Use **peer fake-as** to advertise a fake AS number to a peer or peer group.

Use **undo peer fake-as** to remove the fake AS number advertised to a peer or peer group.

Syntax

peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **fake-as** *as-number*

undo peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **fake-as**

Default

No fake local AS number is advertised to a peer or peer group.

Views

BGP instance view

BGP-VPN instance view

Predefined user roles

network-admin

context-admin

Parameters

group-name: Specifies a peer group by its name, a case-sensitive string of 1 to 47 characters. The peer group must have been created.

ipv4-address: Specifies a peer by its IPv4 address. The peer must have been created.

mask-length: Specifies a mask length in the range of 0 to 32. You can use the *ipv4-address* and *mask-length* arguments together to specify a subnet. If you specify a subnet, this command advertises a fake AS number to all dynamic peers in the subnet.

ipv6-address: Specifies a peer by its IPv6 address. The peer must have been created.

prefix-length: Specifies a prefix length in the range of 0 to 128. You can use the *ipv6-address* and *prefix-length* arguments together to specify a subnet. If you specify a subnet, this command advertises a fake AS number to all dynamic peers in the subnet.

as-number: Specifies a fake AS number in the range of 1 to 4294967295.

Usage guidelines

After you move a BGP router from an AS to another AS (from AS 2 to AS 3 for example), you have to modify the AS number of the router on all its EBGP peers. To avoid such modifications, you can

configure the router to advertise a fake AS number 2 to its EBGP peers so that the EBGP peers still think that Router A is in AS 2.

The **peer fake-as** command is applicable only to EBGP peers or peer groups.

If you execute the **peer fake-as** command on the local router, specify the local router's AS number on the peer as the fake local AS number specified in the command.

Examples

In BGP instance view, advertise a fake AS number of 200 to peer group **test**.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp-default] peer test fake-as 200
```

peer filter-policy

Use **peer filter-policy** to filter routes advertised to or received from a peer or peer group by using an ACL.

Use **undo peer filter-policy** to remove the ACL specified to filter routes advertised to or received from a peer or peer group.

Syntax

In BGP IPv4 unicast address family view/BGP-VPN IPv4 unicast address family view/BGP VPNv4 address family view/BGP IPv4 multicast address family view:

peer { *group-name* | *ipv4-address* [*mask-length*] } **filter-policy** *ipv4-acl-number* { **export** | **import** }

undo peer { *group-name* | *ipv4-address* [*mask-length*] } **filter-policy** { **export** | **import** }

In BGP IPv6 unicast address family view:

peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **filter-policy** *ipv6-acl-number* { **export** | **import** }

undo peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **filter-policy** { **export** | **import** }

In BGP-VPN IPv6 unicast address family view/BGP IPv6 multicast address family view:

peer { *group-name* | *ipv6-address* [*prefix-length*] } **filter-policy** *ipv6-acl-number* { **export** | **import** }

undo peer { *group-name* | *ipv6-address* [*prefix-length*] } **filter-policy** { **export** | **import** }

In BGP VPNv6 address family view:

peer { *group-name* | *ipv4-address* [*mask-length*] } **filter-policy** *ipv6-acl-number* { **export** | **import** }

undo peer { *group-name* | *ipv4-address* [*mask-length*] } **filter-policy** { **export** | **import** }

Default

No ACL-based filtering is configured.

Predefined user roles

network-admin

context-admin

Parameters

group-name: Specifies a peer group by its name, a case-sensitive string of 1 to 47 characters. The peer group must have been created.

ipv4-address: Specifies a peer by its IPv4 address. The peer must have been created.

mask-length: Specifies a mask length in the range of 0 to 32. You can use the *ipv4-address* and *mask-length* arguments together to specify a subnet. If you specify a subnet, this command filters routes advertised to or received from all dynamic peers in the subnet by using an ACL.

ipv6-address: Specifies a peer by its IPv6 address. The peer must have been created.

prefix-length: Specifies a prefix length in the range of 0 to 128. You can use the *ipv6-address* and *prefix-length* arguments together to specify a subnet. If you specify a subnet, this command filters routes advertised to or received from all dynamic peers in the subnet by using an ACL.

ipv4-acl-number: Specifies an ACL by its number in the range of 2000 to 3999.

ipv6-acl-number: Specifies an IPv6 ACL by its number in the range of 2000 to 3999.

export: Filters routes advertised to the peer/peer group.

import: Filters routes received from the peer/peer group.

Usage guidelines

The specified ACL used by the **peer filter-policy** command must have been created with the **acl** command in system view. Otherwise, all routes can pass the ACL.

If you use a basic ACL (with a number from 2000 to 2999) configured with the **rule** [*rule-id*] { **deny** | **permit** } **source** *source-address source-wildcard* command, the command matches routes whose destination network addresses match the *source-address source-wildcard* argument without matching the masks of the destination addresses.

To use an advanced ACL (with a number from 3000 to 3999) in the command, configure the ACL using one of the following steps:

- To deny/permit a route with the specified destination, use the **rule** [*rule-id*] { **deny** | **permit** } **ip source** *sour-addr sour-wildcard* command.
- To deny/permit a route with the specified destination and mask, use the **rule** [*rule-id*] { **deny** | **permit** } **ip source** *sour-addr sour-wildcard* **destination** *dest-addr dest-wildcard* command.

The **source** keyword specifies the destination address of a route and the **destination** keyword specifies the subnet mask of the destination address. For the mask configuration to take effect, specify a contiguous subnet mask.

Examples

In BGP IPv4 unicast address family view, apply ACL 2000 to filter routes advertised to peer group **test**.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp-default] address-family ipv4 unicast
[Sysname-bgp-default-ipv4] peer test filter-policy 2000 export
```

peer group

Use **peer group** to add a peer to a peer group.

Use **undo peer group** to delete a peer from a peer group.

Syntax

peer { *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **group** *group-name* [**as-number** *as-number*]

undo peer { *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **group** *group-name*

Default

No peers exist in a peer group.

Views

BGP instance view

BGP-VPN instance view

Predefined user roles

network-admin

context-admin

Parameters

ipv4-address: Specifies a peer by its IPv4 address.

mask-length: Specifies a mask length in the range of 0 to 32. You can use the *ipv4-address* and *mask-length* arguments together to specify a subnet. If you specify a subnet, this command adds all dynamic peers in the subnet to a peer group.

ipv6-address: Specifies a peer by its IPv6 address.

prefix-length: Specifies a prefix length in the range of 0 to 128. You can use the *ipv6-address* and *prefix-length* arguments together to specify a subnet. If you specify a subnet, this command adds all dynamic peers in the subnet to a peer group.

group-name: Specifies a peer group by its name, a case-sensitive string of 1 to 47 characters. The peer group must have been created.

as-number *as-number*: Specifies an AS for a peer by its number in the range of 1 to 4294967295.

Usage guidelines

You can add a peer to a peer group in the following ways:

- Use the **peer as-number** command to create a peer and specify its AS number, and then use the **peer group** command to add the peer to the peer group.
  - You can specify the **as-number** keyword for the **peer group** command. The AS number must be the same as the AS number specified in the **peer as-number** command.
  - If you have specified the AS number of the peer group with the **peer as-number** command, the peer to be added must have the same AS number as the peer group.
  - To add a peer to an IBGP peer group, the peer must be an IBGP peer.
- Use the **peer group** command to create a peer and add it to the peer group.
  - If you have specified the AS number of the peer group with the **peer as-number** command, you do not need to specify the **as-number** keyword when you execute the **peer group** command. This is because the AS number of the peer is the same as the peer group. To specify the **as-number** keyword for the **peer group** command, make sure the AS number is the same as the peer group.
  - If no AS number is specified for an EBGP peer group, specify the **as-number** keyword when you execute the **peer group** command.
  - If no AS number is specified for an IBGP peer group, you do not need to specify the **as-number** keyword when you execute the **peer group** command. This is because the AS number of the IBGP peer group is the local AS number. To specify the **as-number** keyword for the **peer group** command, make sure the AS number is the same as the local AS number.

If you have specified the AS number of a peer group with the **peer as-number** command, only the peers with the same AS number can be added to the peer group. All peers in the group share the same AS number. If you have not specified the AS number for a peer group, peers added to it can use their own AS numbers.

After you add a peer to a peer group, you must use the **peer enable** command to enable BGP to exchange routing information with the peer group.

Examples

In BGP instance view, add peer 10.1.1.1 to EBGP peer group **test**.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp-default] group test external
[Sysname-bgp-default] peer 10.1.1.1 group test as-number 2004
```

Related commands

group

peer as-number

peer enable

peer ignore

Use **peer ignore** to disable BGP session establishment with a peer or peer group.

Use **undo peer ignore** to enable BGP session establishment with a peer or peer group.

Syntax

peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **ignore**

undo peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **ignore**

Default

BGP can establish a session to a peer or peer group.

Views

BGP instance view

BGP-VPN instance view

Predefined user roles

network-admin

context-admin

Parameters

group-name: Specifies a peer group by its name, a case-sensitive string of 1 to 47 characters. The peer group must have been created.

ipv4-address: Specifies a peer by its IPv4 address. The peer must have been created.

mask-length: Specifies a mask length in the range of 0 to 32. You can use the *ipv4-address* and *mask-length* arguments together to specify a subnet. If you specify a subnet in this command, BGP tears down sessions to all dynamic peers in the subnet.

ipv6-address: Specifies a peer by its IPv6 address. The peer must have been created.

prefix-length: Specifies a prefix length in the range of 0 to 128. You can use the *ipv6-address* and *prefix-length* arguments together to specify a subnet. If you specify a subnet in this command, BGP tears down sessions to all dynamic peers in the subnet.

Usage guidelines

CAUTION:

- If a session has been established to a peer, executing the **peer ignore** command for the peer tears down the session and clears all related routing information.
- If sessions have been established to a peer group, executing the **peer ignore** command for the peer group tears down the sessions to all peers in the group and clears all related routing information.

This command enables you to temporarily tear down the BGP session to a peer or peer group. You can perform network upgrade and maintenance without needing to delete and reconfigure the peer or peer group. To recover the session, execute the **undo peer ignore** command.

Examples

In BGP instance view, disable session establishment with peer 1.1.1.1.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp-default] peer 1.1.1.1 ignore
```

peer ignore-first-as

Use **peer ignore-first-as** to enable BGP to ignore the first AS number of EBGP route updates received from a peer or peer group.

Use **undo peer ignore-first-as** to remove the configuration.

Syntax

peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **ignore-first-as**

undo peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **ignore-first-as**

Default

BGP checks the first AS number of an EBGP-learned route update. If the first AS number is neither that of the BGP peer nor a private AS number, the BGP router disconnects the BGP session to the peer.

Views

BGP instance view

BGP-VPN instance view

Predefined user roles

network-admin

context-admin

Parameters

group-name: Specifies a peer group by its name, a case-sensitive string of 1 to 47 characters. The peer group must have been created.

ipv4-address: Specifies a peer by its IPv4 address. The peer must have been created.

mask-length: Specifies a mask length in the range of 0 to 32. You can use the *ipv4-address* and *mask-length* arguments together to specify a subnet. If you specify a subnet in this command, BGP ignores the first AS number of EBGP route updates received from all dynamic peers in the subnet.

ipv6-address: Specifies a peer by its IPv6 address. The peer must have been created.

prefix-length: Specifies a prefix length in the range of 0 to 128. You can use the *ipv6-address* and *prefix-length* arguments together to specify a subnet. If you specify a subnet in this command, BGP ignores the first AS number of EBGP route updates received from all dynamic peers in the subnet.

Usage guidelines

This command takes effect only on the EBGP routes received after you execute this command. If you execute the **peer ignore-first-as** and then the **undo peer ignore-first-as** commands, BGP advertises a ROUTE-REFRESH message to request the routing information from the EBGP peer or peer group.

Examples

In BGP instance view, enable BGP to ignore the first AS number of EBGP route updates received from peer group **test**.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp-default] peer test ignore-first-as
```

Related commands

ignore-first-as

peer ignore-originatorid

Use **peer ignore-originatorid** to configure BGP to ignore the ORIGINATOR_ID attribute in BGP route updates.

Use **undo peer ignore-originatorid** to remove the configuration.

Syntax

peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **ignore-originatorid**

undo peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **ignore-originatorid**

Default

BGP does not ignore the ORIGINATOR_ID attribute in BGP route updates.

Views

BGP instance view

BGP-VPN instance view

Predefined user roles

network-admin

context-admin

Parameters

group-name: Specifies a peer group by its name, a case-sensitive string of 1 to 47 characters. The peer group must have been created.

ipv4-address: Specifies a peer by its IPv4 address.

mask-length: Specifies a mask length in the range of 0 to 32. You can use the *ipv4-address* and *mask-length* arguments together to specify a subnet. If you specify a subnet in this command, BGP ignores the ORIGINATOR_ID attribute in BGP route updates from all dynamic peers in the subnet.

ipv6-address: Specifies a peer by its IPv6 address.

prefix-length: Specifies a prefix length in the range of 0 to 128. You can use the *ipv6-address* and *prefix-length* arguments together to specify a subnet. If you specify a subnet in this command, BGP ignores the ORIGINATOR_ID attribute in BGP route updates from all dynamic peers in the subnet.

Usage guidelines

Before using this command, make sure it does not cause any routing loops to the network.

Before forwarding a route received from a client, the route reflector adds an ORIGINATOR_ID attribute (the router ID of the client) to the route. By default, BGP drops incoming route updates whose ORIGINATOR_ID attribute is the same as the local router ID.

Some networks such as firewall networks require BGP to accept such route updates. To meet the requirement, you must configure BGP to ignore the ORIGINATOR_ID attribute.

After you execute this command, BGP also ignores the CLUSTER_LIST attribute.

Examples

In BGP instance view, configure BGP to ignore the ORIGINATOR_ID attribute in BGP route updates from peer 1.1.1.1.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp-default] peer 1.1.1.1 ignore-originatorid
```

peer ipsec-profile

Use **peer ipsec-profile** to apply an IPsec profile to an IPv6 BGP peer or peer group.

Use **undo peer ipsec-profile** to remove the profile from an IPv6 BGP peer or peer group.

Syntax

peer { *group-name* | *ipv6-address* [*prefix-length*] } **ipsec-profile** *profile-name*

undo peer { *group-name* | *ipv6-address* [*prefix-length*] } **ipsec-profile**

Default

No IPsec profile is configured for any IPv6 BGP peers or peer groups.

Views

BGP instance view

BGP-VPN instance view

Predefined user roles

network-admin

context-admin

Parameters

group-name: Specifies a peer group by its name, a case-sensitive string of 1 to 47 characters. The peer group must have been created.

ipv6-address: Specifies a peer by its IPv6 address. The peer must have been created.

prefix-length: Specifies a prefix length in the range of 0 to 128. You can use the *ipv6-address* and *prefix-length* arguments together to specify a subnet. If you specify a subnet, this command applies an IPsec profile to all dynamic peers in the subnet.

profile-name: Specifies an IPsec profile by its name, a case-sensitive string of 1 to 63 characters.

Usage guidelines

IPsec can protect IPv6 BGP packets from data eavesdropping, tampering, and attacks caused by forged IPv6 BGP packets.

When two IPv6 BGP neighbor devices, for example Device A and Device B, are configured with IPsec, Device A encapsulates an IPv6 BGP packet with IPsec before sending it to Device B. If Device B successfully receives and decapsulates the packet, it establishes an IPv6 BGP peer relationship with Device A or learns IPv6 BGP routes to Device A. If Device B receives but fails to decapsulate the packet, or receives a packet not protected by IPsec, it discards the packet.

Configure IPsec to protect IPv6 BGP packets through the following steps:

1. Configure an IPsec transform set.
2. Configure a manual IPsec profile.
3. Execute this command to apply the IPsec profile to an IPv6 BGP peer or peer group.

For more information about IPsec transform sets and IPsec profiles, see *Security Configuration Guide*.

This command supports only IPsec profiles in manual mode.

If you configure IPsec on a device, you must configure IPsec on its IPv6 BGP peer. Otherwise, IPv6 BGP packets cannot be received.

Examples

In BGP instance view, apply IPsec profile **profile001** to peer group **test**.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp-default] peer test ipsec-profile profile001
```

Predefined user roles

network-admin

context-admin

Parameters

group-name: Specifies a peer group by its name, a case-sensitive string of 1 to 47 characters. The peer group must have been created.

ipv4-address: Specifies a peer by its IPv4 address. The peer must have been created.

mask-length: Specifies a mask length in the range of 0 to 32. You can use the *ipv4-address* and *mask-length* arguments together to specify a subnet. If you specify a subnet, this command saves all route updates from all dynamic peers in the subnet, regardless of whether the routes have passed the configured routing policy.

ipv6-address: Specifies a peer by its IPv6 address. The peer must have been created.

prefix-length: Specifies a prefix length in the range of 0 to 128. You can use the *ipv6-address* and *prefix-length* arguments together to specify a subnet. If you specify a subnet, this command saves all route updates from all dynamic peers in the subnet, regardless of whether the routes have passed the configured routing policy.

Usage guidelines

To implement BGP session soft-reset when the local router and a peer or peer group do not support the route refresh feature, use the **peer keep-all-routes** command. The command saves all route updates received from the peer or peer group. After modifying the route selection policy, filter all saved routes with the new policy to refresh the routing table. This method avoids tearing down BGP sessions.

Examples

In BGP IPv4 unicast address family view, save all route updates from peer 1.1.1.1.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp-default] address-family ipv4 unicast
[Sysname-bgp-default-ipv4] peer 1.1.1.1 keep-all-routes
```

Related commands

refresh bgp

peer keychain

Use **peer keychain** to enable keychain authentication for a BGP peer or peer group.

Use **undo peer keychain** to remove keychain authentication for a BGP peer or peer group.

Syntax

peer { *group-name* | *ip-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **keychain** *keychain-name*

undo peer { *group-name* | *ip-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **keychain**

Default

Keychain authentication is disabled.

Views

BGP instance view

BGP-VPN instance view

Predefined user roles

network-admin

context-admin

Parameters

group-name: Specifies a peer group by its name, a case-sensitive string of 1 to 47 characters. The peer group must have been created.

ip-address: Specifies a peer by its IPv4 address. The peer must have been created.

mask-length: Specifies a mask length in the range of 0 to 32. You can use the *ip-address* and *mask-length* arguments together to specify a subnet. If you specify a subnet, this command enables keychain authentication for all dynamic peers in the subnet.

ipv6-address: Specifies a peer by its IPv6 address. The peer must have been created.

prefix-length: Specifies a prefix length in the range of 0 to 128. You can use the *ipv6-address* and *prefix-length* arguments together to specify a subnet. If you specify a subnet, this command enables keychain authentication for all dynamic peers in the subnet.

keychain-name: Specifies a keychain by its name, a case-sensitive string of 1 to 63 characters. The keychain must have been created.

Usage guidelines

Keychain authentication enhances the security of BGP in the following ways:

- BGP peers can establish TCP connections only when they are both enabled with keychain authentication.
- The keys used by the BGP peers at the same time must have the same ID.
- The keys with the same ID must use the same authentication algorithm and key string.

BGP supports the HMAC-MD5, HMAC-SHA-256, HMAC-SM3, SM3, and MD5 authentication algorithms. To specify an authentication algorithm for a key, use the **authentication-algorithm** command.

The IDs of keys used for authentication can only be in the range of 0 to 63. To create a key, use the **key** command.

The **peer keychain** and **peer password** commands are mutually exclusive.

Examples

In BGP instance view, configure peer 10.1.1.1 to use keychain **abc** for authentication.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp-default] peer 10.1.1.1 as-number 100
[Sysname-bgp-default] peer 10.1.1.1 keychain abc
```

Related commands

authentication-algorithm (*Security Command Reference*)

Parameters

group-name: Specifies a peer group by its name, a case-sensitive string of 1 to 47 characters. The peer group must have been created.

ipv4-address: Specifies a peer by its IPv4 address. The peer must have been created.

mask-length: Specifies a mask length in the range of 0 to 32. You can use the *ipv4-address* and *mask-length* arguments together to specify a subnet. If you specify a subnet in this command, BGP exchanges labeled routes with all dynamic peers in the subnet.

Usage guidelines

On an inter-AS option C network, use this command in BGP IPv4 unicast or BGP-VPN IPv4 unicast address family view to exchange labeled IPv4 unicast routes for inter-AS public LSP establishment.

Examples

In BGP IPv4 unicast address family view, enable BGP to exchange labeled IPv4 routes with peer 2.2.2.2.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp-default] address-family ipv4
[Sysname-bgp-default-ipv4] peer 2.2.2.2 label-route-capability
```

peer log-change

Use **peer log-change** to enable logging for BGP session state changes for a peer or peer group.

Use **undo peer log-change** to disable logging for BGP session state changes for a peer or peer group.

Syntax

peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **log-change**

undo peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **log-change**

Default

Logging for BGP session state changes is enabled for all peers or peer groups.

context-admin

Parameters

group-name: Specifies a peer group by its name, a case-sensitive string of 1 to 47 characters. The peer group must already exist.

ipv4-address: Specifies the IPv4 address of a peer. The peer must already exist.

mask-length: Specifies a mask length in the range of 0 to 32. You can use the *ipv4-address* and *mask-length* arguments together to specify a subnet. If you specify a subnet, this command enables the logging of BGP session state changes for all dynamic peers in the subnet.

ipv6-address: Specifies the IPv6 address of a peer. The peer must already exist.

prefix-length: Specifies a prefix length in the range of 0 to 128. You can use the *ipv6-address* and *prefix-length* arguments together to specify a subnet. If you specify a subnet, this command enables the logging of BGP session state changes for all dynamic peers in the subnet.

Usage guidelines

After you execute both the **log-peer-change** and **peer log-change** commands, BGP logs session establishment and disconnection events for the peer or peer group. To view the log information, use the **display bgp peer ipv4 unicast log-info** command or the **display bgp peer ipv6 unicast log-info** command. The logs are sent to the information center of the device. The output rules of the logs (whether to output the logs and where to output) are determined by the information center configuration. For more information about information center configuration, see *Network Management and Monitoring Configuration Guide*.

If you disable logging for BGP session state changes globally or disable logging for a peer or peer group, BGP does not generate logs for session establishments and disconnections.

Examples

In BGP instance view, enable logging for BGP session state changes for peer 1.1.1.1.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp-default] peer 1.1.1.1 as-number 200
[Sysname-bgp-default] peer 1.1.1.1 log-change
```

Related commands

display bgp peer

log-peer-change

peer low-memory-exempt

Use **peer low-memory-exempt** to configure BGP to protect EBGP peers or peer groups when the memory usage reaches level 2 threshold.

Use **undo peer low-memory-exempt** to remove the configuration.

Syntax

peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **low-memory-exempt**

undo peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **low-memory-exempt**

Default

When the memory usage reaches level 2 threshold, BGP tears down an EBGP session to release memory resources periodically.

Views

BGP instance view

BGP-VPN instance view

Predefined user roles

network-admin

context-admin

Parameters

group-name: Specifies a peer group by its name, a case-sensitive string of 1 to 47 characters. The peer group must have been created.

ipv4-address: Specifies a peer by its IPv4 address. The peer must have been created.

mask-length: Specifies a mask length in the range of 0 to 32. You can use the *ipv4-address* and *mask-length* arguments together to specify a subnet. If you specify a subnet in this command, BGP protects all dynamic peers in the subnet when the memory usage reaches level 2 threshold.

ipv6-address: Specifies a peer by its IPv6 address. The peer must have been created.

prefix-length: Specifies a prefix length in the range of 0 to 128. You can use the *ipv6-address* and *prefix-length* arguments together to specify a subnet. If you specify a subnet in this command, BGP protects all dynamic peers in the subnet when the memory usage reaches level 2 threshold.

Usage guidelines

When level 2 memory usage threshold is reached, BGP tears down an EBGP session to release memory resources periodically until the memory usage is exempt from level 2 threshold. You can use this command to avoid tearing down the BGP session to an EBGP peer when memory usage reaches level 2 threshold. For more information about thresholds, see *Fundamentals Configuration Guide*.

Examples

In BGP instance view, configure BGP to protect EBGP peer 1.1.1.1 when the memory usage reaches level 2 threshold.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp-default] peer 1.1.1.1 as-number 200
[Sysname-bgp-default] peer 1.1.1.1 low-memory-exempt
```

peer next-hop-local

Use **peer next-hop-local** to set the local router as the next hop for routes sent to a peer or peer group.

Use **undo peer next-hop-local** to remove the configuration.

Syntax

In BGP IPv4 unicast address family view/BGP-VPN IPv4 unicast address family view/BGP VPNv4 address family view/ BGP IPv4 multicast address family view:

peer { *group-name* | *ipv4-address* [*mask-length*] } **next-hop-local**

undo peer { *group-name* | *ipv4-address* [*mask-length*] } **next-hop-local**

In BGP IPv6 unicast address family view/BGP IPv6 multicast address family view:

peer { *group-name* | *ipv6-address* [*prefix-length*] } **next-hop-local**

undo peer { *group-name* | *ipv6-address* [*prefix-length*] } **next-hop-local**

Default

BGP sets the local router as the next hop for all routes sent to an EBGP peer or peer group.

BGP sets the local router as the next hop for EBGP routes sent to an IBGP peer or peer group for BGP VPNv4 and VPNv6 address families. It does not set the local router as the next hop for EBGP routes sent to an IBGP peer or peer group for other address families.

Parameters

group-name: Specifies a peer group by its name, a case-sensitive string of 1 to 47 characters. The peer group must have been created.

ipv4-address: Specifies a peer by its IPv4 address. The peer must have been created.

mask-length: Specifies a mask length in the range of 0 to 32. You can use the *ipv4-address* and *mask-length* arguments together to specify a subnet. If you specify a subnet, this command sets the local router as the next hop for routes sent to all dynamic peers in the subnet.

ipv6-address: Specifies a peer by its IPv6 address. The peer must have been created.

prefix-length: Specifies a prefix length in the range of 0 to 128. You can use the *ipv6-address* and *prefix-length* arguments together to specify a subnet. If you specify a subnet, this command sets the local router as the next hop for routes sent to all dynamic peers in the subnet.

Usage guidelines

By default, BGP does not set the local router as the next hop for EBGP routes sent to an IBGP peer or peer group. To ensure that an IBGP peer can find the next hop, you can use this command to specify the router as the next hop for routes sent to the IBGP peer.

The **peer next-hop-local** command is mutually exclusive with the **peer next-hop-invariable** command. Follow these restrictions and guidelines when you configure the commands for a peer or peer group:

- After you configure the **peer next-hop-local** command for a peer group, you cannot configure the **peer next-hop-invariable** command for the peer group or any peers in the peer group.
- After you configure the **peer next-hop-local** command for a peer, do not configure the **peer next-hop-invariable** command for the peer group to which the peer belongs. The configuration on the peer group will overwrite the configuration on the peer.

Examples

In BGP IPv4 unicast address family view, specify the router as the next hop for routes sent to peer group **test**.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp-default] address-family ipv4 unicast
[Sysname-bgp-default-ipv4] peer test next-hop-local
```

peer password

Use **peer password** to enable MD5 authentication for a BGP peer or peer group.

Use **undo peer password** to remove MD5 authentication for a BGP peer or peer group.

Syntax

peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **password** { **cipher** | **simple** } *password*

undo peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **password**

Default

MD5 authentication is disabled.

Views

BGP instance view

BGP-VPN instance view

Predefined user roles

context-admin

Parameters

group-name: Specifies a peer group by its name, a case-sensitive string of 1 to 47 characters. The peer group must have been created.

ipv4-address: Specifies a peer by its IPv4 address. The peer must have been created.

mask-length: Specifies a mask length in the range of 0 to 32. You can use the *ipv4-address* and *mask-length* arguments together to specify a subnet. If you specify a subnet, this command enables MD5 authentication for all dynamic peers in the subnet.

ipv6-address: Specifies a peer by its IPv6 address. The peer must have been created.

prefix-length: Specifies a prefix length in the range of 0 to 128. You can use the *ipv6-address* and *prefix-length* arguments together to specify a subnet. If you specify a subnet, this command enables MD5 authentication for all dynamic peers in the subnet.

cipher: Specifies a password in encrypted form.

simple: Specifies a password in plaintext form. For security purposes, the password specified in plaintext form will be stored in encrypted form.

password: Specifies the password. Its encrypted form is a case-sensitive string of 33 to 137 characters. Its plaintext form is a case-sensitive string of 1 to 80 characters.

Usage guidelines

You can enable MD5 authentication to enhance security using the following methods:

- Perform MD5 authentication when establishing TCP connections. Only the two parties that have the same password configured can establish TCP connections.
- Perform MD5 calculation on TCP segments to avoid modification to the encapsulated BGP packets.

The **peer keychain** and **peer password** commands are mutually exclusive.

Examples

In BGP instance view, perform MD5 authentication on the TCP connection between local router 10.1.100.1 and peer router 10.1.100.2. Set the authentication password to **aabbcc** in plaintext form.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp-default] peer 10.1.100.2 password simple aabbcc
```

Related commands

peer keychain

peer preferred-value

Use **peer preferred-value** to set a preferred value for routes received from a peer or peer group.

Use **undo peer preferred-value** to remove the configuration.

Syntax

In BGP IPv4 unicast address family view/BGP-VPN IPv4 unicast address family view/BGP VPNv4 address family view/BGP VPNv6 address family view/BGP IPv4 multicast address family view/BGP IPv4 RT filter address family view:

peer { *group-name* | *ipv4-address* [*mask-length*] } **preferred-value** *value*

undo peer { *group-name* | *ipv4-address* [*mask-length*] } **preferred-value**

In BGP IPv6 unicast address family view:

peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **preferred-value** *value*

undo peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **preferred-value**

In BGP-VPN IPv6 unicast address family view/BGP IPv6 multicast address family view:

peer { *group-name* | *ipv6-address* [*prefix-length*] } **preferred-value** *value*

undo peer { *group-name* | *ipv6-address* [*prefix-length*] } **preferred-value**

Default

The preferred value is 0 for routes received from a peer or peer group.

Predefined user roles

network-admin

context-admin

Parameters

group-name: Specifies a peer group by its name, a case-sensitive string of 1 to 47 characters. The peer group must have been created.

ipv4-address: Specifies a peer by its IPv4 address. The peer must have been created.

mask-length: Specifies a mask length in the range of 0 to 32. You can use the *ipv4-address* and *mask-length* arguments together to specify a subnet. If you specify a subnet, this command specifies a preferred value for routes received from all dynamic peers in the subnet.

ipv6-address: Specifies a peer by its IPv6 address. The peer must have been created.

prefix-length: Specifies a prefix length in the range of 0 to 128. You can use the *ipv6-address* and *prefix-length* arguments together to specify a subnet. If you specify a subnet, this command specifies a preferred value for routes received from all dynamic peers in the subnet.

value: Specifies a preferred value in the range of 0 to 65535.

Usage guidelines

If multiple routes that have the same destination are learned from different peers, you can specify different preferred values for the routes as needed to control BGP path selection. The one with the greatest preferred value is selected as the optimal route to the destination.

The preferred value is used for route selection on the local router and is not advertised to the peer. It has only local significance.

You can also use the **apply preferred-value** command in a routing policy to configure the preferred value for BGP routes. If both the **peer preferred-value** and **apply preferred-value** commands are configured, the **apply preferred-value** command applies. If the preferred value is not set in the routing policy or no routing policy is configured, the **peer preferred-value** command applies.

Examples

In BGP IPv4 unicast address family view, set the preferred value to 50 for routes from peer 1.1.1.1.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp-default] address-family ipv4 unicast
[Sysname-bgp-default-ipv4] peer 1.1.1.1 preferred-value 50
```

Related commands

apply preferred-value

peer prefix-list

Use **peer prefix-list** to specify a prefix list to filter routes received from or advertised to a peer or peer group.

Use **undo peer prefix-list** to remove the prefix list specified to filter routes received from or advertised to a peer or peer group.

Syntax

In BGP IPv4 unicast address family view/BGP-VPN IPv4 unicast address family view/BGP VPNv4 address family view/BGP IPv4 multicast address family view:

peer { *group-name* | *ipv4-address* [*mask-length*] } **prefix-list** *ipv4-prefix-list-name* { **export** | **import** }

undo peer { *group-name* | *ipv4-address* [*mask-length*] } **prefix-list** { **export** | **import** }

In BGP IPv6 unicast address family view:

peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **prefix-list** *ipv6-prefix-list-name* { **export** | **import** }

undo peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **prefix-list** { **export** | **import** }

In BGP-VPN IPv6 unicast address family view/BGP IPv6 multicast address family view:

peer { *group-name* | *ipv6-address* [*prefix-length*] } **prefix-list** *ipv6-prefix-list-name* { **export** | **import** }

undo peer { *group-name* | *ipv6-address* [*prefix-length*] } **prefix-list** { **export** | **import** }

In BGP VPNv6 address family view:

peer { *group-name* | *ipv4-address* [*mask-length*] } **prefix-list** *ipv6-prefix-list-name* { **export** | **import** }

undo peer { *group-name* | *ipv4-address* [*mask-length*] } **prefix-list** { **export** | **import** }

Default

No prefix list based filtering is configured.

Predefined user roles

network-admin

context-admin

Parameters

group-name: Specifies a peer group by its name, a case-sensitive string of 1 to 47 characters. The peer group must have been created.

ipv4-address: Specifies a peer by its IPv4 address. The peer must have been created.

mask-length: Specifies a mask length in the range of 0 to 32. You can use the *ipv4-address* and *mask-length* arguments together to specify a subnet. If you specify a subnet, this command uses a prefix list to filter routes received from or advertised to all dynamic peers in the subnet.

ipv6-address: Specifies a peer by its IPv6 address. The peer must have been created.

prefix-length: Specifies a prefix length in the range of 0 to 128. You can use the *ipv6-address* and *prefix-length* arguments together to specify a subnet. If you specify a subnet, this command uses a prefix list to filter routes received from or advertised to all dynamic peers in the subnet.

ipv4-prefix-list-name: Specifies an IPv4 prefix list by its name, a case-sensitive string of 1 to 63 characters.

ipv6-prefix-list-name: Specifies an IPv6 prefix list by its name, a case-sensitive string of 1 to 63 characters.

export: Applies the filter to routes advertised to the specified peer/peer group.

import: Applies the filter to routes received from the specified peer/peer group.

Usage guidelines

The specified prefix list must have been created with the **ip prefix-list** or **ipv6 prefix-list** command in system view. If you specify a nonexistent IPv4/IPv6 prefix list, all routes can pass the prefix list.

Examples

In BGP IPv4 unicast address family view, use IPv4 prefix list **list1** to filter routes advertised to peer group **test**.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp-default] address-family ipv4 unicast
[Sysname-bgp-default-ipv4] peer test prefix-list list1 export
```

peer public-as-only

Use **peer public-as-only** to remove private AS numbers in BGP updates sent to an EBGP peer or peer group.

Use **undo peer public-as-only** to remove the configuration.

Syntax

In BGP IPv4 unicast address family view/BGP-VPN IPv4 unicast address family view/BGP VPNv4 address family view/BGP VPNv6 address family view/BGP IPv4 multicast address family view:

peer { *group-name* | *ipv4-address* [*mask-length*] } **public-as-only**

undo peer { *group-name* | *ipv4-address* [*mask-length*] } **public-as-only**

In BGP IPv6 unicast address family view:

peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **public-as-only**

undo peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **public-as-only**

In BGP-VPN IPv6 unicast address family view/BGP IPv6 multicast address family view:

peer { *group-name* | *ipv6-address* [*prefix-length*] } **public-as-only**

undo peer { *group-name* | *ipv6-address* [*prefix-length*] } **public-as-only**

Default

BGP updates sent to an EBGP peer or peer group can carry both public and private AS numbers.

Predefined user roles

network-admin

context-admin

Parameters

group-name: Specifies a peer group by its name, a case-sensitive string of 1 to 47 characters. The peer group must have been created.

ipv4-address: Specifies a peer by its IPv4 address. The peer must have been created.

mask-length: Specifies a mask length in the range of 0 to 32. You can use the *ipv4-address* and *mask-length* arguments together to specify a subnet. If you specify a subnet, this command removes private AS numbers in BGP updates sent to all dynamic peers in the subnet.

ipv6-address: Specifies a peer by its IPv6 address. The peer must have been created.

prefix-length: Specifies a prefix length in the range of 0 to 128. You can use the *ipv6-address* and *prefix-length* arguments together to specify a subnet. If you specify a subnet, this command removes private AS numbers in BGP updates sent to all dynamic peers in the subnet.

Usage guidelines

Private AS numbers are typically used in test networks, and need not be transmitted in public networks. The range of private AS numbers is from 64512 to 65535.

After you execute the command, you can get the following results:

- If the AS_PATH attribute of a BGP update carries only private AS numbers, the device removes the AS numbers before sending the update to the EBGP peer or peer group.
- If the AS_PATH attribute carries both public and private AS numbers, the command does not take effect. The device sends the BGP update to the EBGP peer or peer group without removing the private AS numbers.
- If the AS_PATH attribute carries AS numbers of the peer or peer group, the command does not take effect. The device sends the BGP update to the peer or peer group without removing the private AS numbers.

This command is applicable only to EBGP peers and peer groups.

Examples

In BGP IPv4 unicast address family view, remove private AS numbers in BGP updates sent to EBGP peer group **test**.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp-default] address-family ipv4 unicast
[Sysname-bgp-default-ipv4] peer test public-as-only
```

peer reflect-client

Use **peer reflect-client** to configure the device as a route reflector and specify a peer or peer group as a client.

Use **undo peer reflect-client** to remove the configuration.

Syntax

In BGP IPv4 unicast address family view/BGP-VPN IPv4 unicast address family view/BGP VPNv4 address family view/BGP VPNv6 address family view/BGP IPv4 multicast address family view/BGP IPv4 MDT address family view/BGP IPv4 RT filter address family view/BGP IPv4 MVPN address family view/BGP IPv4 flowspec address family view/BGP VPNv4 flowspec address family view:

peer { *group-name* | *ipv4-address* [*mask-length*] } **reflect-client**

undo peer { *group-name* | *ipv4-address* [*mask-length*] } **reflect-client**

In BGP IPv6 unicast address family view:

peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **reflect-client**

undo peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **reflect-client**

In BGP LS address family view:

peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **reflect-client**

undo peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **reflect-client**

In BGP IPv6 multicast address family view:

peer { *group-name* | *ipv6-address* [*prefix-length*] } **reflect-client**

undo peer { *group-name* | *ipv6-address* [*prefix-length*] } **reflect-client**

Default

Neither the route reflector nor the client is configured.

Predefined user roles

network-admin

context-admin

Parameters

group-name: Specifies a peer group by its name, a case-sensitive string of 1 to 47 characters. The peer group must have been created.

ipv4-address: Specifies a peer by its IPv4 address. The peer must have been created.

mask-length: Specifies a mask length in the range of 0 to 32. You can use the *ipv4-address* and *mask-length* arguments together to specify a subnet. If you specify a subnet, this command configures the device as a route reflector and specifies all dynamic peers in the subnet as clients.

ipv6-address: Specifies a peer by its IPv6 address. The peer must have been created.

prefix-length: Specifies a prefix length in the range of 0 to 128. You can use the *ipv6-address* and *prefix-length* arguments together to specify a subnet. If you specify a subnet, this command configures the device as a route reflector and specifies all dynamic peers in the subnet as clients.

Usage guidelines

Using route reflectors can solve the issue brought by too many IBGP connections. After you configure a device as a route reflector in an AS, it advertises routes as follows:

- Advertises routes received from a non-client IBGP peer to all clients.
- Advertises routes received from an IBGP peer that acts as a client to all peers.
- Advertises routes received from an EBGP peer to all peers.

Examples

In BGP IPv4 unicast address family view, configure the local device as a route reflector and specify IBGP peer group **test** as a client.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp-default] address-family ipv4 unicast
[Sysname-bgp-default-ipv4] peer test reflect-client
```

Related commands

Predefined user roles

network-admin

context-admin

Parameters

group-name: Specifies a peer group by its name, a case-sensitive string of 1 to 47 characters. The peer group must have been created.

ipv4-address: Specifies a peer by its IPv4 address. The peer must have been created.

mask-length: Specifies a mask length in the range of 0 to 32. You can use the *ipv4-address* and *mask-length* arguments together to specify a subnet. If you specify a subnet, this command specifies the maximum number of routes that can be received from all dynamic peers in the subnet.

ipv6-address: Specifies a peer by its IPv6 address. The peer must have been created.

prefix-length: Specifies a prefix length in the range of 0 to 128. You can use the *ipv6-address* and *prefix-length* arguments together to specify a subnet. If you specify a subnet, this command specifies the maximum number of routes that can be received from all dynamic peers in the subnet.

prefix-number: Specifies the number of routes that can be received from the peer or peer group.The value range for this argument is 1 to 4294967295.The router will tear down the session to the peer or peer group if the following conditions exist:

- The **alert-only**, **discard**, and **reconnect** keywords are not specified.
- The number of routes received from the peer or peer group reaches the *prefix-number*.

The router will not attempt to re-establish the session to a dynamic BGP peer until the router receives a connection request from the peer. For other peers, you can use the **reset bgp** command to re-establish the sessions.

alert-only: If the number of routes received from the peer or peer group reaches the *prefix-number*, the router generates a log message instead of tearing down the session to the peer or peer group. The router can continue to receive routes from the peer or peer group.

discard: If the number of routes received from the peer or peer group reaches the *prefix-number*, the router retains the session to the peer or peer group. However, it discards excess routes and generates a log message. After the number of routes received from the peer or peer group falls below the *prefix-number*, the router can continue to receive routes from the peer or peer group. To restore the discarded routes, use the **refresh bgp import** command to request the peer or peer group to resend the routes.

reconnect *reconnect-time*: Specifies a reconnect time. After the specified time is reached, the router re-establishes a session to the peer or peer group when the number of routes received from the peer or peer group reaches the *prefix-number*. The value range for the *reconnect-time* argument is 1 to 65535 seconds. This option is not available for dynamic BGP peers.

percentage-value: Specifies the threshold value for the router to generate a log message (the router generates a log message when the ratio of the number of received routes to the

prefix-number exceeds the percentage value). The value range of this argument is 1 to 100, and the default is 75.

Usage guidelines

When the number of routes received from the specified peer or peer group reaches *prefix-number*, the **discard** keyword takes effect on the device as follows:

- The device retains the routes already received from the peer or peer group.
- If the device receives subsequent routes from the peer or peer group, it will discard these routes.

Examples

In BGP IPv4 unicast address family view, set the maximum number of routes that can be received from peer 1.1.1.1 to 10000. Configure the router to tear down the session to the peer if the number is exceeded.

```
<Sysname> system-view
[Sysname] bgp 109
[Sysname-bgp-default] address-family ipv4 unicast
[Sysname-bgp-default-ipv4] peer 1.1.1.1 route-limit 10000
```

peer route-policy

Use **peer route-policy** to apply a routing policy to routes incoming from or outgoing to a peer or peer group.

Use **undo peer route-policy** to remove the configuration.

Syntax

In BGP IPv4 unicast address family view/BGP-VPN IPv4 unicast address family view/BGP VPNv4 address family view/BGP VPNv6 address family view/BGP IPv4 multicast address family view:

peer { *group-name* | *ipv4-address* [*mask-length*] } **route-policy** *route-policy-name* { **export** | **import** }

undo peer { *group-name* | *ipv4-address* [*mask-length*] } **route-policy** { **export** | **import** }

In BGP IPv6 unicast address family view:

peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **route-policy** *route-policy-name* { **export** | **import** }

undo peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **route-policy** { **export** | **import** }

In BGP-VPN IPv6 unicast address family view/BGP IPv6 multicast address family view:

peer { *group-name* | *ipv6-address* [*prefix-length*] } **route-policy** *route-policy-name* { **export** | **import** }

undo peer { *group-name* | *ipv6-address* [*prefix-length*] } **route-policy** { **export** | **import** }

Default

No routing policy is applied to routes incoming from or outgoing to a peer or peer group.

Predefined user roles

network-admin

context-admin

Parameters

group-name: Specifies a peer group by its name, a case-sensitive string of 1 to 47 characters. The peer group must have been created.

ipv4-address: Specifies a peer by its IPv4 address. The peer must have been created.

mask-length: Specifies a mask length in the range of 0 to 32. You can use the *ipv4-address* and *mask-length* arguments together to specify a subnet. If you specify a subnet, this command applies a routing policy to routes incoming from or outgoing to all dynamic peers in the subnet.

ipv6-address: Specifies a peer by its IPv6 address. The peer must have been created.

prefix-length: Specifies a prefix length in the range of 0 to 128. You can use the *ipv6-address* and *prefix-length* arguments together to specify a subnet. If you specify a subnet, this command applies a routing policy to routes incoming from or outgoing to all dynamic peers in the subnet.

route-policy-name: Specifies a routing policy by its name, a case-sensitive string of 1 to 63 characters.

export: Applies the routing policy to routes outgoing to the peer or peer group.

import: Applies the routing policy to routes incoming from the peer or peer group.

Usage guidelines

The specified routing policy must have been configured with the **route-policy** command in system view. If you specify a nonexistent routing policy, all routes can pass the routing policy.

The **apply** clause that modifies the AS path does not take effect in a routing policy applied to routes outgoing to an IBGP peer or peer group.

The **if-match interface** command, if configured for the applied routing policy, does not take effect on routes.

Examples

In BGP IPv4 unicast address family view, apply routing policy **test-policy** to routes outgoing to peer group **test**.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp-default] address-family ipv4 unicast
[Sysname-bgp-default-ipv4] peer test route-policy test-policy export
```

Related commands

peer route-update-interval

Use **peer route-update-interval** to specify an interval for sending the same update to a peer or peer group.

Use **undo peer route-update-interval** to remove the configuration.

Syntax

peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **route-update-interval** *interval*

undo peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **route-update-interval**

Default

The interval for sending the same update to an IBGP peer is 15 seconds and the interval for sending the same update to an EBGP peer is 30 seconds.

Views

BGP instance view

BGP-VPN instance view

Predefined user roles

network-admin

context-admin

Parameters

group-name: Specifies a peer group by its name, a case-sensitive string of 1 to 47 characters. The peer group must have been created.

ipv4-address: Specifies a peer by its IPv4 address. The peer must have been created.

mask-length: Specifies a mask length in the range of 0 to 32. You can use the *ipv4-address* and *mask-length* arguments together to specify a subnet. If you specify a subnet, this command specifies an interval for sending the same update to all dynamic peers in the subnet.

ipv6-address: Specifies a peer by its IPv6 address. The peer must have been created.

prefix-length: Specifies a prefix length in the range of 0 to 128. You can use the *ipv6-address* and *prefix-length* arguments together to specify a subnet. If you specify a subnet, this command specifies an interval for sending the same update to all dynamic peers in the subnet.

interval: Specifies a minimum interval for sending the same update message, in the range of 0 to 600 seconds.

Usage guidelines

A BGP router sends an update message to its peers when a route is changed. If the route changes frequently, the BGP router sends many updates for the route, resulting in routing flaps. By configuring the interval for sending the same update to a peer or peer group, you can avoid such routing flaps. This command does not take effect on withdrawn routes. For withdrawn routes, BGP sends the withdrawal messages immediately.

Examples

In BGP instance view, set the interval for sending the same update to peer group **test** to 10 seconds.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp-default] peer test as-number 100
[Sysname-bgp-default] peer test route-update-interval 10
```

peer soo

Use **peer soo** to configure the Site of Origin (SoO) attribute for a BGP peer or peer group.

Use **undo peer soo** to remove the configuration.

Syntax

In BGP IPv4 unicast address family view/BGP-VPN IPv4 unicast address family view/BGP VPNv4 address family view/BGP VPNv6 address family view/BGP IPv4 multicast address family view:

peer { *group-name* | *ipv4-address* [*mask-length*] } **soo** *site-of-origin*

undo peer { *group-name* | *ipv4-address* [*mask-length*] } **soo**

In BGP IPv6 unicast address family view:

peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **soo** *site-of-origin*

undo peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **soo**

In BGP-VPN IPv6 unicast address family view/BGP IPv6 multicast address family view:

peer { *group-name* | *ipv6-address* [*prefix-length*] } **soo** *site-of-origin*

undo peer { *group-name* | *ipv6-address* [*prefix-length*] } **soo**

Default

No SoO attribute is configured for a peer or peer group.

Predefined user roles

network-admin

context-admin

Parameters

group-name: Specifies a peer group by its name, a case-sensitive string of 1 to 47 characters. The peer group must have been created.

ipv4-address: Specifies a peer by its IPv4 address. The peer must have been created.

mask-length: Specifies a mask length in the range of 0 to 32. You can use the *ipv4-address* and *mask-length* arguments together to specify a subnet. If you specify a subnet, this command configures the SoO attribute for all dynamic peers in the subnet.

ipv6-address: Specifies a peer by its IPv6 address. The peer must have been created.

prefix-length: Specifies a prefix length in the range of 0 to 128. You can use the *ipv6-address* and *prefix-length* arguments together to specify a subnet. If you specify a subnet, this command configures the SoO attribute for all dynamic peers in the subnet.

site-of-origin: Specifies the SoO attribute, a string of 3 to 21 characters. The SoO attribute has the following formats:

- *16-bit AS number:32-bit user-defined number*. For example, 100:3.
- *32-bit IP address:16-bit user-defined number*. For example, 192.168.122.15:1.
- *32-bit AS number:16-bit user-defined number*, where the minimum value of the AS number is 65536. For example, 65536:1.

Usage guidelines

The SoO attribute specifies the site where the route was originated. It prevents advertising a route back to the originating site. If the AS-path attribute is lost, the router can use the SoO attribute to avoid routing loops.

After you configure the SoO attribute for a BGP peer or peer group, BGP adds the SoO attribute into the route updates received from the BGP peer or peer group. Before advertising route updates to the peer or peer group, BGP checks the SoO attribute of the route update against the configured SoO attribute. If they are the same, BGP does not advertise the route updates to the BGP peer or peer group to avoid loops.

Examples

In BGP IPv4 unicast address family view, set the SoO attribute to 100:1 for peer 1.1.1.1.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp-default] address-family ipv4
[Sysname-bgp-default-ipv4] peer 1.1.1.1 soo 100:1
```

Related commands

peer substitute-as

peer source-address

Use **peer source-address** to specify a source IPv4 or IPv6 address for establishing TCP connections to a peer or peer group.

Use **undo peer source-address** to remove the configuration.

Syntax

peer *ipv4-address* [*mask-length*] **source-address** *source-ipv4-address*

peer *ipv6-address* [*prefix-length*] **source-address** *source-ipv6-address*

undo peer { *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **source-address**

peer *group-name* **source-address** { *source-ipv4-address* | *source-ipv6-address* } *

undo peer *group-name* **source-address** [*source-ipv4-address* | *source-ipv6-address*]

Default

BGP uses the primary IPv4 or IPv6 address of the output interface in the optimal route destined for the BGP peer or peer group as the source address for TCP connection establishment.

Views

BGP instance view

BGP-VPN instance view

Predefined user roles

network-admin

context-admin

Parameters

ipv4-address: Specifies a peer by its IPv4 address. The peer must have been created.

mask-length: Specifies a mask length in the range of 0 to 32. You can use the *ipv4-address* and *mask-length* arguments together to specify a subnet. If you specify a subnet, this command specifies a source IP address for establishing TCP connections to all dynamic peers in the subnet.

source-ipv4-address: Specifies a source IPv4 address.

ipv6-address: Specifies a peer by its IPv6 address. The peer must have been created.

prefix-length: Specifies a prefix length in the range of 0 to 128. You can use the *ipv6-address* and *prefix-length* arguments together to specify a subnet. If you specify a subnet, this command specifies a source IPv6 address for establishing TCP connections to all dynamic peers in the subnet.

source-ipv6-address: Specifies a source IPv6 address.

group-name: Specifies a peer group by its name, a case-sensitive string of 1 to 47 characters. The peer group must have been created.

Usage guidelines

The **peer connect-interface** command and the **peer source-address** command can both change the source address for establishing TCP connections. If you execute both commands, the most recent configuration takes effect.

The **peer source-address** and **peer connect-interface** commands are applicable to the following scenarios:

- The peer's IPv4/IPv6 address does not belong to the interface directly connected to the local router. To ensure successful TCP connection establishment, use one of the following methods:
  - Specify the interface to which the IPv4/IPv6 address belongs as the source interface on the peer.
  - Specify the IPv4/IPv6 address of the interface directly connected to the local router as the source address on the peer.
- A BGP peer at an IPv6 link-local address must be directly connected to the local router. On the local router, you must use the **peer connect-interface** command to specify the interface directly connected to the BGP peer as the source interface of TCP connections.
- On a BGP router that has multiple links to a peer, the source interface for TCP connection changes because the primary source interface fails. To avoid this problem, specify a loopback interface as the source interface or specify the IP address of a loopback interface as the source address.

- You want to establish multiple BGP sessions to a router. In this case, BGP might fail to determine the source address for each TCP connection based on the optimal route to the peer. To prevent this problem, use one of the following methods:
  - If the BGP sessions use IP addresses of different interfaces, specify a source interface or source address for each session.
  - If the BGP sessions use different IP addresses of the same interface, specify a source address for each session.

The source addresses on the local router and the peer must be reachable to each other.

To specify the address of an indirectly connected interface as the source address, use the **peer ebgp-max-hop** command. The command allows the establishment of an EBGP session to the indirectly connected peer.

You can specify both a source IPv4 address and a source IPv6 address for a peer group. BGP uses the source IPv4 address to establish TCP connections to IPv4 peers in the group. It also uses the source IPv6 address to establish TCP connections to IPv6 peers in the group.

Examples

In BGP instance view, specify source IPv4 address 1.1.1.1 for peer group **test**.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp-default] peer test source-address 1.1.1.1
```

Related commands

peer connect-interface

peer ebgp-max-hop

peer substitute-as

Use **peer substitute-as** to replace the AS number of a peer or peer group in the AS_PATH attribute with the local AS number.

Use **undo peer substitute-as** to remove the configuration.

Syntax

peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **substitute-as**

undo peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **substitute-as**

Default

The AS number of a peer or peer group in the AS_PATH attribute is not replaced.

Views

BGP instance view

BGP-VPN instance view

Predefined user roles

network-admin

context-admin

Parameters

group-name: Specifies a peer group by its name, a case-sensitive string of 1 to 47 characters. The peer group must have been created.

ipv4-address: Specifies a peer by its IPv4 address. The peer must have been created.

mask-length: Specifies a mask length in the range of 0 to 32. You can use the *ipv4-address* and *mask-length* arguments together to specify a subnet. If you specify a subnet, this command replaces the AS number of all dynamic peers in the subnet in the AS_PATH attribute with the local AS number.

ipv6-address: Specifies a peer by its IPv6 address. The peer must have been created.

prefix-length: Specifies a prefix length in the range of 0 to 128. You can use the *ipv6-address* and *prefix-length* arguments together to specify a subnet. If you specify a subnet, this command replaces the AS number of all dynamic peers in the subnet in the AS_PATH attribute with the local AS number.

Usage guidelines

If different CEs use the same AS number, you must configure this feature on the PE attached to the peer CE. With the feature enabled, upon advertising a route to the peer, the PE uses its own AS number to replace the peer AS number if it is contained in the AS_PATH attribute of the route. This ensures correct advertisement of private network routes.

