sysname> system-view
[Sysname] parameter-profile pp1 type http
[Sysname-para-http-pp1] rebalance per-request
```

record

Use **record** to configure a resource record of the specified type.

Use **undo record** to delete a resource record of the specified type.

Syntax

record { **cname alias** *alias-name* **canonical** *canonical-name* | **mx** [**host** *hostname*] **exchanger** *exchanger-name* **preference** *preference* | **ns** [**sub** *subname*] **authority** *ns-name* | **srv** [**service** *service-name*] **host-offering-service** *hostname* **priority** *priority* **weight** *weight* **port** *port-number* | **txt** [**sub** *subname*] **describe-txt** *description* } [**ttl** *ttl-value*]

undo record { **cname alias** *alias-name* **canonical** *canonical-name* | **mx** [**host** *hostname*] **exchanger** *exchanger-name* | **ns** [**sub** *subname*] **authority** *ns-name* }

| **srv** [**service** *hostname*] **host-offering-service** *hostname* **port** *port-number*
| **txt** [**sub** *subname*] **describe-txt** *description*

Default

No resource records exist.

Views

DNS forward zone view

Predefined user roles

network-admin

context-admin

Parameters

cname: Configures a canonical name (CNAME) resource record.

alias *alias-name*: Specifies an alias for a host name, a case-insensitive, dot-separated string that contains a maximum of 254 characters. The string can contain letters, digits, hyphens (-), underscores (_), and dots (.). Each dot-separated part can have a maximum of 63 characters.

canonical *canonical-name*: Specifies the host name, a case-insensitive, dot-separated string that contains a maximum 254 characters. The string can contain letters, digits, hyphens (-), underscores (_), and dots (.). Each dot-separated part can have a maximum of 63 characters.

mx: Configures a mail exchanger (MX) resource record.

host *hostname*: Specifies the host name for the MX resource record, a case-insensitive, dot-separated string that contains a maximum 254 characters. The string can contain letters, digits, hyphens (-), underscores (_), and dots (.). Each dot-separated part can have a maximum of 63 characters.

exchanger *exchanger-name*: Specifies the host name of the mail server, a case-insensitive, dot-separated string that contains a maximum 254 characters. The string can contain letters, digits, hyphens (-), underscores (_), and dots (.). Each dot-separated part can have a maximum of 63 characters.

preference *preference*: Specifies the preference for the MX resource record, in the range of 0 to 65535. The smaller the value, the higher the priority.

ns: Configure a name server (NS) resource record.

sub *subname*: Specifies a subname for the DNS forward zone, a case-insensitive, dot-separated string of 1 to 254 characters for an absolute domain name or 1 to 253 characters for a relative domain name. The string can contain letters, digits, hyphens (-), underscores (_), and dots (.). Each dot-separated part can have a maximum of 63 characters.

authority *ns-name*: Specifies the host name of the authoritative DNS server, a case-insensitive, dot-separated string that contains a maximum of 254 characters. The string can contain letters, digits, hyphens (-), underscores (_), and dots (.). Each dot-separated part can have a maximum of 63 characters.

srv: Configures a service resource record.

service *service-name*: Specifies a service by its name, a case-insensitive, dot-separated string of 1 to 254 characters for an absolute domain name or 1 to 253 characters for a relative domain name. The string can contain letters, digits, hyphens (-), underscores (_), and dots (.). Each dot-separated part can have a maximum of 63 characters. In a service name (for example, **_ftp._tcp.movie.edu**), add an underscore before the application name and the protocol name to distinguish them from host domain names. If you do not specify a service name, the domain name of the DNS forward zone applies.

host-offering-service *host-name*: Specifies the name of the host that provides the service, a case-insensitive, dot-separated string of 1 to 254 characters for an absolute domain name or 1 to 253 characters for a relative domain name. The string can contain letters, digits, hyphens (-), underscores (_), and dots (.). Each dot-separated part can have a maximum of 63 characters.

priority *priority*: Specifies a priority value for the resource record in the range of 0 to 100. The smaller the priority value, the higher the priority.

weight *weight-value*: Specifies a weight value for the resource record in the range of 0 to 100.

port *port-number*: Specifies a port number in the range of 0 to 65535.

txt: Configures a text resource record.

describe-txt *description*: Specifies the description for the TXT resource record, a case-insensitive string of 1 to 255 characters.

ttl *ttl-value*: Specifies the TTL for resource records, in the range of 0 to 4294967295 seconds. The default is 3600.

Usage guidelines

The host name specified in a resource record can be a relative domain name (does not end with a dot) or an absolute domain name (ends with a dot). For an absolute domain name, the host name is not automatically expanded and cannot exceed 254 characters. For a relative domain name, the current domain name is automatically appended to the host name. The relative domain name plus the appended domain name cannot exceed 254 characters.

If a service has multiple resource records, the device first attempts to connect to the record with the lowest priority. If multiple resource records have the same priority, the device first attempts to connect to the record with the highest weight.

The TTL setting in this command takes precedence over the TTL setting in DNS forward zone view.

You can configure multiple resource records for a DNS forward zone.

Examples

Configure an MX resource record for DNS forward zone **abc.com**: Specify the host name of the mail server as **mail.abc.com** and the preference for the resource record as 10.

```
<Sysname> system-view
[Sysname] loadbalance zone abc.com
[Sysname-lb-zone-abc.com] record mx exchanger mail.abc.com preference 10
```

Configure a CNAME resource record for DNS forward zone **abc.com**: Specify alias **test.abc.com** for host name **aaa.abc.com**.

```
<Sysname> system-view
[Sysname] loadbalance zone abc.com
[Sysname-lb-zone-abc.com] record cname alias test.abc.com canonical aaa.abc.com
```

Configure an NS resource record for DNS forward zone **abc.com**: Specify the host name of the authoritative DNS server as **ns1.abc.com**.

```
<Sysname> system-view
[Sysname] loadbalance zone abc.com
[Sysname-lb-zone-abc.com] record ns authority ns1.abc.com
```

Configure a TXT resource record for DNS forward zone **abc.com**.

```
<Sysname> system-view
[Sysname] loadbalance zone abc.com
[Sysname-lb-zone-abc.com] record txt sub hotline describe-txt v=spf1
include:spf.abcmail.abc.com.cn -all
```

Configure an SRV resource record for DNS forward zone **abc.com**.

```
<Sysname> system-view
[Sysname] loadbalance zone abc.com
[Sysname-lb-zone-abc.com] record srv service _http._tcp.example.com.
host-offering-service www.example.com priority 5 weight 10 port 80
```

Related commands

display loadbalance zone

record ptr

Use **record ptr** to configure a pointer record (PTR) resource record.

Use **undo record ptr** to delete a PTR resource record.

Syntax

record ptr { **ip** i*pv4-address* | **ipv6** *ipv6-address* } *domain-name* [**ttl** *ttl-value*]

undo record ptr { **ip** i*pv4-address* | **ipv6** *ipv6-address* } *domain-name*

Default

No PTR resource records exist.

Views

DNS reverse zone view

Predefined user roles

network-admin

context-admin

Parameters

ip i*pv4-address*: Specifies an IPv4 address.

ipv6 *ipv6-address*: Specifies an IPv6 address.

domain-name: Specifies a domain name, a case-insensitive, dot-separated string that contains a maximum of 253 characters. The string can contain letters, digits, hyphens (-), underscores (_), and dots (.). Each dot-separated part can have a maximum of 63 characters.

ttl *ttl-value*: Specifies the TTL for resource records, in the range of 0 to 4294967295 seconds. The default is 3600.

Usage guidelines

You can configure PTR resource records for IP addresses that require reverse DNS resolution.

The IP address specified in a PTR resource record must be within the IP address range of the DNS reverse zone.

You can configure multiple PTR resource records for a DNS reverse zone.

Examples

Configure a PTR resource record for the DNS reverse zone with IPv4 address 10.1.1.0/24.

```
<Sysname> system-view
[Sysname] loadbalance reverse-zone ip 10.1.1.0 24
[Sysname-lb-rzone-10.1.1.0/24] record ptr ip 10.1.1.1 mail.nsfocus.com.cn
```

```

redirect relocation (LB action view)

Use **redirect relocation** to enable the redirection feature and specify a redirection URL for an LB action.

Use **undo redirect relocation** to disable the redirection feature for an LB action.

Syntax

redirect relocation *relocation*

undo redirect relocation

Default

The redirection feature is disabled for an LB action.

Views

HTTP LB action view

Predefined user roles

network-admin

context-admin

Parameters

relocation: Specifies a redirection URL, a case-sensitive string of 1 to 255 characters. You can also specify the question mark (?) or the following character strings as the redirection URL (each character string can be used only once):

- **%h**: Specifies the host name and port number in the client request packet.
- **%{host}**: Specifies the IP address in the client request packet.
- **%{port}**: Specifies the port number in the client request packet.
- **%p**: Specifies the URL in the client request packet.

Usage guidelines

This command and the **server-farm** command are mutually exclusive. If you configure one command, the other command (if configured) is automatically cancelled.

This command redirects all HTTP request packets matching an LB action to the specified URL.

Examples

Enable the redirection feature for the HTTP LB action **lba1**, and specify the redirection URL as **https://%h%p**.

```
<Sysname> system-view
[Sysname] loadbalance action lba1 type http
[Sysname-lba-http-lba1] redirect relocation https://%h%p
```

redirect relocation (virtual server view)

Use **redirect relocation** to enable the redirection feature and specify a redirection URL for a virtual server.

Use **undo redirect relocation** to disable the redirection feature for a virtual server.

Syntax

redirect relocation *relocation*

undo redirect relocation

Default

The redirection feature is disabled for a virtual server.

Views

HTTP virtual server view

Predefined user roles

network-admin

context-admin

Parameters

relocation: Specifies a redirection URL, a case-sensitive string of 1 to 255 characters. The redirection feature redirects all request packets matching the virtual server to the URL. You can also specify the question mark (?) or the following character strings as the redirection URL (each character string can be used only once):

- **%h**: Specifies the host name and port number in the client request packet.
- **%{host}**: Specifies the IP address in the client request packet.
- **%{port}**: Specifies the port number in the client request packet.
- **%p**: Specifies the URL in the client request packet.

Examples

Enable the redirection feature for the HTTP-type virtual server **vs2**, and specify the redirection URL as **https://%h%p**.

```
<Sysname> system-view
[Sysname] virtual-server vs2 type http
[Sysname-vs-http-vs2] redirect relocation https://%h%p
```

redirect return-code (LB action view)

Use **redirect return-code** to specify the status code in the redirection packets that the LB device returns to clients.

Use **undo redirect return-code** to restore the default.

Syntax

redirect return-code { **301** | **302** | **307** }

undo redirect return-code

Default

The status code in the redirection packets that the LB device returns to clients is 302.

Views

HTTP LB action view

Predefined user roles

network-admin

context-admin

Parameters

301: Deletes request resources permanently.

302: Deletes request resources temporarily.

307: Temporarily redirects requests to the URL in the Location header.

Usage guidelines

This configuration takes effect only when the redirection feature is enabled for the HTTP LB action.

Examples

Specify the status code in the redirection packets that the LB device returns to clients as **301** for the HTTP LB action **lba1**.

```
<Sysname> system-view
[Sysname] loadbalance action lba1 type http
[Sysname-lba-http-lba1] redirect return-code 301
```

Related commands

redirect relocation

redirect return-code (virtual server view)

Use **redirect return-code** to specify the status code in the redirection packets that the LB device returns to clients.

Use **undo redirect return-code** to restore the default.

Syntax

redirect return-code { **301** | **302** | **307** }

undo redirect return-code

Default

The status code in the redirection packets that the LB device returns to clients is 302.

Views

HTTP virtual server view

Predefined user roles

context-admin

Parameters

301: Deletes request resources permanently.

302: Deletes request resources temporarily.

307: Temporarily redirects requests to the URL in the Location header.

Usage guidelines

This configuration takes effect only when the redirection feature is enabled for the virtual server.

Examples

Specify the status code in the redirection packets that the LB device returns to clients as **301** for the HTTP-type virtual server **vs2**.

```
<Sysname> system-view
[Sysname] virtual-server vs2 type http
[Sysname-vs-http-vs2] redirect return-code 301
```

Related commands

redirect relocation

refresh

Use **refresh** to set the refresh interval.

Use **undo refresh** to restore the default.

Syntax

refresh *refresh-interval*

undo refresh

Default

The refresh interval is 3600 seconds.

Views

SOA view

Predefined user roles

network-admin

context-admin

Parameters

refresh-interval: Specifies the refresh interval in the range of 300 to 2419200 seconds.

Usage guidelines

The secondary DNS server obtains SOA resource records from the primary DNS server at the refresh interval. After obtaining SOA resource records, the secondary DNS server compares them with the local SOA resource records.

Examples

Set the refresh interval to 4 hours for DNS forward zone **abc.com**.

```
<Sysname> system-view
[Sysname] loadbalance zone abc.com
[Sysname-lb-zone-abc.com] soa
[Sysname-lb-zone-abc.com-soa] refresh 14400
```

Related commands

reload http-response

Use **reload http-response** to reload a response file.

Syntax

reload http-response { **file** *filename* }

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

file *filename*: Specifies a file by its name, a case-insensitive string of 1 to 255 characters.

Usage guidelines

If a response file changes, you must reload the file to make it take effect.

Examples

Reload response file **subsys_intf.js**.

```
<Sysname> system-view
[Sysname] reload http-response /index/subsys_intf.js
```

Related commands

This command clears all application layer connections, including reused idle connections.

Examples

Clear application layer connections.

```
<Sysname> reset loadbalance connection
```

reset loadbalance dns-cache

Use **reset loadbalance dns-cache** to clear DNS cache information.

Syntax

reset loadbalance dns-cache [**vpn-instance** *vpn-instance-name*] [**domain-name** *domain-name*]

Views

User view

Predefined user roles

network-admin

context-admin

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command clears DNS cache information for the public network.

domain-name *domain-name*: Specifies a domain name, a case-insensitive string of 1 to 253 characters. If you do not specify this option, the command clears DNS cache information for all domain names.

Examples

Clear DNS cache information for all domain names.

```
<Sysname> reset loadbalance dns-cache
```

reset loadbalance dns-listener statistics

Use **reset loadbalance dns-listener statistics** to clear DNS listener statistics.

Syntax

reset loadbalance dns-listener statistics [*dns-listener-name*]

Views

User view

Predefined user roles

network-admin

context-admin

Parameters

dns-listener-name: Specifies a DNS listener by its name, a case-insensitive string of 1 to 63 characters. If you do not specify this argument, the command clears statistics for all DNS listeners.

Examples

Clear statistics for the DNS listener **dl2**.

```
<Sysname> reset loadbalance dns-listener statistics dl2
```

Clear statistics for all DNS listeners.

```
<Sysname> reset loadbalance dns-listener statistics
```

Syntax

reset loadbalance dns-server statistics [*dns-server-name*]

reset loadbalance dns-server statistics dns-server-pool *dns-server-pool-name* [**name** *dns-server-name* **port** *port-number*]

Views

User view

Predefined user roles

network-admin

context-admin

Parameters

dns-server-name: Specifies a DNS server by its name, a case-insensitive string of 1 to 63 characters. If you do not specify this argument, the command clears statistics for all DNS servers.

dns-server-pool *dns-server-pool-name*: Clears statistics for members of a DNS server pool. The *dns-server-pool-name* argument specifies a DNS server pool by its name, a case-insensitive string of 1 to 63 characters.

dns-server *dns-server-name* **port** *port-number*: Clears statistics for a DNS server pool member. The *dns-server-name* argument specifies a DNS server pool member by its name, a case-insensitive string of 1 to 63 characters. The *port-number* argument specifies the port number of the DNS server pool member, in the range of 0 to 65535. If you do not specify this option, the command clears statistics for all members of a DNS server pool.

Examples

Clear statistics for DNS server **ds1**.

```
<Sysname> reset loadbalance dns-server statistics ds1
```

Clear statistics for all members in DNS server pool **dsp**.

```
<Sysname> reset loadbalance dns-server statistics dns-server-pool dsp
```

reset loadbalance link statistics

Use **reset loadbalance link statistics** to clear link statistics or link group member statistics.

Syntax

reset loadbalance link statistics [*link-name*]

reset loadbalance link statistics link-group *link-group-name* [**name** *link-name*]

Views

User view

Predefined user roles

network-admin

context-admin

Parameters

link-name: Specifies a link by its name, a case-insensitive string of 1 to 63 characters. If you do not specify this argument, the command clears statistics about all links.

link-group *link-group-name*: Clears statistics for members of a link group. The *link-group-name* argument specifies a link group by its name, a case-insensitive string of 1 to 63 characters.

name *link-name*: Clears statistics for of a link group member. The *link-name* argument specifies a link group member by its name, a case-insensitive string of 1 to 63 characters. If you do not specify this option, the command clears statistics for all members of a link group.

Examples

Clear statistics about all links.

```
<Sysname> reset loadbalance link statistics
```

Clear statistics about all members in link group **lg**.

```
<Sysname> reset loadbalance link statistics link-group lg
```

reset loadbalance local-dns-server parse-fail-record

reset loadbalance proximity

Use **reset loadbalance proximity** to clear proximity entry information.

Syntax

reset loadbalance proximity [**vpn-instance** *vpn-instance-name*] [**ip** [*ipv4-address*] | **ipv6** [*ipv6-address*]]

Views

User view

Predefined user roles

network-admin

context-admin

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify this option, the command clears proximity entry information for the public network.

ip [*ipv4-address*]: Clears IPv4 proximity entry information. If you specify the *ipv4-address* argument, this command clears information about the proximity entry corresponding to the IPv4 address. If you do not specify the *ipv4-address* argument, this command clears information about all IPv4 proximity entries.

ipv6 [*ipv6-address*]: Clears IPv6 proximity entry information. If you specify the *ipv6-address* argument, this command clears information about the proximity entry corresponding to the IPv6 address. If you do not specify the *ipv6-address* argument, this command clears information about all IPv6 proximity entries.

Usage guidelines

If you do not specify the **vpn-instance**, **ip**, or **ipv6** keyword, this command clears information about all IPv4 and IPv6 proximity entries for the public network.

Examples

Clear information about the proximity entry corresponding to the IPv4 address 1.1.1.1 for the VPN instance **vrf1**.

```
<Sysname> reset loadbalance proximity vpn vrf1 ip 1.1.1.1
```

Clear information about all IPv6 proximity entries for the public network.

```
<Sysname> reset loadbalance proximity ipv6
```

reset real-server statistics

Use **reset real-server statistics** to clear real server statistics or server farm member statistics.

Syntax

reset real-server statistics [*real-server-name*]

reset real-server statistics server-farm *server-farm-name* [**name** *real-server-name* **port** *port-number*]

Views

User view

Predefined user roles

network-admin

context-admin

Parameters

real-server-name: Clears statistics of the specified real server. The *real-server-name* argument specifies a real server name, a case-insensitive string of 1 to 63 characters. If you do not specify this argument, the command clears statistics of all real servers.

server-farm *server-farm-name*: Clears statistics for members of a server farm. The *server-farm-name* argument specifies a server farm by its name, a case-insensitive string of 1 to 63 characters.

name *real-server-name* **port** *port-number*: Clears statistics for a server farm member. The *real-server-name* argument specifies a server farm member by its name, a case-insensitive string of 1 to 63 characters. The *port-number* argument specifies the port number of the server farm member, in the range of 0 to 65535. If you do not specify this option, the command clears statistics for all members of a server farm.

Examples

Clear statistics of all real servers.

```
<Sysname> reset real-server statistics
```

Clear statistics of all members in server farm **sf**.

```
<Sysname> reset real-server statistics server-farm sf
```

Related commands

display real-server statistics

reset sticky dns-proxy

Use **reset sticky dns-proxy** to clear sticky entry information for transparent DNS proxies.

Syntax

reset sticky dns-proxy [**dns-proxy-name** *dns-proxy-name*] [**class** { *class-name* | **default-class** } | **client-addr** { *ipv4-address* | *ipv6-address* } | **dns-server-addr** { *ipv4-address* | *ipv6-address* } | **dns-server-pool** *pool-name* | **dns-server-port** *port-number* | **key** *sticky-key*] * [**slot** *slot-number*]

Views

User view

Predefined user roles

network-admin

context-admin

Parameters

dns-proxy-name *dns-proxy-name*: Specifies a transparent DNS proxy by its name, a case-insensitive string of 1 to 63 characters. If you do not specify this option, the command clears sticky entry information for all transparent DNS proxies.

class { *class-name* | **default-class** }: Specifies an LB class by its name, a case-insensitive string of 1 to 63 characters, or specifies the default LB class.

client-addr { *ipv4-address* | *ipv6-address* }: Specifies a client by its IPv4 or IPv6 address.

dns-server-addr { *ipv4-address* | *ipv6-address* }: Specifies a DNS server by its IPv4 or IPv6 address.

dns-server-pool *pool-name*: Specifies a DNS server pool by its name, a case-insensitive string of 1 to 63 characters.

dns-server-port *port-number*: Specifies a DNS server port number in the range of 0 to 65535.

key *sticky-key*: Specifies a key value, a case-sensitive string of 1 to 36 characters.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command clears sticky entry information for all member devices.

Examples

Clear sticky entry information for client address 3.0.0.1 of transparent DNS proxy **dp**.

```
<Sysname> reset sticky dns-proxy dns-proxy-name dp client-addr 3.0.0.1
```

reset sticky virtual-server

Use **reset sticky virtual-server** to clear sticky entry information for virtual servers.

Syntax

reset sticky virtual-server [**virtual-server-name** *virtual-server-name*] [[**link** { **ip** *ipv4-address* | **ipv6** *ipv6-address* | **interface** { *interface-type interface-number* | *interface-name* } } | **link-group** *link-group-name*] * | [**real-server-addr** { *ipv4-address* | *ipv6-address* } | **real-server-port** *port-number* | **server-farm** *server-farm-name* | **text** *text*] *] [**class** { *class-name* | **default-class** } | **client-addr** { *ipv4-address* | *ipv6-address* } | **sticky-type** { **address-port** | **http-content** | **http-cookie** | **http-header** | **http-passive** | **payload** | **radius** | **sip** | **ssl** | **tcp-payload** | **udp-passive** } [**key** *sticky-key*]] * [**slot** *slot-number*]

Views

User view

Predefined user roles

network-admin

context-admin

Parameters

virtual-server-name *virtual-server-name*: Specifies a virtual server by its name, a case-insensitive string of 1 to 63 characters. If you do not specify this option, the command clears sticky entry information for all virtual servers.

link { **ip** *ipv4-address* | **ipv6** *ipv6-address* | **interface** { *interface-type interface-number* | *interface-name* } }: Specifies a link by its IPv4 address, IPv6 address, or output interface.

link-group *link-group-name*: Specifies a link group by its name, a case-insensitive string of 1 to 63 characters.

real-server-addr { *ipv4-address* | *ipv6-address* }: Specifies a real server by its IPv4 or IPv6 address.

real-server-port *port-number*: Specifies a real server port number in the range of 0 to 65535.

server-farm *server-farm-name*: Specifies a server farm by its name, a case-insensitive string of 1 to 63 characters.

text *text*: Specifies a text string to match.

class { *class-name* | **default-class** }: Specifies an LB class by its name, a case-insensitive string of 1 to 63 characters, or specifies the default LB class.

client-addr { *ipv4-address* | *ipv6-address* }: Specifies a client by its IPv4 or IPv6 address.

sticky-type { **address-port** | **http-content** | **http-cookie** | **http-header** | **http-passive** | **payload** | **radius** | **sip** | **ssl** | **tcp-payload** | **udp-passive** }: Specifies a sticky group type.

key *sticky-key*: Specifies a key value, a case-sensitive string of 1 to 36 characters. If you do not specify key value, this command clears sticky entries for all key values.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command clears sticky entry information for all member devices.

Examples

Clear sticky entry information for client address 3.0.0.1 of virtual server **vs**.

```
<Sysname> reset sticky virtual-server virtual-server-name vs client-addr 3.0.0.1
```

reset virtual-server statistics

Use **reset virtual-server statistics** to clear virtual server statistics.

Syntax

reset virtual-server statistics [*virtual-server-name*]

Views

User view

Predefined user roles

network-admin

context-admin

Parameters

virtual-server-name: Clears statistics of the specified virtual server. The *virtual-server-name* argument specifies a virtual server name, a case-insensitive string of 1 to 63 characters. If you do not specify this argument, the command clears statistics of all virtual servers.

Examples

Clear statistics of all virtual servers.

```
<Sysname> reset virtual-server statistics
```

Related commands

display virtual-server statistics

response

Use **response** to specify a response file for matching HTTP requests.

Use **undo response** to restore the default.

Syntax

response { **url** *url* **file** *filename* | **workpath** *workpath* **zip-file** *zip-filename* }

undo response { **url** *url* | **workpath** *workpath* }

Default

No response file is specified for HTTP requests.

Views

HTTP LB action view

Predefined user roles

network-admin

context-admin

Parameters

url *url*: Specifies the URL path used to match HTTP requests, a case-sensitive string of 1 to 255 characters. The specified URL path must start with a forward slash (/).

file *filename*: Specifies an uncompressed file by its name, a case-insensitive string of 1 to 255 characters.

workpath *workpath*: Specifies a working path to match the URL in HTTP requests, a case-sensitive string of 1 to 255 characters. The working path can be a single forward slash (/), or a string that starts with a forward slash and does not end with a forward slash.

zip-file *zip-filename*: Specifies a zip file by its name, a case-insensitive string of 1 to 255 characters. The relative path in the zip file is used to match the URL in HTTP requests.

Usage guidelines

If the URL path in a client request matches the specified URL path, the device responds to the request by using an uncompressed file.

If the URL path in a client request matches the specified working path plus a relative path in the zip file, the device responds to the request by using the file in the zip file. For example, if you configure the **response workpath** */index* **zip-file** *flash:/za/zb/test.zip* command and a relative path **/css/col.css** exists in **test.zip**, the matching URL is **/index/css/col.css** and the response file is **col.css**.

URL-encoded URLs cannot be matched.

If you configure both an uncompressed file and a compressed file for the same URL path, the uncompressed file is used to respond to matching HTTP requests.

The path specified in the command must exist on the device.

For the same HTTP LB action, only one uncompressed file can be used for a URL, and one uncompressed file can be used for multiple URLs.

If you specify multiple compressed files for one or more URL paths in the same HTTP LB action, the most recent configuration takes effect.

If you specify multiple uncompressed files for one URL path in the same HTTP LB action, the most recent configuration takes effect. One uncompressed file can be used for different URL paths.

Any two of the following commands are mutually exclusive:

- **response**
- **server-farm** (LB action view)
- **redirect relocation** (LB action view)

Examples

Specify response file **subsys.js** for the HTTP requests with URL path **/index/subsys/subsys_intf.js**.

```
<Sysname> system-view
[Sysname] loadbalance action a_http type http
[Sysname-lba-http-a_http] response url /index/subsys/subsys_intf.js file subsys.js
```

Related commands

display loadbalance action

redirect relocation (LB action view)

server-farm (LB action view)

responsible-mail

Use **responsible-mail** to specify the email address of the administrator.

Use **undo responsible-mail** to restore the default.

Syntax

responsible-mail *mail-address*

undo responsible-mail

Default

No administrator's email address is specified.

Views

SOA view

Predefined user roles

network-admin

context-admin

Parameters

mail-address: Specifies the administrator's email address, a case-insensitive, dot-separated string that contains a maximum of 254 characters. The string can contain letters, digits, hyphens (-), underscores (_), and dots (.). Each dot-separated part can have a maximum of 63 characters.

Usage guidelines

The email address of the administrator can be a relative domain name (does not end with a dot) or an absolute domain name (ends with a dot). For an absolute domain name, the email address is not automatically expanded and cannot exceed 254 characters. For a relative domain name, the current domain name is automatically appended to the email address. The email address plus the appended domain name cannot exceed 254 characters.

Examples

Specify the administrator's email address **root.ns1.abc.com** for DNS forward zone **abc.com**.

```
<Sysname> system-view
[Sysname] loadbalance zone abc.com
[Sysname-lb-zone-abc.com] soa
[Sysname-lb-zone-abc.com-soa] responsible-mail root.ns1.abc.com
```

Related commands

display loadbalance zone

retry

Use **retry** to set the retry interval.

Use **undo retry** to restore the default.

Syntax

retry *retry-interval*

undo retry

Default

The retry interval is 600 seconds.

Views

SOA view

Predefined user roles

network-admin

context-admin

Parameters

retry-interval: Specifies the retry interval in the range of 500 to 1209600 seconds.

Usage guidelines

The retry interval is the amount of time that the secondary DNS server waits after it fails to copy a DNS forward zone.

Examples

Set the retry interval to 30 minutes for DNS forward zone **abc.com**.

```
<Sysname> system-view
[Sysname] loadbalance zone abc.com
```

```
[Sysname-lb-zone-abc.com] soa
[Sysname-lb-zone-abc.com-soa] retry 1800
```

Related commands

display loadbalance zone

route-advertisement enable

Use **route-advertisement enable** to enable IP address advertisement for a virtual server.

Use **undo route-advertisement enable** to disable IP address advertisement for a virtual server.

Syntax

route-advertisement enable

undo route-advertisement enable

Default

IP address advertisement is disabled for a virtual server.

Views

Virtual server view

Predefined user roles

network-admin

context-admin

Usage guidelines

After this feature is configured, the device advertises the IP address of the virtual server to OSPF for route calculation. When the service of a data center switches to another data center, the traffic to the virtual server can also be switched to that data center. For information about OSPF, see *Layer 3—IP Routing Configuration Guide*.

Examples

Enable IP address advertisement for the virtual server **vs**.

```
<Sysname> system-view
[Sysname] virtual-server vs type ip
[Sysname-vs-ip-vs] route-advertisement enable
```

router interface

Use **router interface** to specify an outgoing interface for an LB link.

Use **undo router interface** to delete the outgoing interface for an LB link.

Syntax

router interface *interface-type interface-number*

undo router interface

Default

No outgoing interface is specified for an LB link.

Views

LB link view

Predefined user roles

network-admin

context-admin

Parameters

*interface-type interface-numbe*r: Specifies an outgoing interface.

Usage guidelines

In scenarios where IP addresses are obtained through PPPoE, use this command to dynamically obtain the outbound next hop IP address through the specified outgoing interface.

The specified outgoing interface must be an interface that can dynamically obtain IP addresses.

You can configure both this command and the **router ip** or **router ipv6** command. The command configured later overwrites the command configured first.

If you configure this command after configuring the **vpn-instance** (link view) command, this command overwrites the **vpn-instance** (link view) command. After you configure this command, you cannot configure the **vpn-instance** (link view) command.

Examples

Specify **Dialer0** as the outgoing interface for the LB link **cnc**.

```
<Sysname> system-view
[Sysname] loadbalance link cnc
[Sysname-lb-link-cnc] router interface Dialer0
```

router ip

Use **router ip** to specify the outbound next hop for an LB link.

Use **undo router ip** to restore the default.

Syntax

router ip *ipv4-address*

undo router ip

Default

The outbound next hop is not specified for an LB link.

Views

LB link view

Predefined user roles

network-admin

context-admin

Parameters

ipv4-address: Specifies an IPv4 address, which cannot be a loopback address, multicast address, broadcast address, or an address in the format of 0.X.X.X.

Usage guidelines

You can specify only one outbound next hop for an LB link.

Examples

Specify the outbound next hop as 1.2.3.4 for the LB link **lk1**.

```
<Sysname> system-view
[Sysname] loadbalance link lk1
[Sysname-lb-link-lk1] router ip 1.2.3.4
```

router ipv6

Use **router ipv6** to specify the outbound next hop for an LB link.

Use **undo router ipv6** to restore the default.

Syntax

router ipv6 *ipv6-address*

undo router ipv6

Default

The outbound next hop is not specified for an LB link.

Views

LB link view

Predefined user roles

network-admin

context-admin

Parameters

ipv6-address: Specifies an IPv6 address, which cannot be an all-zero address, a multicast address, a loopback address, or a link-local address.

Usage guidelines

You can specify only one outbound next hop for an LB link.

Examples

Specify the outbound next hop as 8008::8 for the LB link **lk1**.

```
<Sysname> system-view
[Sysname] loadbalance link lk1
[Sysname-lb-link-lk1] router ipv6 8008::8
```

rst threshold

Use **rst threshold** to set the RST packet count threshold for a TCP-RST LB probe template.

Use **undo rst threshold** to restore the default.

Syntax

rst threshold *number*

undo rst threshold

Default

The RST packet count threshold is 1000000.

Views

TCP-RST LB probe template view

Predefined user roles

network-admin

context-admin

Parameters

number: Specifies the RST packet count threshold value, in the range of 1 to 4294967295.

Usage guidelines

When the number of RST packets sent by a real server reaches the threshold, the protection action specified in the **protect-action** command is taken.

Examples

In TCP-RST LB probe template **rsttplt**, set the RST packet count threshold to 20.

```
<Sysname>system-view
[Sysname] loadbalance probe-template tcp-rst rsttplt
[Sysname-lbpt-tcp-rst-rsttplt] rst threshold 20
```

Related commands

protect-action

rtt weight

Use **rtt weight** to set the network delay weight for proximity calculation.

Use **undo rtt weight** to restore the default.

Syntax

rtt weight *rtt-weight*

undo rtt weight

Default

The network delay weight for proximity calculation is 100.

Views

Proximity view

Predefined user roles

network-admin

context-admin

Parameters

rtt-weight: Specifies the network delay weight for proximity calculation, in the range of 0 to 255. A larger value indicates a higher weight.

Examples

Set the network delay weight for proximity calculation to 200.

```
<Sysname> system-view
[Sysname] loadbalance proximity
[Sysname-lb-proximity] rtt weight 200
```

rule (parameter profile view)

Use **rule** to configure a filtering rule for compression.

Use **undo rule** to restore the default.

Syntax

rule [*rule-id*] { **deny** | **permit** } { **content-type** | **url** } *expression*

undo rule *rule-id*

Default

No filtering rules are configured.

Views

HTTP-compression parameter profile view

Predefined user roles

network-admin

context-admin

Parameters

rule-id: Specifies a rule by its ID in the range of 1 to 65535. If the rule does not exist, the command creates the rule. If the rule already exists, the command modifies the rule. If you do not specify this argument, the system automatically assigns an available rule ID with the smallest number.

deny: Does not compress matching packets.

permit: Compresses matching packets.

content-type: Matches content types in the content-type header of packets.

url: Matches URLs in packets.

expression: Specifies a regular expression, a case-sensitive string of 1 to 255 characters. The string cannot contain question marks (?).

Examples

Create the HTTP-compression parameter profile **http1**, and configure the device to not compress the response packets containing the string **image** in URLs.

```
<Sysname> system-view
[Sysname] parameter-profile http1 type http-compression
[Sysname-para-http-compression-http1] rule deny url image
```

rule (protection policy view)

Use **rule** to create a protection rule and enter its view, or enter the view of an existing protection rule.

Use **undo rule** to delete a protection rule.

Syntax

rule *rule-id*

undo rule *rule-id*

Default

No protection rules exist.

Views

HTTP protection policy view

Predefined user roles

network-admin

context-admin

Parameters

rule-id: Specifies a rule ID in the range of 1 to 65535.

Usage guidelines

You can configure multiple protection rules in an HTTP protection policy. The device compares the URL in a packet with the URLs configured in the protection rules according to the order of the rule IDs. If a match is found and the configured protection threshold is exceeded, the device performs the associated protection action. If the URL in the packet does not match the URL configured in a specific protection rule, the device compares the URL with the next protection rule.

Examples

In HTTP protection policy **p1**, create protection rule 5 and enter its view.

```
<Sysname> system-view
[Sysname] loadbalance protection-policy p1
[Sysname-lbpp-http-p1] rule 5
[Sysname-lbpp-http-p1-rule-5]
```

secondary-cookie delimiters

Use **secondary-cookie delimiters** to configure the delimiter that separates secondary cookies in URLs.

Use **undo secondary-cookie delimiters** to restore the default.

Syntax

secondary-cookie delimiters *text*

undo secondary-cookie delimiters

Default

The delimiter that separates secondary cookies in URLs can be slash (/), ampersand (&), number sign (#), or plus (+).

Views

HTTP parameter profile view

Predefined user roles

network-admin

context-admin

Parameters

text: Specifies the delimiter, a string of 1 to 4 characters including exclamation mark (!), quotation mark (',"), number sign (#), semicolon (;), brackets (( ),[ ], < >), question mark (?), backslash (\), caret (^), grave accent (`), vertical bar (|), colon (:), at sign (@), ampersand (&), dollar sign ($), plus (+), asterisk (*), comma (,), and slash (/). Each character in the string is considered as a delimiter.

Examples

For the HTTP parameter profile **pp1**, configure the delimiter that separates secondary cookies in URLs as slash (/), at sign (@), number sign (#), or dollar sign ($).

```
<Sysname> system-view
[Sysname] parameter-profile pp1 type http
```

```
[Sysname-para-http-pp1] secondary-cookie delimiters !@#$
```

secondary-cookie start

Use **secondary-cookie start** to configure the start delimiter for secondary cookies in URLs.

Use **undo secondary-cookie start** to restore the default.

Syntax

secondary-cookie start *text*

undo secondary-cookie start

Default

The start delimiter for secondary cookies in URLs is question mark (?).

Views

HTTP parameter profile view

Predefined user roles

network-admin

context-admin

Parameters

text: Specifies the delimiter, a string of 1 to 2 characters including exclamation mark (!), quotation mark ("), number sign (#), semicolon (;), brackets ([ ], < >), question mark (?), backslash (\), caret (^), grave accent (`), and vertical bar (|).

Examples

For the HTTP parameter profile **pp1**, configure the start delimiter for secondary cookies in URLs as question mark (?) or exclamation mark (!).

```
<Sysname> system-view
[Sysname] parameter-profile pp1 type http
[Sysname-para-http-pp1] secondary-cookie start ?!
```

selected-link

Use **selected-link** to specify the number of links to participate in scheduling.

Use **undo selected-link** to restore the default.

Syntax

selected-link min *min-number* **max** *max-number*

undo selected-link

Default

The links with the highest priority participate in scheduling.

Views

Link group view

Predefined user roles

network-admin

context-admin

Parameters

min *min-number*: Specifies the minimum number of links to participate in scheduling, in the range of 1 to 1000.

max *max-number*: Specifies the maximum number of links to participate in scheduling, in the range of 1 to 1000. The value of the *max-number* argument must be greater than or equal to the value of the *min-number* argument.

Usage guidelines

If the number of links available to participate in scheduling exceeds the *max-number* setting, the *max-number* setting applies.

If the number of links available to participate in scheduling is smaller than the *min-number* setting, more links are selected by priority in descending order.

Examples

Configure the minimum number and maximum number of links in the link group **lg** to participate in scheduling as 20 and 30, respectively.

```
<Sysname> system-view
[Sysname] loadbalance link-group lg
[Sysname-lb-lgroup-lg] selected-link min 20 max 30
```

Related commands

Use **selected-server** to specify the number of DNS servers to participate in scheduling.

Use **undo selected-server** to restore the default.

Syntax

selected-server min *min-number* **max** *max-number*

undo selected-server

Default

The DNS servers with the highest priority participate in scheduling.

Views

DNS server pool view

Predefined user roles

network-admin

context-admin

Parameters

min *min-number*: Specifies the minimum number of DNS servers to participate in scheduling, in the range of 1 to 1000.

max *max-number*: Specifies the maximum number of DNS servers to participate in scheduling, in the range of 1 to 1000. The value of the *max-number* argument must be greater than or equal to the value of the *min-number* argument.

Usage guidelines

If the number of DNS servers available to participate in scheduling exceeds the *max-number* setting, the *max-number* setting applies.

If the number of DNS servers available to participate in scheduling is less than the *min-number* setting, more DNS servers are selected by priority in descending order.

Examples

Configure the minimum number and maximum number of DNS servers in DNS server pool **dns-pool** to participate in scheduling as 20 and 30, respectively.

```
<Sysname> system-view
[Sysname] loadbalance dns-server-pool dns-pool
[Sysname-lb-dspool-dns-pool] selected-server min 20 max 30
```

selected-server (server farm view)

Use **selected-server** to specify the number of real servers to participate in scheduling.

Use **undo selected-server** to restore the default.

Syntax

selected-server min *min-number* **max** *max-number*

undo selected-server

Default

The real servers with the highest priority participate in scheduling.

Views

Server farm view

Predefined user roles

network-admin

context-admin

Parameters

min *min-number*: Specifies the minimum number of real servers to participate in scheduling, in the range of 1 to 1000.

max *max-number*: Specifies the maximum number of real servers to participate in scheduling, in the range of 1 to 1000. The value of the *max-number* argument must be greater than or equal to the value of the *min-number* argument.

Usage guidelines

If the number of real servers available to participate in scheduling exceeds the *max-number* setting, the *max-number* setting applies.

If the number of real servers available to participate in scheduling is less than the *min-number* setting, more real servers are selected by priority in descending order.

Examples

Configure the minimum number and maximum number of real servers in the server farm **sf** to participate in scheduling as 20 and 30, respectively.

```
<Sysname> system-view
[Sysname] server-farm sf
[Sysname-sfarm-sf] selected-server min 20 max 30
```

Related commands

predictor (server farm view)

priority (real server view)

serial

Use **serial** to configure the serial number for a DNS forward zone.

Use **undo serial** to restore the default.

Syntax

serial *number*

undo serial

Default

The serial number for a DNS forward zone is 1.

Views

SOA view

Predefined user roles

network-admin

context-admin

Parameters

number: Specifies the serial number in the range of 1 to 4294967295.

Usage guidelines

The serial number indicates the configuration order of a DNS forward zone. A newly configured DNS forward zone has a greater serial number than an old DNS forward zone.

The secondary DNS server periodically queries the serial numbers of DNS forward zones on the primary DNS server and compares them with local serial numbers.

Examples

Configure the serial number as 123 for DNS forward zone **abc.com**.

```
<Sysname> system-view
[Sysname] loadbalance zone abc.com
[Sysname-lb-zone-abc.com] soa
[Sysname-lb-zone-abc.com-soa] serial 123
```

Related commands

display loadbalance zone

server-connection reuse

Use **server-connection reuse** to enable connection reuse between the LB device and the server.

Use **undo server-connection reuse** to disable connection reuse between the LB device and the server.

Syntax

server-connection reuse

undo server-connection reuse

Default

Connection reuse between the LB device and the server is disabled.

Views

HTTP parameter profile view

MySQL parameter profile view

Predefined user roles

network-admin

context-admin

Usage guidelines

This command allows the LB device to establish connections to the server that can be reused by clients. Because multiple clients can use the same connection, the number of connections between the clients and the server is reduced.

This command is not supported by the virtual servers of the fast HTTP type.

Examples

Enable connection reuse between the LB device and the server for the HTTP parameter profile **pp1**.

```
<Sysname> system-view
[Sysname] parameter-profile pp1 type http
[Sysname-para-http-pp1] server-connection reuse
```

server-farm (LB action view)

Use **server-farm** to specify the primary server farm.

Use **undo server-farm** to restore the default.

Syntax

server-farm *server-farm-name* [**backup** *backup-server-farm-name*] [**sticky** *sticky-name* [**backup** *backup-sticky-name*]]

undo server-farm

Default

No primary server farm is specified.

Views

LB action view

Predefined user roles

network-admin

context-admin

Parameters

server-farm-name: Specifies a primary server farm name, a case-insensitive string of 1 to 63 characters.

backup *backup-server-farm-name*: Specifies a backup server farm name, a case-insensitive string of 1 to 63 characters.

sticky *sticky-name*: Specifies a primary sticky group by its name, a case-insensitive string of 1 to 63 characters.

backup *backup-sticky-name*: Specifies a backup sticky group by its name, a case-insensitive string of 1 to 63 characters. This option is supported only by HTTP virtual servers and RADIUS virtual servers.

Usage guidelines

This command is mutually exclusive with the **forward all** or **redirect relocation** command. If you configure one command, the other command (if configured) is automatically cancelled.

When the primary server farm is available (contains real servers), packets are forwarded through the primary server farm. When the primary server farm is not available, packets are forwarded through the backup server farm.

If you specify both a primary sticky group and a backup sticky group, the device generates both primary sticky entries and backup sticky entries. If packets do not match primary sticky entries, backup sticky entries will apply.

The device generates backup sticky entries for only the following sticky group combinations:

- RADIUS-type primary sticky group and port-address-type backup sticky group.
- HTTP cookie-type primary sticky group and port-address-type backup sticky group.
- HTTP cookie-type primary sticky group and HTTP passive-type backup sticky group.

Examples

Specify the primary server farm **sf**, the backup server farm **sfb**, and the sticky group **sg1** for the generic LB action **lba1**.

```
<Sysname> system-view
[Sysname] loadbalance action lba1 type generic
[Sysname-lba-generic-lba1] server-farm sf backup sfb sticky sg1
```

Related commands

forward all

server-farm (real server view)

Use **server-farm** to specify the server farm for a real server.

Use **undo server-farm** to restore the default.

Syntax

server-farm *server-farm-name*

undo server-farm [*server-farm-name*]

Default

A real server does not belong to any server farm.

Views

Real server view

Predefined user roles

network-admin

context-admin

Parameters

server-farm-name: Specifies a server farm name, a case-insensitive string of 1 to 63 characters.

Usage guidelines

You can specify a server farm that has not been created.

Examples

Specify the server farm **sf** for the real server **rs**.

```
<Sysname> system-view
[Sysname] real-server rs
[Sysname-rserver-rs] server-farm sf
```

server-farm (system view)

Use **server-farm** to create a server farm and enter its view, or enter the view of an existing server farm.

Use **undo server-farm** to delete the specified server farm.

Syntax

server-farm *server-farm-name*

undo server-farm *server-farm-name*

Default

No server farms exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

server-farm-name: Specifies a server farm name, a case-insensitive string of 1 to 63 characters.

Usage guidelines

You can add servers with common attributes to a server farm to facilitate management.

You can configure this command only if the device has licenses installed. For information about licensing, see license management in *Fundamentals Configuration Guide*.

Examples

Create the server farm **sf** and enter server farm view.

```
<Sysname> system-view
[Sysname] server-farm sf
[Sysname-sfarm-sf]
```

service enable (DNS listener view)

```

service object-group

Use **service object-group** to specify a service object group for address translation.

Use **undo service object-group** to restore the default.

Syntax

service object-group *object-group-name*

undo service object-group

Default

All packets matching a virtual server are translated.

Views

SNAT global policy view

Predefined user roles

network-admin

context-admin

Parameters

object-group-name: Specifies a service object group by its name, a case-insensitive string of 1 to 31 characters.

Usage guidelines

If you specify a service object group, the device performs SNAT on only packets with a matching service. For information about configuring a service object group, see object group configuration in *Security Configuration Guide*.

Examples

Specify a service object group **obj1** for SNAT global policy **sn1**.

```
<Sysname> system-view
[Sysname] loadbalance snat-global-policy sn1
[Sysname-lb-snat-gp-sn1] service object-group obj1
```

```

skip current-dns-proxy

Use **skip current-dns-proxy** to skip the current transparent DNS proxy.

Use **undo skip current-dns-proxy** to restore the default.

Syntax

skip current-dns-proxy

undo skip current-dns-proxy

Default

The forwarding mode is to discard packets.

Views

DNS LB action view

Predefined user roles

network-admin

context-admin

Usage guidelines

This command enables DNS requests to skip the current transparent DNS proxy and match the next transparent DNS proxy or virtual server.

A DNS request can skip a maximum of five transparent DNS proxies and virtual servers.

This command is mutually exclusive with the **dns-server-pool** or **forward all** command. If you configure one command, the other command (if configured) is automatically cancelled.

Examples

Skip the current transparent DNS proxy in DNS LB action **lba1**.

```
<Sysname> system-view
[Sysname] loadbalance action lba1 type dns
[Sysname-lba-dns-lba1] skip current-dns-proxy
```

slow-online (link group view)

Use **slow-online** to enable the slow online feature for a link group.

Use **undo slow-online** to disable the slow online feature for a link group.

Syntax

slow-online [**standby-time** *standby-time* **ramp-up-time** *ramp-up-time*]

undo slow-online

Default

The slow online feature is disabled for a link group.

Views

Link group view

Predefined user roles

network-admin

context-admin

Parameters

standby-time *standby-time*: Specifies the standby timer in the range of 0 to 600 seconds. The default is 5 seconds.

ramp-up-time *ramp-up-time*: Specifies the ramp-up timer in the range of 3 to 600 seconds. The default is 5 seconds.

Usage guidelines

The links newly added to a link group might be unable to immediately process large numbers of services assigned by the LB device. To resolve this issue, enable the slow online feature for the link group. The feature uses the standby timer and ramp-up timer. When a link is added, the LB device does not assign any service to the link until the standby timer expires.

When the standby timer expires, the ramp-up timer starts. During the ramp-up time, the LB device increases the service amount according to the processing capability of the link, until the ramp-up timer expires.

Examples

Enable the slow online feature for the link group **lg**.

```
<Sysname> system-view
[Sysname] loadbalance link-group lg
[Sysname-lb-lgroup-lg] slow-online
```

slow-online (server farm view)

Use **slow-online** to enable the slow online feature for a server farm.

Use **undo slow-online** to disable the slow online feature for a server farm.

Syntax

slow-online [**standby-time** *standby-time* **ramp-up-time** *ramp-up-time*]

undo slow-online

Default

The slow online feature is disabled for a server farm.

Views

Server farm member view

Predefined user roles

network-admin

context-admin

Usage guidelines

The **shutdown** command immediately terminates existing connections of a server farm member. The slow offline feature ages out the connections, and does not establish new connections.

To enable the slow offline feature for a server farm member, you must execute the **slow-shutdown enable** command and then the **shutdown** command. If you execute the **shutdown** command and then the **slow-shutdown enable** command, the slow offline feature does not take effect and the server farm member is shut down.

Examples

Enable the slow offline feature for the server farm member **rs1**.

```
<Sysname> system-view
[Sysname] server-farm sf
[Sysname-sfarm-sf] real-server rs1 port 80
[Sysname-sfarm-sf-#member#-rs1-port-80] slow-shutdown enable
```

Related commands

shutdown (server farm member view)

snat enable

Use **snat enable** to enable a SNAT global policy.

Use **undo snat enable** to disable a SNAT global policy.

Syntax

snat enable

undo snat enable

Default

A SNAT global policy is disabled.

Views

SNAT global policy view

Predefined user roles

network-admin

context-admin

Examples

Enable SNAT global policy **sn1**.

```
<Sysname> system-view
[Sysname] loadbalance snat-global-policy sn1
[Sysname-lb-snat-gp-sn1] snat enable
```

snat-mode

Use **snat-mode** to specify a translation mode for a server farm.

Use **undo snat-mode** to restore the default.

Syntax

snat-mode { **auto-map** | **tcp-option** }

undo snat-mode

Default

No translation mode is specified for a server farm.

Views

Server farm view

Predefined user roles

network-admin

context-admin

Parameters

auto-map: Specifies the automatic mapping mode.

tcp-option: Specifies the TCP option mode.

Usage guidelines

The device supports the following translation modes for a server farm:

- **Automatic mapping**—Translates the source IP address into the IP address of the interface connecting to the real servers.
- **TCP option**—Translates the source IP address into the IP address carried in the TCP option field of packets.
- **SNAT address pool**—Translates the source IP address into an IP address in the SNAT address pool specified by using the **snat-pool** (server farm view) command.

You can configured only one translation mode for a server farm. This command and the **snat-pool** (server farm view) command are mutually exclusive.

If SNAT global policies are configured and SNAT is not configured for a server farm, the server farm uses SNAT global policies for address translation.

SNAT in TCP option mode does not support translating an IPv4 address into an IPv6 address or translating an IPv6 address into an IPv4 address.

Examples

Specify the automatic mapping translation mode for server farm **sf**.

```
<Sysname> system-view
[Sysname] server-farm sf
[Sysname-sfarm-sf] snat-mode auto-map
```

Related commands

loadbalance snat-global-policy

snat-pool (server farm view)

snat-pool (link group view)

Use **snat-pool** to specify the SNAT address pool to be referenced by a link group.

Use **undo snat-pool** to restore the default.

Syntax

snat-pool *pool-name*

undo snat-pool

Default

No SNAT address pool is referenced by a link group.

Views

Link group view

Predefined user roles

network-admin

context-admin

Parameters

pool-name: Specifies the SNAT address pool name, a case-insensitive string of 1 to 63 characters.

Usage guidelines

After a link group references a SNAT address pool, the LB device replaces the source address of packets it receives with an SNAT address before forwarding the packets.

Examples

Specify the SNAT address pool **lbsp** to be referenced by the link group **lg**.

```
<Sysname> system-view
[Sysname] loadbalance link-group lg
[Sysname-lb-lgroup-lg] snat-pool lbsp
```

snat-pool (server farm view)

Use **snat-pool** to specify the SNAT address pool to be referenced by a server farm.

Use **undo snat-pool** to restore the default.

Syntax

snat-pool *pool-name*

undo snat-pool

Default

No SNAT address pool is referenced by a server farm.

Views

Server farm view

Predefined user roles

network-admin

context-admin

Parameters

pool-name: Specifies the SNAT address pool name, a case-insensitive string of 1 to 63 characters.

Usage guidelines

After a server farm references a SNAT address pool, the LB device replaces the source address of packets it receives with an SNAT address before forwarding the packets.

Examples

Specify the SNAT address pool **lbsp** to be referenced by the server farm **sf**.

```
<Sysname> system-view
[Sysname] server-farm sf
[Sysname-sfarm-sf] snat-pool lbsp
```

snmp-agent trap enable loadbalance

Use **snmp-agent trap enable loadbalance** to enable SNMP notifications for load balancing.

Use **undo snmp-agent trap enable loadbalance** to disable SNMP notifications for load balancing.

Syntax

snmp-agent trap enable loadbalance

undo snmp-agent trap enable loadbalance

Default

All SNMP notifications are enabled for load balancing.

Views

System view

Predefined user roles

network-admin

context-admin

Usage guidelines

To report critical load balancing events to an NMS, enable SNMP notifications for load balancing. For load balancing event notifications to be sent correctly, you must also configure SNMP as described in the network management and monitoring configuration guide for the device.

Examples

Disable SNMP notifications for load balancing.

```
<Sysname> system-view
[Sysname] undo snmp-agent trap enable loadbalance
```

soa

Use **soa** to create an SOA resource record and enter SOA view, or enter the view of an existing SOA resource record.

Use **undo soa** to delete the SOA resource record and all its setting.

Syntax

soa

undo soa

Default

No SOA resource record exists.

Views

DNS forward zone view

Predefined user roles

network-admin

context-admin

Examples

Create an SOA resource record for DNS forward zone **abc.com** and enter SOA view.

```
<Sysname> system-view
[Sysname] loadbalance zone abc.com
[Sysname-lb-zone-abc.com] soa
[Sysname-lb-zone-abc.com-soa]
```

Related commands

display loadbalance zone

source-ip

Use **source-ip** to configure a source-IP-based request threshold.

Use **undo source-ip** to restore the default.

Syntax

source-ip request-threshold *threshold*

undo source-ip

Default

The source-IP-based request threshold is not configured.

Views

Protection rule view

Predefined user roles

network-admin

context-admin

Parameters

request-threshold *threshold*: Specifies a request threshold in the range of 1 to 4294967295.

Usage guidelines

If the number of times that a user accesses a protected URL exceeds the request threshold during the protection period, the protection action is taken. The device determines whether requests belong to the same user based on the following elements:

- **Cookie**—Requests with the same cookie value for a cookie (specified in the **cookie** command in protection rule view) belong to the same user.
- **Source IP address**—Requests with the same source IP address belong to the same user.

If you configure both a cookie-based request threshold and a source-IP-based request threshold, the protection action is taken when either threshold is exceeded.