Examples

In BGP instance view, substitute the local AS number for the AS number of peer 1.1.1.1.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp-default] peer 1.1.1.1 substitute-as
```

Related commands

peer timer

Use **peer timer** to set a keepalive interval and hold time for a peer or peer group.

Use **undo peer timer** to remove the configuration.

Syntax

peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **timer keepalive** *keepalive* **hold** *holdtime*

undo peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **timer**

Default

The keepalive interval is 60 seconds, and the hold time is 180 seconds.

Views

BGP instance view

BGP-VPN instance view

Predefined user roles

network-admin

context-admin

Parameters

group-name: Specifies a peer group by its name, a case-sensitive string of 1 to 47 characters. The peer group must have been created.

ipv4-address: Specifies a peer by its IPv4 address. The peer must have been created.

mask-length: Specifies a mask length in the range of 0 to 32. You can use the *ipv4-address* and *mask-length* arguments together to specify a subnet. If you specify a subnet, this command configures a keepalive interval and hold time for all dynamic peers in the subnet.

ipv6-address: Specifies a peer by its IPv6 address. The peer must have been created.

prefix-length: Specifies a prefix length in the range of 0 to 128. You can use the *ipv6-address* and *prefix-length* arguments together to specify a subnet. If you specify a subnet, this command configures a keepalive interval and hold time for all dynamic peers in the subnet.

keepalive *keepalive*: Sets a keepalive interval in the range of 0 to 21845 seconds.

hold *holdtime*: Sets a hold time in the range of 3 to 65535 seconds. The hold time must be at least three times the keepalive interval.

Usage guidelines

After establishing a BGP session, two routers send keepalive messages at the specified keepalive interval to each other to keep the session.

If a router receives no keepalive or update message from the peer within the hold time, it tears down the session.

The timers configured with this command are preferred to the timers configured with the **timer** command.

If the hold time settings on the local and peer routers are different, the smaller one is used.

If the hold time is set to 0, no keepalive message will be sent to the peer, and the peer session will never time out. If neither the hold time nor the keepalive interval is set to 0, the actual keepalive interval is the smaller one between one third of the hold time and the keepalive interval.

The timers configured with this command do not take effect until a session is re-established (for example, a session is reset).

Examples

In BGP instance view, set the keepalive interval and hold time for peer group **test** to 60 seconds and 180 seconds, respectively.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp-default] peer test timer keepalive 60 hold 180
```

Related commands

display bgp peer

timer

peer timer connect-retry

Use **peer timer connect-retry** to set the session retry timer for a peer or peer group.

Use **undo peer timer connect-retry** to remove the configuration.

Syntax

peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **timer connect-retry** *retry-time*

undo peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **timer connect-retry**

Default

The session retry timer is 32 seconds a peer or peer group.

Views

BGP instance view

BGP-VPN instance view

Predefined user roles

network-admin

context-admin

Parameters

group-name: Specifies a peer group by its name, a case-sensitive string of 1 to 47 characters. The peer group must have been created.

ipv4-address: Specifies a peer by its IPv4 address. The peer must have been created.

mask-length: Specifies a mask length in the range of 0 to 32. You can use the *ipv4-address* and *mask-length* arguments together to specify a subnet. If you specify a subnet, this command sets a connection retry timer for all dynamic peers in the subnet.

ipv6-address: Specifies a peer by its IPv6 address. The peer must have been created.

prefix-length: Specifies a prefix length in the range of 0 to 128. You can use the *ipv6-address* and *prefix-length* arguments together to specify a subnet. If you specify a subnet, this command sets a connection retry timer for all dynamic peers in the subnet.

retry-time: Specifies a session retry timer in the range of 1 to 65535 seconds.

Usage guidelines

To speed up session establishment to a peer or peer group and route convergence, set a small session retry timer. If the BGP session flaps, you can set a large session retry timer to reduce the impact.

The timer set by the **peer timer connect-retry** command takes precedence over the timer set by the **timer connect-retry** command.

Examples

In BGP instance view, set the session retry timer to 30 seconds for peer 1.1.1.1.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp-default] peer 1.1.1.1 timer connect-retry 30
```

Related commands

timer connect-retry

peer ttl-security

Use **peer ttl-security** to configure Generalized TTL Security Mechanism (GTSM) for a BGP peer or peer group.

Use **undo peer ttl-security** to disable BGP GTSM for a peer or peer group.

Syntax

peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **ttl-security hops** *hop-count*

undo peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **ttl-security hops**

Default

GTSM is disabled for BGP.

Views

BGP instance view

BGP-VPN instance view

Predefined user roles

network-admin

context-admin

Parameters

group-name: Specifies a peer group by its name, a case-sensitive string of 1 to 47 characters. The peer group must have been created.

ipv4-address: Specifies a peer by its IPv4 address. The peer must have been created.

mask-length: Specifies a mask length in the range of 0 to 32. You can use the *ipv4-address* and *mask-length* arguments together to specify a subnet. If you specify a subnet, this command configures GTSM for all dynamic peers in the subnet.

ipv6-address: Specifies a peer by its IPv6 address. The peer must have been created.

prefix-length: Specifies a prefix length in the range of 0 to 128. You can use the *ipv6-address* and *prefix-length* arguments together to specify a subnet. If you specify a subnet, this command configures GTSM for all dynamic peers in the subnet.

hops *hop-count*: Specifies the maximum number of hops to the specified peer, in the range of 1 to 254.

Usage guidelines

GTSM protects a BGP session by comparing the TTL value of an incoming IP packet against the valid TTL range. If the TTL value is within the valid TTL range, the packet is accepted. If not, the packet is discarded.

The valid TTL range is from 255 – the configured hop count + 1 to 255.

When GTSM is configured, the BGP packets sent by the device have a TTL of 255.

When GTSM is configured, the local device can establish an EBGP session to the peer after they pass GTSM check, regardless of whether the maximum number of hops is reached.

To use GTSM, you must configure GTSM on both the local and peer devices. You can specify different *hop-count* values for them.

Examples

In BGP instance view, enable GTSM for BGP peer group **test** and set the maximum number of hops to the specified peer in the peer group to 1.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp-default] peer test ttl-security hops 1
```

BGP IPv4 unicast address family view

BGP-VPN IPv4 unicast address family view

BGP IPv6 unicast address family view

BGP-VPN IPv6 unicast address family view

Predefined user roles

network-admin

context-admin

Usage guidelines

FRR is used in a dual-homing network to protect a primary route with a backup route. It uses ARP (for IPv4), ND (for IPv6), or echo-mode BFD (for IPv4) to detect the connectivity of the primary route. When the primary route fails, BGP directs packets to the backup route.

After you enable FRR, BGP calculates a backup route for each BGP route in the address family if there are two or more unequal-cost routes to reach the destination.

You can also configure BGP FRR by using the **fast-reroute route-policy** command, which takes precedence over the **pic** command. For more information about routing policies, see *Layer 3—IP Routing Configuration Guide*.

Use the **pic** command with caution because it might cause routing loops in specific scenarios.

Examples

Enable BGP FRR in BGP IPv4 unicast address family view.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp-default] address-family ipv4 unicast
[Sysname-bgp-default-ipv4] pic
```

Related commands

fast-reroute route-policy

preference

Use **preference** to configure preferences for BGP routes.

Use **undo preference** to restore the default.

Syntax

preference { *external-preference internal-preference local-preference* | **route-policy** *route-policy-name* }

undo preference

Default

The preferences of external, internal, and local BGP routes are 255, 255, and 130, respectively.

Predefined user roles

network-admin

context-admin

Parameters

external-preference: Specifies a preference for EBGP routes, in the range of 1 to 255.

internal-preference: Specifies a preference for IBGP routes, in the range of 1 to 255.

local-preference: Specifies a preference for local routes, in the range of 1 to 255.

route-policy *route-policy-name*: Specifies a routing policy by its name, a case-sensitive string of 1 to 63 characters, to set the route preference for matching routes. Routes not matching the routing policy use the default preference.

Usage guidelines

Different routing protocols might find different routes to the same destination. However, not all of those routes are optimal. For route selection, routing protocols, direct routes, and static routes are assigned different preferences. The route with the highest preference is preferred.

Configuring the preferences for BGP routes changes the possibility for the routes to become the optimal route.

To use a routing policy to set the preference, you must configure the preference with the **apply preference** command in the routing policy in advance. Otherwise, all matching routes use the default preference.

Examples

In BGP IPv4 unicast address family view, set preferences for EBGP, IBGP, and local routes to 20, 20, and 200, respectively.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp-default] address-family ipv4 unicast
[Sysname-bgp-default-ipv4] preference 20 20 200
```

primary-path-detect bfd

Use **primary-path-detect bfd** to configure BGP FRR to use BFD to detect next hop connectivity for the primary route.

Use **undo primary-path-detect bfd** to restore the default.

Syntax

primary-path-detect bfd echo

undo primary-path-detect bfd

Default

BGP FRR uses ARP to detect the connectivity to the next hop of the primary route.

Views

Parameters

echo: Uses echo-mode BFD to detect the connectivity to the next hop of the primary route.

Usage guidelines

With this command configured, the device automatically creates a BFD session of the IP FRR type for detecting next hop of the primary route. Upon detecting a failure, traffic immediately switches over to the backup next hop to ensure fast convergence.

This command takes effect and automatically creates a BFD session only when a backup next hop is available for the primary route.

In the current software version, BGP does not support calculating next hops for ECMP routes. The command cannot detect next hop connectivity for an ECMP route used as the primary route.

If another protocol (for example, OSPF and IS-IS) also uses BFD to detect next hop connectivity for the primary route, the protocol automatically creates a BFD session. If the detected link is the same as the link attached to the next hop of the BGP primary route, BGP reuses the BFD session created by the protocol, instead of creating a BFD session.

Examples

In BGP instance view, configure BGP FRR to use echo-mode BFD to detect next hop connectivity for the primary route.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp-default] primary-path-detect bfd echo
```

Usage guidelines

When a route reflector is configured, and the clients of a route reflector are fully meshed, route reflection is unnecessary because it consumes more bandwidth resources. You can use the **undo reflect between-clients** command to disable route reflection instead of modifying network configuration or changing network topology.

After route reflection is disabled between clients, routes can still be reflected between a client and a non-client.

Examples

In BGP IPv4 unicast address family view, disable route reflection between clients.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp-default] address-family ipv4 unicast
[Sysname-bgp-default-ipv4] undo reflect between-clients
```

Related commands

Predefined user roles

network-admin

context-admin

Parameters

cluster-id: Specifies the cluster ID in the format of an integer, in the range of 1 to 4294967295.

ipv4-address: Specifies the cluster ID in the format of an IPv4 address in dotted decimal notation.

Usage guidelines

The route reflector and clients form a cluster. Typically a cluster has one route reflector. The ID of the route reflector is the cluster ID.

You can configure more than one route reflector in a cluster to improve network reliability and prevent a single point of failure. Use this command to configure the same cluster ID for all route reflectors in the cluster to avoid routing loops.

Do not configure the router ID of a client as the cluster ID.

Examples

In BGP IPv4 unicast address family view, set the cluster ID on the local router (a reflector in the cluster) to 80.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp-default] address-family ipv4 unicast
[Sysname-bgp-default-ipv4] reflector cluster-id 80
```

context-admin

Parameters

instance *instance-name*: Specifies a BGP instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify this option, the command soft-resets BGP sessions for the default BGP instance.

ipv4-address: Soft-resets the BGP session to a peer specified by its IP address.

mask-length: Specifies a mask length in the range of 0 to 32. You can use the *ipv4-address* and *mask-length* arguments together to specify a subnet. If you specify a subnet, this command soft-resets BGP sessions to all dynamic peers in the subnet.

ipv6-address: Soft-resets the BGP session to a peer specified by its IPv6 address.

prefix-length: Specifies a prefix length in the range of 0 to 128. You can use the *ipv6-address* and *prefix-length* arguments together to specify a subnet. If you specify a subnet, this command soft-resets BGP sessions to all dynamic peers in the subnet.

all: Soft-resets all BGP sessions.

external: Soft-resets all EBGP sessions.

group *group-name*: Soft-resets the BGP sessions to the peers of the specified peer group. The *group-name* argument refers to the name of a peer group, a case-sensitive string of 1 to 47 characters.

internal: Soft-resets all IBGP sessions.

export: Performs outbound soft-reset (filters routes advertised to the specified peer or peer group by using the new configuration).

import: Performs inbound soft-reset (filters routes received from the specified peer or peer group by using the new configuration).

ipv4: Soft-resets BGP sessions for IPv4 address family.

ipv6: Soft-resets BGP sessions for IPv6 address family.

link-state: Soft-resets BGP sessions for LS address family.

multicast: Soft-resets BGP sessions for multicast address family.

mvpn: Soft-resets BGP sessions for IPv4 MVPN address family.

rtfilter: Soft-resets BGP sessions for IPv4 RT filter address family.

The following compatibility matrixes show the support of hardware platforms for the **rtfilter** keyword:

Models	Parameter compatibility
NFNX5-HD6480, NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB680, NFNX3-HDB1080	Yes
NFNX3-HDB1780, NFNX3-HDB3080, NFNX3-HDB1180, NFNX3-HDB1480	No

unicast: Soft-resets BGP sessions for unicast address family.

vpnv4: Soft-resets BGP sessions for VPNv4 address family.

vpnv6: Soft-resets BGP sessions for VPNv6 address family.

flowspec: Soft-resets BGP sessions for flowspec address family.

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command soft-resets BGP sessions for the specified address family on the public network.

Usage guidelines

A soft-reset operation enables the router to apply a new route selection policy without tearing down BGP connections.

To apply a new policy to outbound BGP sessions, execute this command with the **export** keyword. The router uses the new policy to filter routing information and sends the routing information that passes the filtering to the BGP peers.

To apply a new policy to inbound sessions, execute this command with the **import** keyword. The router advertises a route-refresh message to the peer and the peer resends its routing information to

the router. After receiving the routing information, the router uses the new policy to filter the routing information.

This command requires that both the local router and the peer support route refresh.

If the **peer keep-all-routes** command is configured, the **refresh bgp import** command does not take effect.

By default, the **unicast** keyword is used if the **multicast**, **unicast**, **rtfilter**, and **flowspec** keywords are not specified.

Examples

Soft-reset all inbound BGP sessions for the IPv4 unicast address family.

```
<Sysname> refresh bgp all import ipv4
```

Parameters

instance *instance-name*: Specifies a BGP instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify this option, the command resets BGP sessions for the default BGP instance.

as-number: Resets BGP sessions to peers in the AS specified by its number in the range of 1 to 4294967295.

ipv4-address: Resets the BGP session to a peer specified by its IPv4 address.

mask-length: Specifies a mask length in the range of 0 to 32. You can use the *ipv4-address* and *mask-length* arguments together to specify a subnet. If you specify a subnet, this command resets BGP sessions to all dynamic peers in the subnet.

ipv6-address: Resets the BGP session to a peer specified by its IPv6 address.

prefix-length: Specifies a prefix length in the range of 0 to 128. You can use the *ipv6-address* and *prefix-length* arguments together to specify a subnet. If you specify a subnet, this command resets BGP sessions to all dynamic peers in the subnet.

all: Resets all BGP sessions.

external: Resets all EBGP sessions.

group *group-name*: Resets the BGP sessions to the peers in the peer group specified by its name, a case-sensitive string of 1 to 47 characters.

internal: Resets all IBGP sessions.

ipv4: Resets BGP sessions for IPv4 address family.

ipv6: Resets BGP sessions for IPv6 address family.

link-state: Resets BGP sessions for LS address family.

mdt: Resets BGP sessions for MDT address family.

multicast: Resets BGP sessions for multicast address family.

mvpn: Resets BGP sessions for IPv4 MVPN address family.

rtfilter: Resets BGP sessions for IPv4 RT filter address family.

The following compatibility matrixes show the support of hardware platforms for the **rtfilter** keyword:

Models	Parameter compatibility
NFNX5-HD6480, NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB680, NFNX3-HDB1080	Yes
NFNX3-HDB1780, NFNX3-HDB3080, NFNX3-HDB1180, NFNX3-HDB1480	No

unicast: Resets BGP sessions for unicast address family.

vpnv4: Resets BGP sessions for VPNv4 address family.

vpnv6: Resets BGP sessions for VPNv6 address family.

flowspec: Resets BGP sessions for flowspec address family.

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command resets BGP sessions for the specified address family on the public network.

Usage guidelines

CAUTION:

A reset operation tears down BGP sessions for a short period of time.

A reset operation enables the router to apply a new route selection policy by re-establishing BGP sessions.

By default, the **unicast** keyword is used if the **unicast**, **mdt**, **mvpn**, **rtfilter**, **flowspec**, and **multicast** keywords are not specified.

Examples

Reset all BGP sessions for the IPv4 unicast address family.

```
<Sysname> reset bgp all ipv4
```

reset bgp all

Use **reset bgp all** to reset all BGP sessions for all address families.

Syntax

reset bgp [**instance** *instance-name*] **all**

Parameters

instance *instance-name*: Specifies a BGP instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify this option, the command resets all BGP sessions for all address families of the default BGP instance.

Usage guidelines

CAUTION:

A reset operation tears down BGP sessions for a short period of time.

A reset operation enables the router to apply a new route selection policy by re-establishing BGP sessions.

Examples

Reset all BGP sessions.

```
<Sysname> reset bgp all
```

reset bgp dampening

Use **reset bgp dampening** to clear BGP route dampening information and release suppressed BGP routes.

Syntax

reset bgp [**instance** *instance-name*] **dampening ipv4** [**multicast** | [**unicast**] [**vpn-instance** *vpn-instance-name*]] [*ipv4-address* [*mask-length* | *mask*]]

reset bgp [**instance** *instance-name*] **dampening ipv6** [**multicast** | [**unicast**] [**vpn-instance** *vpn-instance-name*]] [*ipv6-address prefix-length*]

reset bgp [**instance** *instance-name*] **dampening vpnv4** [*ipv4-address* [*mask* | *mask-length*]]

Views

User view

Predefined user roles

network-admin

context-admin

Parameters

instance *instance-name*: Specifies a BGP instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify this option, the command clears BGP route dampening information and releases suppressed BGP routes for the default BGP instance.

ipv4: Clears BGP IPv4 route dampening information and releases suppressed BGP IPv4 routes.

ipv6: Clears BGP IPv6 route dampening information and releases suppressed BGP IPv6 routes.

vpnv4: Clears IBGP VPNv4 route dampening information and releases suppressed IBGP VPNv4 routes.

multicast: Clears BGP multicast route dampening information and releases suppressed BGP multicast routes.

unicast: Clears BGP unicast route dampening information and releases suppressed BGP unicast routes.

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command clears BGP route dampening information for the public network, and releases suppressed BGP routes.

ipv4-address: Specifies an IPv4 destination network address. If you do not specify a network address, this command clears all BGP route dampening information, and releases all suppressed BGP routes.

mask-length: Specifies a mask length in the range of 0 to 32.

mask: Specifies a network mask in dotted decimal notation.

ipv6-address: Specifies an IPv6 destination network address. If you do not specify a network address, this command clears all BGP route dampening information, and releases all suppressed BGP routes.

prefix-length: Specifies a prefix length in the range of 0 to 128.

Usage guidelines

When you execute the **reset bgp dampening ipv4** command:

- If you specify only the *ipv4-address* argument, the system ANDs the network address with the mask of a route. If the result matches the network address of the route, the command clears dampening information for the route, and releases the suppressed route.
- If you specify the *ipv4-address mask* or *ipv4-address mask-length* argument, this command does the following:
  - Clears dampening information for the route that matches both the specified destination network address and the mask (or mask length).
  - Releases the suppressed route.

By default, the **unicast** keyword is used if neither the **unicast** keyword nor the **multicast** keyword is specified.

Examples

Clear dampening information for the BGP IPv4 unicast route to network 20.1.0.0/16 and release the suppressed route.

```
<Sysname> reset bgp dampening ipv4 20.1.0.0 255.255.0.0
```

Related commands

Predefined user roles

network-admin

context-admin

Parameters

instance *instance-name*: Specifies a BGP instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify this option, the command clears flap statistics for the default BGP instance.

ipv4: Clears flap statistics for BGP IPv4 routes.

ipv6: Clears flap statistics for BGP IPv6 routes.

vpnv4: Clears flap statistics for IBGP VPNv4 routes.

multicast: Clears flap statistics for BGP multicast routes.

unicast: Clears flap statistics for BGP unicast routes.

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command clears flap statistics for public BGP routes.

ipv4-address: Specifies an IPv4 destination network address.

mask-length: Specifies a mask length in the range of 0 to 32.

mask: Specifies a network mask in dotted decimal notation.

ipv6-address: Specifies an IPv6 destination network address.

prefix-length: Specifies a prefix length in the range of 0 to 128.

as-path-acl *as-path-acl-number*: Specifies an AS path list by its number in the range of 1 to 256, to filter BGP route flap statistics.

peer *ipv4-address* [*mask-length*]: Clears flap statistics for BGP routes learned from the specified IPv4 BGP peer. The *mask-length* argument specifies a mask length in the range of 0 to 32. You can use the *ipv4-address* and *mask-length* arguments together to specify a subnet. If you specify a subnet, this command clears flap statistics for BGP routes learned from all dynamic peers in the subnet.

peer *ipv6-address* [*prefix-length*]: Clears flap statistics for BGP routes learned from the specified IPv6 BGP peer. The *prefix-length* argument specifies a prefix length in the range of 0 to 128. You can use the *ipv6-address* and *prefix-length* arguments together to specify a subnet. If you specify a subnet, this command clears flap statistics for BGP routes learned from all dynamic peers in the subnet.

Usage guidelines

When you execute the **reset bgp flap-info ipv4** command:

- If you specify only the *ipv4-address* argument, the system ANDs the IPv4 network address with the mask of a route. If the result matches the IPv4 network address of the route, this command clears the flap statistics of the route.
- If you specify the *ipv4-address mask* or *ipv4-address mask-length* argument, this command clears the flap statistics of the route that matches both the specified IPv4 destination network address and the mask (or mask length).

By default, the **unicast** keyword is used if neither the **unicast** keyword nor the **multicast** keyword is specified.

Examples

Clear flap statistics for the BGP IPv4 unicast route to network 20.1.0.0/16.

```
<Sysname> reset bgp flap-info ipv4 20.1.0.0 16
```

router id

Use **router id** to configure a global router ID.

Use **undo router id** to restore the default.

Syntax

router id *router-id*

undo router id

Default

No global router ID is configured.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

router-id: Specifies a router ID in IP address format.

Usage guidelines

Some routing protocols use a router ID to identify a device. You can configure a global router ID, which is used by routing protocols that have no router ID configured.

If no global router ID is configured, the highest loopback address, if any, is used as the router ID. If no loopback address is available, the highest physical interface IP address is used, regardless of the interface status. If no IP address is configured for any interface, the router ID is 0.0.0.0.

During an active/standby switchover, the standby main processing unit (MPU) checks the validity of the previous router ID backed up before switchover. If it is not valid, it selects a new router ID.

If the interface IP address that is selected as the router ID is removed or modified, a new router ID is selected. The following events will not trigger a router ID re-selection:

- The interface goes down.
- After a physical interface address is selected as the router ID, an IP address is configured for a loopback interface.
- A higher interface IP address is configured.

After you modify the global router ID and reset BGP sessions, the modification does not take effect for a BGP instance that uses the global router ID. To modify the router ID for the BGP instance, use the **router-id** command in BGP instance view.

Examples

Configure a global router ID as 1.1.1.1.

```
<Sysname> system-view
[Sysname] router id 1.1.1.1
```

Related commands

router-id (BGP instance view)

router-id (BGP instance view)

Use **router-id** to configure a router ID for a BGP instance.

Use **undo router-id** to restore the default.

Syntax

router-id *router-id*

undo router-id

Default

No router ID is configured for a BGP instance, and the BGP instance uses the global router ID configured by the **router id** command in system view.

Views

BGP instance view

Predefined user roles

network-admin

context-admin

Parameters

router-id: Specifies a router ID for BGP, in IP address format.

Usage guidelines

To run BGP, a BGP instance must have a router ID, which is an unsigned 32-bit integer that uniquely identifies the router in the AS.

To modify a non-zero router ID for BGP, execute the **router-id** command in BGP instance view.

To improve availability, specify the IP address of a loopback interface as the router ID for BGP.

If you execute this command in the same BGP instance view multiple times, the most recent configuration takes effect.

You can configure the same router ID for different BGP instances.

Examples

In BGP instance view, set the router ID for BGP to 1.1.1.1.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp-default] router-id 1.1.1.1
```

Related commands

router id

router-id (BGP-VPN instance view)

Use **router-id** to configure a router ID for a BGP VPN instance.

Use **undo router-id** to restore the default.

Syntax

router-id { *router-id* | **auto-select** }

undo router-id

Default

No router ID is configured for a BGP VPN instance, and the BGP VPN instance uses the router ID configured in BGP instance view. If no router ID is configured in BGP instance view, the BGP VPN instance uses the global router ID configured in system view.

Views

BGP-VPN instance view

Predefined user roles

network-admin

context-admin

Parameters

router-id: Specifies a router ID in IP address format.

auto-select: Automatically selects a router ID for the BGP VPN instance.

Usage guidelines

To run BGP, a VPN instance of a BGP instance must have a router ID, which is an unsigned 32-bit integer that uniquely identifies the BGP VPN router in the AS.

If the **auto-select** keyword is specified, the system selects a router ID for the BGP VPN instance in the following order:

1. The highest loopback address in the BGP VPN instance as the router ID.

2. The highest physical interface address in the BGP VPN instance as the router ID, regardless of the interface status.
3. 0.0.0.0 as the router ID.

If a non-zero router ID is selected for the BGP VPN instance, the router ID will not change when a more preferable router ID is available in the BGP VPN instance.

To improve availability, specify the IP address of a loopback interface as the router ID.

You can specify a different router ID for each VPN instance on a device.

If you execute this command in the same BGP-VPN instance view multiple times, the most recent configuration takes effect.

Examples

In BGP-VPN instance view, set the router ID to 1.1.1.1.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp-default] ip vpn-instance vpn1
[Sysname-bgp-default-vpn1] router-id 1.1.1.1
```

Related commands

router-id (BGP instance view)

snmp context-name

Use **snmp context-name** to configure an SNMP context for a BGP instance.

Use **undo snmp context-name** to restore the default.

Syntax

snmp context-name *context-name*

undo snmp context-name

Default

No SNMP context is configured for a BGP instance.

Views

BGP instance view

Predefined user roles

network-admin

context-admin

Parameters

context-name: Specifies an SNMP context by its name, a case-sensitive string of 1 to 32 characters.

Usage guidelines

BGP does not know the BGP instance to which a managed MIB node belongs. To resolve this issue, configure different SNMP contexts for different BGP instances.

The device selects a MIB for an SNMP packet according to the context (for SNMPv3) or community name (for SNMPv1/v2c) in the following ways:

- For an SNMPv3 packet:

- The device selects the MIB of the BGP instance **default** if the packet does not carry a context and no SNMP context was configured for the BGP instance **default**.
- The device selects the MIB of a BGP instance if the packet meets the following conditions:
  - Carries a context that was configured with the **snmp-agent context** command in system view.
  - Matches the context of the BGP instance.
- The device does not process any MIBs in other situations.

- For an SNMPv1/v2c packet:
  - The device selects the MIB of the BGP instance **default** if the following conditions are met:
    - No SNMP community to SNMP context mapping was configured with the **snmp-agent community-map** command in system view.
    - No SNMP context was configured for the BGP instance **default**.
  - The device selects the MIB of a BGP instance if the SNMP community is mapped to an SNMP context and the context matches the context of the BGP instance.
  - The device does not process any MIBs in other situations.

For more information about SNMP contexts and community names, see *Network Management and Monitoring Configuration Guide*.

Do not configure the same SNMP context for different BGP instances.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Configure SNMP context **bgp-abc** for BGP instance **abc**.

```
<Sysname> system-view
[Sysname] bgp 100 instance abc
[Sysname-bgp-abc] snmp context-name bgp-abc
```

Related commands

snmp-agent community-map (*Network Management and Monitoring Command Reference*)

snmp-agent context (*Network Management and Monitoring Command Reference*)

snmp-agent trap enable bgp

Use **snmp-agent trap enable bgp** to enable SNMP notifications for BGP.

Use **undo snmp-agent trap enable bgp** to disable SNMP notifications for BGP.

Syntax

snmp-agent trap enable bgp [**instance** *instance-name*]

undo snmp-agent trap enable bgp [**instance** *instance-name*]

Default

SNMP notifications for BGP are enabled.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

instance *instance-name*: Specifies a BGP instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify this option, the command enables SNMP notifications for the default BGP instance.

Usage guidelines

After you enable SNMP notifications for BGP, the device generates a notification when a BGP neighbor state change occurs. The notification includes the neighbor address, the error code and subcode of the most recent error, and the current neighbor state.

For BGP notifications to be sent correctly, you must also configure SNMP on the device. For more information about SNMP configuration, see the network management and monitoring configuration guide for the device.

Examples

Enable SNMP notifications for BGP.

```
<Sysname> system-view
[Sysname] snmp-agent trap enable bgp
```

summary automatic

Use **summary automatic** to configure automatic route summarization for redistributed IGP subnet routes.

Use **undo summary automatic** to restore the default.

Syntax

summary automatic

undo summary automatic

Default

Automatic route summarization is not performed for redistributed IGP subnet routes.

Views

BGP IPv4 unicast address family view

BGP-VPN IPv4 unicast address family view

BGP IPv4 multicast address family view

Predefined user roles

network-admin

context-admin

Usage guidelines

After the **summary automatic** command is configured, BGP summarizes IGP subnets redistributed by the **import-route** command.

Automatic summary routes can be manually summarized, but cannot be added to the IP routing table.

Examples

In BGP IPv4 unicast address family view, configure automatic route summarization for redistributed IGP subnet routes.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp-default] address-family ipv4 unicast
```

```
[Sysname-bgp-default-ipv4] summary automatic
```

Related commands

aggregate

import-route

timer

Use **timer** to configure a BGP keepalive interval and hold time.

Use **undo timer** to restore the default.

Syntax

timer keepalive *keepalive* **hold** *holdtime*

undo timer

Default

The BGP keepalive interval and the hold time are 60 seconds and 180 seconds, respectively.

Views

BGP instance view

BGP-VPN instance view

Predefined user roles

network-admin

context-admin

Parameters

keepalive *keepalive*: Configures a keepalive interval in the range of 0 to 21845 seconds.

hold *holdtime*: Configures a hold time in seconds, whose value is 0 or in the range of 3 to 65535. The hold time must be at least three times the keepalive interval.

Usage guidelines

After establishing a BGP session, two routers send keepalive messages at the specified keepalive interval to each other to keep the session.

If a router receives no keepalive or update message from the peer within the hold time, it tears down the session.

Use the **timer** command to configure the keepalive interval and hold time for all BGP peers. Use the **peer timer** command to configure the keepalive interval and hold time for a peer or peer group. If both commands are configured, the intervals configured by the **peer timer** command have higher priority.

If the hold time settings on the local and peer routers are different, the smaller one is used.

If the hold time is set to 0, no keepalive message will be sent to the peer, and the peer session will never time out. If neither the hold time nor the keepalive interval is set to 0, the actual keepalive interval is the smaller one between one third of the hold time and the keepalive interval.

The **timer** command affects only new BGP sessions.

After the **timer** command is executed, no peer session is closed at once. The configured hold time is used for negotiation in session re-establishment (for example, when you reset the BGP session).

Examples

In BGP instance view, set the keepalive interval and hold time to 60 seconds and 180 seconds, respectively.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp-default] timer keepalive 60 hold 180
```

Related commands

display bgp peer

peer timer

timer connect-retry

Use **timer connect-retry** to set the session retry timer for all peers and peer groups.

Use **undo timer connect-retry** to restore the default.

Syntax

timer connect-retry *retry-time*

undo timer connect-retry

Default

The session retry timer is 32 seconds for all peers and peer groups.

Views

BGP instance view

BGP-VPN instance view

Predefined user roles

network-admin

context-admin

Parameters

retry-time: Specifies a session retry timer in the range of 1 to 65535 seconds.

Usage guidelines

To speed up session establishment to a peer or peer group and route convergence, set a small session retry timer. If the BGP session flaps, you can set a large session retry timer to reduce the impact.

The timer set by the **peer timer connect-retry** command takes precedence over the timer set by the **timer connect-retry** command.

Examples

In BGP instance view, set the session retry timer to 30 seconds for all peers.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp-default] timer connect-retry 30
```

Related commands

peer timer connect-retry

unicast-route recursive-lookup tunnel

Use **unicast-route recursive-lookup tunnel** to recurse unlabeled public BGP routes to LSPs.

Use **undo unicast-route recursive-lookup tunnel** to restore the default.

Syntax

In BGP IPv4 unicast address family view:

unicast-route recursive-lookup tunnel [**prefix-list** *ipv4-prefix-list-name*] [**tunnel-policy** *tunnel-policy-name*]

undo unicast-route recursive-lookup tunnel

In BGP IPv6 unicast address family view:

unicast-route recursive-lookup tunnel [**prefix-list** *ipv6-prefix-list-name*] [**tunnel-policy** *tunnel-policy-name*]

undo unicast-route recursive-lookup tunnel

Default

Unlabeled public BGP routes cannot be recursed to LSPs.

Views

BGP IPv4 unicast address family view

BGP IPv6 unicast address family view

Predefined user roles

network-admin

context-admin

Parameters

prefix-list *ipv4-prefix-list-name*: Recurses only unlabeled public BGP routes that match an IPv4 prefix list to LSPs. The *ipv4-prefix-list-name* argument specifies an IPv4 prefix list by its name, a case-sensitive string of 1 to 63 characters. If you do not specify this option, all unlabeled public BGP routes can be recursed to LSPs.

prefix-list *ipv6-prefix-list-name*: Recurses only unlabeled public BGP routes that match an IPv6 prefix list to LSPs. The *ipv6-prefix-list-name* argument specifies an IPv6 prefix list by its name, a case-sensitive string of 1 to 63 characters. If you do not specify this option, all unlabeled public BGP routes can be recursed to LSPs.

tunnel-policy *tunnel-policy-name*: Recurses unlabeled public BGP routes to only LSPs that match a tunnel policy. The *tunnel-policy-name* argument specifies a tunnel policy by its name, a case-sensitive string of 1 to 19 characters. If you do not specify this option, an unlabeled public BGP route can be recursed to any LSPs.

Usage guidelines

After you configure this command, unlabeled public BGP routes will be preferentially recursed to LSPs. If a route fails to be recursed to an LSP, the route will be recursed to the IP next hop.

If you execute this command multiple times for an address family, the most recent configuration takes effect.

Examples

In BGP IPv4 unicast address family view, recurse unlabeled public BGP routes to LSPs.

```
<Sysname> system-view
```

```
[Sysname] bgp 100
[Sysname-bgp-default] address-family ipv4 unicast
[Sysname-bgp-default-ipv4] unicast-route recursive-lookup tunnel
```

Contents

Policy-based routing commands

apply access-vpn

Use **apply access-vpn** to specify the forwarding tables that can be used for the matching packets.

Use **undo apply access-vpn** to remove the specified forwarding tables.

Syntax

apply access-vpn { **public** | **vpn-instance** *vpn-instance-name*&<1-4> }

undo apply access-vpn { **public** | **vpn-instance** [*vpn-instance-name*&<1-4>] }

Default

The device forwards matching packets by using the forwarding table for the network from which the packets are received.

Views

Policy node view

Predefined user roles

network-admin

context-admin

Parameters

public: Specifies the forwarding table for the public network.

vpn-instance: Specifies the forwarding table for the specified MPLS L3VPN instances.

vpn-instance-name&<1-4>: Specifies a space-separated list of up to n VPN instance names. A VPN instance name is a case-sensitive string of 1 to 31 characters. The specified VPN instance must already exist. The value for n is 4.

Usage guidelines

Use this command only in special scenarios that require sending packets received from one network to another network, for example, from a VPN to the public network, or from one VPN to another VPN.

You can repeat this command to specify the forwarding tables for the public network and VPN instances. The device forwards the matching packets by using the first available forwarding table selected in the order in which they are specified.

If you specify the **vpn-instance** keyword without specifying any VPN instances when you execute the **undo** form of this command, all the VPN instances are removed from the policy node.

After all the forwarding tables on the policy node are removed, the default forwarding behavior restores.

Examples

Specify the VPN 1 and VPN 2 forwarding tables on node 10. In this example, VPN 1 and VPN 2 already exist.

```
<Sysname> system-view
[Sysname] policy-based-route policy1 permit node 10
[Sysname-pbr-policy1-10] apply access-vpn vpn-instance vpn1 vpn2
```

Specify the public network forwarding table on node 10.

```
<Sysname> system-view
[Sysname] policy-based-route policy1 permit node 10
[Sysname-pbr-policy1-10] apply access-vpn public
```

Related commands

apply remark-vpn

apply continue

Use **apply continue** to compare packets with the next policy node upon failure on the current node.

Use **undo apply continue** to restore the default.

Syntax

apply continue

undo apply continue

Default

PBR does not compare packets with the next policy node upon failure on the current node.

Views

Policy node view

Predefined user roles

network-admin

context-admin

Usage guidelines

This command takes effect only when the match mode of the node is **permit**.

This command applies when either of the following conditions exist:

- None of the following clauses is configured for packet forwarding:
  - **apply access-vpn**
  - **apply next-hop**
  - **apply output-interface**
  - **apply default-next-hop**
  - **apply default-output-interface**
- A clause listed above is configured, but it has become invalid. Then, a routing table lookup also fails for the matching packet.

NOTE:

A clause might become invalid because the specified next hop is unreachable, packets cannot be forwarded in the specified VPN instance, or the specified output interface is down.

Examples

Compare with the next policy node upon failure on the current node.

```
<Sysname> system-view
[Sysname] policy-based-route aa permit node 11
[Sysname-pbr-aa-11] apply continue
```

apply default-next-hop

Use **apply default-next-hop** to set default next hops.

Use **undo apply default-next-hop** to remove default next hops.

Syntax

apply default-next-hop [**vpn-instance** *vpn-instance-name* | **inbound-vpn**] { *ip-address* [**direct**] [**track** *track-entry-number*] }&<1-4>

undo apply default-next-hop [[**vpn-instance** *vpn-instance-name* | **inbound-vpn**] *ip-address*&<1-4>]

Default

No default next hops are set.

Views

Policy node view

Predefined user roles

network-admin

context-admin

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. The specified VPN instance must already exist.

inbound-vpn: Specifies the VPN instance where the inbound interface belongs.

ip-address: Specifies the IP address of a default next hop. If you do not specify the **vpn-instance** *vpn-instance-name* option or the **inbound-vpn** keyword, the default next hop belongs to the public network.

direct: Specifies a directly connected default next hop.

track *track-entry-number*: Specifies a track entry by its number in the range of 1 to 1024.

&<1-4>: Indicates that you can specify up to four default next hops, each of which can be associated with a track entry.

Usage guidelines

You can specify multiple default next hops for backup or load sharing in one command line or by executing this command multiple times.

With a default next hop specified, the **undo apply default-next-hop** command removes the default next hop.

Without any default next hop specified, the **undo apply default-next-hop** command removes all default next hops.

Examples

Set a directly-connected default next hop of 1.1.1.1.

```
<Sysname> system-view
[Sysname] policy-based-route aa permit node 11
[Sysname-pbr-aa-11] apply default-next-hop 1.1.1.1 direct
```

Related commands

apply loadshare

apply default-output-interface

Use **apply default-output-interface** to set default output interfaces.

Use **undo apply default-output-interface** to remove default output interfaces.

Syntax

apply default-output-interface { *interface-type interface-number* [**track** *track-entry-number*] }&<1-4>

undo apply default-output-interface [{ *interface-type interface-number* }&<1-4>]

Default

No default output interfaces are set.

Views

Policy node view

Predefined user roles

network-admin

context-admin

Parameters

interface-type interface-number: Specifies an interface by its type and number.

track *track-entry-number*: Specifies a track entry by its number in the range of 1 to 1024.

&<1-4>: Indicates that you can specify up to four interfaces, each of which can be associated with a track entry.

Usage guidelines

You can specify multiple default output interfaces for backup or load sharing in one command line or by executing this command multiple times.

The default output interface must be P2P type. Using a non-P2P default output interface can result in forwarding failures when the interface has multiple next hops. Non-P2P interfaces include broadcast interfaces such as Ethernet interfaces.

With a default output interface specified, the **undo apply default-output-interface** command removes the default output interface.

Without any default output interface specified, the **undo apply default-output-interface** command removes all default output interfaces.

Examples

Specify GigabitEthernet 1/0/1 as the default output interface for IP packets.

```
<Sysname> system-view
[Sysname] policy-based-route aa permit node 11
[Sysname-pbr-aa-11] apply default-output-interface gigabitethernet 1/0/1
```

Related commands

apply loadshare

apply ip-df

Use **apply ip-df** to set the Don't Fragment (DF) bit in the IP header of matching packets.

Use **undo apply ip-df** to restore the default.

Syntax

apply ip-df *df-value*

undo apply ip-df

Default

The DF bit is not set.

Views

Policy node view

Predefined user roles

network-admin

context-admin

Parameters

df-value: Sets the DF bit in the IP header of matching packets. The value can be 0 or 1.

Usage guidelines

Setting the DF bit to 0 allows packet fragmentation.

Setting the DF bit to 1 prohibits packet fragmentation.

Examples

Set the DF bit in the IP header of matching packets to 0.

```
<Sysname> system-view
[Sysname] policy-based-route aa permit node 11
[Sysname-pbr-aa-11] apply ip-df 0
```

apply loadshare

Use **apply loadshare** to enable load sharing among multiple next hops, output interfaces, default next hops, or default output interfaces.

Use **undo apply loadshare** to restore the default.

Syntax

apply loadshare { **default-next-hop** | **default-output-interface** | **next-hop** | **output-interface** }

undo apply loadshare { **default-next-hop** | **default-output-interface** | **next-hop** | **output-interface** }

Default

Multiple next hops, output interfaces, default next hops, or default output interfaces operate in primary/backup mode.

Views

Policy node view

Predefined user roles

network-admin

context-admin

Parameters

`default-next-hop`: Enables load sharing among multiple default next hops.

`default-output-interface`: Enables load sharing among multiple default output interfaces.

`next-hop`: Enables load sharing among multiple next hops.

`output-interface`: Enables load sharing among multiple output interfaces.

Usage guidelines

Multiple next hop, output interface, default next hop, or default output interface options operate in either primary/backup or load sharing mode.

- **Primary/backup mode**—One option is selected from all options in configuration order for packet forwarding, with all remaining options as backups. For example, if multiple output interfaces are configured, the first configured output interface is selected. When the selected output interface fails, the next available output interface takes over.
- **Load sharing mode**—Matching traffic is distributed across the available options, as follows:
  - **Multiple output interface, default next hop, or default output interface options**—Load share traffic in round robin manner, starting from the first configured option. They perform per-packet load sharing for traffic that does not match any fast forwarding entry, and perform per-flow load sharing for traffic that matches a fast forwarding entry.
  - **Multiple next hops**—Load share traffic in proportion to their weight. By default, all next hops have the same weight and traffic is evenly distributed among them.

Examples

Enable load sharing among multiple next hops.

```
<Sysname> system-view
[Sysname] policy-based-route aa permit node 11
[Sysname-pbr-aa-11] apply next-hop 1.1.1.1 2.2.2.2
[Sysname-pbr-aa-11] apply loadshare next-hop
```

Enable load sharing among multiple output interfaces.

```
<Sysname> system-view
[Sysname] policy-based-route aa permit node 11
[Sysname-pbr-aa-11] apply output-interface gigabitethernet 1/0/1 gigabitethernet 1/0/2
[Sysname-pbr-aa-11] apply loadshare output-interface
```

Enable load sharing among multiple default next hops.

```
<Sysname> system-view
[Sysname] policy-based-route aa permit node 11
[Sysname-pbr-aa-11] apply default-next-hop 1.1.1.1 2.2.2.2
[Sysname-pbr-aa-11] apply loadshare default-next-hop
```

Enable load sharing among multiple default output interfaces.

```
<Sysname> system-view
[Sysname] policy-based-route aa permit node 11
[Sysname-pbr-aa-11] apply default-output-interface gigabitethernet 1/0/1 gigabitethernet
1/0/2
[Sysname-pbr-aa-11] apply loadshare default-output-interface
```

Related commands

`apply default-output-interface`

`apply next-hop`

apply output-interface

apply next-hop

Use **apply next-hop** to set next hops.

Use **undo apply next-hop** to remove next hops.

Syntax

apply next-hop [**vpn-instance** *vpn-instance-name* | **inbound-vpn**] { *ip-address* [**direct**] [**track** *track-entry-number*] [**weight** *weight-value*] }&<1-4>

undo apply next-hop [[**vpn-instance** *vpn-instance-name* | **inbound-vpn**] *ip-address*&<1-4>]

Default

No next hops are set.

Views

Policy node view

Predefined user roles

network-admin

context-admin

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. The specified VPN instance must already exist.

inbound-vpn: Specifies the VPN instance where the inbound interface belongs.

ip-address: Specifies the IP address of a next hop. If you do not specify the **vpn-instance** *vpn-instance-name* option or the **inbound-vpn** keyword, the next hop belongs to the public network.

direct: Specifies that the next hop must be directly connected to take effect.

track *track-entry-number*: Specifies a track entry by its number in the range of 1 to 1024.

weight *weight-value*: Specifies a load sharing weight for the next hop, in the range of 1 to 100. The default is 10. If you specify weights 1, 1, and 2 for three next hops, they share 1/4, 1/4, and 1/2 of the whole traffic, respectively.

&<1-4>: Indicates that you can specify up to four next hops, each of which can be associated with a track entry.

Usage guidelines

You can specify multiple next hops for backup or load sharing in one command line or by executing this command multiple times.

With a next hop specified, the **undo apply next-hop** command removes the next hop.

Without any next hop specified, the **undo apply next-hop** command removes all next hops.

Examples

Set a directly-connected next hop of 1.1.1.1.

```
<Sysname> system-view
[Sysname] policy-based-route aa permit node 11
[Sysname-pbr-aa-11] apply next-hop 1.1.1.1 direct
```

Syntax

apply output-interface { *interface-type interface-number* [**track** *track-entry-number*] }&<1-4>

undo apply output-interface [{ *interface-type interface-number* }&<1-4>]

Default

No output interfaces are set.

Views

Policy node view

Predefined user roles

network-admin

context-admin

Parameters

interface-type interface-number: Specifies an interface by its type and number.

track *track-entry-number*: Specifies a track entry by its number in the range of 1 to 1024.

&<1-4>: Indicates that you can specify up to four interfaces, each of which can be associated with a track entry.

Usage guidelines

You can specify multiple output interfaces for backup or load sharing in one command line or by executing this command multiple times.

The output interface must be P2P type. Using a non-P2P output interface can result in forwarding failures when the interface has multiple next hops. Non-P2P interfaces include broadcast interfaces such as Ethernet interfaces.

With an output interface specified, the **undo apply output-interface** command removes the output interface.

Without any output interface specified, the **undo apply output-interface** command removes all output interfaces.

Examples

Specify GigabitEthernet 1/0/1 as the output interface for IP packets.

```
<Sysname> system-view
[Sysname] policy-based-route aa permit node 11
[Sysname-pbr-aa-11] apply output-interface gigabitethernet 1/0/1
```

Related commands

apply loadshare

apply precedence

Use **apply precedence** to set a precedence for IP packets.

Use **undo apply precedence** to restore the default.

Syntax

apply precedence { *type* | *value* }

undo apply precedence

Default

No precedence is set for IP packets.

Views

Policy node view

Predefined user roles

network-admin

context-admin

Parameters

type: Specifies the precedence type for IP packets.

value: Specifies the precedence for IP packets. Eight precedence values (0 to 7) are available. Each precedence value corresponds to a precedence type, as shown in Table 1. You can set either a precedence value or a precedence type for IP packets.

Table 1 IP precedences and corresponding types

Precedence value	Precedence type
0	routine
1	priority
2	immediate
3	flash
4	flash-override
5	critical
6	internet
7	network

Examples

Set the precedence to 5 (critical) for IP packets.

```
<Sysname> system-view
[Sysname] policy-based-route aa permit node 11
[Sysname-pbr-aa-11] apply precedence critical
```

apply remark-vpn

Use **apply remark-vpn** to enable VPN remark action.

Use **undo apply remark-vpn** to restore the default.

Syntax

apply remark-vpn

undo apply remark-vpn

Default

VPN remark action is not configured.

Views

Policy node view

Predefined user roles

network-admin

context-admin

Usage guidelines

VPN remark action marks the matching packets as belonging to the VPN instance to which they are forwarded based on the **apply access-vpn vpn-instance** command. All subsequent service modules of PBR handle the packets as belonging to the re-marked VPN instance.

If the VPN remark action is not enabled, the forwarded matching packets are marked as belonging to the VPN instance or the public network from which they were received.

VPN remark action applies only to packets that have been successfully forwarded based on the **apply access-vpn vpn-instance** command.

Examples

Forward packets that match ACL 3000 based on the forwarding table of VPN instance **vpn1** and perform VPN remark action on the successfully forwarded packets.

```
<Sysname> system-view
[Sysname] policy-based-route aaa permit node 10
[Sysname-pbr-aaa-10] if-match acl 3000
[Sysname-pbr-aaa-10] apply access-vpn vpn-instance vpn1
[Sysname-pbr-aaa-10] apply remark-vpn
```

context-operator

Parameters

interface-type interface-number: Specifies an interface by its type and number.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays information on the master device.

Examples

Display PBR configuration and statistics on GigabitEthernet 1/0/1.

```
<Sysname> display ip policy-based-route interface gigabitethernet 1/0/1
Policy based routing information for interface GigabitEthernet1/0/1(failed):
Policy name: aaa
```

```
  node 0 deny:
  Matched: 0
  node 1 permit:
    if-match acl 3999
  Matched: 0
  node 2 permit:
    if-match acl 2000
    apply next-hop 2.2.2.2
  Matched: 0
  node 5 permit:
    if-match acl 3101
    apply next-hop 1.1.1.1
    apply output-interface GigabitEthernet1/0/2 track 1 (down)
    apply output-interface GigabitEthernet1/0/3 track 2 (inactive)
  Matched: 0
Total matched: 0
```

Table 3 Command output

Field	Description
Policy based routing information for interface *XXXX*	PBR configuration and statistics on the interface. This field displays **failed** in brackets if none of the nodes in the policy has been successfully issued to the driver. To issue the policy, you must remove the policy from the interface and then apply it on the interface again. **NOTE:** The **failed** status is available on a per-slot basis. To obtain this information, you must specify a slot number when you execute the command. • For a global interface (for example, a VLAN interface), which might have member physical interfaces on multiple slots, specify a slot that contains its member interfaces. • For a physical interface, specify its slot number.
node 0 deny node 2 permit	Match mode of the node, **permit** or **deny**. If a node fails to be issued to the driver, the command displays the cause in brackets, which include: • **not support**—The device does not support the match criteria configured on the node. • **no resource**—No sufficient resources (for example, ACLs) are available for the node. **NOTE:** The cause is available only on a per-slot basis. To obtain this information, you must specify a slot number when you execute the command. • For a global interface (for example, a VLAN interface), which might have member physical interfaces on multiple slots, specify a slot that contains its member interfaces. • For a physical interface, specify its slot number.
if-match acl	Compares packets with the ACL.
apply next-hop	Specifies a next hop for permitted packets.
apply output-interface track 1	Specifies an output interface and its associated track entry for permitted packets.

Field	Description
	This field displays the interface status in brackets. • **down**—The interface is down at network layer. • **inactive**—The card that hosts the interface is not in position.
Matched	Number of successful matches on the node. If the device does not have sufficient resources to count matches, this field displays **no statistics resource** in brackets. **NOTE:** The statistics collection failure cause is available only on a per-slot basis. To obtain this information, you must specify a slot number when you execute the command. • For a global interface (for example, a VLAN interface), which might have member physical interfaces on multiple slots, specify a slot that contains its member interfaces. • For a physical interface, specify its slot number.
Total matched	Total number of successful matches on all nodes.

context-operator

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays local PBR configuration and statistics for the master device.

Examples

Display local PBR configuration and statistics.

```
<Sysname> display ip policy-based-route local
Policy based routing information for local:
Policy name: aaa
  node 0 deny:
  Matched: 0
  node 1 permit:
    if-match acl 3999
```

```
  Matched: 0
  node 2 permit:
    if-match acl 2000
    apply next-hop 2.2.2.2
  Matched: 0
  node 5 permit:
    if-match acl 3101
    apply next-hop 1.1.1.1
  Matched: 0
Total matched: 0
```

Table 4 Command output

Field	Description
Policy based routing information for local	Local PBR configuration and statistics.
node 0 deny/node 2 permit	Match mode of the node: permit or deny.
if-match acl	Compares packets with the ACL.
apply next-hop	Specifies a next hop for permitted packets.
Matched	Number of successful matches on the node.
Total matched	Total number of successful matches on all nodes.

Related commands

context-operator

Examples

Display PBR configuration.

```
Policy name              Type     Interface
aaa                      Forward  GigabitEthernet1/0/1
aaa                      Forward  GigabitEthernet1/0/2
aaa                      Local    N/A
```

Table 5 Command output

Field	Description
Type	Type of the PBR: • **Forward**—Interface PBR. • **Local**—Local PBR.
Interface	Interface where the policy is applied. This field displays **N/A** for a local PBR policy.

if-match acl

Use **if-match acl** to set an ACL match criterion.

Use **undo if-match acl** to restore the default.

Syntax

if-match acl { *acl-number* | **name** *acl-name* }

undo if-match acl

Default

No ACL match criterion is set.

Views

Policy node view

Predefined user roles

network-admin

context-admin

Parameters

acl-number: Specifies an ACL by its number in the range of 2000 to 2999 for a basic ACL, and in the range of 3000 to 3999 for an advanced ACL.

name *acl-name*: Specifies an ACL by its name, a case-insensitive string of 1 to 63 characters starting with letter *a* to *z* or *A* to *Z*. The ACL name cannot be **all**. For the command to take effect, make sure the specified ACL is a basic or advanced ACL.

Usage guidelines

If the specified ACL does not exist or has no rules configured, no packets will match the ACL.

If the **vpn-instance** keyword is specified for an ACL rule, the rule applies to only VPN packets. If the **vpn-instance** keyword is not specified, the rule applies to only public network packets.

Examples

Configure Node 11 of policy **aa** to permit the packets matching ACL 2011.

```
<Sysname> system-view
[Sysname] policy-based-route aa permit node 11
[Sysname-pbr-aa-11] if-match acl 2011
```

Configure Node 11 of policy **aa** to permit the packets matching ACL **aaa**.

```
<Sysname> system-view
[Sysname] policy-based-route aa permit node 11
[Sysname-pbr-aa-11] if-match acl name aaa
```

if-match app-group

Use **if-match app-group** to set application group match criteria.

Use **undo if-match app-group** to delete application group match criteria.

Syntax

if-match app-group *app-group-name*&<1-6>

undo if-match app-group [*app-group-name*&<1-6>]

The following compatibility matrixes show the support of hardware platforms for this command:

Models	Command compatibility
NFNX5-HD6480, NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB1780, NFNX3-HDB3080, NFNX3-HDB680, NFNX3-HDB1080	Yes
NFNX3-HDB1180, NFNX3-HDB1480	No

Default

No application group match criteria are set.