Examples

In protection rule 5, configure a source-IP-based request threshold of 2.

```
<Sysname> system-view
[Sysname] loadbalance protection-policy p1
[Sysname-lbpp-http-p1] rule 5
[Sysname-lbpp-http-p1-rule-5] source-ip request-threshold 2
```

Related commands

cookie (protection policy view)

protected-url

protection-action

protection-period

source-ip object-group (parameter profile view)

Use **source-ip object-group** to enable collection of HTTP traffic statistics by source IP address object group.

Use **undo source-ip object-group** to remove a source IP address object group for HTTP traffic statistics collection.

Syntax

source-ip object-group *object-group-name*

undo source-ip object-group *object-group-name*

Default

HTTP traffic statistics are collected on a per-IP address basis.

Views

HTTP statistics parameter profile view

Predefined user roles

network-admin

context-admin

Parameters

object-group-name: Specifies a source IP address object group by its name, a case-insensitive string of 1 to 31 characters.

Usage guidelines

If HTTP packets match the specified URL and source IP address object group, they are counted based on the source IP address object group. If HTTP packets match the specified URL but do not

match the specified source IP address object group, they are counted based on the source IP address.

You can specify a maximum of 1024 source IP address object groups in one HTTP statistics parameter profile.

This command takes effect only on IP address objects configured by using the **host**, **subnet**, and **range** keywords in the **network** command. For information about configuring IP address objects, see object group configuration in *Security Configuration Guide*.

Examples

In HTTP statistics parameter profile **http1**, enable collection of HTTP traffic statistics by source IP address object group **cnc**.

```
<Sysname> system-view
[Sysname] parameter-profile http1 type http-statistics
[Sysname-para-http-statistics-http1] source-ip object-group cnc
```

Related commands

network (*Security Command Reference*)

object-group (*Security Command Reference*)

source-ip object-group (SNAT global policy view)

Use **source-ip object-group** to specify a source IP address object group for address translation.

Use **undo source-ip object-group** to restore the default.

Syntax

source-ip object-group *object-group-name*

undo source-ip object-group

Default

All packets are translated.

Views

SNAT global policy view

Predefined user roles

network-admin

context-admin

Parameters

object-group-name: Specifies a source IP address object group by its name, a case-insensitive string of 1 to 31 characters.

Usage guidelines

If you specify a source IP address object group, the device performs SNAT on only packets with a matching source IP address. For information about configuring an IP address object group, see object group configuration in *Security Configuration Guide*.

Examples

Specify source IP address object group **obj1** for SNAT global policy **sn1**.

```
<Sysname> system-view
[Sysname] loadbalance snat-global-policy sn1
```

```
[Sysname-lb-snat-gp-sn1] source-ip object-group obj1
```

Related commands

object-group (*Security Command Reference*)

src-addr-option

Use **src-addr-option** to configure the TCP option for SNAT.

Use **undo src-addr-option** to restore the default.

Syntax

src-addr-option *option-number* [**encode** { **binary** | **string** }]

undo src-addr-option

Default

No TCP option is configured for SNAT.

Views

TCP parameter profile view

Predefined user roles

network-admin

context-admin

Parameters

option-number: Specifies a TCP option by its number. Valid numbers are 6, 7, 9 to 18, and 22 to 254.

encode { **binary** | **string** }: Specifies the bindary or string encoding mode. The default is the binary mode.

Usage guidelines

This command enables the device to parse the IP address in the TCP option by using the specified encoding mode. Then, the device translates the source IP address according to the configured translation mode.

This command takes effect only in a TCP parameter profile that is referenced as a client-side parameter profile by a virtual server.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

In TCP parameter profile **pp3**, specify TCP option 28 with binary encoding mode for SNAT.

```
<Sysname> system-view
[Sysname] parameter-profile pp3 type tcp
[Sysname-para-tcp-pp3] src-addr-option 28 encode binary
```

ssl session-id

Use **ssl session-id** to configure an SSL sticky method based on SSL session ID.

Use **undo ssl session-id** to restore the default.

Syntax

ssl session-id

undo ssl session-id

Default

No sticky methods exist.

Views

SSL sticky group view

Predefined user roles

network-admin

context-admin

Usage guidelines

The SSL sticky method based on SSL session ID applies only to HTTPS request packets. This sticky method requires specifying an SSL server policy for the virtual server.

Examples

Configure the SSL sticky method based on SSL session ID for the SSL sticky group **sg6**.

```
<Sysname> system-view
[Sysname] sticky-group sg6 type ssl
[Sysname-sticky-ssl-sg6] ssl session-id
```

ssl url rewrite

Use **ssl url rewrite** to rewrite the URL in the Location header of HTTP response packets sent by the server.

Use **undo ssl url rewrite** to remove the configuration.

Syntax

ssl url rewrite location *location* [**clearport** *clear-port*] [**sslport** *ssl-port*]

undo ssl url rewrite location *location* [**clearport** *clear-port*]

Default

The URL in the Location header of HTTP response packets sent by the server is not rewritten.

Views

HTTP LB action view

Predefined user roles

network-admin

context-admin

Parameters

location *location*: Specifies the Location header URL regular expression, a case-sensitive string of 1 to 255 characters.

clearport *clear-port*: Specifies the HTTP port number to be rewritten, in the range of 1 to 65535. The default is 80.

sslport *ssl-port*: Specifies the SSL port number after rewrite, in the range of 1 to 65535. The default is 443.

Usage guidelines

If the Location header of an HTTP response packet contains the *location* and *clear-port* values, the system rewrites HTTP in the URL to HTTPS and rewrites the *clear-port* value to the *ssl-port* value.

Examples

For the HTTP LB action **lba2**, rewrite the URL **http://www.ss.com:8080** in the Location header of HTTP response packets sent by the server to **https://www.ss.com:443**.

```
<Sysname> system-view
[Sysname] loadbalance action lba2 type http
[Sysname-lba-http-lba2] ssl url rewrite location www.ss.com clearport 8080 sslport 443
```

ssl-client-policy (LB action view)

Use **ssl-client-policy** to specify an SSL client policy to encrypt traffic between the LB device (SSL client) and the SSL server.

Use **undo ssl-client-policy** to restore the default.

Syntax

ssl-client-policy *policy-name*

undo ssl-client-policy *policy-name*

Default

No SSL client policy is referenced.

Views

HTTP LB action view

Predefined user roles

network-admin

context-admin

Parameters

policy-name: Specifies an SSL policy by its name, a case-insensitive string of 1 to 31 characters.

Usage guidelines

The virtual servers of the fast HTTP type do not support this command.

You must disable and then enable a virtual server for a modified SSL policy to take effect.

The device does not support specifying an SSL client policy that uses the following cipher suites:

- **exp_rsa_des_cbc_sha**.
- **exp_rsa_rc2_md5**.
- **exp_rsa_rc4_md5**.
- **rsa_des_cbc_sha**.

Examples

Specify the SSL client policy **scp** for the HTTP LB action **lba2**.

```
<Sysname> system-view
[Sysname] loadbalance action lba2 type http
[Sysname-lba-http-lba2] ssl-client-policy scp
```

ssl-client-policy (virtual server view)

Use **ssl-client-policy** to specify an SSL client policy for a virtual server to encrypt traffic between the LB device (SSL client) and the SSL server.

Use **undo ssl-client-policy** to restore the default.

Syntax

ssl-client-policy *policy-name*

undo ssl-client-policy *policy-name*

Default

A virtual server does not reference any SSL client policy.

Views

HTTP virtual server view

Predefined user roles

network-admin

context-admin

Parameters

policy-name: Specifies an SSL policy by its name, a case-insensitive string of 1 to 31 characters.

Usage guidelines

The virtual servers of the fast HTTP type do not support this command.

You must disable and then enable a virtual server for a modified SSL policy to take effect.

The device does not support specifying an SSL client policy that uses the following cipher suites:

- **exp_rsa_des_cbc_sha**.
- **exp_rsa_rc2_md5**.
- **exp_rsa_rc4_md5**.
- **rsa_des_cbc_sha**.

Examples

Specify the SSL client policy **scp** for the HTTP virtual server **vs2**.

```
<Sysname> system-view
[Sysname] virtual-server vs2 type http
[Sysname-vs-http-vs2] ssl-client-policy scp
```

ssl-server-policy

Use **ssl-server-policy** to specify an SSL server policy for a virtual server to encrypt traffic between the LB device (SSL server) and the SSL client.

Use **undo ssl-server-policy** to remove an SSL server policy from a virtual server.

Syntax

ssl-server-policy *policy-name* [**sni** *server-name*]

undo ssl-server-policy *policy-name* [*policy-name* **sni**]

Default

A virtual server does not reference any SSL server policy.

Views

HTTP/TCP virtual server view

Predefined user roles

network-admin

context-admin

Parameters

policy-name: Specifies an SSL policy by its name, a case-insensitive string of 1 to 31 characters.

sni *server-name*: Specifies an SSL server indication, a case-insensitive string of 1 to 253 characters.

Usage guidelines

The virtual servers of the fast HTTP type do not support this command.

You must disable and then enable a virtual server for a modified SSL policy to take effect.

The device does not support specifying an SSL server policy that uses the following cipher suites:

- **exp_rsa_des_cbc_sha**.
- **exp_rsa_rc2_md5**.
- **exp_rsa_rc4_md5**.
- **rsa_des_cbc_sha**.

If you execute this command multiple times without the **sni** *server-name* option, the most recent configuration takes effect.

You can specify multiple SSL server policies with SSL server indications, and each SSL server policy must have a different SSL server indication.

If you specify multiple SSL server policies, only the SSL server policy without an SSL server indication takes effect.

Examples

Specify the SSL server policy **ssp** for the HTTP virtual server **vs2**.

```
<Sysname> system-view
[Sysname] virtual-server vs2 type http
[Sysname-vs-http-vs2] ssl-server-policy ssp
```

statistics-match url

Use **statistics-match url** to configure a URL match rule.

Use **undo statistics-match url** to delete a URL match rule.

Syntax

statistics-match [*rule-id*] **url** *url*

undo statistics-match *rule-id*

Default

No URL match rules exist.

Views

Statistics node view

Predefined user roles

network-admin

context-admin

Parameters

rule-id: Specifies the match rule ID in the range of 1 to 256. If you do not specify a match rule ID, the system assigns the smallest available rule ID to the match rule.

url: Specifies a URL regular expression, a case-sensitive string of 1 to 255 characters. The string cannot contain question marks (?).

Usage guidelines

You can configure a maximum of 256 URL match rules for one statistics node.

Examples

In statistics node **bank**, configure a string of **.html** to match URLs in HTTP packets.

```
<Sysname> system-view
[Sysname] parameter-profile http1 type http-statistics
[Sysname-para-http-statistics-http1] node bank
[Sysname-para-http-statistics-http1-node-bank] statistics-match url *.html
```

status-code

Use **status-code** to configure a response status code to check.

Use **undo status-code** to remove a response status code.

Syntax

status-code *code*

undo status-code *code*

Default

No response status code is configured for checking.

Views

HTTP passive LB probe template view

Predefined user roles

network-admin

context-admin

Parameters

code: Specifies a response status code, in the range of 100 to 599.

Usage guidelines

The device monitors the responses of HTTP requests with URLs specified in the **check-url** command. If the status code in an HTTP response is the same as the specified response status code, a URL error is recorded.

You can configure a maximum of 10 response status codes for one HTTP passive load balancing template.

Examples

Configure response status code 404 in HTTP passive load balancing template **tplt**.

```
<Sysname> system-view
```

```
[Sysname] loadbalance probe-template http-passive tplt
[Sysname-lbpt-http-passive-tplt] status-code 404
```

Related commands

check-url

sticky

Use **sticky** to specify a sticky group for a virtual server.

Use **undo sticky** to restore the default.

Syntax

sticky *sticky-name*

undo sticky

Default

No sticky group is specified for a virtual server.

Views

HTTP virtual server view

Predefined user roles

network-admin

context-admin

Parameters

sticky-name: Specifies a sticky group by its name, a case-insensitive string of 1 to 63 characters.

Usage guidelines

You can also specify a sticky group by using the **default server-farm** and **server-farm** (LB action view) commands. The sticky group specified by using the **sticky** command has the highest priority.

This command allows you to specify only HTTP cookie sticky groups.

Examples

Specify the HTTP cookie sticky group **test** for HTTP virtual server **vs**.

```
<Sysname> system-view
[Sysname] virtual-server vs type http
[Sysname-vs-http-vs] sticky test
```

Related commands

default server-farm

server-farm (LB action view)

sticky-group

sticky-group

Use **sticky-group** to create a sticky group and enter its view, or enter the view of an existing sticky group.

Use **undo sticky-group** to delete the specified sticky group.

Syntax

sticky-group *group-name* [**type** { **address-port** | **http-content** | **http-cookie** | **http-header** | **http-passive** | **payload** | **radius**| **sip** | **ssl** | **tcp-payload** | **udp-passive** }]

undo sticky-group *group-name*

Default

No sticky groups exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

group-name: Specifies a sticky group name, a case-insensitive string of 1 to 63 characters.

type { **address-port** | **http-content** | **http-cookie** | **http-header** | **http-passive** | **payload** | **radius** | **sip** | **ssl** | **tcp-payload** | **udp-passive** }: Specifies the sticky group type, address and port, HTTP entity, HTTP cookie, HTTP header, HTTP passive, HTTP or UDP payload, RADIUS, SIP, SSL, TCP payload, or UDP passive. When you create a sticky group, you must specify the sticky group type. You can enter an existing sticky group view without entering the type of the sticky group.

Usage guidelines

A sticky group uses a specific sticky method to distribute similar sessions to the same real server or link. The sticky method applies to the first packet of a session. Subsequent packets of the session are distributed to the same real server or link.

You can configure only the address- and port-type sticky groups if the device does not have any licenses installed. To configure sticky groups of any other type, you must install licenses. For information about licensing, see license management in *Fundamentals Configuration Guide*.

Examples

Create the address- and port-type sticky group **sg1** and enter sticky group view.

```
<Sysname> system-view
[Sysname] sticky-group sg1 type address-port
[Sysname-sticky-address-port-sg1]
```

sticky-over-busy enable

Use **sticky-over-busy enable** to enable stickiness-over-busyness.

Use **undo sticky-over-busy enable** to disable stickiness-over-busyness.

Syntax

sticky-over-busy enable

undo sticky-over-busy enable

Default

Stickiness-over-busyness is disabled.

Views

Sticky group view

Predefined user roles

network-admin

context-admin

Usage guidelines

This command enables the device to assign client requests to real servers based on sticky entries, regardless of whether the real servers are busy.

When stickiness-over-busyness is disabled, the device assigns client requests to only the real servers in normal state.

Examples

In address- and port-type sticky group **sg1**, enable stickiness-over-busyness.

```
<Sysname> system-view
[Sysname] sticky-group sg1 type address-port
[Sysname-sticky-address-port-sg1] sticky-over-busy enable
```

sticky-sync enable (transparent DNS proxy view)

Use **sticky-sync enable** to enable sticky entry synchronization for a transparent DNS proxy.

Use **undo sticky-sync enable** to disable sticky entry synchronization for a transparent DNS proxy.

Syntax

sticky-sync enable [**global**]

undo sticky-sync enable

Default

Sticky entry synchronization is disabled for a transparent DNS proxy.

Views

Transparent DNS proxy view

Predefined user roles

network-admin

context-admin

Parameters

global: Enables global synchronization.

Usage guidelines

This command can back up sticky entry information to ensure service continuity during a master and backup switchover in hot backup mode.

In a VRRP network, you must specify the **global** keyword for the sticky entry synchronization feature to take effect.

The following configuration changes will cause the device to delete existing sticky entries and generate new ones based on subsequent traffic:

- Disable sticky entry synchronization.
- Change the sticky entry synchronization type.

Examples

Enable sticky entry synchronization for transparent DNS proxy **dns_proxy1**.

```
<Sysname>system-view
[Sysname] loadbalance dns-proxy dns_proxy1 type udp
[Sysname-lb-dp-udp-dns_proxy1] sticky-sync enable
```

sticky-sync enable (virtual server view)

Use **sticky-sync enable** to enable sticky entry synchronization for a virtual server.

Use **undo sticky-sync enable** to disable sticky entry synchronization for a virtual server.

Syntax

sticky-sync enable [**global**]

undo sticky-sync enable

Default

Sticky entry synchronization is disabled for a virtual server.

Views

Virtual server view

Predefined user roles

network-admin

context-admin

Parameters

global: Enables global synchronization.

Usage guidelines

For successful sticky entry synchronization, if you want to specify a sticky group, enable sticky entry synchronization before specifying a sticky group on both LB devices. You can specify a sticky group by using the **sticky** *sticky-name* option when you specify a primary server farm (see the default server-farm command).

In a VRRP network, you must specify the **global** keyword for the sticky entry synchronization feature to take effect.

The following configuration changes will cause the device to delete existing sticky entries and generate new ones based on subsequent traffic:

- Disable sticky entry synchronization.
- Change the sticky entry synchronization type.

Examples

Enable sticky entry synchronization for the IP-type virtual server **vs3**.

```
<Sysname>system-view
[Sysname] virtual-server vs3 type ip
[Sysname-vs-ip-vs3] sticky-sync enable
```

success-criteria (DNS server pool member view)

Use **success-criteria** to specify the health monitoring success criteria for a DNS server pool member.

Use **undo success-criteria** to restore the default.

Syntax

success-criteria { **all** | **at-least** *min-number* }

undo success-criteria

Default

Health monitoring succeeds only when all the specified health monitoring methods succeed.

Views

DNS server pool member view

Predefined user roles

network-admin

context-admin

Parameters

all: Specifies the health monitoring success criteria as all successful health monitoring methods.

at-least *min-number*: Specifies the health monitoring success criteria as the specified minimum number of successful health monitoring methods, in the range of 1 to 4294967295.

Usage guidelines

If the *min-number* setting exceeds the number of existing health monitoring methods on the device, the number of existing health monitoring methods applies.

The health monitoring success criteria configuration in DNS server pool member view takes precedence over the configuration in DNS server pool view.

The health monitoring result for a DNS server affects the availability of a DNS server pool member. The health monitoring result for a DNS server pool member does not affect the availability of a DNS server.

Examples

Configure the health monitoring success criteria for the DNS server pool member **ds1** as a minimum number of 2 successful health monitoring methods.

```
<Sysname> system-view
[Sysname] loadbalance dns-server-pool dsp1
[Sysname-lb-dsp-dsp1] dns-server ds1 port 10
[Sysname-lb-dsp-dsp1-#member#-ds1-port-10] success-criteria at-least 2
```

success-criteria (DNS server pool view)

Use **success-criteria** to specify the health monitoring success criteria for a DNS server pool.

Use **undo success-criteria** to restore the default.

Syntax

success-criteria { **all** | **at-least** *min-number* }

undo success-criteria

Default

Health monitoring succeeds only when all the specified health monitoring methods succeed.

Views

DNS server pool view

Predefined user roles

network-admin

context-admin

Parameters

all: Specifies the health monitoring success criteria as all successful health monitoring methods.

at-least *min-number*: Specifies the health monitoring success criteria as the specified minimum number of successful health monitoring methods, in the range of 1 to 4294967295.

Usage guidelines

If the *min-number* setting exceeds the number of existing health monitoring methods on the device, the number of existing health monitoring methods applies.

The health monitoring success criteria configuration in DNS server view takes precedence over the configuration in DNS server pool view.

Examples

Configure the health monitoring success criteria for the DNS server pool **dns-pool** as a minimum number of 2 successful health monitoring methods.

```
<Sysname> system-view
[Sysname] loadbalance dns-server-pool dns-pool
[Sysname-lb-dspool-dns-pool] success-criteria at-least 2
```

Related commands

undo success-criteria

Default

Health monitoring succeeds only when all the specified health monitoring methods succeed.

Views

DNS server view

Predefined user roles

network-admin

context-admin

Parameters

all: Specifies the health monitoring success criteria as all successful health monitoring methods.

at-least *min-number*: Specifies the health monitoring success criteria as the specified minimum number of successful health monitoring methods, in the range of 1 to 4294967295.

Usage guidelines

If the *min-number* setting exceeds the number of existing health monitoring methods on the device, the number of existing health monitoring methods applies.

The health monitoring success criteria configuration in DNS server view takes precedence over the configuration in DNS server pool view.

Examples

Configure the health monitoring success criteria for DNS server **ds1** as a minimum number of 2 successful health monitoring methods.

```
<Sysname> system-view
[Sysname] loadbalance dns-server ds1
[Sysname-lb-ds-ds1] success-criteria at-least 2
```

Related commands

success-criteria (DNS server pool view)

success-criteria (link group member view)

Use **success-criteria** to specify the health monitoring success criteria for a link group member.

Use **undo success-criteria** to restore the default.

Syntax

success-criteria { **all** | **at-least** *min-number* }

undo success-criteria

Default

Health monitoring succeeds only when all the specified health monitoring methods succeed.

Views

Link group member view

Predefined user roles

network-admin

context-admin

Parameters

all: Specifies the health monitoring success criteria as all successful health monitoring methods.

at-least *min-number*: Specifies the health monitoring success criteria as the specified minimum number of successful health monitoring methods, in the range of 1 to 4294967295.

Usage guidelines

If the *min-number* setting exceeds the number of existing health monitoring methods on the device, the number of existing health monitoring methods applies.

The health monitoring success criteria configuration in link group member view takes precedence over the configuration in link group view.

The health monitoring result for a link affects the availability of a link group member. The health monitoring result for a link group member does not affect the availability of a link.

Examples

Configure the health monitoring success criteria for the link group member **lk1** as a minimum number of 2 successful health monitoring methods.

```
<Sysname> system-view
[Sysname] loadbalance link-group lg
[Sysname-lb-lgroup-lg] link lk1
[Sysname-lb-lgroup-lg-#member#-lk1] success-criteria at-least 2
```

success-criteria (link group view)

Use **success-criteria** to specify the health monitoring success criteria for a link group.

Use **undo success-criteria** to restore the default.

Syntax

success-criteria { **all** | **at-least** *min-number* }

undo success-criteria

Default

Health monitoring succeeds only when all the specified health monitoring methods succeed.

[Sysname-sfarm-sf] success-criteria at-least 2
```

syn retransmission-timeout

Use **syn retransmission-timeout** to set the retransmission timeout time for SYN packets.

Use **undo syn retransmission-timeout** to restore the default.

Syntax

syn retransmission-timeout *timeout-value*

undo syn retransmission-timeout

Default

The retransmission timeout time for SYN packets is 10 seconds.

Views

TCP parameter profile view

Predefined user roles

network-admin

context-admin

Parameters

timeout-value: Specifies the retransmission timeout time for SYN packets, in the range of 1 to 75 seconds.

Usage guidelines

This command sets the amount of time the device waits for a SYN ACK before closing a TCP connection.

Examples

Set the retransmission timeout time for SYN packets to 5 seconds for TCP connections.

```
<Sysname> system-view
[Sysname] parameter-profile profile type tcp
[Sysname-para-tcp-profile] syn retransmission-timeout 5
```

Related commands

display parameter-profile

tcp connection idle-timeout

Use **tcp connection idle-timeout** to set the idle timeout for TCP connections.

Use **undo tcp connection idle-timeout** to restore the default.

Syntax

tcp connection idle-timeout *value*

undo tcp connection idle-timeout

Default

The idle timeout is 0 seconds for TCP connections, which means TCP connections never time out.

Views

TCP parameter profile view

Predefined user roles

network-admin

context-admin

Parameters

value: Specifies the idle timeout in the range of 10 to 86400 seconds.

Usage guidelines

This command sets the idle timeout for TCP connections between the LB device and the clients and for TCP connections between the LB device and the servers. If no traffic is available on a TCP connection before the idle timeout expires, the LB device terminates the TCP connection.

Examples

Set the idle timeout to 60 seconds for TCP connections.

```
<Sysname> system-view
[Sysname] parameter-profile pp1 type tcp
[Sysname-para-tcp-pp1] tcp connection idle-timeout 60
```

tcp mss

Use **tcp mss** to set the MSS for the LB device.

Use **undo tcp mss** to restore the default.

Syntax

tcp mss *value*

undo tcp mss

Default

The MSS is not set for the LB device.

Views

TCP parameter profile view

Predefined user roles

network-admin

context-admin

Parameters

value: Specifies the MSS value in the range of 128 to 1460 bytes.

Usage guidelines

This command takes effect only when the fast HTTP or HTTP virtual server has referenced a TCP parameter profile.

When the client establishes a TCP connection to the LB device, the client sends its own MSS value to the LB device. The LB device records the MSS value and sends the configured MSS value to the client. The client and the LB device use the smaller MSS value for communication.

When the LB device establishes a TCP connection to the server, the LB device sends the configured MSS value to the server. The server records the MSS value and sends its own MSS value to the LB device. The LB device and the server use the smaller MSS value for communication.

Examples

Set the MSS to 1300 bytes for the LB device.

```
<Sysname> system-view
[Sysname] parameter-profile tcp type tcp
[Sysname-para-tcp-tcp] tcp mss 1300
```

tcp option insert

Use **tcp option insert** to insert the client IP address into a TCP option.

Use **undo tcp option insert** to remove the configuration.

Syntax

tcp option insert *option-number* **src-addr** [**encode** { **binary** | **string** }]

undo tcp option insert *option-number*

Default

The client IP address is not inserted into any TCP options.

Views

TCP parameter profile view

Predefined user roles

network-admin

context-admin

Parameters

option-number: Specifies a TCP option by its number. Valid values are 6, 7, 9 to 18, and 22 to 254.

encode { **binary** | **string** }: Specifies the binary or string encoding mode. The default is binary mode.

Usage guidelines

This command inserts the client's actual IP address as the source IP address into the specified option in headers of TCP packets sent to the server.

This command takes effect only on TCP parameter profiles referenced by the following virtual servers:

- HTTP virtual servers.
- TCP virtual servers configured with SSL server policies.
- TCP virtual servers operating at Layer 7.
- MySQL virtual servers.

You can execute this command multiple times to insert the client IP address to a maximum of five TCP options.

If you execute this command multiple times for the same TCP option, the most recent configuration takes effect.

Examples

In TCP parameter profile **para2**, insert the client IP address into TCP option 28.

```
<Sysname> system-view
[Sysname] parameter-profile para2 type tcp
[Sysname-para-tcp-para2] tcp option insert 28 src-addr
```

Related commands

parameter-profile

tcp option remove

Use **tcp option remove** to remove the specified TCP option from TCP packet headers.

Use **undo tcp option remove** to cancel the removal configuration.

Syntax

tcp option remove *option-number*

undo tcp option remove *option-number*

Default

No TCP option is removed from TCP packet headers.

Views

TCP parameter profile view

Predefined user roles

network-admin

context-admin

Parameters

option-number: Specifies a TCP option by its number in the range of 3 to 254.

Usage guidelines

This command removes the specified TCP option from headers of TCP packets sent to the server.

You can execute this command multiple times to remove a maximum of five TCP options.

Examples

In TCP parameter profile **para2**, remove TCP option 8 from TCP packet headers.

```
<Sysname> system-view
[Sysname] parameter-profile para2 type tcp
[Sysname-para-tcp-para2] tcp option remove 8
```

Related commands

parameter-profile

tcp window-size

Use **tcp window-size** to configure the maximum local window size for TCP connections.

Use **undo tcp window-size** to restore the default.

Syntax

tcp window-size *size*

undo tcp window-size

Default

The maximum local window size for TCP connections is 65535.

Views

TCP parameter profile view

Predefined user roles

network-admin

context-admin

Parameters

size: Specifies the maximum local window size for TCP connections, in the range of 8192 to 65535.

Examples

Set the maximum local window size for TCP connections to 8192 for the TCP parameter profile **pp3**.

```
<Sysname> system-view
[Sysname] parameter-profile pp3 type tcp
[Sysname-para-tcp-pp3] tcp window-size 8192
```

tcp-close

Use **tcp-close** to configure the method to close TCP connections.

Use **undo tcp-close** to restore the default.

Syntax

tcp-close { **fin** | **rst** }

undo tcp-close

Default

FIN packets are sent to close TCP connections.

Views

Generic/HTTP LB action view

Predefined user roles

network-admin

context-admin

Parameters

fin: Closes TCP connections by sending FIN packets.

rst: Closes TCP connections by sending RST packets.

Examples

In generic LB action **lba1**, configure the **rst** method to close TCP connections.

```
<Sysname> system-view
[Sysname] loadbalance action lba1 type generic
[Sysname-lba-generic-lba1] tcp-close rst
```

tcp-payload

Use **tcp-payload** to configure the TCP payload sticky method.

Use **undo tcp-payload** to delete the TCP payload sticky method.

Syntax

tcp-payload [**offset** *offset*] [**start** *start-string*] [**end** *end-string* | **length** *length*]

undo tcp-payload

Default

No TCP payload sticky methods exist.

Views

TCP payload sticky group view

Predefined user roles

network-admin

context-admin

Parameters

offset *offset*: Specifies the offset value of the TCP payload based on the start of the TCP packet, in the range of 0 to 1000 bytes. The default is 0.

start *start-string*: Specifies the regular expression that marks the start of the TCP payload, a case-sensitive string of 1 to 127 characters starting from the *offset* value. The string cannot contain question marks (?).

end *end-string*: Specifies the regular expression that marks the end of the TCP payload, a case-sensitive string of 1 to 127 characters starting from the *start-string* value. The string cannot contain question marks (?).

length *length*: Specifies the length of the TCP payload, in the range of 0 to 1000 bytes. The default is 0, which indicates all lengths.

Usage guidelines

Use this command to obtain the TCP payload information used to generate sticky entries based on the *offset*, *start-string*, *end-string*, and *length* values. The *start-string* and *end-string* values are not included in the sticky entry information.

If you do not specify any parameters in this command, the sticky entry is generated based on the whole TCP packet.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Configure the TCP payload sticky method for the TCP payload sticky group **sg**: Use the whole TCP packet to generate sticky entries.

```
<Sysname> system-view
[Sysname] sticky-group sg type tcp-payload
[Sysname-sticky-payload-sg] tcp-payload
```

timeout (LB probe template view)

Use **timeout** to set the timeout time for probe responses.

Use **undo timeout** to restore the default.

Syntax

timeout *timeout-value*

undo timeout

Default

The timeout time for probe responses is 3 seconds for ICMP probe packets and custom monitoring probe packets and is 5 seconds for HTTP passive probe packets.

Views

ICMP LB probe template view

HTTP passive LB probe template view

Custom-monitoring LB probe template view

Predefined user roles

network-admin

context-admin

Parameters

timeout-value: Specifies the timeout time for probe responses, in the range of 1 to 60 seconds for ICMP probe packets, 1 to 255 seconds for HTTP passive probe packets, and 1 to 86400 seconds for custom monitoring probe packets.

Usage guidelines

As a best practice, set the timeout time for probe responses to be smaller than the monitoring time (set by using the **monitor-interval** command).

After an HTTP passive LB probe template is referenced, the device monitors the responses of HTTP requests with URLs specified in the **check-url** command. If the response time for an HTTP request exceeds the specified timeout time, a URL error is recorded.

Examples

Set the timeout time for probe responses to 5 seconds in the ICMP template **icmptplt**.

```
<Sysname> system-view
[Sysname] loadbalance probe-template icmp icmptplt
[Sysname-lbpt-icmp-icmptplt] timeout 5
```

Related commands

check-url
monitor-interval

timeout (proximity view)

Use **timeout** to set the timeout timer for proximity entries.

Use **undo timeout** to restore the default.

Syntax

timeout *timeout-value*

undo timeout

Default

The timeout timer for proximity entries is 60 seconds.

Views

Proximity view

Predefined user roles

network-admin

context-admin

Parameters

timeout-value: Specifies the timeout timer in the range of 60 to 3600 seconds.

Examples

Set the timeout timer for proximity entries to 80 seconds.

```
<Sysname> system-view
[Sysname] loadbalance proximity
```

```
[Sysname-lb-proximity] timeout 80
```

timeout (sticky group view)

Use **timeout** to set the timeout timer for sticky entries.

Use **undo timeout** to restore the default.

Syntax

timeout { **indefinite** | *timeout-value* }

undo timeout

Default

The timeout timer for sticky entries is 86400 seconds for sticky groups of the HTTP cookie, HTTP passive, and UDP passive types and 60 seconds for sticky groups of other types.

Views

Sticky group view

Predefined user roles

network-admin

context-admin

Parameters

indefinite: Specifies an indefinite timeout timer for sticky entries so that the sticky entries never age out. Sticky groups of the HTTP cookie type, HTTP passive type, and UDP passive type do not support this keyword.

timeout-value: Specifies the timeout timer in the range of 0 to 31536000 seconds for sticky groups of the HTTP cookie type and in the range of 10 to 604800 seconds for sticky groups of other types.

Usage guidelines

For sticky groups of the HTTP cookie type, the following principles apply:

- If the sticky method is cookie insert or cookie rewrite, a timeout timer of 0 indicates session persistency.
- If the sticky method is cookie get, a timeout timer of 0 indicates the timeout time for the sticky entries is 0 seconds.

Examples

Set the timeout timer for sticky entries to 100 seconds in the address- and port-type sticky group **sg1**.

```
<Sysname> system-view
[Sysname] sticky-group sg1 type address-port
[Sysname-sticky-address-port-sg1] timeout 100
```

time-wait timeout

Use **time-wait timeout** to set the TIME_WAIT state timeout time for TCP connections.

Use **undo time-wait timeout** to restore the default.

Syntax

time-wait timeout *value*

undo time-wait timeout

Default

The TIME_WAIT state timeout time is 2 seconds for TCP connections.

Views

TCP parameter profile view

Predefined user roles

network-admin

context-admin

Parameters

value: Specifies the TIME_WAIT state timeout time in the range of 1 to 65535 seconds.

Usage guidelines

A TCP connection cannot be released until the TIME_WAIT timer expires. To release TCP connections faster and improve load balancing efficiency, use this command to set a shorter TIME_WAIT state timeout time.

Examples

Set the TIME_WAIT state timeout time for TCP connections to 30 seconds in the TCP parameter profile **pa1**.

```
<Sysname> system-view
[Sysname] parameter-profile pa1 type tcp
[Sysname-para-tcp-pa1] time-wait timeout 30
```

topology region

Use **topology region** to configure a topology.

Use **undo topology region** to restore the default.

Syntax

topology region *region-name* { **ip** *ipv4-address* { *mask-length* | *mask* } | **ipv6** *ipv6-address prefix-length* } [**priority** *priority*]

undo topology region *region-name* [**ip** *ipv4-address* [*mask-length* | *mask*] | **ipv6** *ipv6-address* [*prefix-length*]]

Default

No topologies exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

region-name: Specifies a region by its name, a case-insensitive string of 1 to 63 characters.

ip *ipv4-address*: Specifies the IPv4 address of a virtual server.

mask-length: Specifies the mask length for the IPv4 address, in the range of 0 to 32. The default is 32.

mask: Specifies the mask for the IPv4 address. The default is 255.255.255.255.

ipv6 *ipv6-address prefix-length*: Specifies the IPv6 address of a virtual server.

prefix-length: Specifies the prefix length for the IPv6 address, in the range of 0 to 128. The default is 128.

priority *priority*: Specifies the priority of the topology, in the range of 1 to 255. The default weight is 100.

Usage guidelines

A topology associates the region where the local DNS server resides with the IP address of a virtual server.

When the static proximity algorithm (**topology**) is specified for the virtual server pool by using the **predictor** command, you must configure a topology.

When a DNS request matches multiple topology records, the topology record with the highest priority is selected.

You can execute this command multiple times to configure multiple IP address ranges for a region.

If you only specify a region when deleting a topology, all topologies for the region are deleted.

Examples

Configure a topology by associating the region **region-ct** with the IPv4 address **1.2.3.4**.

```
<Sysname> system-view
[Sysname] topology region region-ct ip 1.2.3.4 24 priority 200
```

Related commands

translation-mode

Use **translation-mode** to configure a translation mode for a SNAT global policy.

Use **undo translation-mode** to restore the default.

Syntax

translation-mode { **auto-map** | **snat-pool** *pool-name* }

undo translation-mode

Default

No translation mode is configured for a SNAT global policy.

Views

SNAT global policy view

Predefined user roles

network-admin

context-admin

Parameters

auto-map: Specifies the automatic mapping mode.

snat-pool *pool-name*: Specifies the SNAT address pool mode. The *pool-name* argument specifies the SNAT address pool name, a case-insensitive string of 1 to 63 characters.

Usage guidelines

The device supports the following translation modes in a SNAT global policy:

- **Automatic mapping**—Translates the source IP address into the IP address of the interface connecting to the real servers.
- **SNAT address pool**—Translates the source IP address into an IP address in the specified SNAT address pool.

If SNAT is not configured for a server farm, the server farm uses SNAT global policies for address translation.

Examples

Specify SNAT address pool **sp** for address translation in SNAT global policy **sn1**.

```
<Sysname> system-view
[Sysname] loadbalance snat-global-policy sn1
[Sysname-lb-snat-gp-sn1] translation-mode snat-pool sp
```

transparent enable (link group view)

Use **transparent enable** to disable NAT for a link group.

Use **undo transparent enable** to enable NAT for a link group.

Syntax

transparent enable

undo transparent enable

Default

NAT is enabled for a link group.

Views

Link group view

Predefined user roles

network-admin

context-admin

Examples

Disable NAT for the link group **lg**.

```
<Sysname> system-view
[Sysname] loadbalance link-group lg
[Sysname-lb-lgroup-sinalab] transparent enable
```

transparent enable (server farm view)

Use **transparent enable** to disable NAT for a server farm.

Use **undo transparent enable** to enable NAT for a server farm.

Syntax

transparent enable

undo transparent enable

Default

NAT is enabled for a server farm.

Views

Server farm view

Predefined user roles

network-admin

context-admin

Usage guidelines

If the server farm is referenced by a virtual server of the HTTP type, the NAT feature takes effect even if it is disabled.

Examples

Disable NAT for the server farm **sf**.

```
<Sysname> system-view
[Sysname] server-farm sf
[Sysname-sfarm-sf] transparent enable
```

trusted-access-controller

Use **trusted-access-controller** to specify a trusted access controller for a virtual server.

Use **undo trusted-access-controller** to restore the default.

Syntax

trusted-access-controller iam *controller-name* **action** { **api-auth** | **app-auth** }

undo trusted-access-controller

Default

A virtual server does not reference any trusted access controller.

Views

HTTP virtual server view

Predefined user roles

network-admin

context-admin

Parameters

iam: Specifies the IAM-type trusted access controller.

controller-name: Specifies a trusted access controller by its name, a case-insensitive string of 1 to 63 characters.

action: Specifies an action to take.

api-auth: Performs API authentication.

app-auth: Performs application authentication.

Usage guidelines

The device performs authentication and authorization with the specified trusted access controller for matching requests on behalf of clients. If the authentication and authorization succeed, the device

forwards the requests. For more information about trusted access controllers, see trusted access controller in *Security Configuration Guide*.

Examples

Specify IAM trusted access controller **tac** for the HTTP virtual server **vs3** to perform application authentication.

```
<Sysname> system-view
[Sysname] virtual-server vs3 type http
[Sysname-vs-http-vs3]] trusted-access-controller iam tac action app-auth
```

Related commands

trusted-access controller (*Security Command Reference*)

ttl (DNS forward zone view)

Use **ttl** to set the TTL for resource records.

Use **undo ttl** to restore the default.

Syntax

ttl *ttl-value*

undo ttl

Default

The TTL for resource records is 3600 seconds.

Views

DNS forward zone view

Predefined user roles

network-admin

context-admin

Parameters

ttl-value: Specifies the TTL value in the range of 0 to 4294967295 seconds.

Examples

Set the TTL for resource records to 1 day for DNS forward zone **abc.com**.

```
<Sysname> system-view
[Sysname] loadbalance zone abc.com
[Sysname-lb-zone-abc.com] ttl 86400
```

Related commands

display loadbalance zone

ttl (DNS mapping view)

Use **ttl** to set the TTL for DNS records.

Use **undo ttl** to restore the default.

Syntax

ttl *ttl-value*

undo ttl

Default

The TTL for DNS records is 3600 seconds.

Views

DNS mapping view

Predefined user roles

network-admin

context-admin

Parameters

ttl-value: Specifies the TTL value in the range of 0 to 4294967295 seconds.

Usage guidelines

Use this command to set a proper TTL to cache DNS records for DNS responses.

- For the DNS client to get the updated DNS record when the LB policy or virtual server configuration changes, set a smaller TTL value, for example, 60 seconds.
- For stable, fast domain name resolution when the network is stable, set a larger TTL value, for example, 86400 seconds.

Examples

Set the TTL for DNS records to 4000 seconds for the DNS mapping **dm1**.

```
<Sysname> system-view
[Sysname] loadbalance dns-map dm1
[Sysname-lb-dm-dm1] ttl 4000
```

Related commands

display loadbalance dns-map

ttl weight

Use **ttl weight** to set the TTL weight for proximity calculation.

Use **undo ttl weight** to restore the default.

Syntax

ttl weight *ttl-weight*

undo ttl weight

Default

The TTL weight for proximity calculation is 100.

Views

Proximity view

Predefined user roles

network-admin

context-admin

Parameters

ttl-weight: Specifies the TTL weight for proximity calculation, in the range of 0 to 255. A larger value indicates a higher weight.

Examples

Set the TTL weight for proximity calculation to 200.

```
<Sysname> system-view
[Sysname] loadbalance proximity
[Sysname-lb-proximity] ttl weight 200
```

udp per-packet

Use **udp per-packet** to enable per-packet load balancing for UDP traffic for a virtual server.

Use **undo udp per-packet** to disable per-packet load balancing for UDP traffic for a virtual server.

Syntax

udp per-packet

undo udp per-packet

Default

Per-packet load balancing for UDP traffic is disabled for a virtual server.

Views

UDP virtual server view

UDP-based SIP virtual server view

Predefined user roles

network-admin

context-admin

Usage guidelines

When per-packet load balancing for UDP traffic is disabled, the LB device distributes traffic matching the virtual server according to application type. Traffic of the same application type is distributed to one real server.

When per-packet load balancing for UDP traffic is enabled, the following results apply:

- The LB device distributes traffic matching the virtual server on a per-packet basis.
- The LB device does not collect statistics of connections on the virtual server or real server.
- If NAT is not enabled for the referenced server farm, the LB device does not collect statistics of packets sent by the virtual server or real server.
- The following configurations are still effective:
  - Scheduling algorithm configured on the server farm referenced by the virtual server.
  - Sticky method of the sticky group when the virtual server references the server farm.

    Because packets of the same session have the same quintuple, the hash scheduling algorithm or the source IP address sticky method yields the same result for the packets. For example, if a server farm uses the hash scheduling algorithm or the source IP address sticky method, the LB device distributes UDP packets of the same session to one real server. In this case, the LB device cannot distribute UDP packets on a per-packet basis.

Examples

Enable per-packet load balancing for UDP traffic for the UDP virtual server **vs5**.

```
<Sysname> system-view
[Sysname] virtual-server vs5 type udp
[Sysname-vs-udp-vs5] udp per-packet
```

username

Use **username** to specify the login username and password of the MySQL database.

Use **undo username** to remove the login username and password of the MySQL database.

Syntax

username *username* [**password** { **cipher** | **simple** } *string*]

undo username *username*

Default

The login username and password of the MySQL database is not specified.

Views

MySQL virtual server view

Predefined user roles

network-admin

context-admin

Parameters

username: Specifies the username, a case-sensitive string of 1 to 63 characters.

password: Specifies the password. If you do not specify the password, the password is null.

cipher: Specifies a password in encrypted form.

simple: Specifies a password in plaintext form. For security purposes, the password specified in plaintext form will be stored in encrypted form.

string: Specifies the password string. Its plaintext form is a case-sensitive string of 1 to 127 characters. Its encrypted form is a case-sensitive string of 1 to 255 characters.

Usage guidelines

You can configure a maximum of 100 login users.

The specified login username and password must be the same as the actual login username and password of the MySQL database.

Examples

Specify the username and password as **root** and **123456**, respectively, for the MySQL virtual server **vs1**.

```
<Sysname> system-view
[Sysname] virtual-server vs1 type mysql
[Sysname-vs-mysql-vs1] username root password simple 123456
```

variable

Use **variable** to associate a variable with a server farm member.

Use **undo variable** to disassociate a variable from a server farm member.

Syntax

variable *variable-name* **value** *value*

undo variable *variable-name*

Default

No variable is associated with a server farm member.

Views

Server farm member view

Predefined user roles

network-admin

context-admin

Parameters

variable-name: Specifies a variable name, a case-sensitive string of 1 to 63 characters.

value *value*: Specifies the variable value, a case-sensitive string of 1 to 127 characters.

Examples

Associate a variable with variable name **var1** and variable value 1 with server farm member **rs**.

```
<Sysname> system-view
[Sysname] server-farm sf
[Sysname-sfarm-sf] real-server rs port 5001
[Sysname-sfarm-sf-#member#-rs-port-5001] variable var1 value _1
```

Related commands

payload rewrite

version

Use **version** to configure the MySQL database version.

Use **undo version** to restore the default.

Syntax

version { **5.0** | **5.1** | **5.5** | **5.6** | **5.7** }

undo version

Default

The MySQL database version is 5.6.

Views

MySQL virtual server view

Predefined user roles

network-admin

context-admin

Parameters

{ **5.0** | **5.1** | **5.5** | **5.6** | **5.7** }: Specifies the MySQL database version number.

Usage guidelines

The LB device performs authentication for clients on behalf of the MySQL server and sends database initialization packets of the specified MySQL version to clients.

Examples

Configure the MySQL database version as 5.7 for the MySQL virtual server **vs1**.

```
<Sysname> system-view
[Sysname] virtual-server vs1 type mysql
[Sysname-vs-mysql-vs1] version 5.7
```

virtual-ip

Use **virtual-ip** to add a virtual IPv4 address to a virtual server pool.

Use **undo virtual-ip** to delete a virtual IPv4 address from a virtual server pool.

Syntax

virtual-ip *ipv4-address* **link** *link-name* [**weight** *weight-value*]

undo virtual-ip *ipv4-address*

Default

No virtual IPv4 addresses are added to a virtual server pool.

Views

Virtual server pool view

Predefined user roles

network-admin

context-admin

Parameters

ipv4-address: Specifies a virtual IPv4 address.

link *link-name*: Specifies an LB link by its name, a case-insensitive string of 1 to 63 characters.

weight *weight-value*: Specifies the weight for the virtual IPv4 address, in the range of 1 to 255. The default weight is 100.

Usage guidelines

In scenarios where server load balancing is not required, you can configure virtual IPv4 addresses instead of virtual servers to simplify configuration.

For the weighted round-robin scheduling algorithm, a virtual IPv4 address with a greater weight value are preferentially scheduled.

You can add multiple virtual IPv4 addresses to a virtual server pool, and a virtual IPv4 address can be associated with one link. If you execute this command multiple times for the same virtual IPv4 address, the most recent configuration takes effect.

Examples

Add virtual IPv4 address 10.0.0.1 associated with LB link **link1** to virtual server pool **local-pool**.

```
<Sysname> system-view
[Sysname] loadbalance virtual-server-pool local-pool
[Sysname-lb-vspool-local-pool] virtual-ip 10.0.0.1 link link1
```

Related commands

Use **undo virtual-ipv6** to delete a virtual IPv6 address from a virtual server pool.

Syntax

virtual-ipv6 *ipv6-address* **link** *link-name* [**weight** *weight-value*]

undo virtual-ipv6 *ipv6-address*

Default

No virtual IPv6 addresses are added to a virtual server pool.

Views

Virtual server pool view

Predefined user roles

network-admin

context-admin

Parameters

ipv6-address: Specifies a virtual IPv6 address.

link *link-name*: Specifies an LB link by its name, a case-insensitive string of 1 to 63 characters.

weight *weight-value*: Specifies the weight for the virtual IPv6 address, in the range of 1 to 255. The default weight is 100.

Usage guidelines

In scenarios where server load balancing is not required, you can configure virtual IPv6 addresses instead of virtual servers to simplify configuration.

For the weighted round-robin scheduling algorithm, a virtual IPv6 address with a greater weight value are preferentially scheduled.

You can add multiple virtual IPv6 addresses to a virtual server pool, and a virtual IPv6 address can be associated with one link. If you execute this command multiple times for the same virtual IPv6 address, the most recent configuration takes effect.

Examples

Add virtual IPv6 address 10::1 associated with LB link **link1** to virtual server pool **local-pool**.

```
<Sysname> system-view
[Sysname] loadbalance virtual-server-pool local-pool
[Sysname-lb-vspool-local-pool] virtual-ipv6 10::1 link link1
```

Related commands

loadbalance virtual-server-pool

virtual ip address

Use **virtual ip address** to configure an IPv4 address (VSIP) for a virtual server.

Use **undo virtual ip address** to restore the default.

Syntax

virtual ip address *ipv4-address* [*mask-length* | *mask*]

undo virtual ip address

Default

No IPv4 address is configured for a virtual server.

Views

Virtual server view

Predefined user roles

network-admin

context-admin

Parameters

ipv4-address: Specifies an IPv4 address. It cannot be a loopback address, multicast address, broadcast address, or an address in the format of 0.X.X.X (with a mask length of 32).

mask-length: Specifies a mask length in the range of 0 to 32. The default is 32. This argument is not supported by virtual servers of the fast HTTP type and HTTP type.

mask: Specifies a subnet mask. The default is 255.255.255.255. This argument is not supported by virtual servers of the fast HTTP type and HTTP type.

Usage guidelines

If the virtual server IP address is on the same network as the IP address of the device interface connected to the client, you must execute the **arp-nd interface** command for the virtual server. In the situation does not exist, you do not need to execute the **arp-nd interface** command.

Examples

Configure the IPv4 address for the IP-type virtual server **vs3** as 1.1.1.1/24.

```
<Sysname> system-view
[Sysname] virtual-server vs3 type ip
[Sysname-vs-ip-vs3] virtual ip address 1.1.1.1 24
```

Related commands

virtual ipv6 address

Use **virtual ipv6 address** to configure an IPv6 address (VSIP) for a virtual server.

Use **undo virtual ipv6 address** to restore the default.

Syntax

virtual ipv6 address *ipv6-address* [*prefix-length*]

undo virtual ipv6 address

Default

No IPv6 address is configured for a virtual server.

Views

Virtual server view

Predefined user roles

network-admin

context-admin

Parameters

ipv6-address: Specifies an IPv6 address, which cannot be a loopback address, IPv6 multicast address, link-local address, or all-zero address (when the prefix length is not 0).

prefix-length: Specifies a prefix length in the range of 0 to 128. The default is 128. This argument is not supported by virtual servers of the fast HTTP type and HTTP type.

Usage guidelines

If the virtual server IP address is on the same network as the IP address of the device interface connected to the client, you must execute the **arp-nd interface** command for the virtual server. In the situation does not exist, you do not need to execute the **arp-nd interface** command.

Examples

Configure the IPv6 address for the IP-type virtual server **vs3** as 1001::1/64.

```
<Sysname> system-view
[Sysname] virtual-server vs3 type ip
[Sysname-vs-ip-vs3] virtual ipv6 address 1001::1 64
```

Related commands

arp-nd interface (virtual server view)

virtual-server (system view)

Use **virtual-server** to create a virtual server and enter its view, or enter the view of an existing virtual server.

Use **undo virtual-server** to delete the specified virtual server.

Syntax

virtual-server *virtual-server-name* [**type** { **fast-http** | **http** | **ip** | **link-ip** | | **mysql sip-tcp** | **sip-udp** | **radius** | **tcp** | **udp** }]

undo virtual-server *virtual-server-name*

Default

No virtual servers exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

virtual-server-name: Specifies the virtual server name, a case-insensitive string of 1 to 63 characters.

type { **fast-http** |**http** | **ip** | **link-ip** | **mysql** | **sip-tcp** | **sip-udp** | **radius** | **tcp** | **udp** }: Specifies the virtual server type as fast HTTP, HTTP, IP, link-IP, MySQL, RADIUS, TCP-based SIP, UDP-based SIP, TCP, or UDP. When you create a virtual server, you must specify

a virtual server type. You can enter an existing virtual server view without entering the type of the virtual server.

Usage guidelines

You can create fast HTTP, HTTP, MySQL, RADIUS, SIP, TCP, or UDP virtual servers only if the device has licenses installed. For information about licensing, see license management in *Fundamentals Configuration Guide*.

Examples

Create the virtual server **vs3** with the IP type, and enter virtual server view.

```
<Sysname> system-view
[Sysname] virtual-server vs3 type ip
[Sysname-vs-ip-vs3]
```

virtual-server (virtual server pool view)

Use **virtual-server** to add a virtual server to a virtual server pool.

Use **undo virtual-server** to delete a virtual server from a virtual server pool.

Syntax

virtual-server *virtual-server-name* **link** *link-name* [**weight** *weight-value*]

undo virtual-server *virtual-server-name*

Default

No virtual servers are added to a virtual server pool.

Views

Virtual server pool view

Predefined user roles

network-admin

context-admin

Parameters

virtual-server-name: Specifies a virtual server by its name, a case-insensitive string of 1 to 63 characters.

link *link-name*: Specifies an LB link by its name, a case-insensitive string of 1 to 63 characters.

weight *weight-value*: Specifies the weight for the virtual server, in the range of 1 to 255. The default weight is 100. For the weighted round robin algorithm, a greater value means a higher priority to be referenced. If you do not specify this option, the default weight 100 applies.

Usage guidelines

You can add multiple virtual servers to a virtual server pool.

To ensure correct operation of inbound link load balancing when server load balancing is also enabled, do not specify the virtual server's IP address as the DNS listener's IP address.

The virtual server's IP address for inbound link load balancing must be a unicast address with a 32-bit mask length. The IP address cannot be an all-zero address.

Examples

Add the virtual server **vs1** associated with the LB link **link1** to the virtual server pool **local-pool**.

```
<Sysname> system-view
[Sysname] loadbalance virtual-server-pool local-pool
```

```
[Sysname-lb-vspool-local-pool] virtual-server vs1 link link1
```

Related commands

```

vrrp vrid

Use **vrrp vrid** to bind a VRRP group to a virtual server.

Use **undo vrrp vrid** to unbind a VRRP group from a virtual server.

Syntax

vrrp [**ipv6**] **vrid** *virtual-router-id* **interface** *interface-type interface-number*

undo vrrp [**ipv6**]

Default

No VRRP group is bound to a virtual server.

Views

Virtual server view

Predefined user roles

network-admin

context-admin

Parameters

ipv6: Specifies an IPv6 VRRP group. If you do not specify this keyword, this command binds an IPv4 VRRP group to a virtual server.

virtual-router-id: Specifies a VRRP group by its virtual router ID in the range of 1 to 255.

interface-type interface-number: Specifies the interface on which the VRRP group was created.

Usage guidelines

In a VRRP hot backup system, execute this command if you configure server load balancing on the primary device in a remote backup group to make sure the return packets are processed on the same master device. For more information about remote backup groups, see RBM in *High Availability Configuration Guide*.

Multiple virtual servers bound to different VRRP groups cannot use the same SNAT address pool.

A virtual server can be bound to a maximum of one IPv4 or IPv6 VRRP group. You can bind an IPv4 VRRP group to only an IPv4 virtual server, or bind an IPv6 VRRP group to only an IPv6 virtual server.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Bind VRRP group 1 to TCP virtual server **vs**.

```
<Sysname> system-view
[Sysname] virtual-server vs type tcp
[Sysname-vs-tcp-vs] vrrp vrid 1 interface gigabitethernet 1/0/1
```

Syntax

window-size *size*

undo window-size

Default

The window size used for compression is 16 KB.

Views

HTTP-compression parameter profile view

Predefined user roles

network-admin

context-admin

Parameters

size: Specifies the window size in KB used for compression. The value can only be 1, 2, 4, 8, 16, or 32.

Examples

Create the HTTP-compression parameter profile **pa1**, and set the window size used for compression to 32 KB.

```
<Sysname> system-view
[Sysname] parameter-profile pa1 type http-compress
[Sysname-para-http-compression-pa1] window-size 32
```

zero-window threshold

Use **zero-window threshold** to set the percentage threshold of zero-window packets for a TCP zero-window LB probe template.

Use **undo zero-window threshold** to restore the default.

Syntax

zero-window threshold *percentage*

undo packet-zero-window

Default

The percentage threshold of zero-window packets is 40%.

Views

TCP zero-window LB probe template view

Predefined user roles

network-admin

context-admin

Parameters

percentage: Specifies the percentage threshold of zero-window packets, in the range of 1 to 100.

Usage guidelines

When the percentage of zero-window packets sent by a real server reaches the threshold, the protection action specified in the **protect-action** command is taken.

Examples

In TCP zero-window LB probe template **zerotplt**, set the percentage threshold of zero-window packets to 20%.

```
<Sysname>system-view
[Sysname] loadbalance probe-template tcp-zero-window zerotplt
[Sysname-lbpt-tcp-zwnd-zerotplt] zero-window threshold 20
```

protect-action

NSFOCUS Firewall Series

NF High Availability

Command Reference

NSFOCUS Technologies, Inc.

Document version: 6W600-20230221

Preface

This command reference describes the commands for configuring high availability features.

This preface includes the following topics about the documentation:

- Audience.
- Conventions.

Audience

This documentation is intended for:

- Network planners.
- Field technical support and servicing engineers.
- Network administrators.

Conventions

The following information describes the conventions used in the documentation.

Command conventions

Convention	Description
Boldface	**Bold** text represents commands and keywords that you enter literally as shown.
Italic	*Italic* text represents arguments that you replace with actual values.
[ ]	Square brackets enclose syntax choices (keywords or arguments) that are optional.
{ x | y | ... }	Braces enclose a set of required syntax choices separated by vertical bars, from which you select one.
[x | y | ...]	Square brackets enclose a set of optional syntax choices separated by vertical bars, from which you select one or none.
{ x | y | ... } *	Asterisk marked braces enclose a set of required syntax choices separated by vertical bars, from which you select a minimum of one.
[x | y | ...] *	Asterisk marked square brackets enclose optional syntax choices separated by vertical bars, from which you select one choice, multiple choices, or none.
&<1-n>	The argument or keyword and argument combination before the ampersand (&) sign can be entered 1 to n times.
#	A line that starts with a pound (#) sign is comments.

GUI conventions

Convention	Description
Boldface	Window names, button names, field names, and menu items are in Boldface. For example, the **New User** window opens; click **OK**.
>	Multi-level menus are separated by angle brackets. For example, **File** > **Create** > **Folder**.

Symbols

Convention	Description
WARNING!	An alert that calls attention to important information that if not understood or followed can result in personal injury.
CAUTION:	An alert that calls attention to important information that if not understood or followed can result in data loss, data corruption, or damage to hardware or software.
IMPORTANT:	An alert that calls attention to essential information.
NOTE:	An alert that contains additional or supplementary information.
TIP:	An alert that provides helpful information.

Network topology icons

Convention	Description
	Represents a generic network device, such as a router, switch, or firewall.
	Represents a routing-capable device, such as a router or Layer 3 switch.
	Represents a generic switch, such as a Layer 2 or Layer 3 switch, or a router that supports Layer 2 forwarding and other Layer 2 features.
	Represents an access controller, a unified wired-WLAN module, or the access controller engine on a unified wired-WLAN switch.
	Represents an access point.
	Represents a wireless terminator unit.
	Represents a wireless terminator.
	Represents a mesh access point.
	Represents omnidirectional signals.
	Represents directional signals.
	Represents a security product, such as a firewall, UTM, multiservice security gateway, or load balancing device.
	Represents a security module, such as a firewall, load balancing, NetStream, SSL VPN, IPS, or ACG module.

Examples provided in this document

Examples in this document might use devices that differ from your device in hardware model, configuration, or software version. It is normal that the port numbers, sample output, screenshots, and other information in the examples differ from what you have on your device.

Contents

RBM-based hot backup commands

adjust-cost enable

Use **adjust-cost enable** to enable hot backup to adjust the link cost for the specified routing protocol on the standby device.

Use **undo adjust-cost enable** to disable hot backup from adjusting the link cost for the specified routing protocol on the standby device.

Syntax

adjust-cost { **bgp** | **isis** | **ospf** | **ospfv3** } **enable** { **absolute** [*absolute-cost*] | **increment** [*increment-cost*] }

undo adjust-cost { **bgp** | **isis** | **ospf** | **ospfv3** } **enable**

Default

The hot backup system does not adjust the link cost for the specified routing protocol on the standby device.

Views

RBM view

Predefined user roles

network-admin

Parameters

bgp: Specifies the BGP protocol.

isis: Specifies the IS-IS protocol.

ospf: Specifies the OSPF protocol.

ospfv3: Specifies the OSPFv3 protocol.

absolute [*absolute-cost*]: Specifies an absolute cost in the range of 1 to 65535. The default value is 65500. If you specify this option, the standby device will advertise an absolute link cost for the specified routing protocol.

increment [*increment-cost*]: Specifies an increment cost in the range of 1 to 65535. The default value is 100. If you specify this option, the standby device will advertise the original link cost plus this increment cost for the specified routing protocol.

Usage guidelines

In a hot backup system, the routing protocols on hot backup member devices advertise link cost according to their respective operation mechanisms. This command allows you to enable the routing protocols to advertise link cost modified as configured. The active device still uses the original link cost advertisement method.

To ensure switchover of both uplink and downlink traffic to the new active device, configure this command with the same parameters on both hot backup member devices.

In dual-active mode, both devices advertise link cost according to the operation mechanisms of the running routing protocols. When one device is faulty and becomes the standby device, it will advertise link cost modified as configured.

To enable the feature for multiple routing protocols, execute this command multiple times by specifying the protocols.

If you execute the command multiple times for a specific routing protocol, the most recent configuration takes effect.

Examples

Enable hot backup to adjust OSPF link cost on the standby device by specifying an absolute value of 6000.

```
<Sysname> system-view
[Sysname] remote-backup group
[Sysname-remote-backup-group] adjust-cost ospf enable absolute 6000
```

backup-mode

Use **backup-mode** to configure the hot backup mode.

Use **undo backup-mode** to restore the default.

Syntax

backup-mode dual-active

undo backup-mode

Default

The hot backup mode is active/standby.

Views

RBM view

Predefined user roles

network-admin

Usage guidelines

The hot backup system supports active/standby mode and dual-active mode. In active/standby mode, only the active device processes services. In dual-active mode, both devices process services.

Changing the dual-active mode to active/standby mode might affect services. Make sure you understand the potential impact before performing the operation.

Examples

Configure the dual-active mode.

```
<Sysname> system-view
[Sysname] remote-backup group
[Sysname-remote-backup-group] backup-mode dual-active
```

configuration auto-sync enable

Use **configuration auto-sync enable** to enable automatic configuration synchronization.

Use **undo configuration auto-sync enable** to disable automatic configuration synchronization.

Syntax

configuration auto-sync enable

undo configuration auto-sync enable

Default

Automatic configuration synchronization is enabled.

Views

RBM view

Predefined user roles

network-admin

Usage guidelines

The automatic configuration synchronization feature synchronizes existing configuration on the primary device in bulk to the secondary device. Consequent synchronization for added, deleted, or modified configuration will be performed in real time.

If the amount of configuration to be synchronized is large, bulk synchronization might take one to two hours.

Examples

Enable automatic configuration synchronization.

```
<Sysname> system-view
[Sysname] remote-backup group
[Sysname-remote-backup-group] configuration auto-sync enable
```

configuration manual-sync

Use **configuration manual-sync** to manually synchronize the configuration of the primary device to the secondary device.

Syntax

configuration manual-sync

Views

RBM view

Predefined user roles

network-admin

Usage guidelines

This command takes effect only on the primary device.

This command does not take effect when bulk configuration backup is in progress. To view the backup progress, execute the **display remote-backup-group status** command.

Examples

Manually synchronize the configuration of the primary device to the secondary device.

```
<Sysname> system-view
[Sysname] remote-backup group
[Sysname-remote-backup-group] configuration manual-sync
```

Related commands

display remote-backup-group status

configuration manual-sync-check

Use **configuration manual-syn-check** to perform a one-off configuration consistency check.

Syntax

configuration manual-sync-check

Views

RBM view

Predefined user roles

network-admin

Usage guidelines

This command allows you to perform a one-off configuration consistency check as needed. If the system detects configuration inconsistency, it generates a log for you to manually synchronize configuration. To view the check result, execute the **display remote-backup-group sync-check** command.

Examples

Perform a one-off configuration consistency check.

```
<Sysname> system-view
[Sysname] remote-backup group
[Sysname-remote-backup-group] configuration manual-sync-check
```

Related commands

configuration manual-sync

display remote-backup-group sync-check

configuration sync-check

Use **configuration sync-check** to enable configuration consistency check.

Use **undo configuration sync-check** to disable configuration consistency check.

Syntax

configuration sync-check [**interval** *interval*]

undo configuration sync-check

Default

Configuration consistency check is enabled.

Views

RBM view

Predefined user roles

network-admin

Parameters

interval *interval*: Specifies the configuration consistency check interval, in the range of 1 to 168 hours. The default value is 24.

Usage guidelines

The hot backup system verifies configuration consistency between the primary and secondary devices to avoid service interruption upon active/standby switchover. If a device detects configuration inconsistency, it generates a log for you to manually synchronize configuration.

Examples

Enable configuration consistency check and set the check interval to 120 hours.

```
<Sysname>system-view
[Sysname] remote-backup group
[Sysname-remote-backup-group] configuration sync-check interval 120
```

Related commands

configuration manual-sync

configuration manual-sync-check

data-channel

Use **data-channel** to configure a data channel.

Use **undo data-channel** to restore the default.

Syntax

data-channel interface *interface-type interface-number*

undo data-channel

Default

No data channel is configured.

Views

RBM view

Predefined user roles

network-admin

Parameters

interface *interface-type interface-number*: Specifies an interface by its type and number to set up a data channel between the primary and secondary devices.

Usage guidelines

The primary and secondary devices use the interface specified in the command to set up a data channel. The data channel transmits only backup packets and the packets that require transparent transmission.

The data channel is a Layer 2 channel that can transverse only Layer 2 switches.

Examples

Set up a data channel using interface GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] remote-backup group
[Sysname-remote-backup-group] data-channel interface gigabitethernet 1/0/1
```

delay-time

Use **delay-time** to enable traffic switchover upon failure recovery.

Use **undo delay-time** to disable traffic switchover upon failure recovery.

Syntax

delay-time *delay-time*

undo delay-time

Default

Traffic switchover upon failure recovery is disabled.

Views

RBM view

Predefined user roles

network-admin

Parameters

delay-time: Specifies the switchover delay time in the range of 1 to 1440 minutes.

Usage guidelines

After an active/standby switchover in a hot backup system, if the original active device recovers, traffic will not be switched back by default. Perform this task to enable traffic switchover to the original active device upon failure recovery. You can set a delay timer to ensure smooth service switchover.

In dual-active mode, you must configure this command to ensure that both devices can operate after the failure is recovered.

Examples

Enable traffic switchover upon failure recovery and set the switchover delay time to two minutes.

```
<Sysname>system-view
[Sysname] remote-backup group
[Sysname-remote-backup-group] delay-time 2
```

device-role

Use **device-role** to configure the hot backup role.

Use **undo device-role** to restore the default.

Syntax

device-role { **primary** | **secondary** }

undo device-role

Default

The hot backup role is not configured.

Views

RBM view

Predefined user roles

network-admin

Parameters

primary: Assigns the primary role to the device.

secondary: Assigns the secondary role to the device.

Usage guidelines

The hot backup system backs up important configuration from the primary device to the secondary device to prevent service interruption when an active/standby switchover occurs. The configuration on the secondary device is overwritten. The unidirectional backup mechanism avoids configuration conflicts, especially in dual-active mode, and ensures configuration consistency on the primary and secondary devices.

Each hot backup member device adds a prefix to the view prompt to identify its hot backup role.

- The primary device adds the **RBM_P** prefix, **RBM_P<Sysname>** for example.
- The secondary device adds the **RBM_S** prefix, **RBM_S<Sysname>** for example.

After you assign hot backup roles to hot backup member devices, both devices add the **RBM_P** prefix to their view prompts. The devices display view prompt prefixes according to their hot backup roles after they set up the control channel.

The hot backup system must contain one primary device and one secondary device.

As a best practice, configure service features on the primary device.

Examples

Assign the primary role to the device.

```
<Sysname> system-view
[Sysname] remote-backup group
[Sysname-remote-backup-group] device-role primary
RBM_P[Sysname-remote-backup-group]
```

display remote-backup-group status

Use **display remote-backup-group status** to display hot backup status information.

Syntax

display remote-backup-group status

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Examples

Display hot backup status information on the default context.

```
<Sysname> display remote-backup-group status
Remote backup group information:
  Backup mode: Dual-active
  Device management role: Primary
  Device running status: Active
  Data channel interface: GigabitEthernet1/0/1
  Local IP: 1.1.1.1
  Remote IP: 1.1.1.2   Destination port: 1028
  Control channel status: Connected
```

```
  Keepalive interval: 1s
  Keepalive count: 10
  Configuration consistency check interval: 24 hour
  Configuration consistency check result: Consistent
  Configuration backup status: Batch backup (Do not operate
the device at will, such as board insertion and removal.)
  Session backup status: Hot backup enabled
  Delay-time: 1 min
  Remaining switchover delay time: 3 minutes, 32 seconds
  Uptime since last switchover: 0 days, 0 hours, 11 minutes
  Switchover records:
    Time                    Status change       Cause
    2021-06-22 13:33:33     Initial to Standby  Local device rebooted
    2021-06-22 14:34:34     Initial to Active   Peer device rebooted
```

Display hot backup status information on non-default contexts.

```
<Sysname> display remote-backup-group status
Remote backup group information:
  Backup mode: Dual-active
  Device management role: Primary
  Device running status: Active
  Control channel status: Connected
  Configure channel status: Disconnected
```

Table 1 Command output

Field	Description
Backup mode	Hot backup mode: • **Dual-active**. • **Active/standby**.
Device management role	Hot backup role of the device: • **Primary**. • **Secondary**.
Device running status	Running status of the device. • **Active**. • **Standby**. • **Initial**—The local IP address, peer IP address, or hot backup role is not configured.
Data channel interface	Interface used to set up the data channel.
Local IP	Local IP address used by control channel packets. This field is not displayed if the parameter is not configured.
Remote IP	Peer IP address used by control channel packets. This field is not displayed if the parameter is not configured.
Local IPv6	Local IPv6 address used by control channel packets. This field is not displayed if the parameter is not configured.
Remote IPv6	Peer IPv6 address used by control channel packets. This field is not displayed if the parameter is not configured.
Destination port	Peer port number used by control channel packets.
Control channel status	Control channel status:

Field	Description
	• **Connected**. • **Disconnected**.
Configure channel status: Disconnected	Status of the configuration information channel for non-default contexts: • **Connected**. • **Disconnected**. This filed is displayed only for non-default contexts. If the configuration information channel is disconnected, the device cannot synchronize configuration of non-default contexts.
Keepalive interval	Interval for sending keepalive packets.
Keepalive count	Maximum number of keepalive attempts.
Configuration consistency check interval	Configuration consistency check interval in hours. This field is displayed only when configuration consistency check is enabled.
Configuration consistency check result	Result of the configuration consistency check: • **Consistent**. • **Inconsistent**. • **Checking**. • **Not Performed**.
Configuration backup status	Status of configuration backup: • **Batch backup in progress (Do not operate the device at will, such as board insertion and removal.)**. • **Auto sync enabled**. • **Auto sync disabled**.
Session backup status	Status of session entry backup: • **Batch backup in progress**. • **Hot backup enabled**. • **Hot backup disabled**.
Delay-time	Delay time for traffic switchover back to the original active device in minutes. If the delay time is not configured, this switchover feature is disabled for the hot backup system.
Remaining switchover delay time	Remaining delay time for traffic switchover back to the original active device in minutes. This field is not displayed if traffic switchover is disabled.

display remote-backup-group sync-check

Use **`display remote-backup-group sync-check`** to display the configuration consistency check result for hot backup.

Syntax

`display remote-backup-group sync-check`

Views

Any view

Predefined user roles

network-admin

network-operator

Usage guidelines

Use this command when the primary and secondary devices have inconsistent configuration. You can view the inconsistent configuration only after the configuration consistency check is finished.

The command displays detailed inconsistency information for only the service features supported by hot backup. For a feature not supported by hot backup, the command displays only the interface where configuration inconsistency exists.

Examples

Display the configuration consistency check result for hot backup. (The configuration consistency check has not been performed.)

```
<Sysname> display remote-backup-group sync-check
No configuration consistency checks have been performed.
```

Display the configuration consistency check result for hot backup. (No inconsistent configuration exists.)

```
<Sysname> display remote-backup-group sync-check
No inconsistent configuration exists.
```

Display the configuration consistency check result for hot backup. (Inconsistent configuration exists.)

```
<Sysname> display remote-backup-group sync-check
Inconsistent configuration exists.
Configuration on secondary device:
#
security-policy ip
 rule 0 name abc
  source-zone trust
  destination-zone untrust
#

Configuration on primary device:
#
security-policy ip
 rule 0 name abc
  source-zone dmz
  destination-zone trust
#
Context 2

Configuration on secondary device:
#
security-policy ip
 rule 0 name 10
#

Configuration on primary device:
#
security-policy ip
#
Context 3
```

```
Configuration on secondary device:
#
object-group ipv6 address d
#
security-policy ipv6
 rule 0 name d
  source-ip d
#

Configuration on primary device:
#
security-policy ipv6
 rule 0 name d
#
```

Related commands

configuration sync-check

configuration manual-syn-check

hot-backup enable

Use **hot-backup enable** to enable service entry hot backup.

Use **undo hot-backup enable** to disable service entry hot backup.

Syntax

hot-backup enable

undo hot-backup enable

Default

Service entry hot backup is enabled.

Views

RBM view

Predefined user roles

network-admin

Usage guidelines

This command enables the active device in the hot backup system to back up service entries to the standby device in real time. This prevents service interruption when an active/standby switchover occurs.

Examples

Enable service entry hot backup.

```
<Sysname> system-view
[Sysname] remote-backup group
[Sysname-remote-backup-group] hot-backup enable
```

hot-backup protocol enable

Use **hot-backup protocol enable** to enable hot backup for the session entries of application layer protocols.

Use **undo hot-backup protocol enable** to disable hot backup for the session entries of application layer protocols.

Syntax

hot-backup protocol { **dns** | **http** } * **enable**

undo hot-backup protocol { **dns** | **http** } * **enable**

Default

The hot backup system performs hot backup for the session entries of application layer protocols.

Views

RBM view

Predefined user roles

network-admin

Parameters

dns: Specifies DNS.

http: Specifies HTTP.

Usage guidelines

For this command to take effect, first execute the **hot-backup enable** command.

Enable HTTP and DNS backup if asymmetric-path traffic traverses the hot backup system. HTTP and DNS backup ensures that a flow and its return traffic are processed correctly on hot backup members.

If hot backup active/standby mode is used or only symmetric-path traffic traverses the hot backup system, disabling HTTP and DNS backup can improve performance of hot backup members at the expense of delayed data synchronization. When you disable HTTP and DNS backup, make sure you are fully aware of the impact on the network. A device removes a DNS or HTTP connection if packet exchange is inactive. When a switchover interrupts a connection, the DNS or HTTP client re-initiates the connection immediately, which has little impact on user services.

The hot backup system backs up the sessions created for other application protocols as long as service entry backup is enabled.

Examples

Disable hot backup for the session entries of application layer protocols.

```
<Sysname> system-view
[Sysname] remote-backup group
[Sysname-remote-backup-group] undo hot-backup protocol dns enable
```

Related commands

hot-backup enable

keepalive count

Use **keepalive count** to set the maximum number of keepalive attempts.

Use **undo keepalive count** to restore the default.

Syntax

keepalive count *counts*

undo keepalive count

Default

The maximum number of keepalive attempts is 10.

Views

RBM view

Predefined user roles

network-admin

Parameters

times: Sets the maximum number of keepalive attempts, in the range of 1 to 255.

Usage guidelines

If the value for the maximum number of keepalive attempts is too small, network latency will cause incorrect switchovers. If this issue occurs, increase the value of this parameter.

The device periodically sends keepalive packets to the peer over the control channel. If the device has not received any responses from the peer when the maximum number of keepalive attempts is reached, the control channel is disconnected.

Examples

Set the maximum number of keepalive attempts to 6.

```
<Sysname> system-view
[Sysname] remote-backup group
[Sysname-remote-backup-group] keepalive count 6
```

Related commands

keepalive interval

keepalive interval

Use **keepalive interval** to set the interval for sending keepalive packets.

Use **undo keepalive interval** to restore the default.

Syntax

keepalive interval *interval*

undo keepalive interval

Default

The device sends keepalive packets at one-second intervals.

Views

RBM view

Predefined user roles

network-admin

Parameters

interval: Sets the interval for sending keepalive packets in seconds, in the range of 1 to 60.

Usage guidelines

The device periodically sends keepalive packets to the peer over the control channel. If the device has not received any responses from the peer when the maximum number of keepalive attempts is reached, the control channel is disconnected.

Examples

Set the interval for sending keepalive packets to 2 seconds.

```
<Sysname> system-view
[Sysname] remote-backup group
[Sysname-remote-backup-group] keepalive interval 2
```

Related commands

keepalive count

local-ip

Use **local-ip** to configure the local IPv4 address for setting up the control channel.

Use **undo local-ip** to restore the default.

Syntax

local-ip *ipv4-address*

undo local-ip

Default

The local IPv4 address is not configured for setting up the control channel.

Views

RBM view

Predefined user roles

network-admin

Parameters

ipv4-address: Specifies the local IPv4 address for setting up the control channel. The IP address cannot be an all-zero, loopback, or multicast address.

Usage guidelines

The hot backup system compares the specified local and peer IP address to determine the device role for setting up the control channel. The device with higher IP address acts as the server to listen for TCP connection requests, and the other device acts as the client to initiate the TCP connection.

You can configure a local IPv4 address or a local IPv6 address, but not both.

Examples

Configure the local IPv4 address as 1.1.1.2 for setting up the control channel.

```
<Sysname> system-view
[Sysname] remote-backup group
[Sysname-remote-backup-group] local-ip 1.1.1.2
```

Related commands

local-ipv6

remote-ip

local-ipv6

Use **local-ipv6** to configure the local IPv6 address for setting up the control channel.

Use **undo local-ipv6** to restore the default.

Syntax

local-ipv6 *ipv6-address*

undo local-ipv6

Default

The local IPv6 address is not configured for setting up the control channel.

Views

RBM view

Predefined user roles

network-admin

Parameters

ipv6-address: Specifies the local IPv6 address for setting up the control channel. The IP address cannot be an all-zero address, loopback address, multicast address, or IPv6 address with an embedded IPv4 address.

Usage guidelines

The hot backup system compares the specified local and peer IPv6 address to determine the device role for setting up the control channel. The device with higher IPv6 address acts as the server to listen for TCP connection requests, and the other device acts as the client to initiate the TCP connection.

You can configure a local IPv4 address or a local IPv6 address, but not both.

Examples

Configure the local IPv6 address as 2019::1 for setting up the control channel.

```
<Sysname> system-view
[Sysname] remote-backup group
[Sysname-remote-backup-group] local-ipv6 2019::1
```

Related commands

local-ip

remote-ipv6

remote-backup group

Use **remote-backup group** command to enter RBM view.

Use **undo remote-backup group** to remove all settings of hot backup.

Syntax

remote-backup group

undo remote-backup group

Views

System view

Predefined user roles

network-admin

Usage guidelines

The hot backup system provides backup for important configuration and service entries between devices. It collaborates with VRRP to implement hot backup that enables smooth master/backup switchover upon link failures for service continuity.

Examples

Enter RBM view.

```
<Sysname> system-view
[Sysname] remote-backup group
[Sysname-remote-backup-group]
```

remote-ip

Use **remote-ip** to configure the peer IPv4 address for setting up the control channel.

Use **undo remote-ip** to restore the default.

Syntax

remote-ip *ipv4-address* [**port** *port-number*]

undo remote-ip *ipv4-address*

Default

The peer IPv4 address is not configured for setting up the control channel.

Views

RBM view

Predefined user roles

network-admin

Parameters

ipv4-address: Specifies the peer IPv4 address for setting up the control channel. The IP address cannot be an all-zero, loopback, or multicast address.

port *port-number*: Specifies a port by its number used for establishing TCP connection. The value range for the *port-number* argument is 1024 to 65535, and the default value is 60064.

Usage guidelines

The control channel transmits data by using packets, including hot backup status packets, configuration consistency check packets, and configuration synchronization packets. Each member device compares the specified local and peer IP address to determine the device role for setting up the control channel. The device with higher IP address acts as the server to listen for TCP connection requests, and the other device acts as the client to initiate the TCP connection.

If the port number is configured on the server, the port provides services for the client. If the port number is configured on the client, the port serves as the destination port to establish TCP connection to the server. The source port is randomly generated on the client.

You can specify only one peer IP address with the same port number on the primary and secondary devices.

You can configure a remote IPv4 address or a remote IPv6 address, but not both.

Examples

Configure the peer IPv4 address and port number as 1.1.1.1 and 4456 for setting up the control channel.

```
<Sysname> system-view
[Sysname] remote-backup group
[Sysname-remote-backup-group] remote-ip 1.1.1.1 port 4456
```

Related commands

local-ip

remote-ipv6

remote-ipv6

Use **remote-ipv6** to configure the peer IPv6 address for setting up the control channel.

Use **undo remote-ipv6** to restore the default.

Syntax

remote-ipv6 *ipv6-address* [**port** *port-number*]

undo remote-ipv6 *ipv6-address*

Default

The peer IPv6 address is not configured for setting up the control channel.

network-admin

Parameters

ipv6-address: Specifies the peer IPv6 address for setting up the control channel. The IP address cannot be an all-zero address, loopback address, multicast address, or IPv6 address with an embedded IPv4 address.

port *port-number*: Specifies a port by its number used for establishing TCP connection. The value range for the *port-number* argument is 1024 to 65535, and the default value is 60064. Make sure the port number is not in use.

Usage guidelines

The control channel transmits data by using packets, including hot backup status packets, configuration consistency check packets, and configuration synchronization packets. Each member device compares the specified local and peer IPv6 address to determine the device role for setting up the control channel. The device with higher IPv6 address acts as the server to listen for TCP connection requests, and the other device acts as the client to initiate the TCP connection.

If the port number is configured on the server, the port provides services for the client. If the port number is configured on the client, the port serves as the destination port to establish TCP connection to the server. The source port is randomly generated on the client.

You can specify only one peer IPv6 address with the same port number on the primary and secondary devices.

You can configure a remote IPv4 address or a remote IPv6 address, but not both.

Examples

Configure the peer IPv6 address and port number as 2018::1 and 4456 for setting up the control channel.

```
<Sysname> system-view
[Sysname] remote-backup group
[Sysname-remote-backup-group] remote-ipv6 2018::1 port 4456
```

Related commands

local-ipv6

remote-ip

silent-backup-interface

Use **silent-backup-interface** to disable the standby device from sending or receiving protocol packets of a dynamic routing protocol.

Use **undo silent-backup-interface** to enable the standby device to send and receive protocol packets of a dynamic routing protocol.

Syntax

silent-backup-interface { **ospf** | **ospfv3** }

undo silent-backup-interface { **ospf** | **ospfv3** }

Default

The standby device can send and receive protocol packets of a dynamic routing protocol.

Views

RBM view

Predefined user roles

network-admin

Parameters

ospf: Specifies OSPF.

ospfv3: Specifies OSPFv3.

Usage guidelines

This command disconnects the neighbor relationships for a dynamic routing protocol on the standby device. The active device can send and receive protocol packets of that dynamic routing protocol, and correctly process both uplink and downlink traffic.

You can execute this command multiple times to disable multiple dynamic routing protocols on the standby device.

You cannot use this command together with the **adjust-cost enable** command.

Examples

Disable the standby device from sending or receiving OSPF protocol packets.

```
<Sysname> system-view
[Sysname] remote-backup group
[Sysname-remote-backup-group] silent-backup-interface ospf
```

Related commands

adjust-cost enable

switchover request

Use **switchover request** to perform an active/standby switchover.

Syntax

switchover request

Views

RBM view

Predefined user roles

network-admin

Usage guidelines

If you want to replace components or upgrade software on the current active device, you can execute this command to switch services to the standby device.

This command applies only when hot backup operates in active/standby mode.

In a hot backup and VRRP associated network, executing this command might cause temporary virtual IP address conflict in the VRRP group, which is considered a normal condition.

For stable operation of hot backup, do not repeatedly execute this command within one minute.

Examples

Perform an active/standby switchover.

```
<Sysname> system-view
[Sysname] remote-backup group
[Sysname-remote-backup-group] switchover request
```

track

Use **track** to associate hot backup with Track.

Use **undo track** to remove the association.

Syntax

track *track-entry-number*

undo track *track-entry-number*

Default

The hot backup system is not associated with Track.

Views

RBM view

Predefined user roles

network-admin

Parameters

track-entry-number: Specifies a track entry by its ID in the range of 1 to 1024.

Usage guidelines

Use this command to associate hot backup with Track to monitor links. If one of the monitored track entries becomes Negative, hot backup performs an active/standby switchover and switches traffic

to the new active device to ensure service continuity. For more information about Track, see *Network Management and Monitoring Configuration Guide*.

You can use the **track interface** and **track** commands in conjunction, but you cannot use these commands to monitor the same interfaces.

The **track vlan** and **track** commands are mutually exclusive. You cannot configure both of them.

To associate hot backup with multiple track entries, execute this command multiple times.

Examples

Associate hot backup with track entries 1 and 2.

```
<Sysname> system-view
[Sysname] remote-backup group
[Sysname-remote-backup-group] track 1
[Sysname-remote-backup-group] track 2
```

Related commands

track (*Network Management and Monitoring Command Reference*)

track interface

Use **track interface** to enable hot backup to monitor an interface.

Use **undo track interface** to remove the configuration.

Syntax

track interface *interface-type interface-number*

undo track interface [*interface-type interface-number*]

Default

The hot backup system does not monitor any interfaces.

Views

RBM view

Predefined user roles

network-admin

Parameters

interface-type interface-number: Specifies an interface by its type and number. You can specify a Layer 2 or Layer 3 Ethernet interface in the current software version. If you do not specify this argument, the **undo** form of the command removes the monitoring for all interfaces.

Usage guidelines

Use this command to enable hot backup to monitor the interfaces connecting the uplink and downlink devices. The monitored interfaces can forward packets only when they are all up. If any of the monitored interfaces goes down, none of them will be able to forward packets.

If the uplink and downlink interfaces of the hot backup system are Layer 3 Ethernet interfaces and hot backup is used with static routes, use the **track interface** command to monitor those interfaces.

If the uplink and downlink interfaces of the hot backup system are Layer 2 Ethernet interfaces connected to peer Layer 3 interfaces, use the **track interface** command to monitor the Layer 2 Ethernet interfaces.

You can use the **track interface** and **track** commands in conjunction, but you cannot use these commands to monitor the same interfaces.

The **track vlan** and **track interface** commands are mutually exclusive. You cannot configure both of them.

To enable hot backup to monitor multiple interfaces, execute this command multiple times.

The hot backup system does not support monitoring member ports of aggregate interfaces.

Examples

Enable hot backup to monitor interfaces GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2.

```
<Sysname> system-view
[Sysname] remote-backup group
[Sysname-remote-backup-group] track interface gigabitethernet 1/0/1
[Sysname-remote-backup-group] track interface gigabitethernet 1/0/2
```

Related commands

track

track interface

track vlan

track vlan

Use **track vlan** to enable hot backup to monitor a VLAN.

Use **undo track vlan** to remove the configuration.

Syntax

track vlan *vlan-id*

undo track vlan [*vlan-id*]

Default

The hot backup system does not monitor any VLANs.

Views

RBM view

Predefined user roles

network-admin

Parameters

vlan-id: Specifies a VLAN by its ID in the range of 1 to 4094. If you do not specify this argument, the **undo** form of the command removes the monitoring for all VLANs.

Usage guidelines

Use this command to enable hot backup to monitor the VLANs of the uplink and downlink devices. The monitored VLANs are active and the member ports can forward packets only when the member ports are all up. If any of the member ports goes down, none of them will be able to forward packets, and all the monitored VLANs will become inactive.

In active/standby mode, the state of monitored VLANs is active on the primary device and inactive on the secondary device.

In dual-active mode, the state of monitored VLANs is active on both the primary and secondary devices.

Do not enable hot backup to monitor VLAN 1 (to which all access ports belong by default). This restriction prevents an unused interface in down state from interrupting operation of other interfaces in VLAN 1.

To enable hot backup to monitor multiple VLANs, execute this command multiple times.

The **track vlan** command is mutually exclusive with the **track interface** and **track** commands. You cannot use the **track vlan** command in conjunction with the **track interface** or **track** command.

Examples

Enable hot backup to monitor VLAN 10.

```
<Sysname> system-view
[Sysname] remote-backup group
[Sysname-remote-backup-group] track vlan 10
```

Related commands

track

track interface

track vlan

transparent-transmit enable

Use **transparent-transmit enable** to enable transparent service traffic transmission between the remote backup group members.

Use **undo transparent-transmit enable** to disable transparent service traffic transmission between the remote backup group members.

Syntax

transparent-transmit enable

undo transparent-transmit enable

Default

Transparent service traffic transmission is enabled.

Views

RBM view

Predefined user roles

network-admin

Usage guidelines

Enable transparent service traffic transmission only when asymmetric-path traffic traverses the hot backup system operating in dual-active mode.

If an asymmetric-path flow traverses the hot backup system operating in dual-active mode, the flow and its return traffic are processed by different remote backup group members. This will degrade the traffic processing performance of modules such as NBAR, DPI, and load balancing. For example, the packet recognition rate of NBAR might drop. For an asymmetric-path flow and its return traffic to be processed by the same remote backup group member, enable transparent service traffic transmission. Transparent service traffic transmission is resource-intensive. Make sure you are fully aware of the impact of this feature when you use it on a live network.

Examples

Enable transparent service traffic transmission between the remote backup group members.

```
<Sysname> system-view
[Sysname] remote-backup group
[Sysname-remote-backup-group] transparent-transmit enable
```

vrrp ipv6 vrid

Use **vrrp ipv6 vrid** to create an IPv6 VRRP group and assign a virtual IPv6 address to it, or to assign a virtual IPv6 address to an existing IPv6 VRRP group.

Use **undo vrrp ipv6 vrid** to remove all configurations of an IPv6 VRRP group, or to remove a virtual IPv6 address from an IPv6 VRRP group.

Syntax

vrrp ipv6 vrid *virtual-router-id* **virtual-ip** *virtual-address* [*prefix-length*] **link-local** { **active** | **standby** }

undo vrrp ipv6 vrid *virtual-router-id* [**virtual-ip** [*virtual-address* [**link-local**]]]

Default

No IPv6 VRRP groups exist.

Views

Interface view

Predefined user roles

network-admin

context-admin

Parameters

virtual-router-id: Specifies an IPv6 VRRP group by its virtual router ID in the range of 1 to 255.

virtual-ip *virtual-address*: Specifies a virtual IPv6 address. If you do not specify this option, the **undo vrrp ipv6 vrid** command removes all virtual IPv6 addresses from the specified IPv6 VRRP group.

prefix-length: Specifies the prefix length of the virtual IPv6 address, in the range of 1 to 128. If you do not specify this argument, the default value 128 applies.

link-local: Specifies a link-local address as the virtual IPv6 address.

active: Associates the IPv6 VRRP group with hot backup by adding the device to the IPv6 VRRP active group. The initial role of the device is master.

standby: Associates the IPv6 VRRP group with hot backup by adding the device to the IPv6 VRRP standby group. The initial role of the device is backup.

Usage guidelines

You can execute this command multiple times to assign multiple virtual IPv6 addresses to an IPv6 VRRP group. When you configure hot backup in collaboration with VRRP, you can assign a maximum of 4096 virtual IPv6 addresses to a VRRP group. If you specify the prefix length to assign a virtual IPv6 subnet, the subnet is recognized as one virtual IPv6 address.

The first virtual IPv6 address that you assign to an IPv6 VRRP group must be a link-local address, and it must be removed last.

An IPv6 VRRP group can have only one link-local address as its virtual IPv6 address. For an IPv6 VRRP group to work correctly, you must also assign it a global unicast address as a virtual IPv6 address.

The virtual IPv6 address of an IPv6 VRRP group and the downlink interface IPv6 address of the VRRP group members must be on the same subnet. Otherwise, the hosts on the subnet might fail to access external networks.

You cannot associate an IPv6 VRRP group operating in load balancing mode with hot backup.

When you configure hot backup in collaboration with VRRP, make sure the interfaces in an IPv6 VRRP group do not own the virtual IPv6 addresses.

You cannot associate an IPv6 VRRP group with both hot backup and Track.

You cannot use the **track vlan** command in conjunction with the **track interface** command.

To modify the settings for the command, first execute the **undo** form of the command, and then execute the **vrrp ipv6 vrid** command again.

Examples

Create IPv6 VRRP group 1, assign virtual IPv6 address fe80::10 to the VRRP group, and assign the device to the VRRP active group. Then assign virtual IPv6 address 1::10 to the VRRP group.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] vrrp ipv6 vrid 1 virtual-ip fe80::10 link-local active
[Sysname-GigabitEthernet1/0/1] vrrp ipv6 vrid 1 virtual-ip 1::10
```

vrrp vrid

Use **vrrp vrid** to create an IPv4 VRRP group and assign a virtual IP address to it, or to assign a virtual IP address to an existing IPv4 VRRP group.

Use **undo vrrp vrid** to remove all configurations of an IPv4 VRRP group, or to remove a virtual IP address from an IPv4 VRRP group.

Syntax

vrrp vrid *virtual-router-id* **virtual-ip** *virtual-address* [*mask* | *mask-length*] { **active** | **standby** }

undo vrrp vrid *virtual-router-id* [**virtual-ip** [*virtual-address*]]

Default

No IPv4 VRRP groups exist.

Views

Interface view

Predefined user roles

network-admin

context-admin

Parameters

virtual-router-id: Specifies an IPv4 VRRP group by its virtual router ID in the range of 1 to 255.

virtual-ip *virtual-address*: Specifies a virtual IP address. You cannot specify the virtual IP address as any of the following IP addresses:

- All-zero address (0.0.0.0).
- Broadcast address (255.255.255.255).
- Loopback address.
- IP address of other than Class A, Class B, and Class C.

- Invalid IP address (for example, 0.0.0.1).

If you do not specify the *virtual-address* argument, the **undo vrrp vrid** command removes all virtual IP addresses from the specified IPv4 VRRP group.

mask-length: Specifies a mask length in the range of 1 to 32. If you do not specify a subnet mask or a mask length, the default mask length 32 applies.

active: Associates the VRRP group with hot backup by adding the device to the VRRP active group. The initial role of the device is master.

standby: Associates the VRRP group with hot backup by adding the device to the VRRP standby group. The initial role of the device is backup.

Usage guidelines

You can execute this command multiple times to assign multiple virtual IP addresses to an IPv4 VRRP group. When you configure hot backup in collaboration with VRRP, you can assign a maximum of 4096 virtual IPv4 addresses to a VRRP group. If you specify the mask or mask length to assign a virtual IPv4 subnet, the subnet is recognized as one virtual IPv4 address.

The virtual IP address of an IPv4 VRRP group and the downlink interface IP addresses of the VRRP group members must be on the same subnet. Otherwise, the hosts on the subnet might fail to access external networks.

You cannot associate a VRRP group operating in load balancing mode with hot backup.

For VRRP to operate correctly, make sure a virtual IP address of an IPv4 VRRP group is not the IP address of any interface in the VRRP group.

When you configure hot backup in collaboration with VRRP, make sure the interfaces in an IPv4 VRRP group do not own the virtual IPv4 addresses.

You cannot associate a VRRP group with both hot backup and Track.

You cannot use the **track vlan** command in conjunction with the **track interface** command.

To modify the settings for the command, first execute the **undo** form of the command, and then execute the **vrrp vrid** command again.

Examples

Create IPv4 VRRP group 1, assign virtual IP address 10.10.10.10 to the VRRP group, and assign the device to the VRRP active group.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] vrrp vrid 1 virtual-ip 10.10.10.10 active
```

NSFOCUS Firewall Series

NF Interface Command Reference

NSFOCUS Technologies, Inc.

Document version: 6W600-20230221

Preface

This command reference describes the commands for configuring interfaces in bulk, Ethernet interfaces, loopback interfaces, null interfaces, and inloopback interfaces.

This preface includes the following topics about the documentation:

- Audience.
- Conventions.

Audience

This documentation is intended for:

- Network planners.
- Field technical support and servicing engineers.
- Network administrators.

Conventions

The following information describes the conventions used in the documentation.

Command conventions

Convention	Description
Boldface	**Bold** text represents commands and keywords that you enter literally as shown.
Italic	*Italic* text represents arguments that you replace with actual values.
[ ]	Square brackets enclose syntax choices (keywords or arguments) that are optional.
{ x | y | ... }	Braces enclose a set of required syntax choices separated by vertical bars, from which you select one.
[x | y | ...]	Square brackets enclose a set of optional syntax choices separated by vertical bars, from which you select one or none.
{ x | y | ... } *	Asterisk marked braces enclose a set of required syntax choices separated by vertical bars, from which you select a minimum of one.
[x | y | ...] *	Asterisk marked square brackets enclose optional syntax choices separated by vertical bars, from which you select one choice, multiple choices, or none.
&<1-n>	The argument or keyword and argument combination before the ampersand (&) sign can be entered 1 to n times.
#	A line that starts with a pound (#) sign is comments.

GUI conventions

Convention	Description
Boldface	Window names, button names, field names, and menu items are in Boldface. For example, the **New User** window opens; click **OK**.
>	Multi-level menus are separated by angle brackets. For example, **File** > **Create** > **Folder**.

Symbols

Convention	Description
WARNING!	An alert that calls attention to important information that if not understood or followed can result in personal injury.
CAUTION:	An alert that calls attention to important information that if not understood or followed can result in data loss, data corruption, or damage to hardware or software.
IMPORTANT:	An alert that calls attention to essential information.
NOTE:	An alert that contains additional or supplementary information.
TIP:	An alert that provides helpful information.

Network topology icons

Convention	Description
	Represents a generic network device, such as a router, switch, or firewall.
	Represents a routing-capable device, such as a router or Layer 3 switch.
	Represents a generic switch, such as a Layer 2 or Layer 3 switch, or a router that supports Layer 2 forwarding and other Layer 2 features.
	Represents an access controller, a unified wired-WLAN module, or the access controller engine on a unified wired-WLAN switch.
	Represents an access point.
	Represents a wireless terminator unit.
	Represents a wireless terminator.
	Represents a mesh access point.
	Represents omnidirectional signals.
	Represents directional signals.
	Represents a security product, such as a firewall, UTM, multiservice security gateway, or load balancing device.
	Represents a security module, such as a firewall, load balancing, NetStream, SSL VPN, IPS, or ACG module.

Examples provided in this document

Examples in this document might use devices that differ from your device in hardware model, configuration, or software version. It is normal that the port numbers, sample output, screenshots, and other information in the examples differ from what you have on your device.

Contents

Bulk interface configuration commands

display interface range

Use **display interface range** to display information about named interface ranges created by using the **interface range name** command.

Syntax

display interface range [**name** *name*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

name *name*: Specifies an interface range by its name, a case-sensitive string of 1 to 32 characters. If you do not specify an interface range name, this command displays information about all interface ranges created by using the **interface range name** command.

Examples

Display information about the interface ranges created by using the **interface range name** command.

```
<Sysname> display interface range
Interface range name t2 GigabitEthernet1/0/1 GigabitEthernet1/0/2
Interface range name test GigabitEthernet1/0/3 GigabitEthernet1/0/4
```

The output shows the following:

- Interfaces GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2 are added to interface range **t2**.
- Interfaces GigabitEthernet 1/0/3 and GigabitEthernet 1/0/4 are added to interface range **test**.

Related commands

interface range name

interface range

Use **interface range** to create an interface range and enter the interface range view.

Syntax

interface range *interface-list*

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

interface-list: Specifies a space-separated list of up to 24 interface items. Each item specifies an interface by its type and number or specifies a subrange of interfaces in the form of *interface-type interface-number1* **to** *interface-type interface-number2*.When you specify a subrange of interfaces, the interfaces must be all fixed interfaces or on the same interface module. The start interface number must be identical to or lower than the end interface number.

Usage guidelines

Use this command to bulk configure multiple interfaces with the same feature instead of configuring them one by one. For example, execute the **shutdown** command in interface range view to shut down a range of interfaces.

The interface range created by using this command is not saved to the running configuration. You cannot use the interface range repeatedly. To create an interface range that can be used repeatedly, use the **interface range name** command.

In interface range view, only the commands supported by the first interface in the specified interface list are available for configuration. To view available commands, enter a question mark (?) in interface range view.

After a command is executed in interface range view, one of the following situations might occur:

- The system displays an error message and stays in interface range view. It means that the execution failed on one or multiple member interfaces.
  - If the execution failed on the first member interface, the command is not executed on any member interfaces.
  - If the execution failed on a non-first member interface, the command takes effect on the remaining member interfaces.
- The system returns to system view. It means that:
  - The command is supported in both system view and interface view.
  - The execution failed on a member interface in interface range view and succeeded in system view.
  - The command is not executed on the subsequent member interfaces.

  You can use the **display this** command to verify the configuration in interface view of each member interface. In addition, if the configuration in system view is not needed, use the **undo** form of the command to remove the configuration.

To verify the configuration of the first member interface, you can execute the **display this** command in interface range view.

When you bulk configure interfaces, follow these guidelines:

- Before you configure an interface as the first interface in an interface range, make sure you can enter the view of the interface by using the **interface** *interface-type* { *interface-number* | *interface-number.subnumber* } command.
- Do not assign both an aggregate interface and any of its member interfaces to an interface range. Some commands, after being executed on both an aggregate interface and its member interfaces, can break up the aggregation.
- Understand that the more interfaces you specify, the longer the command execution time.

Examples

Shut down interfaces GigabitEthernet 1/0/1 through GigabitEthernet 1/0/4.

```
<Sysname> system-view
[Sysname] interface range gigabitethernet 1/0/1 to gigabitethernet 1/0/4
```

```
[Sysname-if-range] shutdown
```

interface range name

Use **interface range name** *name* **interface** *interface-list* to create a named interface range and enter the interface range view.

Use **interface range name** *name* without the **interface** keyword to enter the view of a named interface range.

Use **undo interface range name** to delete the interface range with the specified name.

Syntax

interface range name *name* [**interface** *interface-list*]

undo interface range name *name*

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

name: Specifies an interface range name, a case-sensitive string of 1 to 32 characters.

interface-list: Specifies a space-separated list of up to 24 interface items. Each item specifies an interface by its type and number or a subrange of interfaces in the form of *interface-type interface-number1* **to** *interface-type interface-number2*.When you specify a subrange of interfaces, the interfaces must be all fixed interfaces or on the same interface module. The start interface number must be identical to or lower than the end interface number.

Usage guidelines

A named interface range is saved in the running configuration and can be used repeatedly to bulk configure its member interfaces.

In interface range view, only the commands supported by the first interface in the specified interface list are available for configuration. To view available commands, enter a question mark (?) in interface range view.

After a command is executed in interface range view, one of the following situations might occur:

- The system displays an error message and stays in interface range view. It means that the execution failed on one or multiple member interfaces.
  - If the execution failed on the first member interface, the command is not executed on any member interfaces.
  - If the execution failed on a non-first member interface, the command takes effect on the remaining member interfaces.
- The system returns to system view. It means that:
  - The command is supported in both system view and interface view.
  - The execution failed on a member interface in interface range view and succeeded in system view.
  - The command is not executed on the subsequent member interfaces.

  You can use the **display this** command to verify the configuration in interface view of each member interface. In addition, if the configuration in system view is not needed, use the **undo** form of the command to remove the configuration.

To verify the configuration of the first interface, you can execute the **display this** command in interface range view.

To view the member interfaces of a named interface range, use the **display interface range** command.

When you bulk configure interfaces, follow these guidelines:

- Before you configure an interface as the first interface in an interface range, make sure you can enter the view of the interface by using the **interface** *interface-type* { *interface-number* | *interface-number.subnumber* } command.
- Do not assign both an aggregate interface and any of its member interfaces to an interface range. Some commands, after being executed on both an aggregate interface and its member interfaces, can break up the aggregation.
- Understand that the more interfaces you specify, the longer the command execution time.
- To guarantee bulk interface configuration performance, configure fewer than 1000 interface range names.

Examples

Add GigabitEthernet 1/0/1 through GigabitEthernet 1/0/4 to interface range **myEthPort**, and enter the interface range view.

```
<Sysname> system-view
[Sysname] interface range name myEthPort interface gigabitethernet 1/0/1 to
gigabitethernet 1/0/4
[Sysname-if-range-myEthPort]
```

Enter the view of interface range **myEthPort**.

```
<Sysname> system-view
[Sysname] interface range name myEthPort
[Sysname-if-range-myEthPort]
```

Related commands

Contents

Ethernet interface commands

Physical interfaces on firewall modules can only be used as IRF physical interfaces.

Common Ethernet interface commands

bandwidth

Use **bandwidth** to set the expected bandwidth of an interface.

Use **undo bandwidth** to restore the default.

Syntax

bandwidth *bandwidth-value*

undo bandwidth

Default

The expected bandwidth (in kbps) is the interface baud rate divided by 1000.

Views

Ethernet interface view

Ethernet subinterface view

Predefined user roles

network-admin

context-admin

Parameters

bandwidth-value: Specifies the expected bandwidth in the range of 1 to 400000000 kbps.

Usage guidelines

The expected bandwidth is an informational parameter used only by higher-layer protocols for calculation. You cannot adjust the actual bandwidth of an interface by using this command.

Examples

Set the expected bandwidth of GigabitEthernet 1/0/1 to 1000 kbps.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] bandwidth 1000
```

Set the expected bandwidth of GigabitEthernet 1/0/1.1 to 1000 kbps.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1.1
[Sysname-GigabitEthernet1/0/1.1] bandwidth 1000
```

Related commands

speed

broadcast-suppression

Use **broadcast-suppression** to enable broadcast suppression and set the broadcast suppression threshold.

Use **undo broadcast-suppression** to disable broadcast suppression.

Syntax

broadcast-suppression { *ratio* | **pps** *max-pps* | **kbps** *max-kbps* }

undo broadcast-suppression

Default

Ethernet interfaces do not suppress broadcast traffic.

Views

Ethernet interface view

Predefined user roles

network-admin

context-admin

Parameters

ratio: Sets the broadcast suppression threshold as a percentage of the interface bandwidth. The value range for this argument is 0 to 100. A smaller value means that less broadcast traffic is allowed to pass through.

pps *max-pps*: Specifies the maximum number of broadcast packets that the interface can forward per second. The value range for the *max-pps* argument (in pps) is 0 to 1.4881 × the interface bandwidth.

kbps *max-kbps*: Specifies the maximum number of kilobits of broadcast traffic that the Ethernet interface can forward per second. The value range for this argument (in kbps) is 0 to the interface bandwidth.

Usage guidelines

The broadcast storm suppression features limits the size of broadcast traffic to a threshold on an interface. When the broadcast traffic on the interface exceeds this threshold, the system drops packets until the traffic drops below this threshold.

Both the **storm-constrain** command and the **broadcast-suppression** command can suppress broadcast storms on a port. The **broadcast-suppression** command uses the chip to physically suppress broadcast traffic. It has less influence on the device performance than the **storm-constrain** command, which uses software to suppress broadcast traffic.

For the traffic suppression result to be determined, do not configure both the **storm-constrain broadcast** command and the **broadcast-suppression** command on an interface.

The configured suppression threshold value in pps or kbps might be converted into a multiple of a step supported by the chip. As a result, the effective suppression threshold might be different from the configured one. To determine the suppression threshold that takes effect, see the prompts on the device.

Examples

Set the broadcast suppression threshold to 10000 kbps on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] broadcast-suppression kbps 10000
```

Related commands

- **multicast-suppression**

  unicast-suppression

combo enable

> **CAUTION:**
>
> - In the BootWare menu, fiber combo ports are not available.
> - When the fiber combo port is active, it supports only the speeds autonegotiation and 1000 Mbps, and supports only duplex modes full and autonegotiation. If the copper combo port is configured with any other speed or duplex settings, the settings do not take effect after it is switched to the fiber combo port.

Use **combo enable** to activate the copper or fiber combo port of a combo interface.

Syntax

combo enable { **copper** | **fiber** }

The following matrixes show support of hardware platforms for this command:

Models	Command compatibility
NFNX5-HD6480, NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB1780, NFNX3-HDB3080, NFNX3-HDB1180, NFNX3-HDB1480	Yes
NFNX3-HDB680, NFNX3-HDB1080	No

Default

The copper combo port of a combo interface is activated.

Views

Ethernet interface view

Predefined user roles

network-admin

context-admin

Parameters

copper: Activates the copper combo port. In this case, use twisted pairs to connect the port.

fiber: Activates the fiber combo port. In this case, use optical fibers to connect the port.

Usage guidelines

A combo interface is a logical interface that physically contains one fiber combo port and one copper combo port on the device panel. The two ports share one forwarding interface. As a result, they cannot work simultaneously. When you activate either port, the other port is automatically disabled. You can select to activate the copper combo port or fiber combo port.

Before using this command, perform the following tasks according to the marks on the device panel:

- Determine the combo interfaces on your device.
- Identify the two physical interfaces that belong to each combo interface.

Examples

Activate the copper combo port of combo interface GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] combo enable copper
```

Activate the fiber combo port of combo interface GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] combo enable fiber
```

dampening

Use **dampening** to enable the device to dampen an interface when the interface is flapping.

Use **undo dampening** to restore the default.

Syntax

dampening [*half-life reuse suppress max-suppress-time*]

undo dampening

Default

Interface dampening is disabled on Ethernet interfaces.

Views

Ethernet interface view

Predefined user roles

network-admin

context-admin

Parameters

half-life: Specifies the amount of time after which a penalty is decreased, in the range of 1 to 120 seconds. The default value is 54 seconds.

reuse: Specifies the reuse threshold in the range of 200 to 20000. The default value is 750. The reuse threshold must be less than the suppression threshold.

suppress: Specifies the suppression threshold in the range of 200 to 20000. The default value is 2000.

max-suppress-time: Specifies the maximum amount of time the interface can be dampened, in the range of 1 to 255 seconds. The default value is 162 seconds (three times the half-life timer).

Usage guidelines

When configuring the **dampening** command, follow these rules to set the values mentioned above:

- The ceiling is equal to 2 (Max-suppress-time/Decay) × reuse-limits. It is not user configurable.
- The configured suppress limit is lower than or equal to the ceiling.
- The ceiling is lower than or equal to the maximum suppress limit supported.

This command does not take effect on the administratively down events. When you execute the **shutdown** command, the penalty restores to 0, and the interface reports the down event to the higher layer protocols.

Do not enable the dampening function on an interface with spanning tree protocols enabled.

After an interface in down state is dampened, the interface state displayed through the **display interface** command, MIB, or Web is always down.

Examples

Enable interface dampening on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] dampening
```

Enable interface dampening on GigabitEthernet 1/0/1, and set the following parameters:

- Half life time to 2 seconds.
- Reuse value to 800.
- Suppression threshold to 3000.
- Maximum suppression interval to 5 seconds.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] dampening 2 800 3000 5
```

Related commands

display interface

context-admin

Usage guidelines

CAUTION:

The **default** command might interrupt ongoing network services. Make sure you are fully aware of the impacts of this command when you use it in a live network.