Views

Policy node view

Predefined user roles

network-admin

context-admin

Parameters

app-group-name&<1-6>: Specifies up to six application groups by their names. An application group name is a case-insensitive string of 1 to 63 characters, which can contain letters, digits, underscores (_), and hyphens (-). The application group name cannot be **Invalid**, **other**, or any application group name predefined by the system.

Usage guidelines

The application match criteria apply only to interface PBR.

If you specify an application group, the **undo if-match app-group** command deletes the application group match criterion.

If you do not specify an application group, the **undo if-match app-group** command deletes all application group match criteria.

Examples

Specify the application group **test** as a match criterion.

```
<Sysname> system-view
[Sysname] policy-based-route aa permit node 11
[Sysname-pbr-aa-11] if-match app-group test
```

if-match object-group

Use **if-match object-group** to set service object group match criteria.

Use **undo if-match object-group** to delete service object group match criteria.

Syntax

if-match object-group service *object-group-name*&<1-6>

undo if-match object-group service [*object-group-name*&<1-6>]

The following compatibility matrixes show the support of hardware platforms for this command:

Models	Command compatibility
NFNX5-HD6480, NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB1780, NFNX3-HDB3080, NFNX3-HDB680, NFNX3-HDB1080	Yes
NFNX3-HDB1180, NFNX3-HDB1480	No

Default

No service object group match criteria are set.

Views

Policy node view

Predefined user roles

network-admin

context-admin

Parameters

object-group-name&<1-6>: Specifies up to six service object groups by their names. A service object group name is a case-insensitive string of 1 to 63 characters, which can contain letters, digits, underscores (_), and hyphens (-).

Usage guidelines

If you specify a service object group, the **undo if-match object-group** command deletes the service object group match criterion.

If you do not specify a service object group, the **undo if-match object-group** command deletes all service object group match criteria.

Examples

Specify the service object group **test** as a match criterion.

```
<Sysname> system-view
[Sysname] policy-based-route aa permit node 11
[Sysname-pbr-aa-11] if-match object-group service test
```

if-match packet-length

Use **if-match packet-length** to set a packet length match criterion.

Use **undo if-match packet-length** to restore the default.

Syntax

if-match packet-length *min-len max-len*

undo if-match packet-length

Default

No packet length match criterion is set.

Views

Policy node view

Predefined user roles

network-admin

context-admin

Parameters

min-len: Specifies the minimum IP packet length in the range of 1 to 65535 bytes.

max-len: Specifies the maximum IP packet length in the range of 1 to 65535 bytes. The maximum length must be no less than the minimum length.

Usage guidelines

Use this command to set a criterion to match the total length of data packets.

The packet length range includes boundary values. For example, if you set the *min-len* and *max-len* arguments to 100 and 200, respectively, packets with lengths of 100 bytes and 200 bytes are also matched.

Examples

Match packets with a length from 100 to 200 bytes.

```
<Sysname> system-view
[Sysname] policy-based-route aa permit node 11
[Sysname-pbr-aa-11] if-match packet-length 100 200
```

if-match source-ip

Use **if-match source-ip** to set a source IP address match criterion to match locally generated packets.

Use **undo if-match source-ip** to delete the source IP address match criterion to match locally generated packets.

Syntax

if-match source-ip { **interface** *interface-type interface-number* | [**vpn-instance** *vpn-instance-name*] *ip-address* }

undo if-match source-ip

The following compatibility matrixes show the support of hardware platforms for this command:

Models	Command compatibility
NFNX5-HD6480, NFNX3-HDB680, NFNX3-HDB1080	Yes
NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB1780, NFNX3-HDB3080, NFNX3-HDB1180, NFNX3-HDB1480	No

Default

No source IP address match criterion is set.

Views

Policy node view

Predefined user roles

network-admin

context-admin

Parameters

interface *interface-type interface-number*: Specifies an interface by its type and number. The primary IP address of the interface will be used to match packets.

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify this option, the specified IP address belongs to the public network.

ip-address: Specifies an IP address in dotted decimal notation.

Usage guidelines

This command matches locally generated packets sent out with the specified IP address or the primary IP address of the specified interface.

Typically, you use this command to make sure local tunneled or VPN traffic (for example, IPsec packets) is sent towards the correct ISP when the device is dual- or multi-homed to different ISPs. This command helps you avoid packet drops that might occur when packets are sent to an incorrect ISP.

For the matching traffic, use the **apply next-hop** or **apply output-interface** command to specify the next hop or the output interface. As a best practice, specify the output interface in the **apply** clause if you specify the source interface in the **if-match** clause.

If you execute this command multiple times on a policy node, the most recent configuration takes effect.

Examples

Match locally generated packets with source IP address 1.1.1.1.

```
<Sysname> system-view
[Sysname] policy-based-route aa permit node 11
[Sysname-pbr-aa-11] if-match source-ip 1.1.1.1
```

ip local policy-based-route

Use **ip local policy-based-route** to specify a policy for local PBR.

Use **undo ip local policy-based-route** to restore the default.

Syntax

ip local policy-based-route *policy-name*

undo ip local policy-based-route

Default

No policy is specified for local PBR.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

policy-name: Specifies a policy by its name, a case-sensitive string of 1 to 19 characters. The specified policy must already exist.

Usage guidelines

Local PBR guides the forwarding of locally generated packets, such as ICMP packets generated by using the **ping** command.

Local PBR might affect local services, such as ping and Telnet. When you use local PBR, make sure you fully understand its impact on local services of the device.

You can specify only one policy for local PBR and must make sure the specified policy already exists.

Before you apply a new policy, you must first remove the current policy.

Examples

Configure local PBR based on policy **aaa**.

```
<Sysname> system-view
[Sysname] ip local policy-based-route aaa
```

Related commands

display ip policy-based-route local

ip policy-based-route

Use **ip policy-based-route** to specify a policy for interface PBR on an interface.

Use **undo ip policy-based-route** to restore the default.

Syntax

ip policy-based-route *policy-name*

undo ip policy-based-route

Default

No policy is applied to an interface.

Views

Interface view

Predefined user roles

network-admin

context-admin

Parameters

policy-name: Specifies a policy by its name, a case-sensitive string of 1 to 19 characters. The specified policy must already exist.

Examples

Apply policy **aaa** to GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] ip policy-based-route aaa
```

Related commands

display ip policy-based-route interface

policy-based-route

Use **policy-based-route** to create a policy node and enter its view, or enter the view of an existing policy node.

Use **undo policy-based-route** to delete a policy or policy node.

Syntax

policy-based-route *policy-name* [**deny** | **permit**] **node** *node-number*

undo policy-based-route *policy-name* [**deny** | **node** *node-number* | **permit**]

Default

No policy nodes exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

policy-name: Specifies a policy by its name, a case-sensitive string of 1 to 19 characters.

deny: Specifies the match mode for the policy node as **deny**.

permit: Specifies the match mode for the policy node as **permit** (default mode).

node *node-number*: Specifies a policy node by its number. A smaller number has a higher priority. The value range for the *node-number* argument is 0 to 65535.

Usage guidelines

A policy that has been applied to an interface or locally cannot be deleted. To delete it, you must first cancel the application.

- If a policy node is specified, the **undo policy-based-route** command deletes the specified policy node.
- If a match mode is specified, the command deletes all nodes configured with the match mode.
- If no policy node or match mode is specified, the command deletes the whole policy.

Examples

Create permit-mode of Node 10 for policy **policy1** and enter its view.

```
<Sysname> system-view
[Sysname] policy-based-route policy1 permit node 10
[Sysname-pbr-policy1-10]
```

Related commands

display ip policy-based-route

reset ip policy-based-route statistics

Use **reset ip policy-based-route statistics** to clear PBR statistics.

Syntax

reset ip policy-based-route statistics [**policy** *policy-name*]

Views

User view

Predefined user roles

network-admin

context-admin

Parameters

policy *policy-name*: Specifies a policy by its name, a case-sensitive string of 1 to 19 characters. If you do not specify a policy, this command clears PBR statistics for all policies.

Examples

Clear all PBR statistics.

```
<Sysname> reset ip policy-based-route statistics
```

Contents

IPv6 policy-based routing commands

apply access-vpn

Use **apply access-vpn** to specify the forwarding tables that can be used for the matching packets.

Use **undo apply access-vpn** to remove the specified forwarding tables.

Syntax

apply access-vpn { **public** | **vpn-instance** *vpn-instance-name*&<1-4> }

undo apply access-vpn { **public** | **vpn-instance** [*vpn-instance-name*&<1-4>] }

Default

The device forwards matching packets by using the forwarding table for the network from which the packets are received.

Views

IPv6 policy node view

Predefined user roles

network-admin

context-admin

Parameters

public: Specifies the forwarding table for the public network.

vpn-instance: Specifies the forwarding table for the specified MPLS L3VPN instances.

vpn-instance-name&<1-4>: Specifies a space-separated list of up to four VPN instance names. A VPN instance name is a case-sensitive string of 1 to 31 characters. The specified VPN instance must already exist. Specifies a space-separated list of up to four VPN instance names. A VPN instance name is a case-sensitive string of 1 to 31 characters. The specified VPN instance must already exist.

Usage guidelines

Use this command only in special scenarios that require sending packets received from one network to another network, for example, from a VPN to the public network, or from one VPN to another VPN.

You can repeat this command to specify the forwarding tables for the public network and VPN instances. The device forwards the matching packets by using the first available forwarding table selected in the order in which they are specified.

If you specify the **vpn-instance** keyword without specifying any VPN instances when you execute the **undo** form of this command, all the VPN instances are removed from the IPv6 policy node.

After all the forwarding tables on the IPv6 policy node are removed, the default forwarding behavior restores.

Examples

Specify the VPN 1 and VPN 2 forwarding tables on node 10. In this example, VPN 1 and VPN 2 already exist.

```
<Sysname> system-view
[Sysname] ipv6 policy-based-route policy1 permit node 10
```

```
[Sysname-pbr6-policy1-10] apply access-vpn vpn-instance vpn1 vpn2
```

Specify the public network forwarding table on node 10.

```
<Sysname> system-view
[Sysname] ipv6 policy-based-route policy1 permit node 10
[Sysname-pbr6-policy1-10] apply access-vpn public
```

Related commands

apply remark-vpn

apply continue

Use **apply continue** to compare packets with the next policy node upon failure on the current node.

Use **undo apply continue** to restore the default.

Syntax

apply continue

undo apply continue

Default

IPv6 PBR does not compare packets with the next policy node upon failure on the current node.

Views

IPv6 policy node view

Predefined user roles

network-admin

context-admin

Usage guidelines

This command takes effect only when the mode of the node is **permit**.

This command applies when either of the following conditions exist:

- **apply access-vpn**
- **apply next-hop**
- **apply output-interface**
- **apply default-next-hop**
- **apply default-output-interface**

- A clause listed above is configured, but it has become invalid. Then, a routing table lookup also fails for the matching packet.

NOTE:

A clause might become invalid because the specified next hop is unreachable, packets cannot be forwarded in the specified VPN instance, or the specified output interface is down.

Examples

Compare with the next policy node upon failure on the current node.

```
<Sysname> system-view
[Sysname] ipv6 policy-based-route aa permit node 11
[Sysname-pbr6-aa-11] apply continue
```

apply default-next-hop

Use **apply default-next-hop** to set default next hops.

Use **undo apply default-next-hop** to remove default next hops.

Syntax

apply default-next-hop [**vpn-instance** *vpn-instance-name* | **inbound-vpn**] { *ipv6-address* [**direct**] [**track** *track-entry-number*] }&<1-4>

undo apply default-next-hop [[**vpn-instance** *vpn-instance-name* | **inbound-vpn**] *ipv6-address*&<1-4>]

Default

No default next hops are set.

Views

IPv6 policy node view

Predefined user roles

network-admin

context-admin

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. The specified VPN instance must already exist.

inbound-vpn: Specifies the VPN instance where the inbound interface belongs.

ipv6-address: Specifies the IPv6 address of a default next hop. If you do not specify the **vpn-instance** *vpn-instance-name* option or the **inbound-vpn** keyword, the default next hop belongs to the public network.

direct: Specifies a directly connected default next hop.

track *track-entry-number*: Specifies a track entry by its number in the range of 1 to 1024.

&<1-4>: Indicates that you can specify up to four default next hops, each of which can be associated with a track entry.

Usage guidelines

You can specify multiple default next hops for backup or load sharing in one command line or by executing this command multiple times.

With a default next hop specified, the **undo apply default-next-hop** command removes the default next hop.

Without any default next hop specified, the **undo apply default-next-hop** command removes all default next hops.

Examples

Set a directly-connected default next hop of 1:1::1:1.

```
<Sysname> system-view
[Sysname] ipv6 policy-based-route aa permit node 11
[Sysname-pbr6-aa-11] apply default-next-hop 1:1::1:1 direct
```

Related commands

apply loadshare

apply default-output-interface

Use **apply default-output-interface** to set default output interfaces.

Use **undo apply default-output-interface** to remove default output interfaces.

Syntax

apply default-output-interface { *interface-type interface-number* [**track** *track-entry-number*] }&<1-4>

undo apply default-output-interface [{ *interface-type interface-number* }&<1-4>]

Default

No default output interfaces are set.

Views

IPv6 policy node view

Predefined user roles

network-admin

context-admin

Parameters

interface-type interface-number: Specifies an interface by its type and number.

track *track-entry-number*: Specifies a track entry by its number in the range of 1 to 1024.

&<1-4>: Indicates that you can specify up to four interfaces, each of which can be associated with a track entry.

Usage guidelines

You can specify multiple default output interfaces for backup or load sharing in one command line or by executing this command multiple times.

The default output interface must be P2P type. Using a non-P2P default output interface can result in forwarding failures when the interface has multiple next hops. Non-P2P interfaces include broadcast interfaces such as Ethernet interfaces.

With a default output interface specified, the **undo apply default-output-interface** command removes the default output interface.

Without any default output interface specified, the **undo apply default-output-interface** command removes all default output interfaces.

Examples

Specify GigabitEthernet 1/0/1 as the default output interface for IPv6 packets.

```
<Sysname> system-view
[Sysname] ipv6 policy-based-route aa permit node 11
[Sysname-pbr6-aa-11] apply default-output-interface gigabitethernet 1/0/1
```

Related commands

apply loadshare

apply loadshare

Use **apply loadshare** to enable load sharing among multiple next hops, output interfaces, default next hops, or default output interfaces.

Use **undo apply loadshare** to restore the default.

Syntax

apply loadshare { **default-next-hop** | **default-output-interface** | **next-hop** | **output-interface** }

undo apply loadshare { **default-next-hop** | **default-output-interface** | **next-hop** | **output-interface** }

Default

Multiple next hops, output interfaces, default next hops, or default output interfaces operate in primary/backup mode.

Views

IPv6 policy node view

Predefined user roles

network-admin

context-admin

Parameters

default-next-hop: Enables load sharing among multiple default next hops.

default-output-interface: Enables load sharing among multiple default output interfaces.

next-hop: Enables load sharing among multiple next hops.

output-interface: Enables load sharing among multiple output interfaces.

Usage guidelines

Multiple next hop, output interface, default next hop, or default output interface options operate in either primary/backup or load sharing mode.

- **Primary/backup mode**—One option is selected from all options in configuration order for packet forwarding, with all remaining options as backups. For example, if multiple output interfaces are configured, the first configured output interface is selected. When the selected output interface fails, the next available output interface takes over.
- **Load sharing mode**—Matching traffic is distributed across the available options, as follows:
  - **Multiple output interface, default next hop, or default output interface options**—Load share traffic in round robin manner, starting from the first configured option. They perform per-packet load sharing for traffic that does not match any fast forwarding entry, and perform per-flow load sharing for traffic that matches a fast forwarding entry.
  - **Multiple next hops**—Load share traffic in proportion to their weight. By default, all next hops have the same weight and traffic is evenly distributed among them.

Examples

Enable load sharing among multiple next hops.

```
<Sysname> system-view
[Sysname] ipv6 policy-based-route aa permit node 11
[Sysname-pbr6-aa-11] apply next-hop 1::1 2::2
[Sysname-pbr6-aa-11] apply loadshare next-hop
```

Enable load sharing among multiple output interfaces.

```
<Sysname> system-view
[Sysname] ipv6 policy-based-route aa permit node 11
[Sysname-pbr6-aa-11] apply output-interface gigabitethernet 1/0/1 gigabitethernet 1/0/2
[Sysname-pbr6-aa-11] apply loadshare output-interface
```

Enable load sharing among multiple default next hops.

```
<Sysname> system-view
[Sysname] ipv6 policy-based-route aa permit node 11
[Sysname-pbr6-aa-11] apply default-next-hop 1::1 2::2
[Sysname-pbr6-aa-11] apply loadshare default-next-hop
```

Enable load sharing among multiple default output interfaces.

```
<Sysname> system-view
[Sysname] ipv6 policy-based-route aa permit node 11
[Sysname-pbr6-aa-11] apply default-output-interface gigabitethernet 1/0/1
gigabitethernet 1/0/2
[Sysname-pbr6-aa-11] apply loadshare default-output-interface
```

Related commands

apply default-next-hop

apply default-output-interface

apply next-hop

apply output-interface

apply next-hop

Use **apply next-hop** to set next hops.

Use **undo apply next-hop** to remove next hops.

Syntax

apply next-hop [**vpn-instance** *vpn-instance-name* | **inbound-vpn**] { *ipv6-address* [**direct**] [**track** *track-entry-number*] [**weight** *weight-value*] } &<1-4>

undo apply next-hop [[**vpn-instance** *vpn-instance-name* | **inbound-vpn**] *ipv6-address*&<1-4>]

Default

No next hops are set.

Views

IPv6 policy node view

Predefined user roles

network-admin

context-admin

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. The specified VPN instance must already exist.

inbound-vpn: Specifies the VPN instance where the inbound interface belongs.

ipv6-address: Specifies the IPv6 address of a next hop. If you do not specify the **vpn-instance** *vpn-instance-name* option or the **inbound-vpn** keyword, the next hop belongs to the public network.

direct: Specifies that the next hop must be directly connected to take effect.

track *track-entry-number*: Specifies a track entry by its number in the range of 1 to 1024.

weight *weight-value*: Specifies a load sharing weight for the next hop, in the range of 1 to 100. The default is 10. If you specify weights 1, 1, and 2 for three next hops, they share 1/4, 1/4, and 1/2 of the whole traffic, respectively.

&<1-4>: Indicates that you can specify up to four next hops, each of which can be associated with a track entry.

Usage guidelines

You can specify multiple next hops for backup or load sharing in one command line or by executing this command multiple times.

With a next hop specified, the **undo apply next-hop** command removes the next hop.

Without any next hop specified, the **undo apply next-hop** command removes all next hops.

Examples

Set a directly-connected next hop of 1::1.

```
<Sysname> system-view
[Sysname] ipv6 policy-based-route aa permit node 11
[Sysname-pbr6-aa-11] apply next-hop 1::1
```

Related commands

apply loadshare

apply output-interface

Use **apply output-interface** to set output interfaces.

Use **undo apply output-interface** to remove output interfaces.

Syntax

apply output-interface { *interface-type interface-number* [**track** *track-entry-number*] }&<1-4>

undo apply output-interface [{ *interface-type interface-number* }&<1-4>]

Default

No output interfaces are set.

Views

IPv6 policy node view

Predefined user roles

network-admin

context-admin

Parameters

interface-type interface-number: Specifies an interface by its type and number.

track *track-entry-number*: Specifies a track entry by its number in the range of 1 to 1024.

&<1-4>: Indicates that you can specify up to four interfaces, each of which can be associated with a track entry.

Usage guidelines

You can specify multiple output interfaces for backup or load sharing in one command line or by executing this command multiple times.

The output interface must be P2P type. Using a non-P2P output interface can result in forwarding failures when the interface has multiple next hops. Non-P2P interfaces include broadcast interfaces such as Ethernet interfaces.

With an output interface specified, the **undo apply output-interface** command removes the output interface.

Without any output interface specified, the **undo apply output-interface** command removes all output interfaces.

Examples

Specify GigabitEthernet 1/0/1 as the output interface for IPv6 packets.

```
<Sysname> system-view
[Sysname] ipv6 policy-based-route aa permit node 11
[Sysname-pbr6-aa-11] apply output-interface gigabitethernet 1/0/1
```

Related commands

apply loadshare

apply precedence

Use **apply precedence** to set a precedence for IPv6 packets.

Use **undo apply precedence** to restore the default.

Syntax

apply precedence { *type* | *value* }

undo apply precedence

Default

No precedence is set for IPv6 packets.

Views

IPv6 policy node view

Predefined user roles

network-admin

context-admin

Parameters

type: Specifies the precedence type for IPv6 packets.

value: Specifies the precedence for IPv6 packets. Eight precedence values (0 to 7) are available. Each precedence value corresponds to a precedence type, as shown in Table 1. You can set either a precedence value or a precedence type for IPv6 packets.

Table 1 IP precedences and the corresponding types

Precedence value	Precedence type
0	routine
1	priority
2	immediate
3	flash
4	flash-override

Precedence value	Precedence type
5	critical
6	internet
7	network

Examples

Set the precedence to 5 (critical) for IPv6 packets.

```
<Sysname> system-view
[Sysname]ipv6 policy-based-route aa permit node 11
[Sysname-pbr6-aa-11] apply precedence critical
```

apply remark-vpn

Use **apply remark-vpn** to enable VPN remark action.

Use **undo apply remark-vpn** to restore the default.

Syntax

apply remark-vpn

undo apply remark-vpn

Default

VPN remark action is not configured.

Views

IPv6 policy node view

Predefined user roles

network-admin

context-admin

Usage guidelines

VPN remark action marks the matching packets as belonging to the VPN instance to which they are forwarded based on the **apply access-vpn vpn-instance** command. All subsequent service modules of IPv6 PBR handle the packets as belonging to the re-marked VPN instance.

If the VPN remark action is not enabled, the forwarded matching packets are marked as belonging to the VPN instance or the public network from which they were received.

VPN remark action applies only to packets that have been successfully forwarded based on the **apply access-vpn vpn-instance** command.

Examples

Forward packets that match ACL 3000 based on the forwarding table of VPN instance **vpn1** and perform VPN remark action on the successfully forwarded packets.

```
<Sysname> system-view
[Sysname] ipv6 policy-based-route aaa permit node 10
[Sysname-pbr6-aaa-10] if-match acl 3000
[Sysname-pbr6-aaa-10] apply access-vpn vpn-instance vpn1
[Sysname-pbr6-aaa-10] apply remark-vpn
```

Related commands

apply access-vpn vpn-instance

display ipv6 policy-based-route

Use **display ipv6 policy-based-route** to display IPv6 PBR policy information.

Syntax

display ipv6 policy-based-route [**policy** *policy-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

policy *policy-name*: Specifies a policy by its name, a case-sensitive string of 1 to 19 characters. If you do not specify a policy, this command displays information for all IPv6 PBR policies.

Examples

Display all IPv6 policy information.

```
<Sysname> display ipv6 policy-based-route
Policy name: aaa
  node 1 permit:
    if-match acl 2000
    apply next-hop 1000::1
```

Table 2 Command output

Field	Description
node 1 permit	The match mode of Node 1 is **permit**.
if-match acl	Compares IPv6 packets with IPv6 ACL.
apply next-hop	Specifies a next hop for permitted IPv6 packets.

Related commands

ipv6 policy-based-route (system view)

display ipv6 policy-based-route interface

Use **display ipv6 policy-based-route interface** to display IPv6 interface PBR configuration and statistics.

Syntax

display ipv6 policy-based-route interface *interface-type interface-number* [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

interface-type interface-number: Specifies an interface by its type and number.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays IPv6 interface PBR configuration and statistics for the master device.

Examples

Display IPv6 PBR configuration and statistics on GigabitEthernet 1/0/1.

```
<Sysname> display ipv6 policy-based-route interface gigabitethernet 1/0/1
Policy based routing information for interface GigabitEthernet1/0/1(failed):
Policy name: aaa
  node 0 deny:
  Matched: 0
  node 1 permit:
    if-match acl 3999
  Matched: 0
  node 2 permit:
    if-match acl 2000
    apply next-hop 1000::1
    apply output-interface GigabitEthernet1/0/2 track 1 (down)
    apply output-interface GigabitEthernet1/0/3 track 2 (inactive)
  Matched: 0
  node 5 permit:
    if-match acl 3101
    apply next-hop 1000::1
  Matched: 0
Total matched: 0
```

Table 3 Command output

Field	Description
Policy based routing information for interface *XXXX*(failed)	IPv6 PBR configuration and statistics on the interface. This field displays **failed** in brackets if none of the nodes in the policy has been successfully issued to the driver. To issue the policy, you must remove the policy from the interface and then apply it on the interface again. **NOTE:** The **failed** status is available on a per-slot basis. To obtain this information, you must specify a slot number when you execute the command. • For a global interface (for example, a VLAN interface), which might have member physical interfaces on multiple slots, specify

Field	Description
	a slot that contains its member interfaces. • For a physical interface, specify its slot number.
node 0 deny(not support) node 2 permit(no resource)	Match mode of the node, **permit** or **deny**. If a node fails to be issued to the driver, the command displays the cause in brackets, which include: • **not support**—The device does not support the match criteria configured on the node. • **no resource**—No sufficient resources (for example, ACLs) are available for the node. **NOTE:** The cause is available only on a per-slot basis. To obtain this information, you must specify a slot number when you execute the command. • For a global interface (for example, a VLAN interface), which might have member physical interfaces on multiple slots, specify a slot that contains its member interfaces. • For a physical interface, specify its slot number.
if-match acl	Compares IPv6 packets with the IPv6 ACL.
apply next-hop	Specifies a next hop for permitted IPv6 packets.
apply output-interface track 1 (down)	Specifies an output interface for permitted packets. The interface status includes the following: • **down**—The interface is down at network layer. • **inactive**—The interface is not in position.
Matched: 0 (no statistics resource)	Number of successful matches on the node. If the device does not have sufficient resources to count matches, this field displays **no statistics resource** in brackets. **NOTE:** The statistics collection failure cause is available only on a per-slot basis. To obtain this information, you must specify a slot number when you execute the command. • For a global interface (for example, a VLAN interface), which might have member physical interfaces on multiple slots, specify a slot that contains its member interfaces. • For a physical interface, specify its slot number.
Total matched	Total number of successful matches on all nodes.

Display IPv6 PBR configuration.

```
<Sysname> display ipv6 policy-based-route setup
Policy name             Type              Interface
pr01                    Forward           GigabitEthernet 1/0/1
pr02                    Local             N/A
```

Table 5 Command output

Field	Description
Policy name	IPv6 PBR policy name.
Type	Type of the IPv6 PBR: • **Forward**—IPv6 interface PBR. • **Local**—IPv6 local PBR.
Interface	Interface where the policy is applied. This field displays **N/A** for an IPv6 local PBR policy.

if-match acl

Use **if-match acl** to set an ACL match criterion.

Use **undo if-match acl** to restore the default.

Syntax

if-match acl { *ipv6-acl-number* | **name** *ipv6-acl-name* }

undo if-match acl

Default

No ACL match criterion is set.

Views

IPv6 policy node view

Predefined user roles

network-admin

context-admin

Parameters

ipv6-acl-number: Specifies an IPv6 ACL by its number in the range of 2000 to 3999. The value range of a basic ACL is 2000 to 2999 and that of an advanced ACL is 3000 to 3999.

name *ipv6-acl-name*: Specifies an IPv6 ACL by its name, a case-insensitive string of 1 to 63 characters starting with a letter. The ACL name cannot be **all**. For the command to take effect, make sure the specified IPv6 ACL is a basic or advanced ACL.

Usage guidelines

If the specified ACL does not exist or has no rules configured, no packets will match the ACL.

If the **vpn-instance** keyword is specified for an ACL rule, the rule applies to only VPN packets. If the **vpn-instance** keyword is not specified, the rule applies to only public network packets.

Examples

Configure Node 10 of policy **aa** to permit the packets matching ACL 2000.

```
<Sysname> system-view
[Sysname] ipv6 policy-based-route aa permit node 10
[Sysname-pbr6-aa-10] if-match acl 2000
```

Configure Node 10 of policy **aa** to permit the packets matching ACL **aaa**.

```
<Sysname> system-view
[Sysname] ipv6 policy-based-route aa permit node 10
[Sysname-pbr6-aa-10] if-match acl name aaa
```

if-match packet-length

Use **if-match packet-length** to set an IPv6 packet length match criterion.

Use **undo if-match packet-length** to restore the default.

Syntax

if-match packet-length *min-len max-len*

undo if-match packet-length

Default

No packet length match criterion is set.

Views

IPv6 policy node view

Predefined user roles

network-admin

context-admin

Parameters

min-len: Specifies the minimum IPv6 packet length in the range of 1 to 65535 bytes.

max-len: Specifies the maximum IP packet length in the range of 1 to 65535 bytes. The maximum length must be no less than the minimum length.

Usage guidelines

The packet length range includes boundary values. For example, if you set the *min-len* and *max-len* arguments to 100 and 200, respectively, packets with lengths of 100 bytes and 200 bytes are also matched.

Examples

Match packets with a length from 100 to 200 bytes.

```
<Sysname> system-view
[Sysname] ipv6 policy-based-route aa permit node 11
[Sysname-pbr6-aa-11] if-match packet-length 100 200
```

ipv6 local policy-based-route

Use **ipv6 local policy-based-route** to configure IPv6 local PBR based on a specified policy.

Use **undo ipv6 local policy-based-route** to restore the default.

Syntax

ipv6 local policy-based-route *policy-name*

undo ipv6 local policy-based-route

Default

No policy is specified for IPv6 local PBR.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

policy-name: Specifies a policy by its name, a case-sensitive string of 1 to 19 characters. The specified IPv6 policy must already exist.

Usage guidelines

You can apply only one policy locally. Before you apply a new policy, you must first remove the current policy.

IPv6 local PBR is used to route locally generated packets except the packets destined for the sender. This feature might affect local services. Do not configure IPv6 local PBR unless doing so is required.

Examples

Configure IPv6 local PBR based on policy **aaa**.

```
<Sysname> system-view
[Sysname] ipv6 local policy-based-route aaa
```

Related commands

display ipv6 policy-based-route local

ipv6 policy-based-route (interface view)

Use **ipv6 policy-based-route** to configure IPv6 interface PBR by applying an IPv6 policy to an interface.

Use **undo ipv6 policy-based-route** to restore the default.

Syntax

ipv6 policy-based-route *policy-name*

undo ipv6 policy-based-route

Default

No IPv6 is applied to an interface.

Views

Interface view

Predefined user roles

network-admin

context-admin

Parameters

policy-name: Specifies a policy by its name, a case-sensitive string of 1 to 19 characters. The specified policy must already exist.

Examples

Apply policy **aaa** to GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] ipv6 policy-based-route aaa
```

Related commands

display ipv6 policy-based-route interface

ipv6 policy-based-route (system view)

Use **ipv6 policy-based-route** to create an IPv6 policy node and enter its view, or enter the view of an existing IPv6 policy node.

Use **undo ipv6 policy-based-route** to delete an IPv6 policy or IPv6 policy node.

Syntax

ipv6 policy-based-route *policy-name* [**deny** | **permit**] **node** *node-number*

undo ipv6 policy-based-route *policy-name* [**deny** | **node** *node-number* | **permit**]

Default

No IPv6 policy nodes exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

policy-name: Specifies a policy name, a case-sensitive string of 1 to 19 characters.

deny: Specifies the match mode for the policy node as **deny**.

permit: Specifies the match mode for the policy node as **permit** (default mode).

node *node-number*: Specifies the number of the IPv6 policy node. A smaller number has a higher priority. The value range for the *node-number* argument is 0 to 65535.

Usage guidelines

To delete an IPv6 policy that has already applied to an interface, you must delete the policy from the interface first.

If a policy node is specified, the **undo ipv6 policy-based-route** command deletes the specified policy node. If a match mode is specified, the command deletes all nodes configured with the match mode. If no node is specified, the command deletes the whole policy.

Examples

Create permit-mode Node 10 for IPv6 policy **aaa** and enter its view.

```
<Sysname> system-view
[Sysname] ipv6 policy-based-route aaa permit node 10
[Sysname-pbr6-aaa-10]
```

Related commands

display ipv6 policy-based-route

reset ipv6 policy-based-route statistics

Use **reset ipv6 policy-based-route statistics** to clear IPv6 PBR statistics.

Syntax

reset ipv6 policy-based-route statistics [**policy** *policy-name*]

Views

User view

Predefined user roles

network-admin

context-admin

Parameters

policy *policy-name*: Specifies a policy by its name, a case-sensitive string of 1 to 19 characters. If you do not specify a policy, this command clears IPv6 PBR statistics for all policies.

Examples

Clear all IPv6 PBR statistics.

```
<Sysname> reset ipv6 policy-based-route statistics
```

Routing policy commands

Common routing policy commands

apply as-path

Use **apply as-path** to set the AS_PATH attribute for BGP routes.

Use **undo apply as-path** to restore the default.

Syntax

apply as-path *as-number*&<1-32> [**replace**]

undo apply as-path

Default

No AS_PATH attribute is set.

Views

Routing policy node view

Predefined user roles

network-admin

context-admin

Parameters

as-number&<1-32>: Specifies an AS by its number in the range of 1 to 4294967295. &<1-32> indicates that you can specify a maximum of 32 AS numbers.

replace: Replaces the original AS numbers. If you do not specify this keyword, the command adds the specified AS numbers before the original AS_PATH attribute.

Examples

Configure node 10 in **permit** mode for routing policy **policy1** to add AS number 200 before the original AS_PATH attribute of BGP routes matching AS path list 1.

```
<Sysname> system-view
[Sysname] route-policy policy1 permit node 10
[Sysname-route-policy-policy1-10] if-match as-path 1
[Sysname-route-policy-policy1-10] apply as-path 200
```

apply comm-list delete

Use **apply comm-list delete** to delete the COMMUNITY attributes from BGP routes.

Use **undo apply comm-list** to restore the default.

Syntax

apply comm-list { *comm-list-number* | *comm-list-name* } **delete**

undo apply comm-list

Default

No COMMUNITY attributes are deleted from BGP routes.

Views

Routing policy node view

Predefined user roles

network-admin

context-admin

Parameters

comm-list-number: Specifies a basic community list by its number in the range of 1 to 99 or an advanced community list by its number in the range of 100 to 199.

comm-list-name: Specifies a community list by its name, a case-sensitive string of 1 to 63 characters that cannot contain only numbers.

Examples

Configure node 10 in **permit** mode for routing policy **policy1** to delete the COMMUNITY attributes specified in community list 1 from BGP routes.

```
<Sysname> system-view
[Sysname] route-policy policy1 permit node 10
[Sysname-route-policy-policy1-10] apply comm-list 1 delete
```

Related commands

ip community-list

apply community

Use **apply community** to set the COMMUNITY attribute for BGP routes.

Use **undo apply community** to remove the specified COMMUNITY attribute for BGP routes.

Syntax

apply community { **none** | **additive** | { *community-number*&<1-32> | *aa:nn*&<1-32> | **internet** | **no-advertise** | **no-export** | **no-export-subconfed** } * [**additive**] }

undo apply community [**none** | **additive** | { *community-number*&<1-32> | *aa:nn*&<1-32> | **internet** | **no-advertise** | **no-export** | **no-export-subconfed** } * [**additive**]]

Default

No COMMUNITY attribute is set for BGP routes.

Views

Routing policy node view

Predefined user roles

network-admin

context-admin

Parameters

none: Removes the COMMUNITY attributes of BGP routes.

community-number&<1-32>: Specifies a community sequence number in the range of 1 to 4294967295. &<1-32> indicates that you can specify a maximum of 32 community sequence numbers.

aa:nn&<1-32>: Specifies a community number. Both *aa* and *nn* are in the range of 0 to 65535. &<1-32> indicates that you can specify a maximum of 32 community numbers.

internet: Sets the INTERNET community attribute for BGP routes. Routes with this attribute can be advertised to all BGP peers. By default, all routes have this attribute.

no-advertise: Sets the NO_ADVERTISE community attribute for BGP routes. Routes with this attribute cannot be advertised to any peers.

no-export: Sets the NO_EXPORT community attribute for BGP routes. Routes with this attribute cannot be advertised out of the AS or confederation, but can be advertised to other sub-ASs in the confederation.

no-export-subconfed: Sets the NO_EXPORT_SUBCONFED community attribute for BGP routes. Routes with this attribute cannot be advertised out of the local AS or to other sub-ASs in the confederation.

additive: Adds the specified COMMUNITY attribute to the original COMMUNITY attribute of BGP routes.

Examples

Configure node 16 in **permit** mode for routing policy **setcommunity** to set the NO_EXPORT community attribute for BGP routes.

```
<Sysname> system-view
[Sysname] route-policy setcommunity permit node 16
[Sysname-route-policy-setcommunity-16] apply community no-export
```

Related commands

if-match community

ip community-list

apply cost

Use **apply cost** to set a cost for routes.

Use **undo apply cost** to restore the default.

Syntax

apply cost [**+** | **-**] *cost-value*

undo apply cost

Default

No cost is set for routes.

Views

Routing policy node view

Predefined user roles

network-admin

context-admin

Parameters

+: Increases a cost value.

-: Decreases a cost value.

cost-value: Specifies a cost in the range of 0 to 4294967295.

Examples

Configure node 10 in **permit** mode for routing policy **policy1** to set a cost of 120 for OSPF external routes.

```
<Sysname> system-view
[Sysname] route-policy policy1 permit node 10
[Sysname-route-policy-policy1-10] if-match route-type external-type1or2
[Sysname-route-policy-policy1-10] apply cost 120
```

apply cost-type

Use **apply cost-type** to set a cost type for routes.

Use **undo apply cost-type** to restore the default.

Syntax

apply cost-type { **external** | **internal** | **type-1** | **type-2** }

undo apply cost-type

Default

No cost type is set for routes.

Views

Routing policy node view

Predefined user roles

network-admin

context-admin

Parameters

external: Sets the cost type to IS-IS external route.

internal: Sets the cost type to IS-IS internal route, or sets the MED value for a matching BGP route to the IGP metric of the route's next hop.

type-1: Sets the cost type to OSPF Type-1 external route.

type-2: Sets the cost type to OSPF Type-2 external route.

Usage guidelines

For IS-IS, the **apply cost-type internal** command sets the cost type for a matching IS-IS route to IS-IS internal route.

For BGP, the **apply cost-type internal** command sets the MED for a matching BGP route learned from an IBGP peer to the IGP metric of the route's next hop. The MED is modified when BGP advertises the route to an EBGP peer.

Examples

Configure node 10 in **permit** mode for routing policy **policy1** to set the cost type for routes that have a tag of 8 to OSPF Type-1 external routes.

```
<Sysname> system-view
```

```
[Sysname] route-policy policy1 permit node 10
[Sysname-route-policy-policy1-10] if-match tag 8
[Sysname-route-policy-policy1-10] apply cost-type type-1
```

apply extcommunity

Use **apply extcommunity** to set the extended community attribute for BGP routes.

Use **undo apply extcommunity** to remove the extended community attribute for BGP routes.

Syntax

apply extcommunity { **rt** *route-target* }&<1-32> [**additive**]

undo apply extcommunity [{ **rt** *route-target* }&<1-32>]

Default

No extended community attribute is set for BGP routes.

Views

Routing policy node view

Predefined user roles

network-admin

context-admin

Parameters

{ **rt** *route-target* }&<1-32>: Sets the RT extended community attribute, a string of 3 to 21 characters. &<1-32> indicates that you can specify a maximum of 32 RT extended community attributes.

An RT attribute has the following forms:

- *16-bit AS number*:*32-bit self-defined number*. For example, 101:3. The AS number is in the range of 0 to 65535, and the self-defined number is in the range of 0 to 4294967295.
- *32-bit IP address*:*16-bit self-defined number*. For example, 192.168.122.15:1. The self-defined number is in the range of 0 to 65535.
- *32-bit AS number*:*16-bit self-defined number*. For example, 70000:3. The AS number is in the range of 65536 to 4294967295, and the self-defined number is in the range of 0 to 65535.

additive: Adds the specified attribute to the original extended community attribute.

Examples

Configure node 10 in **permit** mode for routing policy **policy1** to add the RT extended community attribute 100:2 to BGP routes matching AS path list 1.

```
<Sysname> system-view
[Sysname] route-policy policy1 permit node 10
[Sysname-route-policy-policy1-10] if-match as-path 1
[Sysname-route-policy-policy1-10] apply extcommunity rt 100:2 additive
```

apply ip-precedence

Use **apply ip-precedence** to set an IP precedence for matching routes.

Use **undo apply ip-precedence** to restore the default.

Syntax

apply ip-precedence { *value* | **clear** }

undo apply ip-precedence

Default

No IP precedence is set.

Views

Routing policy node view

Predefined user roles

network-admin

context-admin

Parameters

value: Specifies an IP precedence in the range of 0 to 7.

clear: Clears the IP precedence of matching routes.

Examples

Configure node 10 in **permit** mode for routing policy **policy1** to set an IP precedence of 3 for routes matching prefix list 100.

```
<Sysname> system-view
[Sysname] ip prefix-list 100 permit 192.168.10.1 24
[Sysname] route-policy policy1 permit node 10
[Sysname-route-policy-policy1-10] if-match ip address prefix-list 100
[Sysname-route-policy-policy1-10] apply ip-precedence 3
```

apply isis

Use **apply isis** to redistribute routes into the specified IS-IS level.

Use **undo apply isis** to restore the default.

Syntax

apply isis { **level-1** | **level-1-2** | **level-2** }

undo apply isis

Default

No IS-IS level is set.

Views

Routing policy node view

Predefined user roles

network-admin

context-admin

Parameters

level-1: Redistributes routes into IS-IS Level-1.

level-1-2: Redistributes routes into both IS-IS Level-1 and Level-2.

level-2: Redistributes routes into IS-IS Level-2.

Examples

Configure node 10 in **permit** mode for routing policy **policy1** to redistribute routes that have a tag of 8 to IS-IS level-2.

```
<Sysname> system-view
[Sysname] route-policy policy1 permit node 10
[Sysname-route-policy-policy1-10] if-match tag 8
[Sysname-route-policy-policy1-10] apply isis level-2
```

apply local-preference

Use **apply local-preference** to set a local preference for BGP routes.

Use **undo apply local-preference** to restore the default.

Syntax

apply local-preference *preference*

undo apply local-preference

Default

No local preference is set for BGP routes.

Views

Routing policy node view

Predefined user roles

network-admin

context-admin

Parameters

preference: Specifies a local preference in the range of 0 to 4294967295.

Examples

Configure node 10 in **permit** mode for routing policy **policy1** to set a local preference of 130 for BGP routes matching AS path list 1.

```
<Sysname> system-view
[Sysname] route-policy policy1 permit node 10
[Sysname-route-policy-policy1-10] if-match as-path 1
[Sysname-route-policy-policy1-10] apply local-preference 130
```

apply origin

Use **apply origin** to set the ORIGIN attribute for BGP routes.

Use **undo apply origin** to restore the default.

Syntax

apply origin { **egp** *as-number* | **igp** | **incomplete** }

undo apply origin

Default

No ORIGIN attribute is set for BGP routes.

Views

Routing policy node view

Predefined user roles

network-admin

context-admin

Parameters

egp *as-number*: Sets the ORIGIN attribute to EGP. The *as-number* argument specifies an AS number in the range 1 to 4294967295 for EGP routes.

igp: Sets the ORIGIN attribute to IGP.

incomplete: Sets the ORIGIN attribute to UNKNOWN.

Examples

Configure node 10 in **permit** mode for routing policy **policy1** to set the ORIGIN attribute to IGP for BGP routes matching AS path list 1.

```
<Sysname> system-view
[Sysname] route-policy policy1 permit node 10
[Sysname-route-policy-policy1-10] if-match as-path 1
[Sysname-route-policy-policy1-10] apply origin igp
```

apply preference

Use **apply preference** to set a preference for a routing protocol.

Use **undo apply preference** to restore the default.

Syntax

apply preference *preference*

undo apply preference

Default

No preference is set for a routing protocol.

Views

Routing policy node view

Predefined user roles

network-admin

context-admin

Parameters

preference: Specifies a preference in the range of 1 to 255.

Usage guidelines

If you have set preferences for routing protocols by using the **preference** command, the **apply preference** command sets a new preference for the matching routing protocol. Unmatched routing protocols still use the preferences set by using the **preference** command.

Examples

Configure node 10 in **permit** mode for routing policy **policy1** to set the preference for OSPF external routes to 90.

```
<Sysname> system-view
[Sysname] route-policy policy1 permit node 10
[Sysname-route-policy-policy1-10] if-match route-type external-type1or2
[Sysname-route-policy-policy1-10] apply preference 90
```

apply preferred-value

Use **apply preferred-value** to set a preferred value for BGP routes.

Use **undo apply preferred-value** to restore the default.

Syntax

apply preferred-value *preferred-value*

undo apply preferred-value

Default

No preferred value is set for BGP routes.

Views

Routing policy node view

Predefined user roles

network-admin

context-admin

Parameters

preferred-value: Specifies a preferred value in the range of 0 to 65535.

Examples

Configure node 10 in **permit** mode for routing policy **policy1** to set a preferred value of 66 for BGP routes matching AS path list 1.

```
<Sysname> system-view
[Sysname] route-policy policy1 permit node 10
[Sysname-route-policy-policy1-10] if-match as-path 1
[Sysname-route-policy-policy1-10] apply preferred-value 66
```

apply prefix-priority

Use **apply prefix-priority** to set a prefix priority for routes.

Use **undo apply prefix-priority** to restore the default.

Syntax

apply prefix-priority { **critical** | **high** | **medium** }

undo apply prefix-priority

Default

No prefix priority is set, which means the prefix priority is low.

Views

Routing policy node view

Predefined user roles

network-admin

context-admin

Parameters

critical: Sets the critical prefix priority for routes.

high: Sets the high prefix priority for routes.

medium: Sets the medium prefix priority for routes.

Examples

Configure node 10 in **permit** mode for routing policy **policy1** to set prefix priority **critical** for routes matching prefix list **abc**.

```
<Sysname> system-view
[Sysname] route-policy policy1 permit node 10
[Sysname-route-policy-policy1-10] if-match ip address prefix-list abc
[Sysname-route-policy-policy1-10] apply prefix-priority critical
```

apply qos-local-id

Use **apply qos-local-id** to set a local QoS ID for matching routes.

Use **undo apply qos-local-id** to restore the default.

Syntax

apply qos-local-id { *local-id-value* | **clear** }

undo apply qos-local-id

Default

No local QoS ID is set.

Views

Routing policy node view

Predefined user roles

network-admin

context-admin

Parameters

local-id-value: Specifies a local QoS ID in the range of 1 to 4095.

clear: Clears the local QoS ID of matching routes.

Examples

Configure node 10 in **permit** mode for routing policy **policy1** to set a local QoS ID of 100 for routes matching prefix list 100.

```
<Sysname> system-view
[Sysname] ip prefix-list 100 permit 192.168.10.1 24
[Sysname] route-policy policy1 permit node 10
[Sysname-route-policy-policy1-10] if-match ip address prefix-list 100
[Sysname-route-policy-policy1-10] apply qos-local-id 100
```

apply tag

Use **apply tag** to set a tag for IGP routes.

Use **undo apply tag** to restore the default.

Syntax

apply tag *tag-value*

undo apply tag

Default

No routing tag is set for IGP routes.

Views

Routing policy node view

Predefined user roles

network-admin

context-admin

Parameters

tag-value: Specifies the tag value in the range of 0 to 4294967295.

Examples

Configure node 10 in **permit** mode for routing policy **policy1** to set a tag of 100 for IGP routes.

```
<Sysname> system-view
[Sysname] route-policy policy1 permit node 10
[Sysname-route-policy-policy1-10] apply tag 100
```

apply traffic-index

Use **apply traffic-index** to set a traffic index for BGP routes.

Use **undo apply traffic-index** to restore the default.

Syntax

apply traffic-index { *value* | **clear** }

undo apply traffic-index

Default

No traffic index is set for BGP routes.

Views

Routing policy node view

Predefined user roles

network-admin

context-admin

Parameters

value: Specifies the traffic index in the range of 1 to 64.

clear: Clear the traffic index of BGP routes.

Examples

Configure node 10 in **permit** mode for routing policy **policy1** to set a traffic index of 6 for BGP routes matching extended community list 100.

```
<Sysname> system-view
```

```
[Sysname] ip extcommunity-list 100 permit rt 100:100
[Sysname] route-policy policy1 permit node 10
[Sysname-route-policy-policy1-10] if-match extcommunity 100
[Sysname-route-policy-policy1-10] apply traffic-index 6
```

continue

Use **continue** to specify the next node to be matched.

Use **undo continue** to restore the default.

Syntax

continue [*node-number*]

undo continue

Default

No next node is specified.

Views

Routing policy node view

Predefined user roles

network-admin

context-admin

Parameters

node-number: Specifies the routing policy node number in the range of 0 to 65535.

Usage guidelines

The specified next node must have a larger number than the current node.

Example

Specify the next node 20 for node 10 of the routing policy **policy1**.

```
<Sysname> system-view
[Sysname] route-policy policy1 permit node 10
[Sysname-route-policy-policy1-10] continue 20
```

description

Use **description** to configure a description for a routing policy node.

Use **undo description** to restore the default.

Syntax

description *text*

undo description

Default

No description is configured for a routing policy node.

Views

Routing policy node view

Predefined user roles

network-admin

context-admin

Parameters

text: Specifies a description for the routing policy node, a case-sensitive string of 1 to 80 characters.

Examples

Configure node 10 in **permit** mode for routing policy **policy1** and configure **aa** as the description for the node.

```
<Sysname> system-view
[Sysname] route-policy policy1 permit node 10
[Sysname-route-policy-policy1-10] description aa
```

display ip as-path

Use **display ip as-path** to display BGP AS path list information.

Syntax

display ip as-path [*as-path-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

as-path-number: Specifies an AS path list by its number in the range of 1 to 256. If you do not specify this argument, the command displays information about all BGP AS path lists.

Examples

Display information about BGP AS path list 1.

```
<Sysname> display ip as-path 1
ListID    Mode      Expression
1         Permit    2
```

Table 1 Command output

Field	Description
ListID	AS path list ID.
Mode	Match mode: • **Permit**. • **Deny**.
Expression	Regular expression used to match routes.

display ip community-list

Use **display ip community-list** to display BGP community list information.

Syntax

display ip community-list [*basic-community-list-number* | *adv-community-list-number* | **name** *comm-list-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

basic-community-list-number: Specifies a basic community list by its number in the range of 1 to 99.

adv-community-list-number: Specifies an advanced community list by its number in the range of 100 to 199.

name *comm-list-name*: Specifies a community list by its name, a case-sensitive string of 1 to 63 characters that cannot contain only numbers.

Usage guidelines

If no community list is specified, this command displays information about all BGP community lists.

Examples

Display information about all BGP community lists.

```
<Sysname> display ip community-list
Community List Basic aaa
        Permit
Community List Advanced bbb
        Permit  3333
```

Table 2 Command output

Field	Description
Community List Basic	Basic community list.
Community List Advanced	Advanced community list.
permit	Match mode: • **Permit**. • **Deny**.

display ip extcommunity-list

Use **display ip extcommunity-list** to display BGP extended community list information.

Syntax

display ip extcommunity-list [*ext-comm-list-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

ext-comm-list-number: Specifies an extended community list by its number in the range of 1 to 65535. If you do not specify this argument, the command displays information about all BGP extended community lists.

Examples

Display information about BGP extended community list 1.

```
<Sysname> display ip extcommunity-list 1
Extended Community List Number 1
        Index: 1          Mode:Permit RT: 3:1 SoO: 3:2
        Index: 2          Mode:Permit RT: 3:1 SoO: 3:2 SoO: 5:2
        Index: 3          Mode:Permit RT: 3:1 SoO: 3:2 RT: 6:7
```

Table 3 Command output

Field	Description
Extended Community List Number	Extended community list.
Index	Index of the extended community list entry.
Mode	Match mode: • Permit. • Deny.
rt	Route Target (RT) extended community attribute.
soo	Site of Origin (SoO) extended community attribute.

display ip rd-list

Use **display ip rd-list** to display route distinguisher (RD) list information.

Syntax

display ip rd-list [*rd-list-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

rd-list-number: Displays information about an RD list. The *rd-list-number* argument represents the number of the RD list, in the range of 1 to 65535. If you do not specify an RD list, this command displays information about all RD lists.

Examples

Display information about all RD lists.

```
<Sysname> display ip rd-list
Route Distinguisher List Number 1
        index: 1          Permit 1.1.1.1:1 2.2.2.2:* 100:1 200:*
Route Distinguisher List Number 2
        index: 2          Deny   1:1 2:2
```

Table 4 Command output

context-operator

Parameters

`name` *`route-policy-name`*: Specifies a routing policy by its name, a case-sensitive string of 1 to 63 characters. If you do not specify this option, the command displays information about all routing policies.

Examples

Display information about routing policy **policy1**.

```
<Sysname> display route-policy name policy1
Route-policy: policy1
  Permit : 1
          Description: policy1
          if-match cost 10
          continue: next node 11
          apply preference 10
```

Table 6 Command output

Field	Description
Route-policy	Routing policy name.
permit	Match mode: • **Permit**. • **Deny**.
Description	Routing policy description.
if-match	Match criterion.
continue	Specify the next node to be matched.
apply	Action.

if-match as-path

Use **if-match as-path** to match BGP routes whose AS_PATH attribute matches a specified AS path list.

Use **undo if-match as-path** to remove the specified AS path list match criterion.

Syntax

if-match as-path *as-path-number*&<1-32>

undo if-match as-path [*as-path-number*&<1-32>]

Default

No AS path list match criterion is configured.

Views

Routing policy node view

Predefined user roles

network-admin

context-admin

Parameters

as-path-number&<1-32>: Specifies an AS path list by its number in the range of 1 to 256. &<1-32> indicates that you can specify a maximum of 32 AS path lists.

Examples

Configure AS path list 2 to permit BGP routes containing AS number 200 or 300 to pass. Configure node 10 in **permit** mode for routing policy **test** to match AS path list 2.

```
<Sysname> system-view
[Sysname] ip as-path 2 permit _*200.*300
[Sysname] route-policy test permit node 10
[Sysname-route-policy-policy1-10] if-match as-path 2
```

apply as-path

ip as-path

if-match community

Use **if-match community** to match BGP routes whose COMMUNITY attribute matches a specified community list.

Use **undo if-match community** to remove the specified community list match criterion.

Syntax

if-match community { { *basic-community-list-number* | **name** *comm-list-name* } [**whole-match**] | *adv-community-list-number* }&<1-32>

undo if-match community [{ *basic-community-list-number* | **name** *comm-list-name* } [**whole-match**] | *adv-community-list-number*]&<1-32>

Default

No community list match criterion is configured.

Views

Routing policy node view

Predefined user roles

network-admin

context-admin

Parameters

basic-community-list-number: Specifies a basic community list by its number in the range of 1 to 99.

adv-community-list-number: Specifies an advanced community list by its number in the range of 100 to 199.

comm-list-name: Specifies a community list by its name, a case-sensitive string of 1 to 63 characters that cannot contain only numbers.

whole-match: Exactly matches the specified community list. All of the communities and only those communities specified must be present.

&<1-32>: Indicates that you can specify a maximum of 32 community lists.