This command might fail to restore the default settings for some commands because of command dependencies or system restrictions. You can use the **display this** command in interface view to identify these commands, and use their **undo** forms or follow the command reference to restore their default settings. If your restoration attempt still fails, follow the error message instructions to solve the problem.

Examples

Restore the default settings for GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] default
```

```
This command will restore the default settings. Continue? [Y/N]:y
```

Restore the default settings for GigabitEthernet 1/0/1.1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1.1
[Sysname-GigabitEthernet1/0/1.1] default
This command will restore the default settings. Continue? [Y/N]:y
```

description

Use **description** to configure the description of an interface.

Use **undo description** to restore the default.

Syntax

description *text*

undo description

Default

The description of an interface is the interface name plus **Interface** (for example, **GigabitEthernet1/0/1 Interface**).

Views

Ethernet interface view

Ethernet subinterface view

Predefined user roles

network-admin

context-admin

Parameters

text: Specifies the interface description, a case-sensitive string of 1 to 255 characters.

Examples

Set the description of GigabitEthernet 1/0/1 to **lan-interface**.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] description lan-interface
```

Set the description of GigabitEthernet 1/0/1.1 to **subinterface1/0/1.1**.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1.1
[Sysname-GigabitEthernet1/0/1.1] description subinterface1/0/1.1
```

display counters

Use **display counters** to display interface traffic statistics.

Syntax

display counters { **inbound** | **outbound** } **interface** [*interface-type* [*interface-number* | *interface-number.subnumber*]]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

inbound: Displays inbound traffic statistics.

outbound: Displays outbound traffic statistics.

interface-type: Specifies an interface type.

interface-number: Specifies an interface number.

interface-number.subnumber: Specifies a subinterface number. The *interface-number* argument is an interface number. The *subnumber* argument is the number of a subinterface created under the interface. The value range for the *subnumber* argument is 1 to 4094.

Usage guidelines

To clear the Ethernet interface traffic statistics, use the **reset counters interface** command.

If you do not specify an interface type, this command displays traffic statistics for all interfaces that have traffic counters.

If you specify an interface type but do not specify an interface number, this command displays traffic statistics for all interfaces of the specified type.

If you specify an interface type and number, this command displays traffic statistics for the specified interface.

Examples

Display inbound traffic statistics for all interfaces.

```
<Sysname> display counters inbound interface
Interface            Total (pkts)    Broadcast (pkts)    Multicast (pkts)  Err (pkts)
GE1/0/1                       100                 100                   0           0
GE1/0/2                  Overflow            Overflow            Overflow    Overflow

 Overflow: More than 14 digits (7 digits for column "Err").
       --: Not supported.
```

Table 1 Command output

Field	Description
Interface	Abbreviated interface name.
Total (pkts)	Total number of packets received or sent through the interface.
Broadcast (pkts)	Total number of broadcast packets received or sent through the interface.
Multicast (pkts)	Total number of multicast packets received or sent through the interface.
Err (pkts)	Total number of error packets received or sent through the interface.
Overflow: More than 14 digits (7 digits for column "Err")	The command displays **Overflow** when any of the following conditions exist: • The data length of an **Err** field value is greater than 7 decimal digits. • The data length of a non-Err field value is greater than 14 decimal digits.

Field	Description
--: Not supported	The statistical item is not supported.

Related commands

reset counters interface

display counters rate

Use **display counters rate** to display traffic rate statistics for interfaces in up state for the most recent statistics polling interval.

Syntax

display counters rate { **inbound** | **outbound** } **interface** [*interface-type* [*interface-number* | *interface-number.subnumber*]]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

inbound: Displays inbound traffic rate statistics.

outbound: Displays outbound traffic rate statistics.

interface-type: Specifies an interface type.

interface-number: Specifies an interface number.

interface-number.subnumber: Specifies a subinterface number. The *interface-number* argument is an interface number. The *subnumber* argument is the number of a subinterface created under the interface. The value range for the *subnumber* argument is 1 to 4094.

Usage guidelines

If you do not specify an interface type, this command displays traffic rate statistics for all up interfaces that have traffic counters.

If you specify an interface type but do not specify an interface number, this command displays traffic rate statistics for all up interfaces of the specified type.

If you specify an interface type and an interface, this command displays traffic rate statistics for the specified interface.

If an interface that you specify is always down for the most recent statistics polling interval, the system prompts that the interface does not support the command.

You can use the **flow-interval** command to set the statistics polling interval.

Examples

Display the inbound traffic rate statistics for all interfaces.

```
<Sysname> display counters rate inbound interface
Usage: Bandwidth utilization in percentage
```

```
Interface            Usage (%)   Total (pps)   Broadcast (pps)   Multicast (pps)
GE1/0/1                      0             0                --                --

 Overflow: More than 14 digits.
       --: Not supported.
```

Table 2 Command output

Field	Description
Interface	Abbreviated interface name.
Usage (%)	Bandwidth usage (in percentage) of the interface for the last statistics polling interval.
Total (pps)	Average receiving or sending rate (in pps) for unicast packets for the last statistics polling interval.
Broadcast (pps)	Average receiving or sending rate (in pps) for broadcast packets for the last statistics polling interval.
Multicast (pps)	Average receiving or sending rate (in pps) for multicast packets for the last statistics polling interval. .
Overflow: more than 14 decimal digits	The command displays **Overflow** if the data length of a statistical item is greater than 14 decimal digits.
--: not supported	The statistical item is not supported.

```

Table 3 Output description

Field	Description
ETH receive packet statistics	Statistics about the Ethernet packets received by the Ethernet module: • **Totalnum**—Total number of received packets. • **ETHIINum**—Number of packets encapsulated by using Ethernet II. • **SNAPNum**—Number of packets encapsulated by using SNAP. • **RAWNum**—Number of packets encapsulated by using RAW. • **ISISNum**—Number of packets encapsulated by using ISIS. • **LLCNum**—Number of packets encapsulated by using LLC. • **UnknownNum**—Number of packets encapsulated by using unknown methods. • **ForwardNum**—Number of packets forwarded at Layer 2 or sent to the CPU. • **ARP**—Number of ARP packets. • **ISIS**—Number of IS-IS packets. • **ISIS2**—Number of large 802.3/802.2 frames encapsulated by using IS-IS. • **IP**—Number of IP packets. • **IPv6**—Number of IPv6 packets.

Field	Description
ETH receive error statistics	Statistics about the error Ethernet packets in the inbound direction on the Ethernet module. Errors might be included in packets or occur during the receiving process. The items include: • **NullPoint**—Number of packets that include null pointers. • **ErrIfindex**—Number of packets that include incorrect interface indexes. • **ErrIfcb**—Number of packets that include incorrect interface control blocks. • **IfShut**—Number of packets that are being received when the interface is shut down. • **ErrAnalyse**—Number of packets that include packet parsing errors. • **ErrSrcMAC**—Number of packets that include incorrect source MAC addresses. • **ErrHdrLen**—Number of packets that include header length errors.
ETH send packet statistics	Statistics about the Ethernet packets sent by the Ethernet module: • **L3OutNum**—Number of packets sent out of Layer 3 Ethernet interfaces. • **VLANOutNum**—Number of packets sent out of VLAN interfaces. • **FastOutNum**—Number of packets fast forwarded. • **L2OutNum**—Number of packets sent out of Layer 2 Ethernet interfaces.
ETH send error statistics	Statistics about the error Ethernet packets in the outbound direction on the Ethernet module: • **MbufRelayNum**—Number of packets transparently sent. • **NullMbuf**—Number of packets with null pointers. • **ErrAdjFwd**—Number of packets with adjacency table errors. • **ErrPrepend**—Number of packets with extension errors. • **ErrHdrLen**—Number of packets with header length errors. • **ErrPad**—Number of packets with padding errors. • **ErrQoSTrs**—Number of packets that failed to be sent by QoS. • **ErrVLANTrs**—Number of packets that failed to be sent in VLANs. • **ErrEncap**—Number of packets that failed to be sent due to link header encapsulation failures. • **ErrTagVLAN**—Number of packets that failed to be sent due to VLAN tag encapsulation failures. • **IfShut**—Number of packets that are being sent when the interface is shut down. • **IfErr**—Number of packets with incorrect outgoing interfaces.

Related commands

`reset ethernet statistics`

display interface

Use **`display interface`** to display interface information.

Syntax

`display interface` [*`interface-type`* [*`interface-number`* | *`interface-number.subnumber`*]] [**`brief`** [**`description`** | **`down`**]]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

interface-type: Specifies an interface type.

interface-number: Specifies an interface number.

interface-number.subnumber: Specifies a subinterface number. The *interface-number* argument is an interface number. The *subnumber* argument is the number of a subinterface created under the interface. The value range for the *subnumber* argument is 1 to 4094.

brief: Displays brief interface information. If you do not specify this keyword, the command displays detailed interface information.

description: Displays complete interface descriptions. If you do not specify this keyword, the command displays only the first 27 characters of each interface description.

down: Displays information about interfaces in down state and the causes. If you do not specify this keyword, the command displays information about interfaces in all states.

Usage guidelines

If you do not specify an interface type, this command displays information about all interfaces except VA interfaces. For more information about VA interfaces, see PPP in *Layer 2—WAN Access Configuration Guide*.

If you specify an interface type but do not specify an interface number, this command displays information about all interfaces of the specified type.

Examples

Display information about Layer 3 interface GigabitEthernet 1/0/1.

```

Table 4 Command output

Field	Description
Current state	Physical link state of the interface: • **Administratively DOWN**—The interface has been shut down by using the **shutdown** command. • **DOWN**—The interface is administratively up, but its physical state is down (possibly because no physical link exists or the link has failed). • **DOWN (Link-Aggregation interface down)**—The aggregate interface to which the interface belongs has been shut down by using the **shutdown** command. • **DOWN (Monitor-Link uplink down)**—The interface has been shut down by Monitor Link. • **ETH-rddc Shutdown**—The interface has been shut down by the Reth module. • **mac-address moving down**—The interface has been shut down by the MAC address move suppression feature. • **MAD ShutDown**—The interface has been shut down by IRF MAD. This state occurs if the interface is on an IRF fabric placed in Recovery state after an IRF split. • **Storm-Constrain**—The interface has been shut down because the storm control feature detected that multicast or broadcast traffic exceeded the upper threshold. • **STP DOWN**—The interface has been shut down by the BPDU guard feature. • **UP**—The interface is both administratively and physically up.

Line protocol state	Data link layer state of the interface. The state is determined through automatic parameter negotiation at the data link layer.
	• **UP**—The data link layer protocol is up.
	• **UP (spoofing)**—The data link layer protocol is up, but the link is an on-demand link or does not exist. This attribute is typical of null interfaces and loopback interfaces.
	• **DOWN**—The data link layer protocol is down.
	• **DOWN (***protocols***)**—The data link layer has been shut down by protocols included in the parentheses. Available protocols include:
	  ○ **LAGG**—Shuts down the data link layer when it detects that the aggregate interface does not have Selected ports.
	  ○ **BFD**—Shuts down the data link layer when it detects a link failure.

The peer line protocol state is DOWN(Bit-error down)	Bit errors occur on the peer interface, so the data link layer state of the interface is down. This field is displayed when the local interface receives bit error messages from the peer interface.
Bandwidth	Expected bandwidth of the interface.
Maximum transmission unit	MTU of the interface.
Internet protocol processing: Disabled	The interface is not assigned an IP address and cannot process IP packets.

Field	Description
Internet address: *ip-address*/*mask-length* (*Type*)	IP address of the interface and type of the address in parentheses. Possible IP address types include: • **Primary**—Manually configured primary IP address. • **Sub**—Manually configured secondary IP address. If the interface has both primary and secondary IP addresses, the primary IP address is displayed. If the interface has only secondary IP addresses, the lowest secondary IP address is displayed. • **DHCP-allocated**—DHCP allocated IP address. For more information, see DHCP client configuration in *Layer 3—IP Services Configuration Guide*. • **BOOTP-allocated**—BOOTP allocated IP address. For more information, see BOOTP client configuration in *Layer 3—IP Services Configuration Guide*. • **PPP-negotiated**—IP address assigned by a PPP server during PPP negotiation. For more information, see PPP configuration in *Layer 2—WAN Access Configuration Guide*. • **Unnumbered**—IP address borrowed from another interface. • **Cellular-allocated**—IP address allocated through the modem-manufacturer's proprietary protocol. For more information, see mobile communication modem management in *Layer 2—WAN Access Configuration Guide*. • **MAD**—IP address assigned to an IRF member device for MAD on the interface. For more information, see IRF configuration in *Virtual Technologies Configuration Guide*.
IP packet frame type	IPv4 packet framing format.
hardware address	MAC address of the interface.
IPv6 packet frame type	IPv6 packet framing format.
FEC mode	FEC mode. This field depends on your configuration.
Port priority	Port priority of the interface.
Loopback is set internal	An internal loopback test is running on the interface. This field depends on your configuration.
Loopback is set external	An external loopback test is running on the interface. This field depends on your configuration.
Loopback is not set	No loopback test is running on the interface. This field depends on your configuration.
10Mbps-speed mode	The interface is operating at 10 Mbps. This field depends on your configuration and the link parameter negotiation result.
100Mbps-speed mode	The interface is operating at 100 Mbps. This field depends on your configuration and the link parameter negotiation result.
1000Mbps-speed mode	The interface is operating at 1000 Mbps. This field depends on your configuration and the link parameter negotiation result.
10Gbps-speed mode	The interface is operating at 10 Gbps. This field depends on your configuration and the link parameter negotiation result.
Unknown-speed mode	The speed of the interface is unknown because the speed negotiation fails or the interface is physically disconnected.

Field	Description
half-duplex mode	The interface is operating in half duplex mode. This field depends on your configuration and the link parameter negotiation result.
full-duplex mode	The interface is operating in full duplex mode. This field depends on your configuration and the link parameter negotiation result.
unknown-duplex mode	The duplex mode of the interface is unknown because the duplex mode negotiation fails or the interface is physically disconnected.
Link speed type is autonegotiation	The interface is configured with the **speed auto** command.
Link speed type is force link	The interface is manually configured with a speed (for example, 1000 Mbps) by using the **speed** command.
link duplex type is autonegotiation	The interface is configured with the **duplex auto** command.
link duplex type is force link	The interface is manually configured with a duplex mode (for example, half or full) by using the **duplex** command.
Flow-control is not enabled	Generic flow control is disabled on the interface. This field depends on your configuration and the link parameter negotiation result.
Maximum frame length	Maximum length of Ethernet frames allowed to pass through the interface.
Allow jumbo frame to pass	The interface allows jumbo frames to pass through.
Broadcast max-	Broadcast storm suppression threshold in ratio, pps, or kbps. The unit of the threshold depends on your configuration.
Multicast max-	Multicast storm suppression threshold in ratio, pps, or kbps. The unit of the threshold depends on your configuration.
Unicast max-	Unknown unicast storm suppression threshold in ratio, pps, or kbps. The unit of the threshold depends on your configuration.
PVID	Port VLAN ID (PVID) of the interface.
MDI type	MDIX mode of the interface. Options include automdix, mdi, and mdix.
Port link-type	Link type of the interface: • access. • trunk. • hybrid.
Tagged VLANs	VLANs for which the interface sends packets without removing VLAN tags.
Untagged VLANs	VLANs for which the interface sends packets after removing VLAN tags.
VLAN Passing	VLANs whose packets can be forwarded by the port. The VLANs must have been created.
VLAN permitted	VLANs whose packets are permitted by the port.
Trunk port encapsulation	Encapsulation protocol type for the trunk port.
Last link flapping	The amount of time that has elapsed since the most recent physical state change of the interface. This field displays **Never** if the interface has been physically down since device startup.

Field	Description
Last clearing of counters	Time when the **reset counters interface** command was last used to clear the interface statistics. This field displays **Never** if the **reset counters interface** command has never been used on the interface since device startup.
Current system time	Current system time in the YYYY/MM/DD HH:MM:SS format. If the time zone is configured, this field is in the YYYY/MM/DD HH:MM:SS UTC±HH:MM:SS format.
Last time when physical state changed to up	Last time when physical state of the interface changed to up. A hyphen (-) indicates that the physical state of the interface has not changed to up.
Last time when physical state changed to down	Last time when physical state of the interface changed to down. A hyphen (-) indicates that the physical state of the interface has not changed to down.
Last 300 second input: 0 packets/sec 0 bytes/sec 0% Last 300 second output: 0 packets/sec 0 bytes/sec 0%	Average inbound or outbound traffic rate (in pps and Bps) in the last 300 seconds, and the ratio of the actual rate to the interface bandwidth. A hyphen (-) indicates that the statistical item is not supported.
Input(total): 0 packets, 0 bytes 0 unicasts, 0 broadcasts, 0 multicasts, 0 pauses	The two fields on the first line represent the inbound traffic statistics (in packets and bytes) for the interface. All inbound normal packets, abnormal packets, and normal pause frames were counted. The four fields on the second line represent: • Number of inbound unicast packets. • Number of inbound broadcasts. • Number of inbound multicasts. • Number of inbound pause frames. A hyphen (-) indicates that the statistical item is not supported.
Input(normal): 0 packets, 0 bytes 0 unicasts, 0 broadcasts, 0 multicasts, 0 pauses	The two fields on the first line represent the inbound normal traffic and pause frame statistics (in packets and bytes) for the interface. The four fields on the second line represent: • Number of inbound normal unicast packets. • Number of inbound normal broadcasts. • Number of inbound normal multicasts. • Number of inbound normal pause frames. A hyphen (-) indicates that the statistical item is not supported.
input errors	Statistics of incoming error packets.
runts	Number of inbound frames meeting the following conditions: • Shorter than 64 bytes. • In correct format. • Containing valid CRCs.

Field	Description
giants	Number of inbound giants. Giants refer to frames larger than the maximum frame length supported on the interface. For an Ethernet interface that does not permit jumbo frames, the maximum frame length is as follows: • 1518 bytes (without VLAN tags). • 1522 bytes (with VLAN tags). For an Ethernet interface that permits jumbo frames, the maximum Ethernet frame length is set when you configure jumbo frame support on the interface.
throttles	Number of inbound frames that had a non-integer number of bytes.
CRC	Total number of inbound frames that had a normal length, but contained CRC errors.
frame	Total number of inbound frames that contained CRC errors and a non-integer number of bytes.
overruns	Number of packets dropped because the input rate of the port exceeded the queuing capability.

aborts	Total number of illegal inbound packets:
	• **Fragment frames**—CRC error frames shorter than 64 bytes. The length (in bytes) can be an integral or non-integral value.
	• **Jabber frames**—CRC error frames greater than the maximum frame length supported on the Ethernet interface (with an integral or non-integral length).
	  ○ For an Ethernet interface that does not permit jumbo frames, the maximum frame length is 1518 bytes (without VLAN tags) or 1522 bytes (with VLAN tags).
	  ○ For an Ethernet interface that permits jumbo frames, the maximum Ethernet frame length is set when you configure jumbo frame support on the interface.
	• **Symbol error frames**—Frames that contained a minimum of one undefined symbol.
	• **Unknown operation code frames**—Non-pause MAC control frames.
	• **Length error frames**—Frames whose 802.3 length fields did not match the actual frame length (46 to 1500 bytes).

ignored	Number of inbound frames dropped because the receiving buffer of the port ran low.
parity errors	Total number of frames with parity errors.
Output(total): 0 packets, 0 bytes 0 unicasts, 0 broadcasts, 0 multicasts, 0 pauses	The two fields on the first line represent the outbound traffic statistics (in packets and bytes) for the interface. All outbound normal packets, abnormal packets, and normal pause frames were counted. The four fields on the second line represent: • Number of outbound unicast packets. • Number of outbound broadcasts. • Number of outbound multicasts. • Number of outbound pause frames. A hyphen (-) indicates that the statistical item is not supported.

Field	Description
Output(normal): 0 packets, 0 bytes 0 unicasts, 0 broadcasts, 0 multicasts, 0 pauses	The two fields on the first line represent the outbound normal traffic and pause frame statistics (in packets and bytes) for the interface. The four fields on the second line represent: • Number of outbound normal unicast packets. • Number of outbound normal broadcasts. • Number of outbound normal multicasts. • Number of outbound normal pause frames. A hyphen (-) indicates that the statistical item is not supported.
output errors	Number of outbound packets with errors.
underruns	Number of packets dropped because the output rate of the interface exceeded the output queuing capability. This is a low-probability hardware anomaly.
buffer failures	Number of packets dropped because the transmitting buffer of the interface ran low.
aborts	Number of packets that failed to be transmitted, for example, because of Ethernet collisions.
deferred	Number of frames that the interface deferred to transmit because of detected collisions.
collisions	Number of frames that the interface stopped transmitting because Ethernet collisions were detected during transmission.
late collisions	Number of frames that the interface deferred to transmit after transmitting their first 512 bits because of detected collisions.
lost carrier	This field is not supported in the current software version. Number of carrier losses during transmission. This counter increases by one when a carrier is lost, and applies to serial WAN interfaces.
no carrier	This field is not supported in the current software version. Number of times that the port failed to detect the carrier when attempting to send frames. This counter increases by one when a port failed to detect the carrier, and applies to serial WAN interfaces.
Peak input rate	Peak rate of inbound traffic in Bps, and the time when the peak inbound traffic rate occurred.
Peak output rate	Peak rate of outbound traffic in Bps, and the time when the peak outbound traffic rate occurred.

Display brief information about all interfaces.

Table 5 Command output

Field	Description
Brief information on interfaces in route mode:	Brief information about Layer 3 interfaces.
Interface	Interface name.
Link	Physical link state of the interface: • **UP**—The interface is physically up. • **DOWN**—The interface is physically down. • **ADM**—The interface has been shut down by using the **shutdown** command. To restore the physical state of the interface, use the **undo shutdown** command. • **Stby**—The interface is a backup interface in standby state. To see the primary interface, use the **display interface-backup state** command.

Field	Description
Protocol	Data link layer protocol state of the interface: • **UP**—The data link layer protocol of the interface is up. • **DOWN**—The data link layer protocol of the interface is down. • **UP(s)**—The data link layer protocol of the interface is up, but the link is an on-demand link or does not exist. The **(s)** attribute represents the spoofing flag. This value is typical of null interfaces and loopback interfaces.
Primary IP	Primary IP address of the interface. This field displays two hyphens (**--**) if the interface does not have an IP address.
Description	Description of the interface.
Brief information of interfaces in bridge mode:	Brief information about Layer 2 interfaces.
Type: A - access; T - trunk; H – hybrid	Link type options for interfaces.
Speed	Speed of the interface, in bps. This field displays the **(a)** flag next to the speed if the speed is automatically negotiated. This field displays **auto** if the interface is configured to autonegotiate its speed but the autonegotiation has not started.
Duplex	Duplex mode of the interface: • **A**—Autonegotiation. The interface is configured to autonegotiate its duplex mode but the autonegotiation has not started. • **F**—Full duplex. • **F(a)**—Autonegotiated full duplex. • **H**—Half duplex. • **H(a)**—Autonegotiated half duplex.
Type	Link type of the interface: • **A**—Access. • **H**—Hybrid. • **T**—Trunk.
PVID	Port VLAN ID.
Cause	Cause for the physical link state of an interface to be **DOWN**: • **Administratively**—The interface has been manually shut down by using the **shutdown** command. To restore the physical state of the interface, use the **undo shutdown** command. • **DOWN (Link-Aggregation interface down)**—The interface is a member port of an aggregate interface, and the aggregate interface is down. • **DOWN (Monitor-Link uplink down)**—The monitor link module has detected that the uplink is down. • **MAD ShutDown**—The interface is on an IRF fabric placed by IRF MAD in Recovery state after an IRF split. • **Not connected**—No physical connection exists (possibly because the network cable is disconnected or faulty). • **Storm-Constrain**—The storm control feature has detected that multicast or broadcast traffic exceeded the upper threshold. • **STP DOWN**—The interface has been shut down by the BPDU guard feature. • **Standby**—The interface is a backup interface in standby state.

display interface link-info

Use **display interface link-info** to display the status and packet statistics of interfaces.

Syntax

display interface link-info [**main**]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

main: Specifies all interfaces except subinterfaces. If you do not specify this keyword, this command displays status and packet statistics of all interfaces.

Examples

Display status and statistics of all interfaces.

```
<Sysname> display interface link-info
Link: ADM - administratively down; Stby - standby
Protocol: (s) - spoofing
Interface                   Link Protocol  InUsage OutUsage   InErrs  OutErrs
GE1/0/1                     UP   UP         10.09%       0%        0        0
NULL0                       UP   UP(s)          0%       0%        0        0
BAGG11                      ADM  DOWN           --       --       --       --
  GE1/0/2                   DOWN DOWN           --       --       --       --
RAGG11                      ADM  DOWN           --       --       --       --
  GE1/0/3                   DOWN DOWN           --       --       --       --

 Overflow: More than 7 digits.
       --: Not supported.
```

Table 6 Command output

Field	Description
Link: ADM - administratively down; Stby - standby	Physical link state of the interface: • **ADM**—The interface has been shut down by using the **shutdown** command. To restore the physical state of the interface, use the **undo shutdown** command. • **Stby**—The interface is a backup interface in standby state. To see the primary interface, use the **display interface-backup state** command.
Protocol: (s) – spoofing	The data link layer protocol of the interface is up, but the link is an on-demand link or does not exist. The **(s)** attribute represents the spoofing

Field	Description
	flag. This value is typical of null interfaces, loopback interfaces, and InLoopback interfaces.
Interface	Abbreviated interface name.
Link	Physical link state of the interface: • **UP**—The interface is physically up. • **DOWN**—The interface is physically down. • **ADM**—The interface has been shut down by using the **shutdown** command. To restore the physical state of the interface, use the **undo shutdown** command. • **Stby**—The interface is a backup interface in standby state.
Protocol	Data link layer protocol state of the interface: • **UP**—The data link layer protocol of the interface is up. • **DOWN**—The data link layer protocol of the interface is down. • **UP(s)**—The data link layer protocol of the interface is up, but the link is an on-demand link or does not exist. The **(s)** attribute represents the spoofing flag. This value is typical of null interfaces, loopback interfaces, and InLoopback interfaces.
InUsage	Inbound bandwidth usage within the most recent statistics polling interval. It is calculated by this formula: Average inbound speed of the interface within the most recent statistics polling interval/interface bandwidth. When the usage is smaller than 0.01%, 0.01% is displayed. To set the statistics polling interval, use the **flow-interval** command.
OutUsage	Outbound bandwidth usage within the most recent statistics polling interval. It is calculated by this formula: Average outbound speed of the interface within the most recent statistics polling interval/interface bandwidth. When the usage is smaller than 0.01%, 0.01% is displayed. To set the statistics polling interval, use the **flow-interval** command.
InErrs	Number of error packets received.
OutErrs	Number of error packets sent.
Overflow: More than 7 digits.	The data length of a statistical item value is greater than 7 decimal digits.
--: Not supported.	A hyphen (-) indicates that the corresponding statistical item is not supported.

For description on the **display interface main** command output, see Table 4 and Table 5.

display packet-drop

Use **display packet-drop** to display information about packets dropped on an interface.

Syntax

display packet-drop { **interface** [*interface-type* [*interface-number*]] | **summary** }

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

interface-type: Specifies an interface type.

interface-number: Specifies an interface number.

summary: Displays the summary of dropped packets on all interfaces.

Usage guidelines

If you do not specify an interface type, this command displays information about dropped packets on all interfaces on the device.

If you specify an interface type but do not specify an interface number, this command displays information about dropped packets on all interfaces of the specified type.

Examples

Display information about dropped packets on GigabitEthernet 1/0/1.

```
<Sysname> display packet-drop interface gigabitethernet 1/0/1
GigabitEthernet1/0/1:
Packets dropped due to full GBP or insufficient bandwidth: 301
Packets dropped due to Fast Filter Processor (FFP): 261
Packets dropped due to STP non-forwarding state: 0
Packets dropped due to rate-limit: 143
Packets dropped due to broadcast-suppression: 301
Packets dropped due to unicast-suppression: 215
Packets dropped due to multicast-suppression: 241
Packets dropped due to Tx packet aging: 246
```

Display the summary of dropped packets on all interfaces.

```
<Sysname> display packet-drop summary
All interfaces:
Packets dropped due to full GBP or insufficient bandwidth: 301
Packets dropped due to Fast Filter Processor (FFP): 261
Packets dropped due to STP non-forwarding state: 0
```

```
Packets dropped due to rate-limit: 143
Packets dropped due to broadcast-suppression: 301
Packets dropped due to unicast-suppression: 215
Packets dropped due to multicast-suppression: 241
Packets dropped due to Tx packet aging: 246
```

Table 7 Command output

Field	Description
Packets dropped due to full GBP or insufficient bandwidth	Packets that are dropped because the buffer is used up or the bandwidth is insufficient.
Packets dropped due to Fast Filter Processor (FFP)	Packets that are filtered out.
Packets dropped due to STP non-forwarding state	Packets that are dropped because STP is in the non-forwarding state.
Packets dropped due to rate-limit	Packets that are dropped due to the rate limit set on the device.
Packets dropped due to broadcast-suppression	Packets that are dropped due to broadcast suppression.
Packets dropped due to unicast-suppression	Packets that are dropped due to unknown unicast suppression.
Packets dropped due to multicast-suppression	Packets that are dropped due to multicast suppression.
Packets dropped due to Tx packet aging	Outbound packets that are timed out.

duplex

Use **duplex** to set the duplex mode for an Ethernet interface.

Use **undo duplex** to restore the default.

Syntax

duplex { **auto** | **full** | **half** }

undo duplex

Default

Ethernet interfaces operate in autonegotiation mode.

Views

Ethernet interface view

Predefined user roles

network-admin

context-admin

Parameters

auto: Configures the interface to autonegotiate the duplex mode with the peer.

full: Configures the interface to operate in full duplex mode. In this mode, the interface can receive and transmit packets simultaneously.

half: Configures the interface to operate in half duplex mode. In this mode, the interface can only receive or transmit packets at a given time.

Examples

Configure GigabitEthernet 1/0/1 to operate in full duplex mode.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] duplex full
```

flow-control

Use **flow-control** to enable TxRx-mode generic flow control on an Ethernet interface.

Use **undo flow-control** to disable TxRx-mode generic flow control on the Ethernet interface.

Syntax

flow-control

undo flow-control

Default

TxRx-mode generic flow control is disabled on an Ethernet interface.

Views

Ethernet interface view

Predefined user roles

network-admin

context-admin

Usage guidelines

With TxRx-mode generic flow control configured, an interface can both send and receive flow control frames:

- When congested, the interface sends a flow control frame to its peer.
- Upon receiving a flow control frame from the peer, the interface suspends sending packets.

To implement flow control on a link, enable generic flow control at both ends of the link.

Examples

Enable TxRx-mode generic flow control on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] flow-control
```

flow-interval

Use **flow-interval** to set the statistics polling interval.

Use **undo flow-interval** to restore the default.

Syntax

flow-interval *interval*

undo flow-interval

Default

The statistics polling interval is 300 seconds.

Views

System view

Ethernet interface view

The following compatibility matrix shows the support of hardware platforms for views:

Models	Views
NFNX5-HD6480, NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280	System view and Ethernet interface view
NFNX3-HDB1780, NFNX3-HDB3080, NFNX3-HDB1180, NFNX3-HDB1480	Ethernet interface view
NFNX3-HDB680, NFNX3-HDB1080	System view and Ethernet interface view

Predefined user roles

network-admin

context-admin

Parameters

interval: Sets the statistics polling interval in seconds. The interval is in the range of 5 to 300 and must be a multiple of 5.

Usage guidelines

The statistics polling interval configured in system view takes effect on all Ethernet interface.

The statistics polling interval configured in Ethernet interface view takes effect only on the current interface.

For an interface, the configuration in its Ethernet interface view takes priority. The configuration in system view is used when the configuration in Ethernet interface view is the default.

This command is not applicable to interfaces assigned to contexts in shared mode.

Examples

Set the statistics polling interval to 100 seconds on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] flow-interval 100
```

interface

Use **interface** to enter interface view, create a subinterface and enter its view, or enter the view of an existing subinterface.

Syntax

interface *interface-type* { *interface-number* | *interface-number.subnumber* }

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

interface-type: Specifies an interface type.

interface-number: Specifies an interface number.

interface-number.subnumber: Specifies a subinterface number. The *interface-number* argument is an interface number. The *subnumber* argument is the number of a subinterface created under the interface. The value range for the *subnumber* argument is 1 to 4094.

Examples

Enter the view of GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1]
```

Create Ethernet subinterface GigabitEthernet 1/0/1.1 and enter its view.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1.1
[Sysname-GigabitEthernet1/0/1.1]
```

jumboframe enable

Use **jumboframe enable** to allow jumbo frames within the specified length to pass through.

Use **undo jumboframe enable** to prevent jumbo frames from passing through.

Use **undo jumboframe enable** *size* to restore the default.

Syntax

jumboframe enable [*size*]

undo jumboframe enable [*size*]

Default

The device allows jumbo frames within a specific length to pass through. The length of jumbo frames that are allowed to pass through varies by device model.

Models	Default
NFNX5-HD6480, NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB1780, NFNX3-HDB3080	9216
NFNX3-HDB1180, NFNX3-HDB1480, NFNX3-HDB680, NFNX3-HDB1080	1600

Views

Layer 2 Ethernet interface view

Layer 3 Ethernet interface view

Predefined user roles

network-admin

context-admin

Parameters

size: Sets the maximum length (in bytes) of Ethernet frames that are allowed to pass through.

The following compatibility matrix shows the value ranges for the maximum jumbo frame size:

Models	Value range
NFNX5-HD6480, NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB1780, NFNX3-HDB3080	9216
NFNX3-HDB1180, NFNX3-HDB1480, NFNX3-HDB680, NFNX3-HDB1080	1600

Usage guidelines

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Allow jumbo frames to pass through GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] jumboframe enable
```

loopback

CAUTION:

After you enable loopback testing on an Ethernet interface, the interface does not forward data traffic.

Use **loopback** to enable loopback testing on an Ethernet interface.

Use **undo loopback** to disable loopback testing on an Ethernet interface.

Syntax

loopback { **external** | **internal** }

undo loopback

Default

Loopback testing is disabled on an Ethernet interface.

Views

Ethernet interface view

Predefined user roles

network-admin

context-admin

Parameters

external: Enables external loopback testing on the Ethernet interface.

internal: Enables internal loopback testing on the Ethernet interface.

Usage guidelines

After you enable loopback testing on an Ethernet interface, the Ethernet interface switches to full duplex mode. After you disable loopback testing, the Ethernet interface restores to its duplex setting.

The **shutdown** and **loopback** commands are mutually exclusive.

Examples

Enable internal loopback testing on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] loopback internal
```

multicast-suppression

Use **multicast-suppression** to enable multicast storm suppression and set the multicast storm suppression threshold.

Use **undo multicast-suppression** to disable multicast storm suppression.

Syntax

multicast-suppression { *ratio* | **pps** *max-pps* | **kbps** *max-kbps* }

undo multicast-suppression

Default

Ethernet interfaces do not suppress multicast traffic.

Views

Ethernet interface view

Predefined user roles

network-admin

context-admin

Parameters

ratio: Sets the multicast suppression threshold as a percentage of the interface bandwidth. The value range for this argument (in percentage) is 0 to 100. A smaller value means that less multicast traffic is allowed to pass through.

pps *max-pps*: Specifies the maximum number of multicast packets that the interface can forward per second. The value range for the *max-pps* argument (in pps) is 0 to 1.4881 × the interface bandwidth.

kbps *max-kbps*: Specifies the maximum number of kilobits of multicast traffic that the Ethernet interface can forward per second. The value range for this argument (in kbps) is 0 to the interface bandwidth.

Usage guidelines

The multicast storm suppression feature limits the size of multicast traffic to a threshold on an interface. When the multicast traffic on the interface exceeds this threshold, the system drops packets until the traffic drops below this threshold.

Both the **storm-constrain** command and the **multicast-suppression** command can suppress multicast storms on a port. The **multicast-suppression** command uses the chip to physically suppress multicast traffic. It has less influence on the device performance than the **storm-constrain** command, which uses software to suppress multicast traffic.

For the traffic suppression result to be determined, do not configure both the **storm-constrain multicast** command and the **multicast-suppression** command on an interface.

The configured suppression threshold value in pps or kbps might be converted into a multiple of a step supported by the chip. As a result, the effective suppression threshold might be different from the configured one. To determine the suppression threshold that takes effect, see the prompts on the device.

Examples

Set the multicast storm suppression threshold to 10000 kbps on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] multicast-suppression kbps 10000
```

Related commands

broadcast-suppression

unicast-suppression

port link-mode

Use **port link-mode** to change the link mode of an Ethernet interface.

Use **undo port link-mode** to restore the default.

Syntax

port link-mode { **bridge** | **route** }

undo port link-mode

Default

An Ethernet interface operates in Layer 3 mode.

Views

Ethernet interface view

Predefined user roles

network-admin

context-admin

Parameters

bridge: Specifies the Layer 2 mode.

route: Specifies the Layer 3 mode.

Usage guidelines

CAUTION:

Changing the link mode of an Ethernet interface also restores all commands (except **shutdown** and **combo enable**) on the Ethernet interface to their defaults in the new link mode.

Interfaces operate differently depending on the hardware structure of interface cards. For a device:

- Some Ethernet interfaces can operate only as Layer 2 Ethernet interfaces (in bridge mode).
- Some Ethernet interfaces can operate only as Layer 3 Ethernet interfaces (in route mode).
- Some Ethernet interfaces can operate either as Layer 2 or Layer 3 Ethernet interfaces. You can use this command to set the link mode to bridge or route for these Ethernet interfaces.

Examples

Configure GigabitEthernet 1/0/1 to operate in Layer 2 mode.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] port link-mode bridge
```

reset counters interface

Use **reset counters interface** to clear the interface statistics.

Syntax

reset counters interface [*interface-type* [*interface-number* | *interface-number.subnumber*]]

Views

User view

Predefined user roles

network-admin

context-admin

Parameters

interface-type: Specifies an interface type.

interface-number: Specifies an interface number.

interface-number.subnumber: Specifies a subinterface number. The *interface-number* argument is an interface number. The *subnumber* argument is the number of a subinterface created under the interface. The value range for the *subnumber* argument is 1 to 4094.

Usage guidelines

Use this command to clear history statistics if you want to collect traffic statistics for a specific time period.

If you do not specify an interface type, this command clears statistics for all interfaces except VA interfaces. For more information about VA interfaces, see PPPoE in *Layer 2—WAN Access Configuration Guide*.

If you specify an interface type but do not specify an interface number, this command clears statistics for all interfaces of the specified type.

Examples

Clear the statistics for GigabitEthernet 1/0/1.

```
<Sysname> reset counters interface gigabitethernet 1/0/1
```

Related commands

display counters interface

display counters rate interface

display interface

reset ethernet statistics

Use **reset ethernet statistics** to clear the Ethernet module statistics.

Syntax

reset ethernet statistics [**slot** *slot-number*]

Views

User view

Predefined user roles

network-admin

context-admin

Parameters

slot *slot-number:* Specifies an IRF member device by its member ID. If you do not specify a member device, this command clears statistics for all IRF member devices.

Examples

Clear the Ethernet module statistics for the specified slot.

```
<Sysname> reset ethernet statistics slot 1
```

Related commands

display ethernet statistics

reset packet-drop interface

Use **reset packet-drop interface** to clear the dropped packet statistics for an interface.

Syntax

reset packet-drop interface [*interface-type* [*interface-number*]]

Views

User view

Predefined user roles

network-admin

context-admin

Parameters

interface-type: Specify an interface type.

interface-number: Specify an interface number.

Usage guidelines

If you do not specify an interface type, this command clears dropped packet statistics for all interfaces on the device.

If you specify an interface type but do not specify an interface number, the command clears dropped packet statistics for all interfaces of the specified type.

Examples

Clear dropped packet statistics for GigabitEthernet 1/0/1.

```
<Sysname> reset packet-drop interface gigabitethernet 1/0/1
```

Clear dropped packet statistics for all interfaces.

```
<Sysname> reset packet-drop interface
```

Related commands

display packet-drop

shutdown

Use **shutdown** to shut down an Ethernet interface or subinterface.

Use **undo shutdown** to bring up an Ethernet interface or subinterface.

Syntax

shutdown

undo shutdown

Default

An Ethernet interface or subinterface is up.

Views

Ethernet interface view

Ethernet subinterface view

Predefined user roles

network-admin

context-admin

Usage guidelines

CAUTION:

Executing the **shutdown** command on an interface will disconnect the link of the interface and interrupt communication. Use this command with caution.

Some interface configurations might require an interface restart before taking effect.

The **shutdown** and **loopback** commands are mutually exclusive.

Examples

Shut down and then bring up GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] shutdown
[Sysname-GigabitEthernet1/0/1] undo shutdown
```

Shut down and then bring up GigabitEthernet 1/0/1.1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1.1
[Sysname-GigabitEthernet1/0/1.1] shutdown
[Sysname-GigabitEthernet1/0/1.1] undo shutdown
```

speed

Use **speed** to set the speed of an Ethernet interface.

Use **undo speed** to restore the default.

Syntax

speed { **10** | **100** | **1000** | **auto** }

undo speed

Default

An Ethernet interface autonegotiates its speed.

Views

Ethernet interface view

Predefined user roles

network-admin

context-admin

Parameters

10: Sets the interface speed to 10 Mbps.

100: Sets the interface speed to 100 Mbps.

1000: Sets the interface speed to 1000 Mbps.

auto: Enables the interface to negotiate a speed with its peer.

Usage guidelines

For an Ethernet copper port, use the **speed** command to set its speed to match the speed of the peer interface. Support of copper ports for keywords of this command varies by copper port type. For more information, use the **speed ?** command in interface view. If the system does not prompt that operation failed when you configure a speed for a copper port, the copper port supports this speed. Otherwise, the copper port does not support this speed.

For a fiber port, use the **speed** command to set its speed to match the rate of a transceiver module. Support of fiber ports for keywords of this command varies by fiber port type. For more information, use the **speed ?** command in interface view. If the system does not prompt that operation failed when you configure a speed for a fiber port, the fiber port supports this speed. Otherwise, the fiber port does not support this speed.

Additionally, you must select a speed for a fiber port according to the transceiver module installed to ensure that the transceiver module can be used properly. If the transceiver module installed in a fiber port does not support the speed for the fiber port, the transceiver module cannot be used. For example, the transceiver module cannot be used if the following conditions exist:

- The transceiver module installed in an SFP+ fiber port is an SFP GE transceiver module and the **speed 10000** command is executed on the fiber port.
- The transceiver module installed in an SFP+ fiber port is an SFP 10-GE transceiver module and the **speed 1000** command is executed on the fiber port.

Examples

Configure GigabitEthernet 1/0/1 to autonegotiate the speed.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] speed auto
```

sub-interface rate-statistic

Use **sub-interface rate-statistic** to enable rate statistics collection for the subinterfaces of an Ethernet interface.

Use **undo sub-interface rate-statistic** to disable rate statistics collection for the subinterfaces of an Ethernet interface.

Syntax

sub-interface rate-statistic

undo sub-interface rate-statistic

Default

The system does not collect rate statistics for the subinterfaces of an Ethernet interface.

Views

Ethernet interface view

Predefined user roles

network-admin

context-admin

Usage guidelines

This command is resource intensive. When you use this command, make sure you fully understand its impact on system performance.

Examples

Enable rate statistics collection for the subinterfaces of GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] sub-interface rate-statistic
This configuration may make a negative effect on the performance. Are you sure to continue?
[Y/N]:y
```

unicast-suppression

Use **unicast-suppression** to enable unknown unicast storm suppression and set the unknown unicast storm suppression threshold.

Use **undo unicast-suppression** to disable unknown unicast storm suppression.

Syntax

unicast-suppression { *ratio* | **pps** *max-pps* | **kbps** *max-kbps* }

undo unicast-suppression

Default

Ethernet interfaces do not suppress unknown unicast traffic.

Views

Ethernet interface view

Predefined user roles

network-admin

context-admin

Parameters

ratio: Sets the unknown unicast suppression threshold as a percentage of the interface bandwidth. The value range for this argument (in percentage) is 0 to 100. A smaller value means that less unknown unicast traffic is allowed to pass through.

pps *max-pps*: Specifies the maximum number of unknown unicast packets that the interface can forward per second. The value range for the *max-pps* argument (in pps) is 0 to 1.4881 × the interface bandwidth.

kbps *max-kbps*: Specifies the maximum number of kilobits of unknown unicast traffic that the Ethernet interface can forward per second. The value range for this argument (in kbps) is 0 to the interface bandwidth.

Usage guidelines

The unknown unicast storm suppression feature limits the size of unknown unicast traffic to a threshold on an interface. When the unknown unicast traffic on the interface exceeds this threshold, the system discards packets until the unknown unicast traffic drops below this threshold.

The configured suppression threshold value in pps or kbps might be converted into a multiple of a step supported by the chip. As a result, the effective suppression threshold might be different from the configured one. To determine the suppression threshold that takes effect, see the prompts on the device.

Examples

Set the unknown unicast storm suppression threshold to 10000 kbps on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] unicast-suppression kbps 10000
```

Layer 2 Ethernet interface commands

display storm-constrain

Use **display storm-constrain** to display storm control settings and statistics.

Syntax

display storm-constrain [**broadcast** | **multicast**] [**interface** *interface-type interface-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

broadcast: Displays broadcast storm control settings and statistics.

multicast: Displays multicast storm control settings and statistics.

interface *interface-type interface-number*: Specifies an interface by its type and number. If you do not specify this option, the command displays storm control settings and statistics for all storm control-enabled interfaces.

Usage guidelines

If you do not specify the **broadcast** or **multicast** keyword, this command displays all storm control settings on all storm control-enabled interfaces.

Examples

Display the storm control settings on all storm control-enabled ports.

```
<Sysname> display storm-constrain
Abbreviation: BC - broadcast; MC - multicast; UC - unicast;
              FW - forwarding
Flow Statistic Interval: 5 (in seconds)
Port          Type Lower     Upper     Unit  Mode     Status   Trap Log StateChg
------------------------------------------------------------------------------
GE1/0/1       MC   100       200       kbps  shutdown shutdown off  on  10
```

Table 8 Command output

Field	Description
Flow Statistic Interval	Traffic polling interval (in seconds) of the storm control module.
Port	Abbreviated interface name.
Type	Type of traffic subjected to storm control: • **BC**—Broadcast packets. • **MC**—Multicast packets. • **UC**—Unicast packets. This field is not supported in the current software version.
Lower	Lower storm control threshold.
Upper	Upper storm control threshold.
Unit	Storm control threshold unit, in pps, kbps, or percentage.
Mode	Action (block or shutdown) taken on the interface when the upper threshold is reached. N/A indicates that no action is configured.
Status	Packet forwarding status: • **FW**—The port is forwarding traffic correctly. • **shutdown**—The port has been shut down. • **block**—The port drops the type of traffic.
Trap	Status of the storm control threshold event trap switch: • **on**—The port sends threshold event traps. • **off**—The port does not send threshold event traps.
Log	Status of the storm control threshold event log switch: • **on**—The port sends threshold event log messages. • **off**—The port does not send threshold event log messages.
StateChg	Number of forwarding state changes of the interface. When the **StateChg** field reaches 65535, it resets automatically.

mdix-mode

IMPORTANT:
Fiber ports do not support this command.

Use **mdix-mode** to configure the Medium Dependent Interface Cross-Over (MDIX) mode of an Ethernet interface.

Use **undo mdix-mode** to restore the default.

Syntax

mdix-mode { **automdix** | **mdi**| **mdix** }

undo mdix-mode

Default

Ethernet interfaces operate in **automdix** mode.

Views

Layer 2 Ethernet interface view

Predefined user roles

network-admin

context-admin

Parameters

automdix: Specifies that the interface negotiates pin roles with its peer.

mdi: Specifies that pins 1 and 2 are transmit pins and pins 3 and 6 are receive pins.

mdix: Specifies that pins 1 and 2 are receive pins and pins 3 and 6 are transmit pins.

Examples

Configure GigabitEthernet 1/0/1 to operate in **automdix** mode.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] mdix-mode automdix
```

storm-constrain

Use **storm-constrain** to enable storm control and set thresholds for broadcast, multicast, or unknown unicast packets on an Ethernet interface.

Use **undo storm-constrain** to disable storm control for broadcast, multicast, unknown unicast, or all types of traffic.

Syntax

storm-constrain { **broadcast** | **multicast** } **pps** *upperlimit lowerlimit*

undo storm-constrain { **all** | **broadcast** | **multicast** }

Default

Traffic storm control is disabled.

Views

Layer 2 Ethernet interface view

Predefined user roles

network-admin

context-admin

Parameters

all: Disables storm control for all types of traffic: multicast and broadcast.

broadcast: Enables or disables broadcast storm control.

multicast: Enables or disables multicast storm control.

pps: Sets storm control thresholds in pps.

upperlimit: Sets the upper threshold. If you specify the **pps** keyword, the value range for the *upperlimit* argument is 0 to 1.4881 × the interface bandwidth.

lowerlimit: Sets the lower threshold. If you specify the **pps** keyword, the value range for the *lowerlimit* argument is 0 to 1.4881 × the interface bandwidth.

Usage guidelines

After you configure storm control for a type of traffic, the device collects the statistics for the type of traffic at the interval configured by using the **storm-constrain interval** command. When the type of traffic exceeds its upper threshold, the interface takes an action configured by using the **storm-constrain control** command.

The **storm-constrain**, **broadcast-suppression**, **multicast-suppression**, and **unicast-suppression** commands can suppress storms on an interface. The **broadcast-suppression**, **multicast-suppression**, and **unicast-suppression** commands use the chip to physically suppress traffic. They have less influence on the device performance than the **storm-constrain** command, which uses software to suppress traffic.

For the traffic suppression result to be determined, do not configure both storm control and storm suppression for the same type of traffic.

When configuring this command, make sure *upperlimit* is greater than *lowerlimit*.

Examples

Enable broadcast storm control on GigabitEthernet 1/0/1 and set the upper and lower thresholds to 200 pps and 150 pps, respectively.

<Sysname> system-view

```
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] storm-constrain broadcast pps 200 150
```

Related commands

storm-constrain control

storm-constrain interval

storm-constrain control

Use **storm-constrain control** to set the action to take on an Ethernet interface when a type of traffic (multicast or broadcast) exceeds the upper storm control threshold.

Use **undo storm-constrain control** to restore the default.

Syntax

storm-constrain control { **block** | **shutdown** }

undo storm-constrain control

Default

No action is taken on an Ethernet interface when a type of traffic exceeds the upper storm control threshold.

Views

Layer 2 Ethernet interface view

Predefined user roles

network-admin

context-admin

Parameters

block: Blocks the type of traffic exceeding the upper threshold and forwards other types of traffic. Even though the interface does not forward the blocked type of traffic, it still counts the traffic. When the blocked type of traffic drops below the lower threshold, the port begins to forward the traffic.

shutdown: Goes down automatically and stops forwarding any traffic. When the type of traffic exceeding the upper threshold drops below the lower threshold, the interface does not forward traffic. To bring up the interface, use the **undo shutdown** command or disable storm control on the interface.

Examples

Configure GigabitEthernet 1/0/1 to block a specific type of traffic when the type of traffic exceeds the upper storm control threshold.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] storm-constrain control block
```

Related commands

context-admin

Examples

Enable GigabitEthernet 1/0/1 to output log messages when it detects storm control threshold events.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] storm-constrain enable log
```

storm-constrain enable trap

Use **storm-constrain enable trap** to enable an Ethernet interface to send storm control threshold event traps.

Use **undo storm-constrain enable trap** to disable an Ethernet interface from sending storm control threshold event traps.

Syntax

storm-constrain enable trap

undo storm-constrain enable trap

Default

An interface sends out storm control threshold event traps when monitored traffic exceeds the upper threshold or drops below the lower threshold from a value above the upper threshold.

Views

Layer 2 Ethernet interface view

Predefined user roles

network-admin

context-admin

Examples

Enable GigabitEthernet 1/0/1 to send traps when it detects storm control threshold events.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] storm-constrain enable trap
```

storm-constrain interval

Use **storm-constrain interval** to set the traffic polling interval of the storm control module.

Use **undo storm-constrain interval** to restore the default.

Syntax

storm-constrain interval *interval*

undo storm-constrain interval

Default

The storm control module polls traffic statistics every 10 seconds.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

interval: Sets the traffic polling interval of the storm control module. The value range is 1 to 300 seconds. To ensure network stability, as a best practice, do not use a traffic polling interval shorter than 10 seconds.

Usage guidelines

The traffic polling interval set by using the **storm-constrain interval** command is specific to storm control. To set the statistics polling interval of an interface, use the **flow-interval** command.

Examples

Set the traffic statistics polling interval of the storm control module to 60 seconds.

```
<Sysname> system-view
[Sysname] storm-constrain interval 60
```

Related commands

storm-constrain

storm-constrain control

Layer 3 Ethernet interface or subinterface commands

mac-address

Use **mac-address** to set the MAC address of an Ethernet interface.

Use **undo mac-address** to restore the default.

Syntax

mac-address *mac-address*

undo mac-address

Default

The MAC address of a Layer 3 Ethernet interface varies by device model. The MAC address of a Layer 3 Ethernet subinterface is that of the main interface.

Views

Layer 3 Ethernet interface view

Layer 3 Ethernet subinterface view

Predefined user roles

network-admin

context-admin

Parameters

mac-address: Specifies a MAC address in the format of H-H-H.

Examples

Set the MAC address of GigabitEthernet 1/0/1 to 0001-0001-0001.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] mac-address 1-1-1
```

mac-address-filter enable

Use **mac-address-filter enable** to enable destination MAC filtering.

Use **undo mac-address-filter enable** to disable destination MAC filtering.

Syntax

mac-address-filter enable

undo mac-address-filter enable

Views

System view

Default

Destination MAC filtering is enabled.

Predefined user roles

network-admin

Usage guidelines

This feature takes effect only on Layer 3 Ethernet interfaces/subinterfaces, Layer 3 aggregate interfaces, and Layer 3 Reth interfaces. These interfaces are referred to as interfaces in this command.

Typically, use the default settings.

With this feature enabled, when an interface receives a packet, the interface operates as follows:

- If the destination MAC address of the packet is the MAC address of the interface, the interface accepts and processes the packet.
- If the destination MAC address of the packet is not the MAC address of the interface, the interface drops the packet.

With this feature disabled, an interface accepts and processes a packet, without checking the destination MAC address of the packet.

Examples

Enable destination MAC filtering.

```
<Sysname> system-view
[Sysname] mac-address-filter enable
```

mtu

Use **mtu** to set the MTU for an Ethernet interface or subinterface.

Use **undo mtu** to restore the default.

Syntax

mtu *size*

undo mtu

Default

The MTU of an Ethernet interface or subinterface is 1500 bytes.

Views

Layer 3 Ethernet interface view

Layer 3 Ethernet subinterface view

Predefined user roles

network-admin

context-admin

Parameters

size: Sets the MTU in bytes. The value range for this argument is 46 to 1560.

Usage guidelines

A smaller MTU size results in more fragments. When you set the MTU for an interface, consider QoS queue lengths, for example, consider that the default FIFO queue length is 75. To prevent a too small MTU from causing packet drops in QoS queuing, you can perform one of the following configurations:

- Tune the MTU with the **mtu** command.
- Tune QoS queue lengths with the **qos fifo queue-length** command.

For more information about the **qos fifo queue-length** command, see *ACL and QoS Command Reference*.

Examples

Set the MTU to 1430 bytes for GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] mtu 1430
```

Set the MTU to 1430 bytes for GigabitEthernet 1/0/1.1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1.1
[Sysname-GigabitEthernet1/0/1.1] mtu 1430
```

traffic-statistic enable

Use **traffic-statistic enable** to enable subinterface rate statistics collection for a Layer 3 Ethernet subinterface.

Use **undo traffic-statistic enable** to disable subinterface rate statistics collection for a Layer 3 Ethernet subinterface.

Syntax

traffic-statistic enable

undo traffic-statistic enable

Default

Subinterface rate statistics collection is disabled for a Layer 3 Ethernet subinterface.

Views

Layer 3 Ethernet subinterface view

Predefined user roles

network-admin

context-admin

Usage guidelines

This command is resource intensive. The system becomes busy and the CPU usage increases when you enable this feature on a large number of Ethernet subinterfaces or set a shorter interval by using the **flow-interval** command.

You can use the **display interface** or **display counters** command to display the subinterface rate statistics.

Examples

Enable subinterface rate statistics collection for GigabitEthernet 1/0/1.1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1.1
[Sysname-GigabitEthernet1/0/1.1] traffic-statistic enable
```

Related commands

Contents

Loopback, null, and inloopback interface commands

bandwidth

Use **bandwidth** to set the expected bandwidth for an interface.

Use **undo bandwidth** to restore the default.

Syntax

bandwidth *bandwidth-value*

undo bandwidth

Default

The expected bandwidth of a loopback interface is 0 kbps.

Views

Loopback interface view

Predefined user roles

network-admin

context-admin

Parameters

bandwidth-value: Specifies the expected bandwidth in the range of 1 to 400000000 kbps.

Usage guidelines

The expected bandwidth is an informational parameter used only by higher-layer protocols for calculation. You cannot adjust the actual bandwidth of an interface by using this command.

Examples

Set the expected bandwidth of Loopback 0 to 1000 kbps.

```
<Sysname> system-view
[Sysname] interface loopback 0
[Sysname-LoopBack0] bandwidth 1000
```

default

Use **default** to restore the default settings for an interface.

Syntax

default

Views

Loopback interface view

Null interface view

Predefined user roles

network-admin

context-admin

Usage guidelines

CAUTION:

The **default** command might interrupt ongoing network services. Make sure you are fully aware of the impact of this command before using it on a live network.

This command might fail to restore the default settings for some commands for reasons such as command dependencies and system restrictions. Use the **display this** command in interface view to identify these commands, and then use their **undo** forms or follow the command reference to restore their default settings. If your restoration attempt still fails, follow the error message instructions to resolve the problem.

Examples

Restore the default settings for Loopback 0.

```
<Sysname> system-view
[Sysname] interface loopback 0
[Sysname-LoopBack0] default
```

description

Use **description** to configure the description of an interface.

Use **undo description** to restore the default.

Syntax

description *text*

undo description

Default

The interface description uses the *interface name* **Interface** format, for example, LoopBack0 **Interface**.

Views

Loopback interface view

Null interface view

Predefined user roles

network-admin

context-admin

Parameters

text: Specifies the description, a case-sensitive string of 1 to 255 characters.

Usage guidelines

Configure a description for an interface for easy identification and management purposes.

You can use the **display interface** command to view the configured description.

Examples

Configure the description of Loopback 0 as **for RouterID**.

```
<Sysname> system-view
[Sysname] interface loopback 0
[Sysname-LoopBack0] description for RouterID
```

display interface inloopback

Use **display interface inloopback** to display information about the inloopback interface.

Syntax

display interface [**inloopback** [**0**]] [**brief** [**description** | **down**]]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

inloopback [**0**]: Specifies an inloopback interface by its number. If you do not specify the **inloopback** keyword, the command displays information about all interfaces except VA interfaces. For more information about VA interfaces, see PPP in *Layer 2—WAN Access Configuration Guide*.

brief: Displays brief interface information. If you do not specify this keyword, the command displays detailed interface information.

description: Displays complete interface descriptions. If you do not specify this keyword, the command displays only the first 27 characters of interface descriptions. The description of an inloopback interface is always **InLoopBack0 Interface** and cannot be configured.

down: Displays information about interfaces in down state and the causes. If you do not specify this keyword, the command displays information about interfaces in all states.

Usage guidelines

The device has only one inloopback interface Inloopback 0. If you specify the **inloopback** keyword, the command displays information about the interface Inloopback 0 regardless of whether you specify the **0** keyword.

Examples

Display detailed information about Inloopback 0.

```
<Sysname> display interface inloopback
InLoopBack0
Current state: UP
Line protocol state: UP(spoofing)
Description: InLoopBack0 Interface
Maximum transmission unit: 1536
Physical: InLoopBack
Last 300 seconds input rate: 0 bytes/sec, 0 bits/sec, 0 packets/sec
Last 300 seconds output rate: 0 bytes/sec, 0 bits/sec, 0 packets/sec
Input: 0 packets, 0 bytes, 0 drops
Output: 0 packets, 0 bytes, 0 drops
```

Table 1 Command output

Field	Description
Current state	Physical link state of the interface, which is always **UP**, meaning that the inloopback interface can receive and transmit packets.
Line protocol state	Data link layer state of the interface, which is always **UP(spoofing)**. **UP(spoofing)** represents that the data link layer protocol of the interface is up, but the link is an on-demand link or does not exist. This attribute is typical of null interfaces and loopback interfaces.
Description	Description of the interface, which is always **InLoopBack0 Interface** and cannot be configured.
Maximum transmission unit	MTU of the interface.
Physical: InLoopBack	The physical type of the interface is inloopback.
Last 300 seconds input rate: 0 bytes/sec, 0 bits/sec, 0 packets/sec	Average input rate during the last 300 seconds (displayed when the interface supports traffic statistics collection): • **bytes/sec**—Average number of bytes received per second. • **bits/sec**—Average number of bits received per second. • **packets/sec**—Average number of packets received per second.
Last 300 seconds output rate: 0 bytes/sec, 0 bits/sec, 0 packets/sec	Average output rate over the last 300 seconds (displayed when the interface supports traffic statistics collection): • **bytes/sec**—Average number of bytes sent per second. • **bits/sec**—Average number of bits sent per second. • **packets/sec**—Average number of packets sent per second.
Input: 0 packets, 0 bytes, 0 drops	Total number and size (in bytes) of incoming packets of the interface and the number of dropped packets (displayed when the interface supports traffic statistics collection).
Output: 0 packets, 0 bytes, 0 drops	Total number and size (in bytes) of outgoing packets of the interface and the number of dropped packets (displayed when the interface supports traffic statistics collection).

Display brief information about Inloopback 0.

```
<Sysname> display interface inloopback 0 brief
Brief information on interfaces in route mode:
Link: ADM - administratively down; Stby - standby
Protocol: (s) - spoofing
Interface            Link Protocol Primary IP         Description
InLoop0              UP   UP(s)    --
```

Table 2 Command output

Field	Description
Link	Physical link state of the interface, which is always **UP**, meaning that the link is physically up.
Protocol	Data link layer protocol state of the interface, which is always **UP(s)**. **UP(s)** represents that the data link layer protocol of the interface is up, but the link is an on-demand link or does not exist. The **(s)** attribute represents the spoofing flag. This value is typical of null interfaces and loopback interfaces.

Field	Description
Primary IP	IP address of the interface. Because inloopback interfaces do not support CLI configuration, this field does not display a value.
Description	Description of the interface. Because inloopback interfaces do not support CLI configuration, this field does not display a value.

display interface loopback

Use **display interface loopback** to display information about the specified or all existing loopback interfaces.

Syntax

display interface [**loopback** [*interface-number*]] [**brief** [**description** | **down**]]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

loopback [*interface-number*]: Specifies a loopback interface by its number, which can be the number of any existing loopback interface. If you do not specify the **loopback** keyword, the command displays information about all interfaces except VA interfaces. If you specify the **loopback** keyword but do not specify the *interface-number* argument, the command displays information about all existing loopback interfaces on the device. For more information about VA interfaces, see PPP in *Layer 2—WAN Access Configuration Guide*.

brief: Displays brief interface information. If you do not specify this keyword, the command displays detailed interface information.

description: Displays complete interface descriptions. If you do not specify this keyword, the command displays only the first 27 characters of interface descriptions.

down: Displays information about interfaces in down state and the causes. If you do not specify this keyword, the command displays information about interfaces in all states.

Usage guidelines

This command is supported only after a loopback interface is created.

Examples

Display detailed information about Loopback 0.

```
<Sysname> display interface loopback 0
LoopBack0
Current state: UP
Line protocol state: UP(spoofing)
```

```
Description: LoopBack0 Interface
Bandwidth: 1000 kbps
Maximum transmission unit: 1536
Internet protocol processing: Disabled
Physical: Loopback
Last clearing of counters:  Never
Last 300 seconds input rate:  0 bytes/sec, 0 bits/sec, 0 packets/sec
Last 300 seconds output rate:  0 bytes/sec, 0 bits/sec, 0 packets/sec
Input: 0 packets, 0 bytes, 0 drops
Output: 0 packets, 0 bytes, 0 drops
```

Table 3 Command output

Field	Description
Current state	Physical link state of the interface: • **UP**—The loopback interface can receive and transmit packets. • **Administratively DOWN**—The interface has been shut down by using the **shutdown** command.
Line protocol state	Data link layer state of the interface. **UP (spoofing)** means that the data link layer protocol of the interface is up, but the link is an on-demand link or does not exist. This attribute is typical of null interfaces and loopback interfaces.
Description	Description of the interface.
Bandwidth	Expected bandwidth of the interface. This field is not displayed when the value is 0.
Maximum transmission unit	MTU of the interface.
Internet protocol processing: Disabled	The interface is not assigned an IP address and cannot process IP packets.
Internet address: *ip-address*/*mask-length* (*Type*)	IP address of the interface and type of the address in parentheses. Possible IP address types include: • **Primary**—Manually configured primary IP address. • **Sub**—Manually configured secondary IP address. If the interface has both primary and secondary IP addresses, the primary IP address is displayed. If the interface has only secondary IP addresses, the lowest secondary IP address is displayed. • **DHCP-Allocated**—DHCP allocated IP address. For more information, see DHCP client configuration in *Layer 3—IP Services Configuration Guide*. • **BOOTP-Allocated**—BOOTP allocated IP address. For more information, see BOOTP client configuration in *Layer 3—IP Services Configuration Guide*. • **PPP-Negotiated**—IP address assigned by a PPP server during PPP negotiation. For more information, see PPP configuration in *Layer 2—WAN Access Configuration Guide*. • **Unnumbered**—IP address borrowed from another interface. • **Cellular-Allocated**—IP address allocated through the modem manufacturer's proprietary protocol. For more information, see mobile communication modem management in *Layer 2—WAN Access Configuration Guide*. • **MAD**—IP address assigned to an IRF member device for MAD on the interface. For more information, see IRF configuration in *Virtual Technologies Configuration Guide*.

Field	Description
Physical: Loopback	The physical type of the interface is loopback.
baudrate	Baud rate in Kbps.
Last clearing of counters	Time when statistics on the logical interface were last cleared by using the **reset counters interface** command. If the statistics of the interface have never been cleared by using the **reset counters interface** command since the device started, this field displays **Never**.
Last 300 seconds input rate: 0 bytes/sec, 0 bits/sec, 0 packets/sec	Average input rate during the last 300 seconds (displayed when the interface supports traffic statistics collection): • **bytes/sec**—Average number of bytes received per second. • **bits/sec**—Average number of bits received per second. • **packets/sec**—Average number of packets received per second.
Last 300 seconds output rate: 0 bytes/sec, 0 bits/sec, 0 packets/sec	Average output rate over the last 300 seconds (displayed when the interface supports traffic statistics collection): • **bytes/sec**—Average number of bytes sent per second. • **bits/sec**—Average number of bits sent per second. • **packets/sec**—Average number of packets sent per second.
Input: 0 packets, 0 bytes, 0 drops	Total number and size (in bytes) of incoming packets of the interface and the number of dropped packets (displayed when the interface supports traffic statistics collection).
Output: 0 packets, 0 bytes, 0 drops	Total number and size (in bytes) of outgoing packets of the interface and the number of dropped packets (displayed when the interface supports traffic statistics collection).

Display brief information about all loopback interfaces.

```
<Sysname> display interface loopback brief
Brief information on interfaces in route mode:
Link: ADM - administratively down; Stby - standby
Protocol: (s) - spoofing
Interface            Link Protocol Primary IP      Description
Loop0                UP   UP(s)    --              forLAN1
```

Display information about all loopback interfaces in down state and the causes.

```
<Sysname> display interface loopback brief down
Brief information on interfaces in route mode:
Link: ADM - administratively down; Stby - standby
Interface            Link Cause
Loop0                ADM  Administratively
```

Table 4 Command output

Field	Description
Link	Physical link state of the interface: • **UP**—The interface is physically up. • **DOWN**—The interface is physically down. • **ADM**—The interface has been shut down by using the **shutdown** command. To restore the physical state of the interface, use the **undo shutdown** command. • **Stby**—The interface is a backup interface in standby state.

Field	Description
Protocol	Data link layer protocol state of the interface, which is always **UP(s)**. **UP(s)** represents that the data link layer protocol of the interface is up, but the link is an on-demand link or does not exist. The **(s)** attribute represents the spoofing flag. This value is typical of null interfaces and loopback interfaces.
Primary IP	Primary IP address of the interface.
Description	Description of the interface.
Cause	Cause for the physical link state of the interface to be **DOWN**. **Administratively** represents that the interface has been manually shut down by using the **shutdown** command. To restore the physical state of the interface, use the **undo shutdown** command.

Related commands

reset counters interface loopback

display interface null

Use **display interface null** to display information about the null interface.

Syntax

display interface [**null** [**0**]] [**brief** [**description** | **down**]]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

null [**0**]: Specifies a null interface by its number. If you do not specify the **null** keyword, the command displays information about all interfaces except VA interfaces. For more information about VA interfaces, see PPP in *Layer 2—WAN Access Configuration Guide*.

brief: Displays brief interface information. If you do not specify this keyword, the command displays detailed interface information.

description: Displays complete interface descriptions. If you do not specify this keyword, the command displays only the first 27 characters of interface descriptions.

down: Displays information about interfaces in down state and the causes. If you do not specify this keyword, the command displays information about interfaces in all states.

Usage guidelines

The device has only one null interface Null 0. If you specify the **null** keyword, the command displays information about the interface Null 0 regardless of whether you specify the **0** keyword.

Examples

Display detailed information about Null 0.

```
<Sysname> display interface null 0
NULL0
Current state: UP
Line protocol state: UP(spoofing)
Description: NULL0 Interface
Bandwidth: 1000000 kbps
Maximum transmission unit: 1500
Internet protocol processing: Disabled
Physical: NULL DEV, baudrate: 1000000 kbps
Last clearing of counters: Never
Last 300 seconds input rate:  0 bytes/sec, 0 bits/sec, 0 packets/sec
Last 300 seconds output rate:  0 bytes/sec, 0 bits/sec, 0 packets/sec
Input: 0 packets, 0 bytes, 0 drops
Output: 0 packets, 0 bytes, 0 drops
```

Display brief information about Null 0.

```
<Sysname> display interface null 0 brief
Brief information on interfaces in route mode:
Link: ADM - administratively down; Stby - standby
Protocol: (s) - spoofing
Interface            Link Protocol Primary IP         Description
NULL0                UP   UP(s)    --
```

For the command output, see Table 3 and Table 4.

Related commands

`interface null`

`reset counters interface null`

interface loopback

Use **`interface loopback`** to create a loopback interface and enter its view, or enter the view of an existing loopback interface.

Use **`undo interface loopback`** to remove a loopback interface.

Syntax

`interface loopback` *`interface-number`*

`undo interface loopback` *`interface-number`*

Default

No loopback interfaces exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

interface-number: Specifies a loopback interface by its number. The value range for this argument is 0 to 1023.

Usage guidelines

The physical layer state and link layer protocols of a loopback interface are always up unless the loopback interface is manually shut down. You can use a loopback interface to achieve the following purposes:

- Prevent the connection from being affected by the physical state of the interface.
- Improve the reliability of the connection.

For example, you can configure a loopback interface as the source interface for establishing an FTP connection, or use the loopback interface address as the Router ID in BGP.

Examples

Create Loopback 0.

```
<Sysname> system-view
[Sysname] interface loopback 0
[Sysname-LoopBack0]
```

interface null

Use **interface null** to enter null interface view.

Syntax

interface null 0

Default

A device has only one null interface (Null 0), which cannot be created or deleted.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

0: Specifies Null 0. The null interface number is always 0.

Examples

Enter Null 0 interface view.

```
<Sysname> system-view
[Sysname] interface null 0
[Sysname-NULL0]
```

reset counters interface loopback

Use **reset counters interface loopback** to clear the statistics on the specified or all loopback interfaces.

Syntax

reset counters interface [**loopback** [*interface-number*]]

Views

User view

Predefined user roles

network-admin

context-admin

Parameters

loopback [*interface-number*]: Specifies a loopback interface by its number. If you do not specify the **loopback** keyword, the command clears the statistics on all interfaces except VA interfaces. If you specify the **loopback** keyword but do not specify the *interface-number* argument, the command clears the statistics on all loopback interfaces.

Usage guidelines

To determine whether a loopback interface works correctly within a period by collecting the traffic statistics within that period, first use the **reset counters interface** [**loopback** [*interface-number*]] command to clear the statistics. Then have the interface automatically collect the statistics.

This command is available only if a minimum of one loopback interface has been created.

Examples

Clear the statistics on Loopback 0.

```
<Sysname> reset counters interface loopback 0
```

Related commands

display interface loopback

reset counters interface null

Use **reset counters interface null** to clear the statistics on the null interface.

Syntax

reset counters interface [**null** [**0**]]

Views

User view

Predefined user roles

network-admin

context-admin

Parameters

null [**0**]: Specifies a null interface by its number. If you do not specify the **null** keyword, the command clears the statistics on all interfaces except VA interfaces.

Usage guidelines

To determine whether the null interface works correctly within a period by collecting the traffic statistics within that period, first use the **reset counters interface** [**null** [**0**]] command to clear the statistics. Then have the interface automatically collect the statistics.

Examples

Clear the statistics on Null 0.

```
<Sysname> reset counters interface null 0
```

Related commands

display interface null

shutdown

Use **shutdown** to shut down a loopback interface.

Use **undo shutdown** to bring up a loopback interface.

Syntax

shutdown

undo shutdown

Default

A loopback interface is up.

Views

Loopback interface view

Predefined user roles

network-admin

context-admin

Usage guidelines

CAUTION:

Use the **shutdown** command with caution, because the command disconnects the connection of the interface and disables the interface from communicating.

Examples

Shut down Loopback 0.

```
<Sysname> system-view
[Sysname] interface loopback 0
[Sysname-LoopBack0] shutdown
```

NSFOCUS Firewall Series

NF Layer 2—LAN Switching Command Reference

NSFOCUS Technologies, Inc.

Document version: 6W600-20230221

Preface

This command reference describes the commands for configuring LAN switching features, including MAC address table, Ethernet link aggregation, spanning tree, VLANs, VLAN termination, LLDP, and Layer 2 forwarding.

This preface includes the following topics about the documentation:

- Audience.
- Conventions.

Audience

This documentation is intended for:

- Network planners.
- Field technical support and servicing engineers.
- Network administrators.

Conventions

The following information describes the conventions used in the documentation.

Command conventions

Convention	Description
Boldface	**Bold** text represents commands and keywords that you enter literally as shown.
Italic	*Italic* text represents arguments that you replace with actual values.
[ ]	Square brackets enclose syntax choices (keywords or arguments) that are optional.
{ x | y | ... }	Braces enclose a set of required syntax choices separated by vertical bars, from which you select one.
[x | y | ...]	Square brackets enclose a set of optional syntax choices separated by vertical bars, from which you select one or none.
{ x | y | ... } *	Asterisk marked braces enclose a set of required syntax choices separated by vertical bars, from which you select a minimum of one.
[x | y | ...] *	Asterisk marked square brackets enclose optional syntax choices separated by vertical bars, from which you select one choice, multiple choices, or none.
&<1-n>	The argument or keyword and argument combination before the ampersand (&) sign can be entered 1 to n times.
#	A line that starts with a pound (#) sign is comments.

GUI conventions

Convention	Description
Boldface	Window names, button names, field names, and menu items are in Boldface. For example, the **New User** window opens; click **OK**.
>	Multi-level menus are separated by angle brackets. For example, **File** > **Create** > **Folder**.

Symbols

Convention	Description
WARNING!	An alert that calls attention to important information that if not understood or followed can result in personal injury.
CAUTION:	An alert that calls attention to important information that if not understood or followed can result in data loss, data corruption, or damage to hardware or software.
IMPORTANT:	An alert that calls attention to essential information.
NOTE:	An alert that contains additional or supplementary information.
TIP:	An alert that provides helpful information.

Network topology icons

Convention	Description
	Represents a generic network device, such as a router, switch, or firewall.
	Represents a routing-capable device, such as a router or Layer 3 switch.
	Represents a generic switch, such as a Layer 2 or Layer 3 switch, or a router that supports Layer 2 forwarding and other Layer 2 features.
	Represents an access controller, a unified wired-WLAN module, or the access controller engine on a unified wired-WLAN switch.
	Represents an access point.
	Represents a wireless terminator unit.
	Represents a wireless terminator.
	Represents a mesh access point.
	Represents omnidirectional signals.
	Represents directional signals.
	Represents a security product, such as a firewall, UTM, multiservice security gateway, or load balancing device.
	Represents a security module, such as a firewall, load balancing, NetStream, SSL VPN, IPS, or ACG module.

Examples provided in this document

Examples in this document might use devices that differ from your device in hardware model, configuration, or software version. It is normal that the port numbers, sample output, screenshots, and other information in the examples differ from what you have on your device.

Contents

MAC address table commands

display mac-address

Use **display mac-address** to display MAC address entries.

Syntax

display mac-address [*mac-address* [**vlan** *vlan-id*] | [[**dynamic** | **static**] [**interface** *interface-type interface-number*] | **blackhole**] [**vlan** *vlan-id*] [**count**]]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

mac-address: Specifies a MAC address in the format of H-H-H. When entering a MAC address, you can omit the leading zeros in each H section. For example, enter f-e2-1 for 000f-00e2-0001.

vlan *vlan-id*: Specifies a VLAN by its ID in the range of 1 to 4094.

dynamic: Displays dynamic MAC address entries.

static: Displays static MAC address entries.

interface *interface-type interface-number*: Specifies an interface by its type and number.

blackhole: Displays blackhole MAC address entries.

count: Displays only the number of MAC address entries that match all entry attributes you specify in the command. Detailed information about MAC address entries is not displayed. For example, you can use the **display mac-address vlan 20 dynamic count** command to display the number of dynamic entries for VLAN 20. If you do not specify an entry attribute, the command displays the number of entries in the MAC address table. If you do not specify this keyword, the command displays detailed information about the specified MAC address entries.

Usage guidelines

Use this command to display static, dynamic, or blackhole MAC address entries. A MAC address entry includes a destination MAC address, an outgoing interface, and a VLAN ID.

If you do not specify any parameters, the command displays all MAC address entries.

This command displays dynamic MAC address entries for an aggregate interface only when the aggregate interface has a minimum of one Selected member port.

Examples

Display MAC address entries for VLAN 100.

```
<Sysname> display mac-address vlan 100
MAC Address      VLAN ID    State           Port/Nickname           Aging
```

```
0033-0033-0033   100        Blackhole        N/A                  N
0000-0000-0002   100        Static           GE1/0/3              N
00e0-fc00-5829   100        Learned          GE1/0/4              Y
```

Display the number of MAC address entries.

```
<Sysname> display mac-address count
1 mac address(es) found.
```

Table 1 Command output

Field	Description
VLAN ID	ID of the VLAN to which the outgoing interface of the MAC address entry belongs.
State	MAC address entry state: • **Static**—Static MAC address entry. • **Learned**—Dynamic MAC address entry. Dynamic entries can be learned or manually configured. • **Blackhole**—Blackhole MAC address entry. • **Drop aging**—MAC address entry that can age out. Packets from this MAC address are dropped. • **Drop no-aging**—MAC address entry that cannot age out. Packets from this MAC address are dropped. • **Vlan-interface**—MAC address entry of a VLAN interface.
Port/Nickname	When the field displays an interface name, the field indicates the outgoing interface for packets that are destined for the MAC address. This field displays **N/A** for a blackhole MAC address entry. The **Nickname** field is not supported in the current software version.
Aging	Whether the entry can age out: • **Y**—The entry can age out. • **N**—The entry never ages out.
mac address(es) found	Number of matching MAC address entries.

display mac-address mac-learning

Use **display mac-address mac-learning** to display the global MAC address learning status and the MAC learning status of the specified interface or all interfaces.

Syntax

display mac-address mac-learning [**interface** *interface-type interface-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

interface *interface-type interface-number*: Specifies an interface by its type and number. If you do not specify an interface, the command displays the global MAC address learning status and the MAC address learning status of all interfaces.

Examples

Display the global MAC address learning status and the MAC learning status of all interfaces.

```
<Sysname> display mac-address mac-learning
Global MAC address learning status: Enabled.

Port                         Learning Status
GE1/0/1                      Enabled
GE1/0/2                      Enabled
```

Table 2 Command output

Field	Description
Global MAC address learning status	Global MAC address learning status: • Enabled. • Disabled.
Learning Status	MAC address learning status of an interface: • Enabled. • Disabled.

Related commands

mac-address mac-learning enable

mac-address (interface view)

Use **mac-address** to add or modify a MAC address entry on an interface.

Use **undo mac-address** to delete a MAC address entry on an interface.

Syntax

mac-address { **dynamic** | **static** } *mac-address* **vlan** *vlan-id*

undo mac-address { **dynamic** | **static** } *mac-address* **vlan** *vlan-id*

Default

An interface is not configured with MAC address entries.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

context-admin

Parameters

dynamic: Specifies dynamic MAC address entries.

static: Specifies static MAC address entries.

mac-address: Specifies a MAC address in the format of H-H-H, excluding multicast, all-zero, and all-F MAC addresses. When entering a MAC address, you can omit the leading zeros in each H section. For example, enter f-e2-1 for 000f-00e2-0001.

vlan *vlan-id*: Specifies an existing VLAN to which the specified interface belongs. The value range for the *vlan-id* argument is 1 to 4094.

Usage guidelines

Typically, the device automatically builds the MAC address table by learning the source MAC addresses of incoming frames on each interface. However, you can manually configure static MAC address entries. For a MAC address, a manually configured static entry takes precedence over a dynamically learned entry. To improve the security for the user device connected to an interface, manually configure a static entry to bind the user device to the interface. Then, the frames destined for the user device (for example, Host A) are always sent out of the interface. Other hosts using the forged MAC address of Host A cannot obtain the frames destined for Host A.

The MAC address entry configuration cannot survive a reboot unless you save it. The dynamic MAC address entries, however, are lost upon reboot whether or not you save the configuration.

Examples

Add a static entry for MAC address 000f-e201-0101 on GigabitEthernet 1/0/1 that belongs to VLAN 2.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] mac-address static 000f-e201-0101 vlan 2
```

Add a static entry for MAC address 000f-e201-0101 on Bridge-Aggregation 1 that belongs to VLAN 1.

```
<Sysname> system-view
[Sysname] interface bridge-aggregation 1
[Sysname-Bridge-Aggregation1] mac-address static 000f-e201-0102 vlan 1
```

Related commands

display mac-address

mac-address (system view)

mac-address (system view)

Use **mac-address** to add or modify a MAC address entry.

Use **undo mac-address** to delete one or all MAC address entries.

Syntax

mac-address { **dynamic** | **static** } *mac-address* **interface** *interface-type interface-number* **vlan** *vlan-id*

mac-address blackhole *mac-address* **vlan** *vlan-id*

undo mac-address [[**dynamic** | **static**] *mac-address* **interface** *interface-type interface-number* **vlan** *vlan-id*]

undo mac-address [**blackhole** | **dynamic** | **static**] [*mac-address*] **vlan** *vlan-id*

undo mac-address [**dynamic** | **static**] **interface** *interface-type interface-number*

Default

The system is not configured with MAC address entries.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

dynamic: Specifies dynamic MAC address entries.

static: Specifies static MAC address entries.

blackhole: Specifies blackhole MAC address entries. Packets whose source or destination MAC addresses match blackhole MAC address entries are dropped.

mac-address: Specifies a MAC address in the format of H-H-H, excluding multicast, all-zero, and all-F MAC addresses. When entering a MAC address, you can omit the leading zeros in each H section. For example, enter f-e2-1 for 000f-00e2-0001.

vlan *vlan-id*: Specifies an existing VLAN to which the interface belongs. The value range for the *vlan-id* argument is 1 to 4094.

interface *interface-type interface-number*: Specifies an outgoing interface by its type and number.

Usage guidelines

You can use this command to configure the following types of MAC address entries:

- Dynamic entries.

Dynamic entries include manually configured dynamic entries and automatically learned dynamic entries.

- Static entries.

  For a MAC address, a manually configured static entry takes precedence over a dynamic entry. To improve the security for the user device connected to an interface, manually configure a static entry to bind the user device to the interface. Then, the frames destined for the user device (for example, Host A) are always sent out of the interface. Other hosts using the forged MAC address of Host A cannot obtain the frames destined for Host A.

- Blackhole entries.

  To drop frames with the specified source MAC addresses or destination MAC addresses, you can configure blackhole entries.

A static or blackhole entry can overwrite a dynamic entry, but not vice versa.

If you execute the **undo mac-address** command without specifying any parameters, this command deletes all unicast MAC address entries and static multicast MAC address entries.

You can delete all the MAC address entries (including unicast and static multicast MAC address entries) from the specified VLAN. You can also delete only one type (dynamic, static, or blackhole) of MAC address entries. You can single out an interface and delete the unicast MAC address entries on it, but not the static multicast MAC address entries.

The MAC address entry configuration cannot survive a reboot unless you save it. The dynamic MAC address entries, however, are lost upon reboot whether or not you save the configuration.

Examples

Add a static entry for MAC address 000f-e201-0101. Then, all frames that are destined for this MAC address are sent out of GigabitEthernet 1/0/1, which belongs to VLAN 2.

```
<Sysname> system-view
[Sysname] mac-address static 000f-e201-0101 interface gigabitethernet 1/0/1 vlan 2
```

Related commands

mac-address mac-learning enable

Use **mac-address mac-learning enable** to enable MAC address learning globally, on an interface, or on a VLAN.

Use **undo mac-address mac-learning enable** to disable MAC address learning globally or on an interface.

Syntax

mac-address mac-learning enable

undo mac-address mac-learning enable

Default

MAC address learning is enabled.

Views

System view

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

VLAN view

Predefined user roles

network-admin

context-admin

Usage guidelines

To prevent the MAC address table from becoming saturated, you can disable MAC address learning.

For example, a number of packets with different source MAC addresses reaching a device can affect the MAC address table update. To avoid such attacks, you can disable MAC address learning by following these guidelines:

- You can disable MAC address learning on a per-interface basis. If you disable MAC address learning globally, MAC address learning is disabled for all interfaces. The device then stops learning MAC addresses and cannot dynamically update the MAC address table.
- Because disabling MAC address learning can result in broadcast storms, enable broadcast storm suppression after you disable MAC address learning on an interface. For more information about broadcast storm suppression, see *Interface Configuration Guide*.
- With MAC address learning enabled globally, you can disable MAC address learning for an interface.
- After MAC address learning is disabled, existing dynamic MAC address entries can age out.

Examples

Disable MAC address learning globally.

```
<Sysname> system-view
[Sysname] undo mac-address mac-learning enable
```

Disable MAC address learning on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] undo mac-address mac-learning enable
```

Related commands

display mac-address mac-learning

mac-address mac-learning priority

Use **mac-address mac-learning priority** to assign MAC learning priority to an interface.

Use **undo mac-address mac-learning priority** to restore the default.

Syntax

mac-address mac-learning priority { **high** | **low** }

undo mac-address mac-learning priority

Default

Low MAC address learning priority is used.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

context-admin

Parameters

high: Assigns high MAC learning priority.

low: Assigns low MAC learning priority.

Usage guidelines

The MAC address learning priority values can be high and low. An interface with high MAC address learning priority can learn any MAC address. An interface with low MAC address learning priority can learn only the MAC addresses that have not been learned by high-priority interfaces.

The MAC learning priority mechanism can help defend your network against MAC address spoofing attacks. To prevent the downlink interface from learning the MAC address of an upper layer device (for example, the gateway), you can perform the following tasks:

- Assign high MAC learning priority to an uplink interface.
- Assign low MAC learning priority to a downlink interface.

Examples

Assign high MAC learning priority to GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] mac-address mac-learning priority high
```

Assign high MAC learning priority to Bridge-Aggregation 1.

```
<Sysname> system-view
[Sysname] interface bridge-aggregation 1
[Sysname-Bridge-Aggregation1] mac-address mac-learning priority high
```

mac-address max-mac-count

Use **mac-address max-mac-count** to set the MAC learning limit on an interface.

Use **undo mac-address max-mac-count** to restore the default.

Syntax

mac-address max-mac-count *count*

undo mac-address max-mac-count

Default

The maximum number of MAC addresses that an interface can learn is restricted by hardware capability of the device.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

context-admin

Parameters

count: Specifies the maximum number of MAC addresses that can be learned on an interface. When the argument is set to 0, the interface is not allowed to learn MAC addresses.

The following compatibility matrixes show the value ranges for this argument:

Models	Value range
NFNX5-HD6480, NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB1780, NFNX3-HDB3080	0 to 4096
NFNX3-HDB1180, NFNX3-HDB1480, NFNX3-HDB680, NFNX3-HDB1080	0 to 1024

Usage guidelines

This command helps limit the MAC address table size. When the number of MAC address entries learned by an interface reaches the limit, the interface stops learning MAC address entries.

Examples

Configure GigabitEthernet 1/0/1 to learn a maximum of 200 MAC address entries.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] mac-address max-mac-count 200
```

Related commands

mac-address

mac-address max-mac-count enable-forwarding

mac-address max-mac-count enable-forwarding

Use **mac-address max-mac-count enable-forwarding** to enable the device to forward unknown frames received on an interface after the MAC learning limit on the interface is reached. Unknown frames refer to frames whose source MAC addresses are not in the MAC address table.

Use **undo mac-address max-mac-count enable-forwarding** to disable the device from forwarding unknown frames received on an interface after the MAC learning limit on the interface is reached.

Syntax

mac-address max-mac-count enable-forwarding

undo mac-address max-mac-count enable-forwarding

Default

When the MAC learning limit on an interface is reached, the device can forward unknown frames received on the interface.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

context-admin

Examples

Configure GigabitEthernet 1/0/1 to learn a maximum of 200 MAC address entries.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] mac-address max-mac-count 200
```

Disable the device from forwarding unknown frames received on GigabitEthernet 1/0/1 after the MAC learning limit on GigabitEthernet 1/0/1 is reached.

```
[Sysname-GigabitEthernet1/0/1] undo mac-address max-mac-count enable-forwarding
```

Related commands

mac-address

mac-address max-mac-count

mac-address timer

Use **mac-address timer** to set the aging timer for dynamic MAC address entries.

Use **undo mac-address timer** to restore the default.

Syntax

mac-address timer { **aging** *seconds* | **no-aging** }

undo mac-address timer

Default

The aging timer is 300 seconds for dynamic MAC address entries.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

aging *seconds*: Specifies an aging timer for dynamic MAC address entries, in seconds. The value range for the *seconds* argument is 10 to 1400.

no-aging: Configures dynamic MAC address entries not to age.

Usage guidelines

To set the aging timer appropriately, follow these guidelines:

- A long aging interval causes the MAC address table to retain outdated entries and fail to accommodate the most recent network changes.
- A short aging interval results in removal of valid entries. Then, unnecessary broadcast packets appear and affect device performance.

Examples

Set the aging time to 500 seconds for dynamic MAC address entries.

```
<Sysname> system-view
[Sysname] mac-address timer aging 500
```

Related commands

display mac-address aging-time

snmp-agent trap enable mac-address

Use **snmp-agent trap enable mac-address** to enable SNMP notifications for the MAC address table.

Use **undo snmp-agent trap enable mac-address** to disable SNMP notifications for the MAC address table.

Syntax

snmp-agent trap enable mac-address

undo snmp-agent trap enable mac-address

Default

SNMP notifications are enabled for the MAC address table.

Views

System view

Predefined user roles

network-admin

context-admin

Usage guidelines

To report critical MAC address move events to an NMS, enable SNMP notifications for the MAC address table. For MAC address move event notifications to be sent correctly, you must also configure SNMP on the device.

When SNMP notifications are disabled for the MAC address table, the device sends the generated logs to the information center. To display the logs, configure the log destination and output rule configuration in the information center.

For information about SNMP and information center configuration, see the network management and monitoring configuration guide for the device.

The MAC address table supports only SNMP notifications about MAC address moves. When you enable or disable SNMP notifications about MAC address moves, you enable or disable all types of SNMP notifications for the MAC address table.

Examples

Disable SNMP notifications for the MAC address table.

```
<Sysname> system-view
[Sysname] undo snmp-agent trap enable mac-address
```

Layer 3 aggregate subinterface view

Predefined user roles

network-admin

context-admin

Parameters

bandwidth-value: Specifies the expected bandwidth in the range of 1 to 400000000 kbps.

Usage guidelines

The expected bandwidth is an informational parameter used only by higher-layer protocols for calculation. You cannot adjust the actual bandwidth of an interface by using this command.

Examples

Set the expected bandwidth to 10000 kbps for Layer 2 aggregate interface Bridge-Aggregation 1.

```
<Sysname> system-view
[Sysname] interface bridge-aggregation 1
[Sysname-Bridge-Aggregation1] bandwidth 10000
```

Set the expected bandwidth to 10000 kbps for Layer 3 aggregate interface Route-Aggregation 1.

```
<Sysname> system-view
[Sysname] interface route-aggregation 1
[Sysname-Route-Aggregation1] bandwidth 10000
```

default

Use **default** to restore the default settings for an aggregate interface.

Syntax

default

Views

Layer 2 aggregate interface view

Layer 3 aggregate interface view

Layer 3 aggregate subinterface view

Predefined user roles

network-admin

context-admin

Usage guidelines

CAUTION:

The **default** command might interrupt ongoing network services. Make sure you are fully aware of the impacts of this command when you execute it on a live network.

This command might fail to restore the default settings for some commands for reasons such as command dependencies and system restrictions. Use the **display this** command in interface view to identify these commands, and then use their **undo** forms or follow the command reference to restore their default settings. If your restoration attempt still fails, follow the error message instructions to resolve the problem.

Examples

Restore the default settings for Layer 2 aggregate interface 1.

```
<Sysname> system-view
[Sysname] interface bridge-aggregation 1
[Sysname-Bridge-Aggregation1] default
```

Restore the default settings for Layer 3 aggregate interface 1.

```
<Sysname> system-view
[Sysname] interface route-aggregation 1
[Sysname-Route-Aggregation1] default
```

description

Use **description** to configure the description of an interface.

Use **undo description** to restore the default.

Syntax

description *text*

undo description

Default

The description of an interface is *interface-name* **Interface**. For example, the default description of Bridge-Aggregation 1 is **Bridge-Aggregation1 Interface**.

network-admin

network-operator

context-admin

context-operator

Parameters

bridge-aggregation: Specifies Layer 2 aggregate interfaces.

route-aggregation: Specifies Layer 3 aggregate interfaces.

interface-number: Specifies an existing aggregate interface number.

brief: Displays brief interface information. If you do not specify this keyword, the command displays detailed interface information.

description: Displays complete interface descriptions. If you do not specify this keyword, the command displays only the first 27 characters of each interface description.

down: Displays information about interfaces in down state and the causes for the down state. If you do not specify this keyword, the command displays information about interfaces in all states.

Usage guidelines

If you do not specify an aggregate interface type, this command displays information about all interfaces except VA interfaces. For more information about VA interfaces, see PPP configuration in *Layer 2—WAN Access Configuration Guide*.

If you specify an aggregate interface type but do not specify an interface number, this command displays information about all aggregate interfaces of the specified type.

Examples

Display detailed information about Layer 2 aggregate interface Bridge-Aggregation 1.

```
<Sysname> display interface bridge-aggregation 1
Bridge-Aggregation1

RAGG1                UP   UP       --
```

Table 1 Command output

Field	Description
Bridge-Aggregation1	Layer 2 aggregate interface name.
Route-Aggregation1	Layer 3 aggregate interface name.
Current state	Physical link state of the interface: • **Administratively DOWN**—The interface has been shut down by using the **shutdown** command. • **DOWN**—The interface is administratively up, but its physical state is down (possibly because no physical link exists or the link has failed). • **UP**—The interface is both administratively and physically up.
IP packet frame type	IPv4 packet framing format.
Description	Description of the interface.
Bandwidth	Expected bandwidth of the interface. This field is not displayed when the bandwidth is 0 kbps.
Port priority	Port priority of the interface.
Unknown-speed mode, unknown-duplex mode	The interface speed and duplex mode are unknown.
Port link-type	Port link type: • Access. • Trunk. • Hybrid.
Tagged VLANs	VLAN whose packets are sent out of this interface with a tag.
Untagged VLANs	VLAN whose packets are sent out of this interface without a tag.
Last clearing of counters	Time when the **reset counters interface** command was last used to clear the interface statistics. This field displays **Never** if the **reset counters interface** command has never been used on the interface since device startup.
Last 300 seconds input/output rate	Average input or output rate over the last 300 seconds.

Field	Description
Input/Output (total)	Statistics of all packets received or sent on the interface.
Input/Output (normal)	Statistics of all normal packets received or sent on the interface.
Line protocol state	Data link layer state of the interface: • **UP**. • **DOWN**.
Maximum transmission unit	MTU of the interface.
Internet protocol processing: Disabled	The interface is not assigned an IP address and cannot process IP packets.
Internet address: *ip-address*/*mask-length* (*Type*)	IP address of the interface and type of the address in parentheses. Possible IP address types include: • **Primary**—Manually configured primary IP address. • **Sub**—Manually configured secondary IP address. If the interface has both primary and secondary IP addresses, the primary IP address is displayed. If the interface has only secondary IP addresses, the lowest secondary IP address is displayed. • **DHCP-Allocated**—DHCP allocated IP address. For more information, see DHCP client configuration in *Layer 3—IP Services Configuration Guide*. • **BOOTP-Allocated**—BOOTP allocated IP address. For more information, see BOOTP client configuration in *Layer 3—IP Services Configuration Guide*. • **PPP-Negotiated**—IP address assigned by a PPP server during PPP negotiation. For more information, see PPP configuration in *Layer 2—WAN Access Configuration Guide*. • **Unnumbered**—IP address borrowed from another interface. • **MAD**—IP address assigned to an IRF member device for MAD on the interface. For more information, see IRF configuration in *Virtual Technologies Configuration Guide*.
Brief information on interfaces in route mode	Brief information about Layer 3 interfaces.
Brief information on interfaces in bridge mode	Brief information about Layer 2 interfaces.
Interface	Abbreviated interface name.
Link	Physical link state of the interface: • **UP**—The interface is physically up. • **DOWN**—The interface is physically down. • **ADM**—The interface has been shut down by using the **shutdown** command. To restore the physical state of the interface, use the **undo shutdown** command. • **Stby**—The interface is a backup interface in standby state.
Speed	Speed of the interface, in bps. This field displays the **(a)** flag next to the speed if the speed is automatically negotiated. This field displays **auto** if the interface is configured to autonegotiate its speed but the autonegotiation has not started.
Duplex	Duplex mode of the interface: • **A**—Autonegotiation. The interface is configured to autonegotiate its duplex mode but the autonegotiation has

Field	Description
	not started. • **F**—Full duplex. • **F(a)**—Autonegotiated full duplex. • **H**—Half duplex. • **H(a)**—Autonegotiated half duplex.
Type	Link type of the interface: • **A**—Access. • **H**—Hybrid. • **T**—Trunk.
Protocol	Data link layer protocol state of the interface: • **UP**—The data link layer protocol of the interface is up. • **DOWN**—The data link layer protocol of the interface is down. • **UP(s)**—The data link layer protocol of the interface is up, but the link is an on-demand link or does not exist. The **(s)** attribute represents the spoofing flag. This value is typical of null interfaces and loopback interfaces.
Primary IP	Primary IP address of the interface. This field displays two hyphens (**--**) if the interface does not have an IP address.
Cause	Cause for the physical link state of an interface to be **DOWN**.

display lacp system-id

Use **display lacp system-id** to display the local system ID.

Syntax

display lacp system-id

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Usage guidelines

You can use the **lacp system-priority** command to change the LACP priority of the local system. The LACP priority value is specified in decimal format in the **lacp system-priority** command. However, it is displayed in hexadecimal format in the output from the **display lacp system-id** command.

Examples

Display the local system ID.

```
<Sysname> display lacp system-id
Actor System ID: 0x8000, 0000-fc00-6504
```

Table 2 Command output

Field	Description
Actor System ID: 0x8000, 0000-fc00-6504	Local system ID, which contains the system LACP priority (0x8000 in this sample output) and the system MAC address (0000-FC00-6504 in this sample output).

Related commands

lacp system-priority

display link-aggregation load-sharing mode

Use **display link-aggregation load-sharing mode** to display global or group-specific link-aggregation load sharing modes.

Syntax

display link-aggregation load-sharing mode [**interface** [{ **bridge-aggregation** | **route-aggregation** } *interface-number*]]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

bridge-aggregation: Specifies Layer 2 aggregate interfaces.

route-aggregation: Specifies Layer 3 aggregate interfaces.

interface-number: Specifies an existing aggregate interface number.

Usage guidelines

If you do not specify the **interface** keyword, the command displays the global link-aggregation load sharing modes.

If you specify the **interface** keyword, but do not specify an interface, the command displays all group-specific load sharing modes.

The **bridge-aggregation** or **route-aggregation** keyword is available only when aggregate interfaces of the corresponding type exist on the device.

Examples

Display the global link-aggregation load sharing mode. This example displays the default settings.

```
<Sysname> display link-aggregation load-sharing mode
MAC-in-MAC traffic load-sharing mode:
Default
Link-aggregation load-sharing algorithm:
Default
Link-aggregation load-sharing seed:
Default
```

```
Link-aggregation load-sharing mode:
Layer 2 traffic: packet type-based sharing
Layer 3 traffic: packet type-based sharing
```

Display the global link-aggregation load sharing mode. This example displays user-configured settings.

```
<Sysname> display link-aggregation load-sharing mode
MAC-in-MAC traffic load-sharing mode:
Inner
Link-aggregation load-sharing algorithm:
4
Link-aggregation load-sharing seed:
0x3ff
Link-aggregation load-sharing mode:
destination-mac address, source-mac address
```

Display the link-aggregation load sharing mode of Layer 2 aggregation group 1. This example displays the default settings.

```
<Sysname> display link-aggregation load-sharing mode interface bridge-aggregation 1
Bridge-Aggregation1 load-sharing mode:
Layer 2 traffic: packet type-based sharing
Layer 3 traffic: packet type-based sharing
```

Display the link-aggregation load sharing mode of Layer 2 aggregation group 1. This example displays user-configured settings.

```
<Sysname> display link-aggregation load-sharing mode interface bridge-aggregation 1
Bridge-Aggregation1 load-sharing mode:
destination-mac address, source-mac address
```

Display the link-aggregation load sharing mode of Layer 3 aggregation group 1. This example displays the default settings.

```
<Sysname> display link-aggregation load-sharing mode interface route-aggregation 1
Route-Aggregation1 load-sharing mode:
Layer 2 traffic: packet type-based sharing
Layer 3 traffic: packet type-based sharing
```

Display the link-aggregation load sharing mode of Layer 3 aggregation group 1. This example displays user-configured settings.

```
<Sysname> display link-aggregation load-sharing mode interface route-aggregation 1
Route-Aggregation1 load-sharing mode:
destination-mac address, source-mac address
```

Table 3 Command output

Field	Description
Link-aggregation load-sharing mode	Global link-aggregation load sharing mode. By default, this field displays the link-aggregation load sharing modes for Layer 2 and Layer 3 traffic. If you have configured the global link-aggregation load sharing mode, this field displays the configured mode.
Bridge-Aggregation1 load-sharing mode	Link-aggregation load sharing mode of Layer 2 aggregation group 1. By default, this field displays the global link-aggregation load sharing modes.

Field	Description
	If you have configured a link-aggregation load sharing mode for this aggregation group, this field displays the configured mode.
Route-Aggregation1 load-sharing mode	Link-aggregation load sharing mode of Layer 3 aggregation group 1. By default, this field displays the global link-aggregation load sharing modes. If you have configured a link-aggregation load sharing mode for this aggregation group, this field displays the configured mode.
Layer 2 traffic: destination-mac address, source-mac address	Default link-aggregation load sharing mode for Layer 2 traffic. In this sample output, Layer 2 traffic is load shared based on source and destination MAC addresses.
Layer 2 traffic: packet type-based sharing	Default link-aggregation load sharing mode for Layer 2 traffic. In this sample output, the system automatically selects a load sharing mode for Layer 2 traffic.
Layer 3 traffic: destination-ip address, source-ip address	Default link-aggregation load sharing mode for Layer 3 traffic. In this sample output, Layer 3 traffic is load shared based on source and destination IP addresses.
Layer 3 traffic: packet type-based sharing	Default link-aggregation load sharing mode for Layer 3 traffic. In this sample output, the system automatically selects a load sharing mode for Layer 3 traffic.
destination-mac address, source-mac address	User-configured link-aggregation load sharing mode. In this sample output, traffic is load shared based on source and destination MAC addresses.

display link-aggregation load-sharing path

Use **display link-aggregation load-sharing path** to display forwarding information about the specified traffic flow.

Syntax

display link-aggregation load-sharing path interface { **bridge-aggregation** | **route-aggregation** } *interface-number* **ingress-port** *interface-type interface-number* [**route**] { { **destination-ip** *ip-address* | **destination-ipv6** *ipv6-address* } | { **source-ip** *ip-address* | **source-ipv6** *ipv6-address* } | **destination-mac** *mac-address* | **destination-port** *port-id* | **ethernet-type** *type-number* | **ip-protocol** *protocol-id* | **source-mac** *mac-address* | **source-port** *port-id* | **vlan** *vlan-id* } * **slot** *slot-number*

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

bridge-aggregation: Specifies Layer 2 aggregate interfaces.

route-aggregation: Specifies Layer 3 aggregate interfaces.

interface-number: Specifies an existing aggregate interface by its number.

ingress-port *interface-type interface-number*: Specifies an ingress port by its type and number. The ingress port must be a physical port.

route: Displays forwarding information about Layer 3 traffic. If you do not specify this keyword, the command displays forwarding information about Layer 2 traffic.

destination-ip *ip-address*: Specifies a destination IPv4 address.

destination-ipv6 *ipv6-address*: Specifies a destination IPv6 address.

source-ip *ip-address*: Specifies a source IPv4 address.

source-ipv6 *ipv6-address*: Specifies a source IPv6 address.

destination-mac *mac-address*: Specifies a destination MAC address in H-H-H format.

destination-port *port-id*: Specifies a destination port number in the range of 1 to 65535.

ethernet-type *type-number*: Specifies an Ethernet type code in the range of 1 to 65535.

ip-protocol *protocol-id*: Specifies an IP protocol by its ID in the range of 0 to 255.

source-mac *mac-address*: Specifies a source MAC address in H-H-H format.

source-port *port-id*: Specifies a source port number in the range of 1 to 65535.

vlan *vlan-id*: Specifies a VLAN by its ID in the range of 1 to 4094.

slot *slot-number*: Specifies an IRF member device by its member ID.

Usage guidelines

A parameter specified in the command might not be used for selecting the egress port. The **Load sharing parameters** field displays the parameters that are used in egress port selection. For example, you can specify both the **destination-mac** *mac-address* and **destination-ip** *ip-address* options. If only the destination MAC address is used for selecting the egress port, the **Load sharing parameters** field does not display the **destination-ip** parameter.

If a parameter required for selecting the egress port is not specified, the default value of the parameter is used. If the parameter does not have any default values, the parameter is set to 0.

This command takes effect only on per-flow load sharing and automatic load sharing. As a best practice, do not use this command for per-packet load sharing.

Examples

Display forwarding information about the specified traffic flow to be sent out of Layer 2 aggregate interface Bridge-Aggregation 1.

```
<Sysname> display link-aggregation load-sharing path interface bridge-aggregation 1
ingress-port gigabitethernet 1/0/1 destination-mac 0000-fc00-0001 source-mac
0000-fc00-0002 source-ip 10.100.0.2 destination-ip 10.100.0.1 slot 1
Load sharing mode: destination-mac, source-mac, source-ip, destination-ip
Unspecified parameters are set to 0.
Load-sharing parameters:
  Ingress port：GigabitEthernet1/0/1
  Destination MAC: 0000-fc00-0001
  Source MAC: 0000-fc00-0002
  Destination IP: 10.100.0.1
  Source IP: 10.100.0.2
Egress port: GigabitEthernet1/0/3
```

Table 4 Command output

Field	Description
Load sharing mode:	Load sharing mode set for the aggregation group: • **destination-mac**—Traffic is load shared based on destination MAC addresses. • **source-mac**—Traffic is load shared based on source MAC addresses. • **destination-ip**—Traffic is load shared based on destination IP addresses. • **source-ip**—Traffic is load shared based on source IP addresses. • **destination-port**—Traffic is load shared based on destination ports. • **source-port**—Traffic is load shared based on source ports. • **ip-protocol**—Traffic is load shared based on IP protocol types. • **ingress-port**—Traffic is load shared based on ingress ports. • **vlan**—Traffic is load shared based on VLAN IDs. • **packet type-based sharing**—Traffic is load shared automatically based on packet types. If no load sharing mode is set, this field also displays **packet type-based sharing**.
Load sharing parameters	Parameters that are used in egress port selection.
Egress port	Egress port of the specified traffic flow. If no egress port is found, this field displays **N/A**.

display link-aggregation member-port

Use **display link-aggregation member-port** to display detailed link aggregation information about the specified member ports.

Syntax

display link-aggregation member-port [*interface-list* | **auto**]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

interface-list: Specifies a list of link aggregation member ports, in the format *interface-type interface-number1* [**to** *interface-type interface-number2*]. The value for the *interface-number2* argument must be equal to or greater than the value for the *interface-number1* argument.

auto: Specifies all link aggregation member ports that are enabled with automatic assignment.

Usage guidelines

A member port in a static aggregation group cannot obtain information about the peer group. For such member ports, the command displays the port number, port priority, and operational key of only the local end.

Examples

Display detailed information about GigabitEthernet 1/0/1, which is a member port of a static aggregation group.

```
<Sysname> display link-aggregation member-port gigabitethernet 1/0/1
Flags: A -- LACP_Activity, B -- LACP_Timeout, C -- Aggregation,
       D -- Synchronization, E -- Collecting, F -- Distributing,
       G -- Defaulted, H -- Expired

GigabitEthernet1/0/1:
Aggregate Interface: Bridge-Aggregation1
Port Number: 1
Port Priority: 32768
Oper-Key: 1
```

Display detailed information about GigabitEthernet 1/0/2, which is a member port of a dynamic aggregation group.