Examples

Configure community list 1 to permit BGP routes with community number 100 or 200. Then configure node 10 in **permit** mode for routing policy **test** to use community list 1 to match BGP routes.

```
<Sysname> system-view
[Sysname] ip community-list 1 permit 100 200
[Sysname] route-policy test permit node 10
[Sysname-route-policy-test-10] if-match community 1
```

Related commands

apply community

ip community-list

if-match cost

Use **if-match cost** to match routes that have the specified cost.

Use **undo if-match cost** to restore the default.

Syntax

if-match cost *cost-value*

undo if-match cost

Default

No cost match criterion is configured.

Views

Routing policy node view

Predefined user roles

network-admin

context-admin

Parameters

cost-value: Specifies a cost in the range of 0 to 4294967295.

Examples

Configure node 10 in **permit** mode for routing policy **policy1** to permit routes with a cost of 8.

```
<Sysname> system-view
[Sysname] route-policy policy1 permit node 10
[Sysname-route-policy-policy1-10] if-match cost 8
```

if-match extcommunity

Use **if-match extcommunity** to match BGP routes whose extended community attribute matches a specified extended community list.

Use **undo if-match extcommunity** to remove the specified extended community list match criterion.

Syntax

if-match extcommunity *ext-comm-list-number*&<1-32>

undo if-match extcommunity [*ext-comm-list-number*&<1-32>]

Default

No extended community list match criterion is configured.

Views

Routing policy node view

Predefined user roles

network-admin

apply extcommunity

ip extcommunity-list

if-match interface

Use **if-match interface** to match routes that have the specified output interfaces.

Use **undo if-match interface** to remove the specified output interface match criterion.

Syntax

if-match interface { *interface-type interface-number* }&<1-16>

undo if-match interface [*interface-type interface-number*]&<1-16>

Default

No output interface match criterion is configured.

Views

Routing policy node view

Predefined user roles

network-admin

context-admin

Parameters

interface-type interface-number: Specifies an interface by its type and number.

&<1-16>: Indicates that you can specify a maximum of 16 interfaces.

Usage guidelines

BGP does not support criteria for matching the output interfaces of routes.

Examples

Configure node 10 in **permit** mode for routing policy **policy1** to permit routes with the output interface GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] route-policy policy1 permit node 10
[Sysname-route-policy-policy1-10] if-match interface gigabitethernet 1/0/1
```

if-match local-preference

Use **if-match local-preference** to match BGP routes that have the specified local preference.

Use **undo if-match local-preference** to restore the default.

Syntax

if-match local-preference *preference*

undo if-match local-preference

Default

No local preference match criterion is configured.

Views

Routing policy node view

Predefined user roles

network-admin

if-match route-type

Use **if-match route-type** to set a route-type match criterion.

Use **undo if-match route-type** to remove the specified route-type match criterion.

Syntax

if-match route-type { **external-type1** | **external-type1or2** | **external-type2** | **internal** | **is-is-level-1** | **is-is-level-2** | **nssa-external-type1** | **nssa-external-type1or2** | **nssa-external-type2** } *

undo if-match route-type [**external-type1** | **external-type1or2** | **external-type2** | **internal** | **is-is-level-1** | **is-is-level-2** | **nssa-external-type1** | **nssa-external-type1or2** | **nssa-external-type2**] *

Default

No route-type match criterion is set.

Views

Routing policy node view

Predefined user roles

network-admin

context-admin

Parameters

external-type1: Matches OSPF Type 1 external routes.

external-type1or2: Matches OSPF Type 1 and Type 2 external routes.

external-type2: Matches OSPF Type 2 external routes.

internal: Matches OSPF internal routes (including OSPF intra-area and inter-area routes).

is-is-level-1: Matches IS-IS Level-1 routes.

is-is-level-2: Matches IS-IS Level-2 routes.

nssa-external-type1: Matches OSPF NSSA Type 1 external routes.

nssa-external-type1or2: Matches OSPF NSSA Type 1 and 2 external routes.

nssa-external-type2: Matches OSPF NSSA Type 2 external routes.

Examples

Configure node 10 in **permit** mode for routing policy **policy1** to match OSPF internal routes.

```
<Sysname> system-view
[Sysname] route-policy policy1 permit node 10
[Sysname-route-policy-policy1-10] if-match route-type internal
```

if-match tag

Use **if-match tag** to match IGP routes that have the specified tag.

Use **undo if-match tag** to restore the default.

Syntax

if-match tag *tag-value*

undo if-match tag

Default

No tag match criterion is configured.

Views

Parameters

as-path-number: Specifies an AS path list number in the range of 1 to 256.

deny: Specifies the match mode for the AS path list as **deny**.

permit: Specifies the match mode for the AS path list as **permit**.

regular-expression: Specifies an AS path regular expression, a string of 1 to 63 characters.

Usage guidelines

BGP routing updates contain an AS_PATH attribute field that identifies the ASs through which the routes have passed. An AS path regular expression, for example, ^200.*100$, matches the AS_PATH attribute that starts with AS 200 and ends with AS 100. For more information about regular expressions, see *Layer 3—IP Routing Configuration Guide*.

Examples

Configure AS path list 1 to permit routes whose AS_PATH attribute starts with 10.

```
<Sysname> system-view
[Sysname] ip as-path 1 permit ^10
```

Related commands

apply as-path

ip community-list

Use **ip community-list** to configure a community list.

Use **undo ip community-list** to remove a community list.

Syntax

ip community-list { *basic-comm-list-num* | **basic** *basic-comm-list-name* } { **deny** | **permit** } [*community-number*&<1-32> | *aa:nn*&<1-32>] [**internet** | **no-advertise** | **no-export** | **no-export-subconfed**] *

undo ip community-list { *basic-comm-list-num* | **basic** *basic-comm-list-name* } [**deny** | **permit**] [*community-number*&<1-32> | *aa:nn*&<1-32>] [**internet** | **no-advertise** | **no-export** | **no-export-subconfed**] *

ip community-list { *adv-comm-list-num* | **advanced** *adv-comm-list-name* } { **deny** | **permit** } *regular-expression*

undo ip community-list { *adv-comm-list-num* | **advanced** *adv-comm-list-name* } [**deny** | **permit**] [*regular-expression*]

Default

No community lists exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

basic-comm-list-num: Specifies a basic community list number in the range of 1 to 99.

basic *basic-comm-list-name*: Specifies a basic community list name, a case-sensitive string of 1 to 63 characters that cannot contain only numbers.

advanced *adv-comm-list-name*: Specifies an advanced community list name, a case-sensitive string of 1 to 63 characters that cannot contain only numbers.

adv-comm-list-num: Specifies an advanced community list number in the range of 100 to 199.

regular-expression: Specifies a regular expression for the advanced community list, a string of 1 to 63 characters. For more information about regular expressions, see routing policy configuration in *Layer 3—IP Routing Configuration Guide*.

deny: Specifies the match mode for the community list as **deny**.

permit: Specifies the match mode for the community list as **permit**.

community-number&<1-32>: Specifies a community sequence number in the range of 1 to 4294967295. &<1-32> indicates that you can specify a maximum of 32 community sequence numbers.

aa:nn&<1-32>: Specifies a community number. Both *aa* and *nn* are in the range of 0 to 65535. &<1-32> indicates that you can specify a maximum of 32 community numbers.

internet: Specifies the INTERNET community attribute. Routes with this attribute can be advertised to all BGP peers. By default, all routes have this attribute.

no-advertise: Specifies the NO_ADVERTISE community attribute. Routes with this attribute cannot be advertised to other BGP peers.

no-export: Specifies the NO_EXPORT community attribute. Routes with this attribute cannot be advertised out of the local AS or the local confederation but can be advertised to other ASs in the confederation.

no-export-subconfed: Specifies the NO_EXPORT_SUBCONFED community attribute. Routes with this attribute cannot be advertised out of the local AS, or to other sub-ASs in the local confederation.

Examples

Configure basic community list 1 to permit routes with the INTERNET community attribute.

```
<Sysname> system-view
[Sysname] ip community-list 1 permit internet
```

Configure advanced community list 100 to permit routes with the COMMUNITY attribute starting with 10.

```
<Sysname> system-view
[Sysname] ip community-list 100 permit ^10
```

Related commands

display ip community-list

if-match community

ip extcommunity-list

Use **ip extcommunity-list** to configure an extended community list.

Use **undo ip extcommunity-list** to remove an extended community list.

Syntax

ip extcommunity-list *ext-comm-list-number* [**index** *index-number*] { **deny** | **permit** } { **rt** *route-target* | **soo** *site-of-origin* }&<1-32>

undo ip extcommunity-list *ext-comm-list-number* [**index** *index-number* | { **deny** | **permit** } [**rt** *route-target* | **soo** *site-of-origin*]&<1-32>]

Default

No extended community lists exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

ext-comm-list-number: Specifies an extended community list number in the range of 1 to 65535.

index *index-number*: Specifies an index for the extended community list entry, in the range of 1 to 4294967295. An extended community list entry with a smaller index number is matched first. If you do not specify this option, the index number starts from 1 and increases by 1 for each of the consecutive extended community list entries.

deny: Specifies the match mode for the extended community list as **deny**.

permit: Specifies the match mode for the extended community list as **permit**.

rt *route-target*: Specifies a space-separated list of up to 32 RT extended community attribute items. Each item is a string of 3 to 21 characters.

soo *site-of-origin*: Specifies a space-separated list of up to 32 SoO extended community attribute items. Each item is a string of 3 to 21 characters.

An RT or SoO attribute has the following forms:

- *16-bit AS number*:*32-bit self-defined number*. For example, 101:3. The AS number is in the range of 0 to 65535, and the self-defined number is in the range of 0 to 4294967295.
- *32-bit IP address*:*16-bit self-defined number*. For example, 192.168.122.15:1. The self-defined number is in the range of 0 to 65535.
- *32-bit AS number*:*16-bit self-defined number*. For example, 70000:3. The AS number is in the range of 65536 to 4294967295, and the self-defined number is in the range of 0 to 65535.

Usage guidelines

If you execute this command multiple times for an extended community list entry, the most recent configuration takes effect.

Examples

Configure extended community list 1 to permit routes with RT 200:200 to pass.

```
<Sysname> system-view
[Sysname] ip extcommunity-list 1 permit rt 200:200
```

Configure extended community list 2 to permit routes with SoO 100:100 to pass.

```
<Sysname> system-view
[Sysname] ip extcommunity-list 2 permit soo 100:100
```

Related commands

apply extcommunity

display ip extcommunity-list

if-match extcommunity

ip rd-list

Use **ip rd-list** configure an RD list.

Use **undo ip rd-list** to remove an RD list.

Syntax

ip rd-list *rd-list-number* [**index** *index-number*] { **deny** | **permit** } *route-distinguisher*&<1-10>

undo ip rd-list *rd-list-number* [**index** *index-number*] [{ **deny** | **permit** } *route-distinguisher*&<1-10>]

Default

No RD lists exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

rd-list-number: Specifies an RD list by its number in the range of 1 to 65535.

index *index-number*: Specifies an index number for an RD list item, in the range of 1 to 4294967295. An item with a smaller index number is matched first. If you do not specify this option, the index number starts from 10 and increases by 10 for each of the consecutive RD list items.

deny: Specifies the deny mode. If a route matches the item, the route is denied without being compared with the next item. If a route does not match the item, the route is compared with the next item.

permit: Specifies the permit mode. If a route matches the item, it passes the RD list. If a route does not match the item, the route is compared with the next item.

route-distinguisher&<1-10>: Specifies a list of up to 10 RD list items. Each item is a string of 3 to 21 characters.

An RD has the following forms:

- *16-bit AS number*:*32-bit self-defined number*. For example, 101:3.
- *16-bit AS number*:*wildcard character*. For example, 101:*.
- *32-bit IP address*:*16-bit self-defined number*. For example, 192.168.122.15:1.
- *32-bit IP address*:*wildcard character*. For example, 192.168.122.15:*.
- *32-bit AS number*:*16-bit self-defined number*. For example, 65536:1. The minimum AS number is 65536.
- *32-bit AS number*:*wildcard character*. For example, 65536:*. The minimum AS number is 65536.

Usage guidelines

An RD list matches the RDs of BGP routes. An RD list is identified by an RD list number and can contain multiple items that specify RD ranges. The relationship between the items is logical OR. A route matches the RD list if it matches one item in the list. A route does not match the RD list if it does not match any items in the list.

To filter routes by RD, use the **ip rd-list** command together with the **if-match rd-list** command. If you specify a nonexistent RD list for the **if-match rd-list** command, all routes pass the RD match criterion.

Examples

Configure RD list 1 to permit routes with RD 100: 1.

```
<Sysname> system-view
[Sysname] ip rd-list 1 permit 100:1
```

Related commands

display ip rd-list

if-match rd-list

route tag-list

Use **route tag-list** to configure a tag list.

Use **undo route tag-list** to delete a tag list or a tag list entry.

Syntax

route tag-list *tag-list-number* [**index** *index-number*] { **deny** | **permit** } *tag-value*&<1-32>

undo route tag-list *tag-list-number* [**index** *index-number* [{ **deny** | **permit** } *tag-value*&<1-32>]]

Default

No tag lists exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

tag-list-number: Specifies a tag list by its number in the range of 1 to 65535.

index *index-number*: Specifies an index for the tag list entry, in the range of 1 to 4294967295. A tag list entry with a smaller index number is matched first. If you do not specify this option, the index number starts from 1 and increases by 1 for each of the consecutive tag list entries.

deny: Specifies the match mode for the tag list as **deny**.

permit: Specifies the match mode for the tag list as **permit**.

tag-value: Specifies a tag value in the range of 0 to 4294967295. &<1-32> indicates that the argument before it can be entered up to 32 times.

Usage guidelines

If you execute this command multiple times for a tag list entry, all tag values take effect. A tag list entry can contain up to 32 tag values.

Examples

Configure tag list 1 and create tag list entry 10 to permit IGP routes with tag value 100 to pass.

```
<Sysname> system-view
[Sysname] route tag-list 1 index 10 permit 100
```

Related commands

display route tag-list

if-match tag-list

route-policy

Use **route-policy** to create a routing policy and a node and enter routing policy node view, or enter the view of an existing routing policy node.

Use **undo route-policy** to remove a routing policy or a node of it.

Syntax

route-policy *route-policy-name* { **deny** | **permit** } **node** *node-number*

undo route-policy *route-policy-name* [**deny** | **permit**] [**node** *node-number*]

Default

No routing policies exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

route-policy-name: Specifies a routing policy name, a case-sensitive string of 1 to 63 characters.

deny: Specifies the deny match mode for the routing policy node. If a route matches all the **if-match** clauses of the node, it is denied without being compared with the next node. If a route does not match any **if-match** clauses of the node, the route is compared with the next node.

permit: Specifies the permit match mode for the routing policy node. If a route matches all the **if-match** clauses of the node, it is handled by the **apply** clauses of the node. If a route does not match any **if-match** clauses of the node, the route is compared with the next node.

node *node-number*: Specifies a node number in the range of 0 to 65535. A node with a smaller number is matched first.

Usage guidelines

Use a routing policy to filter routing information. A routing policy can contain several nodes and each node contains a set of **if-match** and **apply** clauses. The **if-match** clauses define the match criteria of the node and the **apply** clauses define the actions to be taken on packets matching the criteria. The relation between the **if-match** clauses of different types is logical AND and the relation between the **if-match** clauses of the same type is logical OR. **if-match** clauses of all types must be met. The relation between nodes is logical OR. A packet passing a node passes the routing policy. If a packet does not pass any nodes, the packet does not pass the routing policy.

Examples

Create node 10 in **permit** mode for routing policy **policy1** and enter routing policy node view.

```
<Sysname> system-view
[Sysname] route-policy policy1 permit node 10
[Sysname-route-policy-policy1-10]
```

Related commands

display route-policy

IPv4 routing policy commands

apply fast-reroute

Use **apply fast-reroute** to set a backup link for fast route (FRR).

Use **undo apply fast-reroute** to restore the default.

Syntax

apply fast-reroute { **backup-interface** *interface-type interface-number* [**backup-nexthop** *ip-address*] | **backup-nexthop** *ip-address* }

undo apply fast-reroute

Default

No backup link for FRR is configured.

Views

Routing policy node view

Predefined user roles

network-admin

context-admin

Parameters

backup-interface *interface-type interface-number*: Specifies a backup output interface by its type and number. If the specified interface is a non-P2P interface, you must also specify a backup next hop. Non-P2P interfaces include NBMA and broadcast interfaces.

backup-nexthop *ip-address*: Specifies a backup next hop.

Usage guidelines

This command sets a backup link in the routing policy for FRR.

Using the routing policy, a routing protocol can designate a backup link for specific routes to implement FRR. When the primary link fails, FRR immediately directs packets to the backup link to minimize interruption time.

Examples

Configure node 10 of routing policy **policy1** to set the backup output interface GigabitEthernet 1/0/1 and backup next hop 193.1.1.8 for the route destined for 100.1.1.0/24.

```
<Sysname> system-view
[Sysname] ip prefix-list abc index 10 permit 100.1.1.0 24
[Sysname] route-policy policy1 permit node 10
[Sysname-route-policy-policy1-10] if-match ip address prefix-list abc
[Sysname-route-policy-policy1-10] apply fast-reroute backup-interface gigabitethernet
1/0/1 backup-nexthop 193.1.1.8
```

apply ip-address next-hop

Use **apply ip-address next-hop** to set a next hop for IPv4 routes.

Use **undo apply ip-address next-hop** to restore the default.

Syntax

apply ip-address next-hop *ip-address* [**public** | **vpn-instance** *vpn-instance-name*]

undo apply ip-address next-hop

Default

No next hop is set for IPv4 routes.

Views

Routing policy node view

Predefined user roles

network-admin

context-admin

Parameters

ip-address: Specifies the next hop IP address.

public: Specifies the public network.

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters.

Usage guidelines

If you use this command to set a next hop for redistributed routes, the configuration does not take effect.

If you do not specify the **public** keyword and the **vpn-instance** *vpn-instance-name* option, the next hop belongs to the public network.

Examples

Configure node 10 in **permit** mode for routing policy **policy1** to set next hop 193.1.1.8 for routes matching prefix list 100.

```
<Sysname> system-view
[Sysname] ip prefix-list 100 permit 192.168.10.1 24
[Sysname] route-policy policy1 permit node 10
[Sysname-route-policy-policy1-10] if-match ip address prefix-list 100
[Sysname-route-policy-policy1-10] apply ip-address next-hop 193.1.1.8
```

display ip prefix-list

Use **display ip prefix-list** to display IPv4 prefix list statistics.

Syntax

display ip prefix-list [**name** *prefix-list-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

name *prefix-list-name*: Specifies an IP prefix list by its name, a case-sensitive string of 1 to 63 characters. If you do not specify this option, the command displays statistics for all IPv4 prefix lists.

Examples

Display the statistics for IPv4 prefix list **abc**.

```
<Sysname> display ip prefix-list name abc
Prefix-list: abc
 Permitted 0
 Denied 0
        index: 10        Deny   6.6.6.0/24              ge  26  le  28
```

Table 7 Command output

Field	Description
Prefix-list	Name of the IPv4 prefix list.

Permitted	Number of routes matching the criterion.
Denied	Number of routes not matching the criterion.
index	Index of an item.
deny	Match mode of the item: • **Permit**. • **Deny**.
6.6.6.0/24	IP address and mask.
ge	Greater-equal, the lower mask length limit.
le	Less-equal, the upper mask length limit.

Related commands

ip prefix-list

reset ip prefix-list

if-match ip

Use **if-match ip** to match IPv4 routes whose destination, next hop, or source address matches an ACL or IPv4 prefix list.

Use **undo if-match ip** to remove the specified ACL or IPv4 prefix list match criterion.

Syntax

if-match ip { **address** | **next-hop** | **route-source** } { **acl** { *ipv4-acl-number* | **name** *ipv4-acl-name* } | **prefix-list** *prefix-list-name* }

undo if-match ip { **address** | **next-hop** | **route-source** } [**acl** | **prefix-list**]

Default

No ACL or IPv4 prefix list match criterion is configured.

Views

Routing policy node view

Predefined user roles

network-admin

context-admin

Parameters

address: Matches the destination address of IPv4 routes.

next-hop: Matches the next hop of IPv4 routes.

route-source: Matches the source address of BGP routes. This keyword corresponds to the **Neighbor** field in the output from the **display ip routing-table verbose** command.

acl *ipv4-acl-number*: Specifies an ACL by its number. The value range for the *ipv4-acl-number* argument is 2000 to 3999 for the **address** keyword, and 2000 to 2999 for the **next-hop** keyword and **route-source** keyword.

acl name *ipv4-acl-name*: Specifies an ACL by its name, a case-insensitive string of 1 to 63 characters. The ACL name must start with a letter and cannot be **all**.

prefix-list *prefix-list-name*: Specifies an IP prefix list by its name, a case-sensitive string of 1 to 63 characters.

Usage guidelines

Follow these restrictions and guidelines to use an IPv4 advanced ACL rule to configure an ACL match criterion:

- To match the destination address of IPv4 routes, execute the **rule** [*rule-id*] { **deny** | **permit** } **ip source** *sour-addr sour-wildcard* command to create the rule.
- To match the destination address mask of IPv4 routes, execute the **rule** [*rule-id*] { **deny** | **permit** } **ip destination** *dest-addr dest-wildcard* command to create the rule. Make sure the wildcard mask specified by the *dest-wildcard* argument is consecutive. If the wildcard mask is nonconsecutive, the rule is not applicable to the **if-match ip** command.

Examples

Configure node 10 of routing policy **policy1** to match IPv4 routes whose next hop matches IP prefix list **p1**.

```
<Sysname> system-view
[Sysname] route-policy policy1 permit node 10
[Sysname-route-policy-policy1-10] if-match ip next-hop prefix-list p1
```

ip prefix-list

Use **ip prefix-list** to configure an IPv4 prefix list or an item for the list.

Use **undo ip prefix-list** to remove an IPv4 prefix list or an item of it.

Syntax

ip prefix-list *prefix-list-name* [**index** *index-number*] { **deny** | **permit** } *ip-address mask-length* [**greater-equal** *min-mask-length*] [**less-equal** *max-mask-length*]

undo ip prefix-list *prefix-list-name* [**index** *index-number*]

Default

No IPv4 prefix lists exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

prefix-list-name: Specifies an IPv4 prefix list name, a case-sensitive string of 1 to 63 characters.

index *index-number*: Specifies an index number for an IPv4 prefix list item, in the range of 1 to 65535. An item with a smaller index number is matched first. If you do not specify this option, the index number starts from 10 and increases by 10 for each of the consecutive prefix list items.

deny: Specifies the deny mode. If a route matches the item, the route is denied without being compared with the next item. If a route does not match the item, the route is compared with the next item.

permit: Specifies the permit mode. If a route matches the item, it passes the IPv4 prefix list. If a route does not match the item, the route is compared with the next item.

ip-address mask-length: Specifies an IPv4 prefix and mask length. The value range for the *mask-length* argument is 0 to 32.

greater-equal *min-mask-length*, **less-equal** *max-mask-length*: Specifies a prefix length range. The **greater-equal** keyword means "greater than or equal to" and the **less-equal** keyword means "less than or equal to." The prefix length range relation is *mask-length* <= *min-mask-length* <= *max-mask-length* <= 32.

- If only the *min-mask-length* argument is specified, the prefix length range is [*min-mask-length*, 32].
- If only the *max-mask-length* argument is specified, the prefix length range is [*mask-length*, *max-mask-length*].
- If both the *min-mask-length* and *max-mask-length* arguments are specified, the prefix length range is [*min-mask-length*, *max-mask-length*].

Usage guidelines

An IPv4 prefix list is used to filter IPv4 addresses. It can contain multiple items, each of which specifies a range of IPv4 prefixes. The relation between the items is logical OR. If an item is passed, the IPv4 prefix list is passed. If no item is passed, the IP prefix list cannot be passed.

If both the *ip-address* and *mask-length* arguments are specified as 0.0.0.0 0, only the default route will be matched.

To match all routes, use 0.0.0.0 0 **less-equal** 32.

Examples

Configure IP prefix list **p1** to permit routes destined for network 10.0.0.0/8 and with mask length 17 or 18.

```
<Sysname> system-view
[Sysname] ip prefix-list p1 permit 10.0.0.0 8 greater-equal 17 less-equal 18
```

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

name *prefix-list-name*: Specifies an IPv6 prefix list by its name, a case-sensitive string of 1 to 63 characters. If you do not specify this option, the command displays statistics for all IPv6 prefix lists.

Examples

Display the statistics for all IPv6 prefix lists.

```
<Sysname> display ipv6 prefix-list
Prefix-list6: 666
 Permitted 0
 Denied 0
        index: 10        Permit 6::/64                 ge  66  le  88
```

Table 8 Command output

Field	Description
Prefix-list6	Name of the IPv6 prefix list.
Permitted	Number of routes matching the criterion.
Denied	Number of routes not matching the criterion.
index	Index number of an item.
permit	Match mode of the item: • **Permit**. • **Deny**.
6::/64	IPv6 address and prefix length for matching.
ge	Greater-equal, the lower prefix length limit.
le	Less-equal, the upper prefix length limit.

Related commands

ipv6 prefix-list

reset ipv6 prefix-list

if-match ipv6

Use **if-match ipv6** to match IPv6 routes whose destination, next hop, or source address matches an ACL or IPv6 prefix list.

Use **undo if-match ipv6** to remove the specified ACL or IPv6 prefix list match criterion.

Syntax

if-match ipv6 { **address** | **next-hop** | **route-source** } { **acl** { *ipv6-acl-number* | **name** *ipv6-acl-name* } | **prefix-list** *prefix-list-name*

undo if-match ipv6 { **address** | **next-hop** | **route-source** } [**acl** | **prefix-list**]

Default

No ACL or IPv6 prefix list match criterion is configured.

Views

Routing policy node view

Predefined user roles

network-admin

context-admin

Parameters

address: Matches the destination address of IPv6 routes.

next-hop: Matches the next hop of IPv6 routes.

route-source: Matches the source address of IPv6 routes.

acl *ipv6-acl-number*: Specifies an IPv6 ACL by its number. The value range for the *ipv6-acl-number* argument is 2000 to 3999 for the **address** keyword, and 2000 to 2999 for the **next-hop** and **route-source** keywords.

acl name *ipv6-acl-name*: Specifies an IPv6 ACL by its name, a case-insensitive string of 1 to 63 characters. The ACL name must start with a letter and cannot be **all**.

prefix-list *prefix-list-name*: Specifies an IPv6 prefix list by its name, a case-sensitive string of 1 to 63 characters.

Usage guidelines

Follow these restrictions and guidelines to use an IPv6 advanced ACL rule to configure an ACL match criterion:

- To match the destination address of IPv6 routes, execute the **rule** [*rule-id*] { **deny** | **permit** } **ip source** *sour-addr sour-wildcard* command to create the rule.
- To match the destination address prefix of IPv6 routes, execute the **rule** [*rule-id*] { **deny** | **permit** } **ip destination** *dest-addr dest-wildcard* command to create the rule. Make sure the address prefix specified by the *dest-wildcard* argument is consecutive. If the address prefix is nonconsecutive, the rule is not applicable to the **if-match ipv6** command.

Examples

Configure node 10 of routing policy **policy1** to permit routes whose next hop matches IPv6 prefix list **p1**.

```
<Sysname> system-view
[Sysname] route-policy policy1 permit node 10
[Sysname-route-policy-policy1-10] if-match ipv6 next-hop prefix-list p1
```

ipv6 prefix-list

Use **ipv6 prefix-list** to configure an IPv6 prefix list or an item for it.

Use **undo ipv6 prefix-list** to remove an IPv6 prefix list or an item.

Syntax

ipv6 prefix-list *prefix-list-name* [**index** *index-number*] { **deny** | **permit** } *ipv6-address* { *prefix-length* [**greater-equal** *min-prefix-length*] [**less-equal** *max-prefix-length*] | **inverse** *inverse-prefix-length* }

undo ipv6 prefix-list *prefix-list-name* [**index** *index-number*]

Default

No IPv6 prefix lists exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

prefix-list-name: Specifies an IPv6 prefix list name, a case-sensitive string of 1 to 63 characters.

index *index-number*: Specifies an index number for an IPv6 prefix list item, in the range of 1 to 65535. An item with a smaller index number is matched first. If you do not specify this option, the index number starts from 10 and increases by 10 for each of the consecutive IPv6 prefix list items.

deny: Specifies the deny mode. If a route matches the item, the route is denied without being compared with the next item. If a route does not match the item, the route is compared with the next item.

permit: Specifies the permit mode. If a route matches the item, it passes the IPv6 prefix list. If a route does not match the item, the route is compared with the next item.

ipv6-address: Specifies an IPv6 address.

prefix-length: Specifies the IPv6 prefix length. The value range for the *prefix-length* argument is 0 to 128.

greater-equal *min-mask-length*, **less-equal** *max-mask-length*: Specifies a prefix length range. The **greater-equal** keyword means "greater than or equal to" and the **less-equal** keyword means "less than or equal to."

The prefix length range relation is *mask-length* <= *min-mask-length* <= *max-mask-length* <= 128.

- If only the *min-prefix-length* argument is specified, the prefix length range is [*min-prefix-length*, 128].
- If only the *max-prefix-length* argument is specified, the prefix length range is [*prefix-length*, *max-prefix-length*].
- If both the *min-prefix-length* and *max-prefix-length* arguments are specified, the prefix length range is [*min-prefix-length*, *max-prefix-length*].

inverse *inverse-prefix-length*: Matches IPv6 addresses from the least significant bit to the specified length. The value range for the *inverse-prefix-length* argument is 1 to 128.

Usage guidelines

An IPv6 prefix list is used to filter IPv6 addresses. An IPv6 prefix list can have multiple items, and each of them specifies a range of IPv6 prefixes. The relation between the items is logical OR. A route passing an item passes the IPv6 prefix list. A route passing no item does not pass the IPv6 prefix list.

If the *ipv6-address prefix-length* argument is specified as :: 0, only the default route matches.

To match all routes, configure :: 0 **less-equal** 128.

Examples

Permit IPv6 addresses with a mask length between 32 bits and 64 bits.

```
<Sysname> system-view
[Sysname] ipv6 prefix-list abc permit :: 0 greater-equal 32 less-equal 64
```

Deny IPv6 addresses with a prefix 3FFE:D00::/32 and a prefix length greater than or equal to 32 bits.

```
<Sysname> system-view
[Sysname] ipv6 prefix-list abc deny 3FFE:D00:: 32 less-equal 128
```

Guard route commands

ip route-guard

Use **ip route-guard** to configure an IPv4 guard route.

Use **undo ip route-guard** to delete an IPv4 guard route.

Syntax

ip route-guard *ip-address* { *mask-length* | *mask* }

undo ip route-guard *ip-address* { *mask-length* | *mask* }

Default

No IPv4 guard route is configured.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

ip-address: Specifies the destination IP address in dotted decimal format.

mask-length: Specifies a mask length in the range of 0 to 32.

mask: Specifies a mask in dotted decimal format.

Usage guidelines

A guard route directs traffic to the guard device for filtering and cleaning. You can manually configure a guard route on the guard device, or use a script to automatically configure a guard route upon receipt of a notification.

Guard routes have the following characteristics:

- Guard routes use Null 0 as the outgoing interface.
- Guard routes are inactive routes and will not be installed into the FIB.
- You must configure a routing protocol, such as BGP or OSPF, to redistribute and advertise guard routes for directing traffic to the guard device.

Examples

Configure a guard route destined to 11.11.11.11/32.

```
<Sysname> system-view
[Sysname] ip route-guard 11.11.11.11 255.255.255.255
```

RIR commands

The following compatibility matrixes show the support of hardware platforms for RIR:

Models	RIR compatibility
NFNX5-HD6480, NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB1780, NFNX3-HDB3080, NFNX3-HDB680, NFNX3-HDB1080	Yes
NFNX3-HDB1180, NFNX3-HDB1480	No

client enable

Use **client enable** to enable the RIR client globally.

Use **undo client enable** to disable the RIR client globally.

Syntax

client enable

undo client enable

Default

The RIR client is disabled globally.

Views

RIR view

Predefined user roles

network-admin

context-admin

Usage guidelines

To avoid NQA probes from occupying too many resources on a hub in a hub-spoke network, configure the hub as an RIR server and configure the spokes as RIR clients.

You can enable the RIR client globally or on an interface.

- Enabling the RIR client globally also enables the RIR client for all interfaces on the device. The interfaces can send link quality probe results for the RIR client.
- Enabling the RIR client on an interface allows only that interface to send link quality probe results for the RIR client.

When you enable the RIR client, follow these restrictions and guidelines:

- In a VXLAN network, only tunnel interfaces support enabling the RIR client. The RIR client uses the tunnel interfaces to send link quality probe results.
- The RIR server and RIR client cannot be both enabled on the same interface.
- If the enabled role (RIR server or client) on an interface is different from the globally enabled role, the interface-specific role takes effect on that interface.

Examples

Enable the RIR client globally.

```
<Sysname> system-view
[Sysname] rir
```

```
[Sysname-rir] client enable
```

collaboration peer local

Use **collaboration peer local** to enable the local device to establish RIR collaboration relationship with a peer device.

Use **undo collaboration peer local** to restore the default.

Syntax

collaboration peer [**vpn-instance** *vpn-instance-name*] *peer-ipv4-address* **local** *local-ipv4-address* **sync-port** *port-number*

undo collaboration peer [**vpn-instance** *vpn-instance-name*] *peer-ipv4-address* **local**

Default

The local device does not establish RIR collaboration relationship with any device.

Views

RIR view

Predefined user roles

network-admin

context-admin

Parameters

vpn-instance *vpn-instance-name*: Specifies the MPLS L3VPN instance on which the local and peer devices establish RIR collaboration relationship. The *vpn-instance-name* argument is a case-sensitive string of 1 to 31 characters. The specified VPN instance must exist. If the local and peer IP addresses belong to the public network, do not specify this option.

peer-ipv4-address: Specifies an RIR collaboration peer by its IPv4 address.

local-ipv4-address: Specifies the IPv4 address of the local device. The local and peer devices must both belong to the public network or the same VPN instance.

sync-port *port-number*: Specifies the TCP port number used by the local and peer devices to synchronize link data. The value range for the *port-number* argument is 1024 to 65535. Make sure the port number is not used by any other service on the device.

Usage guidelines

Each pair of devices in an RIR collaboration device group must establish RIR collaboration relationship. You must configure this command on both the local and peer devices.

In a pair of devices with RIR collaboration relationship, the device with a lower IP address is the client. The client uses the port number specified by using this command to initiate a TCP connection request to its peer. Through the TCP connection, the local device can synchronize the configuration and status data of links that meet the service requirements to the peer device. The data does not include link data synchronized from other devices in the same RIR collaboration device group.

For the local device to select links from a peer device, you must execute the **collaboration peer redirect** command on both the local and peer devices.

The local and peer devices must use the same TCP port number for link data synchronization. A device can use the same or different TCP port numbers to synchronize data to different peers.

If you execute this command multiple times for the same pair of devices in the public network or a VPN instance, the most recent configuration takes effect.

Examples

Establish RIR collaboration relationship between local device 1.1.1.1 and peer device 1.1.1.2 on the public network. They use TCP port number 6000 for link data synchronization.

```
<Sysname> system-view
[Sysname] rir
[Sysname-rir] collaboration peer 1.1.1.2 local 1.1.1.1 sync-port 6000
```

Establish RIR collaboration relationship between local device 1.1.1.1 and peer device 1.1.1.2 in VPN instance **a**. They use TCP port number 6000 for link data synchronization.

```
<Sysname> system-view
[Sysname] rir
[Sysname-rir] collaboration peer vpn-instance a 1.1.1.2 local 1.1.1.1 sync-port 6000
```

Related commands

collaboration peer redirect

collaboration peer redirect

Use **collaboration peer redirect** to configure the redirect IP address of an RIR collaboration peer.

Use **undo collaboration peer redirect** to delete the redirect IP address of an RIR collaboration peer.

Syntax

collaboration peer [**vpn-instance** *vpn-instance-name*] *peer-ipv4-address* **redirect** [**vpn-instance** *redirect-vpn-instance-name*] *redirect-ipv4-address*

undo collaboration peer [**vpn-instance** *vpn-instance-name*] *peer-ipv4-address* **redirect** [**vpn-instance** *redirect-vpn-instance-name*]

Default

No redirect IP address is configured for an RIR collaboration peer.

Views

RIR view

Predefined user roles

network-admin

context-admin

Parameters

vpn-instance *vpn-instance-name*: Specifies the MPLS L3VPN instance on which the local and peer devices establish RIR collaboration relationship. The *vpn-instance-name* argument is a case-sensitive string of 1 to 31 characters. If the local and peer devices establish RIR collaboration relationship on the public network, do not specify this option.

peer-ipv4-address: Specifies an RIR collaboration peer by its IPv4 address.

vpn-instance *redirect-vpn-instance-name*: Specifies the MPLS L3VPN instance for the packets to be redirected to the redirect IPv4 address of the peer device. The

redirect-vpn-instance-name argument is a case-sensitive string of 1 to 31 characters. If the packets to be redirected belong to the public network, do not specify this option.

redirect-ipv4-address: Specifies the redirect IPv4 address of the peer device.

Usage guidelines

Use this command on both the local and peer devices that have established RIR collaboration relationship. This command specifies the redirect IP address for packets redirected to a peer device on the public network or a VPN instance. When the local device selects links from the peer device to forward packets on the public network or a VPN instance, it performs the following operations:

- Looks up the routing table of the public network or VPN instance based on the redirect IP address.
- Forwards the packets to the peer device through the RIR dedicated link.

If you execute the **undo** form of this command without the **vpn-instance** *redirect-vpn-instance-name* option for a peer, the redirect IPv4 address of the public network is deleted for the peer.

If you execute this command multiple times for the same peer on the public network or in the same redirect VPN instance, the most recent configuration takes effect.

Examples

Specify 2.1.1.1 as the redirect IP address in VPN instance **b** for peer device 1.1.1.2 in VPN instance **a**.

```
<Sysname> system-view
[Sysname] rir
[Sysname-rir] collaboration peer vpn-instance a 1.1.1.2 redirect vpn-instance b 2.1.1.1
```

delay threshold

Use **delay threshold** to set the link delay threshold.

Use **undo delay threshold** to restore the default.

Syntax

delay threshold *threshold-value*

undo delay threshold

Default

The link delay threshold is 10 milliseconds.

Views

SLA view

Predefined user roles

network-admin

context-admin

Parameters

threshold-value: Sets the link delay threshold, in the range of 10 to 60000 milliseconds.

Usage guidelines

Link delay refers to the interval between the sending time and receiving time of a packet.

The shorter the delay time, the higher the link quality.

A flow template uses the link delay threshold in its associated SLA to filter links that meet the link delay requirement.

Examples

In SLA 1, set the link delay threshold to 1000 milliseconds.

```
<Sysname> system-view
[Sysname] sla 1
[Sysname-sla-1] delay threshold 1000
```

display tunnel flow-statistics

Use **display tunnel flow-statistics** to display flow ID-based traffic rate statistics for tunnels.

Syntax

display tunnel flow-statistics [**flow** *flow-id* [**interface tunnel** *number*]]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

flow *flow-id*: Specifies a flow template by its flow ID, in the range of 1 to 65535. If you do not specify a flow ID, this command displays statistics for all flow templates.

interface tunnel *number*: Specifies a tunnel interface by its tunnel interface number. The value range for the *number* argument is 1 to 65535. If you do not specify a tunnel interface, this command displays statistics about the specified flow template for all tunnel interfaces.

Examples

Display flow ID-based traffic rate statistics for tunnels.

```
<Sysname> display tunnel flow-statistics

RIR flow 100:
  Interface    Out pps       Out bps
  Tunnel1      10            4800
  Tunnel2      20            9600

RIR flow 101:
  Interface    Out pps       Out bps
  Tunnel3      10            4800
  Tunnel4      20            9600
```

Table 1 Command output

Field	Description
RIR flow	Flow ID of an RIR flow template.
Interface	Tunnel interface name.
Out pps	Number of outgoing packets per second.
Out bps	Number of outgoing bits per second.

Related commands

`reset tunnel flow-statistics`

expect-bandwidth

Use **`expect-bandwidth`** to specify the per-session expected bandwidth.

Use **`undo expect-bandwidth`** to restore the default.

Syntax

`expect-bandwidth` *`bandwidth`*

`undo expect-bandwidth`

Default

The per-session expected bandwidth is 0 kbps.

Views

Flow template view

Predefined user roles

network-admin

context-admin

Parameters

`bandwidth`: Specifies the bandwidth in kbps, in the range of 1 to 400000000.

Usage guidelines

The per-session expected bandwidth configured by using this command is not the actual bandwidth used by a session. It is only a value estimated based on user services.

When performing RIR link selection for a session, the device performs bandwidth detection based on the per-session expected bandwidth configured in the flow template to which the session belongs. If the used bandwidth plus the per-session expected bandwidth of a candidate link is less than 80% of its total bandwidth, the current available bandwidth of the candidate link meets the session bandwidth requirements. The link passes the bandwidth detection.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Set the per-session expected bandwidth to 10 kbps in flow template 1.

```
<Sysname> system-view
[Sysname] rir
[Sysname-rir] flow 1
[Sysname-rir-flow-1] expect-bandwidth 10
```

Related commands

flow

flow

Use **flow** to create a flow template and enter its view, or enter the view of an existing flow template.

Use **undo flow** to delete a flow template.

Syntax

flow *flow-id*

undo flow *flow-id*

Default

No flow templates exist.

Views

RIR view

Predefined user roles

network-admin

context-admin

Parameters

flow-id: Specifies a flow ID for the flow template. The flow ID is a hexadecimal string in the range of 0 to ffffff.

Usage guidelines

Use a flow template to define link selection policies (including the quality policy and link preference) that can filter qualified links for a type of service flow. After the device identifies the service of a packet based on the quintuple and DSCP of the packet, it assigns a flow ID to the packet according to the QoS policy applied to the service. Then, RIR selects a qualified link for the packet based on the link selection policies of the flow template that uses the flow ID.

Examples

Create flow template 1 and enter its view.

```
<Sysname> system-view
[Sysname] rir
[Sysname-rir] flow 1
[Sysname-rir-flow-1]
```

flow priority-based-schedule bandwidth-threshold

Use **flow priority-based-schedule bandwidth-threshold** to set the bandwidth usage thresholds for flow priority-based traffic scheduling.

Use **undo flow priority-based-schedule bandwidth-threshold** to restore the default.

Syntax

flow priority-based-schedule bandwidth-threshold upper *upper-threshold* **lower** *lower-threshold*

undo flow priority-based-schedule bandwidth-threshold

Default

The bandwidth usage upper threshold is 90% and the bandwidth usage lower threshold is 20%.

Views

RIR view

Predefined user roles

network-admin

context-admin

Parameters

upper *upper-threshold*: Sets the bandwidth usage upper threshold in percentage, in the range of 1 to 100. The upper threshold must be greater than or equal to the lower threshold.

lower *lower-threshold*: Sets the bandwidth usage lower threshold in percentage, in the range of 1 to 100.

Usage guidelines

If flow priority-based traffic scheduling is enabled, traffic scheduling is triggered when the bandwidth usage of a link exceeds the upper threshold. The scheduling might be last for several scheduling periods. Within each scheduling period, RIR redistributes the current lowest priority flow on this link to other links. The scheduling does not stop until the bandwidth usage of all links for the current lowest priority flow is below the lower threshold or only the highest priority flow is left on this link.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Enable flow priority-based traffic scheduling and set the bandwidth usage upper threshold and lower threshold to 80% and 30%, respectively.

```
<Sysname> system-view
[Sysname] rir
[Sysname-rir] flow priority-based-schedule enable
[Sysname-rir] flow priority-based-schedule bandwidth-threshold upper 80 lower 30
```

flow priority-based-schedule enable

undo flow priority-based-schedule enable

Default

Flow priority-based traffic scheduling is disabled.

Views

RIR view

Predefined user roles

network-admin

context-admin

Usage guidelines

To ensure that services with higher priority preferentially use link resources, enable flow priority-based traffic scheduling.

The priority of a flow that matches a flow template is determined by the ID of the SLA associated with that flow template. The greater the SLA ID, the higher the flow priority. To specify an SLA for a flow template, use the **quality-policy** command. If the command is not configured in a flow template, flows that match the flow template have the lowest priority.

If flow priority-based traffic scheduling is enabled, traffic scheduling is triggered when the bandwidth usage of a link exceeds the upper threshold. The scheduling might be last for several scheduling periods. Within each scheduling period, RIR redistributes the current lowest priority flow on this link to other links. The scheduling does not stop until the bandwidth usage of all links for the current lowest priority flow is below the lower threshold or only the highest priority flow is left on this link.

Examples

Enable flow priority-based traffic scheduling.

```

<Sysname> system-view
[Sysname] rir
[Sysname-rir] flow priority-based-schedule enable
[Sysname-rir] flow priority-based-schedule schedule-period 20
```

jitter threshold

Use **jitter threshold** to set the link jitter threshold.

Use **undo jitter threshold** to restore the default.

Syntax

jitter threshold *threshold-value*

undo jitter threshold

Default

The link jitter threshold is 100 milliseconds.

Views

SLA view

Predefined user roles

network-admin

context-admin

Parameters

threshold-value: Sets the link jitter threshold, in the range of 0 to 3600000 milliseconds.

Usage guidelines

The jitter time equals the receiving time interval between two consecutive packets minus the sending time interval between the two consecutive packets. The shorter the jitter time, the higher the link quality. A flow template uses the jitter threshold in its associated SLA to filter links that meet the jitter requirement.

Examples

In SLA 1, set the link jitter threshold to 1000 milliseconds.

```
<Sysname> system-view
[Sysname] sla 1
[Sysname-sla-1] jitter threshold 1000
```

link-select delay

Use **link-select delay** to set the link selection delay.

Use **undo link-select delay** to restore the default.

Syntax

link-select delay *delay*

undo link-select delay

Default

The link selection delay is 60 seconds.

Views

RIR view

Predefined user roles

network-admin

context-admin

Parameters

delay: Sets the link selection delay in seconds, in the range of 1 to 65535.

Usage guidelines

To improve packet forwarding efficiency, the device does not repeatedly perform link selection for traffic of the same session. After the device performs link selection for traffic of a session, it forwards the subsequent traffic of that session according to the previous link selection result. Link reselection is triggered when any link in the session's flow template has one of the following changes:

- The quality of a link becomes qualified from unqualified or the quality of a link becomes unqualified from qualified.
- The bandwidth usage of a link has reached the maximum.

To avoid frequent link selection caused by link flapping, RIR defines a link selection delay and link selection suppression period.

After the device performs link selection, it starts the link selection suppression period if the period has been configured. Within the link selection suppression period, the device does not perform link reselection, but it maintains the link state data. When the link selection suppression period ends, the link selection delay timer starts. If the link state still meets the conditions that can trigger link reselection when the delay timer expires, the device performs link reselection. If the link state changes to not meet the conditions that can trigger link reselection within the delay time, the device does not perform link reselection.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Set the link selection delay to 30 seconds.

```
<Sysname> system-view
[Sysname] rir
[Sysname-rir] link-select delay 30
```

Related commands

link-select suppress-period

context-admin

Parameters

period-value: Sets the link selection suppression period in seconds, in the range of 1 to 131070.

Usage guidelines

To avoid frequent link selection caused by link flapping, configure a link selection suppression period. The device starts the link selection suppression period after it performs a link selection.

Within the link selection suppression period, the device does not perform link reselection, but it maintains the link state data. When the link selection suppression period ends, the link selection delay timer starts. If the link state still meets the conditions that can trigger link reselection when the delay timer expires, the device performs link reselection. If the link state changes to not meet the conditions that can trigger link reselection within the delay time, the device does not perform link reselection.

As a best practice, set the link selection suppression period to a multiple of the link selection delay time. Make sure the suppression period is at least double of the link selection delay time.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Set the link selection suppression period to 60 seconds.

```
<Sysname> system-view
[Sysname] rir
[Sysname-rir] link-select suppress-period 60
```

context-admin

Usage guidelines

Based on link bandwidth, RIR supports the following link load balancing modes:

- **Per-session weight-based link selection mode**—RIR global link load balancing mode that takes effect on all RIR flows. This mode can distribute the sessions that match the same flow template to different links according to the weights of the links. RIR selects only one link to transmit a session.
- **Per-session periodic link adjustment mode**—RIR global link load balancing mode that takes effect on all RIR flows. This mode not only can distribute the sessions that match the same flow template to different links, but also can periodically adjust links for the sessions. Within one adjustment period, RIR selects only one link to transmit a session.
- **Per-packet mode**—Flow-specific link load balancing mode that takes effect only on sessions that match the flow template where this mode is enabled. This mode can distribute the same session to different links for transmission.

The mechanisms of the per-packet mode are as follows:

- **For preference-based primary link selection, preference-based backup link selection, and quality tolerant link selection**—If multiple links with the same preference meet the requirements of a session, all these links are candidate optimal links for this session. When forwarding traffic for the session, the device distributes the traffic to these links packet by packet according to the remaining bandwidth weight of each link.

  For example, the device needs 10 Mbps of bandwidth to transmit traffic for a session with flow ID 1. Links 1 and 2 are available to transmit traffic for this session. The remaining bandwidth of link 1 is 20 Mbps and the remaining bandwidth of link 2 is 30 Mbps. Finally, the traffic of this session uses 4 Mbps of bandwidth on link 1 and 6 Mbps of bandwidth on link 2.
- **For bandwidth tolerant link selection**—If multiple links meet the requirements of a session, all these links are candidate optimal links for this session. When forwarding traffic for the session, the device distributes the traffic to these links packet by packet. Each link has the same probability to be selected.

Because packets of the same session are distributed to multiple links, the receiver might receive out-of-order packets. As a best practice, do not enable per-packet load balancing for order-sensitive services (except the services that use protocols to maintain a correct packet order, for example, TCP).

Examples

Enable per-packet load balancing mode in flow template with flow ID 1.

```
<Sysname> system-view
[Sysname] rir
[Sysname-rir] flow 1
[Sysname-rir-flow-1] load-balance per-packet enable
```

load-balance per-session periodic-adjust adjust-interval

Use **load-balance per-session periodic-adjust adjust-interval** to set the adjustment interval for per-session periodic link adjustment mode.

Use **undo load-balance per-session periodic-adjust adjust-interval** to restore the default.

Syntax

load-balance per-session periodic-adjust adjust-interval *interval-value*

undo load-balance per-session periodic-adjust adjust-interval

Default

The adjustment interval for per-session periodic link adjustment mode is 30 seconds.

Views

RIR view

Predefined user roles

network-admin

context-admin

Parameters

interval-value: Sets the adjustment interval for per-session periodic link adjustment mode, in the range of 15 to 65535 seconds.

Usage guidelines

In per-session periodic link adjustment mode, the device periodically detects the bandwidth usage of all links that have RIR sessions at intervals configured by using this command. RIR reselect links for sessions that match a flow template if the links in the flow template meets the following requirements: The difference between the largest remaining bandwidth ratio and the smallest remaining bandwidth ratio becomes larger than or equal to the periodic adjustment upper threshold. The link adjustment might be last for several adjustment intervals. RIR stops link adjustment if one of the following requirements is met:

- The difference between the largest remaining bandwidth ratio and the smallest remaining bandwidth ratio of the links becomes smaller than the periodic adjustment lower threshold.
- The adjustment interval is the 20th interval after link reselection is triggered.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Set the adjustment interval for per-session periodic link adjustment mode to 20 seconds.

```
<Sysname> system-view
[Sysname] rir
[Sysname-rir] load-balance per-session periodic-adjust adjust-interval 20
```

Usage guidelines

Based on link bandwidth, RIR supports the following link load balancing modes:

- **Per-session weight-based link selection mode**—RIR global link load balancing mode that takes effect on all RIR flows. This mode can distribute the sessions that match the same flow template to different links according to the weights of the links. RIR selects only one link to transmit a session.
- **Per-session periodic link adjustment mode**—RIR global link load balancing mode that takes effect on all RIR flows. This mode not only can distribute the sessions that match the same flow template to different links, but also can periodically adjust links for the sessions. Within one adjustment period, RIR selects only one link to transmit a session.
- **Per-packet mode**—Flow-specific link load balancing mode that takes effect only on traffic that matches the flow template where this mode is enabled. This mode can distribute the same session to different links for transmission.

The mechanisms of the per-session periodic link adjustment mode are as follows:

- **For preference-based primary link selection, preference-based backup link selection, and quality tolerant link selection**—If multiple links with the same preference meet the requirements of a flow template, RIR selects one optimal link for each session of the flow template from these links. RIR preferentially selects the link with the lowest bandwidth usage for a session. The bandwidth usage adopted by RIR is the actual bandwidth usage plus the per-session expected bandwidth.
- **For bandwidth tolerant link selection**—If multiple links meet the requirements of a flow template, RIR selects one optimal link for each session of the flow template from these links. The link selected the last time for a session takes precedence over the other links for that session. If RIR performs link selection for a session for the first time, it selects a link based on the remaining bandwidth weights of the available links.

In per-session periodic link adjustment mode, the device periodically detects the bandwidth usage of all links that have RIR sessions at the configured adjustment intervals. RIR reselect links for sessions that match a flow template if the links in the flow template meets the following requirements: The difference between the largest remaining bandwidth ratio and the smallest remaining bandwidth ratio becomes larger than or equal to the periodic adjustment upper threshold. The link adjustment might be last for several adjustment intervals. RIR stops link adjustment if one of the following requirements is met:

- The difference between the largest remaining bandwidth ratio and the smallest remaining bandwidth ratio of the links becomes smaller than the periodic adjustment lower threshold.
- The adjustment interval is the 20th interval after link reselection is triggered.

For a flow template, the per-packet load balancing mode takes precedence over the global per-session periodic link adjustment mode. If the per-packet load balancing mode is not enabled for a flow template, the flow template uses the global link load balancing mode.

Examples

Enable per-session periodic link adjustment mode.

```
<Sysname> system-view
[Sysname] rir
[Sysname-rir] load-balance per-session periodic-adjust enable
```

Related commands

load-balance per-session periodic-adjust adjust-interval

load-balance per-session periodic-adjust threshold

Use **load-balance per-session periodic-adjust threshold** to set the periodic adjustment thresholds in per-session periodic link adjustment mode.

Use **undo load-balance per-session periodic-adjust threshold** to restore the default.

Syntax

load-balance per-session periodic-adjust threshold upper *upper-threshold-value* **lower** *lower-threshold-value*

undo load-balance per-session periodic-adjust threshold

Default

The periodic adjustment upper threshold is 50% and the periodic adjustment lower threshold is 20%.

Views

RIR view

Predefined user roles

network-admin

context-admin

Parameters

upper *upper-threshold-value*: Sets the periodic adjustment upper threshold, in the range of 1 to 100. The *upper-threshold-value* argument specifies the largest difference allowed between the largest remaining bandwidth ratio and the smallest remaining bandwidth ratio of all available links.

lower *lower-threshold-value*: Sets the periodic adjustment lower threshold, in the range of 1 to 100. After the difference between the largest remaining bandwidth ratio and the smallest remaining bandwidth ratio becomes smaller than this threshold, RIR stops link adjustment.

Usage guidelines

In per-session periodic link adjustment mode, the device periodically detects the bandwidth usage of all links that have RIR sessions at the configured adjustment intervals. RIR reselect links for sessions that match a flow template if the links in the flow template meets the following requirements: The difference between the largest remaining bandwidth ratio and the smallest remaining bandwidth ratio becomes larger than or equal to the periodic adjustment upper threshold. The link adjustment might be last for several adjustment intervals. RIR stops link adjustment if one of the following requirements is met:

- The difference between the largest remaining bandwidth ratio and the smallest remaining bandwidth ratio of the links becomes smaller than the periodic adjustment lower threshold.
- The adjustment interval is the 20th interval after link reselection is triggered.

The periodic adjustment upper threshold must be greater than or equal to the periodic adjustment lower threshold.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Set the periodic adjustment upper threshold and the periodic adjustment lower threshold to 60% and 30%, respectively.

```
<Sysname> system-view
[Sysname] rir
[Sysname-rir] load-balance per-session periodic-adjust threshold upper 60 lower 30
```

nqa

Use **nqa** to create an NQA link quality operation and enter its view, or enter the view of an existing NQA link quality operation.

Use **undo nqa** to delete an NQA link quality operation.

Syntax

nqa *`nqa-id`*

undo nqa *`nqa-id`*

Default

No NQA link quality operations exist.

Views

RIR view

Predefined user roles

network-admin

context-admin

Parameters

`nqa-id`: Specifies an NQA link quality operation by its ID, in the range of 0 to 128.

Usage guidelines

An NQA link quality operation allows a flow template to start UDP jitter probes based on the probe parameters in the operation in order to detect the quality of links.

You can configure a quality policy for a flow template to associate the flow template with an SLA and an NQA link quality operation. The device monitors the quality of links in the flow template based on the NQA link quality operation and compares the NQA probe results with the thresholds in the SLA. If all parameter values in the probe results of a link are lower than or equal to the thresholds in the SLA, the link is qualified for the flow.

To differentiate service flows that have different link quality requirements, associate the flow templates with NQA link quality operations that contain different probe parameter values. Two NQA link quality operations with different probe parameter values might offer different probe results for the same link.

In a VXLAN network, the NQA link quality probe targets are VXLAN tunnel interfaces enabled with the RIR client.

The device supports a maximum of 129 NQA link quality operations.

Examples

Create NQA link quality operation 1 and enter its view.

```
<Sysname> system-view
[Sysname] rir
[Sysname-rir] nqa 1
[Sysname-rir-nqa-1]
```

packet-loss threshold

Use **packet-loss threshold** to set the packet loss threshold.

Use **undo packet-loss threshold** to restore the default.

Syntax

packet-loss threshold *threshold-value*

undo packet-loss threshold

Default

The packet loss threshold is 100‰.

Views

SLA view

Predefined user roles

network-admin

context-admin

Parameters

threshold-value: Sets the packet loss threshold, in the range of 0 to 1000 in permillage.

Usage guidelines

The packet loss ratio is the number of lost packets to the total number of sent packets. The lower the packet loss ratio, the higher the link quality. A flow template uses the packet loss threshold in its associated SLA to filter links that meet the packet loss requirement.

Examples

In SLA 1, set the packet loss threshold to 500‰.

```
<Sysname> system-view
[Sysname] sla 1
[Sysname-sla-1] packet-loss threshold 500
```

Related commands

path link-type index preference

Use **path link-type index preference** to specify a link preference for a type of links with a specific link index in a flow template.

Use **undo path link-type index preference** to restore the default.

Syntax

path link-type { **4g** | **internet** | **mpls** | **mstp** } **index** *link-index* **preference** *preference*

undo path link-type { **4g** | **internet** | **mpls** | **mstp** } **index** *link-index*

Default

No link preference is specified for a type of links with a specific link index in a flow template.

Views

Flow template view

Predefined user roles

network-admin

context-admin

Parameters

4g: Specifies the 4G type.

internet: Specifies the Internet type.

mpls: Specifies the MPLS type.

mstp: Specifies the MSTP type.

index *link-index*: Specifies a link index in the range of 1 to 65535.

preference *preference*: Specifies a link preference in the range of 1 to 255. The lower the value, the higher the priority.

Usage guidelines

RIR preferentially selects links with higher preference.

The link type and link index specified in this command identify links on a VSI interface. .Because a VSI interface can have only one VXLAN tunnel between a hub and spoke, this command sets the link preference for a specific VXLAN tunnel.

You can assign the same link preference value to different links in the same flow template.

Examples

In flow template 1, set the preference of MPLS link 1 to 100.

```
<Sysname> system-view
[Sysname] rir
[Sysname-rir] flow 1
[Sysname-flow-1] path link-type mpls index 1 preference 100
```

Related commands

rir link-type

probe connect

Use **probe connect** to configure NQA link connectivity probe parameters.

Use **undo probe connect** to restore the default.

Syntax

probe connect interval *interval* **timeout** *timeout*

undo probe connect

Default

The NQA link connectivity probe interval is 100 milliseconds. The timeout time is 3000 milliseconds for waiting for a response to a link connectivity probe packet.

Views

RIR view

Predefined user roles

network-admin

context-admin

Parameters

interval *interval*: Sets the NQA link connectivity probe interval in milliseconds. The value range for the *interval* argument is 0 to 604800000. The value of 0 represents that only one probe is performed.

timeout *timeout*: Sets the timeout time for waiting for a response to a link connectivity probe packet. The value range for the *timeout* argument is 10 to 3600000 milliseconds.

Usage guidelines

The device starts to detect the connectivity of all links in flow templates after RIR is enabled. Spokes (RIR clients) performs consecutive probes at the configured intervals and wait for responses for the probe packets. If an RIR client has not received any responses on a link when the probe packet timeout timer expires, the client determines that the link has connectivity issues.

Setting a shorter probe interval obtains more precise probe results but requires more system resources.

Set a shorter probe packet timeout time if the requirement for link quality is high.

In a VXLAN network, the probe targets are VXLAN tunnel interfaces enabled with the RIR client.

Examples

Set the NQA link connectivity probe interval to 30 milliseconds, and set the timeout time to 20 milliseconds for waiting for a response to a link connectivity probe packet.

```
<Sysname> system-view
[Sysname] rir
[Sysname-rir] probe connect interval 30 timeout 20
```

quality-policy

Use **quality-policy** to configure a quality policy for a flow template.

Use **undo quality-policy** to restore the default.

Syntax

quality-policy sla *sla-id* **nqa** *nqa-id*

undo quality-policy

Default

No quality policy is configured for a flow template.

Views

Flow template view

Predefined user roles

network-admin

context-admin

Parameters

sla *sla-id*: Specifies an SLA by its ID, in the range of 0 to 128. The specified SLA must exist on the device.

nqa *nqa-id*: Specifies an NQA link quality operation by its ID, in the range of 0 to 128. The specified NQA link quality operation must exist.

Usage guidelines

Use this command to specify an SLA and an NQA link quality operation for a flow template. The device monitors the link quality based on the NQA link quality operation and compares the NQA probe results with the thresholds set in the SLA. The device selects only links that meet the quality requirements of the SLA for traffic that matches the flow template.

For flow priority-based traffic scheduling, the priority of a flow that matches a flow template is determined by the SLA ID specified in the quality policy of that flow template. The greater the SLA ID, the higher the flow priority. If no quality policy is configured for a flow template, flows that match the flow template have the lowest priority.

You can specify only one SLA and one NQA link quality operation for the quality policy of a flow template. However, you can specify the same SLA or NQA link quality operation for the quality policies of multiple flow templates.

If you execute this command multiple times for a flow template, the most recent configuration takes effect.

Examples

Configure the quality policy of flow template **1** to associate SLA 2 with NQA link quality operation 1.

```
<Sysname> system-view
[Sysname] rir
[Sysname-rir] flow 1
[Sysname-rir-flow-1] quality-policy sla 2 nqa 1

In a hub-spoke network, you must enable the RIR process on all hubs and spokes.

Examples

Enable the RIR process and enter RIR view.

```
<Sysname> system-view
[Sysname] rir
[Sysname-rir]
```

rir backup

Use **rir backup** to configure a tunnel as an RIR backup tunnel.

Use **undo rir backup** to restore the default.

Syntax

rir backup

undo rir backup

Default

A tunnel is an RIR primary tunnel.

Views

VXLAN tunnel interface view

Predefined user roles

network-admin

context-admin

Usage guidelines

This command enables the RIR process if the RIR process has not been enabled. The **undo** form of this command does not disable the RIR process.

RIR selects qualified primary links prior to qualified backup links.

A spoke is typically connected to both a primary hub and a backup hub. You can specify the tunnels connected to the backup hub as backup tunnels. If no suitable link is available to reach the primary hub, the spoke can forward traffic through the backup tunnels to the backup hub to ensure service continuity.

Examples

Configure VXLAN tunnel **Tunnel 1** as an RIR backup tunnel.

```
<Sysname> system-view
[Sysname] interface tunnel1 mode vxlan
[Sysname-Tunnel1] rir backup
```

rir collaboration-link-group

Use **rir collaboration-link-group** to assign a VXLAN tunnel to an RIR collaboration link group.

Use **undo rir collaboration-link-group** to restore the default.

Syntax

rir collaboration-link-group *group-id*

undo rir collaboration-link-group

Default

A VXLAN tunnel belongs to the RIR collaboration link group with a group ID of 0.

Views

VXLAN tunnel interface view

Predefined user roles

network-admin

context-admin

Parameters

group-id: Specifies an RIR collaboration link group by its group ID in the range of 1 to 65535.

Usage guidelines

In an RIR collaboration device group, make sure all links to the same device or RIR collaboration device group are assigned to the same RIR collaboration link group. A device in an RIR collaboration device group can select links for service packets from the following links:

- ECMP links configured in the matching flow template on the local device.
- Links configured in the same flow template on devices that belong to the same RIR collaboration device group as the local device. In addition, the links belong to the same RIR collaboration link group as the candidate links on the local device.

You can use this command when RIR is enabled or disabled. However, this command takes effect only when RIR is enabled.

To ensure correct link selection, use this command on each device that belongs to the same RIR collaboration device group. Make sure all links to the same device or RIR collaboration device group are assigned to the same RIR collaboration link group.

In an RIR collaboration device group, make sure the links to different devices or RIR collaboration device groups are assigned to different RIR collaboration link groups.

In different RIR collaboration device groups, the links to the same device or RIR collaboration device group can be assigned to the same RIR collaboration link group. As a best practice to identify links, assign the links to different RIR collaboration link groups.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Assign VXLAN tunnel 1 to RIR collaboration link group 1.

```
<Sysname> system-view
[Sysname] interface Tunnel 1
[Sysname-Tunnel1] rir collaboration-link-group 1
```

rir link-type index

Use **rir link-type** to assign a link type and link index to a VSI interface.

Use **undo rir link-type** to restore the default.

Syntax

rir link-type { **4g** | **internet** | **mpls** | **mstp** } **index** *link-index*

undo rir link-type { **4g** | **internet** | **mpls** | **mstp** } **index** *link-index*

Default

No link type or link index is assigned to a VSI interface.

Views

VSI interface view

Predefined user roles

network-admin

context-admin

Parameters

4g: Specifies the 4G type.

internet: Specifies the Internet type.

mpls: Specifies the MPLS type.

mstp: Specifies the MSTP type.

index *link-index*: Specifies a link index in the range of 1 to 65535.

Usage guidelines

This command enables the RIR process if the RIR process has not been enabled. The **undo** form of this command does not disable the RIR process.

The link type and link index together uniquely identify a link between a hub and a spoke. For a flow template to use a link, you must assign a link type and index to the link. Use this command to configure the link type as 4G, Internet, MPLS, or MSTP. The link type only marks the network type of the link and it does not affect packet encapsulation.

VXLAN-based RIR allows a hub and a spoke to have only one VXLAN tunnel for a VSI interface (a VXLAN). By assigning a link type and index to the VSI interface, RIR can identify the VXLAN tunnel between the hub and spoke.

A VSI interface on a hub (or spoke) can have a VXLAN tunnel to each spoke (or hub). The VXLAN tunnels of the same VSI interface are assigned the same link type and link index.

A VSI interface can be associated only with one link type.

You must assign different link indexes to the same type of links on different VSI interfaces.

Examples

Set the link type to MPLS and link index to 1 on VSI-interface 1.

```
<Sysname>system-view
[Sysname] interface vsi-interface 1
[Sysname-Vsi-interface1] rir link-type mpls index 1
```

rir role

Use **rir role** to enable the RIR client or the RIR server on a VXLAN tunnel interface.

Use **undo rir role** to restore the default.

Syntax

rir role { **client** | **server** }

undo rir role

Default

The default for this command depends on the configuration of the **client enable** and **server enable** commands.

Views

VXLAN tunnel interface view

Predefined user roles

network-admin

context-admin

Parameters

client: Specifies the RIR client.

server: Specifies the RIR server.

Usage guidelines

To avoid NQA probes from occupying too many resources on a hub in a hub-spoke network, configure the hub as an RIR server and configure the spokes as RIR clients.

You can enable the RIR client or server globally or on an interface.

- Enabling the RIR client or server globally also enables the RIR client or server for all interfaces on the device. The interfaces can send or receive link quality probe results.
- Enabling the RIR client or server on an interface allows only that interface to send or receive link quality probe results.

Enable the RIR server or RIR client, or use them in combination, depending on the role of the device in the network.

- If the device acts only as a hub, you can enable the RIR server globally.
- If the device acts only as a spoke, you can enable the RIR client globally.
- If the device acts as both a hub and a spoke, you can enable the RIR server and RIR client on the corresponding interfaces.

When you enable the RIR client or server, follow these restrictions and guidelines:

- In a VXLAN network, only tunnel interfaces support enabling the RIR client or server. The RIR server uses the tunnel interfaces to receive link quality probe results synchronized from RIR clients.
- The RIR client and RIR server cannot be both enabled on the same interface.
- If the enabled role (RIR server or client) on an interface is different from the globally enabled role, the interface-specific role takes effect on that interface.

To modify the role of an interface, you must first use the **undo rir role** command to remove the original role.

Examples

Enable the RIR server on tunnel interface **Tunnel 1**.

```
<Sysname> system-view
[Sysname] interface Tunnel 1 mode vxlan
[Sysname-tunnel1] rir role client
```

Related commands

client enable

server enable

server enable

Use **server enable** to enable the RIR server globally.

Use **undo server enable** to disable the RIR server globally.

Syntax

server enable

undo server enable

Default

The RIR server is disabled globally.

Views

Predefined user roles

network-admin

context-admin

Usage guidelines

To avoid NQA probes from occupying too many resources on a hub in a hub-spoke network, configure the hub as an RIR server and configure the spokes as RIR clients.

You can enable the RIR server globally or on an interface.

- Enabling the RIR server globally also enables the RIR server for all interfaces on the device. The interfaces can receive link quality probe results synchronized from RIR clients.
- Enabling the RIR server on an interface allows only that interface to receive link quality probe results synchronized from RIR clients.

When you enable the RIR server, follow these restrictions and guidelines:

- In a VXLAN network, only tunnel interfaces support enabling the RIR server. The RIR server uses the tunnel interfaces to receive link quality probe results synchronized from RIR clients.
- The RIR server and RIR client cannot be both enabled on the same interface.
- If the enabled role (RIR server or client) on an interface is different from the globally enabled role, the interface-specific role takes effect on that interface.

Examples

Enable the RIR server globally.

```
<Sysname> system-view
[Sysname] rir
[Sysname-rir] server enable
```

probe connect

probe sync-port

sla

Use **sla** to create an SLA and enter its view, or enter the view of an existing SLA.

Use **undo sla** to delete an SLA.

Syntax

sla *sla-id*

undo sla *sla-id*

Default

No SLAs exist.

Views

RIR view

Predefined user roles

network-admin

context-admin

Parameters

sla-id: Specifies an SLA ID in the range of 0 to 128.

Usage guidelines

To meet the differentiated requirements of services on link quality, configure a Service Level Agreement (SLA) for each service. An SLA contains a set of parameters to evaluate link quality, including the link delay, jitter, and packet loss thresholds.

The quality policy of a flow template contains an SLA and an NQA link quality operation. By comparing the NQA link quality probe results with the thresholds in the SLA, the device determines whether a link meets the quality requirements of the service. If all parameter values in the probe results of a link are lower than or equal to the thresholds in the SLA, the link is qualified for the service.

For flow priority-based traffic scheduling, the priority of a flow that matches a flow template is determined by the SLA ID specified in the quality policy of that flow template. The greater the SLA ID, the higher the flow priority. If no quality policy is configured for a flow template, flows that match the flow template have the lowest priority.

The device supports a maximum of 129 SLAs.

Examples

Create SLA 1 and enter its view.

```
<Sysname> system-view
[Sysname] rir
[Sysname-rir] sla 1
[Sysname-rir-sla-1]
```

Related commands

NSFOCUS Firewall Series

NF ACL and QoS

Command Reference

NSFOCUS Technologies, Inc.

Document version: 6W600-20230221

Preface

This command reference describes the commands for configuring ACL and QoS features, including ACL, QoS, and time range.

This preface includes the following topics about the documentation:

- Audience.
- Conventions.

Audience

This documentation is intended for:

- Network planners.
- Field technical support and servicing engineers.
- Network administrators.

Conventions

The following information describes the conventions used in the documentation.

Command conventions

Convention	Description
Boldface	**Bold** text represents commands and keywords that you enter literally as shown.
Italic	*Italic* text represents arguments that you replace with actual values.
[ ]	Square brackets enclose syntax choices (keywords or arguments) that are optional.
{ x | y | ... }	Braces enclose a set of required syntax choices separated by vertical bars, from which you select one.
[x | y | ...]	Square brackets enclose a set of optional syntax choices separated by vertical bars, from which you select one or none.
{ x | y | ... } *	Asterisk marked braces enclose a set of required syntax choices separated by vertical bars, from which you select a minimum of one.
[x | y | ...] *	Asterisk marked square brackets enclose optional syntax choices separated by vertical bars, from which you select one choice, multiple choices, or none.
&<1-n>	The argument or keyword and argument combination before the ampersand (&) sign can be entered 1 to n times.
#	A line that starts with a pound (#) sign is comments.

GUI conventions

Convention	Description
Boldface	Window names, button names, field names, and menu items are in Boldface. For example, the **New User** window opens; click **OK**.
>	Multi-level menus are separated by angle brackets. For example, **File** > **Create** > **Folder**.

Symbols

Convention	Description
WARNING!	An alert that calls attention to important information that if not understood or followed can result in personal injury.
CAUTION:	An alert that calls attention to important information that if not understood or followed can result in data loss, data corruption, or damage to hardware or software.
IMPORTANT:	An alert that calls attention to essential information.
NOTE:	An alert that contains additional or supplementary information.
TIP:	An alert that provides helpful information.

Network topology icons

Convention	Description
	Represents a generic network device, such as a router, switch, or firewall.
	Represents a routing-capable device, such as a router or Layer 3 switch.
	Represents a generic switch, such as a Layer 2 or Layer 3 switch, or a router that supports Layer 2 forwarding and other Layer 2 features.
	Represents an access controller, a unified wired-WLAN module, or the access controller engine on a unified wired-WLAN switch.
	Represents an access point.
	Represents a wireless terminator unit.
	Represents a wireless terminator.
	Represents a mesh access point.
	Represents omnidirectional signals.
	Represents directional signals.
	Represents a security product, such as a firewall, UTM, multiservice security gateway, or load balancing device.
	Represents a security module, such as a firewall, load balancing, NetStream, SSL VPN, IPS, or ACG module.

Examples provided in this document

Examples in this document might use devices that differ from your device in hardware model, configuration, or software version. It is normal that the port numbers, sample output, screenshots, and other information in the examples differ from what you have on your device.

Contents

ACL commands

accelerate

Use **accelerate** to enable ACL acceleration.

Use **undo accelerate** to restore the default.

Syntax

accelerate

undo accelerate

Default

ACL acceleration is disabled.

Views

IPv4 basic/advanced ACL view

IPv6 basic/advanced ACL view

Layer 2 ACL view

Predefined user roles

network-admin

context-admin

Usage guidelines

This command does not take effect if the ACL resources are insufficient.

ACL acceleration can be successfully enabled only if all rules in an ACL support acceleration.

You can modify, add, or delete rules for an accelerated ACL. ACL acceleration might fail when the ACL resources are insufficient or the modified or added rule does not support acceleration.

ACL acceleration is delayed for a period after an ACL rule is added, deleted, or modified. If additional rule changes occur during the delay period, the delay period starts to count again. If an ACL contains 100 or less rules, the delay period is 2 seconds. If an ACL contains more than 100 rules, the delay period is 20 seconds.

Examples

Enable ACL acceleration for ACL 2000.

```
<Sysname> system-view
[Sysname] acl basic 2000
[Sysname-acl-ipv4-basic-2000] accelerate
```

Related commands

display acl accelerate

acl

Use **acl** to create an ACL and enter its view, or enter the view of an existing ACL.

Use **undo acl** to delete the specified or all ACLs.

Syntax

acl [**ipv6**] { **name** *acl-name* | **number** *acl-number* [**name** *acl-name*] [**match-order** { **auto** | **config** }] }

undo acl [**ipv6**] { **all** | **name** *acl-name* | **number** *acl-number* }

acl [**ipv6**] { **advanced** | **basic** } { *acl-number* | **name** *acl-name* } [**match-order** { **auto** | **config** }]

acl mac { *acl-number* | **name** *acl-name* } [**match-order** { **auto** | **config** }]

undo acl [**ipv6**] { **all** | { **advanced** | **basic** } { *acl-number* | **name** *acl-name* } }

undo acl mac { **all** | *acl-number* | **name** *acl-name* }

Default

No ACLs exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

ipv6: Specifies the IPv6 ACL type.

basic: Specifies the basic ACL type.

advanced: Specifies the advanced ACL type.

mac: Specifies the Layer 2 ACL type.

acl-number: Assigns a number to the ACL. The following are available value ranges:

- 2000 to 2999 for basic ACLs.
- 3000 to 3999 for advanced ACLs.
- 4000 to 4999 for Layer 2 ACLs.

name *acl-name*: Assigns a name to the ACL. The *acl-name* argument is a case-insensitive string of 1 to 63 characters. It must start with an English letter and to avoid confusion, it cannot be **all**.

match-order: Specifies the order in which ACL rules are compared against packets.

auto: Compares ACL rules in depth-first order.

config: Compares ACL rules in ascending order of rule ID. The rule with a smaller ID has a higher priority. If you do not specify a match order, the **config** order applies by default.

all: Specifies all ACLs of the specified type.

Usage guidelines

If you create a numbered ACL, you can enter the view of the ACL by using the following commands:

- **acl** [**ipv6**] **number** *acl-number*
- **acl** { [**ipv6**] { **advanced** | **basic** } | **mac** } *acl-number*

If you create a ACL by specifying both a number and a name, you can enter the view of the ACL by using the following commands:

- **acl** [**ipv6**] **number** *acl-number* (only for basic and advanced ACLs)

- **acl** [**ipv6**] **number** *acl-number* [**name** *acl-name*]
- **acl** { [**ipv6**] { **advanced** | **basic** } | **mac** } **name** *acl-name*

If you create a named ACL by using the **acl** { [**ipv6**] { **advanced** | **basic** } | **mac** } **name** *acl-name* command, you can enter the view of the ACL by using the following commands:

- **acl** [**ipv6**] **name** *acl-name*
- **acl** { [**ipv6**] { **advanced** | **basic** } | **mac** } **name** *acl-name*

You can change the match order only for ACLs that do not contain any rules.

Matching packets are forwarded through slow forwarding if an ACL rule contains match criteria or has functions enabled in addition to the following match criteria and functions:

- Source and destination IP addresses.
- Source and destination ports.
- Transport layer protocol.
- ICMP or ICMPv6 message type, message code, and message name.
- VPN instance.
- Logging.
- Time range.

Slow forwarding requires packets to be sent to the control plane for forwarding entry calculation, which affects the device forwarding performance.

Examples

Create IPv4 basic ACL 2000 and enter its view.

```
<Sysname> system-view
[Sysname] acl basic 2000
[Sysname-acl-ipv4-basic-2000]
```

Create IPv4 basic ACL **flow** and enter its view.

```
<Sysname> system-view
[Sysname] acl basic name flow
[Sysname-acl-ipv4-basic-flow]
```

Create IPv4 advanced ACL 3000 and enter its view.

```
<Sysname> system-view
[Sysname] acl advanced 3000
[Sysname-acl-ipv4-adv-3000]
```

Create IPv6 basic ACL 2000 and enter its view.

```
<Sysname> system-view
[Sysname] acl ipv6 basic 2000
[Sysname-acl-ipv6-basic-2000]
```

Create IPv6 basic ACL **flow** and enter its view.

```
<Sysname> system-view
[Sysname] acl ipv6 basic name flow
[Sysname-acl-ipv6-basic-flow]
```

Create IPv6 advanced ACL **abc** and enter its view.

```
<Sysname> system-view
[Sysname] acl ipv6 advanced name abc
[Sysname-acl-ipv6-adv-abc]
```

Create Layer 2 ACL 4000 and enter its view.

```
<Sysname> system-view
[Sysname] acl mac 4000
[Sysname-acl-mac-4000]
```

Create Layer 2 ACL **flow** and enter its view.

```
<Sysname> system-view
[Sysname] acl mac name flow
[Sysname-acl-mac-flow]
```

Related commands

display acl

acl copy

Use **acl copy** to create an ACL by copying an ACL that already exists.

Syntax

acl [**ipv6** | **mac**] **copy** { *source-acl-number* | **name** *source-acl-name* } **to** { *dest-acl-number* | **name** *dest-acl-name* }

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

ipv6: Specifies the IPv6 ACL type.

mac: Specifies the Layer 2 ACL type.

source-acl-number: Specifies an existing source ACL by its number. The following are available value ranges:

- 2000 to 2999 for basic ACLs.
- 3000 to 3999 for advanced ACLs.
- 4000 to 4999 for Layer 2 ACLs.

name *source-acl-name*: Specifies an existing source ACL by its name. The *source-acl-name* argument is a case-insensitive string of 1 to 63 characters.

dest-acl-number: Assigns a unique number to the new ACL. The following are available value ranges:

- 2000 to 2999 for basic ACLs.
- 3000 to 3999 for advanced ACLs.
- 4000 to 4999 for Layer 2 ACLs.

name *dest-acl-name*: Assigns a unique name to the new ACL. The *dest-acl-name* argument is a case-insensitive string of 1 to 63 characters. It must start with an English letter and to avoid confusion, it cannot be **all**.

Usage guidelines

The new ACL and the source ACL must be the same type.

The new ACL has the same properties and content as the source ACL, but uses a different number or name from the source ACL.

Examples

Create IPv4 basic ACL 2002 by copying IPv4 basic ACL 2001.

```
<Sysname> system-view
[Sysname] acl copy 2001 to 2002
```

Create IPv4 basic ACL **paste** by copying IPv4 basic ACL **test**.

```
<Sysname> system-view
[Sysname] acl copy name test to name paste
```

acl logging interval

Use **acl logging interval** to enable logging for packet filtering and set the interval.

Use **undo acl logging interval** to restore the default.

Syntax

acl logging interval *interval*

undo acl logging interval

Default

The interval is 0. The device does not generate log entries for packet filtering.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

interval: Specifies the interval at which log entries are generated and output. It must be a multiple of 5, in the range of 0 to 1440 minutes. To disable the logging, set the value to 0.

Usage guidelines

The logging feature is available for IPv4 or IPv6 ACL rules that have the **logging** keyword.

You can configure the ACL module to generate log entries for packet filtering and output them to the information center at the output interval. The log entry records the number of matching packets and the matched ACL rules. When the first packet of a flow matches an ACL rule, the output interval starts, and the device immediately outputs a log entry for this packet. When the output interval ends, the device outputs a log entry for subsequent matching packets of the flow.

For more information about the information center, see *Network Management and Monitoring Configuration Guide*.

Examples

Configure the device to generate and output packet filtering log entries every 10 minutes.

```
<Sysname> system-view
[Sysname] acl logging interval 10
```

Related commands

rule (IPv4 advanced ACL view)

rule (IPv4 basic ACL view)

rule (IPv6 advanced ACL view)

rule (IPv6 basic ACL view)

acl trap interval

Use **acl trap interval** to enable SNMP notifications for packet filtering and set the interval.

Use **undo acl interval** to restore the default.

Syntax

acl trap interval *interval*

undo acl trap interval

Default

The interval is 0. The device does not generate SNMP notifications for packet filtering.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

interval: Specifies the interval at which SNMP notifications are generated and output. It must be a multiple of 5, in the range of 0 to 1440 minutes. To disable SNMP notifications, set the value to 0.

Usage guidelines

The SNMP notifications feature is available for IPv4 or IPv6 ACL rules that have the **logging** keyword.

You can configure the ACL module to generate SNMP notifications for packet filtering and output them to the SNMP module at the output interval. The notification records the number of matching packets and the matched ACL rules. When the first packet of a flow matches an ACL rule, the output interval starts, and the device immediately outputs a notification for this packet. When the output interval ends, the device outputs a notification for subsequent matching packets of the flow. For more information about SNMP, see *Network Management and Monitoring Configuration Guide*.

Examples

Configure the device to generate and output packet filtering SNMP notifications every 10 minutes.

```
<Sysname> system-view
[Sysname] acl trap interval 10
```

IPv6 basic/advanced ACL view

Layer 2 ACL view

Predefined user roles

network-admin

context-admin

Parameters

text: Specifies a description, a case-sensitive string of 1 to 127 characters.

Examples

Configure a description for IPv4 basic ACL 2000.

```
<Sysname> system-view
[Sysname] acl basic 2000
[Sysname-acl-ipv4-basic-2000] description This is an IPv4 basic ACL.
```

Related commands

display acl

display acl

Use **display acl** to display ACL configuration and match statistics.

Syntax

display acl [**ipv6** | **mac**] { *acl-number* | **all** | **name** *acl-name* }

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

ipv6: Specifies the IPv6 ACL type.

mac: Specifies the Layer 2 ACL type.

acl-number: Specifies an ACL by its number. The following are available value ranges:

- 2000 to 2999 for basic ACLs.
- 3000 to 3999 for advanced ACLs.

- 4000 to 4999 for Layer 2 ACLs.

all: Specifies all ACLs of the specified type.

name *acl-name*: Specifies an ACL by its name. The *acl-name* argument is a case-insensitive string of 1 to 63 characters.

Usage guidelines

This command displays ACL rules in **config** or **auto** order, whichever is configured.

Examples

Display configuration and match statistics for all IPv4 ACLs.

```
<Sysname> display acl all
Basic IPv4 ACL 2001, 2 rules, match-order is auto,
This is an IPv4 basic ACL.
ACL's step is 5
ACL accelerated
Rule insert-only enabled
 rule 5 permit source 1.1.1.1 0 (5 times matched)
 rule 5 comment This rule is used on GigabitEthernet1/0/1.
 rule 10 permit source object-group permit (5 times matched)
Advanced IPv4 ACL 3001, 1 rule,
ACL's step is 5
 rule 0 permit ip source 1.1.1.0 0.0.0.255 destination 3.3.3.0 0.0.0.255 (Dynamic)
```

Table 1 Command output

Field	Description
Basic IPv4 ACL 2001	Type and number of the ACL.
2 rules	The ACL contains two rules.
match-order is auto	The match order for the ACL is **auto**, which sorts ACL rules in depth-first order. This field is not displayed when the match order is **config**.
This is an IPv4 basic ACL.	Description of the ACL.
ACL's step is 5	The rule numbering step is 5.
ACL accelerated	ACL acceleration is enabled for the ACL.
Rule insert-only enabled	Rule ID preemption is enabled for the ACL.
rule 5 permit source 1.1.1.1 0	Content of rule 5. The rule permits packets sourced from the IP address 1.1.1.1.
rule 10 permit source object-group permit	Content of rule 10. The rule permits packets sourced from the object group **permit**.
5 times matched	The rule has been matched five times. Only matches performed in software are counted. This field is not displayed when no packets matched the rule.
rule 5 comment This rule is used on GigabitEthernet1/0/1.	Comment of rule 5.
Dynamic	A dynamic rule is added dynamically by an application module.

display acl accelerate

Use **display acl accelerate** to display ACL acceleration status.

Syntax

display acl accelerate { **summary** [**ipv6** | **mac**] | **verbose** [**ipv6** | **mac**] { *acl-number* | **name** *acl-name* } **slot** *slot-number* }

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

summary: Displays summary information about ACL acceleration status.

verbose: Displays detailed information about ACL acceleration status.

ipv6: Specifies the IPv6 ACL type.

mac: Specifies the Layer 2 ACL type.

acl-number: Specifies an ACL by its number. The following are available value ranges:

- 2000 to 2999 for basic ACLs.
- 3000 to 3999 for advanced ACLs.
- 4000 to 4999 for Layer 2 ACLs.

name *acl-name*: Specifies an ACL by its name. The *acl-name* argument is a case-insensitive string of 1 to 63 characters.

slot *slot-number*: Specifies an IRF member device. The *slot-number* argument represents the ID of the IRF member device. The specified device must be the device where the acceleration chip resides.

Usage guidelines

If you specify the **verbose** keyword, this command displays the ACLs for which acceleration is successfully enabled and their rules. The ACLs for which acceleration is disabled or fails to be enabled are not displayed.

Examples

Display summary information about ACL acceleration status.

```
<Sysname> display acl accelerate summary
Basic IPv4 ACL 2000
```

display packet-filter

Use **display packet-filter** to display ACL application information for packet filtering.

Syntax

display packet-filter { **interface** [*interface-type interface-number*] [**inbound**] | **zone-pair security** [**source** *source-zone-name* **destination** *destination-zone-name*] } [**slot** *slot-number*]

Views

context-operator

Parameters

interface [*interface-type interface-number*]: Specifies an interface by its type and number. If you do not specify an interface, this command displays ACL application information for packet filtering on all interfaces except VA interfaces. For information about VA interfaces, see PPP in *Layer 2—WAN Access Configuration Guide*. If you specify an Ethernet interface, you do not need to specify the **slot** *slot-number* option.

zone-pair security [**source** *source-zone-name* **destination** *destination-zone-name*]: Specifies a zone pair. The *source-zone-name* argument specifies a source security zone by its name. The *destination-zone-name* argument specifies a destination security zone by its name. The security zone name is a case-insensitive string of 1 to 31 characters.

inbound: Specifies the inbound direction.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays ACL application information for packet filtering for the master device.

Usage guidelines

Examples

Display ACL application information for inbound packet filtering on interface GigabitEthernet 1/0/1.

```
<Sysname> display packet-filter interface gigabitethernet 1/0/1 inbound
Interface: GigabitEthernet1/0/1
Inbound policy:
  IPv4 ACL 2001
  IPv6 ACL 2002 (Failed)
  MAC ACL 4003 (Failed)
  IPv4 default action: Deny
  IPv6 default action: Deny
  MAC default action: Deny
```

Display ACL application information for packet filtering from source security zone **office** to destination security zone **library**.

```
<Sysname> display packet-filter zone-pair security source office destination library
Zone-pair: source office destination library
  IPv4 ACL 2001
  IPv4 ACL 2002
```

Table 2 Command output

Field	Description
Interface	Interface to which the ACL applies.
Zone-pair	Zone pair to which the ACL applies.
Inbound policy	ACL used for filtering incoming traffic.
IPv4 ACL 2001	IPv4 basic ACL 2001 has been successfully applied.
IPv6 ACL 2002 (Failed)	The device has failed to apply IPv6 basic ACL 2002.
IPv4 default action	Packet filter default action for packets that do not match any IPv4 ACLs: • **Deny**—The default action **deny** has been successfully applied for packet filtering. • **Deny (Failed)**—The device has failed to apply the default action **deny** for packet filtering. The action **permit** still functions. • **Permit**—The default action **permit** has been successfully applied for packet filtering.
IPv6 default action	Packet filter default action for packets that do not match any IPv6 ACLs: • **Deny**—The default action **deny** has been successfully applied for packet filtering. • **Deny (Failed)**—The device has failed to apply the default action **deny** for packet filtering. The action **permit** still functions. • **Permit**—The default action **permit** has been successfully applied for packet filtering.
MAC default action	Packet filter default action for packets that do not match any Layer 2 ACLs: • **Deny**—The default action **deny** has been successfully applied for packet filtering. • **Deny (Failed)**—The device has failed to apply the default action **deny** for packet filtering. The action **permit** still functions. • **Permit**—The default action **permit** has been successfully applied for packet filtering.

display packet-filter statistics

Use **display packet-filter statistics** to display packet filtering statistics.

Syntax

display packet-filter statistics { **interface** *interface-type interface-number* **inbound** [**default** | [**ipv6** | **mac**] { *acl-number* | **name** *acl-name* }] | **zone-pair security source** *source-zone-name* **destination** *destination-zone-name* [[**ipv6**] { *acl-number* | **name** *acl-name* }] } [**brief**]

Views

Any view

network-operator

context-admin

context-operator

Parameters

interface *interface-type interface-number*: Specifies an interface by its type and number.

zone-pair security source *source-zone-name* **destination** *destination-zone-name*: Specifies a zone pair. The *source-zone-name* argument specifies a source security zone by its name. The *destination-zone-name* argument specifies a destination security zone by its name. The security zone name is a case-insensitive string of 1 to 31 characters.

inbound: Specifies the inbound direction.

default: Displays the default action statistics for packet filtering.

ipv6: Specifies the IPv6 ACL type.

mac: Specifies the Layer 2 ACL type.

acl-number: Specifies an ACL by its number. The following are available value ranges:

- 2000 to 2999 for basic ACLs.
- 3000 to 3999 for advanced ACLs.
- 4000 to 4999 for Layer 2 ACLs.

name *acl-name*: Specifies an ACL by its name. The *acl-name* argument is a case-insensitive string of 1 to 63 characters.

brief: Displays brief statistics.

Usage guidelines

If you do not specify any parameters, this command displays packet filtering statistics for all ACLs.

Examples

Display packet filtering statistics for all ACLs on incoming packets of GigabitEthernet 1/0/1.

```
<Sysname> display packet-filter statistics interface gigabitethernet 1/0/1 inbound
Interface: GigabitEthernet1/0/1
 Inbound policy:
  IPv4 ACL 2001
   From 2011-06-04 10:25:21 to 2011-06-04 10:35:57
   rule 0 permit source 2.2.2.2 0 counting (2 packets, 256 bytes)
   rule 5 permit source 1.1.1.1 0 counting (Failed)
   rule 10 permit vpn-instance test counting (No resource)
   Totally 2 packets 256 bytes permitted, 0 packets 0 bytes denied
   Totally 100% permitted, 0% denied

  IPv6 ACL 2000

  MAC ACL 4000
   rule 0 permit

  IPv4 default action: Deny
   From 2011-06-04 10:25:21 to 2011-06-04 10:35:57
   Totally 7 packets
```

```
  IPv6 default action: Deny
    From 2011-06-04 10:25:41 to 2011-06-04 10:35:57
    Totally 0 packets
  MAC default action: Deny
    From 2011-06-04 10:25:34 to 2011-06-04 10:35:57
    Totally 0 packets
```

Display packet filtering statistics for IPv4 advanced ACL 3001 on packets from source security zone **office** to destination security zone **library**.

```
<Sysname> display packet-filter statistics zone-pair security source office destination
library 3001
Zone-pair: source office destination library
IPv4 ACL 3001
   rule 0 permit source 2.2.2.2 0
   rule 5 permit source 1.1.1.1 0 counting (2 packets)
   rule 10 permit vpn-instance test (Failed)
   Totally 2 packets 256 bytes permitted, 0 packets 0 bytes denied
   Totally 100% permitted, 0% denied
```

Table 3 Command output

Field	Description
Interface	Interface to which the ACL applies.
Zone-pair	Zone pair to which the ACL applies.
Inbound policy	ACL used for filtering incoming traffic.
IPv4 ACL 2001	IPv4 basic ACL 2001 has been successfully applied.
IPv4 ACL 2002 (Failed)	The device has failed to apply IPv4 basic ACL 2002.
From 2011-06-04 10:25:21 to 2011-06-04 10:35:57	Start time and end time of the statistics. This field is not supported in the current software version.
2 packets	Two packets matched the rule. This field is not displayed when no packets matched the rule.
No resource	Resources are not enough for counting matches for the rule. In packet filtering statistics, this field is displayed for a rule when resources are not sufficient for rule match counting.
rule 5 permit source 1.1.1.1 0 (Failed)	The device has failed to apply rule 5.
Totally 2 packets permitted, 0 packets denied	Number of packets permitted and denied by the ACL.
Totally 100% permitted, 0% denied	Ratios of permitted and denied packets to all packets.
IPv4 default action	Packet filter default action for packets that do not match any IPv4 ACLs: • **Deny**—The default action **deny** has been successfully applied for packet filtering. • **Deny (Failed)**—The device has failed to apply the default action **deny** for packet filtering. The action **permit** still functions. • **Permit**—The default action **permit** has been successfully applied for packet filtering.

IPv6 default action	Packet filter default action for packets that do not match any IPv6 ACLs: • **Deny**—The default action **deny** has been successfully applied for packet filtering. • **Deny (Failed)**—The device has failed to apply the default action **deny** for packet filtering. The action **permit** still functions. • **Permit**—The default action **permit** has been successfully applied for packet filtering.
MAC default action	Packet filter default action for packets that do not match any Layer 2 ACLs: • **Deny**—The default action **deny** has been successfully applied for packet filtering. • **Deny (Failed)**—The device has failed to apply the default action **deny** for packet filtering. The action **permit** still functions. • **Permit**—The default action **permit** has been successfully applied for packet filtering.
Totally 7 packets	The default action has been executed on seven packets. This field is not supported in the current software version.

Related commands

reset packet-filter statistics

display packet-filter statistics sum

Use **display packet-filter statistics sum** to display accumulated packet filtering statistics for an ACL.

Syntax

display packet-filter statistics sum inbound [**ipv6** | **mac**] { *acl-number* | **name** *acl-name* } [**brief**]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

inbound: Specifies the inbound direction.

ipv6: Specifies the IPv6 ACL type.

mac: Specifies the Layer 2 ACL type.

acl-number: Specifies an ACL by its number. The following are available value ranges:

- 2000 to 2999 for basic ACLs.
- 3000 to 3999 for advanced ACLs.
- 4000 to 4999 for Layer 2 ACLs.

name *acl-name*: Specifies an ACL by its name. The *acl-name* argument is a case-insensitive string of 1 to 63 characters.

brief: Displays brief statistics.

Examples

Display accumulated packet filtering statistics for IPv4 basic ACL 2001 on incoming packets.

```
<Sysname> display packet-filter statistics sum inbound 2001
Sum:
 Inbound policy:
  IPv4 ACL 2001
   rule 0 permit source 2.2.2.2 0 counting (2 packets, 256 bytes)
   rule 5 permit source 1.1.1.1 0
   rule 10 permit vpn-instance test
   Totally 2 packets 256 bytes permitted, 0 packets 0 bytes denied
   Totally 100% permitted, 0% denied
```

Display brief accumulated packet filtering statistics for IPv4 basic ACL 2000 on incoming packets.

```
<Sysname> display packet-filter statistics sum inbound 2000 brief
Sum:
 Inbound policy:
  IPv4 ACL 2000
   Totally 2 packets 256 bytes permitted, 0 packets 0 bytes denied
   Totally 100% permitted, 0% denied
```

Table 4 Command output

Field	Description
Sum	Accumulated packet filtering statistics.
Inbound policy	Accumulated packet filtering statistics in the inbound direction.
IPv4 ACL 2001	Accumulated packet filtering statistics of IPv4 basic ACL 2001.
2 packets, 256 bytes	Number of packets matched the rule and the size of the matching packets. In this example, 2 packets (256 bytes) matched the rule. This field is not displayed when no packets matched the rule.
Totally 2 packets 256 bytes permitted, 0 packets 0 bytes denied	Number of packets and number of bytes permitted and denied by the ACL.
Totally 100% permitted, 0% denied	Ratios of permitted and denied packets to all packets.

Related commands

reset packet-filter statistics

display packet-filter verbose

Use **display packet-filter verbose** to display ACL application details for packet filtering.

Syntax

display packet-filter verbose { **interface** *interface-type interface-number* **inbound** [[**ipv6** | **mac**] { *acl-number* | **name** *acl-name* }] | **zone-pair security source** *source-zone-name* **destination** *destination-zone-name* [[**ipv6**] { *acl-number* | **name** *acl-name* }] } [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

interface *interface-type interface-number*: Specifies an interface by its type and number. The **slot** *slot-number* option is not available for an Ethernet interface.

zone-pair security source *source-zone-name* **destination** *destination-zone-name*: Specifies a zone pair. The *source-zone-name* argument specifies a source security zone by its name. The *destination-zone-name* argument specifies a destination security zone by its name. The security zone name is a case-insensitive string of 1 to 31 characters.

inbound: Specifies the inbound direction.

ipv6: Specifies the IPv6 ACL type.

mac: Specifies the Layer 2 ACL type.

acl-number: Specifies an ACL by its number. The following are available value ranges:

- 2000 to 2999 for basic ACLs.
- 3000 to 3999 for advanced ACLs.
- 4000 to 4999 for Layer 2 ACLs.

name *acl-name*: Specifies an ACL by its name. The *acl-name* argument is a case-insensitive string of 1 to 63 characters.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays ACL application details for packet filtering for the master device.

Usage guidelines

If *acl-number*, **name** *acl-name*, **ipv6**, or **mac** is not specified, this command displays application details of all ACLs for packet filtering.

Examples

Display application details of all ACLs for inbound packet filtering on GigabitEthernet 1/0/1.

```
<Sysname> display packet-filter verbose interface gigabitethernet 1/0/1 inbound
Interface: GigabitEthernet1/0/1
 Inbound policy:
  IPv4 ACL 2001
   rule 0 permit
   rule 5 permit source 1.1.1.1 0 (Failed)
   rule 10 permit vpn-instance test (Failed)

  IPv6 ACL 2000
   rule 0 permit

  MAC ACL 4000

  IPv4 default action: Deny
```

```
  IPv6 default action: Deny

  MAC default action: Deny
```

Display application details of all ACLs for packet filtering from source security zone **office** to destination security zone **library**.

```
<Sysname> display packet-filter verbose zone-pair security source office destination
library
Zone-pair: source office destination library
  IPv4 ACL 2001
   rule 0 permit
   rule 5 permit source 1.1.1.1 0
   rule 10 permit vpn-instance test
```

Table 5 Command output

Field	Description
Interface	Interface to which the ACL applies.
Zone-pair	Zone pair to which the ACL applies.
Inbound policy	ACL used for filtering incoming traffic.
IPv4 ACL 2001	IPv4 basic ACL 2001 has been successfully applied.
IPv4 ACL 2002 (Failed)	The device has failed to apply IPv4 basic ACL 2002.
Hardware-count	ACL rule match counting in hardware has been successfully enabled.
Hardware-count (Failed)	The device has failed to enable counting ACL rule matches in hardware.
rule 5 permit source 1.1.1.1 0 (Failed)	The device has failed to apply rule 5.
IPv4 default action	Packet filter default action for packets that do not match any IPv4 ACLs: • **Deny**—The default action **deny** has been successfully applied for packet filtering. • **Deny (Failed)**—The device has failed to apply the default action **deny** for packet filtering. The action **permit** still functions. • **Permit**—The default action **permit** has been successfully applied for packet filtering.
IPv6 default action	Packet filter default action for packets that do not match any IPv6 ACLs: • **Deny**—The default action **deny** has been successfully applied for packet filtering. • **Deny (Failed)**—The device has failed to apply the default action **deny** for packet filtering. The action **permit** still functions. • **Permit**—The default action **permit** has been successfully applied for packet filtering.
MAC default action	Packet filter default action for packets that do not match any Layer 2 ACLs: • **Deny**—The default action **deny** has been successfully applied for packet filtering. • **Deny (Failed)**—The device has failed to apply the default action **deny** for packet filtering. The action **permit**

	still functions. • **Permit**—The default action **permit** has been successfully applied for packet filtering.

packet-filter (interface view)

Use **packet-filter** to apply an ACL to an interface to filter packets.

Use **undo packet-filter** to remove an ACL from an interface.

Syntax

packet-filter [**ipv6** | **mac**] { *acl-number* | **name** *acl-name* } **inbound**

undo packet-filter [**ipv6** | **mac**] { *acl-number* | **name** *acl-name* } **inbound**

Default

No ACL is applied to an interface to filter packets.

Views

Interface view

Predefined user roles

network-admin

context-admin

Parameters

ipv6: Specifies the IPv6 ACL type.

mac: Specifies the Layer 2 ACL type.

acl-number: Specifies an ACL by its number. The following are available value ranges:

- 2000 to 2999 for basic ACLs.
- 3000 to 3999 for advanced ACLs.
- 4000 to 4999 for Layer 2 ACLs.

name *acl-name*: Specifies an ACL by its name. The *acl-name* argument is a case-insensitive string of 1 to 63 characters.

inbound: Filters incoming packets.

Usage guidelines

When you reference an ACL, follow these restrictions and guidelines:

- If the ACL does not exist or contains no rules, the ACL is not used to filter packets.
- If the **vpn-instance** *vpn-instance* option is specified in a rule, the rule takes effect only on VPN packets. If the **vpn-instance** *vpn-instance* option is not specified in a rule, the rule takes effect on both VPN packets and non-VPN packets.

This command does not take effect on member ports of an aggregation group.

Examples

Apply IPv4 basic ACL 2001 to filter incoming traffic on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] packet-filter 2001 inbound
```

Related commands

display packet-filter

display packet-filter statistics

display packet-filter verbose

packet-filter (zone pair view)

Use **packet-filter** to apply an ACL to a zone pair to filter packets.

Use **undo packet-filter** to remove an ACL from a zone pair.

Syntax

packet-filter [**ipv6**] { *acl-number* | **name** *acl-name* }

undo packet-filter [**ipv6**] { *acl-number* | **name** *acl-name* }

Default

No ACL is applied to a zone pair to filter packets.

Views

Zone pair view

Predefined user roles

network-admin

context-admin

Parameters

ipv6: Specifies the IPv6 ACL type. To specify the IPv4 ACL type, do not provide this keyword.

acl-number: Specifies an ACL by its number:

- 2000 to 2999 for basic ACLs.
- 3000 to 3999 for advanced ACLs.

name *acl-name*: Specifies an ACL by its name. The *acl-name* argument is a case-insensitive string of 1 to 63 characters.

Usage guidelines

When you reference an ACL, follow these restrictions and guidelines:

- If the ACL does not exist or contains no rules, the ACL is not used to filter packets.
- If the **vpn-instance** *vpn-instance* option is specified in a rule, the rule takes effect only on VPN packets. If the **vpn-instance** *vpn-instance* option is not specified in a rule, the rule takes effect on both VPN packets and non-VPN packets.

Examples

Apply IPv4 basic ACL 2002 to filter traffic from source security zone **office** to destination security zone **library**.

```
<Sysname> system-view
[Sysname] zone-pair security source office destination library
[Sysname-zone-pair-security-office-library] packet-filter 2002
```

Related commands

display packet-filter

display packet-filter statistics

display packet-filter verbose

packet-filter default deny

Use **packet-filter default deny** to set the packet filtering default action to **deny**. The packet filter denies packets that do not match any ACL rule.

Use **undo packet-filter default deny** to restore the default.

Syntax

packet-filter default deny

undo packet-filter default deny

Default

The packet filtering default action is **permit**. The packet filter permits packets that do not match any ACL rule.

Views

System view

Predefined user roles

network-admin

context-admin

Usage guidelines

The packet filter applies the default action to all ACL applications for packet filtering. The default action appears in the **display** command output for packet filtering.

Examples

Set the packet filter default action to **deny**.

```
<Sysname> system-view
[Sysname] packet-filter default deny
```

display packet-filter verbose

reset acl counter

Use **reset acl counter** to clear statistics for ACLs.

Syntax

reset acl [**ipv6** | **mac**] **counter** { *acl-number* | **all** | **name** *acl-name* }

Views

User view

Predefined user roles

network-admin

context-admin

Parameters

ipv6: Specifies the IPv6 ACL type.

mac: Specifies the Layer 2 ACL type.

acl-number: Specifies an ACL by its number. The following are available value ranges:

- 2000 to 2999 for basic ACLs.
- 3000 to 3999 for advanced ACLs.
- 4000 to 4999 for Layer 2 ACLs.

all: Clears statistics for all ACLs of the specified type.

name *acl-name*: Clears statistics of an ACL specified by its name. The *acl-name* argument is a case-insensitive string of 1 to 63 characters.

Examples

Clear statistics for IPv4 basic ACL 2001.

```
<Sysname> reset acl counter 2001
```

Related commands

display acl

reset packet-filter statistics

Use **reset packet-filter statistics** to clear the packet filtering statistics.

Syntax

reset packet-filter statistics { **interface** [*interface-type interface-number*] **inbound** [**default** | [**ipv6** | **mac**] { *acl-number* | **name** *acl-name* }] | **zone-pair security** [**source** *source-zone-name* **destination** *destination-zone-name*] [**ipv6**] { *acl-number* | **name** *acl-name* }] }

Views

User view

Predefined user roles

network-admin

context-admin

Parameters

interface [*interface-type interface-number*]: Specifies an interface by its type and number. If you do not specify an interface, this command clears packet filtering statistics for all interfaces.

zone-pair security [**source** *source-zone-name* **destination** *destination-zone-name*]: Specifies a zone pair. The *source-zone-name* argument specifies a source security zone by its name. The *destination-zone-name* argument specifies a destination security zone by its name. The security zone name is a case-insensitive string of 1 to 31 characters.

inbound: Specifies the inbound direction.

default: Clears the default action statistics for packet filtering.

ipv6: Specifies the IPv6 ACL type.

mac: Specifies the Layer 2 ACL type.

acl-number: Specifies an ACL by its number. The following are available value ranges:

- 2000 to 2999 for basic ACLs.
- 3000 to 3999 for advanced ACLs.
- 4000 to 4999 for Layer 2 ACLs.

name *acl-name*: Specifies an ACL by its name. The *acl-name* argument is a case-insensitive string of 1 to 63 characters.

Usage guidelines

If **default**, *acl-number*, **name** *acl-name*, **ipv6**, or **mac**is not specified, this command clears the packet filtering statistics for all ACLs.

Examples

Clear IPv4 basic ACL 2001 statistics for inbound packet filtering on GigabitEthernet 1/0/1.

```
<Sysname> reset packet-filter statistics interface gigabitethernet 1/0/1 inbound 2001
```

Clear IPv4 basic ACL 2001 statistics for packet filtering on the zone pair from source security zone **office** to destination security zone **library**.