```
<Sysname> display link-aggregation member-port gigabitethernet 1/0/2
Flags: A -- LACP_Activity, B -- LACP_Timeout, C -- Aggregation,
       D -- Synchronization, E -- Collecting, F -- Distributing,
       G -- Defaulted, H -- Expired

GigabitEthernet1/0/2:
Aggregate Interface: Bridge-Aggregation2
Local:
    Port Number: 2
    Port Priority: 32768
    Oper-Key: 2
    Flag: {ACDEF}
Remote:
    System ID: 0x8000, 000f-e267-6c6a
    Port Number: 26
    Port Priority: 32768
    Oper-Key: 2
    Flag: {ACDEF}
Received LACP Packets: 5 packet(s)
Illegal: 0 packet(s)
Sent LACP Packets: 7 packet(s)
```

Table 5 Command output

Field	Description
Flags	LACP state flags. This field is one byte long, represented by ABCDEFGH from the least significant bit to the most significant bit. A letter appears when its bit is 1 and does not appear when its bit is 0. • **A**—Indicates whether LACP is active on the port. 1 indicates active. 0 indicates passive. • **B**—Indicates the LACP timeout interval. 1 indicates the short timeout

Field	Description
	interval. 0 indicates the long timeout interval. • **C**—Indicates whether the sending system considers that the link is aggregatable. 1 indicates yes. 0 indicates no. • **D**—Indicates whether the sending system considers that the link has been aggregated. 1 indicates yes. 0 indicates no. • **E**—Indicates whether the sending system considers that the link can collect frames. 1 indicates yes. 0 indicates no. • **F**—Indicates whether the sending system considers that the link can distribute frames. 1 indicates yes. 0 indicates no. • **G**—Indicates whether the RX state machine of the sending system is in default state. 1 indicates yes. 0 indicates no. • **H**—Indicates whether the RX state machine of the sending system is in expired state. 1 indicates yes. 0 indicates no.
Aggregate Interface	Aggregate interface to which the member port belongs.
Local	Information about the local end.
Oper-key	Operational key.
Flag	LACP protocol state flag.
Remote	Information about the peer end.
System ID	Peer system ID, containing the system LACP priority and the system MAC address.
Received LACP Packets	Total number of LACP packets received.
Illegal	Total number of illegal packets.
Sent LACP Packets	Total number of LACP packets sent.

display link-aggregation summary

Use **`display link-aggregation summary`** to display brief information about all aggregation groups.

Syntax

`display link-aggregation summary`

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Usage guidelines

Static link aggregation groups cannot obtain information about the peer groups. As a result, the **Partner ID** field displays **None** or nothing for a static link aggregation group.

Examples

Display brief information about all aggregation groups.

```
<Sysname> display link-aggregation summary
Aggregate Interface Type:
BAGG -- Bridge-Aggregation, BLAGG –- Blade-Aggregation, RAGG -- Route-Aggregation, SCH-B
– Schannel-Bundle
Aggregation Mode: S -- Static, D -- Dynamic
Loadsharing Type: Shar -- Loadsharing, NonS -- Non-Loadsharing
Actor System ID: 0x8000, 000f-e267-6c6a

AGG         AGG   Partner ID              Selected  Unselected  Individual  Share
Interface   Mode                          Ports     Ports       Ports       Type
--------------------------------------------------------------------------------
RAGG1       S     None                    1         0           0           NonS
BAGG2       D     0x8000,00e0-fcff-ff01   2         0           0           Shar
```

Table 6 Command output

Field	Description
Aggregate Interface Type	Aggregate interface type: • **BAGG**—Layer 2. • **RAGG**—Layer 3. • **BLAGG**—Blade. This type is not supported in the current software version. • **SCH-B**—S-channel bundle. This type is not supported in the current software version.
Aggregation Mode	Aggregation group type: • **S**—Static. • **D**—Dynamic.
Loadsharing Type	Load sharing type: • **Shar**—Load-sharing. • **NonS**—Non-load-sharing.
Actor System ID	Local system ID, which contains the local system LACP priority and the local system MAC address.
AGG Interface	Type and number of the aggregate interface.
AGG Mode	Aggregation group type.
Partner ID	System ID of the peer system, which contains the peer system LACP priority and the peer system MAC address.
Selected Ports	Total number of Selected ports.
Unselected Ports	Total number of Unselected ports.
Individual Ports	Total number of Individual ports.
Share Type	Load sharing type.

display link-aggregation verbose

Use **display link-aggregation verbose** to display detailed information about the aggregation groups that correspond to the specified aggregate interfaces.

Syntax

display link-aggregation verbose [{ **bridge-aggregation** | **route-aggregation** } [*interface-number*]]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

bridge-aggregation: Specifies Layer 2 aggregate interfaces.

route-aggregation: Specifies Layer 3 aggregate interfaces.

interface-number: Specifies an existing aggregate interface by its number.

Usage guidelines

If you do not specify an aggregate interface type, the command displays detailed information about all aggregation groups.

If you specify an aggregate interface type but do not specify an interface number, the command displays detailed information about all aggregation groups of the specified type.

The **bridge-aggregation** or **route-aggregation** keyword is available only when aggregate interfaces of the corresponding type exist on the device.

Examples

Display detailed information about Layer 2 aggregation group 1, which is a dynamic aggregation group.

```
<Sysname> display link-aggregation verbose bridge-aggregation 1
Loadsharing Type: Shar -- Loadsharing, NonS -- Non-Loadsharing
Port Status: S -- Selected, U -- Unselected, I -- Individual
Port: A -- Auto port
Flags:  A -- LACP_Activity, B -- LACP_Timeout, C -- Aggregation,
        D -- Synchronization, E -- Collecting, F -- Distributing,
        G -- Defaulted, H -- Expired

Aggregate Interface: Bridge-Aggregation1

Table 7 Command output

Field	Description
Loadsharing Type	Load sharing type: • **Shar**—Load-sharing. • **NonS**—Non-load-sharing.
Port Status	Port state: • **Selected**. • **Unselected**. • **Individual**.
Port	Port type. **Auto port** indicates that the port is enabled with automatic assignment.
Flags	LACP state flags. This field is one byte long, represented by ABCDEFGH from the least significant bit to the most significant bit. A letter appears when its bit is 1 and does not appear when its bit is 0. • **A**—Indicates whether LACP is active on the port. 1 indicates active. 0 indicates passive. • **B**—Indicates the LACP timeout interval. 1 indicates the short timeout interval. 0 indicates the long timeout interval. • **C**—Indicates whether the sending system considers that the link is aggregatable. 1 indicates yes. 0 indicates no. • **D**—Indicates whether the sending system considers that the link has been aggregated. 1 indicates yes. 0 indicates no. • **E**—Indicates whether the sending system considers that the link can collect frames. 1 indicates yes. 0 indicates no. • **F**—Indicates whether the sending system considers that the link can distribute frames. 1 indicates yes. 0 indicates no. • **G**—Indicates whether the RX state machine of the sending system is in default state. 1 indicates yes. 0 indicates no. • **H**—Indicates whether the RX state machine of the sending system is in expired state. 1 indicates yes. 0 indicates no.

Field	Description
Aggregate Interface	Name of the aggregate interface.
Creation Mode	Creation mode of the dynamic aggregate interface: • **Auto**. • **Manual**.
Aggregation Mode	Aggregation group type: • **S**—Static. • **D**—Dynamic.
System ID	Local system ID, containing the local system LACP priority and the local system MAC address.
Local	Information about the local end: • **Port**—Port type and number. • **Status**—Port state, which can be Selected, Unselected, or Individual. • **Priority**—Port priority. • **Oper-Key**—Operational key. • **Flag**—LACP state flag. **NOTE:** For static aggregation groups, the **Flag** field is not displayed.
Remote	Information about the peer end: • **Actor**—Type and number of the local port. This field displays the **(R)** flag next to the port if its peer port is the reference port. • **Partner**—Index of the peer port. • **Priority**—Priority of the peer port. • **Oper-Key**—Operational key of the peer port. • **System ID**—System ID of the peer end. • **Flag**—LACP state flag of the peer end.

interface bridge-aggregation

Use **`interface bridge-aggregation`** to create a Layer 2 aggregate interface and enter its view, or enter the view of an existing Layer 2 aggregate interface.

Use **`undo interface bridge-aggregation`** to delete a Layer 2 aggregate interface.

Syntax

`interface bridge-aggregation` *`interface-number`*

`undo interface bridge-aggregation` *`interface-number`*

Default

No Layer 2 aggregate interfaces exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

interface-number: Specifies a Layer 2 aggregate interface number. The value range for the *interface-number* argument is 1 to 64.

Usage guidelines

When you create a Layer 2 aggregate interface, the system automatically creates a Layer 2 aggregation group with the same number. The aggregation group operates in static aggregation mode by default.

Deleting a Layer 2 aggregate interface also deletes the Layer 2 aggregation group. At the same time, the member ports of the aggregation group, if any, leave the aggregation group.

Examples

Create Layer 2 aggregate interface Bridge-Aggregation 1, and enter its view.

```
<Sysname> system-view
[Sysname] interface bridge-aggregation 1
[Sysname-Bridge-Aggregation1]
```

interface route-aggregation

Use **interface route-aggregation** to create a Layer 3 aggregate interface or subinterface and enter its view, or enter the view of an existing Layer 3 aggregate interface or subinterface.

Use **undo interface route-aggregation** to delete a Layer 3 aggregate interface or subinterface.

Syntax

interface route-aggregation { *interface-number* | *interface-number.subnumber* }

undo interface route-aggregation { *interface-number* | *interface-number.subnumber* }

Default

No Layer 3 aggregate interfaces or subinterfaces exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

interface-number: Specifies a Layer 3 aggregate interface number. The value range for the *interface-number* argument is 1 to 64.

interface-number.subnumber: Specifies a subinterface of a Layer 3 aggregate interface. The *interface-number* argument specifies the main interface number. The *subnumber* argument specifies the subinterface number and is separated from the main interface number by a dot (.). The value range for the *interface-number* argument is 1 to 4094.

Usage guidelines

When you create a Layer 3 aggregate interface, the system automatically creates a Layer 3 aggregation group with the same number. The Layer 3 aggregation group operates in static aggregation mode by default.

Deleting a Layer 3 aggregate interface also deletes the Layer 3 aggregation group and all its aggregate subinterfaces. At the same time, the member ports of the aggregation group, if any, leave the aggregation group.

Deleting a Layer 3 aggregate subinterface does not affect the state of the main interface and the corresponding aggregation group.

Examples

Create Layer 3 aggregate interface Route-Aggregation 1 and enter its view.

```
<Sysname> system-view
[Sysname] interface route-aggregation 1
[Sysname-Route-Aggregation1]
```

Create Layer 3 aggregate subinterface Route-Aggregation 1.1 and enter its view.

```
<Sysname> system-view
[Sysname] interface route-aggregation 1.1
[Sysname-Route-Aggregation1.1]
```

jumboframe enable

Use **jumboframe enable** to allow the jumbo frames on an interface to pass through.

Use **undo jumboframe enable** to deny jumbo frames on an interface.

Use **undo jumboframe enable** *size* to restore the default.

Syntax

jumboframe enable [*size*]

undo jumboframe enable [*size*]

Default

An aggregate interface allows jumbo frames within a specific length to pass through. The following compatibility matrixes show the default maximum jumbo frame length on each hardware model:

Models	Default
NFNX5-HD6480, NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB1780, NFNX3-HDB3080, NFNX3-HDB1180, NFNX3-HDB1480	9216 bytes
NFNX3-HDB680, NFNX3-HDB1080	1524 bytes

Views

Layer 2 aggregate interface view

Layer 3 aggregate interface view

Predefined user roles

network-admin

context-admin

Parameters

size: Specifies the maximum length of jumbo frames, in bytes.

The following compatibility matrix shows the value ranges for this argument:

Hardware	Value range
NFNX3-HDB680, NFNX3-HDB1080	Fixed at 1524 bytes

Usage guidelines

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Allow jumbo frames to pass through on Layer 2 aggregate interface Bridge-Aggregation 1.

```
<Sysname> System-view
[Sysname] interface bridge-aggregation 1
[Sysname-Bridge-Aggregation1] jumboframe enable
```

Allow jumbo frames to pass through on Layer 3 aggregate interface Route-Aggregation 1.

```
<Sysname> System-view
[Sysname] interface route-aggregation 1
[Sysname-Route-Aggregation1] jumboframe enable
```

lacp default-selected-port disable

Use **lacp default-selected-port disable** to disable the default port selection action for dynamic aggregation groups.

Use **undo lacp default-selected-port disable** to enable the default port selection action for dynamic aggregation groups.

Syntax

lacp default-selected-port disable

undo lacp default-selected-port disable

Default

The default port selection action is enabled for dynamic aggregation groups.

Views

System view

Predefined user roles

network-admin

context-admin

Usage guidelines

The default port selection action applies to dynamic aggregation groups.

This action automatically chooses the port with the lowest ID from among all up member ports as a Selected port if none of them has received LACPDUs before the LACP timeout interval expires.

After this action is disabled, a dynamic aggregation group will not have any Selected ports to forward traffic if it has not received LACPDUs before the LACP timeout interval expires.

Examples

Disable the default port selection action.

```
<Sysname> system-view
[Sysname] lacp default-selected-port disable
```

lacp edge-port

Use **lacp edge-port** to configure an aggregate interface as an edge aggregate interface.

Use **undo lacp edge-port** to restore the default.

Syntax

lacp edge-port

undo lacp edge-port

Default

An aggregate interface does not operate as an edge aggregate interface.

Views

Layer 2 aggregate interface view

Layer 3 aggregate interface view

Predefined user roles

network-admin

context-admin

Usage guidelines

Use this command on the aggregate interface that connects the device to a server if dynamic link aggregation is configured only on the device. This feature improves link reliability by enabling all member ports of the aggregation group to forward packets.

This command takes effect only on an aggregate interface corresponding to a dynamic aggregation group.

Link-aggregation traffic redirection cannot operate correctly on an edge aggregate interface.

Examples

Configure Layer 2 aggregate interface Bridge-Aggregation 1 as an edge aggregate interface.

```
<Sysname> System-view
[Sysname] interface bridge-aggregation 1
[Sysname-Bridge-Aggregation1] lacp edge-port
```

Configure Layer 3 aggregate interface Route-Aggregation 1 as an edge aggregate interface.

```
<Sysname> System-view
[Sysname] interface route-aggregation 1
[Sysname-Route-Aggregation1] lacp edge-port
```

lacp mode

Use **lacp mode passive** to configure LACP to operate in passive mode on a port.

Use **undo lacp mode** to restore the default.

Syntax

lacp mode passive

undo lacp mode

Default

LACP operates in active mode on a port.

Views

Layer 2 Ethernet interface view

Layer 3 Ethernet interface view

Predefined user roles

network-admin

context-admin

Usage guidelines

This command takes effect only on member ports of dynamic aggregation groups.

When LACP is operating in passive mode on a local member port and its peer port, both ports cannot send LACPDUs. When LACP is operating in active mode on either end of a link, both ports can send LACPDUs.

Examples

Configure LACP to operate in passive mode on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] lacp mode passive
```

lacp period short

Use **lacp period short** to enable the short LACP timeout interval (3 seconds) on an interface.

Use **undo lacp period** to restore the default.

Syntax

lacp period short

undo lacp period

Default

The LACP timeout interval is the long timeout interval (90 seconds) on an interface.

Views

Layer 2 Ethernet interface view

Layer 3 Ethernet interface view

Predefined user roles

network-admin

context-admin

Usage guidelines

To avoid traffic interruption during an ISSU, do not enable the short LACP timeout interval before performing the ISSU. For more information about ISSU, see *Fundamentals Configuration Guide*.

Examples

Enable the short LACP timeout interval (3 seconds) on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] lacp period short
```

lacp system-priority

Use **lacp system-priority** to set the system LACP priority.

Use **undo lacp system-priority** to restore the default.

Syntax

lacp system-priority *priority*

undo lacp system-priority

Default

The system LACP priority is 32768.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

priority: Specifies the system LACP priority in the range of 0 to 65535. The smaller the value, the higher the system LACP priority.

Examples

Set the system LACP priority to 64.

```
<Sysname> system-view
[Sysname] lacp system-priority 64
```

Related commands

link-aggregation forwarding-acceleration enable

Use **link-aggregation forwarding-acceleration enable** to enable forwarding acceleration on an aggregate interface.

Use **undo link-aggregation forwarding-acceleration enable** to disable forwarding acceleration on an aggregate interface.

Syntax

link-aggregation forwarding-acceleration enable

undo link-aggregation forwarding-acceleration enable

Default

Forwarding acceleration is enabled on aggregate interfaces.

Views

Layer 2 aggregate interface view

Layer 3 aggregate interface view

Predefined user roles

network-admin

context-admin

Usage guidelines

Forwarding acceleration takes effect on an aggregate interface only when it is enabled both globally and on the aggregate interface.

This feature accelerates traffic forwarding on an aggregate interface whose member ports are located on multiple slots.

Examples

Enable forwarding acceleration on Bridge-Aggregation 1.

```
<Sysname> system-view
[Sysname] interface bridge-aggregation 1
[Sysname-Bridge-Aggregation1] link-aggregation forwarding-acceleration enable
```

Enable forwarding acceleration on Route-Aggregation 1.

```
<Sysname> system-view
[Sysname] interface route-aggregation 1
[Sysname-Route-Aggregation1] link-aggregation forwarding-acceleration enable
```

Related commands

link-aggregation global forwarding-acceleration enable

link-aggregation global forwarding-acceleration enable

Use **link-aggregation global forwarding-acceleration enable** to enable forwarding acceleration globally.

undo link-aggregation global forwarding-acceleration enable to disable forwarding acceleration globally.

Syntax

link-aggregation global forwarding-acceleration enable

undo link-aggregation global forwarding-acceleration enable

Default

Forwarding acceleration is disabled globally.

Views

System view

Predefined user roles

network-admin

context-admin

Usage guidelines

Forwarding acceleration takes effect on an aggregate interface only when it is enabled both globally and on the aggregate interface.

This feature accelerates traffic forwarding on an aggregate interface whose member ports are located on multiple slots.

Enable forwarding acceleration globally.

```
<Sysname> system-view
[Sysname] link-aggregation global forwarding-acceleration enable
```

Related commands

link-aggregation forwarding-acceleration enable

link-aggregation global load-sharing mode

Use **link-aggregation global load-sharing mode** to set the global link-aggregation load sharing mode.

Use **undo link-aggregation global load-sharing mode** to restore the default.

Syntax

link-aggregation global load-sharing mode { **destination-ip** | **destination-mac** | **destination-port** | **ingress-port** | **source-ip** | **source-mac** | **source-port** } *

undo link-aggregation global load-sharing mode

Default

The system automatically chooses a load sharing mode depending on the packet type.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

destination-ip: Distributes traffic based on destination IP addresses.

destination-mac: Distributes traffic based on destination MAC addresses.

destination-port: Distributes traffic based on destination ports.

ingress-port: Distributes traffic based on ingress ports.

source-ip: Distributes traffic based on source IP addresses.

source-mac: Distributes traffic based on source MAC addresses.

source-port: Distributes traffic based on source ports.

Usage guidelines

If you execute this command multiple times, the most recent configuration takes effect.

If an unsupported load sharing mode is set, the device displays an error message.

Examples

Set the global load sharing mode to load share packets based on destination MAC addresses.

```
<Sysname> system-view
[Sysname] link-aggregation global load-sharing mode destination-mac
```

Related commands

bandwidth

link-aggregation load-sharing mode

link-aggregation ignore vlan

Use **link-aggregation ignore vlan** to configure a Layer 2 aggregate interface to ignore the specified VLANs.

Use **undo link-aggregation ignore vlan** to remove the specified ignored VLANs for a Layer 2 aggregate interface.

Syntax

link-aggregation ignore vlan *vlan-id-list*

undo link-aggregation ignore vlan *vlan-id-list*

Default

A Layer 2 aggregate interface does not ignore any VLANs.

Views

Layer 2 aggregate interface view

Predefined user roles

network-admin

context-admin

Parameters

vlan-id-list: Specifies a space-separated list of up to 10 VLAN items. Each item specifies a VLAN ID or a range of VLAN IDs in the form of *vlan-id1* to *vlan-id2*. The value range for VLAN IDs is 1 to 4094. The value for the *vlan-id2* argument must be equal to or greater than the value for the *vlan-id1* argument.

Usage guidelines

This command takes effect only when the link type of the Layer 2 aggregate interface is hybrid or trunk.

With this command configured, a Layer 2 aggregate interface ignores the permitted VLAN and VLAN tagging mode configuration of the specified VLANs when choosing Selected ports.

Examples

Configure Layer 2 aggregate interface **bridge-aggregation 1** to ignore VLAN 50.

```
<Sysname> system-view
[Sysname] interface bridge-aggregation 1
[Sysname-Bridge-Aggregation1] link-aggregation ignore vlan 50
```

link-aggregation load-sharing mode

Use **link-aggregation load-sharing mode** to set the link-aggregation load sharing mode for an aggregation group.

Use **undo link-aggregation load-sharing mode** to restore the default.

Syntax

link-aggregation load-sharing mode { **destination-ip** | **destination-mac** | **destination-port** | **source-ip** | **source-mac** | **source-port** } *

undo link-aggregation load-sharing mode

Default

An aggregation group uses the global link-aggregation load sharing mode.

Views

Layer 2 aggregate interface view

Layer 3 aggregate interface view

Predefined user roles

network-admin

context-admin

Parameters

destination-ip: Distributes traffic based on destination IP addresses.

destination-mac: Distributes traffic based on destination MAC addresses.

destination-port: Distributes traffic based on destination ports.

source-ip: Distributes traffic based on source IP addresses.

source-mac: Distributes traffic based on source MAC addresses.

source-port: Distributes traffic based on source ports.

Usage guidelines

If you execute this command multiple times, the most recent configuration takes effect.

If an unsupported load sharing mode is set, the device displays an error message.

Examples

Configure Layer 2 aggregation group 1 to load share packets based on destination MAC addresses.

```
<Sysname> system-view
[Sysname] interface bridge-aggregation 1
[Sysname-Bridge-Aggregation1] link-aggregation load-sharing mode destination-mac
```

Configure Layer 3 aggregation group 1 to load share packets based on destination MAC addresses.

```
<Sysname> system-view
[Sysname] interface route-aggregation 1
[Sysname-Route-Aggregation1] link-aggregation load-sharing mode destination-mac
```

Related commands

bandwidth

link-aggregation global load-sharing mode

link-aggregation load-sharing mode local-first

Use **link-aggregation load-sharing mode local-first** to enable local-first load sharing for link aggregation globally.

Use **undo link-aggregation load-sharing mode local-first** to disable local-first load sharing for link aggregation globally.

Syntax

link-aggregation load-sharing mode local-first

undo link-aggregation load-sharing mode local-first

Default

Local-first load sharing is enabled for link aggregation globally.

Views

System view

Predefined user roles

network-admin

context-admin

Usage guidelines

Use local-first load sharing in a multichassis link aggregation scenario to distribute traffic preferentially across member ports on the ingress device.

If you disable local-first load sharing, packets of an aggregate interface are load shared among all Selected ports on IRF member devices.

You can configure local-first load sharing globally or on a per-interface basis. An aggregate interface preferentially uses the interface-specific setting. If no interface-specific setting is available, the aggregate interface uses the global setting.

Examples

Disable local-first load sharing for link aggregation globally.

```
<Sysname> system-view
[Sysname] undo link-aggregation load-sharing mode local-first
```

Related commands

link-aggregation group load-sharing mode local-first

link-aggregation mode

Use **link-aggregation mode dynamic** to configure an aggregation group to operate in dynamic aggregation mode and enable LACP.

Use **undo link-aggregation mode** to restore the default.

Syntax

link-aggregation mode dynamic

undo link-aggregation mode

Default

An aggregation group operates in static aggregation mode.

Views

Layer 2 aggregate interface view

Layer 3 aggregate interface view

Predefined user roles

network-admin

context-admin

Usage guidelines

Aggregation mode change might cause Selected member ports to become Unselected.

When you change the aggregation mode, make sure you understand the impact of the change on services.

Examples

Configure Layer 2 aggregation group 1 to operate in dynamic aggregation mode.

```
<Sysname> system-view
[Sysname] interface bridge-aggregation 1
[Sysname-Bridge-Aggregation1] link-aggregation mode dynamic
```

Configure Layer 3 aggregation group 1 to operate in dynamic aggregation mode.

```
<Sysname> system-view
[Sysname] interface route-aggregation 1
[Sysname-Route-Aggregation1] link-aggregation mode dynamic
```

link-aggregation port-priority

Use **link-aggregation port-priority** to set the port priority of an interface.

Use **undo link-aggregation port-priority** to restore the default.

Syntax

link-aggregation port-priority *priority*

undo link-aggregation port-priority

Default

The port priority of an interface is 32768.

Views

Layer 2 Ethernet interface view

Layer 3 Ethernet interface view

Predefined user roles

network-admin

context-admin

Parameters

priority: Specifies the port priority in the range of 0 to 65535. The smaller the value, the higher the port priority.

Examples

Set the port priority to 64 for Layer 2 Ethernet interface GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] link-aggregation port-priority 64
```

Set the port priority to 64 for Layer 3 Ethernet interface GigabitEthernet 1/0/2.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/2
[Sysname-GigabitEthernet1/0/2] link-aggregation port-priority 64
```

Related commands

lacp system-priority

link-aggregation selected-port maximum

Use **link-aggregation selected-port maximum** to set the maximum number of Selected ports allowed in an aggregation group.

Use **undo link-aggregation selected-port maximum** to restore the default.

Syntax

link-aggregation selected-port maximum *max-number*

undo link-aggregation selected-port maximum

Default

The maximum number of Selected ports allowed in an aggregation group depends on hardware limitation.

Views

Layer 2 aggregate interface view

Layer 3 aggregate interface view

Predefined user roles

network-admin

context-admin

Parameters

max-number: Specifies the maximum number of Selected ports allowed in an aggregation group. The value range for this argument is 1 to 16.

Usage guidelines

Executing this command might cause some of the Selected ports in an aggregation group to become Unselected ports.

The maximum number of Selected ports allowed in the aggregation groups must be the same for the local and peer ends.

For an aggregation group, the maximum number of Selected ports must be equal to or higher than the minimum number of Selected ports.

The maximum number of Selected ports allowed in an aggregation group is limited by one of the following values, whichever value is smaller:

- Maximum number set by using the **link-aggregation selected-port maximum** command.
- Maximum number of Selected ports allowed by the link aggregation capability.

You can implement backup between two ports by performing the following tasks:

- Assigning two ports to an aggregation group.
- Setting the maximum number of Selected ports to 1 for the aggregation group.

Then, only one Selected port is allowed in the aggregation group at any point in time, while the Unselected port acts as a backup port.

Examples

Set the maximum number of Selected ports to 5 for Layer 2 aggregation group 1.

```
<Sysname> system-view
[Sysname] interface bridge-aggregation 1
[Sysname-Bridge-Aggregation1] link-aggregation selected-port maximum 5
```

Set the maximum number of Selected ports to 5 for Layer 3 aggregation group 1.

```
<Sysname> system-view
[Sysname] interface route-aggregation 1
[Sysname-Route-Aggregation1] link-aggregation selected-port maximum 5
```

Related commands

link-aggregation selected-port minimum

link-aggregation selected-port minimum

Use **link-aggregation selected-port minimum** to set the minimum number of Selected ports in an aggregation group.

Use **undo link-aggregation selected-port minimum** to restore the default.

Syntax

link-aggregation selected-port minimum *min-number*

undo link-aggregation selected-port minimum

Default

The minimum number of Selected ports in an aggregation group is not specified.

Views

Layer 2 aggregate interface view

Layer 3 aggregate interface view

Predefined user roles

network-admin

context-admin

Parameters

min-number: Specifies the minimum number of Selected ports in an aggregation group required to bring up the aggregate interface. The value range for this argument is 1 to 16.

Usage guidelines

Executing this command might cause all member ports in the aggregation group to become Unselected ports.

The minimum number of Selected ports allowed in the aggregation groups must be the same for the local and peer ends.

For an aggregation group, the minimum number of Selected ports must be equal to or lower than the maximum number of Selected ports.

Examples

Set the minimum number of Selected ports to 3 for Layer 2 aggregation group 1.

```
<Sysname> system-view
[Sysname] interface bridge-aggregation 1
[Sysname-Bridge-Aggregation1] link-aggregation selected-port minimum 3
```

Set the minimum number of Selected ports to 3 for Layer 3 aggregation group 1.

```
<Sysname> system-view
[Sysname] interface route-aggregation 1
[Sysname-Route-Aggregation1] link-aggregation selected-port minimum 3
```

Related commands

link-aggregation selected-port maximum

link-delay

Use **link-delay** to set the physical state change suppression interval on an aggregate interface.

Use **undo link-delay** to restore the default.

Syntax

link-delay [**msec**] *delay-time* [**mode** { **up** | **updown** }]

undo link-delay [**msec**] *delay-time* [**mode** { **up** | **updown** }]

Default

Each time the physical link of an aggregate interface goes up or comes down, the system immediately reports the change to the CPU.

Views

Layer 2 aggregate interface view

Layer 3 aggregate interface view

Predefined user roles

network-admin

context-admin

Parameters

msec: Sets the physical state change suppression interval in milliseconds. If you do not specify this keyword, the suppression interval is in seconds.

delay-time: Sets the physical state change suppression interval. To report a physical state change immediately to the CPU, set the interval to 0.

- If you do not specify the **msec** keyword, the value range is 0 to 30 seconds.
- If you specify the **msec** keyword, the value range is 0 to 10000 milliseconds, and the value must be a multiple of 100.

mode up: Suppresses link-up events.

mode updown: Suppresses both link-up and link-down events.

Usage guidelines

You can configure this feature to suppress only link-down events, only link-up events, or both. If an event of the specified type persists when the suppression interval expires, the system reports the event.

When you configure this feature, follow these guidelines:

- To suppress only link-down events, use the **link-delay** [**msec**] *delay-time* command.
- To suppress only link-up events, use the **link-delay** [**msec**] *delay-time* **mode up** command.
- To suppress both link-down and link-up events, use the **link-delay** [**msec**] *delay-time* **mode updown** command.

On an interface, you can configure different suppression intervals for link-up and link-down events. If you execute the **link-delay** command multiple times for link-up or link-down events, the most recent configuration takes effect.

Examples

Set the link-down event suppression interval to 8 seconds on Bridge-Aggregation 1.

```
<Sysname> system-view
[Sysname] interface bridge-aggregation 1
[Sysname-Bridge-Aggregation1] link-delay down 8
```

Set the link-down event suppression interval to 8 seconds on Route-Aggregation 1.

```
<Sysname> system-view
[Sysname] interface route-aggregation 1
[Sysname-Route-Aggregation1] link-delay 8
```

mtu

Use **mtu** to set the MTU of a Layer 3 aggregate interface or subinterface.

Use **undo mtu** to restore the default.

Syntax

mtu *size*

undo mtu

Default

The MTU of Layer 3 aggregate interfaces and subinterfaces is 1500 bytes.

Views

Layer 3 aggregate interface view

Layer 3 aggregate subinterface view

Predefined user roles

network-admin

context-admin

Parameters

size: Specifies an MTU in bytes. The value range for this argument is 46 to 1560..

Examples

Set the MTU of interface Route-Aggregation 1 to 1430 bytes.

```
<Sysname> system-view
[Sysname] interface route-aggregation 1
[Sysname-Route-Aggregation1] mtu 1430
```

display interface

port link-aggregation group

Use **port link-aggregation group** to assign an interface to an aggregation group.

Use **undo port link-aggregation group** to remove an interface from the aggregation group to which it belongs.

Syntax

port link-aggregation group *group-id*

undo port link-aggregation group

Default

An interface does not belong to any aggregation group.

Views

Layer 2 Ethernet interface view

Layer 3 Ethernet interface view

Layer 3 Ethernet subinterface view

Predefined user roles

network-admin

context-admin

Parameters

group-id: Specifies an aggregation group by its aggregate interface number. The value range for the *number* argument is 1 to 64.

Usage guidelines

You can assign a Layer 2 or Layer 3 Ethernet interface only to a Layer 2 or Layer 3 aggregation group, respectively.

An interface can belong to only one aggregation group.

The following restrictions apply if you have not enabled multi-VLAN termination on an aggregate interface by using the **link-aggregation multivlan-termination** command:

- You cannot assign both Ethernet interfaces and Ethernet subinterfaces to the aggregation group.
- You cannot create subinterfaces on an Ethernet interface that is in the aggregation group.
- You cannot assign an Ethernet interface that has subinterfaces to the aggregation group.

You cannot create aggregate subinterfaces on an aggregate interface if its aggregation group contains Ethernet subinterfaces. You cannot assign Ethernet subinterfaces to an aggregation group if its aggregate interface has aggregate subinterfaces.

Before you assign an Ethernet subinterface to an aggregation group, perform the following tasks:

- If multi-VLAN termination is not enabled on the aggregate interface, configure VLAN termination on the Ethernet subinterface. You will be unable to modify the VLAN termination configuration after you assign the subinterface to the aggregation group. To configure VLAN termination, use the following commands:
  - **vlan-type dot1q default**.
  - **vlan-type dot1q untagged**.
  - **vlan-type dot1q vid**.
- To assign Ethernet subinterfaces that terminate different VLANs to the same aggregation group, enable multi-VLAN termination on the aggregate interface. If multi-VLAN termination is not enabled on the aggregate interface, you must make sure the Ethernet subinterfaces to be assigned to its aggregation group terminate the same VLAN.
- If you are assigning the Ethernet subinterface to a dynamic aggregation group, specify only one VLAN ID when you execute the **vlan-type dot1q vid** *vlan-id-list* [**loose**] command.

You cannot assign the following interfaces to an aggregation group:

- Member interfaces of redundant Ethernet interfaces.
- Member interfaces of redundancy group nodes.

For more information about redundant Ethernet interfaces and redundancy group nodes, see *Virtual Technologies Configuration Guide*.

Examples

Assign Layer 2 Ethernet interface GigabitEthernet 1/0/1 to Layer 2 aggregation group 1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] port link-aggregation group 1
```

Assign Layer 3 Ethernet interface GigabitEthernet 1/0/2 to Layer 3 aggregation group 2.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/2
[Sysname-GigabitEthernet1/0/2] port link-aggregation group 2
```

Related commands

link-aggregation multivlan-termination

vlan-type dot1q default

vlan-type dot1q untagged

vlan-type dot1q vid

reset counters interface

Use **reset counters interface** to clear statistics about the specified aggregate interfaces.

Syntax

reset counters interface [{ **bridge-aggregation** | **route-aggregation** } [*interface-number*]]

Views

User view

Predefined user roles

network-admin

context-admin

Parameters

bridge-aggregation: Specifies Layer 2 aggregate interfaces.

route-aggregation: Specifies Layer 3 aggregate interfaces.

interface-number: Specifies an existing aggregate interface number.

Usage guidelines

Use this command to clear history statistics before you collect traffic statistics for a time period.

If you do not specify an aggregate interface type, the command clears statistics about all interfaces in the system except VA interfaces.

If you specify only an aggregate interface type, the command clears statistics about all aggregate interfaces of the specified type.

The **bridge-aggregation** or **route-aggregation** keyword is available only when aggregate interfaces of the corresponding type exist on the device.

Examples

Clear the statistics about interface Bridge-Aggregation 1.

```
<Sysname> reset counters interface bridge-aggregation 1
```

reset lacp statistics

Use **reset lacp statistics** to clear LACP statistics about the specified link aggregation member ports.

Syntax

reset lacp statistics [**interface** *interface-list*]

Views

User view

Predefined user roles

network-admin

context-admin

Parameters

interface *interface-list*: Specifies a list of link aggregation member ports, in the format *interface-type interface-number1* [**to** *interface-type interface-number2*]. The value for the *interface-number1* argument must be equal to or greater than the value for the *interface-number2* argument. If you do not specify any member ports, the command clears LACP statistics about all member ports.

Examples

Clear LACP statistics about all link aggregation member ports.

```
<Sysname> reset lacp statistics
```

Related commands

display link-aggregation member-port

shutdown

Use **shutdown** to shut down an aggregate interface or subinterface.

Use **undo shutdown** to bring up an aggregate interface or subinterface.

Syntax

shutdown

undo shutdown

Default

An interface is not manually shut down.

Views

Layer 2 aggregate interface view

Layer 3 aggregate interface view

Layer 3 aggregate subinterface view

Predefined user roles

network-admin

context-admin

Usage guidelines

CAUTION:

The **shutdown** command will disconnect all links established on an interface. Make sure you are fully aware of the impacts of this command when you use it on a live network.

Shutting down or bringing up a Layer 3 aggregate interface shuts down or brings up its subinterfaces. Shutting down or bringing up a Layer 3 aggregate subinterface does not affect its main interface.

Examples

Bring up Layer 2 aggregate interface Bridge-Aggregation 1.

```
<Sysname> system-view
[Sysname] interface bridge-aggregation 1
[Sysname-Bridge-Aggregation1] undo shutdown
```

Bring up Layer 3 aggregate interface Route-Aggregation 1.

```
<Sysname> system-view
[Sysname] interface route-aggregation 1
[Sysname-Route-Aggregation1] undo shutdown
```

Contents

VLAN commands

Basic VLAN commands

bandwidth

Use **bandwidth** to set the expected bandwidth of an interface.

Use **undo bandwidth** to restore the default.

Syntax

bandwidth *bandwidth-value*

undo bandwidth

Default

The expected bandwidth (in kbps) is the interface baud rate divided by 1000.

Views

VLAN interface view

Predefined user roles

network-admin

context-admin

Parameters

bandwidth-value: Specifies the expected bandwidth in the range of 1 to 400000000 kbps.

Usage guidelines

The expected bandwidth is an informational parameter used only by higher-layer protocols for calculation. You cannot adjust the actual bandwidth of an interface by using this command.

Examples

Set the expected bandwidth to 10000 kbps for VLAN-interface 1.

```
<Sysname> system-view
[Sysname] interface vlan-interface 1
[Sysname-Vlan-interface1] bandwidth 10000
```

default

Use **default** to restore the default settings for a VLAN interface.

Syntax

default

Views

VLAN interface view

Predefined user roles

network-admin

context-admin

Usage guidelines

CAUTION:

The **default** command might interrupt ongoing network services. Make sure you are fully aware of the impact of this command when you use it on a live network.

This command might fail to restore the default settings for some commands for reasons such as command dependencies or system restrictions. Use the **display this** command in interface view to identify these commands, and then use their **undo** forms or follow the command reference to restore their default settings. If your restoration attempt still fails, follow the error message instructions to resolve the problem.

Examples

Restore the default settings for VLAN-interface 1.

```
<Sysname> system-view
[Sysname] interface vlan-interface 1
[Sysname-Vlan-interface1] default
```

description

Use **description** to configure the description of a VLAN or VLAN interface.

Use **undo description** to restore the default.

Syntax

description *text*

undo description

Default

For a VLAN, the description is **VLAN** *vlan-id*. The *vlan-id* argument specifies the VLAN ID in a four-digit format. If the VLAN ID has fewer than four digits, leading zeros are added. For example, the default description of VLAN 100 is **VLAN 0100**.

For a VLAN interface, the description is the name of the interface. For example, **Vlan-interface1 Interface**.

Views

VLAN view

VLAN interface view

Predefined user roles

network-admin

context-admin

Parameters

text: Specifies a description, a case-sensitive string of 1 to 255 characters.

Usage guidelines

To manage VLANs and VLAN interfaces efficiently, configure descriptions for them based on their functions or connections.

Examples

Configure the description of VLAN 2 as **sales-private**.

```
<Sysname> system-view
```

```
[Sysname] vlan 2
[Sysname-vlan2] description sales-private
```

Configure the description of VLAN-interface 2 as **linktoPC56**.

```
<Sysname> system-view
[Sysname] vlan 2
[Sysname-vlan2] quit
[Sysname] interface vlan-interface 2
[Sysname-Vlan-interface2] description linktoPC56
```

Related commands

display interface vlan-interface

display vlan

display interface vlan-interface

Use **display interface vlan-interface** to display VLAN interface information.

Syntax

display interface [**vlan-interface** [*interface-number*]] [**brief**]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

vlan-interface *interface-number*: Specifies a VLAN interface number. If you do not specify this option, the command displays information about all interfaces except VA interfaces. If you specify the **vlan-interface** keyword without specifying an interface, the command displays information about all VLAN interfaces. For more information about VA interfaces, see PPP in *Layer 2—WAN Access Configuration Guide*.

brief: Displays brief interface information. If you do not specify this keyword, the command displays detailed interface information.

Examples

Display information about VLAN-interface 2.

```
<Sysname> display interface vlan-interface 2
Vlan-interface2
Current state: DOWN
Line protocol state: DOWN
Description: Vlan-interface2 Interface
Bandwidth: 100000 kbps
Maximum transmission unit: 1500
Internet protocol processing : Disabled
IP packet frame type: Ethernet II, hardware address: 000f-e249-8050
IPv6 packet frame type: Ethernet II, hardware address: 000f-e249-8050
```

```
Last clearing of counters: Never
Last 300 seconds input rate: 0 bytes/sec, 0 bits/sec, 0 packets/sec
Last 300 seconds output rate: 0 bytes/sec, 0 bits/sec, 0 packets/sec
Input: 0 packets, 0 bytes, 0 drops
Output: 0 packets, 0 bytes, 0 drops
```

Display brief information about VLAN-interface 2.

```
<Sysname> display interface vlan-interface 2 brief
Brief information on interfaces in route mode:
Link: ADM - administratively down; Stby - standby
Protocol: (s) - spoofing
Interface            Link Protocol Primary IP         Description
Vlan2                DOWN DOWN     --
```

Table 1 Command output

Field	Description
Vlan-interface2	VLAN interface name.
Current state	Physical link state of the VLAN interface: • **Administratively DOWN**—The interface has been shut down by using the **shutdown** command. • **DOWN**—The interface is administratively up, but its physical state is down. The VLAN of this VLAN interface does not contain any physical ports in up state. The ports might not be connected correctly or the links might have failed. • **UP**—The interface is both administratively and physically up.
Line protocol state	Data link layer state of the VLAN interface: • **DOWN**—The link layer protocol state of the interface is down. • **UP**—The link layer protocol state of the interface is up.
Description	Description of the VLAN interface.
Bandwidth	Expected bandwidth of the VLAN interface.
Maximum transmission unit	MTU of the VLAN interface.
Internet protocol processing : Disabled	The VLAN interface is not assigned an IP address and cannot process IP packets.
IP packet frame type	IPv4 packet framing format.
hardware address	MAC address of the VLAN interface.
IPv6 packet frame type	IPv6 packet framing format.
Last clearing of counters	The most recent time that the **reset counters interface vlan-interface** command was executed. This field displays **Never** if you have never executed this command.
Last 300 seconds input rate: 0 bytes/sec, 0 bits/sec, 0 packets/sec Last 300 seconds output rate: 0 bytes/sec, 0 bits/sec, 0 packets/sec	Average rates of input packets and output packets in the last 300 seconds (in Bps, bps, and pps).
Input: 0 packets, 0 bytes, 0 drops	Total number and size (in bytes) of the received packets of the interface and the number of the dropped packets.

Field	Description
Output: 0 packets, 0 bytes, 0 drops	Total number and size (in bytes) of the sent packets of the interface and the number of the dropped packets.
Brief information on interfaces in route mode	Brief information about Layer 3 interfaces.
Interface	Abbreviated interface name.
Link	Physical link state of the interface: • **UP**—The interface is physically up. • **DOWN**—The interface is physically down. • **ADM**—The interface has been shut down by using the **shutdown** command. To restore the physical state of the interface, use the **undo shutdown** command. • **Stby**—The interface is a backup interface in standby state. To see the primary interface, use the **display interface-backup state** command.
Protocol	Data link layer protocol state of the interface: • **UP**—The data link layer protocol state of the interface is up. • **DOWN**—The data link layer protocol state of the interface is down. • **UP(s)**—The data link layer protocol of the interface is up, but the link is an on-demand link or does not exist. The **(s)** attribute represents the spoofing flag.
Primary IP	Primary IP address of the interface.

Related commands

reset counters interface vlan-interface

display vlan

Use **display vlan** to display VLAN information.

Syntax

display vlan [*vlan-id1* [**to** *vlan-id2*] | **all** | **dynamic** | **static**]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

vlan-id1: Specifies a VLAN by its ID in the range of 1 to 4094.

vlan-id1 **to** *vlan-id2*: Specifies a VLAN ID range. Both the *vlan-id1* and the *vlan-id2* arguments are in the range of 1 to 4094. The value for the *vlan-id2* argument must be equal to or greater than the value for the *vlan-id1* argument.

all: Specifies all VLANs.

dynamic: Specifies dynamic VLANs. If you specify this keyword, the command displays the total number of dynamic VLANs and each dynamic VLAN ID. Dynamic VLANs are assigned by a RADIUS server.

static: Specifies static VLANs. If you specify this keyword, the command displays the total number of static VLANs and each static VLAN ID. Static VLANs are manually created.

Examples

Display information about VLAN 2.

```
<Sysname> display vlan 2
 VLAN ID: 2
 VLAN type: Static
 Route interface: Not configured
 Description: VLAN 0002
 Name: VLAN 0002
 Tagged ports:   None
 Untagged ports:
    GigabitEthernet1/0/1  GigabitEthernet1/0/2  GigabitEthernet1/0/3
```

Display information about VLAN 3.

```
<Sysname> display vlan 3
 VLAN ID: 3
 VLAN type: static
 Route interface: Configured
 IPv4 address: 1.1.1.1
 IPv4 subnet mask: 255.255.255.0
 Description: VLAN 0003
 Name: VLAN 0003
 Tagged ports:   None
 Untagged ports: None
```

Table 2 Command output

Field	Description
VLAN type	VLAN type, static or dynamic.
Route interface	Whether the VLAN interface is configured for the VLAN. • Not configured. • Configured.
Description	Description of the VLAN.
Name	VLAN name.
IP address	Primary IPv4 address of the VLAN interface. This field is displayed only when an IPv4 address is configured for the VLAN interface. When the VLAN interface is also configured with secondary IPv4 addresses, you can view them by using one of the following commands: • **display interface vlan-interface**. • **display this** (VLAN interface view).
Subnet mask	Subnet mask of the primary IP address. This field is available only when an IP address is configured for the VLAN interface.

Field	Description
Tagged ports	Tagged members of the VLAN.
Untagged ports	Untagged members of the VLAN.

Related commands

vlan

display vlan brief

Use **display vlan brief** to display brief VLAN information.

Syntax

display vlan brief

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Examples

Display brief VLAN information.

```
<Sysname> display vlan brief
Brief information about all VLANs:
Supported Minimum VLAN ID: 1
Supported Maximum VLAN ID: 4094
Default VLAN ID: 1
VLAN ID   Name                            Port
1         VLAN 0001                       GE1/0/1  GE1/0/2  GE1/0/3
2         VLAN 0002
3         VLAN 0003
```

Table 3 Command output

Field	Description
Default VLAN ID	System default VLAN ID.
Name	VLAN name.
Port	Ports that allow packets from the VLAN to pass through.

interface vlan-interface

Use **interface vlan-interface** to create a VLAN interface and enter its view, or enter the view of an existing VLAN interface.

Use **undo interface vlan-interface** to delete a VLAN interface.

Syntax

interface vlan-interface *interface-number*

undo interface vlan-interface *interface-number*

Default

No VLAN interfaces exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

interface-number: Specifies a VLAN interface number in the range of 1 to 4094.

Usage guidelines

Create the VLAN before you create the VLAN interface for a VLAN.

Examples

Create VLAN-interface 2, and enter its view.

```
<Sysname> system-view
[Sysname] vlan 2
[Sysname-vlan2] quit
[Sysname] interface vlan-interface 2
[Sysname-Vlan-interface2]
```

Related commands

display interface vlan-interface

mtu

Use **mtu** to set the MTU for a VLAN interface.

Use **undo mtu** to restore the default.

Syntax

mtu *size*

undo mtu

Default

The MTU of a VLAN interface is 1500 bytes.

Views

VLAN interface view

Predefined user roles

network-admin

context-admin

Parameters

size: Sets the MTU .

The following matrix shows the value ranges for the MTU:

Models	Value range
NFNX3-HDB680, NFNX3-HDB1080	46 to 1500
NFNX5-HD6480, NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB1780, NFNX3-HDB3080, NFNX3-HDB1180, NFNX3-HDB1480	46 to 1500

Usage guidelines

If you configure both the **mtu** and **ip mtu** commands on a VLAN interface, the MTU set by the **ip mtu** command is used for fragmentation. For more information about the **ip mtu** command, see *Layer 3—IP Services Command Reference*.

Examples

Set the MTU to 1492 bytes for VLAN-interface 1.

```
<Sysname> system-view
[Sysname] interface vlan-interface 1
[Sysname-Vlan-interface1] mtu 1492
```

Related commands

display interface vlan-interface

name

Use **name** to assign a name to a VLAN.

Use **undo name** to restore the default.

Syntax

name *text*

undo name

Default

The name of a VLAN is **VLAN** *vlan-id.* The *vlan-id* argument specifies the VLAN ID in a four-digit format. If the VLAN ID has fewer than four digits, leading zeros are added. For example, the name of VLAN 100 is **VLAN 0100**.

Views

VLAN view

Predefined user roles

network-admin

context-admin

Parameters

text: Specifies a VLAN name, a case-sensitive string of 1 to 32 characters.

Usage guidelines

If a large number of VLANs are configured, use VLAN names to identify them.

Examples

Assign the name **test vlan** to VLAN 2.

```
<Sysname> system-view
[Sysname] vlan 2
[Sysname-vlan2] name test vlan
```

Related commands

display vlan

reset counters interface vlan-interface

Use **reset counters interface vlan-interface** to clear statistics on a VLAN interface.

Syntax

reset counters interface [**vlan-interface** [*interface-number*]]

Views

User view

Predefined user roles

network-admin

context-admin

Parameters

vlan-interface *interface-number*: Specifies a VLAN interface by its number. If you do not specify this option, this command clears statistics on all interfaces except VA interfaces. If you specify the **vlan-interface** keyword without specifying an interface, this command clears statistics on all VLAN interfaces.

Usage guidelines

Use this command to clear the history statistics before you collect statistics within a time period.

Examples

Clear statistics on VLAN-interface 2.

```
<Sysname> reset counters interface vlan-interface 2
```

Related commands

display interface vlan-interface

shutdown

Use **shutdown** to shut down a VLAN interface.

Use **undo shutdown** to bring up a VLAN interface.

Syntax

shutdown

undo shutdown

Default

A VLAN interface is not manually shut down.

Views

VLAN interface view

Predefined user roles

network-admin

context-admin

Usage guidelines

CAUTION:

Executing the **shutdown** command on a VLAN interface will disconnect the link of the VLAN interface and interrupt communication. Use this command with caution.

When a VLAN interface is not manually shut down, the following guidelines apply to the interface state:

- The VLAN interface is down if all ports in the VLAN are down.
- The VLAN interface is up if one or more ports in the VLAN are up.

When you use this command to shut down a VLAN interface, the VLAN interface remains in DOWN (Administratively) state. In this case, the VLAN interface state is not affected by the state of the ports in the VLAN.

Before you configure parameters for a VLAN interface, use this command to shut it down to prevent the configuration from affecting the network. After you complete the VLAN interface configuration, use the **undo shutdown** command to make the settings take effect.

To troubleshoot a failed VLAN interface, you can use the **shutdown** command and then the **undo shutdown** command on the interface to see whether it recovers.

In a VLAN, the state of each Ethernet port is independent of the state of the VLAN interface.

Examples

Shut down VLAN-interface 2, and then bring it up.

```
<Sysname> system-view
[Sysname] interface vlan-interface 2
[Sysname-Vlan-interface2] shutdown
[Sysname-Vlan-interface2] undo shutdown
```

vlan

Use **vlan** *vlan-id* to create a VLAN and enter its view, or enter the view of an existing VLAN.

Use **vlan** *vlan-id1* **to** *vlan-id2* to create VLANs *vlan-id1* through *vlan-id2*, except reserved VLANs.

Use **vlan all** to create VLANs 1 through 4094.

Use **undo vlan** to delete the specified VLANs.

Syntax

vlan { *vlan-id1* [**to** *vlan-id2*] | **all** }

undo vlan { *vlan-id1* [**to** *vlan-id2*] | **all** }

Default

VLAN 1 (system default VLAN) exists.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

vlan-id1: Specifies a VLAN ID in the range of 1 to 4094.

vlan-id1 **to** *vlan-id2*: Specifies a VLAN range. The *vlan-id1* and *vlan-id2* arguments specify VLAN IDs. The value range for each of the two arguments is 1 to 4094. The value for the *vlan-id2* argument must be equal to or greater than the value for the *vlan-id1* argument.

all: Specifies all VLANs except reserved VLANs. The keyword is not supported when the maximum number of VLANs that can be created on a device is less than 4094.

Usage guidelines

You cannot create or delete the system default VLAN (VLAN 1) or reserved VLANs.

Before you delete a dynamic VLAN or a VLAN locked by an application, you must first remove the configuration from the VLAN.

Examples

Create VLAN 2 and enter its view.

```
<Sysname> system-view
[Sysname] vlan 2
[Sysname-vlan2]
```

Create VLANs 4 through 100.

```
<Sysname> system-view
[Sysname] vlan 4 to 100
```

Related commands

display vlan

display port

Use **display port** to display information about hybrid or trunk ports.

Syntax

display port { **hybrid** | **trunk** }

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

hybrid: Specifies hybrid ports.

trunk: Specifies trunk ports.

Examples

Display information about hybrid ports.

```
<Sysname> display port hybrid
Interface            PVID  VLAN Passing
GE1/0/1              100   Tagged:  1000, 1002, 1500, 1600-1611, 2000,
                                    2555-2558, 3000, 4000
                           Untagged:1, 10, 15, 18, 20-30, 44, 55, 67, 100,
                                    150-160, 200, 255, 286, 300-302
```

Display information about trunk ports.

```
<Sysname> display port trunk
Interface            PVID  VLAN Passing
GE1/0/2              2     1-4, 6-100, 145, 177, 189-200, 244, 289, 400,
                           555, 600-611, 1000, 2006-2008
```

Table 4 Command output

Field	Description
Interface	Interface name.
PVID	Port VLAN ID.
VLAN Passing	Existing VLANs allowed on the port.
Tagged	VLANs from which the port sends packets without removing VLAN tags.
Untagged	VLANs from which the port sends packets after removing VLAN tags.

port

Use **port** to assign the specified access ports to a VLAN.

Use **undo port** to remove the specified access ports from a VLAN.

Syntax

port *interface-list*

undo port *interface-list*

Default

All ports are in VLAN 1.

Views

VLAN view

Predefined user roles

network-admin

context-admin

Parameters

interface-list: Specifies a space-separated list of up to 10 Ethernet interface items. Each item specifies an Ethernet interface or a range of Ethernet interfaces in the form of *interface-type interface-number1* **to** *interface-type interface-number2*. The value for the

interface-number2 argument must be equal to or greater than the value for the *interface-number1* argument.

Usage guidelines

This command is applicable only to access ports. This command cannot assign access ports to or remove access ports from VLAN 1.

By default, all ports are access ports. You can manually configure the port link type. For more information, see "port link-type."

Examples

Assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/2 to VLAN 2.

```
<Sysname> system-view
[Sysname] vlan 2
[Sysname-vlan2] port gigabitethernet 1/0/1 to gigabitethernet 1/0/2
```

Related commands

display vlan

port access vlan

Use **port access vlan** to assign an access port to the specified VLAN.

Use **undo port access vlan** to restore the default.

Syntax

port access vlan *vlan-id*

undo port access vlan

Default

All access ports belong to VLAN 1.

Views

Layer 2 aggregate interface view

Layer 2 Ethernet interface view

Predefined user roles

network-admin

context-admin

Parameters

vlan-id: Specifies a VLAN by its ID in the range of 1 to 4094.

Usage guidelines

By default, all access ports belong to VLAN 1. Therefore, this command cannot be used to assign access ports to VLAN 1. To move an access port to VLAN 1, execute the **undo port access vlan** command on the access port.

Before assigning an access port to a VLAN, make sure the VLAN has been created.

Examples

Assign GigabitEthernet 1/0/1 to VLAN 3.

```
<Sysname> system-view
[Sysname] vlan 3
[Sysname-vlan3] quit
```

```
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] port access vlan 3
```

port hybrid pvid

Use **port hybrid pvid** to set the PVID of a hybrid port.

Use **undo port hybrid pvid** to set the PVID of a hybrid port to 1.

Syntax

port hybrid pvid vlan *vlan-id*

undo port hybrid pvid

Default

The PVID of a hybrid port is the ID of the VLAN to which the port belongs when its link type is **access**.

Views

Layer 2 aggregate interface view

Layer 2 Ethernet interface view

Predefined user roles

network-admin

context-admin

Parameters

vlan-id: Specifies a VLAN by its ID in the range of 1 to 4094.