```
<Sysname> reset packet-filter statistics zone-pair security source office destination
library 2001
```

rule (IPv4 advanced ACL view)

Use **rule** to create or edit an IPv4 advanced ACL rule.

Use **undo rule** to delete an entire IPv4 advanced ACL rule or some attributes in the rule.

Syntax

rule [*rule-id*] { **deny** | **permit** } *protocol* [{ { **ack** *ack-value* | **fin** *fin-value* | **psh** *psh-value* | **rst** *rst-value* | **syn** *syn-value* | **urg** *urg-value* } * | **established** } | **counting** | **destination** { **object-group** *address-group-name* | *dest-address dest-wildcard* | **any** } | **destination-port** { **object-group** *port-group-name* | *operator port1* [*port2*] } | { **dscp** *dscp* | { **precedence** *precedence* | **tos** *tos* } * } | **fragment** | **icmp-type** { *icmp-type* [*icmp-code*] | *icmp-message* } | **logging** | **source** { **object-group** *address-group-name* | *source-address source-wildcard* | **any** } | **source-port** { **object-group** *port-group-name* | *operator port1* [*port2*] } | **time-range** *time-range-name* | **vpn-instance** *vpn-instance-name*] *

undo rule *rule-id* [{ { **ack** | **fin** | **psh** | **rst** | **syn** | **urg** } * | **established** } | **counting** | **destination** | **destination-port** | { **dscp** | { **precedence** | **tos** } * } | **fragment** | **icmp-type** | **logging** | **source** | **source-port** | **time-range** | **vpn-instance**] *

undo rule [*rule-id*] { **deny** | **permit** } *protocol* [{ { **ack** *ack-value* | **fin** *fin-value* | **psh** *psh-value* | **rst** *rst-value* | **syn** *syn-value* | **urg** *urg-value* } * | **established** } | **counting** | **destination** { **object-group** *address-group-name* | *dest-address dest-wildcard* | **any** } | **destination-port** { **object-group** *port-group-name* | *operator port1* [*port2*] } | { **dscp** *dscp* | { **precedence** *precedence* | **tos** *tos* } * } | **fragment** | **icmp-type** { *icmp-type* [*icmp-code*] | *icmp-message* } | **logging** | **source** { **object-group** *address-group-name* | *source-address source-wildcard* | **any** } | **source-port** { **object-group**

port-group-name | *operator port1* [*port2*] } | **time-range** *time-range-name* | **vpn-instance** *vpn-instance-name*] *

Default

No IPv4 advanced ACL rules exist.

Views

IPv4 advanced ACL view

Predefined user roles

network-admin

context-admin

Parameters

rule-id: Specifies a rule ID in the range of 0 to 65534. If you do not specify a rule ID when creating an ACL rule, the system automatically assigns it a rule ID. This rule ID is the nearest higher multiple of the numbering step to the current highest rule ID, starting from the start rule ID. For example, if the rule numbering step is 5 and the current highest rule ID is 28, the rule is numbered 30.

deny: Denies matching packets.

permit: Allows matching packets to pass.

protocol: Specifies one of the following values:

- A protocol number in the range of 0 to 255.
- A protocol by its name: **gre** (47), **icmp** (1), **igmp** (2), **ip**, **ipinip** (4), **ospf** (89), **tcp** (6), or **udp** (17). The **ip** keyword specifies all protocols.

Table 6 describes the parameters that you can specify regardless of the value for the *protocol* argument.

Table 6 Match criteria and other rule information for IPv4 advanced ACL rules

Parameters	Function	Description
source { **object-group** *address-group-name* | *source-address source-wildcard* | **any** }	Specifies a source address.	The *address-group-name* argument specifies an object group of source IP addresses. The *source-address source-wildcard* arguments specify a source IP address and a wildcard mask in dotted decimal notation. An all-zero wildcard represents a host address. The **any** keyword specifies any source IP address.
destination { **object-group** *address-group-name* | *dest-address dest-wildcard* | **any** }	Specifies a destination address.	The *address-group-name* argument specifies an object group of destination IP addresses. The *dest-address dest-wildcard* arguments specify a destination IP address and a wildcard mask in dotted decimal notation. An all-zero wildcard mask represents a host address. The **any** keyword represents any destination IP address.
counting	Enables rule match counting in software.	The **counting** keyword enables match counting specific to rules. If the **counting**

		keyword is not specified, matches for the rule are not counted in software.
precedence *precedence*	Specifies an IP precedence value.	The *precedence* argument can be a number in the range of 0 to 7, or in words: **routine** (0), **priority** (1), **immediate** (2), **flash** (3), **flash-override** (4), **critical** (5), **internet** (6), or **network** (7).
tos *tos*	Specifies a ToS preference.	The *tos* argument can be a number in the range of 0 to 15, or in words: **max-reliability** (2), **max-throughput** (4), **min-delay** (8), **min-monetary-cost** (1), or **normal** (0).
dscp *dscp*	Specifies a DSCP priority.	The *dscp* argument can be a number in the range of 0 to 63, or in words: **af11** (10), **af12** (12), **af13** (14), **af21** (18), **af22** (20), **af23** (22), **af31** (26), **af32** (28), **af33** (30), **af41** (34), **af42** (36), **af43** (38), **cs1** (8), **cs2** (16), **cs3** (24), **cs4** (32), **cs5** (40), **cs6** (48), **cs7** (56), **default** (0), or **ef** (46).
fragment	Applies the rule only to non-first fragments.	If you do not specify this keyword, the rule applies to all fragments and non-fragments.
logging	Logs the number of matching packets.	This feature requires that the module (for example, packet filtering) that uses the ACL supports logging.
time-range *time-range-name*	Specifies a time range for the rule.	The *time-range-name* argument is a case-insensitive string of 1 to 32 characters. If the time range is not configured, the system creates the rule. However, the rule using the time range can take effect only after you configure the time range. For more information about time range, see *ACL and QoS Configuration Guide*.
vpn-instance *vpn-instance-name*	Applies the rule to an MPLS L3VPN instance.	The *vpn-instance-name* argument is a case-sensitive string of 1 to 31 characters. For an ACL used to filter packets, if you do not specify a VPN instance, the rule applies to only non-VPN packets. For an ACL used by other features, if you do not specify a VPN instance, the implementation varies by feature. For more information, see the configuration guide of the feature..

If the *protocol* argument is **tcp** (6) or **udp** (17), set the parameters shown in Table 7.

Table 7 TCP/UDP-specific parameters for IPv4 advanced ACL rules

Parameters	Function	Description
source-port { **object-group** *port-group-name* | *operator port1* [*port2*] }	Specifies one or more UDP or TCP source ports.	The *port-group-name* argument specifies an object group of ports. The *operator* argument can be **lt** (lower than), **gt** (greater than), **eq** (equal to), **neq** (not equal to), or **range** (inclusive range). The *port1* and *port2* arguments are TCP or UDP port numbers in the range of 0 to 65535. The *port2* argument is needed only when the *operator* argument is **range**.
destination-port	Specifies one or more	

{ **object-group** *port-group-name* | *operator port1* [*port2*] }	UDP or TCP destination ports.	TCP port numbers can be represented as: **chargen** (19), **bgp** (179), **cmd** (514), **daytime** (13), **discard** (9), **dns** (53), **domain** (53), **echo** (7), **exec** (512), **finger** (79), **ftp** (21), **ftp-data** (20), **gopher** (70), **hostname** (101), **irc** (194), **klogin** (543), **kshell** (544), **login** (513), **lpd** (515), **nntp** (119), **pop2** (109), **pop3** (110), **smtp** (25), **sunrpc** (111), **tacacs** (49), **talk** (517), **telnet** (23), **time** (37), **uucp** (540), **whois** (43), and **www** (80). UDP port numbers can be represented as: **biff** (512), **bootpc** (68), **bootps** (67), **discard** (9), **dns** (53), **dnsix** (90), **echo** (7), **mobilip-ag** (434), **mobilip-mn** (435), **nameserver** (42), **netbios-dgm** (138), **netbios-ns** (137), **netbios-ssn** (139), **ntp** (123), **rip** (520), **snmp** (161), **snmptrap** (162), **sunrpc** (111), **syslog** (514), **tacacs-ds** (65), **talk** (517), **tftp** (69), **time** (37), **who** (513), and **xdmcp** (177).
{ **ack** *ack-value* | **fin** *fin-value* | **psh** *psh-value* | **rst** *rst-value* | **syn** *syn-value* | **urg** *urg-value* }*	Specifies one or more TCP flags including ACK, FIN, PSH, RST, SYN, and URG.	Parameters specific to TCP. The value for each argument can be 0 (flag bit not set) or 1 (flag bit set). The TCP flags in a rule are ORed. For example, a rule configured with **ack** 0 **psh** 1 matches both packets that have the ACK flag bit not set and packets that have the PSH flag bit set.
established	Specifies the flags for indicating the established status of a TCP connection.	Parameter specific to TCP. The rule matches TCP connection packets with the ACK or RST flag bit set.

If the *protocol* argument is **icmp** (1), set the parameters shown in Table 8.

Table 8 ICMP-specific parameters for IPv4 advanced ACL rules

Parameters	Function	Description
icmp-type { *icmp-type icmp-code* | *icmp-message* }	Specifies the ICMP message type and code.	The *icmp-type* argument is in the range of 0 to 255. The *icmp-code* argument is in the range of 0 to 255. The *icmp-message* argument specifies a message name. Supported ICMP message names and their corresponding type and code values are listed in Table 9.

Table 9 ICMP message names supported in IPv4 advanced ACL rules

ICMP message name	ICMP message type	ICMP message code
echo	8	0
echo-reply	0	0
fragmentneed-DFset	3	4
host-redirect	5	1
host-tos-redirect	5	3
host-unreachable	3	1

information-reply	16	0
information-request	15	0
net-redirect	5	0
net-tos-redirect	5	2
net-unreachable	3	0
parameter-problem	12	0
port-unreachable	3	3
protocol-unreachable	3	2
reassembly-timeout	11	1
source-quench	4	0
source-route-failed	3	5
timestamp-reply	14	0
timestamp-request	13	0
ttl-exceeded	11	0

Usage guidelines

Within an ACL, the permit or deny statement of each rule must be unique. If the rule you are creating or editing has the same deny or permit statement as another manually added rule in the ACL, the rule will not be created or changed. If the rule you are creating or editing has the same deny or permit statement as a dynamically added rule in the ACL, the rule will overwrite the dynamically added rule.

The object group you specify when creating or editing a rule must already exist. Otherwise, the rule will not be created or changed.

You can edit ACL rules only when the match order is **config**.

To view the existing IPv4 basic and advanced ACL rules, use the **display acl all** command.

The **undo rule** *rule-id* command without any optional parameters deletes an entire rule. If you specify optional parameters, the **undo rule** *rule-id* command deletes the specified attributes for the rule.

The **undo rule** [*rule-id*] { **deny** | **permit** } command can only be used to delete an entire rule. You must specify all the attributes of the rule for the command.

Examples

Create an IPv4 advanced ACL rule to permit TCP packets with the destination port 80 from 129.9.0.0/16 to 202.38.160.0/24.

```
<Sysname> system-view
[Sysname] acl advanced 3000
[Sysname-acl-ipv4-adv-3000] rule permit tcp source 129.9.0.0 0.0.255.255 destination
202.38.160.0 0.0.0.255 destination-port eq 80
```

Create IPv4 advanced ACL rules to permit all IP packets but the ICMP packets destined for 192.168.1.0/24.

```
<Sysname> system-view
[Sysname] acl advanced 3001
[Sysname-acl-ipv4-adv-3001] rule deny icmp destination 192.168.1.0 0.0.0.255
[Sysname-acl-ipv4-adv-3001] rule permit ip
```

Create IPv4 advanced ACL rules to permit inbound and outbound FTP packets.

```
<Sysname> system-view
[Sysname] acl advanced 3002
[Sysname-acl-ipv4-adv-3002] rule permit tcp source-port eq ftp
[Sysname-acl-ipv4-adv-3002] rule permit tcp source-port eq ftp-data
[Sysname-acl-ipv4-adv-3002] rule permit tcp destination-port eq ftp
[Sysname-acl-ipv4-adv-3002] rule permit tcp destination-port eq ftp-data
```

Create IPv4 advanced ACL rules to permit inbound and outbound SNMP and SNMP trap packets.

```
<Sysname> system-view
[Sysname] acl advanced 3003
[Sysname-acl-ipv4-adv-3003] rule permit udp source-port eq snmp
[Sysname-acl-ipv4-adv-3003] rule permit udp source-port eq snmptrap
[Sysname-acl-ipv4-adv-3003] rule permit udp destination-port eq snmp
[Sysname-acl-ipv4-adv-3003] rule permit udp destination-port eq snmptrap
```

Parameters

rule-id: Specifies a rule ID in the range of 0 to 65534. If you do not specify a rule ID when creating an ACL rule, the system automatically assigns it a rule ID. This rule ID is the nearest higher multiple

of the numbering step to the current highest rule ID, starting from the start rule ID. For example, if the rule numbering step is 5 and the current highest rule ID is 28, the rule is numbered 30.

deny: Denies matching packets.

permit: Allows matching packets to pass.

counting: Enables rule match counting in software. If you do not specify this keyword, matches for the rule are not counted in software.

fragment: Applies the rule only to non-first fragments. If you do not specify this keyword, the rule applies to both fragments and non-fragments.

logging: Logs the number of matching packets. This feature is available only when the application module (for example, packet filtering) that uses the ACL supports the logging feature.

source { **object-group** *address-group-name* | *source-address source-wildcard* | **any** }: Matches a source address. The **object-group** *address-group-name* option specifies an object group of source IP addresses. The *source-address* and *source-wildcard* arguments specify a source IP address and a wildcard mask in dotted decimal notation. A wildcard mask of zeros represents a host address. The **any** keyword represents any source IP address.

time-range *time-range-name*: Specifies a time range for the rule. The *time-range-name* argument is a case-insensitive string of 1 to 32 characters. If the time range is not configured, the system creates the rule. However, the rule using the time range can take effect only after you configure the time range. For more information about time range, see *ACL and QoS Configuration Guide*.

vpn-instance *vpn-instance-name*: Applies the rule to an MPLS L3VPN instance. The *vpn-instance-name* argument is a case-sensitive string of 1 to 31 characters. For an ACL used to filter packets, if you do not specify a VPN instance, the rule applies to only non-VPN packets. For an ACL used by other features, if you do not specify a VPN instance, the implementation varies by feature. For more information, see the configuration guide of the feature.

Usage guidelines

Within an ACL, the permit or deny statement of each rule must be unique. If the rule you are creating or editing has the same deny or permit statement as another rule in the ACL, the rule will not be created or changed.

The object group you specify when creating or editing a rule must already exist. Otherwise, the rule will not be created or changed.

You can edit ACL rules only when the match order is **config**.

To view the existing IPv4 basic and advanced ACL rules, use the **display acl all** command.

The **undo rule** *rule-id* command without any optional parameters deletes an entire rule. If you specify optional parameters, the **undo rule** *rule-id* command deletes the specified attributes for the rule.

The **undo rule** [*rule-id*] { **deny** | **permit** } command can only be used to delete an entire rule. You must specify all the attributes of the rule for the command.

Examples

Create a rule in IPv4 basic ACL 2000 to deny the packets from any source IP subnet but 10.0.0.0/8, 172.17.0.0/16, or 192.168.1.0/24.

```
<Sysname> system-view
[Sysname] acl basic 2000
[Sysname-acl-ipv4-basic-2000] rule permit source 10.0.0.0 0.255.255.255
[Sysname-acl-ipv4-basic-2000] rule permit source 172.17.0.0 0.0.255.255
[Sysname-acl-ipv4-basic-2000] rule permit source 192.168.1.0 0.0.0.255
```

```
[Sysname-acl-ipv4-basic-2000] rule deny source any
```

Parameters

rule-id: Specifies a rule ID in the range of 0 to 65534. If you do not specify a rule ID when creating an ACL rule, the system automatically assigns it a rule ID. This rule ID is the nearest higher multiple of the numbering step to the current highest rule ID, starting from the start rule ID. For example, if the rule numbering step is 5 and the current highest rule ID is 28, the rule is numbered 30.

deny: Denies matching packets.

permit: Allows matching packets to pass.

protocol: Specifies one of the following values:

- A protocol number in the range of 0 to 255.
- A protocol name: **gre** (47), **icmpv6** (58), **ipv6**, **ipv6-ah** (51), **ipv6-esp** (50), **ospf** (89), **tcp** (6), or **udp** (17). The **ipv6** keyword specifies all protocols.

Table 10 describes the parameters that you can specify regardless of the value for the *protocol* argument.

Table 10 Match criteria and other rule information for IPv6 advanced ACL rules

Parameters	Function	Description
source { **object-group** *address-group-name* | *source-address/source-prefix* | **any** }	Specifies a source IPv6 address.	The *address-group-name* argument specifies an object group of source IPv6 addresses. The *source-address* argument specifies an IPv6 source address. The *source-prefix* argument specifies a prefix length in the range of 1 to 128. The **any** keyword represents any IPv6 source address.
destination { **object-group** *address-group-name* | *dest-address/dest-prefix* | **any** }	Specifies a destination IPv6 address.	The *address-group-name* argument specifies an object group of destination IPv6 addresses. The *dest-address* argument specifies a destination IPv6 address. The *dest-prefix* argument specifies a prefix length in the range of 1 to 128. The **any** keyword represents any IPv6 destination address.
counting	Enables rule match counting in software.	The **counting** keyword enables match counting specific to rules. If the **counting** keyword is not specified, matches for the rule are not counted in software.
dscp *dscp*	Specifies a DSCP preference.	The *dscp* argument can be a number in the range of 0 to 63, or in words, **af11** (10), **af12** (12), **af13** (14), **af21** (18), **af22** (20), **af23** (22), **af31** (26), **af32** (28), **af33** (30), **af41** (34), **af42** (36), **af43** (38), **cs1** (8), **cs2** (16), **cs3** (24), **cs4** (32), **cs5** (40), **cs6** (48), **cs7** (56), **default** (0), or **ef** (46).
flow-label	Specifies a flow label value in an IPv6 packet	The *flow-label-value* argument is in the

flow-label-value	header.	range of 0 to 1048575.
fragment	Applies the rule only to non-first fragments.	If you do not specify this keyword, the rule applies to all fragments and non-fragments.
logging	Logs the number of matching packets.	This feature requires that the module (for example, packet filtering) that uses the ACL supports logging.
routing [**type** *routing-type*]	Specifies an IPv6 routing header type.	*routing-type*: Value of the IPv6 routing header type, in the range of 0 to 255. If you specify the **type** *routing-type* option, the rule applies to the specified type of IPv6 routing header. If you do not specify the **type** *routing-type* option, the rule applies to all types of IPv6 routing headers.
hop-by-hop [**type** *hop-type*]	Specifies an IPv6 Hop-by-Hop Options header type.	*hop-type*: Value of the IPv6 Hop-by-Hop Options header type, in the range of 0 to 255. If you specify the **type** *hop-type* option, the rule applies to the specified type of IPv6 Hop-by-Hop Options header. If you do not specify the **type** *hop-type* option, the rule applies to all types of IPv6 Hop-by-Hop Options header.
time-range *time-range-name*	Specifies a time range for the rule.	The *time-range-name* argument is a case-insensitive string of 1 to 32 characters. If the time range is not configured, the system creates the rule. However, the rule using the time range can take effect only after you configure the time range. For more information about time range, see *ACL and QoS Configuration Guide*.
vpn-instance *vpn-instance-name*	Applies the rule to an MPLS L3VPN instance.	The *vpn-instance-name* argument is a case-sensitive string of 1 to 31 characters. For an ACL used to filter packets, if you do not specify a VPN instance, the rule applies to only non-VPN packets. For an ACL used by other features, if you do not specify a VPN instance, the implementation varies by feature. For more information, see the configuration guide of the feature.

If the *protocol* argument is **tcp** (6) or **udp** (17), set the parameters shown in Table 11.

Table 11 TCP/UDP-specific parameters for IPv6 advanced ACL rules

Parameters	Function	Description
source-port { **object-group** *port-group-name* | *operator port1* [*port2*] }	Specifies one or more UDP or TCP source ports.	The *port-group-name* argument specifies an object group of ports. The *operator* argument can be **lt** (lower than), **gt** (greater than), **eq** (equal to), **neq** (not equal to), or **range** (inclusive range). The *port1* and *port2* arguments are TCP or UDP port numbers in the range of 0 to 65535. The *port2* argument is needed only when the *operator* argument is **range**. TCP port numbers can be represented as: **chargen** (19), **bgp** (179), **cmd** (514), **daytime** (13), **discard** (9), **dns** (53), **domain** (53), **echo** (7), **exec** (512), **finger** (79), **ftp**
destination-port { **object-group** *port-group-name* | *operator port1* [*port2*] }	Specifies one or more UDP or TCP destination ports.	

		(21), **ftp-data** (20), **gopher** (70), **hostname** (101), **irc** (194), **klogin** (543), **kshell** (544), **login** (513), **lpd** (515), **nntp** (119), **pop2** (109), **pop3** (110), **smtp** (25), **sunrpc** (111), **tacacs** (49), **talk** (517), **telnet** (23), **time** (37), **uucp** (540), **whois** (43), and **www** (80). UDP port numbers can be represented as: **biff** (512), **bootpc** (68), **bootps** (67), **discard** (9), **dns** (53), **dnsix** (90), **echo** (7), **mobilip-ag** (434), **mobilip-mn** (435), **nameserver** (42), **netbios-dgm** (138), **netbios-ns** (137), **netbios-ssn** (139), **ntp** (123), **rip** (520), **snmp** (161), **snmptrap** (162), **sunrpc** (111), **syslog** (514), **tacacs-ds** (65), **talk** (517), **tftp** (69), **time** (37), **who** (513), and **xdmcp** (177).
{ **ack** *ack-value* | **fin** *fin-value* | **psh** *psh-value* | **rst** *rst-value* | **syn** *syn-value* | **urg** *urg-value* }*	Specifies one or more TCP flags, including ACK, FIN, PSH, RST, SYN, and URG.	Parameters specific to TCP. The value for each argument can be 0 (flag bit not set) or 1 (flag bit set). The TCP flags in a rule are ORed. For example, a rule configured with **ack** 0 **psh** 1 matches both packets that have the ACK flag bit not set and packets that have the PSH flag bit set.
established	Specifies the flags for indicating the established status of a TCP connection.	Parameter specific to TCP. The rule matches TCP connection packets with the ACK or RST flag bit set.

If the *protocol* argument is **icmpv6** (58), set the parameters shown in Table 12.

Table 12 ICMPv6-specific parameters for IPv6 advanced ACL rules

Parameters	Function	Description
icmp6-type { *icmp6-type* *icmp6-code* | *icmp6-message* }	Specifies the ICMPv6 message type and code.	The *icmp6-type* argument is in the range of 0 to 255. The *icmp6-code* argument is in the range of 0 to 255. The *icmp6-message* argument specifies a message name. Supported ICMP message names and their corresponding type and code values are listed in Table 13.

Table 13 ICMPv6 message names supported in IPv6 advanced ACL rules

ICMPv6 message name	ICMPv6 message type	ICMPv6 message code
echo-reply	129	0
echo-request	128	0
err-Header-field	4	0
frag-time-exceeded	3	1
hop-limit-exceeded	3	0
host-admin-prohib	1	1
host-unreachable	1	3
neighbor-advertisement	136	0
neighbor-solicitation	135	0
network-unreachable	1	0

packet-too-big	2	0
port-unreachable	1	4
redirect	137	0
router-advertisement	134	0
router-solicitation	133	0
unknown-ipv6-opt	4	2
unknown-next-hdr	4	1

Usage guidelines

Within an ACL, the permit or deny statement of each rule must be unique. If the rule you are creating or editing has the same deny or permit statement as another manually added rule in the ACL, the rule will not be created or changed. If the rule you are creating or editing has the same deny or permit statement as a dynamically added rule in the ACL, the rule will overwrite the dynamically added rule.

The object group you specify when creating or editing a rule must already exist. Otherwise, the rule will not be created or changed.

You can edit ACL rules only when the match order is **config**.

To view the existing IPv6 basic and advanced ACL rules, use the **display acl ipv6 all** command.

The **undo rule** *rule-id* command without any optional parameters deletes an entire rule. If you specify optional parameters, the **undo rule** *rule-id* command deletes the specified attributes for a rule.

The **undo rule** [*rule-id*] { **deny** | **permit** } command can only be used to delete an entire rule. You must specify all the attributes of the rule for the command.

Examples

Create an IPv6 advanced ACL rule to permit TCP packets with the destination port 80 from 2030:5060::/64 to FE80:5060::/96.

```
<Sysname> system-view
[Sysname] acl ipv6 advanced 3000
[Sysname-acl-ipv6-adv-3000] rule permit tcp source 2030:5060::/64 destination
fe80:5060::/96 destination-port eq 80
```

Create IPv6 advanced ACL rules to permit all IPv6 packets but the ICMPv6 packets destined for FE80:5060:1001::/48.

```
<Sysname> system-view
[Sysname] acl ipv6 advanced 3001
[Sysname-acl-ipv6-adv-3001] rule deny icmpv6 destination fe80:5060:1001:: 48
[Sysname-acl-ipv6-adv-3001] rule permit ipv6
```

Create IPv6 advanced ACL rules to permit inbound and outbound FTP packets.

```
<Sysname> system-view
[Sysname] acl ipv6 advanced 3002
[Sysname-acl-ipv6-adv-3002] rule permit tcp source-port eq ftp
[Sysname-acl-ipv6-adv-3002] rule permit tcp source-port eq ftp-data
[Sysname-acl-ipv6-adv-3002] rule permit tcp destination-port eq ftp
[Sysname-acl-ipv6-adv-3002] rule permit tcp destination-port eq ftp-data
```

Create IPv6 advanced ACL rules to permit inbound and outbound SNMP and SNMP trap packets.

```
<Sysname> system-view
```

```
[Sysname] acl ipv6 advanced 3003
[Sysname-acl-ipv6-adv-3003] rule permit udp source-port eq snmp
[Sysname-acl-ipv6-adv-3003] rule permit udp source-port eq snmptrap
[Sysname-acl-ipv6-adv-3003] rule permit udp destination-port eq snmp
[Sysname-acl-ipv6-adv-3003] rule permit udp destination-port eq snmptrap
```

Create IPv6 advanced ACL 3004, and configure two rules: one permits packets with the Hop-by-Hop Options header type as 5, and the other one denies packets with other Hop-by-Hop Options header types.

```
<Sysname> system-view
[Sysname] acl ipv6 advanced 3004
[Sysname-acl-ipv6-adv-3004] rule permit ipv6 hop-by-hop type 5
[Sysname-acl-ipv6-adv-3004] rule deny ipv6 hop-by-hop
```

Parameters

rule-id: Specifies a rule ID in the range of 0 to 65534. If you do not specify a rule ID when creating an ACL rule, the system automatically assigns it a rule ID. This rule ID is the nearest higher multiple

of the numbering step to the current highest rule ID, starting from the start rule ID. For example, if the rule numbering step is 5 and the current highest rule ID is 28, the rule is numbered 30.

deny: Denies matching packets.

permit: Allows matching packets to pass.

counting: Enables rule match counting in software. If you do not specify this keyword, matches for the rule are not counted in software.

fragment: Applies the rule only to non-first fragments. If you do not specify this keyword, the rule applies to both fragments and non-fragments.

logging: Logs the number of matching packets. This feature is available only when the application module (for example, packet filtering) that uses the ACL supports the logging feature.

routing [**type** *routing-type*]: Applies the rule to the specified type of IPv6 routing header or all types of IPv6 routing headers. The *routing-type* argument specifies the value of the IPv6 routing header type, in the range of 0 to 255. If you do not specify the **type** *routing-type* option, the rule applies to all types of IPv6 routing headers.

source { **object-group** *address-group-name* | *source-address source-prefix* | *source-address*/*source-prefix* | **any** }: Matches a source IPv6 address. The **object-group** *address-group-name* option specifies an object group of source IPv6 addresses. The *source-address* argument specifies a source IPv6 address. The *source-prefix* argument specifies an address prefix length in the range of 1 to 128. The **any** keyword represents any IPv6 source address.

time-range *time-range-name*: Specifies a time range for the rule. The *time-range-name* argument is a case-insensitive string of 1 to 32 characters. If the time range is not configured, the system creates the rule. However, the rule using the time range can take effect only after you configure the time range. For more information about time range, see *ACL and QoS Configuration Guide*.

vpn-instance *vpn-instance-name*: Applies the rule to an MPLS L3VPN instance. The *vpn-instance-name* argument is a case-sensitive string of 1 to 31 characters. For an ACL used to filter packets, if you do not specify a VPN instance, the rule applies to only non-VPN packets. For an ACL used by other features, if you do not specify a VPN instance, the implementation varies by feature. For more information, see the configuration guide of the feature.

Within an ACL, the permit or deny statement of each rule must be unique. If the rule you are creating or editing has the same deny or permit statement as another rule in the ACL, the rule will not be created or changed.

The object group you specify when creating or editing a rule must already exist. Otherwise, the rule will not be created or changed.

You can edit ACL rules only when the match order is **config**.

To view the existing IPv6 basic and advanced ACL rules, use the **display acl ipv6 all** command.

The **undo rule** *rule-id* command without any optional parameters deletes an entire rule. If you specify optional parameters, the **undo rule** *rule-id* command deletes the specified attributes for a rule.

The **undo rule** [*rule-id*] { **deny** | **permit** } command can only be used to delete an entire rule. You must specify all the attributes of the rule for the command.

Examples

Create an IPv6 basic ACL rule to deny the packets from any source IP subnet but 1001::/16, 3124:1123::/32, or FE80:5060:1001::/48.

```
<Sysname> system-view
[Sysname] acl ipv6 basic 2000
```

```
[Sysname-acl-ipv6-basic-2000] rule permit source 1001:: 16
[Sysname-acl-ipv6-basic-2000] rule permit source 3124:1123:: 32
[Sysname-acl-ipv6-basic-2000] rule permit source fe80:5060:1001:: 48
[Sysname-acl-ipv6-basic-2000] rule deny source any
```

Parameters

rule-id: Specifies a rule ID in the range of 0 to 65534. If you do not specify a rule ID when creating an ACL rule, the system automatically assigns it a rule ID. This rule ID is the nearest higher multiple of the numbering step to the current highest rule ID, starting from the start rule ID. For example, if the rule numbering step is 5 and the current highest rule ID is 28, the rule is numbered 30.

deny: Denies matching packets.

permit: Allows matching packets to pass.

cos *dot1p:* Matches an 802.1p priority. The 802.1p priority can be specified by one of the following values:

- A priority number in the range of 0 to 7.

- A priority name: **best-effort** (0), **background** (1), **spare** (2), **excellent-effort** (3), **controlled-load** (4), **video** (5), **voice** (6), or **network-management** (7).

counting: Enables rule match counting in software. If you do not specify this keyword, matches for the rule are not counted in software.

dest-mac *dest-address dest-mask:* Matches a destination MAC address range. The *dest-address* and *dest-mask* arguments represent a destination MAC address and mask in the H-H-H format.

lsap *lsap-type lsap-type-mask:* Matches the DSAP and SSAP fields in LLC encapsulation. The *lsap-type* argument is a hexadecimal number that represents the encapsulation format. The value range for the *lsap-type* argument is 0 to ffff. The *lsap-type-mask* argument is a hexadecimal number that represents the LSAP mask. The value range for the *lsap-type-mask* argument is 0 to ffff.

type *protocol-type protocol-type-mask*: Matches one or more protocols in the Layer 2. The *protocol-type* argument is a hexadecimal number that represents a protocol type in Ethernet_II and Ethernet_SNAP frames. The value range for the *protocol-type* argument is 0 to ffff. The *protocol-type-mask* argument is a hexadecimal number that represents a protocol type mask. The value range for the *protocol-type-mask* argument is 0 to ffff.

source-mac *source-address source-mask:* Matches a source MAC address range. The *source-address* argument represents a source MAC address, and the *sour-mask* argument represents a mask in the H-H-H format.

time-range *time-range-name*: Specifies a time range for the rule. The *time-range-name* argument is a case-insensitive string of 1 to 32 characters. If the time range is not configured, the system creates the rule. However, the rule using the time range can take effect only after you configure the time range. For more information about time range, see *ACL and QoS Configuration Guide*.

Usage guidelines

Within an ACL, the permit or deny statement of each rule must be unique. If the rule you are creating or editing has the same deny or permit statement as another rule in the ACL, the rule will not be created or changed.

You can edit ACL rules only when the match order is **config**.

To view the existing Layer 2 ACL rules, use the **display acl mac all** command.

The **undo rule** *rule-id* command without any optional parameters deletes an entire rule. If you specify optional parameters, the **undo rule** *rule-id* command deletes the specified attributes for the rule.

The **undo rule** [*rule-id*] { **deny** | **permit** } command can only be used to delete an entire rule. You must specify all the attributes of the rule for the command.

Examples

Create a rule in Layer 2 ACL 4000 to permit ARP packets and deny RARP packets.

```
<Sysname> system-view
[Sysname] acl mac 4000
[Sysname-acl-mac-4000] rule permit type 0806 ffff
[Sysname-acl-mac-4000] rule deny type 8035 ffff
```

IPv6 basic/advanced ACL view

Layer 2 ACL view

Predefined user roles

network-admin

context-admin

Parameters

rule-id: Specifies an ACL rule ID in the range of 0 to 65534. The ACL rule must already exist.

text: Specifies a comment about the ACL rule, a case-sensitive string of 1 to 127 characters.

Usage guidelines

This command adds a comment to a rule if the rule does not have a comment. It modifies the comment for a rule if the rule already has a comment.

Examples

Create a rule for IPv4 basic ACL 2000, and add a comment about the rule.

```
<Sysname> system-view
[Sysname] acl basic 2000
[Sysname-acl-ipv4-basic-2000] rule 0 deny source 1.1.1.1 0
[Sysname-acl-ipv4-basic-2000] rule 0 comment This rule is used on gigabitethernet 1/0/1.
```

Related commands

rule insert-only enable

Use **rule insert-only enable** to enable rule ID preemption.

Use **undo rule insert-only enable** to restore the default.

Syntax

rule insert-only enable

undo rule insert-only enable

The following compatibility matrixes show the support of hardware platforms for this command:

Models	Command compatibility
NFNX5-HD6480, NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB1780, NFNX3-HDB3080	Yes
NFNX3-HDB1180, NFNX3-HDB1480 , NFNX3-HDB680, NFNX3-HDB1080	No

Default

Rule ID preemption is disabled.

Views

IPv4 basic/advanced ACL view

IPv6 basic/advanced ACL view

Layer 2 ACL view

Predefined user roles

network-admin

context-admin

Usage guidelines

CAUTION:

When there are a large number of ACLs on the device, executing the **undo accelerate** command might cause the CPU usage of the device to reach the upper threshold and cause service processing exceptions.

This feature enables a new rule to preempt an existing rule ID. The existing rule is assigned the next rule ID. All continuous rule IDs after the preempted rule ID are assigned their respective next rule IDs. For example, if you create rule 1 when rules 1, 2, 3, 6, and 7 exist, rule IDs are rearranged as 1, 2, 3, 4, 6, and 7.

After this feature is enabled, you cannot modify existing rules.

Examples

Enable rule ID preemption for ACL 2000.

```
<Sysname> system-view
[Sysname] acl basic 2000
[Sysname-acl-ipv4-basic-2000] rule insert-only enable
```

step

Use **step** to set a rule numbering step for an ACL.

Use **undo step** to restore the default.

Syntax

step *step-value*

undo step

Default

The rule numbering step is 5, and the start rule ID is 0.

Views

IPv4 basic/advanced ACL view

IPv6 basic/advanced ACL view

Layer 2 ACL view

Predefined user roles

network-admin

context-admin

Parameters

step-value: Specifies the ACL rule numbering step in the range of 1 to 20.

Usage guidelines

The rule numbering step sets the increment by which the system numbers rules automatically. If you do not specify a rule ID when creating an ACL rule, the system automatically assigns it a rule ID. This rule ID is the nearest higher multiple of the numbering step to the current highest rule ID, starting from the start rule ID. For example, if the rule numbering step is 5 and the current highest rule ID is 12, the rule is numbered 15.

The wider the numbering step, the more rules you can insert between two rules. Whenever the step changes, the rules are renumbered, starting from the start rule ID. For example, if there are five rules numbered 0, 5, 9, 10, and 15, changing the step from 5 to 2 causes the rules to be renumbered 0, 2, 4, 6, and 8.

Examples

Set the rule numbering step to 2 for IPv4 basic ACL 2000.

```
<Sysname> system-view
[Sysname] acl basic 2000
[Sysname-acl-ipv4-basic-2000] step 2
```

display traffic classifier

Use **display traffic classifier** to display traffic classes.

Syntax

display traffic classifier user-defined [*classifier-name*] [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

user-defined: Specifies user-defined traffic classes.

classifier-name: Specifies a traffic class by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a traffic class, this command displays all traffic classes.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays the traffic classes for the master device.

Examples

Display all user-defined traffic classes.

```
<Sysname> display traffic classifier user-defined

  User-defined classifier information:

   Classifier: 1 (ID 100)
     Operator: AND
     Rule(s) :
      If-match acl 2000

   Classifier: 2 (ID 101)
     Operator: AND
     Rule(s) :
      If-match protocol ipv6

   Classifier: 3 (ID 102)
     Operator: AND
     Rule(s) :
```

```
-none-
```

Table 1 Command output

Field	Description
Classifier	Traffic class name and its match criteria.
Operator	Match operator you set for the traffic class. If the operator is AND, the traffic class matches the packets that match all its match criteria. If the operator is OR, the traffic class matches the packets that match any of its match criteria.
Rule(s)	Match criteria.

if-match

Use **if-match** to define a match criterion.

Use **undo if-match** to delete a match criterion.

Syntax

if-match [**not**] *match-criteria*

undo if-match [**not**] *match-criteria*

Default

No match criterion is configured.

Views

Traffic class view

Predefined user roles

network-admin

context-admin

Parameters

not: Matches packets that do not conform to the specified criterion.

match-criteria: Specifies a match criterion. Table 2 shows the available match criteria.

Table 2 Available match criteria

Option	Description
acl [**ipv6**] { *acl-number* | **name** *acl-name* }	Matches an ACL. The value range for the *acl-number* argument is as follows: • 2000 to 3999 for IPv4 ACLs. • 2000 to 3999 for IPv6 ACLs. The *acl-name* argument is a case-insensitive string of 1 to 63 characters, which must start with an English letter. To avoid confusion, make sure the argument is not **all**. If no VPN instance is specified in an ACL rule, the ACL rule takes effect on both non-VPN packets and VPN packets.

Option	Description
app-group *group-name*	Matches an application group. The group-name argument specifies an application group by its name. The application group must have been created. A nonexistent application group cannot match packets. For more information about creating application groups, see APR in Security Configuration Guide.
application *app-name*	Matches an application. The app-name argument specifies a user-created application by its name.
any	Matches all packets.
classifier *classifier-name*	Matches a class. The *classifier-name* argument specifies a class by its name.
control-plane protocol *protocol-name*&<1-8>	Matches a control plane protocol. The *protocol-name* argument can only be **arp**.
customer-dot1p *dot1p-value*&<1-8>	Matches 802.1p priority values in inner VLAN tags of double-tagged packets. The *dot1p-value*&<1-8> argument specifies a space-separated list of up to eight 802.1p priority values. The value range for the *dot1p-value* argument is 0 to 7.
destination-mac *mac-address*	Matches a destination MAC address. This option takes effect only on Ethernet interfaces.
dscp *dscp-value*&<1-8>	Matches DSCP values. The *dscp-value*&<1-8> argument specifies a space-separated list of up to eight DSCP values. The value range for the *dscp-value* argument is 0 to 63 or keywords shown in Table 4.
inbound-interface *interface-type interface-number*	Matches an input interface specified by its type and number. If this option is configured in a traffic class with logic AND operator, the traffic class is no longer in effect after the card or subcard where the input interface resides is removed. After the removed card or subcard is reinserted, the traffic class takes effect again. If you do not reinsert the card or subcard and add other match criteria to the traffic class, the traffic class does not take effect again.
ip-precedence *ip-precedence-value*&<1-8>	Matches IP precedence values. The *ip-precedence-value*&<1-8> argument specifies a space-separated list of up to eight IP precedence values. The value range for the *ip-precedence-value* argument is 0 to 7.
mpls-exp *exp-value*&<1-8>	Matches MPLS EXP values. The *exp-value*&<1-8> argument specifies a space-separated list of up to eight EXP values. The value range for the *exp-value* argument is 0 to 7. MPLS packets do not support IP-related match criteria.

Option	Description
packet-length { **min** *min-value* | **max** *max-value* }*	Matches the packet length. The *min-value* argument specifies the minimum packet length in bytes. The *max-value* argument specifies the maximum packet length in bytes. The maximum packet length must be greater than or equal to the minimum packet length.
protocol *protocol-name*	Matches a protocol. The *protocol-name* argument can be The *protocol-name* argument can be **ip** or **ipv6**.
qos-local-id *local-id-value*	Matches a local QoS ID in the range of 1 to 4095.
rtp payload-type { *type-value*&<0-16> | **audio** | **video** }*	Matches RTP payload types. The *type-value*&<0-16> argument specifies a space-separated list of up to 16 RTP payload type values. The value range for the *type-value* argument is 0 to 127. The **audio** keyword matches an RTP payload type value in the range of 0 to 23 or 33. The **video** keyword matches an RTP payload type value in the range of 24 to 34. Support for this option depends on the device model.
rtp start-port *start-port-number* **end-port** *end-port-number*	Matches RTP protocol ports. The value ranges for the *start-port-number* and *end-port-number* arguments are both 2000 to 65535. This criterion matches RTP packets with an even UDP destination port number in the specified RTP port number range.
source-mac *mac-address*	Matches a source MAC address. This option takes effect only on Ethernet interfaces.

Usage guidelines

In a traffic class with the logical OR operator, you can configure multiple **if match** commands for any of the available match criteria.

When you configure a match criterion that can have multiple values in one **if-match** command, follow these restrictions and guidelines:

- You can specify up to eight values for any of the following match criteria in one **if-match** command:
- If a packet matches one of the specified values, it matches the **if-match** command.
- To delete a criterion that has multiple values, the specified values in the **undo if-match** command must be the same as those specified in the **if-match** command. The order of the values can be different.

When you configure ACL-based match criteria, follow these restrictions and guidelines:

- The ACL must already exist.
- If the ACL contains deny rules, the **if-match** command is ignored and the matching process continues.

You can use both AND and OR operators to define the match relationships between the criteria for a class. For example, you can define relationships among three match criteria in traffic class **classA** as follows:

```
traffic classifier classB operator and
if-match criterion 1
```

```
if-match criterion 2
traffic classifier classA operator or
if-match criterion 3
if-match classifier classB
```

Examples

Define a match criterion for traffic class **class1** to match the packets with a destination MAC address of 0050-ba27-bed3.

```
<Sysname> system-view
[Sysname] traffic classifier class1
[Sysname-classifier-class1] if-match destination-mac 0050-ba27-bed3
```

Define a match criterion for traffic class **class2** to match the packets with a source MAC address of 0050-ba27-bed2.

```
<Sysname> system-view
[Sysname] traffic classifier class2
[Sysname-classifier-class2] if-match source-mac 0050-ba27-bed2
```

Define a match criterion for traffic class **class1** to match the double-tagged packets with 802.1p priority 3 in the inner VLAN tag.

```
<Sysname> system-view
[Sysname] traffic classifier class1
[Sysname-classifier-class1] if-match customer-dot1p 3
```

Define a match criterion for traffic class **class1** to match advanced ACL 3101.

```
<Sysname> system-view
[Sysname] traffic classifier class1
[Sysname-classifier-class1] if-match acl 3101
```

Define a match criterion for traffic class **class1** to match the ACL named **flow**.

```
<Sysname> system-view
[Sysname] traffic classifier class1
[Sysname-classifier-class1] if-match acl name flow
```

Define a match criterion for traffic class **class1** to match advanced IPv6 ACL 3101.

```
<Sysname> system-view
[Sysname] traffic classifier class1
[Sysname-classifier-class1] if-match acl ipv6 3101
```

Define a match criterion for traffic class **class1** to match the IPv6 ACL named **flow**.

```
<Sysname> system-view
[Sysname] traffic classifier class1
[Sysname-classifier-class1] if-match acl ipv6 name flow
```

Define a match criterion for traffic class **class1** to match all packets.

```
<Sysname> system-view
[Sysname] traffic classifier class1
[Sysname-classifier-class1] if-match any
```

Define a match criterion for traffic class **class1** to match the packets with a DSCP value of 1, 6, or 9.

```
<Sysname> system-view
[Sysname] traffic classifier class1 operator or
[Sysname-classifier-class1] if-match dscp 1 6 9
```

Define a match criterion for traffic class **class1** to match the packets with an IP precedence value of 1 or 6.

```
<Sysname> system-view
[Sysname] traffic classifier class1 operator or
[Sysname-classifier-class1] if-match ip-precedence 1 6
```

Define a match criterion for traffic class **class1** to match IP packets.

```
<Sysname> system-view
[Sysname] traffic classifier class1
[Sysname-classifier-class1] if-match protocol ip
```

Define a match criterion for traffic class **class1** to match the RTP packets with even UDP destination port numbers in the range of 16384 to 32767.

```
<Sysname> system-view
[Sysname] traffic classifier class1 operator or
[Sysname-classifier-class1] if-match rtp start-port 16384 end-port 32767
```

Define a match criterion for traffic class **class1** to match the packets with a local QoS ID of 3.

```
<Sysname> system-view
[Sysname] traffic classifier class1
[Sysname-classifier-class1] if-match qos-local-id 3
```

Define a match criterion for traffic class **class1** to match the packets of the application group **multimedia**.

```
<Sysname> system-view
[Sysname] traffic classifier class1
[Sysname-classifier-class1] if-match app-group multimedia
```

Define a match criterion for traffic class **class1** to match the packets of the application **3link**.

```
<Sysname> system-view
[Sysname] traffic classifier class1
[Sysname-classifier-class1] if-match application 3link
```

Define a match criterion for traffic class **class1** to match packets with the length in the range of 100 to 200 bytes.

```
<Sysname> system-view
[Sysname] traffic classifier class1
[Sysname-classifier-class1] if-match packet-length min 100 max 200
```

traffic classifier

Use **traffic classifier** to create a traffic class and enter its view, or enter the view of an existing traffic class.

Use **undo traffic classifier** to delete a traffic class.

Syntax

traffic classifier *classifier-name* [**operator** { **and** | **or** }]

undo traffic classifier *classifier-name*

Default

No traffic classes exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

classifier-name: Specifies a name for the traffic class, a case-sensitive string of 1 to 31 characters.

operator: Sets the operator to logic AND (the default) or OR for the traffic class.

and: Specifies the logic AND operator. The traffic class matches the packets that match all its criteria.

or: Specifies the logic OR operator. The traffic class matches the packets that match any of its criteria.

Examples

Create a traffic class named **class1**.

```
<Sysname> system-view
[Sysname] traffic classifier class1
[Sysname-classifier-class1]
```

Related commands

display traffic classifier

Traffic behavior commands

car

Use **car** to configure a CAR action in absolute value in a traffic behavior.

Use **undo car** to restore the default.

Syntax

car cir *committed-information-rate* [**cbs** *committed-burst-size* [**ebs** *excess-burst-size*]] [**green** *action* | **red** *action* | **yellow** *action*] *

car cir *committed-information-rate* [**cbs** *committed-burst-size*] **pir** *peak-information-rate* [**ebs** *excess-burst-size*] [**green** *action* | **red** *action* | **yellow** *action*] *

undo car

Default

No CAR action is configured.

Views

Traffic behavior view

Predefined user roles

network-admin

context-admin

Parameters

cir *committed-information-rate*: Specifies the committed information rate (CIR) in the range of 8 to 10000000 kbps.

cbs *committed-burst-size*: Specifies the committed burst size (CBS) in the range of 1000 to 1000000000 bytes. The default value for this argument is the product of 62.5 and the CIR.

ebs *excess-burst-size*: Specifies the excess burst size (EBS) in the range of 0 to 1000000000 bytes. The default EBS is 0.

pir *peak-information-rate*: Specifies the peak information rate (PIR) in the range of 8 to 10000000 kbps. The PIR must be specified in the same unit as the CIR.

green *action*: Specifies the action to take on packets that conform to the CIR. The default setting is **pass**.

red *action*: Specifies the action to take on packets that conform to neither CIR nor PIR. The default setting is **discard**.

yellow *action*: Specifies the action to take on packets that conform to the PIR but not to the CIR. The default setting is **pass**.

action: Sets the action to take on the packet:

- **discard**: Drops the packet.
- **pass**: Permits the packet to pass through.
- **remark-dot1p-pass** *new-cos*: Sets the 802.1p priority value of the 802.1p packet to *new-cos* and permits the packet to pass through. The *new-cos* argument is in the range of 0 to 7.
- **remark-dscp-pass** *new-dscp*: Sets the DSCP value of the packet to *new-dscp* and permits the packet to pass through. The *new-dscp* argument is in the range of 0 to 63.
- **remark-mpls-exp-pass** *new-exp*: Sets the EXP field value of the MPLS packet to *new-exp* and permits the packet to pass through. The *new-exp* argument is in the range of 0 to 7.
- **remark-prec-pass** *new-precedence*: Sets the IP precedence of the packet to *new-precedence* and permits the packet to pass through. The *new-precedence* argument is in the range of 0 to 7.

Usage guidelines

To use two rates for traffic policing, configure the **car** command with the **pir** *peak-information-rate* option. To use one rate for traffic policing, configure the **car** command without the **pir** *peak-information-rate* option.

If you execute the **car** command multiple times in the same traffic behavior, the most recent configuration takes effect.

Examples

Configure a CAR action in traffic behavior **database**:

- Set the CIR to 200 kbps, CBS to 51200 bytes, and EBS to 0.
- Transmit the conforming packets, and mark the excess packets with DSCP value 0 and transmit them.

```
<Sysname> system-view
[Sysname] traffic behavior database
[Sysname-behavior-database] car cir 200 cbs 51200 ebs 0 green pass red remark-dscp-pass
0
```

car percent

Use **car percent** to configure a CAR action in percentage in a traffic behavior.

Use **undo car** to restore the default.

Syntax

car cir percent *cir-percent* [**cbs** *cbs-time* [**ebs** *ebs-time*]] [**green** *action* | **red** *action* | **yellow** *action*] *

car cir percent *cir-percent* [**cbs** *cbs-time*] **pir percent** *pir-percent* [**ebs** *ebs-time*] [**green** *action* | **red** *action* | **yellow** *action*] *

undo car

The following compatibility matrixes show the support of hardware platforms for this command:

Models	Command compatibility
NFNX5-HD6480, NFNX3-HDB1780, NFNX3-HDB3080, NFNX3-HDB1180, NFNX3-HDB1480, NFNX3-HDB680, NFNX3-HDB1080	No
NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280	Yes

Default

No percentage-based CAR action is configured.

Views

Traffic behavior view

Predefined user roles

network-admin

context-admin

Parameters

cir percent *cir-percent*: Specifies the CIR in percentage, in the range of 1 to 100. The actual CIR value is *cir-percent* × interface bandwidth.

cbs *cbs-time*: Specifies the CBS in milliseconds. The actual CBS value is *cbs-time* × the actual CIR value. The value range for the *cbs-time* argument is 50 to 2000. The default CBS is 500.

ebs *ebs-time*: Specifies the EBS in milliseconds. The actual EBS value is *ebs-time* × the actual CIR value. The value range for the *ebs-time* argument is 0 to 2000. The default EBS is 0.

pir percent *pir-percent*: Specifies the PIR in percentage, in the range of 1 to 100. The PIR value must be greater than or equal to the CIR value.

green *action*: Specifies the action to take on packets that conform to the CIR. The default is **pass**.

red *action*: Specifies the action to take on packets that conform to neither CIR nor PIR. The default is **discard**.

yellow *action*: Specifies the action to take on packets that conform to the PIR but not to the CIR. The default is **pass**.

action: Sets the action to take on the packet:

- **discard**: Drops the packet.
- **pass**: Permits the packet to pass through.
- **remark-dot1p-pass** *new-cos*: Sets the 802.1p priority value of the packet to *new-cos* and permits the packet to pass through. The *new-cos* argument is in the range of 0 to 7.
- **remark-dscp-pass** *new-dscp*: Sets the DSCP value of the packet to *new-dscp* and permits the packet to pass through. The *new-dscp* argument is in the range of 0 to 63. Alternatively, you can specify the *new-dscp* argument with **af11**, **af12**, **af13**, **af21**, **af22**,

af23, **af31**, **af32**, **af33**, **af41**, **af42**, **af43**, **cs1**, **cs2**, **cs3**, **cs4**, **cs5**, **cs6**, **cs7**, **default**, or **ef**.

- **remark-mpls-exp-pass** *new-exp*: Sets the EXP field value of the MPLS packet to *new-exp* and permits the packet to pass through. The *new-exp* argument is in the range of 0 to 7.
- **remark-prec-pass** *new-precedence*: Sets the IP precedence of the packet to *new-precedence* and permits the packet to pass through. The *new-precedence* argument is in the range of 0 to 7.

Usage guidelines

To use two rates for traffic policing, configure the **car percent** command with the **pir percent** *pir-percent* option. To use one rate for traffic policing, configure the **car percent** command without the **pir percent** *pir-percent* option.

A QoS policy that uses a traffic behavior configured with percentage-based CAR can be applied in the inbound or outbound direction of an interface.

If you execute the **car percent** command multiple times in the same traffic behavior, the most recent configuration takes effect.

A QoS policy that uses a behavior configured with percentage-based CAR can be applied only to interfaces.

The actual CIR value is *cir-percent* × bandwidth. The actual PIR value is *pir-percent* × bandwidth. For a physical interface, the bandwidth is the actual interface bandwidth. For a virtual interface(for example, tunnel interface and Layer 3 aggregate interface), you must set its expected bandwidth (the default expected bandwidth is 0 kbps). For more information about the expected bandwidth, see Ethernet interface commands in *Interface Command Reference*. In the policy nesting case, the bandwidth used for the CIR and PIR calculations is determined by using the following rules:

- The top policy uses the interface bandwidth.

Examples

Configure a CAR action in percentage in traffic behavior **database**. The CAR parameters are as follows: CIR is 20% and CBS is 100 ms.

```
<Sysname> system-view
[Sysname] traffic behavior database
[Sysname-behavior-database] car cir percent 20 cbs 100
```

display traffic behavior

Use **display traffic behavior** to display traffic behaviors.

Syntax

display traffic behavior user-defined [*behavior-name*] [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

user-defined: Specifies user-defined traffic behaviors.

behavior-name: Specifies a behavior by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a traffic behavior, this command displays all traffic behaviors.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays the traffic behaviors for the master device.

Examples

Display all user-defined traffic behaviors.

```
<Sysname> display traffic behavior user-defined

  User-defined behavior information:

    Behavior: 1 (ID 100)
      Committed Access Rate:
        CIR 2222 (kbps), CBS 22222222 (Bytes), EBS 0 (Bytes)
        Green action  : pass
        Yellow action : pass
        Red action    : discard
```

Table 3 Command output

Field	Description
Behavior	Name and contents of a traffic behavior.
Committed Access Rate	Information about the CAR action.
Green action	Action to take on green packets.
Yellow action	Action to take on yellow packets.
Red action	Action to take on red packets.

filter

Use **filter** to configure a traffic filtering action in a traffic behavior.

Use **undo filter** to restore the default.

Syntax

filter { **deny** | **permit** }

undo filter

Default

No traffic filtering action is configured.

Views

Traffic behavior view

Predefined user roles

network-admin

context-admin

Parameters

deny: Drops packets.

permit: Transmits packets.

Examples

Configure a traffic filtering action as **deny** in traffic behavior **database**.

```
<Sysname> system-view
[Sysname] traffic behavior database
[Sysname-behavior-database] filter deny
```

gts

Use **gts** to configure a GTS action in absolute value in a traffic behavior.

Use **undo gts** to restore the default.

Syntax

gts cir *committed-information-rate* [**cbs** *committed-burst-size* [**ebs** *excess-burst-size*]] [**queue-length** *queue-length*]

undo gts

The following compatibility matrixes show the support of hardware platforms for this command:

Models	Command compatibility
NFNX5-HD6480, NFNX3-HDB680, NFNX3-HDB1080	Yes
NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB1780, NFNX3-HDB3080, NFNX3-HDB1180, NFNX3-HDB1480	No

Default

No GTS action is configured.

Views

Traffic behavior view

Predefined user roles

network-admin

context-admin

Parameters

cir *committed-information-rate*: Sets the CIR in kbps, which specifies the average traffic rate. The value range for *committed-information-rate* is 8 to 10000000.

cbs *committed-burst-size*: Sets the CBS in bytes, which specifies the size of bursty traffic when the actual average rate is not greater than the CIR. The value range for *committed-burst-size* is 1000 to 1000000000. The default CBS is the product of 62.5 and the CIR.

ebs *excess-burst-size*: Sets the EBS in bytes. The value range for *excess-burst-size* is 0 to 1000000000. The default EBS is 0.

queue-length *queue-length*: Sets the maximum number of packets allowed in the queue. The default is 50. The value range for *queue-length* is 1 to 1024.

Usage guidelines

A QoS policy that uses a behavior configured with GTS can be applied only to the outbound direction of an interface.

A QoS policy that uses a behavior configured with GTS overwrites the **qos gts** command on the interface, if both are configured.

If you execute the **gts** command multiple times in the same traffic behavior, the most recent configuration takes effect.

To use two rates for traffic shaping, configure the **gts** command with the **pir** *peak-information-rate* option. To use one rate for traffic shaping, configure the **gts** command without the **pir** *peak-information-rate* option.

Examples

Configure a GTS action in absolute value in traffic behavior **database**. The GTS parameters are as follows: CIR is 200 kbps, CBS is 51200 bytes, EBS is 0, and the maximum queue length is 100.

```
<Sysname> system-view
[Sysname] traffic behavior database
[Sysname-behavior-database] gts cir 200 cbs 51200 ebs 0 queue-length 100
```

Related commands

gts percent

gts percent

Use **gts percent** to configure a GTS action in percentage in a traffic behavior.

Use **undo gts** to restore the default.

Syntax

gts percent cir *cir-percent* [**cbs** *cbs-time* [**ebs** *ebs-time*]] [**queue-length** *queue-length*]

undo gts

The following compatibility matrixes show the support of hardware platforms for this command:

Models	Command compatibility
NFNX5-HD6480, NFNX3-HDB680, NFNX3-HDB1080	Yes
NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB1780, NFNX3-HDB3080, NFNX3-HDB1180, NFNX3-HDB1480	No

Default

No percentage-based GTS action is configured.

Views

Traffic behavior view

Predefined user roles

network-admin

context-admin

Parameters

cir *cir-percent*: Specifies the CIR in percentage, in the range of 1 to 100. The actual CIR value is *cir-percent* × interface bandwidth.

cbs *cbs-time*: Specifies the CBS in milliseconds. The default *cbs-time* is 500 milliseconds. The actual CBS value is *cbs-time* × the actual CIR value. The value range for *cbs-time* is 50 to 2000. The default CBS is 500.

ebs *ebs-time*: Specifies the EBS in milliseconds. The default *ebs-time* is 0 milliseconds. The actual EBS value is *ebs-time* × the actual CIR value. The value range for *ebs-time* is 0 to 2000. The default EBS is 0.

queue-length *queue-length*: Specifies the maximum number of packets allowed in the queue. The default is 50. The value range for *queue-length* is 1 to 1024.

Usage guidelines

A QoS policy that uses a behavior configured with percentage-based GTS can be applied only to the outbound direction of an interface.

A QoS policy that uses a behavior configured with percentage-based GTS overwrites the **qos gts** command on the interface, if both configured.

If you execute the **gts percent** command multiple times in the same traffic behavior, the most recent configuration takes effect.

Examples

Configure a GTS action in percentage in traffic behavior **database**. The GTS parameters are as follows: CIR is 50 and CBS is 200 ms.

```
<Sysname> system-view
[Sysname] traffic behavior database
[Sysname-behavior-database] gts percent cir 50 cbs 200
```

Related commands

gts

remark dot1p

Use **remark dot1p** to configure an 802.1p priority marking action or an inner-to-outer tag priority copying action in a traffic behavior.

Use **undo remark dot1p** to restore the default.

Syntax

remark dot1p *dot1p-value*

undo remark dot1p

Default

No 802.1p priority marking or inner-to-outer tag priority copying action is configured.

Views

Traffic behavior view

Predefined user roles

network-admin

context-admin

Parameters

dot1p-value: Specifies the 802.1p priority to be marked for packets, in the range of 0 to 7.

Examples

Configure traffic behavior **database** to mark matching traffic with 802.1p 2.

```
<Sysname> system-view
[Sysname] traffic behavior database
[Sysname-behavior-database] remark dot1p 2
```

remark dscp

Use **remark dscp** to configure a DSCP marking action in a traffic behavior.

Use **undo remark dscp** to restore the default.

Syntax

remark dscp *dscp-value*

undo remark dscp

Default

No DSCP marking action is configured.

Views

Traffic behavior view

Predefined user roles

network-admin

context-admin

Parameters

dscp-value: Specifies a DSCP value, which can be a number from 0 to 63 or a keyword in Table 4.

Table 4 DSCP keywords and values

Keyword	DSCP value (binary)	DSCP value (decimal)
af11	001010	10
af12	001100	12
af13	001110	14
af21	010010	18
af22	010100	20
af23	010110	22
af31	011010	26
af32	011100	28
af33	011110	30
af41	100010	34
af42	100100	36
af43	100110	38

Keyword	DSCP value (binary)	DSCP value (decimal)
cs1	001000	8
cs2	010000	16
cs3	011000	24
cs4	100000	32
cs5	101000	40
cs6	110000	48
cs7	111000	56
default	000000	0
ef	101110	46

Usage guidelines

If you execute the **remark dscp** command multiple times in the same traffic behavior, the most recent configuration takes effect.

Examples

Configure traffic behavior **database** to mark matching traffic with DSCP 6.

```
<Sysname> system-view
[Sysname] traffic behavior database
[Sysname-behavior-database] remark dscp 6
```

remark flow-id

Use **remark flow-id** to configure a flow ID marking action in a traffic behavior.

Use **undo remark flow-id** to restore the default.

Syntax

remark flow-id *flow-id*

undo remark flow-id *flow-id*

The following compatibility matrix shows the support of hardware platforms for this command:

Models	Command compatibility
NFNX5-HD6480, NFNX3-HDB680, NFNX3-HDB1080	Yes
NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB1780, NFNX3-HDB3080, NFNX3-HDB1180, NFNX3-HDB1480	No

Default

No flow ID marking action is configured.

Views

Traffic behavior view

Predefined user roles

network-admin

context-admin

Parameters

flow-id: Specifies a flow ID in the range of 1 to 65535.

Examples

Configure traffic behavior **behavior1** to mark matching traffic with flow ID 10.

```
<Sysname> system-view
[Sysname] traffic behavior behavior1
[Sysname-behavior-behavior1] remark flow-id 10
```

remark ip-precedence

Use **remark ip-precedence** to configure an IP precedence marking action in a traffic behavior.

Use **undo remark ip-precedence** to restore the default.

Syntax

remark ip-precedence *ip-precedence-value*

undo remark ip-precedence

Default

No IP precedence marking action is configured.

Views

Traffic behavior view

Predefined user roles

network-admin

context-admin

Parameters

ip-precedence-value: Specifies the IP precedence value to be marked for packets, in the range of 0 to 7.

Usage guidelines

If you execute the **remark ip-precedence** command multiple times in the same traffic behavior, the most recent configuration takes effect.

Examples

Set the IP precedence to 6 for packets.

```
<Sysname> system-view
[Sysname] traffic behavior database
[Sysname-behavior-database] remark ip-precedence 6
```

remark local-precedence

Use **remark local-precedence** to configure a local precedence marking action in a traffic behavior.

Use **undo remark local-precedence** to restore the default.

Syntax

remark local-precedence *local-precedence-value*

undo remark local-precedence

The following compatibility matrixes show the support of hardware platforms for this command:

Models	Command compatibility
NFNX5-HD6480, NFNX3-HDB680, NFNX3-HDB1080	Yes
NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB1780, NFNX3-HDB3080, NFNX3-HDB1180, NFNX3-HDB1480	No

Default

No local precedence marking action is configured.

Views

Traffic behavior view

Predefined user roles

network-admin

context-admin

Parameters

local-precedence-value: Specifies the local precedence to be marked for packets, in the range of 0 to 7.

Examples

Configure traffic behavior **database** to mark matching traffic with local precedence 2.

```
<Sysname> system-view
[Sysname] traffic behavior database
[Sysname-behavior-database] remark local-precedence 2
```

remark qos-local-id

Use **remark qos-local-id** to configure a local QoS ID marking action in a traffic behavior.

Use **undo remark qos-local-id** to restore the default.

Syntax

remark qos-local-id *local-id-value*

undo remark qos-local-id

Default

No local QoS ID marking action is configured.

Views

Traffic behavior view

Predefined user roles

network-admin

context-admin

Parameters

local-id-value: Specifies the local QoS ID to be marked for packets, in the range of 1 to 4095.

Usage guidelines

You can use one QoS policy to mark the local QoS ID for packets in the inbound direction. Then, you can use another QoS policy to apply other QoS features in the outbound direction based on the marked local QoS ID.

If you execute the **remark qos-local-id** command multiple times in the same traffic behavior, the most recent configuration takes effect.

Examples

Configure the action of marking packets with local QoS ID 2.

```
<Sysname> system-view
[Sysname] traffic behavior database
[Sysname-behavior-database] remark qos-local-id 2
```

traffic behavior

Use **traffic behavior** to create a traffic behavior and enter its view, or enter the view of an existing traffic behavior.

Use **undo traffic behavior** to delete a traffic behavior.

Syntax

traffic behavior *behavior-name*

undo traffic behavior *behavior-name*

Default

No traffic behaviors exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

behavior-name: Specifies a name for the traffic behavior, a case-sensitive string of 1 to 31 characters.

Examples

Create a traffic behavior named **behavior1**.

```
<Sysname> system-view
[Sysname] traffic behavior behavior1
[Sysname-behavior-behavior1]
```

Related commands

display traffic behavior

traffic-policy

Use **traffic-policy** to nest a policy in a traffic behavior.

Use **undo traffic-policy** to remove child policies from a traffic behavior.

Syntax

traffic-policy *policy-name*

undo traffic-policy

Default

No policy is nested in a traffic behavior.

Views

Traffic behavior view

Predefined user roles

network-admin

context-admin

Parameters

policy-name: Specifies a policy by its name, a string of 1 to 31 characters. If the policy does not exist, it is automatically created.

Usage guidelines

After you nest a child policy in a behavior of a parent policy, the system performs the following operations:

- Performs the associated behavior defined in the parent policy for a class of traffic.
- Uses the child policy to further classify the class of traffic and performs the behaviors defined in the child policy.
- Policy nesting is available for IPv4 and IPv6 packets.
- To delete the child policy after you apply the parent policy to an interface, first remove the child policy from the parent policy.

Examples

Nest child policy **child** in traffic behavior **database** of the parent policy.

```
<Sysname> system-view
[Sysname] traffic behavior database
[Sysname-behavior-database] traffic-policy child
```

Related commands

traffic behavior

traffic classifier

QoS policy commands

classifier behavior

Use **classifier behavior** to associate a traffic behavior with a traffic class in a QoS policy.

Use **undo classifier** to delete a class-behavior association from a QoS policy.

Syntax

classifier *classifier-name* **behavior** *behavior-name* [**insert-before** *before-classifier-name*]

undo classifier *classifier-name*

Default

No traffic behavior is associated with a traffic class.

Views

QoS policy view

Predefined user roles

network-admin

context-admin

Parameters

classifier-name: Specifies a traffic class by its name, a case-sensitive string of 1 to 31 characters.

behavior-name: Specifies a traffic behavior by its name, a case-sensitive string of 1 to 31 characters.

insert-before *before-classifier-name*: Inserts the new traffic class before an existing traffic class in the QoS policy. The *before-classifier-name* argument specifies an existing traffic class by its name, a case-sensitive string of 1 to 31 characters. If you do not specify the **insert-before** *before-classifier-name* option, the new traffic class is placed at the end of the QoS policy.

Usage guidelines

A traffic class can be associated only with one traffic behavior in a QoS policy.

If the specified traffic class or traffic behavior does not exist, the system defines a null traffic class or traffic behavior.

The **undo classifier default-class** command performs the following operations:

- Deletes the existing class-behavior association for the system-defined class **default-class**.
- Associates the system-defined class **default-class** with the system-defined behavior **be**.

Examples

Associate traffic class **database** with traffic behavior **test** in QoS policy **user1**.

```
<Sysname> system-view
[Sysname] qos policy user1
[Sysname-qospolicy-user1] classifier database behavior test
```

Associate traffic class **database** with traffic behavior **test** in QoS policy **user1**, and insert traffic class **database** before an existing traffic class named **class-a**.

```
<Sysname> system-view
[Sysname] qos policy user1
[Sysname-qospolicy-user1] classifier database behavior test insert-before class-a
```

Related commands

qos policy

context-operator

Parameters

user-defined: Specifies user-defined QoS policies.

policy-name: Specifies a QoS policy by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a QoS policy, this command displays all user-defined QoS policies.

classifier *classifier-name*: Specifies a traffic class by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a traffic class, this command displays all traffic classes.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays the QoS policies for the master device.

Examples

Display all user-defined QoS policies.

```
<Sysname> display qos policy user-defined

  User-defined QoS policy information:

  Policy: 1 (ID 100)
   Classifier: 1 (ID 100)
     Behavior: 1
      Marking:
        Remark dscp 3
      Committed Access Rate:
        CIR 112 (kbps), CBS 51200 (Bytes), EBS 512 (Bytes)
        Green action  : pass
        Yellow action : pass
        Red action    : discard
   Classifier: 2 (ID 101)
     Behavior: 2
      Filter enable: Permit
   Classifier: 3 (ID 102)
     Behavior: 3
      -none-
```

Table 5 Command output

Field	Description
User-defined QoS policy information	Information about a user-defined QoS policy.
System-defined QoS policy information	Information about a system-defined QoS policy.
Policy	User-defined QoS policy name.

For the description of other fields, see Table 1 and Table 3.

display qos policy advpn

Use **display qos policy advpn** to display QoS policies applied to hub-spoke tunnels on a tunnel interface.

Syntax

display qos policy advpn tunnel *number* [*ipv4-address* | *ipv6-address*] [**outbound**]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

number: Specifies a tunnel interface by its number. The value range for the *number* argument is 0 to 1023.

ipv4-address: Specifies the spoke's private IPv4 address of a hub-spoke tunnel.

ipv6-address: Specifies the spoke's private IPv6 address of a hub-spoke tunnel.

outbound: Specifies the QoS policies applied to the outbound direction.

Usage guidelines

If you do not specify a spoke's private IP address of a hub-spoke tunnel, this command displays the QoS policy information for all hub-spoke tunnels on a tunnel interface. For information about hub-spoke tunnels, see ADVPN in *VPN Configuration Guide*.

For configuration commands for tunnel interfaces, see tunnel commands in *Layer 3—IP Services Command Reference*.

Examples

Display the QoS policy applied to the outgoing traffic of all hub-spoke tunnels on tunnel interface 1.

```
<Sysname> display qos policy advpn tunnel 1 outbound
Session: Tunnel1 192.168.0.3
  Direction: Outbound
  Policy: finance
   Classifier: default-class
     Matched : 0 (Packets) 0 (Bytes)
     Operator: AND
     Rule(s) :
      If-match any
     Behavior: be
      -none-
   Classifier: finance
     Matched : 123713988 (Packets) 13608538380 (Bytes)
     Operator: AND
     Rule(s) :
      If-match any
```

```
    Behavior: finance
     Committed Access Rate:
       CIR 1500 (kbps), CBS 93750 (Bytes), EBS 0 (Bytes)
       Green action  : pass
       Yellow action : pass
       Red action    : discard
       Green packets : 14980239 (Packets) 1647826290 (Bytes)
       Yellow packets: 0 (Packets) 0 (Bytes)
       Red packets   : 108733781 (Packets) 11960715910 (Bytes)

Session: Tunnel1 192.168.0.4 (inactive)
  Direction: Outbound
  Policy: business
```

Table 6 Command output

Field	Description
Session	Hub-spoke tunnel information. A hub-spoke tunnel is uniquely identified by a tunnel interface and the spoke's private IPv4 or IPv6 address. The word **inactive** indicates that a QoS policy fails to be applied to the hub-spoke tunnel or the applied QoS policy does not exist.
Direction	Direction to which a QoS policy is applied on the hub-spoke tunnel.

For the description of other fields, see Table 1 and Table 3.

display qos policy control-plane

Use **display qos policy control-plane** to display QoS policies applied to a control plane.

Syntax

display qos policy control-plane slot *slot-number*

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID.

Examples

Display the QoS policy applied to the control plane of slot 1.

```
<Sysname> display qos policy control-plane slot 1

Control plane slot 1

  Direction: Inbound
```

```
Policy: 1
 Classifier: 1
   Operator: AND
   Rule(s) :
    If-match acl 2000
   Behavior: 1
    Marking:
      Remark dscp 3
    Committed Access Rate:
      CIR 112 (kbps), CBS 51200 (Bytes), EBS 512 (Bytes)
      Green action  : pass
      Yellow action : pass
      Red action    : discard
      Green packets : 0 (Packets) 0 (Bytes)
      Yellow packets: 0 (Packets) 0 (Bytes)
      Red packets   : 0 (Packets) 0 (Bytes)
 Classifier: 2
   Operator: AND
   Rule(s) :
    If-match protocol ipv6
   Behavior: 2
    Filter enable: Permit
    Marking:
      Remark dscp 3
 Classifier: 3
   Operator: AND
   Rule(s) :
    -none-
   Behavior: 3
    -none-
```

Table 7 Command output

Field	Description
Direction	Direction in which the QoS policy is applied.
Green packets	Statistics about green packets.
Yellow packets	Statistics about yellow packets.
Red packets	Statistics about red packets.

For the description of other fields, see Table 1 and Table 3.

display qos policy control-plane management pre-defined

Use **display qos policy control-plane management pre-defined** to display the predefined QoS policy applied in control-plane management view.

Syntax

display qos policy control-plane management pre-defined

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Examples

Display the predefined QoS policy applied in control-plane management view.

```
<Sysname> display qos policy control-plane management pre-defined
Pre-defined control plane policy management
  Protocol          Priority   Bandwidth                Group

```

Table 9 Command output

Field	Description
Pre-defined control plane policy	Contents of the predefined control plane QoS policy.
Group	Protocol group of the protocol.

display qos policy interface

Use **display qos policy interface** to display the QoS policies applied to interfaces.

Syntax

display qos policy interface [*interface-type interface-number*] [**slot** *slot-number*] [**inbound** | **outbound**]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

interface-type interface-number: Specifies an interface by its type and number. If you do not specify an interface, this command displays QoS policies applied to all interfaces except VA interfaces. For information about VA interfaces, see PPP in *Layer 2—WAN Access Configuration Guide*.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify an IRF member device, this command displays QoS policies on the master device. Only logical interfaces support this option.

inbound: Specifies the QoS policy applied to incoming traffic.

outbound: Specifies the QoS policy applied to outgoing traffic.

Usage guidelines

If you do not specify a direction, this command displays the QoS policy applied to incoming traffic and the QoS policy applied to outgoing traffic.

If you specify a VT interface, this command displays the QoS policies applied to each VA interface of the VT interface. It does not display QoS information about the VT interface.

Examples

Display the QoS policy applied to the incoming traffic of GigabitEthernet 1/0/1.

```
<Sysname> display qos policy interface gigabitethernet 1/0/1 inbound
Interface: GigabitEthernet1/0/1
  Direction: Inbound
```

```
  Policy: 1
   Classifier: 1
     Matched : 0 (Packets) 0 (Bytes)
     5-minute statistics:
      Forwarded: 0/0 (pps/bps)
      Dropped  : 0/0 (pps/bps)
     Operator: AND
     Rule(s) :
      If-match acl 2000
     Behavior: 1
      Marking:
        Remark dscp 3
      Committed Access Rate:
        CIR 112 (kbps), CBS 51200 (Bytes), EBS 512 (Bytes)
        Green action  : pass
        Yellow action : pass
        Red action    : discard
        Green packets : 0 (Packets) 0 (Bytes)
        Yellow packets: 0 (Packets) 0 (Bytes)
        Red packets   : 0 (Packets) 0 (Bytes)
   Classifier: 2
     Matched : 0 (Packets) 0 (Bytes)
     5-minute statistics:
      Forwarded: 0/0 (pps/bps)
      Dropped  : 0/0 (pps/bps)
     Operator: AND
     Rule(s) :
      If-match protocol ipv6
     Behavior: 2
      Filter enable: Permit

   Classifier: 3
     Matched : 0 (Packets) 0 (Bytes)
     5-minute statistics:
      Forwarded: 0/0 (pps/bps)
      Dropped  : 0/0 (pps/bps)
     Operator: AND
     Rule(s) :
      -none-
     Behavior: 3
      -none-
```

Display the QoS policies applied to all interfaces.

```
<Sysname> display qos policy interface
Interface: GigabitEthernet1/0/1
  Direction: Inbound
  Policy: a
   Classifier: a
     Operator: AND
```

```
    Rule(s) :

        Green action  : pass
        Yellow action : pass
        Red action    : discard
        Green packets : 0 (Packets)
        Red packets   : 0 (Packets)
```

Table 10 Command output

Field	Description
Direction	Direction in which the QoS policy is applied.
Policy	User-defined QoS policy name or system-defined QoS policy name.
Matched	Number of matching packets.

Field	Description
Forwarded	Average rate of successfully forwarded matching packets in a statistics collection period.
Dropped	Average rate of dropped matching packets in a statistics collection period.
Green packets	Traffic statistics for green packets.
Yellow packets	Traffic statistics for yellow packets.
Red packets	Traffic statistics for red packets.

For the description of other fields, see Table 1, Table 3, and Table 5.

qos apply policy (interface view, control plane view, control-plane management view)

Use **qos apply policy** to apply a QoS policy to an interface or control plane.

Use **undo qos apply policy** to remove an applied QoS policy.

Syntax

qos apply policy *policy-name* { **inbound** | **outbound** }

undo qos apply policy *policy-name* { **inbound** | **outbound** }

Default

No QoS policy is applied.

Views

Control plane view

Control-plane management view

Interface view

Predefined user roles

network-admin

context-admin

Parameters

policy-name: Specifies a QoS policy by its name, a case-sensitive string of 1 to 31 characters.

inbound: Applies the QoS policy to incoming traffic.

outbound: Applies the QoS policy to outgoing traffic.

Usage guidelines

When you apply a QoS policy to an interface, follow these rules:

- The bandwidth assigned to AF and EF queues in the QoS policy must be smaller than the available bandwidth of the interface. Otherwise, the QoS policy cannot be successfully applied to the interface.
- If you modify the available bandwidth of the interface to be smaller than the bandwidth for AF and EF queues, the applied QoS policy is removed.

A QoS policy configured with CBQ is not supported in control plane view or control-plane management view.

Examples

Apply QoS policy **USER1** to the incoming traffic of GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] qos apply policy USER1 inbound
```

qos policy

Use **qos policy** to create a QoS policy and enter its view, or enter the view of an existing QoS policy.

Use **undo qos policy** to delete a QoS policy.

Syntax

qos policy *policy-name*

undo qos policy *policy-name*

Default

No QoS policies exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

policy-name: Specifies a name for the QoS policy, a case-sensitive string of 1 to 31 characters.

Usage guidelines

To delete a QoS policy that has been applied to an object, you must first remove the QoS policy from the object.

Examples

Create a QoS policy named **user1**.

```
<Sysname> system-view
[Sysname] qos policy user1
[Sysname-qospolicy-user1]
```

Related commands

classifier behavior

qos apply policy

reset qos policy advpn

Use **reset qos policy advpn** to clear the statistics for QoS policies applied to hub-spoke tunnels on a tunnel interface.

Syntax

reset qos policy advpn tunnel *number* [*ipv4-address* | *ipv6-address*] [**outbound**]

Views

User view

Predefined user roles

network-admin

context-admin

Parameters

number: Specifies a tunnel interface by its number. The value range for the *number* argument is 0 to 1023.

ipv4-address: Specifies the spoke's private IPv4 address of a hub-spoke tunnel.

ipv6-address: Specifies the spoke's private IPv6 address of a hub-spoke tunnel.

outbound: Specifies the QoS policies applied to the outbound direction.

Usage guidelines

If you do not specify a spoke's private IP address of a hub-spoke tunnel, this command clears the QoS policy statistics for all hub-spoke tunnels on a tunnel interface. For information about hub-spoke tunnels, see ADVPN in *VPN Configuration Guide*.

For configuration commands for tunnel interfaces, see tunnel commands in *VPN Command Reference*.

Examples

Clear the statistics for the QoS policy applied to the outgoing traffic of the hub-spoke tunnel with spoke's IPv4 address 192.168.0.3 on tunnel interface 1.

```
<Sysname> reset qos policy advpn tunnel 1 192.168.0.3 outbound
```

reset qos policy control-plane

Use **reset qos policy control-plane** to clear the statistics of the QoS policy applied to a control plane.

Syntax

reset qos policy control-plane slot *slot-number*

Views

User view

Predefined user roles

network-admin

context-admin

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID.

Examples

Clear the statistics of the QoS policy applied to the control plane of slot 1.

```
<Sysname> reset qos policy control-plane slot 1
```

Clear the statistics of the QoS policy applied to the control plane of slot 3 in chassis 1.

```
<Sysname> reset qos policy control-plane chassis 1 slot 3
```

QoS policy-based traffic rate statistics collection period commands

qos flow-interval

Use **qos flow-interval** to set the QoS policy-based traffic rate statistics collection period for an interface.

Use **undo qos flow-interval** to restore the default.

Syntax

qos flow-interval *interval*

undo qos flow-interval

Default

The QoS policy-based traffic rate statistics collection period is 5 minutes on an interface.

Views

Interface view

Predefined user roles

network-admin

context-admin

Parameters

interval: Sets the QoS policy-based traffic rate statistics collection period in minutes. The value range for this argument is 1 to 10.

Usage guidelines

You can enable collection of per-class traffic statistics over a period of time, including the average forwarding rate and drop rate. For example, if you set the statistics collection period to 10 minutes, the system performs the following operations:

- Collects traffic statistics for the most recent 10 minutes.
- Refreshes the statistics every 10/5 minutes, 2 minutes.

The traffic rate statistics collection period of a subinterface is the same as the period configured on the main interface.

Examples

Set the QoS policy-based traffic rate statistics collection period to 10 minutes on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] qos flow-interval 10
```

Related commands

display qos policy interface

Traffic policing commands

Traffic policing commands

display qos car interface

Use **display qos car interface** to display the CAR configuration and statistics for interfaces.

Syntax

display qos car interface [*interface-type interface-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

interface-type interface-number: Specifies an interface by its type and number. If you do not specify an interface, this command displays the CAR configuration and statistics for all interfaces except VA interfaces. For information about VA interfaces, see PPP in *Layer 2—WAN Access Configuration Guide*.

Usage guidelines

If you specify a VT interface, this command displays the CAR configuration and statistics of each VA interface of the VT interface. It does not display QoS information about the VT interface.

Examples

Display the CAR configuration and statistics for GigabitEthernet 1/0/1.

```
<Sysname> display qos car interface gigabitethernet 1/0/1
Interface: GigabitEthernet1/0/1
 Direction: inbound
  Rule: If-match any
   CIR 128 (kbps), CBS 5120 (Bytes), PIR 128 (kbps), EBS 512 (Bytes)
   Green action  : pass
   Yellow action : pass
   Red action    : discard
   Green packets : 0 (Packets), 0 (Bytes)
   Yellow packets: 0 (Packets), 0 (Bytes)
   Red packets   : 0 (Packets), 0 (Bytes)
```

Display the CAR information on GigabitEthernet 1/0/2.

```
<Sysname> display qos car interface gigabitethernet 1/0/2
Interface: GigabitEthernet1/0/2
 Direction: inbound
  Rule: If-match any
```

```
CIR 50 (%), CBS 600 (ms), EBS 0 (ms), PIR 50 (%)
Green action  : pass
Yellow action : pass
Red action    : discard
Green packets : 0 (Packets), 0 (Bytes)
Yellow packets: 0 (Packets), 0 (Bytes)
Red packets   : 0 (Packets), 0 (Bytes)
```

Table 11 Command output

Field	Description
Interface	Interface name, including interface type and interface number.
Direction	Direction in which traffic policing is applied.
Rule	Match criteria.
CIR	CIR in kbps.
CBS	CBS in bytes.
EBS	EBS in bytes.
PIR	PIR in kbps.
Green action	Action to take on green packets.
Yellow action	Action to take on yellow packets.
Red action	Action to take on red packets.
Overhead compensation length	Packet compensation length in bytes for outbound traffic policing.
Online session count	Number of current online sessions.
Current CIR	CIR in kbps after dynamic adjustment.
Current bandwidth	The actual total traffic rate in kbps for all online sessions. This value might be greater than the current CIR multiplied by the number of current online sessions.
Bandwidth utilization threshold	Maximum bandwidth threshold in kbps. • If the **bandwidth** command is not executed on the interface, this value is the actual interface bandwidth multiplied by the maximum bandwidth percentage. • If the **bandwidth** command is executed on the interface, this value is the configured interface bandwidth multiplied by the maximum bandwidth percentage.

bandwidth (*Interface Command Reference*)

qos car (interface view)

qos carl

display qos carl

Use **display qos carl** to display CAR lists.

Syntax

display qos carl [*carl-index*] [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

carl-index: Specifies a CAR list by its number in the range of 1 to 199. If you do not specify a CAR list, this command displays all CAR lists.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays the CAR lists for the master device.

Examples

Display all CAR lists.

```
<Sysname> display qos carl
List  Rules
1     destination-ip-address range 1.1.1.1 to 1.1.1.2 per-address shared-bandwidth
2     destination-ip-address subnet 1.1.1.1 22 per-address shared-bandwidth
4     dscp 1 2 3 4 5 6 7 cs1
5     mac 0000-0000-0000
6     mpls-exp 0 1 2
9     precedence 0 1 2 3 4 5 6 7
10    source-ip-address range 1.1.1.1 to 1.1.1.2
11    source-ip-address subnet 1.1.1.1 31
```

qos car

Use **qos car** to configure a CAR policy on an interface.

Use **undo qos car** to delete a CAR policy from an interface.

Syntax

qos car { **inbound** | **outbound** } { **any** | **acl** [**ipv6**] *acl-number* | **carl** *carl-index* } **cir** *committed-information-rate* [**cbs** *committed-burst-size* [**ebs** *excess-burst-size*]] [**green** *action* | **red** *action* | **yellow** *action*] *

qos car { **inbound** | **outbound** } { **any** | **acl** [**ipv6**] *acl-numbe*r | **carl** *carl-index* } **cir** *committed-information-rate* [**cbs** *committed-burst-size*] **pir** *peak-information-rate* [**ebs** *excess-burst-size*] [**green** *action* | **red** *action* | **yellow** *action*] *

undo qos car { **inbound** | **outbound** } { **any** | **acl** [**ipv6**] *acl-number* | **carl** *carl-index* }

Default

No CAR policy is configured.

Views

Interface view

Predefined user roles

network-admin

context-admin

Parameters

inbound: Performs CAR for incoming packets on the interface.

outbound: Performs CAR for outgoing packets on the interface.

any: Performs CAR for all IP packets in the specified direction.

acl [**ipv6**] *acl-number*: Performs CAR for packets matching an ACL specified by its number. The value range for the *acl-number* argument is 2000 to 2999 for basic ACLs and 3000 to 3999 for advanced ACLs. If you do not specify **ipv6**, this option specifies an IPv4 ACL. If you specify **ipv6**, this option specifies an IPv6 ACL.

carl *carl-index*: Performs CAR for packets matching a CAR list specified by its number in the range of 1 to 199.

cir *committed-information-rate*: Specifies the CIR in kbps. The value range for *committed-information-rate* is 8 to 10000000.

cbs *committed-burst-size*: Specifies the CBS in bytes, which is the size of bursty traffic when the actual average rate is not greater than the CIR. The value range for *committed-burst-size* is 1875 to 19375000. The default CBS is the product of 62.5 and the CIR.

ebs *excess-burst-size*: Specifies the EBS in bytes. The value range for *excess-burst-size* is 0 to 19375000. The default EBS is 0.

pir *peak-information-rate*: Specifies the PIR in kbps. The value range for *peak-information-rate* is 8 to 10000000.

green: Specifies the action to take on packets when the traffic rate conforms to the CIR. The default is **pass**.

red: Specifies the action to take on packets when the traffic rate conforms to neither CIR nor PIR. The default is **discard**.

yellow: Specifies the action to take on packets when the traffic rate exceeds the CIR but conforms to the PIR. The default is **pass**.

action: Specifies the action to take on packets:

- **continue**: Continues to process the packet by using the next CAR policy.
- **discard**: Drops the packet.
- **pass**: Permits the packet to pass through.
- **remark-dot1p-continue** *new-cos*: Sets the 802.1p priority value of the 802.1p packet to *new-cos* and continues to process the packet by using the next CAR policy. The *new-cos* argument is in the range of 0 to 7.
- **remark-dot1p-pass** *new-cos*: Sets the 802.1p priority value of the 802.1p packet to *new-cos* and permits the packet to pass through. The *new-cos* argument is in the range of 0 to 7.
- **remark-dscp-continue** *new-dscp*: Remarks the packet with a new DSCP value and continues to process the packet by using the next CAR policy. The *new-dscp* argument is in the range of 0 to 63. Alternatively, you can specify the *new-dscp* argument with **af11**, **af12**,

af13, **af21**, **af22**, **af23**, **af31**, **af32**, **af33**, **af41**, **af42**, **af43**, **cs1**, **cs2**, **cs3**, **cs4**, **cs5**, **cs6**, **cs7**, **default**, or **ef**.

- **remark-dscp-pass** *new-dscp*: Remarks the packet with a new DSCP value and permits the packet to pass through. The *new-dscp* argument is in the range of 0 to 63. Alternatively, you can specify the *new-dscp* argument with **af11**, **af12**, **af13**, **af21**, **af22**, **af23**, **af31**, **af32**, **af33**, **af41**, **af42**, **af43**, **cs1**, **cs2**, **cs3**, **cs4**, **cs5**, **cs6**, **cs7**, **default**, or **ef**.
- **remark-mpls-exp-continue** *new-exp*: Sets the EXP field value of the MPLS packet to *new-exp* and continues to process the packet by using the next CAR policy. The *new-exp* argument is in the range of 0 to 7.
- **remark-mpls-exp-pass** *new-exp*: Sets the EXP field value of the MPLS packet to *new-exp* and permits the packet to pass through. The *new-exp* argument is in the range of 0 to 7.
- **remark-prec-continue** *new-precedence*: Re-marks the packet with a new IP precedence and continues to process the packet by using the next CAR policy. The *new-precedence* argument is in the range of 0 to 7.
- **remark-prec-pass** *new-precedence*: Re-marks the packet with a new IP precedence and permits the packet to pass through. The *new-precedence* argument is in the range of 0 to 7.

Usage guidelines

To use two rates for traffic policing, configure the **qos car** command with the **pir** *peak-information-rate* option. To use one rate for traffic policing, configure the **qos car** command without the **pir** *peak-information-rate* option.

You can configure multiple **qos car** commands on an interface to define multiple CAR policies. These CAR policies are executed in their configuration order.

When you reference an ACL, follow these restrictions and guidelines:

- If the ACL does not exist or contains no rules, the ACL is not used to match packets.
- If the **vpn-instance** *vpn-instance* option is specified in a rule, the rule takes effect only on VPN packets. If the **vpn-instance** *vpn-instance* option is not specified in a rule, the rule takes effect on both VPN packets and non-VPN packets.

Dynamic traffic policing allows you to dynamically adjust the bandwidth allowed per IP address on an interface to improve bandwidth usage.

When the following conditions exist, the dynamic traffic policing feature is activated on an interface:

- A CAR list is used and he **per-address** parameter is specified in the CAR list.
- Only one CAR list-based CAR policy is applied to the same direction of an interface, and the **max-cir** parameter is specified.

Examples

Perform CAR for all packets in the outbound direction of GigabitEthernet 1/0/1. The CAR parameters are as follows:

- CIR is 200 kbps.
- CBS is 5120 bytes.
- EBS is 0.
- Conforming packets are transmitted.
- Excess packets are set with an IP precedence of 0 and transmitted.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
```

```
[Sysname-GigabitEthernet1/0/1] qos car outbound any cir 200 cbs 5000 ebs 0 green pass red
remark-prec-pass 0
```

Related commands

display qos car interface

qos carl

qos carl

Use **qos carl** to create or modify a CAR list.

Use **undo qos carl** to delete a CAR list.

Syntax

qos carl *carl-index* { **dscp** *dscp-list* | **mac** *mac-address* | **mpls-exp** *mpls-exp-value* | **precedence** *precedence-value* | { **destination-ip-address** | **source-ip-address** } { **range** *start-ip-address* **to** *end-ip-address* | **subnet** *ip-address mask-length* } [**per-address** [**shared-bandwidth**]] }

undo qos carl *carl-index*

Default

No CAR list is configured.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

carl-index: Specifies a CAR list by its number in the range of 1 to 199.

dscp *dscp-list*: Specifies a list of DSCP values. A DSCP value can be a number from 0 to 63 or any of the following keywords **af11**, **af12**, **af13**, **af21**, **af22**, **af23**, **af31**, **af32**, **af33**, **af41**, **af42**, **af43**, **cs1**, **cs2**, **cs3**, **cs4**, **cs5**, **cs6**, **cs7**, **default**, or **ef**. You can configure up to eight DSCP values in one command line. If the same DSCP value is specified multiple times, the system considers the values to be one value. If a packet matches one of the defined DSCP values, it matches the **if-match** clause.

mac *mac-address*: Specifies a MAC address in hexadecimal format.

mpls-exp *mpls-exp-value*: Specifies an MPLS EXP value in the range of 0 to 7. You can configure up to eight MPLS EXP values in one command line. If the same MPLS EXP value is specified multiple times, the system considers the values to be one value. If a packet matches one of the defined MPLS EXP values, it matches the **if-match** clause.

precedence *precedence*: Specifies a precedence value in the range of 0 to 7. You can configure up to eight IP precedence values in one command line. If the same IP precedence value is specified multiple times, the system considers the values to be one value. If a packet matches one of the defined IP precedence values, it matches the **if-match** clause.

destination-ip-address: Configures a destination IP address-based CAR list.

source-ip-address: Configures a source IP address-based CAR list.

range *start-ip-address* **to** *end-ip-address*: Specifies an IP address range by the start address and end address. The value for *end-ip-address* must be greater than the value for *start-ip-address*.

subnet *ip-address mask-length*: Specifies a subnet by the IP subnet address and IP subnet address mask length. The value range for *mask-length* is 22 to 31.

per-address: Performs per-IP address rate limiting within the network segment. When this keyword is specified, the CIR is dedicated bandwidth for each IP address and is not shared by any other IP address. If you do not specify this keyword, the following events occur:

- Rate limiting is performed for the entire network segment.
- All of the CIR is allocated among all IP addresses in proportion to the traffic load of each IP address.

shared-bandwidth: Specifies that traffic of all IP addresses within the network segment shares the remaining bandwidth (the CIR). If you specify this keyword, all of the CIR is allocated evenly among all IP addresses with traffic load.

Usage guidelines

You can create a CAR list based on IP precedence, MAC address, MPLS EXP, DSCP, or IP network segment.

If you execute this command multiple times for the same CAR list, the most recent configuration takes effect. If you execute this command multiple times for different CAR lists, multiple CAR lists are created.

To perform rate limiting for a single IP address, use the **qos car acl** command in interface view.

Examples

Apply CAR list 1 to the outbound direction of GigabitEthernet 1/0/1 to meet the following requirements:

- The rate of each host on the subnet 1.1.1.0/24 is limited to 512 kbps.
- Traffic of IP addresses in the subnet does not share the remaining bandwidth.

```
<Sysname> system-view
[Sysname] qos carl 1 source-ip-address subnet 1.1.1.0 24 per-address
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] qos car outbound carl 1 cir 512 cbs 5120 ebs 0 green pass red discard
```

Apply CAR list 2 to the outbound direction of GigabitEthernet 1/0/1 to meet the following requirements:

- The rate of each host in the IP address range of 1.1.2.100 to 1.1.2.199 is limited to 5 Mbps.
- Traffic of IP addresses in the subnet shares the remaining bandwidth.

```
<Sysname> system-view
[Sysname] qos carl 2 source-ip-address range 1.1.2.100 to 1.1.2.199 per-address shared-bandwidth
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] qos car outbound carl 2 cir 5120 cbs 51200 ebs 51200 green pass red discard
```

NFNX5-HD6480, NFNX3-HDB680, NFNX3-HDB1080	Yes
NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB1780, NFNX3-HDB3080, NFNX3-HDB1180, NFNX3-HDB1480	No

display qos gts interface

Use **display qos gts interface** to display the GTS configuration and statistics for interfaces.

Syntax

display qos gts interface [*interface-type interface-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

interface-type interface-number: Specifies an interface by its type and number. If you do not specify an interface, this command displays the GTS configuration and statistics for all interfaces except VA interfaces. For information about VA interfaces, see PPP in *Layer 2—WAN Access Configuration Guide*.

Usage guidelines

If you specify a VT interface, this command displays the GTS configuration and statistics of each VA interface of the VT interface. It does not display QoS information about the VT interface.

Examples

Display the GTS configuration and statistics for all interfaces.

```
<Sysname> display qos gts interface
Interface: GigabitEthernet1/0/1
 Rule: If-match acl 2001
  CIR 512 (kbps), CBS 51200 (Bytes), PIR 5120 (kbps), EBS 0 (Bytes)
  Queue Length: 100 (Packets)
  Queue Size: 70 (Packets)
  Passed   : 0 (Packets) 0 (Bytes)
  Discarded: 0 (Packets) 0 (Bytes)
  Delayed  : 0 (Packets) 0 (Bytes)

Interface: GigabitEthernet1/0/2
 Rule: If-match acl 2001
```

```
CIR 64 (kbps), CBS 51200 (Bytes), EBS 0 (Bytes)
Queue Length: 100 (Packets)
Queue Size: 70 (Packets)
Passed   : 0 (Packets) 0 (Bytes)
Discarded: 0 (Packets) 0 (Bytes)
Delayed  : 0 (Packets) 0 (Bytes)
```

Table 12 Command output

Field	Description
Interface	Interface name, including the interface type and interface number.
Rule	Match criteria.
CIR	CIR in kbps (if the CIR is specified in absolute value) or in percentage (if the CIR is specified in percentage).
CBS	CBS in bytes (if the CBS is specified in absolute value) or in ms (if the CBS is specified in milliseconds). When the CBS is specified in milliseconds, the actual CBS value is *cbs-time* × the actual CIR value.
EBS	EBS in bytes (if the EBS is specified in absolute value) or in ms (if the EBS is specified in milliseconds). When the EBS is specified in milliseconds, the actual EBS value is *ebs-time* × the actual CIR value.
PIR	PIR in kbps (if the PIR is specified in absolute value) or in percentage (if the PIR is specified in percentage).
Queue Length	Number of packets that the buffer can hold.
Queue Size	Number of packets in the buffer.
Passed	Number and bytes of packets that have been forwarded.
Discarded	Number and bytes of dropped packets.
Delayed	Number and bytes of delayed packets.

qos gts

Use **qos gts** to set GTS parameters on an interface.

Use **undo qos gts** to delete the GTS configuration on an interface.

Syntax

qos gts { **any** | **acl** [**ipv6**] *acl-number* } **cir** *committed-information-rate* [**cbs** *committed-burst-size* [**ebs** *excess-burst-size*]] [**queue-length** *queue-length*]

undo qos gts { **any** | **acl** [**ipv6**] *acl-number* }

Default

No GTS parameters are configured.

Views

Interface view

Predefined user roles

network-admin

context-admin

Parameters

any: Shapes all packets.

acl [**ipv6**] *acl-number*: Performs GTS for packets matching an ACL specified by its number. The value range for the *acl-number* argument is 2000 to 3999 for basic ACLs and 3000 to 3999 for advanced ACLs. If you do not specify **ipv6**, this option specifies an IPv4 ACL. If you specify **ipv6**, this option specifies an IPv6 ACL.

cir *committed-information-rate*: Specifies the CIR in kbps. The value range for *committed-information-rate* is 8 to 32000000.

cbs *committed-burst-size*: Specifies the CBS in bytes. The value range for *committed-burst-size* is 512 to 1000000000. The default CBS is the product of 62.5 and the CIR.

ebs *excess-burst-size*: Specifies the EBS in bytes, which is the traffic exceeding CBS when two token buckets are used. The value range for *excess-burst-size* is 0 to 1000000000. The default EBS is 0.

queue-length *queue-length*: Specifies the maximum number of packets allowed in the queue. The value range for *queue-length* is 1 to 1024. The default is 50.

Usage guidelines

To use two rates for traffic shaping, configure the **qos gts** command with the **pir** *peak-information-rate* option. To use one rate for traffic shaping, configure the **qos gts** command without the **pir** *peak-information-rate* option.

When you reference an ACL, follow these restrictions and guidelines:

- If the ACL does not exist or contains no rules, the ACL is not used to match packets.
- If the **vpn-instance** *vpn-instance* option is specified in a rule, the rule takes effect only on VPN packets. If the **vpn-instance** *vpn-instance* option is not specified in a rule, the rule takes effect on both VPN packets and non-VPN packets.

Examples

Shape the packets matching ACL 2001 on GigabitEthernet 1/0/1. The GTS parameters are as follows:

- The CIR is 200 kbps.
- The CBS is 51200 bytes.
- The EBS is 0.
- The maximum buffer queue length is 100.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] qos gts acl 2001 cir 200 cbs 51200 ebs 0 queue-length 100
```

Rate limit commands

The following compatibility matrixes show the support of hardware platforms for rate limit:

Models	Rate limit compatibility
NFNX5-HD6480, NFNX3-HDB680, NFNX3-HDB1080	Yes
NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB1780, NFNX3-HDB3080, NFNX3-HDB1180, NFNX3-HDB1480	No

display qos lr

Use **`display qos lr`** to display the rate limit configuration and statistics for interfaces.

Syntax

`display qos lr interface` [*`interface-type interface-number`*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

`interface-type interface-number`: Specifies an interface by its type and number. If you do not specify an interface, this command displays the rate limit configuration and statistics for all interfaces except VA interfaces. For information about VA interfaces, see PPP in *Layer 2—WAN Access Configuration Guide*.

Usage guidelines

If you specify a VT interface, this command displays the rate limit configuration and statistics of each VA interface of the VT interface. It does not display QoS information about the VT interface.

Examples

Display the rate limit configuration and statistics for all interfaces.

```
<Sysname> display qos lr interface
Interface: GigabitEthernet1/0/1
 Direction: Outbound
  CIR 2000 (kbps), CBS 20480 (Bytes), EBS 0 (Bytes)
  Passed   : 1000 (Packets) 1000 (Bytes)
  Discarded: 1000 (Packets) 1000 (Bytes)
  Delayed  : 1000 (Packets) 1000 (Bytes)
  Active shaping: No
Interface: GigabitEthernet1/0/2
 Direction: Outbound
  CIR 64 (kbps), CBS 512 (Bytes), EBS 0 (Bytes)
  Passed   : 1000 (Packets) 1000 (Bytes)
  Discarded: 1000 (Packets) 1000 (Bytes)
  Delayed  : 1000 (Packets) 1000 (Bytes)
  Active shaping: No
```

Table 13 Command output

Field	Description
Interface	Interface name, including the interface type and interface number.
Direction	Direction in which the rate limit configuration is applied.
CIR	CIR in kbps (if the CIR is specified in absolute value) or in percentage (if the CIR is specified in percentage).

Field	Description
CBS	CBS in bytes (if the CBS is specified in absolute value) or in ms (if the CBS is specified in milliseconds). When the CBS is specified in milliseconds, the actual CBS value is *cbs-time* × the actual CIR value.
EBS	EBS in bytes (if the EBS is specified in absolute value) or in ms (if the EBS is specified in milliseconds). When the EBS is specified in milliseconds, the actual EBS value is *ebs-time* × the actual CIR value.
Passed	Number and bytes of packets that have passed.
Discarded	Number and bytes of dropped packets.
Delayed	Number and bytes of delayed packets.
Active shaping	Indicates whether the rate limit configuration is activated: • **Yes**—Activated. • **No**—Not activated.

qos lr

Use **qos lr** to configure rate limiting on an interface.

Use **undo qos lr** to delete the rate limit configuration on an interface.

Syntax

qos lr outbound cir *committed-information-rate* [**cbs** *committed-burst-size* [**ebs** *excess-burst-size*]]

undo qos lr outbound

Default

No rate limit is configured.

Views

Interface view

Predefined user roles

network-admin

context-admin

Parameters

outbound: Limits the rate of outgoing packets.

cir *committed-information-rate*: Specifies the CIR in kbps. The value range for *committed-information-rate* is 5 to 1000000.

cbs *committed-burst-size*: Specifies the CBS in the range of 100 to 100000 bytes. The default CBS is the product of 62.5 and the CIR.

ebs *excess-burst-size*: Specifies the EBS in bytes, which is the traffic exceeding CBS when two token buckets are used. The value range for *excess-burst-size* is 0 to 100000. The default is 0.

Examples

Limit the rate of outgoing packets on GigabitEthernet 1/0/1, with CIR 256 kbps and CBS 51200 bytes.

```
<Sysname> system-view
```

```
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] qos lr outbound cir 256 cbs 51200
```

qos overhead layer

Use **qos overhead layer physical** to include the physical layer header in calculating the packet length for rate limiting.

Use **undo qos overhead layer physical** to restore the default.

Syntax

qos overhead layer physical

undo qos overhead layer physical

Default

The device calculates the packet length for rate limiting based on the data link layer frame.

Views

System view

Predefined user roles

network-admin

context-admin

Usage guidelines

This command allows the device to include a 24-byte physical layer header in calculating the packet length for rate limiting. As a best practice, configure this command in scenarios where packets are small and precise rate limiting is required. To save computing resources, do not configure this command if the device processes large packets.

This command takes effect only on Layer 3 Ethernet interfaces and Layer 3 aggregate interfaces.

Examples

Include the physical layer header in calculating the packet length for rate limiting.

```
<Sysname> system-view
[Sysname] qos overhead layer physical
```

Syntax

display time-range { *time-range-name* | **all** }

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

time-range-name: Specifies a time range name, a case-insensitive string of 1 to 32 characters.

all: Displays the configuration and status of all existing time ranges.

Examples

Display the configuration and status of time range **t4**.

```
<Sysname> display time-range t4
Current time is 17:12:34 11/23/2010 Tuesday

Time-range : t4 (Inactive)
 10:00 to 12:00 Mon
 14:00 to 16:00 Wed
 from 00:00:00 1/1/2011 to 00:00:00 1/1/2012
 from 00:00:00 6/1/2011 to 00:00:00 7/1/2011
```

Table 1 Command output

Field	Description
Current time	Current system time.
Time-range	Configuration and status of the time range, including its name, status (active or inactive), and start time and end time.

time-range

Use **time-range** to create or edit a time range.

Use **undo time-range** to delete a time range or a statement in the time range.

Syntax

time-range *time-range-name* { *start-time* **to** *end-time days* [**from** *time1 date1*] [**to** *time2 date2*] | **from** *time1 date1* [**to** *time2 date2*] | **to** *time2 date2* }

undo time-range *time-range-name* [*start-time* **to** *end-time days* [**from** *time1 date1*] [**to** *time2 date2*] | **from** *time1 date1* [**to** *time2 date2*] | **to** *time2 date2*]

Default

No time ranges exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

time-range-name: Specifies a time range name. The name is a case-insensitive string of 1 to 32 characters. To avoid confusion, it cannot be **all**.

start-time **to** *end-time*: Specifies a periodic statement. Both *start-time* and *end-time* are in hh:mm format (24-hour clock). The value is in the range of 00:00 to 23:59 for the start time, and 00:00 to 24:00 for the end time. The end time must be greater than the start time.

days: Specifies the day or days of the week (in words or digits) on which the periodic statement is valid. If you specify multiple values, separate each value with a space, and make sure they do not overlap. These values can take one of the following forms:

- A digit in the range of 0 to 6, for Sunday, Monday, Tuesday, Wednesday, Thursday, Friday, and Saturday.
- A day of a week in abbreviated words: **Sun**, **Mon**, **Tue**, **Wed**, **Thu**, **Fri**, and **Sat**.
- **working-day** for Monday through Friday.
- **off-day** for Saturday and Sunday.
- **daily** for the whole week.

from *time1 date1*: Specifies the start time and date of an absolute statement. The *time1* argument specifies the time of the day in hh:mm or hh:mm:ss format (24-hour clock). Its value is in the range of 00:00:00 to 23:59:59. The *date1* argument specifies a date in MM/DD/YYYY or YYYY/MM/DD format, where MM is the month of the year in the range of 1 to 12, DD is the day of the month with the range varying by MM, and YYYY is the year in the calendar in the range of 1970 to 2100. If you do not specify this option, the start time is 01/01/1970 00:00:00 AM, the earliest time available in the system.

to *time2 date2*: Specifies the end time and date of the absolute time statement. The *time2* argument has the same format as the *time1* argument, but its value is in the range of 00:00:00 to 24:00:00. The *date2* argument has the same format and value range as the *date1* argument. The end time must be greater than the start time. If you do not specify this option, the end time is 12/31/2100 24:00:00 PM, the maximum time available in the system.

Usage guidelines

If an existing time range name is provided, this command adds a statement to the time range.

You can create multiple statements in a time range. Each time statement can take one of the following forms:

- Periodic statement in the *start-time* **to** *end-time days* format. A periodic statement recurs periodically on a day or days of the week.
- Absolute statement in the **from** *time1 date1* **to** *time2 date2* format. An absolute statement does not recur.

- Compound statement in the *start-time* **to** *end-time days* **from** *time1 date1* **to** *time2 date2* format. A compound statement recurs on a day or days of the week only within the specified period. For example, to create a time range that is active from 08:00 to 12:00 on Monday between January 1, 2015, 00:00 and December 31, 2015, 23:59, use the **time-range test 08:00 to 12:00 Mon from 00:00 01/01/2015 to 23:59 12/31/2015** command.

You can create a maximum of 1024 time ranges, each with a maximum of 32 periodic statements and 12 absolute statements. The active period of a time range is calculated as follows:

1. Combining all periodic statements.
2. Combining all absolute statements.
3. Taking the intersection of the two statement sets as the active period of the time range.

Examples

Create a periodic time range **t1**, setting it to be active between 8:00 to 18:00 during working days.

```
<Sysname> system-view
[Sysname] time-range t1 08:00 to 18:00 working-day
```

Create an absolute time range **t2**, setting it to be active in the whole year of 2011.

```
<Sysname> system-view
[Sysname] time-range t2 from 00:00 1/1/2011 to 24:00 12/31/2011
```

Create a compound time range **t3**, setting it to be active from 08:00 to 12:00 on Saturdays and Sundays of the year 2011.

```
<Sysname> system-view
[Sysname] time-range t3 08:00 to 12:00 off-day from 00:00 1/1/2011 to 24:00 12/31/2011
```

Create a compound time range **t4**, setting it to be active from 10:00 to 12:00 on Mondays and from 14:00 to 16:00 on Wednesdays in January and June of the year 2011.