Usage guidelines

You can use a nonexistent VLAN as the PVID of a hybrid port. When you delete the PVID of a hybrid port by using the **undo vlan** command, the PVID setting of the port does not change.

For correct packet transmission, set the same PVID for a local hybrid port and its peer.

To enable a hybrid port to transmit packets from its PVID, you must assign the hybrid port to the PVID by using the **port hybrid vlan** command.

Examples

Configure GigabitEthernet 1/0/1 as a hybrid port, set its PVID to VLAN 100, and assign it to VLAN 100 as an untagged member.

```
<Sysname> system-view
[Sysname] vlan 100
[Sysname-vlan100] quit
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] port link-type hybrid
[Sysname-GigabitEthernet1/0/1] port hybrid pvid vlan 100
[Sysname-GigabitEthernet1/0/1] port hybrid vlan 100 untagged
```

Related commands

port hybrid vlan

port link-type

port hybrid vlan

Use **port hybrid vlan** to assign a hybrid port to the specified VLANs.

Use **undo port hybrid vlan** to remove a hybrid port from the specified VLANs.

Syntax

port hybrid vlan *vlan-id-list* { **tagged** | **untagged** }

undo port hybrid vlan *vlan-id-list*

Default

A hybrid port is an untagged member of the VLAN to which the port belongs when its link type is **access**.

Views

Layer 2 aggregate interface view

Layer 2 Ethernet interface view

Predefined user roles

network-admin

context-admin

Parameters

vlan-id-list: Specifies a space-separated list of up to 10 VLAN items. Each item specifies a VLAN ID or a range of VLAN IDs in the form of *vlan-id1* **to** *vlan-id2*. The value range for VLAN IDs is 1 to 4094. The value for the *vlan-id2* argument must be equal to or greater than the value for the *vlan-id1* argument. The specified VLANs must already exist on the device.

tagged: Configures the port as a tagged member of the specified VLANs. A tagged member of a VLAN sends packets from the VLAN without removing VLAN tags.

untagged: Configures the port as an untagged member of the specified VLANs. An untagged member of a VLAN sends packets from the VLAN after removing VLAN tags.

Usage guidelines

A hybrid port can allow multiple VLANs. If you execute this command multiple times on a hybrid port, the hybrid port allows all the specified VLANs.

Examples

Configure GigabitEthernet 1/0/1 as a hybrid port, and assign it to VLAN 2, VLAN 4, and VLAN 50 through VLAN 100 as a tagged member.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] port link-type hybrid
[Sysname-GigabitEthernet1/0/1] port hybrid vlan 2 4 50 to 100 tagged
```

Related commands

port link-type

port link-type

Use **port link-type** to set the link type of a port.

Use **undo port link-type** to restore the default link type of a port.

Syntax

port link-type { **access** | **hybrid** | **trunk** }

undo port link-type

Default

Each port is an access port.

Views

Layer 2 aggregate interface view

Layer 2 Ethernet interface view

Predefined user roles

network-admin

context-admin

Parameters

access: Sets the port link type to access.

hybrid: Sets the port link type to hybrid.

trunk: Sets the port link type to trunk.

Usage guidelines

To change the link type of a port from trunk to hybrid or vice versa, first set the link type to access.

Examples

Configure GigabitEthernet 1/0/1 as a trunk port.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] port link-type trunk
```

port trunk permit vlan

Use **port trunk permit vlan** to assign a trunk port to the specified VLANs.

Use **undo port trunk permit vlan** to remove a trunk port from the specified VLANs.

Syntax

port trunk permit vlan { *vlan-id-list* | **all** }

undo port trunk permit vlan { *vlan-id-list* | **all** }

Default

A trunk port allows packets only from VLAN 1 to pass through.

Views

Layer 2 aggregate interface view

Layer 2 Ethernet interface view

Predefined user roles

network-admin

context-admin

Parameters

vlan-id-list: Specifies a space-separated list of up to 10 VLAN items. Each item specifies a VLAN ID or a range of VLAN IDs in the form of *vlan-id1* **to** *vlan-id2*. The value range for VLAN IDs is 1 to 4094. The value for the *vlan-id2* argument must be equal to or greater than the value for the *vlan-id1* argument.

all: Specifies all VLANs. To prevent unauthorized VLAN users from accessing restricted resources through the port, use the **port trunk permit vlan all** command with caution.

Usage guidelines

A trunk port can allow multiple VLANs. If you execute this command multiple times on a trunk port, the trunk port allows all the specified VLANs.

On a trunk port, packets only from the PVID can pass through untagged.

Examples

Configure GigabitEthernet 1/0/1 as a trunk port, and assign it to VLAN 2, VLAN 4, and VLAN 50 through VLAN 100.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] port link-type trunk
[Sysname-GigabitEthernet1/0/1] port trunk permit vlan 2 4 50 to 100
```

Related commands

port link-type

port trunk pvid

Use **port trunk pvid** to set the PVID for a trunk port.

Use **undo port trunk pvid** to restore the default.

Syntax

port trunk pvid vlan *vlan-id*

undo port trunk pvid

Default

The PVID of a trunk port is VLAN 1.

Views

Layer 2 aggregate interface view

Layer 2 Ethernet interface view

Predefined user roles

network-admin

context-admin

Parameters

vlan-id: Specifies a VLAN by its ID in the range of 1 to 4094.

Usage guidelines

You can use a nonexistent VLAN as the PVID for a trunk port. When you delete the PVID of a trunk port by using the **undo vlan** command, the PVID setting of the port does not change.

For correct packet transmission, set the same PVID for a local trunk port and its peer.

To enable a trunk port to transmit packets from its PVID, you must assign the trunk port to the PVID by using the **port trunk permit vlan** command.

Examples

Configure GigabitEthernet 1/0/1 as a trunk, set its PVID to VLAN 100, and assign it to VLAN 100.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] port link-type trunk
[Sysname-GigabitEthernet1/0/1] port trunk pvid vlan 100
[Sysname-GigabitEthernet1/0/1] port trunk permit vlan 100
```

display vlan-group

Use **display vlan-group** to display VLAN group information.

Syntax

display vlan-group [*group-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

group-name: Specifies a VLAN group by its name, a case-sensitive string of 1 to 31 characters. The first character must be an alphabetical character. If you do not specify this argument, the command displays information about all VLAN groups.

Examples

Display information about VLAN group **test001**.

```
<Sysname> display vlan-group test001
VLAN group: test001
     VLAN list: 2-4 100 200
```

Display information about all VLAN groups.

```
<Sysname> display vlan-group
VLAN group: rnd
     VLAN list: Null
VLAN group: test001
     VLAN list: 2-4 100 200
```

vlan-group

Use **vlan-group** to create a VLAN group and enter its view, or enter the view of an existing VLAN group.

Use **undo vlan-group** to delete a VLAN group.

Syntax

vlan-group *group-name*

undo vlan-group *group-name*

Default

No VLAN groups exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

group-name: Specifies a VLAN group by its name, a case-sensitive string of 1 to 31 characters. The first character must be an alphabetical character.

Usage guidelines

A VLAN group includes a set of VLANs. You can add multiple VLAN lists to a VLAN group.

Examples

Create a VLAN group named **test001** and enter VLAN group view.

```
<Sysname> system-view
[Sysname] vlan-group test001
[Sysname-vlan-group-test001]
```

Related commands

vlan-list

vlan-list

Use **vlan-list** to add VLANs to a VLAN group.

Use **undo vlan-list** to remove VLANs from a VLAN group.

Syntax

vlan-list *vlan-id-list*

undo vlan-list *vlan-id-list*

Default

No VLANs exist in a VLAN group.

Views

VLAN group view

Contents

VLAN termination commands

dot1q ethernet-type

Use **dot1q ethernet-type** to set the TPID value in the outermost VLAN tag of packets received and sent by an interface.

Use **undo dot1q ethernet-type** to restore the default.

Syntax

dot1q ethernet-type *hex-value*

undo dot1q ethernet-type

Default

The TPID value for the outermost VLAN tag of a VLAN-tagged packet received and sent by the interface is 0x8100.

Views

Layer 3 aggregate/Ethernet interface view

Reth interface view

Predefined user roles

network-admin

context-admin

Parameters

hex-value: Sets a hexadecimal TPID value in the range of 600 to ffff, excluding the common protocol type values listed in Table 1.

Table 1 Common protocol type values

Protocol	Value
ARP	0x0806
PUP	0x0200
RARP	0x8035
IP	0x0800
IPv6	0x86DD
PPPoE	0x8863/0x8864
IPX/SPX	0x8137
IS-IS	0x8000
LACP	0x8809
LLDP	0x88CC
802.1ag	0x8902
Cluster	0x88A7
Reserved on the device	0xFFFD/0xFFFE/0xFFFF

Usage guidelines

After you execute this command, only packets whose TPID in the outermost VLAN tag is 0x8100 or the configured value are processed as VLAN-tagged packets. When sending a packet, the interface sets the TPID value in the outermost VLAN tag to the configured value. If the packet includes two or more layers of VLAN tags, the interface sets the TPID values in the other VLAN tags to 0x8100.

Do not use this command in subinterface view.

Configurations made in interface view take effect on all subinterfaces of the interface.

Examples

Set the TPID value to 0x9100 in the outermost VLAN tag of VLAN-tagged packets received and sent by the subinterfaces of GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] dot1q ethernet-type 9100
```

vlan-termination broadcast enable

Use **vlan-termination broadcast enable** to enable an interface to transmit broadcasts and multicasts.

Use **undo vlan-termination broadcast enable** to disable an interface from transmitting broadcasts and multicasts.

Syntax

vlan-termination broadcast enable

undo vlan-termination broadcast enable

Default

An ambiguous Dot1q termination-enabled interface drops broadcast and multicast packets.

Views

Layer 3 Ethernet subinterface view

Layer 3 aggregate subinterface view

Reth subinterface view

Predefined user roles

network-admin

context-admin

Usage guidelines

IMPORTANT:

This command affects system performance. If system performance is seriously affected by this command, execute the **undo** form of this command to remove the command configuration.

.To transmit a broadcast or multicast packet, the interface starts a traversal over the VLAN IDs specified for ambiguous termination. It copies the packet and tags each copy with a VLAN ID, until all VLAN IDs in the specified range are traversed.

Use this command when ambiguous Dot1q termination is enabled on an interface.

Examples

Configure GigabitEthernet 1/0/1.10 to tag a multicast or broadcast packet with each VLAN tag in the range of 10 to 20.

Enable Dot1q termination on GigabitEthernet 1/0/1.10 to terminate VLAN-tagged packets with outermost VLAN IDs in the range of 10 to 20.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1.10
[Sysname-GigabitEthernet1/0/1.10] vlan-type dot1q vid 10 to 20
```

Enable GigabitEthernet 1/0/1.10 to transmit broadcast and multicast packets.

```
[Sysname-GigabitEthernet1/0/1.10] vlan-termination broadcast enable
```

vlan-termination broadcast ra

Use **vlan-termination broadcast ra** to enable an interface to transmit router advertisement (RA) multicast packets.

Use **undo vlan-termination broadcast ra** to disable an interface from transmitting RA multicast packets.

Syntax

vlan-termination broadcast ra

undo vlan-termination broadcast ra

Default

An ambiguous Dot1q termination-enabled interface drops broadcast and multicast packets.

Views

Layer 3 Ethernet subinterface view

Layer 3 aggregate subinterface view

Reth subinterface view

Predefined user roles

network-admin

context-admin

Usage guidelines

To transmit an RA multicast packet, the interface starts a traversal over the VLAN IDs specified for ambiguous termination. It copies the packet and tags each copy with a VLAN ID, until all VLAN IDs in the specified range are traversed.

As a best practice, use this command to enable an ambiguous Dot1q termination-enabled interface to transmit RA multicast packets on an IPv6 network. This command prohibits transmission of broadcast packets and other types of multicast packets, and consumes less CPU resources than the **vlan-termination broadcast enable** command.

Examples

Configure GigabitEthernet 1/0/1.10 to tag RA multicast packets with each VLAN tag in the range of 10 to 20.

Enable Dot1q termination on GigabitEthernet 1/0/1.10 to terminate VLAN-tagged packets with outermost VLAN IDs in the range of 10 to 20.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1.10
[Sysname-GigabitEthernet1/0/1.10] vlan-type dot1q vid 10 to 20
```

Enable GigabitEthernet 1/0/1.10 to transmit RA multicast packets.

```
[Sysname-GigabitEthernet1/0/1.10] vlan-termination broadcast ra
```

vlan-type dot1q default

Use **vlan-type dot1q default** to enable default termination on a subinterface.

Use **undo vlan-type dot1q default** to disable default termination on a subinterface.

Syntax

vlan-type dot1q default

undo vlan-type dot1q default

Default

Default termination is disabled on a subinterface.

Views

Layer 3 Ethernet subinterface view

Layer 3 aggregate subinterface view

Reth subinterface view

Predefined user roles

network-admin

context-admin

Usage guidelines

This command enables the subinterface to process packets that cannot be terminated by other subinterfaces on the same main interface.

Examples

Enable default termination on GigabitEthernet 1/0/1.1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1.1
[Sysname-GigabitEthernet1/0/1.1] vlan-type dot1q default
[Sysname-GigabitEthernet1/0/1.1] quit
```

vlan-type dot1q untagged

Use **vlan-type dot1q untagged** to enable untagged termination on a subinterface.

Use **undo vlan-type dot1q untagged** to disable untagged termination on a subinterface.

Syntax

vlan-type dot1q untagged

undo vlan-type dot1q untagged

Default

Untagged termination is disabled on a subinterface.

Views

Layer 3 Ethernet subinterface view

Layer 3 aggregate subinterface view

Reth subinterface view

Predefined user roles

network-admin

context-admin

Usage guidelines

This command enables the subinterface to process untagged packets.

Examples

Enable untagged termination on GigabitEthernet 1/0/1.1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1.1
[Sysname-GigabitEthernet1/0/1.1] vlan-type dot1q untagged
[Sysname-GigabitEthernet1/0/1.1] quit
```

vlan-type dot1q vid

Use **vlan-type dot1q vid** to enable Dot1q termination on a subinterface, and specify the outermost VLAN IDs in the VLAN-tagged packets that can be terminated by the subinterface.

Use **undo vlan-type dot1q vid** to disable Dot1q termination on a subinterface.

Syntax

vlan-type dot1q vid *vlan-id-list*

undo vlan-type dot1q vid *vlan-id-list*

Default

Dot1q termination is disabled on a subinterface.

Views

Layer 3 Ethernet subinterface view

Layer 3 aggregate subinterface view

Reth subinterface view

Predefined user roles

network-admin

context-admin

Parameters

vlan-id-list: Specifies a space-separated list of up to 10 outermost VLAN ID items. Each item specifies an outermost VLAN ID or a range of outermost VLAN IDs in the form of *vlan-id1* **to** *vlan-id2*. The value range for VLAN IDs is 1 to 4094. The value for the *vlan-id2* argument must be equal to or greater than the value for the *vlan-id1* argument.

Usage guidelines

The VLAN ID ranges specified by the *vlan-id-list* argument for different subinterfaces of a main interface cannot overlap.

Examples

Configure GigabitEthernet 1/0/1.1 to terminate VLAN-tagged packets with outermost VLAN IDs in the range of 2 to 100.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1.1
```

```
[Sysname-GigabitEthernet1/0/1.1] vlan-type dot1q vid 2 to 100
```

Spanning tree commands

active region-configuration

Use **active region-configuration** to activate your MST region configuration.

Syntax

active region-configuration

Views

MST region view

Predefined user roles

network-admin

context-admin

Usage guidelines

When you configure MST region parameters, MSTP launches a new spanning tree calculation process that might cause network topology instability. This is most likely to occur when you configure the VLAN-to-instance mapping table. The launch occurs after you execute the **active region-configuration** command or the **stp global enable** command.

As a best practice, use the **check region-configuration** command to determine whether the MST region configurations to be activated are correct. Run this command only when they are correct.

Examples

Map VLAN 2 to MSTI 1 and activate the MST region configuration.

```
<Sysname> system-view
[Sysname] stp region-configuration
[Sysname-mst-region] instance 1 vlan 2
[Sysname-mst-region] active region-configuration
```

Related commands

vlan-mapping modulo

check region-configuration

Use **check region-configuration** to display MST region pre-configuration information.

Syntax

check region-configuration

Views

MST region view

Predefined user roles

network-admin

context-admin

Usage guidelines

Spanning tree devices belong to the same MST region only when they are connected through a physical link and configured with the same details as follows:

- Format selector (0 by default and not configurable).
- MST region name.
- MST region revision level.
- VLAN-to-instance mapping entries in the MST region.

As a best practice, use this command to determine whether the MST region configurations to be activated are correct. Activate them only when they are correct.

Examples

Display MST region pre-configurations.

```
<Sysname> system-view
[Sysname] stp region-configuration
[Sysname-mst-region] check region-configuration
 Admin Configuration
   Format selector      : 0
   Region name          : 001122334400
   Revision level       : 0
   Configuration digest : 0x3ab68794d602fdf43b21c0b37ac3bca8

   Instance  VLANs Mapped
   0         1, 3 to 4094
   15        2
```

Table 1 Command output

Field	Description
Format selector	Format selector of the MST region, which is 0 (not configurable).
Region name	MST region name.
Revision level	Revision level of the MST region.

display stp

Use **display stp** to display spanning tree status and statistics.

Syntax

display stp [**instance** *instance-list* | **vlan** *vlan-id-list*] [**interface** *interface-list* | **slot** *slot-number*] [**brief**]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

instance *instance-list*: Specifies a space-separated list of up to 10 MSTI items. Each item specifies an MSTI or a range of MSTIs in the form of *instance-id1* [**to** *instance-id2*]. The value for *instance-id2* must be equal to or greater than the value for *instance-id1*. The value range for the *instance-id* argument is 0 to 4094, and the value 0 represents the CIST.

vlan *vlan-id-list*: Specifies a space-separated list of up to 10 VLAN items. Each item specifies a VLAN or a range of VLANs in the form of *vlan-id1* [**to** *vlan-id2*]. The value for *vlan-id2* must be equal to or greater than the value for *vlan-id1*. The value range for the *vlan-id* argument is 1 to 4094.

interface *interface-list*: Specifies a space-separated list of up to 10 interface items. Each item specifies an interface or a range of interfaces in the form of *interface-type interface-number 1* [**to** *interface-type interface-number 2*]. The interface number for *interface-number 2* must be equal to or greater than the interface number for *interface-number 1*.

brief: Displays brief spanning tree status and statistics. If this keyword is not specified, the command displays detailed spanning tree status and statistics.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays information for all member devices.

Usage guidelines

In STP or RSTP mode, the command output is sorted by port name.

- If you do not specify a port, this command applies to all ports.
- If you specify a port list, this command applies to the specified ports.

In PVST mode, the command output is sorted by VLAN ID and by port name in each VLAN.

- If you do not specify a VLAN or port, this command applies to all ports in all VLANs.
- If you only specify a VLAN list but not a port, this command applies to all ports in the specified VLANs.
- If you only specify a port list but not a VLAN, this command applies to the specified ports in all VLANs.
- If you specify both a VLAN list and a port list, this command applies to the ports in the specified VLANs.

In MSTP mode, the command output is sorted by MSTI ID and by port name in each MSTI.

- If you do not specify an MSTI or port, this command applies to all MSTIs on all ports.
- If you specify an MSTI list but not a port, this command applies to all ports in the specified MSTIs.

- If you specify a port list but not an MSTI, this command applies to all MSTIs on the specified ports.
- If you specify both an MSTI list and a port list, this command applies to the specified ports in the specified MSTIs.

Examples

In MSTP mode, display the brief spanning tree status and statistics for MSTI 0 on port GigabitEthernet 1/0/1.

```
<Sysname> display stp instance 0 interface GigabitEthernet 1/0/1 brief
 MST ID      Port                        Role  STP State     Protection
 0           0           GigabitEthernet1/0/1         ALTE  DISCARDING    LOOP
```

In PVST mode, display the brief spanning tree status and statistics for VLAN 2 on port GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] stp mode pvst
[Sysname] display stp vlan 2 interface gigabitethernet 1/0/1 brief
 VLAN ID     Port                        Role  STP State     Protection
 2           GigabitEthernet1/0/1        ALTE  DISCARDING    LOOP
```

Table 2 Command output

Field	Description
MST ID	MSTI ID in the MST region.
Port	Port name, corresponding to each MSTI or VLAN.
Role	Port role: • **ALTE**—The port is an alternate port. • **BACK**—The port is a backup port. • **ROOT**—The port is a root port. • **DESI**—The port is a designated port. • **MAST**—The port is a master port. • **DISA**—The port is disabled.
STP State	Spanning tree status on the port: • **FORWARDING**—The port can receive and send BPDUs and also forward user traffic. • **DISCARDING**—The port can receive and send BPDUs but cannot forward user traffic. • **LEARNING**—The port is in a transitional state. It can receive and send BPDUs but cannot forward user traffic.
Protection	Effective spanning tree protection feature on the port: • **ROOT**—Root guard. • **LOOP**—Loop guard. • **BPDU**—BPDU guard. If no spanning tree protection feature is configured or spanning tree protection is not triggered, this field displays **NONE**.

In MSTP mode, display the detailed spanning tree status and statistics for all MSTIs on all ports.

 Hello time(s)      : 2
```

```
 Max hops           : 20
 TC Snooping        : Disabled
```

In PVST mode, display the spanning tree status and statistics when the spanning tree feature is disabled.

```
<Sysname> display stp
 Protocol status    : Disabled
 Protocol Std.      : IEEE 802.1w (pvst)
 Version            : 2
 Bridge-Prio.       : 32768
 MAC address        : 3822-d69f-0800
 Max age(s)         : 20
 Forward delay(s)   : 15
 Hello time(s)      : 2
 TC Snooping        : Disabled
```

Table 3 Command output

Field	Description
Bridge ID	Bridge ID, which contains the device's priority and its MAC address. For example, in output 32768.000f-e200-2200, the value preceding the dot is the device's priority. The value following the dot is the device's MAC address.
Bridge times	Major parameters for the bridge: • **Hello**—Hello timer. • **MaxAge**—Maximum age timer. • **FwdDelay**—Forward delay timer. • **MaxHops**—Maximum hops within the MST region.
Root ID/ERPC	CIST root ID and external path cost (the path cost from the device to the CIST root).
RegRoot ID/IRPC	CIST regional root ID and internal path cost (the path cost from the device to the CIST regional root).
VlanRoot ID/RPC	VLAN root ID and root path cost (the path cost from the device to the VLAN root bridge).
RootPort ID	Root port ID. The value **0.0** indicates that the device is the root and there is no root port.
BPDU-Protection	Global status of the BPDU guard feature.
Bridge Config-Digest-Snooping	Global status of Digest Snooping.
TC or TCN received	Number of TC/TCN BPDUs received in the MSTI or VLAN.
Time since last TC	Time since the latest topology change in the MSTI or VLAN.
Port protocol	Status of the spanning tree feature on the port.
Port role	Port role: • Alternate. • Backup. • Root. • Designated. • Master. • Disabled.
(Boundary)	The port is a regional boundary port.

Field	Description
Port cost(Legacy)	Path cost of the port. The field in parentheses indicates the standard (legacy, dot1d-1998, or dot1t) used for port path cost calculation. • **Config**—Configured value. • **Active**—Actual value.
Desg.bridge/port	Designated bridge ID and port ID of the port. The port ID displayed is insignificant for a port which does not support port priority.
Port edged	The port is an edge port or non-edge port. • **Config**—Configured value. • **Active**—Actual value.
Point-to-Point	The port is connected to a point-to-point link or not. • **Config**—Configured value. • **Active**—Actual value.
Transmit limit	Maximum number of BPDUs sent by a port within each hello time.
Protection type	Whether spanning tree protection is configured on the port: • **Config**—Configured spanning tree protection feature. • **Active**—Effective spanning tree protection feature. Spanning tree protection features are as follows: • **ROOT**—Root guard. • **LOOP**—Loop guard. • **BPDU**—BPDU guard. • **PVST BPDU**—PVST BPDU guard. If no spanning tree protection feature is configured or spanning tree protection is not triggered, this field displays **NONE**.
TC-Restriction	Status of TC transmission restriction on the port.
Role-Restriction	Status of port role restriction on the port.
MST BPDU format	Format of the MST BPDUs that the port can send: • **Config**—Configured value (legacy or 802.1s). • **Active**—Actual value (legacy or 802.1s).
Port Config-Digest-Snooping	Status of Digest Snooping on the port.
Rapid transition	Indicates whether the port rapidly transits to the forwarding state in the MSTI or VLAN.
Num of VLANs mapped	Number of VLANs that are mapped to the MSTI.
Port times	Major parameters for the port: • **Hello**—Hello timer. • **MaxAge**—Maximum age timer. • **FwdDelay**—Forward delay timer. • **MsgAge**—Message age timer. • **RemHops**—Remaining hops.
BPDU sent	Statistics on sent BPDUs.
BPDU received	Statistics on received BPDUs.
RegRoot ID/IRPC	MSTI regional root/internal path cost.
Root Type	MSTI root type:

Field	Description
	• **Primary root**. • **Secondary root**.
Master bridge	MSTI root bridge ID.
Cost to master	Path cost from the MSTI to the master bridge.
TC received	Number of received TC BPDUs.
Protocol status	Spanning tree protocol status.
Protocol Std.	Spanning tree protocol standard.
Version	Spanning tree protocol version.
Bridge-Prio.	In MSTP mode: Device's priority in the CIST. In PVST mode: Device's priority in VLAN 1.
Max age(s)	Aging timer for BPDUs (in seconds, which is the same as the aging timer for VLAN 1 in PVST mode).
Forward delay(s)	Port state transition delay (in seconds, which is the same as the port state transition delay for VLAN 1 in PVST mode).
Hello time(s)	Interval for the root bridge to send BPDUs (in seconds, which is the same as the interval for VLAN 1 in PVST mode).
Max hops	Maximum hops in the MSTI.
TC Snooping	Status of TC Snooping: **Enabled** or **Disabled**.

Related commands

`reset stp`

display stp abnormal-port

Use **`display stp abnormal-port`** to display information about ports that are blocked by spanning tree protection features.

Syntax

`display stp abnormal-port`

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Examples

In MSTP mode, display information about ports that are blocked by spanning tree protection features.

```
<Sysname> display stp abnormal-port
 MST ID      Blocked Port                Reason
 1           GigabitEthernet1/0/1        Root-Protected
```

```
 2           GigabitEthernet1/0/2         Loop-Protected
 12          GigabitEthernet1/0/3         Loopback-Protected
```

In PVST mode, display information about ports that are blocked by spanning tree protection features.

```
<Sysname> system-view
[Sysname] stp mode pvst
[Sysname] display stp abnormal-port
 VLAN ID      Blocked Port                 Reason
 1            GigabitEthernet1/0/1         Root-Protected
 2            GigabitEthernet1/0/2         Loop-Protected
 2            GigabitEthernet1/0/3         Loopback-Protected
```

Table 4 Command output

Field	Description
MST ID	MSTI of a blocked port.
VLAN ID	VLAN of a blocked port.
Blocked Port	Name of a blocked port.
BlockReason	Reason that the port was blocked: • **Root-Protected**—Root guard feature. • **Loop-Protected**—Loop guard feature. • **Loopback-Protected**—Self-loop protection. A port in the MSTI receives a BPDU sent by itself. • **Disputed**—Dispute guard. A port receives a low-priority BPDU from a non-blocked designated port in forwarding or learning state. • **InconsistentPortType-Protected**—Inconsistent port type protection. • **InconsistentPvid-Protected**—Inconsistent PVID protection.

display stp bpdu-statistics

Use **display stp bpdu-statistics** to display the BPDU statistics for ports.

Syntax

display stp bpdu-statistics [**interface** *interface-type interface-number* [**instance** *instance-list*]]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

interface *interface-type interface-number*: Specifies an interface by its type and number.

instance *instance-list*: Specifies a space-separated list of up to 10 MSTI items. Each item specifies an MSTI or a range of MSTIs in the form of *instance-id1* [**to** *instance-id2*]. The value for *instance-id2* must be equal to or greater than the value for *instance-id1*. The value range for the *instance-id* argument is 0 to 4094, and the value 0 represents the CIST.

Usage guidelines

In MSTP mode, the command output is sorted by port name and by MSTI ID on each port.

- If you do not specify an MSTI or port, this command applies to all MSTIs on all ports.
- If you specify a port but not an MSTI, this command applies to all MSTIs on the port.
- If you specify both an MSTI ID and a port, this command applies to the specified MSTI on the port.

In STP, PVST, or RSTP mode, the command output is sorted by port name.

- If you do not specify a port, this command applies to all ports.
- If you specify a port, this command applies to the port.

Examples

In MSTP mode, display the BPDU statistics for all MSTIs on GigabitEthernet 1/0/1.

```
<Sysname> display stp bpdu-statistics interface gigabitethernet 1/0/1
 Port: GigabitEthernet1/0/1

 Instance-Independent:

```

Table 5 Command output

Field	Description
Port	Port name.
Instance-Independent	Statistics not related to a specific MSTI.
Type	Statistical item.
Looped-back BPDUs	Number of BPDUs sent and then received by the same port.
Max-aged BPDUs	Number of BPDUs whose max age was exceeded.
TCN sent	Number of sent TCN BPDUs.
TCN received	Number of received TCN BPDUs.
TCA sent	Number of sent TCA BPDUs.
TCA received	Number of received TCA BPDUs.
Config sent	Number of sent configuration BPDUs.
Config received	Number of received configuration BPDUs.
RST sent	Number of sent RSTP BPDUs.
RST received	Number of received RSTP BPDUs.
MST sent	Number of sent MSTP BPDUs.
MST received	Number of received MSTP BPDUs.
Instance	Statistics for a specific MSTI.

Field	Description
Timeout BPDUs	Number of expired BPDUs.
Max-hoped BPDUs	Number of BPDUs whose maximum hops were exceeded.
TC detected	Number of detected topology changes.
TC sent	Number of sent TC BPDUs.
TC received	Number of received TC BPDUs.
PVID inconsistency BPDUs	Number of received PVST BPDUs with a PVID inconsistent with the incoming port.

display stp down-port

Use **display stp down-port** to display information about ports that were shut down by spanning tree protection features.

Syntax

display stp down-port

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Examples

Display information about ports that were shut down by spanning tree protection features.

```
<Sysname> display stp down-port
 Down Port                      Reason
 GigabitEthernet1/0/1           BPDU protection
```

Table 6 Command output

Field	Description
Down Port	Name of a port that was shut down by the spanning tree protection features.
Reason	Reason that the port was shut down: • **BPDU protection**—Indicates the BPDU guard feature. • **PVST BPDU protection**—Indicates the PVST BPDU guard feature.

display stp history

Use **display stp history** to display port role calculation history.

Syntax

display stp [**instance** *instance-list* | **vlan** *vlan-id-list*] **history** [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

instance *instance-list*: Specifies a space-separated list of up to 10 MSTI items. Each item specifies an MSTI or a range of MSTIs in the form of *instance-id1* [**to** *instance-id2*]. The value for *instance-id2* must be equal to or greater than the value for *instance-id1*. The value range for the *instance-id* argument is 0 to 4094, and the value 0 represents the CIST.

vlan *vlan-id-list*: Specifies a space-separated list of up to 10 VLAN items. Each item specifies a VLAN or a range of VLANs in the form of *vlan-id1* [**to** *vlan-id2*]. The value for *vlan-id2* must be equal to or greater than the value for *vlan-id1*. The value range for the *vlan-id* argument is 1 to 4094.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays information for all member devices.

Usage guidelines

In STP or RSTP mode, the command output is sorted by port role calculation time.

In PVST mode, the command output is sorted by VLAN ID and by port role calculation time in each VLAN.

- If you do not specify a VLAN, this command applies to all VLANs.
- If you specify a VLAN list, this command applies to the specified VLANs.

In MSTP mode, the command output is sorted by MSTI ID and by port role calculation time in each MSTI.

- If you do not specify an MSTI, this command applies to all MSTIs.
- If you specify an MSTI list, this command applies to the specified MSTIs.

Examples

In STP mode, display the port role calculation history on the specified slot.

```
<Sysname> display stp history slot 1
 --------------- STP slot 1 history trace ---------------
 -------------------  Instance 0   ---------------------

 Port GigabitEthernet1/0/2
   Role change         : DESI->ALTE
   Time                : 2022/08/09 17:44:06
   Port priority       : 32768.36b5-6d1a-0300 0 32768.36b5-7829-0400 0
                         32768.36b5-6d1a-0300 128.3 128.3
   Designated priority : 32768.36b5-6d1a-0300 20 32768.36b5-7829-0400 0
                         32768.36b5-7829-0400 128.3 128.3

```

Table 7 Command output

Field	Description
Port	Port name.
Role change	Role change of the port (**Aged** means that the change was caused by expiration of the received configuration BPDU).
Time	Time of port role calculation.
Port priority	Current priority of the port: • For STP mode, RSTP mode, and ISTs (MSTI 0) in MSTP mode, port priority includes common root bridge ID, cost of the path to the common root bridge, regional root bridge ID, cost of the path to the regional root bridge, designated bridge ID, designated port ID, and ID of the port that receives

Field	Description
	messages from the designated port, which are separated with spaces. • For PVST mode and CSTs in MSTP mode, port priority includes regional root bridge ID, cost of the path to the regional root bridge, designated bridge ID, designated port ID, and ID of the port that receives messages from the designated port, which are separated with spaces.
Designated priority	Priority information reported by the current port as a designated port: • For STP mode, RSTP mode, and ISTs (MSTI 0) in MSTP mode, port priority includes common root bridge ID, cost of the path to the common root bridge, regional root bridge ID, cost of the path to the regional root bridge, device bridge ID, designated port ID, and current port ID, which are separated with spaces. • For PVST mode and CSTs in MSTP mode, port priority includes regional root bridge ID, cost of the path to the regional root bridge, device bridge ID, designated port ID, and current port ID, which are separated with spaces.

display stp region-configuration

Use **display stp region-configuration** to display effective MST region configuration.

Syntax

context-operator

Examples

In MSTP mode, display the root bridge information of all spanning trees.

```
<Sysname> display stp root
 MST ID  Root Bridge ID        ExtPathCost IntPathCost Root Port
 0       0.00e0-fc0e-6554      200200      0           GigabitEthernet1/0/1
```

In PVST mode, display the root bridge information of all spanning trees.

```
<Sysname> display stp root
 VLAN ID  Root Bridge ID        ExtPathCost IntPathCost Root Port
 1        0.00e0-fc0e-6554      200200      0           GigabitEthernet1/0/1
```

Table 9 Command output

Field	Description
ExtPathCost	External path cost. The path cost of a port is either automatically calculated by the device or manually configured by using the **stp cost** command.
IntPathCost	Internal path cost. The path cost of a port is either automatically calculated by the device or manually configured by using the **stp cost** command.
Root Port	Root port name (displayed only if a port of the device is the root port of the MSTI).

display stp tc

Use **display stp tc** to display the incoming and outgoing TC/TCN BPDU statistics for ports.

Syntax

display stp [**instance** *instance-list* | **vlan** *vlan-id-list*] **tc** [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

instance *instance-list*: Specifies a space-separated list of up to 10 MSTI items. Each item specifies an MSTI or a range of MSTIs in the form of *instance-id1* [**to** *instance-id2*]. The value for *instance-id2* must be equal to or greater than the value for *instance-id1*. The value range for the *instance-id* argument is 0 to 4094, and the value 0 represents the CIST.

vlan *vlan-id-list*: Specifies a space-separated list of up to 10 VLAN items. Each item specifies a VLAN or a range of VLANs in the form of *vlan-id1* [**to** *vlan-id2*]. The value for *vlan-id2* must be equal to or greater than the value for *vlan-id1*. The value range for the *vlan-id* argument is 1 to 4094.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays information for all member devices.

Usage guidelines

In STP or RSTP mode, the command output is sorted by port name.

In PVST mode, the command output is sorted by VLAN ID and by port name in each VLAN.

- If you do not specify a VLAN, this command applies to all VLANs.
- If you specify a VLAN list, this command applies to the specified VLANs.

In MSTP mode, the command output is sorted by MSTI ID and by port name in each MSTI.

- If you do not specify an MSTI, this command applies to all MSTIs.
- If you specify an MSTI list, this command applies to the specified MSTIs.

Examples

In MSTP mode, display the incoming and outgoing TC/TCN BPDU statistics for all ports on slot 1 in MSTI 0.

```
<Sysname> display stp instance 0 tc slot 1
 -------------- STP slot 1 TC or TCN count -------------
 MST ID      Port                        Receive      Send
 0           GigabitEthernet1/0/1        6            4
 0           GigabitEthernet1/0/2        0            2
```

In PVST mode, display the incoming and outgoing TC/TCN BPDU statistics for all ports on slot 1 in VLAN 2.

```
<Sysname> display stp vlan 2 tc slot 1
 -------------- STP slot 1 TC or TCN count -------------
 VLAN ID     Port                        Receive      Send
 2           GigabitEthernet1/0/1        6            4
 2           GigabitEthernet1/0/2        0            2
```

Table 10 Command output

Field	Description
Port	Port name.
Receive	Number of TC/TCN BPDUs received on a port.
Send	Number of TC/TCN BPDUs sent by a port.

instance

Use **instance** to map a list of VLANs to an MSTI.

Use **undo instance** to remap the specified VLAN or all VLANs to the CIST (MSTI 0).

Syntax

instance *instance-id* **vlan** *vlan-id-list*

undo instance *instance-id* [**vlan** *vlan-id-list*]

Default

All VLANs are mapped to the CIST.

Views

MST region view

Predefined user roles

network-admin

context-admin

Parameters

instance-id: Specifies an MSTI ID in the range of 0 to 4094. A value of 0 represents the CIST. The value range for the *instance-id* argument is 1 to 4094 for the **undo instance** command.

vlan *vlan-id-list*: Specifies a space-separated list of up to 10 VLAN items. Each item specifies a VLAN or a range of VLANs in the form of *vlan-id1* [**to** *vlan-id2*]. The value for *vlan-id2* must be equal to or greater than the value for *vlan-id1*. The value range for the *vlan-id* argument is 1 to 4094.

Usage guidelines

CAUTION:

Use caution with global Digest Snooping in the following situations:

- When you modify the VLAN-to-instance mappings.
- When you restore the default MST region configuration.

If the local device has different VLAN-to-instance mappings than its neighboring devices, loops or traffic interruption will occur.

If you do not specify any VLANs in the **undo instance** command, all VLANs mapped to the specified MSTI are remapped to the CIST.

You cannot map a VLAN to different MSTIs. If you map a VLAN that has been mapped to an MSTI to a new MSTI, the old mapping is automatically deleted.

You can configure VLAN-to-instance mapping for up to 65 MSTIs.

After configuring this command, run the **active region-configuration** command to activate the VLAN-to-instance mapping.

Examples

Map VLAN 2 to MSTI 1.

```
<Sysname> system-view
[Sysname] stp region-configuration
[Sysname-mst-region] instance 1 vlan 2
```

Related commands

active region-configuration

check region-configuration

display stp region-configuration

region-name

Use **region-name** to configure the MST region name.

Use **undo region-name** to restore the default MST region name.

Syntax

region-name *name*

undo region-name

Default

The MST region name of the device is its MAC address.

Views

MST region view

Predefined user roles

network-admin

context-admin

Parameters

name: Specifies the MST region name, a string of 1 to 32 characters.

Usage guidelines

The MST region name, the VLAN-to-instance mapping table, and the MSTP revision level of a device determine the device's MST region.

After configuring this command, execute the **active region-configuration** command to activate the configured MST region name.

Examples

Set the MST region name of the device to **hello**.

```
<Sysname> system-view
[Sysname] stp region-configuration
```

```
[Sysname-mst-region] region-name hello
```

Related commands

reset stp

Use **reset stp** to clear the spanning tree statistics.

Syntax

reset stp [**interface** *interface-list*]

Views

User view

Predefined user roles

network-admin

context-admin

Parameters

interface *interface-list*: Specifies a space-separated list of up to 10 interface items. Each item specifies an interface or a range of interfaces in the form of *interface-type interface-number 1* [**to** *interface-type interface-number 2*]. The interface number for *interface-number 2* must be equal to or greater than the interface number for *interface-number 1*. If you do not specify this option, this command clears the spanning tree statistics on all ports.

Examples

Clear the spanning tree statistics on ports GigabitEthernet 1/0/1 through GigabitEthernet 1/0/3.

```
<Sysname> reset stp interface gigabitethernet 1/0/1 to gigabitethernet 1/0/3
```

Related commands

display stp

revision-level

Use **revision-level** to configure the MSTP revision level.

Use **undo revision-level** to restore the default MSTP revision level.

Syntax

revision-level *level*

undo revision-level

Default

The MSTP revision level is 0.

Views

MST region view

Predefined user roles

network-admin

context-admin

Parameters

level: Specifies an MSTP revision level in the range of 0 to 65535.

Usage guidelines

The MSTP revision level, the MST region name, and the VLAN-to-instance mapping table of a device determine the device's MST region.

After configuring this command, execute the **active region-configuration** command to activate the configured MST region level.

Examples

Set the MSTP revision level of the MST region to 5.

```
<Sysname> system-view
[Sysname] stp region-configuration
[Sysname-mst-region] revision-level 5
```

vlan-mapping modulo

snmp-agent trap enable stp

Use **snmp-agent trap enable stp** to enable SNMP notifications for new-root election events or spanning tree topology changes.

Use **undo snmp-agent trap enable stp** to disable SNMP notifications for new-root election events or spanning tree topology changes.

Syntax

snmp-agent trap enable stp [**new-root** | **tc**]

undo snmp-agent trap enable stp [**new-root** | **tc**]

Default

SNMP notifications are disabled for new-root election events.

In MSTP mode, SNMP notifications are enabled in MSTI 0 and disabled in other MSTIs for spanning tree topology changes.

In PVST mode, SNMP notifications are disabled for spanning tree topology changes in all VLANs.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

new-root: Enables the device to send notifications if the device is elected as a new root bridge. This keyword applies only to STP, MSTP, and RSTP modes.

tc: Enables the device to send notifications if the device receives TCN BPDUs. This keyword applies only to PVST mode.

Usage guidelines

If no keyword is specified, the **snmp-agent trap enable stp** command applies to SNMP notifications for different events as follows:

- In STP, MSTP, and RSTP modes, the command applies to SNMP notifications for new-root election events.
- In PVST mode, the command applies to SNMP notifications for spanning tree topology changes.

Examples

Enable SNMP notifications for new-root election events.

```
<Sysname> system-view
[Sysname] snmp-agent trap enable stp new-root
```

stp bpdu-protection

Use **stp bpdu-protection** to enable BPDU guard globally.

Use **undo stp bpdu-protection** to disable BPDU guard globally.

Syntax

stp bpdu-protection

undo stp bpdu-protection

Default

BPDU guard is globally disabled.

Views

System view

Predefined user roles

network-admin

context-admin

Usage guidelines

With BPDU guard enabled, the device shuts down an edge port and notifies the NMS of the shutdown event when the edge port receives configuration BPDUs.

The device reactivates the ports that have been shut down when the port status detection timer expires. You can set this timer by using the **shutdown-interval** command. For more information about this command, see device management commands in *Fundamentals Command Reference*.

The **stp bpdu-protection** command takes effect only on the edge ports configured by using the **stp edged-port** command.

Examples

Enable BPDU guard globally.

```
<Sysname> system-view
[Sysname] stp bpdu-protection
```

Related commands

shutdown-interval (*Fundamentals Command Reference*)

stp edged-port

stp bridge-diameter

Use **stp bridge-diameter** to set the network diameter. The switched network diameter refers to the maximum number of devices on the path for an edge device to reach another through the root bridge.

Use **undo stp bridge-diameter** to restore the default.

Syntax

stp [**vlan** *vlan-id-list*] **bridge-diameter** *diameter*

undo stp [**vlan** *vlan-id-list*] **bridge-diameter**

Default

The network diameter of the switched network is 7.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

vlan *vlan-id-list*: Specifies a space-separated list of up to 10 VLAN items. Each item specifies a VLAN or a range of VLANs in the form of *vlan-id1* [**to** *vlan-id2*]. The value for *vlan-id2* must be equal to or greater than the value for *vlan-id1*. The value range for the *vlan-id* argument is 1 to 4094. If you set the STP, RSTP, or MSTP switched network diameter, do not specify this option.

diameter: Specifies the switched network diameter in the range of 2 to 7.

Usage guidelines

An appropriate setting of hello time, forward delay, and max age can speed up network convergence. The values of these timers are related to the network size, and you can set the timers by setting the network diameter. With the network diameter set to 7 (the default), the three timers are also set to their defaults.

In STP, RSTP, or MSTP mode, each MST region is considered as a device. The configured network diameter of the switched network takes effect only on the CIST (or the common root bridge).

In PVST mode, the configured network diameter takes effect only on the root bridges of the specified VLANs.

Examples

In MSTP mode, set the network diameter of the switched network to 5.

```
<Sysname> system-view
```

```
[Sysname] stp bridge-diameter 5
```

In PVST mode, set the network diameter of VLAN 2 in the switched network to 5.

```
<Sysname> system-view
[Sysname] stp vlan 2 bridge-diameter 5
```

stp compliance

Use **stp compliance** to configure the mode a port uses to recognize and send MSTP BPDUs.

Use **undo stp compliance** to restore the default.

Syntax

stp compliance { **auto** | **dot1s** | **legacy** }

undo stp compliance

Default

A port automatically recognizes the formats of received MSTP packets and determines the formats of MSTP packets to be sent based on the recognized formats.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

context-admin

Parameters

auto: Configures the port to recognize the MSTP BPDU format automatically and determine the format of MSTP BPDUs to send.

dot1s: Configures the port to receive and send only standard-format (802.1s-compliant) MSTP BPDUs.

legacy: Configures the port to receive and send only compatible-format MSTP BPDUs.

Usage guidelines

If this command is configured in Layer 2 Ethernet interface view, it takes effect only on that interface.

If this command is configured in Layer 2 aggregate interface view, it takes effect only on the aggregate interface.

If this command is configured on a member port in an aggregation group, it takes effect only after the port leaves the aggregation group.

Examples

Configure GigabitEthernet 1/0/1 to send only standard-format (802.1s) MSTP packets.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] stp compliance dot1s
```

stp config-digest-snooping

Use **stp config-digest-snooping** to enable Digest Snooping.

Use **undo stp config-digest-snooping** to disable Digest Snooping.

Syntax

stp config-digest-snooping

undo stp config-digest-snooping

Default

Digest Snooping is disabled.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

context-admin

Usage guidelines

For Digest Snooping to take effect, you must enable Digest Snooping both globally and on associated ports. As a best practice, first enable Digest Snooping on ports connected to third-party vendor devices and then enable the feature globally. Digest Snooping takes effect on the ports simultaneously, which reduces impact on the network.

If this command is configured in Layer 2 Ethernet interface view, it takes effect only on that interface.

If this command is configured in Layer 2 aggregate interface view, it takes effect only on the aggregate interface.

If this command is configured on a member port in an aggregation group, it takes effect only after the port leaves the aggregation group.

Examples

Enable Digest Snooping on GigabitEthernet 1/0/1 and then globally.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] stp config-digest-snooping
[Sysname-GigabitEthernet1/0/1] quit
[Sysname] stp global config-digest-snooping
```

Related commands

display stp

stp global config-digest-snooping

stp cost

Use **stp cost** to set the path cost of a port.

Use **undo stp cost** to restore the default.

Syntax

stp [**instance** *instance-list* | **vlan** *vlan-id-list*] **cost** *cost-value*

undo stp [**instance** *instance-list* | **vlan** *vlan-id-list*] **cost**

Default

The device automatically calculates the path costs of ports in each spanning tree based on the corresponding standard.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

context-admin

Parameters

instance *instance-list*: Specifies a space-separated list of up to 10 MSTI items. Each item specifies an MSTI or a range of MSTIs in the form of *instance-id1* [**to** *instance-id2*]. The value for *instance-id2* must be equal to or greater than the value for *instance-id1*. The value range for the *instance-id* argument is 0 to 4094, and the value 0 represents the CIST.

vlan *vlan-id-list*: Specifies a space-separated list of up to 10 VLAN items. Each item specifies a VLAN or a range of VLANs in the form of *vlan-id1* [**to** *vlan-id2*]. The value for *vlan-id2* must be equal to or greater than the value for *vlan-id1*. The value range for the *vlan-id* argument is 1 to 4094.

cost-value: Specifies the path cost of the port, with an effective range that varies by path cost calculation standard that is used.

- When the IEEE 802.1d-1998 standard is selected for path cost calculation, the value range for the *cost* argument is 1 to 65535.
- When the IEEE 802.1t standard is selected for path cost calculation, the value range for the *cost* argument is 1 to 200000000.
- When the private standard is selected for path cost calculation, the value range for the *cost* argument is 1 to 200000.

Usage guidelines

Path cost is an important factor in spanning tree calculation. Setting different path costs for a port in MSTIs allows VLAN traffic flows to be forwarded along different physical links. This results in VLAN-based load balancing.

The path cost setting of a port can affect the role selection of the port. When the path cost of a port is changed, the system calculates the role of the port and initiates a state transition.

If this command is configured in Layer 2 Ethernet interface view, it takes effect only on that interface.

If this command is configured in Layer 2 aggregate interface view, it takes effect only on the aggregate interface.

If this command is configured on a member port in an aggregation group, is takes effect only after the port leaves the aggregation group.

If you do not specify an MSTI or VLAN, this command sets the path cost of a port in the MSTP CIST or in the STP or RSTP spanning tree.

Examples

In MSTP mode, set the path cost to 200 for GigabitEthernet 1/0/1 in MSTI 2.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] stp instance 2 cost 200
```

In PVST mode, set the path cost to 200 for GigabitEthernet 1/0/1 in VLAN 2.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] stp vlan 2 cost 200
```

Related commands

stp edged-port

Use **stp edged-port** to configure a port as an edge port.

Use **undo stp edged-port** to restore the default.

Syntax

stp edged-port

undo stp edged-port

Default

All ports are non-edge ports.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

context-admin

Usage guidelines

A port directly connecting to a user terminal rather than another device or a shared LAN segment can be configured as an edge port. In case the network topology changes, an edge port does not cause a temporary loop. You can enable the port to transit to the forwarding state rapidly by configuring it as an edge port. As a best practice, configure ports that directly connect to user terminals as edge ports.

Typically, configuration BPDUs from other devices cannot reach an edge port, because the edge port does not connect to any other device. When BPDU guard is disabled on a port configured as an edge port, the port acts as a non-edge port if it receives configuration BPDUs.

On a port, the loop guard feature and the edge port setting are mutually exclusive.

If this command is configured in Layer 2 Ethernet interface view, it takes effect only on that interface.

If this command is configured in Layer 2 aggregate interface view, it takes effect only on the aggregate interface.

If this command is configured on a member port in an aggregation group, it takes effect only after the port leaves the aggregation group.

Examples

Configure GigabitEthernet 1/0/1 as an edge port.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] stp edged-port
```

stp mode

stp global mcheck

Use **stp global mcheck** to perform mCheck globally.

Syntax

stp global mcheck

Views

System view

Predefined user roles

network-admin

context-admin

Usage guidelines

When a port on an MSTP, RSTP, or PVST device connects to an STP device and receives STP BPDUs, the port automatically transits to the STP mode. However, the port cannot automatically transit back to the original mode when the following conditions exist:

- The peer STP device is shut down or removed.
- The port cannot detect the change.

In this case, you can perform an mCheck operation to forcibly transit the port to operate in the original mode.

The device operates in STP, RSTP, PVST, or MSTP mode, depending on the spanning tree mode setting.

The **stp global mcheck** command takes effect only when the device operates in MSTP, RSTP, or PVST mode.

Examples

Perform mCheck globally.

```
<Sysname> system-view
[Sysname] stp global mcheck
```

Use **stp ignore-pvid-inconsistency** to disable inconsistent PVID protection.

Use **undo stp ignore-pvid-inconsistency** to enable inconsistent PVID protection.

Syntax

stp ignore-pvid-inconsistency

undo stp ignore-pvid-inconsistency

Default

Inconsistent PVID protection is enabled.

Views

System view

Predefined user roles

network-admin

context-admin

Usage guidelines

This command takes effect only when the device is operating in PVST mode.

Disabling inconsistent PVID protection might cause spanning tree calculation errors. To avoid such errors, make sure the following requirements are met:

- Make sure the VLANs on one device do not use the same ID as the PVID of its peer port (except the default VLAN) on another device.
- If the local port or its peer is a hybrid port, do not configure the local and peer ports as untagged members of the same VLAN.
- Disable inconsistent PVID protection on both the local device and the peer device.

Examples

In PVST mode, disable the inconsistent PVID protection feature.

```
<Sysname> system-view
[Sysname] stp mode pvst
[Sysname] stp ignore-pvid-inconsistency
```

stp loop-protection

Use **stp loop-protection** to enable loop guard on a port.

Use **undo stp loop-protection** to disable loop guard on a port.

Syntax

stp loop-protection

undo stp loop-protection

Default

Loop guard is disabled.

Views

Layer 2 Ethernet interface view

context-admin

Usage guidelines

When a port on an MSTP, RSTP, or PVST device connects to an STP device and receives STP BPDUs, the port automatically transits to the STP mode. However, the port cannot automatically transit back to the original mode when the following conditions exist:

- The peer STP device is shut down or removed.
- The port cannot detect the change.

In this case, you can perform an mCheck operation to forcibly transit the port to operation in the original mode.

For example, Device A, Device B, and Device C are connected in sequence. Device A runs STP, Device B does not run any spanning tree protocol, and Device C runs RSTP, MSTP, or PVST. When Device C receives an STP BPDU transparently transmitted by Device B, the receiving port transits to the STP mode. If you configure Device B to run RSTP, MSTP, or PVST with Device C, perform mCheck operations on the ports that connect Device B and Device C.

The device operates in STP, RSTP, PVST, or MSTP mode, depending on the spanning tree mode setting.

The **stp mcheck** command takes effect only when the device operates in MSTP, RSTP, or PVST mode.

If this command is configured in Layer 2 Ethernet interface view, it takes effect only on that interface.

If this command is configured in Layer 2 aggregate interface view, it takes effect only on the aggregate interface.

If this command is configured on a member port in an aggregation group, it takes effect only after the port leaves the aggregation group.

Examples

Perform mCheck on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] stp mcheck
```

Related commands

stp global mcheck

stp mode

stp mode

Use **stp mode** to configure the spanning tree operating mode.

Use **undo stp mode** to restore the default.

Syntax

stp mode { **mstp** | **pvst** | **rstp** | **stp** }

undo stp mode

Default

A spanning tree device operates in MSTP mode.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

mstp: Configures the spanning tree device to operate in MSTP mode.

pvst: Configures the spanning tree device to operate in PVST mode.

rstp: Configures the spanning tree device to operate in RSTP mode.

stp: Configures the spanning tree device to operate in STP mode.

Usage guidelines

The MSTP mode is compatible with the RSTP mode, and the RSTP mode is compatible with the STP mode.

The PVST mode's compatibility with other modes is as follows:

- **Access port**—The PVST mode is compatible with other modes in any VLAN.
- **Trunk or hybrid port**—The PVST mode is compatible with other modes only in the default VLAN.

Examples

Configure the spanning tree device to operate in STP mode.

```
<Sysname> system-view
[Sysname] stp mode stp
```

Usage guidelines

This command takes effect only after you enable it on the root port.

If this command is configured in Layer 2 Ethernet interface view, it takes effect only on that interface.

If this command is configured in Layer 2 aggregate interface view, it takes effect only on the aggregate interface.

If this command is configured on a member port in an aggregation group, it takes effect only after the port leaves the aggregation group.