```
<Sysname> system-view
[Sysname] time-range t4 10:00 to 12:00 1 from 00:00 1/1/2011 to 24:00 1/31/2011
[Sysname] time-range t4 14:00 to 16:00 3 from 00:00 6/1/2011 to 24:00 6/30/2011
```

Create an absolute time range **t5**, setting it to be active between 8:00 to 18:00 on January 1st, 2018.

```
<Sysname> system-view
[Sysname] time-range t5 from 08:00:00 1/1/2018 to 18:00:00 1/1/2018
```

NSFOCUS Firewall Series

NF IP Multicast Command Reference

NSFOCUS Technologies, Inc.

Document version: 6W600-20230221

Preface

This command reference describes the commands for configuring IP multicast features, including multicast routing and forwarding, PIM, IGMP, IPv6 multicast routing and forwarding, and MLD.

This preface includes the following topics about the documentation:

- Audience.
- Conventions.

Audience

This documentation is intended for:

- Network planners.
- Field technical support and servicing engineers.
- Network administrators.

Conventions

The following information describes the conventions used in the documentation.

Command conventions

Convention	Description
Boldface	**Bold** text represents commands and keywords that you enter literally as shown.
Italic	*Italic* text represents arguments that you replace with actual values.
[ ]	Square brackets enclose syntax choices (keywords or arguments) that are optional.
{ x | y | ... }	Braces enclose a set of required syntax choices separated by vertical bars, from which you select one.
[x | y | ...]	Square brackets enclose a set of optional syntax choices separated by vertical bars, from which you select one or none.
{ x | y | ... } *	Asterisk marked braces enclose a set of required syntax choices separated by vertical bars, from which you select a minimum of one.
[x | y | ...] *	Asterisk marked square brackets enclose optional syntax choices separated by vertical bars, from which you select one choice, multiple choices, or none.
&<1-n>	The argument or keyword and argument combination before the ampersand (&) sign can be entered 1 to n times.
#	A line that starts with a pound (#) sign is comments.

GUI conventions

Convention	Description
Boldface	Window names, button names, field names, and menu items are in Boldface. For example, the **New User** window opens; click **OK**.
>	Multi-level menus are separated by angle brackets. For example, **File** > **Create** > **Folder**.

Symbols

Convention	Description
WARNING!	An alert that calls attention to important information that if not understood or followed can result in personal injury.
CAUTION:	An alert that calls attention to important information that if not understood or followed can result in data loss, data corruption, or damage to hardware or software.
IMPORTANT:	An alert that calls attention to essential information.
NOTE:	An alert that contains additional or supplementary information.
TIP:	An alert that provides helpful information.

Network topology icons

Convention	Description
	Represents a generic network device, such as a router, switch, or firewall.
	Represents a routing-capable device, such as a router or Layer 3 switch.
	Represents a generic switch, such as a Layer 2 or Layer 3 switch, or a router that supports Layer 2 forwarding and other Layer 2 features.
	Represents an access controller, a unified wired-WLAN module, or the access controller engine on a unified wired-WLAN switch.
	Represents an access point.
	Represents a wireless terminator unit.
	Represents a wireless terminator.
	Represents a mesh access point.
	Represents omnidirectional signals.
	Represents directional signals.
	Represents a security product, such as a firewall, UTM, multiservice security gateway, or load balancing device.
	Represents a security module, such as a firewall, load balancing, NetStream, SSL VPN, IPS, or ACG module.

Examples provided in this document

Examples in this document might use devices that differ from your device in hardware model, configuration, or software version. It is normal that the port numbers, sample output, screenshots, and other information in the examples differ from what you have on your device.

Contents

Multicast routing and forwarding commands

delete ip rpf-route-static

Use **delete ip rpf-route-static** to delete all static multicast routes.

Syntax

delete ip rpf-route-static [**vpn-instance** *vpn-instance-name*]

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command deletes all static multicast routes on the public network.

Usage guidelines

This command deletes all static multicast routes. To delete a specified static multicast route, use the **undo ip rpf-route-static** command.

Examples

Delete all static multicast routes on the public network.

```
<Sysname> system-view
[Sysname] delete ip rpf-route-static
This will erase all multicast static routes and their configurations, you must reconfigure all static routes.
Are you sure?[Y/N]:y
```

Related commands

ip rpf-route-static

display mrib interface

Use **display mrib interface** to display information about interfaces maintained by the MRIB.

Syntax

display mrib [**vpn-instance** *vpn-instance-name*] **interface** [*interface-type interface-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command displays information about interfaces maintained by the MRIB on the public network.

interface-type interface-number: Specifies an interface by its type and number. If you do not specify an interface, this command displays information about all interfaces maintained by the MRIB.

Examples

Display information about interfaces maintained by the MRIB on the public network.

```
<Sysname> display mrib interface
 Interface: GigabitEthernet1/0/1
     Index: 0x00004444
     Current state: up
     MTU: 1500
     Type: BROADCAST
     Protocol: PIM-DM
     PIM protocol state: Enabled
     Address list:
          1. Local address : 8.12.0.2/16
             Remote address: 0.0.0.0
             Reference     : 1
             State         : NORMAL
```

Table 1 Command output

Field	Description
Interface	Interface name.
Index	Index number of the interface.
Current state	Current status of the interface: up or down.
MTU	MTU value.
Type	Interface type: • **BROADCAST**—Broadcast link interface. • **P2P**—P2P interface. • **LOOP**—Loopback interface. • **REGISTER**—Register interface. • **NBMA**—NBMA interface. • **MTUNNEL**—Multicast tunnel interface. This field is empty if the interface is Null 0.
Protocol	Protocol running on the interface: PIM-DM, PIM-SM, IGMP, PROXY, or MD.
PIM protocol state	Whether PIM is enabled: Enabled or Disabled.
Address list	Interface address list.
Local address	Local IP address.
Remote address	Remote end IP address. This field is displayed only when the interface is

Field	Description
	vlink type.
Reference	Number of times that the address has been referenced.
State	Status of the interface address: NORMAL or DEL.

display multicast boundary

Use **display multicast boundary** to display multicast boundary information.

Syntax

display multicast [**vpn-instance** *vpn-instance-name*] **boundary** [*group-address* [*mask-length* | *mask*]] [**interface** *interface-type interface-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-operator

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command displays multicast boundary information on the public network.

group-address: Specifies a multicast group by its IP address in the range of 224.0.0.0 to 239.255.255.255. If you do not specify a multicast group, this command displays multicast boundary information for all multicast groups.

mask-length: Specifies an address mask length in the range of 4 to 32. The default is 32.

mask: Specifies an address mask. The default is 255.255.255.255.

interface *interface-type interface-number*: Specifies an interface by its type and number. If you do not specify an interface, this command displays multicast boundary information for all interfaces.

Examples

Display information about all multicast boundaries on the public network.

```
<Sysname> display multicast boundary
 Boundary            Interface
 224.1.1.0/24        GE1/0/1
 239.2.2.0/24        GE1/0/2
```

Table 2 Command output

Field	Description
Boundary	Multicast group associated with the multicast boundary.
Interface	Boundary interface associated with the multicast boundary.

Related commands

multicast boundary

display multicast fast-forwarding cache

Use **display multicast fast-forwarding cache** to display multicast fast forwarding entries.

Syntax

display multicast [**vpn-instance** *vpn-instance-name*] **fast-forwarding cache** [*source-address* | *group-address*] * [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command displays multicast fast forwarding entries on the public network.

source-address: Specifies a multicast source address.

group-address: Specifies a multicast group address in the range of 224.0.1.0 to 239.255.255.255.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays multicast fast forwarding entries for the master device.

Examples

Display multicast fast forwarding entries on the public network.

```
<Sysname> display multicast fast-forwarding cache
Total 1 entries, 1 matched

 (60.1.1.200, 225.0.0.2)
    Status     : Enabled
    Source port: 2001                  Destination port: 2002
    Protocol   : 2                     Flag            : 0x2
    Incoming interface: GigabitEthernet1/0/3
    List of 1 outgoing interfaces:
        GigabitEthernet1/0/2
          Status: Enabled              Flag: 0x14
```

Table 3 Command output

Field	Description
Total 1 entries, 1 matched	Total number of (S, G) entries in the multicast fast forwarding table, and the total number of matching (S, G) entries.

Field	Description
(60.1.1.200, 225.0.0.2)	(S, G) entry.
Protocol	Protocol number.
Flag	Flag of the (S, G) entry or the outgoing interface in the entry. This field displays one flag or the sum of multiple flags. In this example, the value 0x2 means that the entry has only one flag 0x2. The value 0x14 means that the interface has flags 0x4 and 0x10. The following flags are available for an entry: • **0x1**—The entry is created because of packets passed through between cards. • **0x2**—The entry is added by multicast forwarding. The following flags are available for an outgoing interface: • **0x1**—The interface is added to the entry because of packets passed through between cards. • **0x2**—The interface is added to an existing entry. • **0x4**—The MAC address of the interface is needed for fast forwarding. • **0x8**—The interface is an outgoing interface associated with the incoming VLAN interface. • **0x10**—The interface is associated with the entry. • **0x20**—The interface is to be deleted.
Status	Status of the (S, G) entry or the outgoing interface: • **Enabled**—Available. • **Disabled**—Unavailable.
Incoming interface	Incoming interface of the (S, G) entry.
List of 1 outgoing interfaces	Outgoing interface list of the (S, G) entry.

Related commands

`reset multicast fast-forwarding cache all`

display multicast forwarding df-info

Use **`display multicast forwarding df-info`** to display DF information.

Syntax

`display multicast` [**`vpn-instance`** *`vpn-instance-name`*] **`forwarding df-info`** [*`rp-address`*] [**`verbose`**] [**`slot`** *`slot-number`*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command displays DF information on the public network.

rp-address: Specifies a BIDIR-PIM RP by its IP address.

verbose: Specifies detailed information. If you do not specify this keyword, the command displays brief information about DFs.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays DF information for the master device.

Usage guidelines

In a BIDIR-PIM domain, only the DF on each subnet can forward multicast data destined for a multicast group toward the RP of the group. For more information about the DF, see *IP Multicast Configuration Guide*.

Examples

Display brief information about DFs on an ADVPN network.

```
<Sysname> display multicast forwarding df-info
Total 1 RPs, 1 matched

00001. RP address: 1.1.1.1
     Flags: 0x0
     Uptime: 00:00:53
     RPF interface: Tunnel2, 192.168.0.1
     List of 2 DF interfaces:
       1: LoopBack0
       2: Tunnel2, 192.168.0.3
```

Display brief information about DFs on the public network.

```
<Sysname> display multicast forwarding df-info
Total 1 RPs, 1 matched

00001. RP address: 7.11.0.2
     Flags: 0x0
     Uptime: 04:14:40
     RPF interface: GigabitEthernet1/0/1
     List of 1 DF interfaces:
       1: GigabitEthernet1/0/2
```

Display detailed information about DFs on the public network.

```
<Sysname> display multicast forwarding df-info verbose
Total 1 RPs, 1 matched

00001. RP address: 7.11.0.2
     MID: 2, Flags: 0x0
     Uptime: 03:37:22
       Product information: 0x7a2f762f, 0x718fee9f, 0x4b82f137, 0x71c32184
     RPF interface: GigabitEthernet1/0/1
       Product information: 0xa567d6fc, 0xadeb03e3
       Tunnel  information: 0xdfb107d4, 0x7aa5d510
     List of 1 DF interfaces:
```

```
1: GigabitEthernet1/0/2
   Product information: 0xa986152b, 0xb74a9a2f
   Tunnel  information: 0x297ca208, 0x76985b89
```

Table 4 Command output

Field	Description
Total 1 RPs, 1 matched	Total number of RPs, and the total number of matching RPs.
00001	Sequence number of the entry to which the RP is designated.
RP address	IP address of the RP.
MID	ID of the entry to which the RP is designated. Each entry to which the RP is designated has a unique MID.
Flags	Entry flag. This field displays one flag or the sum of multiple flags. In this example, the value 0x0 means that the entry has only one flag 0x0. The following flags are available for an entry: • **0x0**—The entry is in correct state. • **0x4**—The entry fails to update. • **0x8**—DF interface information fails to update for the entry. • **0x40**—The entry is to be deleted. • **0x100**—The entry is being deleted. • **0x200**—The entry is in GR state.
Uptime	Length of time for which the entry has been up.
RPF interface	RPF interface to the RP.
List of 1 DF interfaces	DF interface list.
Tunnel2, 192.168.0.3	ADVPN tunnel interface, and the IP address of the remote end.

display multicast forwarding event

Use **display multicast forwarding event** to display statistics of multicast forwarding events.

Syntax

display multicast [**vpn-instance** *vpn-instance-name*] **forwarding event** [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command displays statistics of the multicast forwarding events on the public network.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays statistics of multicast forwarding events for the master device.

Examples

Display statistics of multicast forwarding events on the public network.

```
<Sysname> display multicast forwarding event
Total active events sent: 0
Total inactive events sent: 0
Total NoCache events sent: 2
Total NoCache events dropped: 0
Total WrongIF events sent: 0
Total WrongIF events dropped: 0
Total SPT switch events sent: 0
NoCache rate limit: 1024 packets/s
WrongIF rate limit: 1 packets/10s
Total timer of register suppress timeout: 0
```

Table 5 Command output

Field	Description
Total active events sent	Number of times that entry-active events have been sent.
Total inactive events sent	Number of times that entry-inactive events have been sent.
Total NoCache events sent	Number of times that NoCache events have been sent.
Total NoCache events dropped	Number of times that NoCache events have been dropped.
Total WrongIF events sent	Number of times that WrongIF events have been sent.
Total WrongIF events dropped	Number of times that WrongIF events have been dropped.
Total SPT switch events sent	Number of times that SPT-switch events have been sent.
NoCache rate limit	Rate limit for sending NoCache events, in pps.
WrongIF rate limit	Rate limit for sending WrongIF events, in packets per 10 seconds.
Total timer of register suppress timeout	Number of times that the registration suppression has timed out in total.

Related commands

reset multicast forwarding event

display multicast forwarding-table

Use **display multicast forwarding-table** to display multicast forwarding entries.

Syntax

display multicast [**vpn-instance** *vpn-instance-name*] **forwarding-table** [*source-address* [**mask** { *mask-length* | *mask* }] | *group-address* [**mask** { *mask-length* | *mask* }] | **incoming-interface** *interface-type interface-number* | **outgoing-interface** { **exclude** | **include** | **match** } *interface-type interface-number* | **slot** *slot-number* | **statistics**] *

Views

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command displays multicast forwarding entries on the public network.

source-address: Specifies a multicast source address.

group-address: Specifies a multicast group address in the range of 224.0.0.0 to 239.255.255.255.

mask-length: Specifies an address mask length. The default value is 32. For a multicast group address, the value range for this argument is 4 to 32. For a multicast source address, the value range for this argument is 0 to 32.

mask: Specifies an address mask. The default value is 255.255.255.255.

incoming-interface: Specifies the multicast forwarding entries that contain the specified incoming interface.

interface-type interface-number: Specifies an incoming interface by its type and number.

outgoing-interface: Specifies the multicast forwarding entries that contain the specified outgoing interface.

exclude: Specifies the multicast forwarding entries that do not contain the specified interface in the outgoing interface list.

include: Specifies the multicast forwarding entries that contain the specified interface in the outgoing interface list.

match: Specifies the forwarding entries that contain only the specified interface in the outgoing interface list.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays multicast forwarding entries for the master device.

statistics: Displays statistics for the multicast forwarding table.

Examples

Display multicast forwarding entries on an ADVPN network.

```
<Sysname> display multicast forwarding-table
Total 1 entries, 1 matched

00001. (172.168.0.2, 227.0.0.1)
     Flags: 0x0
     Uptime: 00:08:32, Timeout in: 00:03:26
     Incoming interface: Tunnel1, 12.1.1.3
     List of 2 outgoing interface:
            1:  Tunnel1, 12.1.1.1
            2:  Tunnel1, 12.1.1.2
     Matched 19648 packets(20512512 bytes), Wrong If 0 packet
     Forwarded 19648 packets(20512512 bytes)
```

Display multicast forwarding entries on the public network.

```
<Sysname> display multicast forwarding-table
Total 1 entries, 1 matched

00001. (172.168.0.2, 227.0.0.1)
     Flags: 0x0
     Uptime: 00:08:32, Timeout in: 00:03:26
     Incoming interface: Vlan-interface10
          Incoming sub-VLAN: VLAN 11
          Outgoing sub-VLAN: VLAN 12
                             VLAN 13
     List of 1 outgoing interfaces:
       1: Vlan-interface20
          Sub-VLAN: VLAN 21
                    VLAN 22
     Matched 19648 packets(20512512 bytes), Wrong If 0 packet
     Forwarded 19648 packets(20512512 bytes)
```

Table 6 Command output

Field	Description
Total 1 entries, 1 matched	Total number of (S, G) entries, and the total number of matching (S, G) entries.
00001	Sequence number of the (S, G) entry.
(172.168.0.2,227.0.0.1)	(S, G) entry.
Flags	Entry flag. This field displays one flag or the sum of multiple flags. In this example, the value 0x0 means that the entry has only one flag 0x0. The following entries are available for an entry: • **0x0**—The entry is in correct state. • **0x1**—The entry is in inactive state. • **0x2**—The entry is null. • **0x4**—The entry fails to update. • **0x8**—Outgoing interface information fails to update for the entry. • **0x10**—Data-group information fails to update for the entry. • **0x20**—A register outgoing interface is available. • **0x40**—The entry is to be deleted. • **0x80**—The entry is in registration suppression state. • **0x100**—The entry is being deleted. • **0x200**—The entry is in GR state. • **0x800**—The entry has the associated ARP entry for the multicast source address. • **0x400000**—The entry is created by the IGMP proxy. • **0x2000000**—The entry is a BIDIR-PIM forwarding entry.
Uptime	Length of time for which the (S, G) entry has been up.
Timeout in	Length of time in which the (S, G) entry will expire.
Incoming interface	Incoming interface of the (S, G) entry.
List of 1 outgoing interfaces	Outgoing interface list of the (S, G) entry.
Tunnel1, 12.1.1.1	ADVPN tunnel interface, and the IP address of the remote end.

Field	Description
Matched 19648 packets(20512512 bytes), Wrong If 0 packet	Number of packets (bytes) that match the (S, G) entry, and number of packets with incoming interface errors. The numbers are displayed as 0 if an outgoing interface of the (S, G) entry is on the specified slot.
Forwarded 19648 packets(20512512 bytes)	Number of packets (bytes) that have been forwarded. The numbers are displayed as 0 if an outgoing interface of the (S, G) entry is on the specified slot.

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command displays information about the DF list in multicast forwarding entries on the public network.

group-address: Specifies a multicast group address in the range of 224.0.0.0 to 239.255.255.255.

verbose: Specifies detailed information about the DF list in multicast forwarding entries. If you do not specify this keyword, the command displays brief information about the DF list in multicast forwarding entries.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays information about the DF list in multicast forwarding entries for the master device.

Examples

Display brief information about the DF list in multicast forwarding entries on the public network.

```
<Sysname> display multicast forwarding-table df-list
Total 1 entries, 1 matched

00001. (0.0.0.0, 225.0.0.1)
     List of 1 DF interfaces:
```

```
       1: GigabitEthernet1/0/1
```

Display detailed information about the DF list in multicast forwarding entries on the public network.

```
<Sysname> display multicast forwarding-table df-list verbose
Total 1 entries, 1 matched

00001. (0.0.0.0, 225.0.0.1)
       List of 1 DF interfaces:
         1: GigabitEthernet1/0/1
            Product information: 0x347849f6, 0x14bd6837
            Tunnel  information: 0xc4857986, 0x128a9c8f
```

Table 7 Command output

Field	Description
Total 1 entries, 1 matched	Total number of forwarding entries, and the total number of matching entries.
00001	Sequence number of the entry.
(0.0.0.0, 225.0.0.1)	(*, G) entry.
List of 1 DF interfaces	DF interface list.

display multicast routing-table

Use **display multicast routing-table** to display multicast routing entries.

Syntax

display multicast [**vpn-instance** *vpn-instance-name*] **routing-table** [*source-address* [**mask** { *mask-length* | *mask* }] | *group-address* [**mask** { *mask-length* | *mask* }] | **incoming-interface** *interface-type interface-number* | **outgoing-interface** { **exclude** | **include** | **match** } *interface-type interface-number*] *

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command displays multicast routing entries on the public network.

source-address: Specifies a multicast source address.

group-address: Specifies a multicast group address in the range of 224.0.0.0 to 239.255.255.255.

mask-length: Specifies an address mask length. The default value is 32. For a multicast group address, the value range for this argument is 4 to 32. For a multicast source address, the value range for this argument is 0 to 32.

mask: Specifies an address mask. The default is 255.255.255.255.

incoming-interface: Specifies the multicast routing entries that contain the specified incoming interface.

interface-type interface-number: Specifies an interface by its type and number.

outgoing-interface: Specifies the multicast routing entries that contain the specified outgoing interface.

exclude: Specifies the multicast routing entries that do not contain the specified interface in the outgoing interface list.

include: Specifies the multicast routing entries that contain the specified interface in the outgoing interface list.

match: Specifies the multicast routing entries that contain only the specified interface in the outgoing interface list.

Usage guidelines

Multicast routing entries are the basis of multicast forwarding. You can use this command to view the establishment state of (S, G) entries.

Examples

Display multicast routing entries on an ADVPN network.

```
<Sysname> display multicast routing-table
 Total 1 entries

 00001. (172.168.0.2, 227.0.0.1)
       Uptime: 00:00:28
       Upstream Interface: Tunnel1, 12.1.1.3
       List of 2 downstream interfaces
           1:  Tunnel1, 12.1.1.1
           2:  Tunnel1, 12.1.1.2
```

Display multicast routing entries on the public network.

```
<Sysname> display multicast routing-table
 Total 1 entries

 00001. (172.168.0.2, 227.0.0.1)
       Uptime: 00:00:28
       Upstream Interface: GigabitEthernet1/0/1
       List of 2 downstream interfaces
           1:  GigabitEthernet1/0/2
           2:  GigabitEthernet1/0/3
```

Table 8 Command output

Field	Description
Total 1 entries	Total number of (S, G) entries.
00001	Sequence number of the (S, G) entry.
(172.168.0.2, 227.0.0.1)	(S, G) entry.
Uptime	Length of time for which the (S, G) entry has been up.
Upstream Interface	Upstream interface at which (S, G) packets should arrive.

Field	Description
List of 2 downstream interfaces	List of downstream interfaces that need to forward (S, G) packets.
Tunnel1, 12.1.1.1	ADVPN tunnel interface, and the IP address of the remote end.

Related commands

reset multicast routing-table

display multicast routing-table static

Use **display multicast routing-table static** to display static multicast routing entries.

Syntax

display multicast [**vpn-instance** *vpn-instance-name*] **routing-table static** [*source-address* { *mask-length* | *mask* }]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command displays static multicast routing entries on the public network.

source-address: Specifies a multicast source address.

mask-length: Specifies an address mask length in the range of 0 to 32.

mask: Specifies an address mask.

Usage guidelines

This command displays only valid static multicast routing entries.

Examples

Display static multicast routing entries on the public network.

```
<Sysname> display multicast routing-table static
Destinations: 3        Routes: 4

Destination/Mask   Pre  RPF neighbor    Interface
1.1.0.0/16         10   7.12.0.1        GE1/0/1
                        7.11.0.1        GE1/0/2
2.2.2.0/24         20   7.11.0.1        GE1/0/3
3.3.3.3/32         50   7.12.0.1        GE1/0/4
```

Table 9 Command output

Field	Description
Destinations	Number of the multicast destination addresses.
Routes	Number of routes.
Destination/Mask	Destination address and its mask length.
Pre	Route preference.
RPF neighbor	IP address of the RPF neighbor to the reachable destination.
Interface	Outgoing interface to the reachable destination.

display multicast rpf-info

Use **display multicast rpf-info** to display RPF information for a multicast source.

Syntax

display multicast [**vpn-instance** *vpn-instance-name*] **rpf-info** *source-address* [*group-address*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command displays RPF information for a multicast source on the public network.

source-address: Specifies a multicast source address.

group-address: Specifies a multicast group address in the range of 224.0.1.0 to 239.255.255.255.

Examples

Display RPF information for multicast source 192.168.1.55 on the public network.

```
<Sysname> display multicast rpf-info 192.168.1.55
 RPF information about source 192.168.1.55:
     RPF interface: GigabitEthernet1/0/1, RPF neighbor: 10.1.1.1
     Referenced route/mask: 192.168.1.0/24
     Referenced route type: igp
     Route selection rule: preference-preferred
     Load splitting rule: disable
     Source AS: 0
     C-multicast route target: 0x0000000000000000
```

Table 10 Command output

Field	Description
RPF neighbor	IP address of the RPF neighbor.
Referenced route/mask	Referenced route and its mask length.
Referenced route type	Type of the referenced route: • **igp**—IGP unicast route. • **egp**—EGP unicast route. • **unicast (direct)**—Directly connected unicast route. • **unicast**—Other unicast routes, such as static unicast route. • **multicast static**—Static multicast route. • **mbgp**—MBGP route.
Route selection rule	Rule for RPF route selection: • Route preference. • Longest prefix match.
Load splitting rule	Status of the load splitting rule: enable or disable.
Source AS	AS number of the source-side PE.
C-multicast route target	Route target attribute value of the C-multicast route.

Related commands

display multicast forwarding-table

display multicast routing-table

ip rpf-route-static

Use **ip rpf-route-static** to configure a static multicast route.

Use **undo ip rpf-route-static** to delete a static multicast route.

Syntax

ip rpf-route-static [**vpn-instance** *vpn-instance-name*] *source-address* { *mask-length* | *mask* } { *rpf-nbr-address* | *interface-type interface-number* } [**preference** *preference*]

undo ip rpf-route-static [**vpn-instance** *vpn-instance-name*] *source-address* { *mask-length* | *mask* } { *rpf-nbr-address* | *interface-type interface-number* }

Default

No static multicast routes exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command configures a static multicast route on the public network.

source-address: Specifies a multicast source address.

mask-length: Specifies an address mask length in the range of 0 to 32.

mask: Specifies an address mask.

rpf-nbr-address: Specifies an RPF neighbor by its IP address.

interface-type interface-number: Specifies an interface by its type and number. The interface connects the RPF neighbor.

preference: Sets a route preference in the range of 1 to 255. The default value is 1.

Usage guidelines

If the interface connected to an RPF neighbor is a point-to-point interface, you must specify the interface by its type and number.

If the interface connected to an RPF neighbor is not a point-to-point interface, you must specify the interface by its IP address. This type of interfaces includes Layer 3 Ethernet, Layer 3 aggregate, Loopback, and VLAN interfaces.

The configured static multicast route might not take effect when one of the following conditions exists:

- The outgoing interface iteration fails.
- The specified interface is not in the public network or the same VPN instance as the current interface.
- The specified interface is not a point-to-point interface.
- The specified interface is down.

If multiple static multicast routes within the same multicast source address range are available, only the one with the highest route preference can become active. You can use the **display multicast routing-table static** command to verify that the configured static multicast route has taken effect.

The **undo ip rpf-route-static** command deletes the specified static multicast route, but the **delete ip rpf-route-static** command deletes all static multicast routes.

Examples

Configure a static multicast route to multicast source 10.1.1.0/24 and specify the interface with IP address 192.168.1.23 as the RPF neighbor on the public network.

```
<Sysname> system-view
[Sysname] ip rpf-route-static 10.1.1.0 24 192.168.1.23
```

Related commands

delete ip rpf-route-static

display multicast routing-table static

load-splitting (MRIB view)

Use **load-splitting** to enable multicast load splitting.

Use **undo load-splitting** to restore the default.

Syntax

load-splitting { **source** | **source-group** }

undo load-splitting

Default

Multicast load splitting is disabled.

Views

MRIB view

Predefined user roles

network-admin

context-admin

Parameters

source: Enables multicast load splitting based on multicast source.

source-group: Enables multicast load splitting based on multicast source and group.

Usage guidelines

This command does not take effect on BIDIR-PIM.

Examples

Enable multicast load splitting based on multicast source on the public network.

```
<Sysname> system-view
[Sysname] multicast routing
[Sysname-mrib] load-splitting source
```

longest-match (MRIB view)

Use **longest-match** to specify the longest prefix match principle for RPF route. The device will use the matching route with the longest prefix as the RPF route.

Use **undo longest-match** to restore the default.

Syntax

longest-match

undo longest-match

Default

Route preference is used for RPF route selection. The route with the highest preference is used as the RPF route.

Views

MRIB view

Predefined user roles

network-admin

context-admin

Examples

Specify the longest prefix match principle for RPF route selection on the public network.

```
<Sysname> system-view
[Sysname] multicast routing
```

```
[Sysname-mrib] multicast longest-match
```

multicast boundary

Use **multicast boundary** to configure a multicast forwarding boundary.

Use **undo multicast boundary** to delete a multicast forwarding boundary.

Syntax

multicast boundary *group-address* { *mask-length* | *mask* }

undo multicast boundary { *group-address* { *mask-length* | *mask* } | **all** }

Default

No multicast forwarding boundaries are configured on an interface.

Views

Interface view

Predefined user roles

network-admin

context-admin

Parameters

group-address: Specifies a multicast group address in the range of 224.0.0.0 to 239.255.255.255.

mask-length: Specifies an address mask length in the range of 4 to 32.

mask: Specifies an address mask.

all: Specifies all forwarding boundaries configured on the interface.

Usage guidelines

A multicast forwarding boundary sets the boundary condition for the multicast groups in the specified address range. If the destination address of a multicast packet matches the set boundary condition, the packet is not forwarded.

You can configure an interface as a multicast forwarding boundary for different multicast group ranges by executing this command multiple times on the interface.

You do not need to enable IP multicast routing before you execute this command.

Assume that Set A and Set B are multicast forwarding boundary sets with different address ranges, and B is a subset of A. A takes effect on the interface no matter whether A is configured earlier or later than B.

Examples

Configure GigabitEthernet 1/0/1 as the forwarding boundary of multicast groups in the range of 239.2.0.0/16.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] multicast boundary 239.2.0.0 16
```

Related commands

display multicast boundary

multicast forwarding-table cache-unknown per-entry

Use **multicast forwarding-table cache-unknown per-entry** to set the maximum number of unknown multicast packets that can be cached for an (S, G) entry.

Use **undo multicast forwarding-table cache-unknown per-entry** to restore the default.

Syntax

multicast forwarding-table cache-unknown per-entry *per-entry-limit*

undo multicast forwarding-table cache-unknown per-entry

Default

The device can cache only one unknown multicast packet for an (S, G) entry.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

per-entry-limit: Specifies the maximum number of unknown multicast packets that can be cached for an (S, G) entry. The value range for this argument is 0 to 256. If you set the value to 0, the device cannot cache unknown multicast packets.

Examples

Set the maximum number to 20 for unknown multicast packets that can be cached for an (S, G) entry.

```
<Sysname> system-view
[Sysname] multicast forwarding-table cache-unknown per-entry 20
```

Related commands

multicast forwarding-table cache-unknown total

multicast forwarding-table cache-unknown total

Use **multicast forwarding-table cache-unknown total** to set the maximum number of all unknown multicast packets that can be cached.

Use **undo multicast forwarding-table cache-unknown total** to restore the default.

Syntax

multicast forwarding-table cache-unknown total *total-limit*

undo multicast forwarding-table cache-unknown total

Default

The device can cache 1024 unknown multicast packets in total.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

total-limit: Specifies the maximum number of all unknown multicast packets that can be cached. The value range for this argument is 0 to 65535. If you set the value to 0, the device cannot cache unknown multicast packets.

Usage guidelines

As a best practice, set the value in this command to be far greater than the value set in the **multicast forwarding-table cache-unknown per-entry** command.

Examples

Set the maximum number to 10000 for all unknown multicast packets that can be cached.

```
<Sysname> system-view
[Sysname] multicast forwarding-table cache-unknown total 10000
```

Related commands

multicast forwarding-table cache-unknown per-entry

multicast routing

Use **multicast routing** to enable IP multicast routing and enter MRIB view.

Use **undo multicast routing** to disable IP multicast routing.

Syntax

multicast routing [**vpn-instance** *vpn-instance-name*]

undo multicast routing [**vpn-instance** *vpn-instance-name*]

Default

IP multicast routing is disabled.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command enables IP multicast routing on the public network.

Usage guidelines

Other Layer 3 multicast commands take effect only when IP multicast routing is enabled on the public network or for a VPN instance.

The device does not forward multicast packets before IP multicast routing is enabled.

Examples

Enable IP multicast routing on the public network, and enter MRIB view.

```
<Sysname> system-view
[Sysname] multicast routing
[Sysname-mrib]
```

Enable IP multicast routing for the VPN instance **mvpn**, and enter MRIB view.

```
<Sysname> system-view
[Sysname] multicast routing vpn-instance mvpn
[Sysname-mrib-mvpn]
```

reset multicast fast-forwarding cache

Use **reset multicast fast-forwarding cache** to clear multicast fast forwarding entries.

Syntax

reset multicast [**vpn-instance** *vpn-instance-name*] **fast-forwarding cache** { { *source-address* | *group-address* } * | **all** } [**slot** *slot-number*]

Views

User view

Predefined user roles

network-admin

context-admin

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command clears multicast fast forwarding entries on the public network.

source-address: Specifies a multicast source address.

group-address: Specifies a multicast group address in the range of 224.0.0.0 to 239.255.255.255.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command clears multicast fast forwarding entries for the master device.

all: Specifies all multicast fast forwarding entries.

Examples

Clear all multicast fast forwarding entries on the public network.

```
<Sysname> reset multicast fast-forwarding cache all
```

Clear the multicast fast forwarding entry for multicast source and group (20.0.0.2, 225.0.0.2) on the public network.

```
<Sysname> reset multicast fast-forwarding cache 20.0.0.2 225.0.0.2
```

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command clears multicast forwarding entries on the public network.

source-address: Specifies a multicast source address.

group-address: Specifies a multicast group address in the range of 224.0.0.0 to 239.255.255.255.

mask-length: Specifies an address mask length. The default value is 32. For a multicast group address, the value range for this argument is 4 to 32. For a multicast source address, the value range for this argument is 0 to 32.

mask: Specifies an address mask. The default is 255.255.255.255.

incoming-interface: Specifies the multicast forwarding entries that contain the specified incoming interface.

interface-type interface-number: Specifies an incoming interface by its type and number.

all: Specifies all multicast forwarding entries.

Usage guidelines

When you clear a multicast forwarding entry, the associated multicast routing entry is also cleared.

Examples

Clear multicast forwarding entries for multicast group 225.5.4.3 on the public network.

```
<Sysname> reset multicast forwarding-table 225.5.4.3
```

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command displays information about IGMP multicast groups on the public network.

group-address: Specifies a multicast group by its IP address in the range of 224.0.1.0 to 239.255.255.255. If you do not specify a multicast group, this command displays information about all IGMP multicast groups.

interface *interface-type interface-number*: Specifies an interface by its type and number. If you do not specify an interface, this command displays information about IGMP multicast groups for all interfaces.

static: Specifies IGMP multicast groups that hosts have joined statically. If you do not specify this keyword, the command displays information about IGMP multicast groups that hosts have joined dynamically.

verbose: Displays detailed information.

Examples

Display information about IGMP multicast groups that hosts have dynamically joined on the public network.

```
<Sysname> display igmp group
IGMP groups in total: 3
 GigabitEthernet1/0/1(10.10.1.20):
  IGMP groups reported in total: 3
   Group address   Last reporter   Uptime      Expires
   225.1.1.1       10.10.1.10      00:02:04    00:01:15
   225.1.1.2       10.10.1.10      00:02:04    00:01:15
   225.1.1.3       10.10.1.10      00:02:04    00:01:15
```

Table 1 Command output

Field	Description
IGMP groups in total	Total number of IGMP multicast groups.
IGMP groups reported in total	Total number of IGMP multicast groups that hosts attached to the interface have joined dynamically.
Group address	Multicast group address.
Last reporter	Address of the last host that reported its membership to the multicast group.
Uptime	Length of time since the multicast group was reported.
Expire	Remaining lifetime for the multicast group. This field displays **Off** if the timer is disabled.

Display detailed information about IGMP multicast group 232.1.1.1 that hosts have dynamically joined on the public network. In this example, the router is configured with IGMP SSM mappings.

```
<Sysname> display igmp group 232.1.1.1 verbose
GigabitEthernet1/0/1(10.10.1.20):
  IGMP groups reported in total: 3
   Group: 232.1.1.1
     Uptime: 00:00:34
     Exclude expires: 00:04:16
     Mapping expires: 00:02:16
     Last reporter: 10.10.1.10
     Last-member-query-counter: 0
     Last-member-query-timer-expiry: Off
     Mapping last-member-query-counter: 0
     Mapping last-member-query-timer-expiry: Off
     Group mode: Exclude
     Version1-host-present-timer-expiry: Off
     Version2-host-present-timer-expiry: 00:02:11
     Mapping version1-host-present-timer-expiry: Off
     Source list (sources in total: 1):
       Source: 10.1.1.1
          Uptime: 00:00:03
          V3 expires: 00:04:16
          Mapping expires: 00:02:16
          Last-member-query-counter: 0
          Last-member-query-timer-expiry: Off
```

Table 2 Command output

Field	Description
IGMP groups reported in total	Total number of IGMP multicast groups that hosts attached to the interface have joined dynamically.
Group	Multicast group address.
Uptime	Length of time since the multicast group was reported.
Exclude expires	Remaining lifetime for the multicast group in Exclude mode. This field displays **Off** if the timer is disabled.

Field	Description
Mapping expires	Remaining time for the multicast group specified in IGMP SSM mappings. This field is displayed only when the device is configured with IGMP SSM mappings.
Last reporter	Address of the last host that reported its membership to this multicast group.
Last-member-query-counter	Number of IGMP group-specific queries or IGMP source-and-group-specific queries sent for the multicast group.
Last-member-query-timer-expiry	Remaining time for the last member query timer for the multicast group. This field displays **Off** if the timer is disabled.
Mapping last-member-query-counter	Number of IGMP group-specific queries or IGMP source-and-group-specific queries sent for the multicast group specified in IGMP SSM mappings. This field is displayed only when the device is configured with IGMP SSM mappings.
Mapping last-member-query-timer-expiry	Remaining time for the last member query timer of the multicast group specified in IGMP SSM mappings. This field displays **Off** if the timer is disabled. This field is displayed only when the device is configured with IGMP SSM mappings.
Group mode	Multicast source filtering mode: • **Include**—Include mode. • **Exclude**—Exclude mode. For a device that runs IGMPv1 or IGMPv2: • If IGMP SSM mappings are not configured, this field displays **Exclude**. • If IGMP SSM mappings are configured, this field displays **Include** or **Exclude** depending on the SSM mappings and the multicast groups that the host joins.
Version1-host-present-timer-expiry	Remaining time for the IGMPv1 host present timer. This field displays **Off** if the timer is disabled. This field is displayed only when the device runs IGMPv2 or IGMPv3.
Version2-host-present-timer-expiry	Remaining time for the IGMPv2 host present timer. This field displays **Off** if the timer is disabled. This field is displayed only when the device runs IGMPv3.
Mapping version1-host-present-timer-expiry	Remaining time for the IGMPv1 host present timer when the device is configured with IGMP SSM mappings. This field displays **Off** if the timer is disabled. This field is displayed only when the device is configured with IGMP SSM mappings.
Source list (sources in total)	List of multicast sources and total number of multicast sources. This field is displayed only when the device runs IGMPv3 or when the device is configured with IGMP SSM mappings.
Source	Multicast source address. This field is displayed only when the device runs IGMPv3 or when the device is configured with IGMP SSM mappings.
Uptime	Length of time since the multicast source was reported.

Field	Description
	This field is displayed only when the device runs IGMPv3 or when the device is configured with IGMP SSM mappings.
V3 expires	Remaining time for the multicast source when the device runs IGMPv3. This field displays **Off** if the timer is disabled and displays three hyphens (---) if the multicast source is specified in IGMP SSM mappings. This field is displayed only when the device runs IGMPv3 or when the device is configured with IGMP SSM mappings.
Mapping expires	Remaining time for the multicast source specified in IGMP SSM mappings. This field is displayed only when the device is configured with IGMP SSM mappings.
Last-member-query-counter	Number of IGMP group-specific queries or IGMP group-and-source-specific queries sent for the multicast source and group. This field is displayed only when the device runs IGMPv3 or is configured with IGMP SSM mappings.
Last-member-query-timer-expiry	Remaining time for the last member query timer for the multicast source and group. This field displays **Off** if the timer is disabled. This field is displayed only when the device runs IGMPv3 or is configured with IGMP SSM mappings.

Display information about IGMP multicast groups that hosts have statically joined on the public network.

```
<Sysname> display igmp group static
 Entries in total: 2
   Group address   Source address  Interface           Expires
   225.1.1.1       0.0.0.0         GE1/0/1             Never
   225.2.2.2       1.1.1.1         GE1/0/1             Never
```

Table 3 Command output

Field	Description
Entries in total	Total number of the multicast groups that hosts have joined statically.
Group address	Multicast group address.
Source address	Multicast source address.
Interface	Interface name.
Expires	Remaining lifetime for the multicast group. This field always displays **Never** because the multicast group never expires.

Related commands

`reset igmp group`

display igmp interface

Use **`display igmp interface`** to display IGMP information for interfaces.

Syntax

display igmp [**vpn-instance** *vpn-instance-name*] **interface** [*interface-type interface-number*] [**proxy**] [**verbose**]

Views

Any view

Predefined user roles

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command displays IGMP information for interfaces on the public network.

interface-type interface-number: Specifies an interface by its type and number. If you do not specify an interface, this command displays IGMP information for all IGMP-enabled interfaces.

proxy: Displays the IGMP proxy interface information. If you do not specify this keyword, the command displays IGMP information about all interfaces.

verbose: Displays detailed IGMP information.

Examples

Display detailed IGMP information for GigabitEthernet 1/0/1 (non-proxy interface) on the public network.

```
<Sysname> display igmp interface gigabitethernet 1/0/1 verbose
 GigabitEthernet1/0/1(10.10.1.20):
   IGMP is enabled.
   IGMP version: 2
   Query interval for IGMP: 125s
   Other querier present time for IGMP: 255s
   Maximum query response time for IGMP: 10s
   Last member query interval: 1s
   Last member query count: 2
   Startup query interval: 31s
   Startup query count: 2
   General query timer expiry (hh:mm:ss): 00:00:54
   Querier for IGMP: 10.10.1.20 (This router)
   IGMP activity: 1 join(s), 0 leave(s)
   Multicast routing on this interface: Enabled
   Robustness: 2
   Require-router-alert: Disabled
   Fast-leave: Disabled
   Startup-query: Off
   Other-querier-present-timer-expiry (hh:mm:ss): Off
  IGMP groups reported in total: 1
```

Display detailed IGMP information for all IGMP proxy interfaces on the public network.

```
<Sysname> display igmp interface proxy verbose
```

```
GigabitEthernet1/0/2(20.10.1.20):
  IGMP proxy is enabled.
  IGMP version: 2
  Multicast routing on this interface: Enabled
  Require-router-alert: Disabled
  Version1-querier-present-timer-expiry (hh:mm:ss): Off
```

Table 4 Command output

Field	Description
GigabitEthernet1/0/1(10.10.1.20)	Interface and its IP address.
IGMP is enabled	IGMP is enabled on the interface.
IGMP version	Version of IGMP that the interface runs.
Query interval for IGMP	IGMP general query interval, in seconds.
Other querier present time for IGMP	IGMP other querier present interval, in seconds.
Maximum query response time for IGMP	Maximum response time for IGMP general queries, in seconds.
Last member query interval	Interval for sending IGMP group-specific queries or IGMP group-and-source-specific queries, in seconds.
Last member query count	Number of IGMP group-specific queries or IGMP group-and-source-specific queries sent for the multicast group.
Startup query interval	Interval for sending IGMP general queries on startup, in seconds.
Startup query count	Number of IGMP general queries that the device sends on startup.
General query timer expiry	Remaining time for the IGMP general query timer. This field displays **Off** if the timer is disabled.
Querier for IGMP	IP address of the IGMP querier. This field is not displayed when the device runs IGMPv1 and the device is not the IGMP querier. NOTE: In IGMPv1, the PIM DR acts as the IGMP querier. You can use the **display pim interface** command to display PIM information.
No querier elected	No IGMP querier election is performed. This field is displayed when the device runs IGMPv1 and is not the IGMP querier. NOTE: In IGMPv1, the PIM DR acts as the IGMP querier. You can use the **display pim interface** command to display PIM information.
IGMP activity: 1 join(s), 0 leave(s)	Statistics of IGMP activities: • **join(s)**—Total number of multicast groups that this interface has joined. • **leave(s)**—Total number of multicast groups that this interface has left.
Multicast routing on this interface	Whether IP multicast routing is enabled: Enabled or Disabled.
Robustness	Robustness variable of the IGMP querier.
Require-router-alert	Whether the feature of dropping IGMP messages without

Field	Description
	Router-Alert is enabled: Enabled or Disabled,
Fast-leave	Whether the fast-leave processing feature is enabled: Enabled or Disabled.
Startup-query	Whether the IGMP querier sends IGMP general queries at the startup query interval on startup: • **On**—The IGMP querier performs the above action. • **Off**—The IGMP querier does not perform the above action.
Other-querier-present-timer-expiry	Remaining time for the other querier present timer. This field displays **Off** if the timer is disabled.
IGMP groups reported in total	Total number of multicast groups that the interface has joined dynamically. This field is not displayed if the interface does not join multicast groups.
IGMP proxy is enabled	IGMP proxying is enabled on the interface.
Version1-querier-present-timer-expiry	Remaining time for the IGMPv1 querier present timer. This field displays **Off** if the timer is disabled.

display igmp proxy group

Use **display igmp proxy group** to display information about multicast groups maintained by the IGMP proxy.

Syntax

display igmp [**vpn-instance** *vpn-instance-name*] **proxy group** [*group-address* | **interface** *interface-type interface-number*] [**verbose**]

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command displays information about multicast groups maintained by the IGMP proxy on the public network.

group-address: Specifies a multicast group by its IP address in the range of 224.0.1.0 to 239.255.255.255. If you do not specify a multicast group, this command displays information about all multicast groups maintained by the IGMP proxy.

interface *interface-type interface-number*: Specifies an interface by its type and number. If you do not specify an interface, this command displays information about multicast groups maintained by the IGMP proxy for all interfaces.

verbose: Displays detailed information.

Examples

Display information about multicast groups maintained by the IGMP proxy on the public network.

```
<Sysname> display igmp proxy group
IGMP proxy group records in total: 2
 GigabitEthernet1/0/1(1.1.1.20):
  IGMP proxy group records in total: 2
   Group address      Member state      Expires
   225.1.1.1          Delay             00:00:02
   225.1.1.2          Idle              Off
```

Display detailed information about multicast group 225.1.1.1 maintained by the IGMP proxy on the public network.

```
<Sysname> display igmp proxy group 225.1.1.1 verbose
 GigabitEthernet1/0/1(1.1.1.20):
  IGMP proxy group records in total: 2
   Group: 225.1.1.1
     Group mode: Include
     Member state: Delay
     Expires: 00:00:02
     Source list (sources in total: 1):
       1.1.1.1
```

Table 5 Command output

Field	Description
IGMP groups records in total	Total number of multicast groups maintained by the IGMP proxy.
GigabitEthernet1/0/1(1.1.1.20)	IGMP proxy interface and its IP address.
Pending proxy group	Pending multicast groups maintained by the IGMP proxy.
Group address/Group	Multicast group address.
Member state	Member host states: • **Delay**—The member host has joined a group and started a delay timer. • **Idle**—The member host has joined a group, but didn't start a delay timer.
Expires	Remaining delay time for the member host to send a responding report. This field displays **Off** if the timer is disabled.
Group mode	Multicast source filtering mode: Include or Exclude.
Source list	Multicast source list for the multicast group maintained by the IGMP proxy.
sources in total	Total number of multicast sources.

display igmp proxy routing-table

Use **display igmp proxy routing-table** to display multicast routing entries maintained by the IGMP proxy.

Syntax

display igmp [**vpn-instance** *vpn-instance-name*] **proxy routing-table** [*source-address* [**mask** { *mask-length* | *mask* }] | *group-address* [**mask** { *mask-length* | *mask* }]] * [**verbose**]

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command displays multicast routing entries maintained by the IGMP proxy on the public network.

source-address: Specifies a multicast source by its IP address. If you do not specify a multicast source, this command displays multicast routing entries for all multicast sources maintained by the IGMP proxy.

group-address: Specifies a multicast group address by its IP address in the range of 224.0.1.0 to 239.255.255.255. If you do not specify a multicast group, this command displays multicast routing entries for all multicast groups maintained by the IGMP proxy.

mask-length: Specifies a mask length of the multicast group address or multicast source address. For a multicast source address, the value range for this argument is 0 to 32. For a multicast group address, the value range for this argument is 4 to 32. The default value is 32 in both cases.

mask: Specifies a mask of the multicast group address or multicast source address. The default value is 255.255.255.255.

verbose: Displays detailed information about multicast routing entries maintained by the IGMP proxy.

Examples

Display multicast routing entries maintained by the IGMP proxy on the public network.

```
<Sysname> display igmp proxy routing-table
 Total 1 (*, G) entries, 2 (S, G) entries.

 (172.168.0.12, 227.0.0.1)
     Upstream interface: GigabitEthernet1/0/1
     Downstream interfaces (1 in total):
         1: GigabitEthernet1/0/2
             Protocol: IGMP

(*, 225.1.1.1)
     Upstream interface: GigabitEthernet1/0/1
     Downstream interfaces (1 in total):
         1: GigabitEthernet1/0/2
             Protocol: STATIC

  (2.2.2.2, 225.1.1.1)
```

```
     Upstream interface: GigabitEthernet1/0/1
     Downstream interfaces (2 in total):
         1: LoopBack1
             Protocol: STATIC
         2: GigabitEthernet1/0/2
             Protocol: PROXY
```

Display detailed information about multicast routing entries maintained by the IGMP proxy on the public network.

```
<Sysname> display igmp proxy routing-table verbose
 Total 1 (*, G) entries, 2 (S, G) entries.

 (172.168.0.12, 227.0.0.1)
     Upstream interface: GigabitEthernet1/0/1
     Downstream interfaces (1 in total):
         1: GigabitEthernet1/0/2
             Protocol: IGMP
             Querier state: Querier
             Join/Prune state:Join

     Non-downstream interfaces: None

 (*, 225.1.1.1)
     Upstream interface: GigabitEthernet1/0/1
     Downstream interfaces (1 in total):
         1: GigabitEthernet1/0/2
             Protocol: STATIC
             Querier state: Querier
             Join/Prune state:Join

     Non-downstream interfaces (1 in total):
         1: GigabitEthernet1/0/2
             Protocol: IGMP
             Querier state: Non-querier
             Join/Prune state:Join

(2.2.2.2, 225.1.1.1)
     Upstream interface: GigabitEthernet1/0/1
     Downstream interfaces (2 in total):
         1: LoopBack1
             Protocol: STATIC
             Querier state: Querier
             Join/Prune state: Join
         2: GigabitEthernet1/0/2
             Protocol: PROXY
             Querier state: Querier
             Join/Prune state: Join

     Non-downstream interfaces: None
```

Table 6 Command output

Field	Description
Total 1 (*, G) entries, 2 (S, G) entries	Total number of (*, G) entries, and the total number of (S, G) entries.
(172.168.0.12, 227.0.0.1)	(S, G) entry.
Upstream interface	Incoming interface of the (S, G) entry.
Downstream interfaces (1 in total)	Outgoing interfaces of the (S, G) entry, and the total number of outgoing interfaces.
Non-downstream interfaces (1 in total)	Non-outgoing interfaces of the (S, G) entry, and the total number of non-outgoing interfaces.
1: GigabitEthernet1/0/2	Index of an interface, and the interface.
Protocol	Protocol type: • **IGMP**—Dynamic IGMP. • **PROXY**—IGMP proxy. • **STATIC**—Static IGMP.
Querier state	Querier state: • Querier. • Non-querier.
Join/Prune state	Joined or pruned state of the interface: • **NI**—Default state. • **Join**—Joined state. • **Prune**—Pruned state.

display igmp ssm-mapping

Use **display igmp ssm-mapping** to display IGMP SSM mappings.

Syntax

display igmp [**vpn-instance** *vpn-instance-name*] **ssm-mapping** *group-address*

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command displays information about the IGMP SSM mappings on the public network.

group-address: Specifies a multicast group by its IP address in the range of 224.0.1.0 to 239.255.255.255.

Examples

Display IGMP SSM mappings for multicast group 232.1.1.1 on the public network.

```
<Sysname> display igmp ssm-mapping 232.1.1.1
 Group: 232.1.1.1
 Source list:
        1.2.3.4
        5.5.5.5
        10.1.1.1
        100.1.1.10
```

Table 7 Command output

Field	Description
Group	Multicast group address.
Source list	List of multicast source addresses.

igmp

Use **igmp** to enter IGMP view.

Use **undo igmp** to delete the configurations in IGMP view.

Syntax

igmp [**vpn-instance** *vpn-instance-name*]

undo igmp [**vpn-instance** *vpn-instance-name*]

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command applies to the public network.

Examples

Enter IGMP view for the public network.

```
<Sysname> system-view
[Sysname] igmp
[Sysname-igmp]
```

Enter IGMP view for the VPN instance **mvpn**.

```
<Sysname> system-view
[Sysname] igmp vpn-instance mvpn
[Sysname-igmp-mvpn]
```

igmp enable

Use **igmp enable** to enable IGMP on an interface.

Use **undo igmp enable** to disable IGMP on an interface.

Syntax

igmp enable

undo igmp enable

Default

IGMP is disabled on an interface.

Views

Interface view

Predefined user roles

network-admin

context-admin

Usage guidelines

This command takes effect only when IP multicast routing is enabled on the public network or for the VPN instance to which the interface belongs.

Other IGMP configurations on the interface take effects only when IGMP is enabled on the interface.

Examples

Enable IP multicast routing on the public network, and enable IGMP on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] multicast routing
[Sysname-mrib] quit
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] igmp enable
```

Related commands

multicast routing

igmp fast-leave

Use **igmp fast-leave** to enable fast-leave processing on an interface.

Use **undo igmp fast-leave** to disable fast-leave processing on an interface.

Syntax

igmp fast-leave [**group-policy** *ipv4-acl-number*]

undo igmp fast-leave

Default

Fast-leave processing is disabled. The IGMP querier sends IGMP group-specific or group-and-source-specific queries after receiving a leave message.

Views

Interface view

Predefined user roles

network-admin

context-admin

Parameters

ipv4-acl-number: Specifies an IPv4 basic ACL by its number in the range of 2000 to 2999. If you specify an ACL, the fast-leave processing feature takes effect only on the multicast groups that the ACL permits. The feature takes effect on all multicast groups when one of the following conditions exists:

- You do not specify an ACL.
- The specified ACL does not exist.
- The specified ACL does not have valid rules.

Usage guidelines

The fast-leave processing feature enables an IGMP querier to suppress IGMP group-specific or group-and-source-specific queries upon receiving IGMP leave messages permitted by the ACL.

When you configure a rule in the IPv4 basic ACL, follow these restrictions and guidelines:

- If the **vpn-instance** *vpn-instance* option is specified, the rule does not take effect.
- The **source** *source-address source-wildcard* option specifies a multicast group address.
- Among the other optional parameters, only the **fragment** keyword and the **time-range** *time-range-name* option take effect.

Examples