Examples

Enable No Agreement Check on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] stp no-agreement-check
```

stp pathcost-standard

Use **stp pathcost-standard** to specify a standard for the device to use when calculating the default path costs for ports.

Use **undo stp pathcost-standard** to restore the default.

Syntax

stp pathcost-standard { **dot1d-1998** | **dot1t** | **legacy** }

undo stp pathcost-standard

Default

The default standard is **legacy**.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

dot1d-1998: Configures the device to calculate the default path cost for ports based on IEEE 802.1d-1998.

dot1t: Configures the device to calculate the default path cost for ports based on IEEE 802.1t.

legacy: Configures the device to calculate the default path cost for ports based on a private standard.

Usage guidelines

If you change the standard that the device uses in calculating the default path costs, you restore the path costs to the default.

Examples

Configure the device to calculate the default path cost for ports based on IEEE 802.1d-1998.

```
<Sysname> system-view
[Sysname] stp pathcost-standard dot1d-1998
```

Related commands

display stp

stp cost

stp point-to-point

Use **stp point-to-point** to configure the link type of a port.

Use **undo stp point-to-point** to restore the default.

Syntax

stp point-to-point { **auto** | **force-false** | **force-true** }

undo stp point-to-point

Default

The default setting is **auto,** and the spanning tree device automatically detects whether a port connects to a point-to-point link.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

context-admin

Parameters

auto: Specifies automatic detection of the link type.

force-false: Specifies the non-point-to-point link type.

force-true: Specifies the point-to-point link type.

Usage guidelines

When connecting to a non-point-to-point link, a port is incapable of rapid state transition.

You can configure the link type as point-to-point for a Layer 2 aggregate interface or a port that operates in full duplex mode. As a best practice, use the default setting to let the device automatically detect the port link type.

In MSTP or PVST mode, the **stp point-to-point force-false** or **stp point-to-point force-true** command configured on a port takes effect on all MSTIs or VLANs.

Before you set the link type of a port to point-to-point, make sure the port is connected to a point-to-point link. Otherwise, a temporary loop might occur.

If this command is configured in Layer 2 Ethernet interface view, it takes effect only on that interface.

If this command is configured in Layer 2 aggregate interface view, it takes effect only on the aggregate interface.

If this command is configured on a member port in an aggregation group, it takes effect only after the port leaves the aggregation group.

Examples

Configure the link type of GigabitEthernet 1/0/1 as point-to-point.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] stp point-to-point force-true
```

Related commands

stp port priority

Use **stp port priority** to set the priority of a port. The port priority affects the role of a port in a spanning tree.

Use **undo stp port priority** to restore the default.

Syntax

stp [**instance** *instance-list* | **vlan** *vlan-id-list*] **port priority** *priority*

undo stp [**instance** *instance-list* | **vlan** *vlan-id-list*] **port priority**

Default

The port priority is 128.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

context-admin

Parameters

instance *instance-list*: Specifies a space-separated list of up to 10 MSTI items. Each item specifies an MSTI or a range of MSTIs in the form of *instance-id1* [**to** *instance-id2*]. The value for *instance-id2* must be equal to or greater than the value for *instance-id1*. The value range for the *instance-id* argument is 0 to 4094, and the value 0 represents the CIST.

vlan *vlan-id-list*: Specifies a space-separated list of up to 10 VLAN items. Each item specifies a VLAN or a range of VLANs in the form of *vlan-id1* [**to** *vlan-id2*]. The value for *vlan-id2* must be equal to or greater than the value for *vlan-id1*. The value range for the *vlan-id* argument is 1 to 4094.

priority: Specifies the port priority in the range of 0 to 240 in increments of 16 (as in 0, 16, 32).

Usage guidelines

The smaller the value, the higher the port priority. If all ports on your device use the same priority value, the port priority depends on the port index. The smaller the index, the higher the priority.

If this command is configured in Layer 2 Ethernet interface view, it takes effect only on that interface.

If this command is configured in Layer 2 aggregate interface view, it takes effect only on the aggregate interface.

If this command is configured on a member port in an aggregation group, it takes effect only after the port leaves the aggregation group.

If you do not specify an MSTI or VLAN, this command configures the priority of the ports in the MSTP CIST or in the STP or RSTP spanning tree.

Examples

In MSTP mode, set the port priority of GigabitEthernet 1/0/1 to 16 in MSTI 2.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] stp instance 2 port priority 16
```

In PVST mode, set the port priority of GigabitEthernet 1/0/1 to 16 in VLAN 2.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] stp vlan 2 port priority 16
```

Related commands

stp port-log

Use **stp port-log** to enable outputting port state transition information.

Use **undo stp port-log** to disable outputting port state transition information.

Syntax

stp port-log { **all** | **instance** *instance-list* | **vlan** *vlan-id-list* }

undo stp port-log { **all** | **instance** *instance-list* | **vlan** *vlan-id-list* }

Default

Outputting port state transition information is disabled.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

all: Specifies all MSTIs or VLANs.

instance *instance-list*: Specifies a space-separated list of up to 10 MSTI items. Each item specifies an MSTI or a range of MSTIs in the form of *instance-id1* [**to** *instance-id2*]. The value for *instance-id2* must be equal to or greater than the value for *instance-id1*. The value range for the *instance-id* argument is 0 to 4094, and the value 0 represents the CIST.

vlan *vlan-id-list*: Specifies a space-separated list of up to 10 VLAN items. Each item specifies a VLAN or a range of VLANs in the form of *vlan-id1* [**to** *vlan-id2*]. The value for *vlan-id2* must be equal to or greater than the value for *vlan-id1*. The value range for the *vlan-id* argument is 1 to 4094.

Examples

In MSTP mode, enable outputting port state transition information for MSTI 2.

```
<Sysname> system-view
[Sysname] stp port-log instance 2
%Aug 16 00:49:41:856 2011 Sysname STP/3/STP_DISCARDING: Instance 2's port
GigabitEthernet1/0/1 has been set to discarding state.
%Aug 16 00:49:41:856 2011 Sysname STP/3/STP_FORWARDING: Instance 2's port
GigabitEthernet1/0/2 has been set to forwarding state.
```

The output shows that GigabitEthernet 1/0/1 in MSTI 2 transited to the discarding state and GigabitEthernet 1/0/2 in MSTI 2 transited to the forwarding state.

In PVST mode, enable outputting port state transition information for VLAN 1 through VLAN 4094.

```
<Sysname> system-view
[Sysname] stp port-log vlan 1 to 4094
%Aug 16 00:49:41:856 2006 Sysname STP/3/STP_DISCARDING: VLAN 2's GigabitEthernet1/0/1 has
been set to discarding state.
%Aug 16 00:49:41:856 2006 Sysname STP/3/STP_FORWARDING: VLAN 2's GigabitEthernet1/0/2 has
been set to forwarding state.
```

The output shows that GigabitEthernet 1/0/1 in VLAN 2 transited to the discarding state and GigabitEthernet 1/0/2 in VLAN 2 transited to the forwarding state.

stp priority

Use **stp priority** to set the priority of the device.

Use **undo stp priority** to restore the default.

Syntax

stp [**instance** *instance-list* | **vlan** *vlan-id-list*] **priority** *priority*

undo stp [**instance** *instance-list* | **vlan** *vlan-id-list*] **priority**

Default

The device priority is 32768.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

instance *instance-list*: Specifies a space-separated list of up to 10 MSTI items. Each item specifies an MSTI or a range of MSTIs in the form of *instance-id1* [**to** *instance-id2*]. The

value for *instance-id2* must be equal to or greater than the value for *instance-id1*. The value range for the *instance-id* argument is 0 to 4094, and the value 0 represents the CIST.

vlan *vlan-id-list*: Specifies a space-separated list of up to 10 VLAN items. Each item specifies a VLAN or a range of VLANs in the form of *vlan-id1* [**to** *vlan-id2*]. The value for *vlan-id2* must be equal to or greater than the value for *vlan-id1*. The value range for the *vlan-id* argument is 1 to 4094.

priority: Specifies the device priority in the range of 0 to 61440 in increments of 4096 (as in 0, 4096, 8192). You can set up to 16 priority values on the device. The smaller the value, the higher the device priority.

Usage guidelines

If you do not specify an MSTI or VLAN, this command configures the priority of the device in the MSTP CIST or in the STP or RSTP spanning tree.

Examples

In MSTP mode, set the device priority to 4096 in MSTI 1.

```
<Sysname> system-view
[Sysname] stp instance 1 priority 4096
```

In PVST mode, set the device priority to 4096 in VLAN 1.

```
<Sysname> system-view
[Sysname] stp vlan 1 priority 4096
```

stp pvst-bpdu-protection

Use **stp pvst-bpdu-protection** to enable PVST BPDU guard.

Use **undo stp pvst-bpdu-protection** to disable PVST BPDU guard.

Syntax

stp pvst-bpdu-protection

undo stp pvst-bpdu-protection

Default

PVST BPDU guard is disabled.

Views

System view

Predefined user roles

network-admin

context-admin

Usage guidelines

PVST BPDU guard enables an MSTP-enabled device to shut down a port if the port receives PVST BPDUs. The shutdown port is brought up after a detection timer expires. To set the detection timer, use the **shutdown-interval** command.

Examples

In MSTP mode, enable PVST BPDU guard.

```
<Sysname> system-view
[Sysname] stp pvst-bpdu-protection
```

Related commands

shutdown-interval (For more information, see *Fundamentals Command Reference*.)

stp region-configuration

Use **stp region-configuration** to enter MST region view.

Use **undo stp region-configuration** to restore the default MST region configurations.

Syntax

stp region-configuration

undo stp region-configuration

Default

The default settings for an MST region are as follows:

- The MST region name of the device is its MAC address.
- All VLANs are mapped to the CIST.
- The MSTP revision level is 0.

Views

After you enter MST region view, you can configure MST region parameters, including the region name, VLAN-to-instance mappings, and revision level.

Examples

Enter MST region view.

```
<Sysname> system-view
[Sysname] stp region-configuration
[Sysname-mst-region]
```

stp role-restriction

Use **stp role-restriction** to enable port role restriction.

Use **undo stp role-restriction** to disable port role restriction.

Syntax

stp role-restriction

undo stp role-restriction

Default

Port role restriction is disabled.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

context-admin

Usage guidelines

When port role restriction is enabled on a port, the port cannot become a root port.

If this command is configured in Layer 2 Ethernet interface view, it takes effect only on that interface.

If this command is configured in Layer 2 aggregate interface view, it takes effect only on the aggregate interface.

If this command is configured on a member port in an aggregation group, it takes effect only after the port leaves the aggregation group.

Examples

Enable port role restriction on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] stp role-restriction
```

stp root primary

Use **stp root primary** to configure the device as the root bridge.

Use **undo stp root** to restore the default.

Syntax

stp [**instance** *instance-list* | **vlan** *vlan-id-list*] **root primary**

undo stp [**instance** *instance-list* | **vlan** *vlan-id-list*] **root**

Default

The device is not a root bridge.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

instance *instance-list*: Specifies a space-separated list of up to 10 MSTI items. Each item specifies an MSTI or a range of MSTIs in the form of *instance-id1* [**to** *instance-id2*]. The value for *instance-id2* must be equal to or greater than the value for *instance-id1*. The value range for the *instance-id* argument is 0 to 4094, and the value 0 represents the CIST.

vlan *vlan-id-list*: Specifies a space-separated list of up to 10 VLAN items. Each item specifies a VLAN or a range of VLANs in the form of *vlan-id1* [**to** *vlan-id2*]. The value for *vlan-id2* must be equal to or greater than the value for *vlan-id1*. The value range for the *vlan-id* argument is 1 to 4094.

Usage guidelines

Once you specify the device as the root bridge, you cannot change the priority of the device.

If you do not specify an MSTI or VLAN, this command configures the device as the root bridge of the MSTP CIST or of the STP or RSTP spanning tree.

Examples

In MSTP mode, specify the device as the root bridge of MSTI 1.

```
<Sysname> system-view
[Sysname] stp instance 1 root primary
```

In PVST mode, specify the device as the root bridge of VLAN 1.

```
<Sysname> system-view
[Sysname] stp vlan 1 root primary
```

Related commands

stp priority

stp root secondary

stp root secondary

Use **stp root secondary** to configure the device as a secondary root bridge.

Use **undo stp root** to restore the default.

Syntax

stp [**instance** *instance-list* | **vlan** *vlan-id-list*] **root secondary**

undo stp [**instance** *instance-list* | **vlan** *vlan-id-list*] **root**

Default

The device is not a secondary root bridge.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

instance *instance-list*: Specifies a space-separated list of up to 10 MSTI items. Each item specifies an MSTI or a range of MSTIs in the form of *instance-id1* [**to** *instance-id2*]. The value for *instance-id2* must be equal to or greater than the value for *instance-id1*. The value range for the *instance-id* argument is 0 to 4094, and the value 0 represents the CIST.

vlan *vlan-id-list*: Specifies a space-separated list of up to 10 VLAN items. Each item specifies a VLAN or a range of VLANs in the form of *vlan-id1* [**to** *vlan-id2*]. The value for *vlan-id2* must be equal to or greater than the value for *vlan-id1*. The value range for the *vlan-id* argument is 1 to 4094.

Usage guidelines

Once you specify the device as a secondary root bridge, you cannot change the priority of the device.

If you do not specify an MSTI or VLAN, this command configures a secondary root bridge for the MSTP CIST or the STP or RSTP spanning tree.

Examples

In MSTP mode, specify the device as a secondary root bridge in MSTI 1.

```
<Sysname> system-view
[Sysname] stp instance 1 root secondary
```

In PVST mode, specify the device as a secondary root bridge in VLAN 1.

```
<Sysname> system-view
[Sysname] stp vlan 1 root secondary
```

stp timer forward-delay

Use **stp timer forward-delay** to set the forward delay timer.

Use **undo stp timer forward-delay** to restore the default.

Syntax

stp [**vlan** *vlan-id-list*] **timer forward-delay** *time*

undo stp [**vlan** *vlan-id-list*] **timer forward-delay**

Default

The forward delay timer is 1500 centiseconds.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

vlan *vlan-id-list*: Specifies a space-separated list of up to 10 VLAN items. Each item specifies a VLAN or a range of VLANs in the form of *vlan-id1* [**to** *vlan-id2*]. The value for *vlan-id2* must be equal to or greater than the value for *vlan-id1*. The value range for the *vlan-id* argument is 1 to 4094. If you set the STP, RSTP, or MSTP forward delay, do not specify this option.

time: Specifies the forward delay in centiseconds, in the range of 400 to 3000 in increments of 100 (as in 400, 500, 600).

Usage guidelines

The forward delay timer determines the time interval of state transition. To prevent temporary loops, a spanning tree port goes through the learning (intermediate) state before it transits from the discarding state to the forwarding state. To stay synchronized with the remote device, the port has a wait period that is determined by the forward delay timer between transition states.

As a best practice, do not set the forward delay with this command. Instead, you can specify the network diameter of the switched network by using the **stp bridge-diameter** command. This command makes the spanning tree protocols automatically calculate the optimal settings for the forward delay timer. If the network diameter uses the default value, the forward delay timer also uses the default value.

Examples

In MSTP mode, set the forward delay timer to 2000 centiseconds.

```
<Sysname> system-view
[Sysname] stp timer forward-delay 2000
```

In PVST mode, set the forward delay timer for VLAN 2 to 2000 centiseconds.

```
<Sysname> system-view
[Sysname] stp vlan 2 timer forward-delay 2000
```

context-admin

Parameters

vlan *vlan-id-list*: Specifies a space-separated list of up to 10 VLAN items. Each item specifies a VLAN or a range of VLANs in the form of *vlan-id1* [**to** *vlan-id2*]. The value for *vlan-id2* must be equal to or greater than the value for *vlan-id1*. The value range for the *vlan-id* argument is 1 to 4094. If you set the STP, RSTP, or MSTP hello time, do not specify this option.

time: Specifies the hello time in centiseconds, in the range of 100 to 1000 in increments of 100 (as in 100, 200, 300).

Usage guidelines

Hello time is the interval at which spanning tree devices send configuration BPDUs to maintain the spanning tree. If a device fails to receive configuration BPDUs within the set period of time, a new spanning tree calculation process is triggered.

As a best practice, do not set the hello time with this command. Instead, you can specify the network diameter of the switched network by using the **stp bridge-diameter** command. This command makes the spanning tree protocols automatically calculate the optimal settings for the hello timer. If the network diameter uses the default value, the hello timer also uses the default value.

Examples

In MSTP mode, set the hello time to 400 centiseconds.

```
<Sysname> system-view
[Sysname] stp timer hello 400
```

In PVST mode, set the hello time for VLAN 2 to 400 centiseconds.

```
<Sysname> system-view
[Sysname] stp vlan 2 timer hello 400
```

Related commands

stp bridge-diameter

stp timer forward-delay

stp timer max-age

stp timer max-age

Use **stp timer max-age** to set the max age timer.

Use **undo stp timer max-age** to restore the default.

Syntax

stp [**vlan** *vlan-id-list*] **timer max-age** *time*

undo stp [**vlan** *vlan-id-list*] **timer max-age**

Default

The max age is 2000 centiseconds.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

vlan *vlan-id-list*: Specifies a space-separated list of up to 10 VLAN items. Each item specifies a VLAN or a range of VLANs in the form of *vlan-id1* [**to** *vlan-id2*]. The value for *vlan-id2* must be equal to or greater than the value for *vlan-id1*. The value range for the *vlan-id* argument is 1 to 4094. If you set the STP, RSTP, or MSTP max age, do not specify this option.

time: Specifies the max age in centiseconds, in the range of 600 to 4000 in increments of 100 (as in 600, 700, 800).

Usage guidelines

In the CIST of an MSTP network, the device determines whether a configuration BPDU received on a port has expired based on the max age timer. If the configuration BPDU has expired, a new spanning tree calculation process starts. The max age timer takes effect only on the CIST (or MSTI 0).

As a best practice, do not set the max age timer with this command. Instead, you can specify the network diameter of the switched network by using the **stp bridge-diameter** command. This command makes the spanning tree protocols automatically calculate the optimal settings for the max age timer. If the network diameter uses the default value, the max age timer also uses the default value.

Examples

In MSTP mode, set the max age timer to 1000 centiseconds.

```
<Sysname> system-view
[Sysname] stp timer max-age 1000
```

In PVST mode, set the max age timer for VLAN 2 to 1000 centiseconds.

```
<Sysname> system-view
[Sysname] stp vlan 2 timer max-age 1000
```

Related commands

stp bridge-diameter

stp timer forward-delay

stp timer hello

stp timer-factor

Use **stp timer-factor** to configure the timeout period by setting the timeout factor.

Timeout period = timeout factor × 3 × hello time.

Use **undo stp timer-factor** to restore the default.

Syntax

stp timer-factor *factor*

undo stp timer-factor

Default

The timeout factor of the device is set to 3.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

factor: Specifies the timeout factor in the range of 1 to 20.

Usage guidelines

In a stable network, each non-root-bridge forwards configuration BPDUs to surrounding devices at the interval of hello time to determine whether any link fails. If a device does not receive a BPDU from the upstream device within nine times of the hello time, it assumes that the upstream device has failed. Then it will start a new spanning tree calculation process.

As a best practice, set the timeout factor to 5, 6, or 7 in the following situations:

- To prevent undesired spanning tree calculations. An upstream device might be too busy to forward configuration BPDUs in time, for example, many Layer 2 interfaces are configured on the upstream device. In this case, the downstream device fails to receive a BPDU within the timeout period and then starts an undesired spanning tree calculation.
- To save network resources on a stable network.

Examples

Set the timeout factor of the device to 7.

```
<Sysname> system-view
[Sysname] stp timer-factor 7
```

Related commands

stp timer hello

stp transmit-limit

Use **stp transmit-limit** to set the BPDU transmission rate of a port.

Use **undo stp transmit-limit** to restore the default.

Syntax

stp transmit-limit *limit*

undo stp transmit-limit

Default

The BPDU transmission rate of all ports is 10.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

context-admin

Parameters

limit: Specifies the BPDU transmission rate in the range of 1 to 255.

Usage guidelines

The maximum number of BPDUs a port can send within each hello time equals the BPDU transmission rate plus the hello timer value.

A larger BPDU transmission rate value requires more system resources. An appropriate BPDU transmission rate setting can prevent spanning tree protocols from using excessive bandwidth resources during network topology changes. As a best practice, use the default value.

If this command is configured in Layer 2 Ethernet interface view, it takes effect only on that interface.

If this command is configured in Layer 2 aggregate interface view, it takes effect only on the aggregate interface.

If this command is configured on a member port in an aggregation group, it takes effect only after the port leaves the aggregation group.

Examples

Set the BPDU transmission rate of GigabitEthernet 1/0/1 to 5.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] stp transmit-limit 5
```

stp vlan enable

Use **stp vlan enable** to enable the spanning tree feature for VLANs.

Use **undo stp enable** to disable the spanning tree feature for VLANs.

Syntax

stp vlan *vlan-id-list* **enable**

undo stp vlan *vlan-id-list* **enable**

Default

The spanning tree feature is enabled in VLANs.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

vlan *vlan-id-list*: Specifies a space-separated list of up to 10 VLAN items. Each item specifies a VLAN or a range of VLANs in the form of *vlan-id1* [**to** *vlan-id2*]. The value for *vlan-id2* must be equal to or greater than the value for *vlan-id1*. The value range for the *vlan-id* argument is 1 to 4094.

Usage guidelines

When you enable the spanning tree feature, the device operates in STP, RSTP, PVST, or MSTP mode, depending on the spanning tree mode setting.

When you enable the spanning tree feature, the device dynamically maintains the spanning tree status of VLANs, based on received configuration BPDUs. When you disable the spanning tree feature, the device stops maintaining the spanning tree status.

Examples

In PVST mode, globally enable the spanning tree feature and then enable the spanning tree feature for VLAN 2.

```
<Sysname> system-view
[Sysname] stp mode pvst
```

```
[Sysname] stp global enable
[Sysname] stp vlan 2 enable
```

Related commands

stp enable

stp global enable

stp mode

vlan-mapping modulo

Use **vlan-mapping modulo** to map VLANs in an MST region to MSTIs according to the specified modulo value and quickly create a VLAN-to-instance mapping table.

Syntax

vlan-mapping modulo *modulo*

Default

All VLANs are mapped to the CIST (MSTI 0).

Views

MST region view

Predefined user roles

network-admin

context-admin

Parameters

modulo: Specifies the modulo value. The value range for this argument is 1 to 64.

Usage guidelines

You cannot map a VLAN to different MSTIs. If you map a VLAN that has been mapped to an MSTI to a new MSTI, the old mapping is automatically deleted.

This command maps each VLAN to the MSTI with ID (VLAN ID – 1) % *modulo* + 1. (VLAN ID – 1) % *modulo* is the modulo operation for (VLAN ID – 1). If the modulo value is 15, then VLAN 1 is mapped to MSTI 1, VLAN 2 to MSTI 2, …, VLAN 15 to MSTI 15, VLAN 16 to MSTI 16, and so on.

Examples

Map VLANs to MSTIs as per modulo 8.

```
<Sysname> system-view
[Sysname] stp region-configuration
[Sysname-mst-region] vlan-mapping modulo 8
```

context-operator

Parameters

global: Displays the global local LLDP information.

interface *interface-type interface-number*: Specifies a port by its type and number.

Usage guidelines

If you do not specify any keywords or arguments, the command displays all local LLDP information, which includes the following:

- The global LLDP information.
- The LLDP information about the LLDP-enabled ports in up state.

Examples

Display all local LLDP information.

```
<Sysname> display lldp local-information

Table 1 Command output

Field	Description
Chassis ID	Bridge MAC address of the device.
System capabilities supported	Supported capabilities: • **Bridge**—Switching is supported. • **Router**—Routing is supported. • **Customer Bridge**—The customer bridge feature is supported. • **Service Bridge**—The service bridge feature is supported.
System capabilities enabled	Enabled capabilities: • **Bridge**—Switching is enabled. • **Router**—Routing is enabled. • **Customer Bridge**—The customer bridge feature is enabled. • **Service Bridge**—The service bridge feature is enabled.
Device class	MED device class: • **Connectivity device**—Network device. • **Class I**—Normal terminal device. It requires the basic LLDP discovery services. • **Class II**—Media terminal device. It supports media streams, and can also act as a normal terminal device. • **Class III**—Communication terminal device. It supports the IP communication systems of end users, and can also act as a normal terminal device or media terminal device.
MED inventory information of master board	MED inventory information about the MPU.
HardwareRev	Hardware version.
FirmwareRev	Firmware version.
SoftwareRev	Software version.
SerialNum	Serial number.
Manufacturer name	Device manufacturer.
Model name	Device model.
Port ID type	Port ID type: • MAC address. • Interface name.
Port ID	Port ID, the value of which depends on the port ID type.
Management address interface type	Numbering type of the interface identified by the management address.
Management address interface ID	Index of the interface identified by the management address.
Management address OID	Management address object ID.
Link aggregation supported	Indicates whether link aggregation is supported on the port.
Link aggregation enabled	Indicates whether link aggregation is enabled on the port.
Aggregation port ID	Member port ID, which is 0 when link aggregation is disabled.
Auto-negotiation supported	Indicates whether autonegotiation is supported on the port.
Auto-negotiation enabled	Indicates whether autonegotiation is enabled on the port.

Field	Description
OperMau	Speed and duplex state of the port.
Power port class	This field is not supported in the current software version. PoE port class: • **PSE**—Power sourcing equipment. • **PD**—Powered device.
PSE power supported	Indicates whether the device can operate as a PSE.
PSE power enabled	Indicates whether the device is operating as a PSE.
PSE pairs control ability	Indicates whether the pair selection ability is available.
Power pairs	This field is not supported in the current software version. Power supply mode: • **Signal**—Uses data pairs to supply power. • **Spare**—Uses spare pairs to supply power.
Transmit Tw	Sleep time of the local client, in μs.
Receive Tw	Sleep time of the peer client expected by the local client, in μs.
Fallback Tw	Candidate sleep time of the peer client expected by the local client, in μs.
Echo Transmit Tw	Sleep time of the peer client, in μs. This field displays zero when one of the following cases occurs: • The local client has not received the sleep time of the peer client. • The sleep time of the peer client is 0 μs.
Echo Receive Tw	Sleep time of the local client expected by the peer client, in μs. This field displays zero when one of the following cases occurs: • The local client has not received the expected sleep time from the peer client. • The sleep time of the local client expected by the peer client is 0 μs.

display lldp neighbor-information

Use **display lldp neighbor-information** to display the LLDP information received from the neighboring devices.

Syntax

display lldp neighbor-information [[[**interface** *interface-type interface-number*] [**agent** { **nearest-bridge** | **nearest-customer** | **nearest-nontpmr** }] [**verbose**]] | **list** [**system-name** *system-name*]]

Parameters

interface *interface-type interface-number*: Specifies a port by its type and number. If you do not specify this option, the command displays the LLDP information that all ports receive from the neighboring devices.

agent: Specifies an agent type. If you do not specify an agent type, the command displays the LLDP information that all LLDP agents receive from the neighboring devices.

nearest-bridge: Specifies nearest bridge agents.

nearest-customer: Specifies nearest customer bridge agents.

nearest-nontpmr: Specifies nearest non-TPMR bridge agents.

verbose: Displays the detailed LLDP information that the local device receives from the neighboring devices. If you do not specify this keyword, the command displays the brief LLDP information that the local device receives from the neighboring devices.

list: Displays the LLDP information that the local device receives from the neighboring devices in the form of a list.

system-name *system-name*: Displays the LLDP information that the local device receives from a neighboring device specified by its system name. The *system-name* argument is a string of 1 to 255 characters. If you do not specify this option, the command displays the LLDP information that the local device receives from all neighboring devices in a list.

Examples

Display detailed LLDP information that the nearest bridge agents on all ports received from the neighboring devices.

```
<Sysname> display lldp neighbor-information agent nearest-bridge verbose

Table 2 Command output

Field	Description
LLDP neighbor-information of port 1	LLDP information received through port 1.
Update time	Time when LLDP information about a neighboring device was last updated.
LLDP mac type	Type of the neighbor MAC address: • Nearest bridge. • Nearest customer bridge. • Nearest non-TPMR bridge.

Field	Description
Chassis type	Chassis ID type: • **Chassis component**. • **Interface alias**. • **Port component**. • **MAC address**. • **Network address (ipv4)**. • **Interface name**. • **Locally assigned**—Locally-defined chassis type other than those listed above.
Chassis ID	ID that identifies the LLDP sending device, which can be a MAC address, a network address, an interface, or some other value, depending on the chassis ID type of the neighboring device.
Port ID type	Port ID type: • **Interface alias**. • **Port component**. • **MAC address**. • **Network address (ipv4)**. • **Interface name**. • **Agent circuit ID**. • **Locally assigned**—Locally-defined port ID type other than those listed above.
Port ID	Value of the type of the port ID.
System name	System name of the neighboring device.
System description	System description of the neighboring device.
System capabilities supported	Capabilities supported on the neighboring device: • **Bridge**—Switching is supported. • **Router**—Routing is supported. • . • **Customer Bridge**—The customer bridge feature is enabled. • **Service Bridge**—The service bridge feature is enabled.
System capabilities enabled	Capabilities enabled on the neighboring device: • **Bridge**—Switching is enabled. • **Router**—Routing is enabled. • **Customer Bridge**—The customer bridge feature is enabled. • **Service Bridge**—The service bridge feature is enabled.
Port and protocol VLAN ID(PPVID)	Port and protocol VLAN ID.
Port and protocol VLAN supported	Indicates whether protocol VLAN is supported on the port.
Port and protocol VLAN enabled	Indicates whether protocol VLAN is enabled on the port.
VLAN name of VLAN 12	Name of VLAN 12.
Link aggregation supported	Indicates whether link aggregation is supported.
Link aggregation enabled	Indicates whether link aggregation is enabled.
Aggregation port ID	Member port ID, which is 0 when link aggregation is disabled.
Auto-negotiation supported	Indicates whether autonegotiation is supported on the port.
Auto-negotiation enabled	Indicates whether autonegotiation is enabled on the port.

Field	Description
OperMau	Speed and duplex state on the port.
Power port class	This field is not supported in the current software version. PoE port class: • **PSE**—Power sourcing equipment. • **PD**—Powered device.
PSE power supported	Indicates whether the device can operate as a PSE.
PSE power enabled	Indicates whether the device is operating as a PSE.
PSE pairs control ability	Indicates whether the pair selection ability is available.
Power pairs	This field is not supported in the current software version. Power supply mode: • **Signal**—Uses data pairs to supply power. • **Spare**—Uses spare pairs to supply power.
TLV type	Unknown basic TLV type.
Capabilities	Capabilities enabled on the neighboring device: • **Bridge**—Switching is enabled. • **Router**—Routing is enabled. • **None**—The neighboring device does not advertise this TLV.
Local Interface	Local port that receives the LLDP information.
Chassis ID : * -- -- Nearest nontpmr bridge neighbor #-- -- Nearest customer bridge neighbor	Chassis ID flag: • An asterisk (*) indicates the nearest non-TPMR bridge neighbor. • A pound sign (#) indicates the nearest customer bridge neighbor.

display lldp statistics

Use **display lldp statistics** to display the global LLDP statistics or the LLDP statistics of a port.

Syntax

display lldp statistics [**global** | [**interface** *interface-type interface-number*] [**agent** { **nearest-bridge** | **nearest-customer** | **nearest-nontpmr** }]]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

global: Displays the global LLDP statistics.

interface *interface-type interface-number*: Specifies a port by its type and number.

agent: Specifies an LLDP agent type. If you do not specify an agent type, the command displays the statistics for all LLDP agents.

nearest-bridge: Specifies nearest bridge agents.

nearest-customer: Specifies nearest customer bridge agents.

nearest-nontpmr: Specifies nearest non-TPMR bridge agents.

Usage guidelines

If you do not specify any keywords or arguments, the command displays the global LLDP statistics and the LLDP statistics of all ports.

Examples

Display the global LLDP statistics and the LLDP statistics of all ports.

```
<Sysname> display lldp statistics
LLDP statistics global information:
LLDP neighbor information last change time:0 days, 0 hours, 4 minutes, 40 seconds
The number of LLDP neighbor information inserted : 1
The number of LLDP neighbor information deleted  : 1
The number of LLDP neighbor information dropped  : 0
The number of LLDP neighbor information aged out : 1

LLDP statistics information of port 1 [GigabitEthernet1/0/1]:
LLDP agent nearest-bridge:
The number of LLDP frames transmitted           : 0
The number of LLDP frames received              : 0
The number of LLDP frames discarded             : 0
The number of LLDP error frames                 : 0
The number of LLDP TLVs discarded               : 0
The number of LLDP TLVs unrecognized            : 0
The number of LLDP neighbor information aged out : 0
The number of CDP frames transmitted            : 0
The number of CDP frames received               : 0
The number of CDP frames discarded              : 0
The number of CDP error frames                  : 0

The number of LLDP TLVs discarded               : 0
The number of LLDP TLVs unrecognized            : 0
The number of LLDP neighbor information aged out : 0
The number of CDP frames transmitted            : 0
The number of CDP frames received               : 0
The number of CDP frames discarded              : 0
The number of CDP error frames                  : 0
```

Display the LLDP statistics for the nearest customer bridge agents on GigabitEthernet 1/0/1.

```
<Sysname> display lldp statistics interface gigabitethernet 1/0/1 agent nearest-customer
LLDP statistics information of port 1 [GigabitEthernet1/0/1]:
LLDP agent nearest-customer:
The number of LLDP frames transmitted           : 0
The number of LLDP frames received              : 0
The number of LLDP frames discarded             : 0
The number of LLDP error frames                 : 0
The number of LLDP TLVs discarded               : 0
The number of LLDP TLVs unrecognized            : 0
The number of LLDP neighbor information aged out : 0
The number of CDP frames transmitted            : 0
The number of CDP frames received               : 0
The number of CDP frames discarded              : 0
The number of CDP error frames                  : 0
```

Table 3 Command output

Field	Description
LLDP statistics global information	Global LLDP statistics.
LLDP neighbor information last change time	Time when the neighbor information was last updated.
The number of LLDP neighbor information inserted	Number of times neighbor information was added.
The number of LLDP neighbor information deleted	Number of times neighbor information was removed.
The number of LLDP neighbor information dropped	Number of times neighbor information was dropped due to lack of available memory space.

display lldp status

Use **display lldp status** to display LLDP status.

Syntax

display lldp status [**interface** *interface-type interface-number*] [**agent** { **nearest-bridge** | **nearest-customer** | **nearest-nontpmr** }]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

interface *interface-type interface-number*: Specifies a port by its type and number. If you do not specify this option, the command displays the global LLDP status and the LLDP status of all ports.

agent: Specifies an LLDP agent type. If you do not specify an agent type, the command displays the status information for all LLDP agents.

nearest-bridge: Specifies nearest bridge agents.

nearest-customer: Specifies nearest customer bridge agents.

nearest-nontpmr: Specifies nearest non-TPMR bridge agents.

Examples

Display the global LLDP status and the LLDP status of each port.

```
<Sysname> display lldp status
Global status of LLDP: Enable
Bridge mode of LLDP: customer-bridge
The current number of LLDP neighbors: 5
The current number of CDP neighbors: 0
LLDP neighbor information last changed time: 0 days, 0 hours, 4 minutes, 40 seconds
Transmit interval              : 30s
Fast transmit interval         : 1s
Transmit max credit            : 5
Hold multiplier                : 4
Reinit delay                   : 2s
Trap interval                  : 5s
Fast start times               : 3

LLDP status information of port 1 [GigabitEthernet1/0/1]:
LLDP agent nearest-bridge:
Port status of LLDP            : Enable
Admin status                   : TX_RX
Trap flag                      : No
MED trap flag                  : No
Polling interval               : 0s
Number of LLDP neighbors       : 5
Number of MED neighbors        : 2
Number of CDP neighbors        : 0
Number of sent optional TLV    : 12
Number of received unknown TLV : 5

LLDP agent nearest-nontpmr:
Port status of LLDP            : Enable
Admin status                   : TX_RX
```

```
Trap flag                      : No
MED trap flag                  : No
Polling interval               : 0s
Number of LLDP neighbors       : 5
Number of MED neighbors        : 2
Number of CDP neighbors        : 0
Number of sent optional TLV    : 12
Number of received unknown TLV : 5

LLDP agent nearest-customer:
Port status of LLDP            : Enable
Admin status                   : TX_RX
Trap flag                      : No
MED trap flag                  : No
Polling interval               : 0s
Number of LLDP neighbors       : 5
Number of MED neighbors        : 2
Number of CDP neighbors        : 0
Number of sent optional TLV    : 12
Number of received unknown TLV : 5
```

Table 4 Command output

Field	Description
Bridge mode of LLDP	LLDP bridge mode: service-bridge or customer-bridge.
Global status of LLDP	Indicates whether LLDP is globally enabled.
LLDP neighbor information last changed time	Time when the neighbor information was last updated.
Transmit interval	LLDP frame transmission interval.
Hold multiplier	TTL multiplier.
Reinit delay	LLDP reinitialization delay.
Transmit max credit	Token bucket size for sending LLDP frames.
Trap interval	Trap transmission interval.
Fast start times	Number of LLDP frames sent each time fast LLDP frame transmission is triggered.
Port 1	LLDP status of port 1.
Port status of LLDP	Indicates whether LLDP is enabled on the port.
Admin status	LLDP operating mode of the port: • **TX_RX**—The port can send and receive LLDP frames. • **Rx_Only**—The port can only receive LLDP frames. • **Tx_Only**—The port can only send LLDP frames. • **Disable**—The port cannot send or receive LLDP frames.
Trap Flag	Indicates whether trapping is enabled.
Polling interval	LLDP polling interval, which is 0 when LLDP polling is disabled.
Number of neighbors	Number of LLDP neighbors connecting to the port.

Field	Description
Number of MED neighbors	Number of MED neighbors connecting to the port.
Number of CDP neighbors	Number of CDP neighbors connected to the port. This field is not supported in the current software version.
Number of sent optional TLV	Number of optional TLVs contained in an LLDP frame sent through the port.
Number of received unknown TLV	Number of unknown TLVs contained in a received LLDP frame.

display lldp tlv-config

Use **display lldp tlv-config** to display the types of advertisable optional LLDP TLVs of a port.

Syntax

display lldp tlv-config [**interface** *interface-type interface-number*] [**agent** { **nearest-bridge** | **nearest-customer** | **nearest-nontpmr** }]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

interface *interface-type interface-number*: Specifies a port by its type and number. If you do not specify this option, the command displays the types of advertisable optional TLVs of all ports.

agent: Specifies an LLDP agent type. If you do not specify an agent type, the command displays the types of advertisable optional LLDP TLVs for all LLDP agents.

nearest-bridge: Specifies nearest bridge agents.

nearest-customer: Specifies nearest customer bridge agents.

nearest-nontpmr: Specifies nearest non-TPMR bridge agents.

Examples

Display the types of advertisable optional LLDP TLVs of GigabitEthernet 1/0/1.

```
<Sysname> display lldp tlv-config interface gigabitethernet 1/0/1
LLDP tlv-config of port 1[GigabitEthernet1/0/1]:

Table 5 Command output

Field	Description
LLDP tlv-config of port 1	Advertisable optional TLVs of port 1.
NAME	TLV type.
STATUS	Indicates whether the type of TLV is sent through a port.
DEFAULT	Indicates whether the type of TLV is sent through a port by default.
Basic optional TLV	Basic optional TLVs: • Port Description TLV. • System Name TLV. • System Description TLV. • System Capabilities TLV. • Management Address TLV.
IEEE 802.1 extended TLV	IEEE 802.1 organizationally specific TLVs: • PVID TLV. • Port and protocol VLAN ID TLV. • VLAN name TLV. • DCBX TLV. DCBX TLVs are not supported in the current software version. • EVB TLV. EVB TLVs are not supported in the current software version. • Management VID TLV.
IEEE 802.3 extended TLV	IEEE 802.3 organizationally specific TLVs: • MAC-Physic TLV.

Field	Description
	• Power via MDI TLV. • Link aggregation TLV. • Maximum frame size TLV.
LLDP-MED extend TLV	LLDP-MED TLVs: • Capabilities TLV. • Network Policy TLV. • Extended Power-via-MDI TLV. • Location Identification TLV. • Inventory TLV.
Inventory TLV	Inventory TLVs: • Hardware Revision TLV. • Firmware Revision TLV. • Software Revision TLV. • Serial Number TLV. • Manufacturer Name TLV. • Model name TLV. • Asset ID TLV.

lldp admin-status

Use **lldp admin-status** to set the LLDP operating mode.

Use **undo lldp admin-status** to restore the default.

Syntax

In Layer 2 or Layer 3 Ethernet interface view:

lldp [**agent** { **nearest-customer** | **nearest-nontpmr** }] **admin-status** { **disable** | **rx** | **tx** | **txrx** }

undo lldp [**agent** { **nearest-customer** | **nearest-nontpmr** }] **admin-status**

In Layer 2/Layer 3 aggregate interface view:

lldp agent { **nearest-customer** | **nearest-nontpmr** } **admin-status** { **disable** | **rx** | **tx** | **txrx** }

undo lldp agent { **nearest-customer** | **nearest-nontpmr** } **admin-status**

Default

The nearest bridge agent operates in **TxRx** mode, and the nearest customer bridge agent and nearest non-TPMR bridge agent operate in **Disable** mode.

Views

Layer 2 Ethernet interface view

Layer 3 Ethernet interface view

Layer 2 aggregate interface view

Layer 3 aggregate interface view

Predefined user roles

network-admin

context-admin

Parameters

agent: Specifies an LLDP agent type. If you do not specify an agent type in Ethernet interface view, the command sets the operating mode for nearest bridge agents.

nearest-customer: Specifies nearest customer bridge agents.

nearest-nontpmr: Specifies nearest non-TPMR bridge agents.

disable: Specifies the **Disable** mode. A port in this mode cannot send or receive LLDP frames.

rx: Specifies the **Rx** mode. A port in this mode can only receive LLDP frames.

tx: Specifies the **Tx** mode. A port in this mode can only send LLDP frames.

txrx: Specifies the **TxRx** mode. A port in this mode can send and receive LLDP frames.

Examples

Set the LLDP operating mode to **Rx** for the nearest customer bridge agents on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] lldp agent nearest-customer admin-status rx
```

lldp check-change-interval

Use **lldp check-change-interval** to enable LLDP polling and set the polling interval.

Use **undo lldp check-change-interval** to disable LLDP polling.

Syntax

In Layer 2 or Layer 3 Ethernet interface view:

lldp [**agent** { **nearest-customer** | **nearest-nontpmr** }] **check-change-interval** *interval*

undo lldp [**agent** { **nearest-customer** | **nearest-nontpmr** }] **check-change-interval**

In Layer 2/Layer 3 aggregate interface view:

lldp agent { **nearest-customer** | **nearest-nontpmr** } **check-change-interval** *interval*

undo lldp agent { **nearest-customer** | **nearest-nontpmr** } **check-change-interval**

Default

LLDP polling is disabled.

Views

Layer 2 Ethernet interface view

Layer 3 Ethernet interface view

Layer 2 aggregate interface view

Layer 3 aggregate interface view

Predefined user roles

network-admin

context-admin

Parameters

agent: Specifies an LLDP agent type. If you do not specify an agent type in Ethernet interface view, the command enables LLDP polling and sets the polling interval for nearest bridge agents.

nearest-customer: Specifies nearest customer bridge agents.

nearest-nontpmr: Specifies nearest non-TPMR bridge agents.

interval: Sets the LLDP polling interval in the range of 1 to 30 seconds.

Examples

Enable LLDP polling and set the polling interval to 30 seconds for the nearest customer bridge agents on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] lldp agent nearest-customer check-change-interval 30
```

lldp compliance admin-status cdp

Use **lldp compliance admin-status cdp** to set the operating mode of CDP-compatible LLDP.

Use **undo lldp compliance admin-status cdp** to restore the default.

Syntax

lldp compliance admin-status cdp { **disable** | **txrx** }

undo lldp compliance admin-status cdp

Default

CDP-compatible LLDP operates in **Disable** mode.

Views

Layer 2 Ethernet interface view

Layer 3 Ethernet interface view

Management Ethernet interface view

Predefined user roles

network-admin

context-admin

Parameters

disable: Specifies the **Disable** mode. CDP-compatible LLDP in this mode cannot receive or transmit CDP packets.

txrx: Specifies the **TxRx** mode. CDP-compatible LLDP in this mode can send and receive CDP packets.

Usage guidelines

For your device to work with Cisco IP phones, you must perform the following tasks:

- Enable CDP-compatible LLDP globally.
- Configure CDP-compatible LLDP to operate in TxRx mode on the specified ports.

Examples

Enable CDP-compatible LLDP globally and configure CDP-compatible LLDP to operate in **TxRx** mode on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] lldp compliance cdp
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] lldp compliance admin-status cdp txrx
```

Related commands

lldp compliance cdp

lldp compliance cdp

Use **lldp compliance cdp** to enable CDP compatibility.

Use **undo lldp compliance cdp** to disable CDP compatibility.

Syntax

lldp compliance cdp

undo lldp compliance cdp

Default

CDP compatibility is disabled.

Views

System view

Predefined user roles

network-admin

context-admin

Usage guidelines

The maximum TTL that CDP allows is 255 seconds. To make CDP-compatible LLDP work correctly with Cisco IP phones, set the LLDP frame transmission interval to be no more than 1/3 of the TTL value.

Examples

Enable CDP compatibility.

```
<Sysname> system-view
[Sysname] lldp compliance cdp
```

Related commands

lldp hold-multiplier

lldp timer tx-interval

lldp enable

Use **lldp enable** to enable LLDP on a port.

Use **undo lldp enable** to disable LLDP on a port.

Syntax

lldp enable

undo lldp enable

Default

LLDP is enabled on a port.

Views

Layer 2 Ethernet interface view

Layer 3 Ethernet interface view

Layer 2 aggregate interface view

Layer 3 aggregate interface view

Predefined user roles

network-admin

context-admin

Usage guidelines

LLDP takes effect on a port only when LLDP is enabled both globally and on the port.

Examples

Disable LLDP on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] undo lldp enable
```

Related commands

lldp global enable

lldp encapsulation snap

Use **lldp encapsulation snap** to set the encapsulation format for LLDP frames to SNAP.

Use **undo lldp encapsulation** to restore the default.

Syntax

In Layer 2 or Layer 3 Ethernet interface view:

lldp [**agent** { **nearest-customer** | **nearest-nontpmr** }] **encapsulation snap**

undo lldp [**agent** { **nearest-customer** | **nearest-nontpmr** }] **encapsulation**

In Layer 2/Layer 3 aggregate interface view:

lldp agent { **nearest-customer** | **nearest-nontpmr** } **encapsulation snap**

undo lldp agent { **nearest-customer** | **nearest-nontpmr** } **encapsulation**

Default

The encapsulation format for LLDP frames is Ethernet II.

Views

Layer 2 Ethernet interface view

Layer 3 Ethernet interface view

Layer 2 aggregate interface view

Layer 3 aggregate interface view

Predefined user roles

network-admin

context-admin

Parameters

agent: Specifies an LLDP agent type. If you do not specify an agent type in Ethernet interface view, the command sets the LLDP frame encapsulation format for nearest bridge agents.

nearest-customer: Specifies nearest customer bridge agents.

nearest-nontpmr: Specifies nearest non-TPMR bridge agents.

Usage guidelines

LLDP-CDP packets use only SNAP encapsulation.

Examples

Set the encapsulation format for LLDP frames to SNAP on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] lldp encapsulation snap
```

lldp fast-count

Use **lldp fast-count** to set the number of LLDP frames sent each time fast LLDP frame transmission is triggered.

Use **undo lldp fast-count** to restore the default.

Syntax

lldp fast-count *count*

undo lldp fast-count

Default

Four LLDP frames are sent each time fast LLDP frame transmission is triggered.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

count: Sets the number of LLDP frames sent each time fast LLDP frame transmission is triggered. The value range is 1 to 8.

Examples

Configure the device to send five LLDP frames each time fast LLDP frame transmission is triggered.

```
<Sysname> system-view
[Sysname] lldp fast-count 5
```

lldp global enable

Use **lldp global enable** to enable LLDP globally.

Use **undo lldp global enable** to disable LLDP globally.

Syntax

lldp global enable

undo lldp global enable

Default

LLDP is disabled globally.

Views

System view

Predefined user roles

network-admin

context-admin

Usage guidelines

LLDP takes effect on a port only when LLDP is enabled both globally and on the port.

Examples

Disable LLDP globally.

```
<Sysname> system-view
[Sysname] undo lldp global enable
```

Related commands

lldp enable

lldp hold-multiplier

Use **lldp hold-multiplier** to set the TTL multiplier.

Use **undo lldp hold-multiplier to** restore the default.

Syntax

lldp hold-multiplier *value*

undo lldp hold-multiplier

Default

The TTL multiplier is 4.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

value: Sets the TTL multiplier in the range of 2 to 10.

Usage guidelines

The TTL TLV carried in an LLDPDU determines how long the device information carried in the LLDPDU can be saved on a recipient device.

By setting the TTL multiplier, you can set the TTL of locally sent LLDP frames. The TTL is expressed by using the following formula:

TTL = Min (65535, (TTL multiplier × LLDP frame transmission interval + 1))

As the expression shows, the TTL can be up to 65535 seconds.

Examples

Set the TTL multiplier to 6.

```
<Sysname> system-view
[Sysname] lldp hold-multiplier 6
```

Related commands

lldp timer tx-interval

lldp ignore-pvid-inconsistency

Use **lldp ignore-pvid-inconsistency** to disable LLDP PVID inconsistency check.

Use **undo lldp ignore-pvid-inconsistency** to enable LLDP PVID inconsistency check.

Syntax

lldp ignore-pvid-inconsistency

undo lldp ignore-pvid-inconsistency

Default

LLDP PVID inconsistency check is enabled.

Views

System view

Predefined user roles

network-admin

context-admin

Usage guidelines

By default, when the system receives an LLDP packet, it compares the PVID value contained in packet with the PVID configured on the receiving interface. If the two PVIDs do not match, a log message will be printed to notify the user.

You can disable PVID inconsistency check if different PVIDs are required on a link.

Examples

Disable LLDP PVID inconsistency check.

```
<Sysname> system-view
[Sysname] lldp ignore-pvid-inconsistency
```

lldp management-address

Use **lldp management-address** to enable the device to generate an ARP or ND entry after receiving an LLDP frame that carries a management address TLV.

Use **undo lldp management-address** to restore the default.

Syntax

lldp management-address { **arp-learning** | **nd-learning** } [**vlan** *vlan-id*]

undo lldp management-address { **arp-learning** | **nd-learning** }

Default

The device does not generate an ARP or ND entry after receiving an LLDP frame that carries a management address TLV.

Views

Layer 3 Ethernet interface view

Predefined user roles

network-admin

context-admin

Parameters

arp-learning: Generates an ARP entry if the received management address TLV contains an IPv4 address.

nd-learning: Generates an ND entry if the received management address TLV contains an IPv6 address.

vlan *vlan-id*: Specifies the Layer 3 Ethernet subinterface that terminates the specified VLAN as the output interface. The VLAN ID is in the range of 1 to 4094. If you do not specify a VLAN ID, the Layer 3 Ethernet interface is recorded as the output interface.

Usage guidelines

This command must be used together with the **lldp source-mac vlan** command for the device to use the MAC address of a Layer 3 Ethernet subinterface as the source MAC address of LLDP frames. This ensures that the LLDP neighbor can learn correct ARP or ND entries.

You can enable the device to generate both ARP entries and ND entries.

If you specify the **vlan** *vlan-id* option, the Layer 3 Ethernet subinterface that terminates the VLAN is recorded as the output interface in the generated ARP or ND entries. If the VLAN is not terminated by any Layer 3 Ethernet subinterface or the **vlan** *vlan-id* option is not specified, the Layer 3 Ethernet interface is recorded as the output interface. For more information about VLAN termination, see VLAN termination configuration in *Layer 2—LAN Switching Configuration Guide*.

Examples

Configure GigabitEthernet 1/0/1 to generate an ARP entry after receiving an LLDP frame carrying an IPv4 management address TLV.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] lldp management-address arp-learning
```

Related commands

lldp source-mac vlan

lldp management-address-format string

Use **lldp management-address-format string** to set the encoding format of the management address to string.

Use **undo lldp management-address-format** to restore the default.

Syntax

In Layer 2 or Layer 3 Ethernet interface view:

lldp [**agent** { **nearest-customer** | **nearest-nontpmr** }] **management-address-format string**

undo lldp [agent { nearest-customer | nearest-nontpmr }] management-address-format

In Layer 2/Layer 3 aggregate interface view:

lldp agent { nearest-customer | nearest-nontpmr } management-address-format string

undo lldp agent { nearest-customer | nearest-nontpmr } management-address-format

Default

The encoding format of the management address is numeric.

Views

Layer 2 Ethernet interface view

Layer 3 Ethernet interface view

Layer 2 aggregate interface view

Layer 3 aggregate interface view

Predefined user roles

network-admin

context-admin

Parameters

agent: Specifies an LLDP agent type. If you do not specify an agent type in Ethernet interface view, the command sets the encoding format of the management address for nearest bridge agents.

nearest-customer: Specifies nearest customer bridge agents.

nearest-nontpmr: Specifies nearest non-TPMR bridge agents.

Usage guidelines

LLDP neighbors must use the same encoding format for the management address. If a neighbor encodes its management address in string format, set the encoding format of the management address to **string** on the connecting port. This guarantees normal communication with the neighbor.

Examples

Set the encoding format of the management address to string for the nearest customer bridge agents on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] lldp agent nearest-customer management-address-format string
```

lldp max-credit

Use **lldp max-credit** to set the token bucket size for sending LLDP frames.

Use **undo lldp max-credit** to restore the default.

Syntax

lldp max-credit *credit-value*

undo lldp max-credit

Default

The token bucket size for sending LLDP frames is 5.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

credit-value: Specifies the token bucket size for sending LLDP frames, in the range of 1 to 100.

Examples

Set the token bucket size for sending LLDP frames to 10.

```
<Sysname> system-view
[Sysname] lldp max-credit 10
```

lldp mode

Use **lldp mode** to configure LLDP to operate in service bridge mode.

Use **undo lldp mode** to restore the default.

Syntax

lldp mode service-bridge

undo lldp mode

Default

LLDP operates in customer bridge mode.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

service-bridge: Specifies the service bridge mode.

Usage guidelines

The LLDP agent types supported by LLDP depend on the LLDP bridge mode:

- **Service bridge mode**—LLDP supports nearest bridge agents and nearest non-TPMR bridge agents. LLDP processes the LLDP frames with destination MAC addresses for these agents and transparently transmits the LLDP frames with other destination MAC addresses in a VLAN.
- **Customer bridge mode**—LLDP supports nearest bridge agents, nearest non-TPMR bridge agents, and nearest customer bridge agents. LLDP processes the LLDP frames with destination MAC addresses for these agents and transparently transmits the LLDP frames with other destination MAC addresses in a VLAN.

The bridge mode configuration takes effect only when LLDP is enabled globally. If LLDP is disabled globally, LLDP can only operate in customer bridge mode.

Examples

Configure LLDP to operate in service bridge mode.

```
<Sysname> system-view
[Sysname] lldp mode service-bridge
```

Related commands

lldp global enable

lldp notification med-topology-change enable

Use **lldp notification med-topology-change enable** to enable LLDP-MED trapping.

Use **undo lldp notification med-topology-change enable** to disable LLDP-MED trapping.

Syntax

lldp notification med-topology-change enable

undo lldp notification med-topology-change enable

Default

LLDP-MED trapping is disabled.

Views

Layer 2 Ethernet interface view

Layer 3 Ethernet interface view

Predefined user roles

network-admin

context-admin

Examples

Enable LLDP-MED trapping on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] lldp notification med-topology-change enable
```

lldp notification remote-change enable

Use **lldp notification remote-change enable** to enable LLDP trapping.

Use **undo lldp notification remote-change enable** to disable LLDP trapping.

Syntax

In Layer 2 or Layer 3 Ethernet interface view:
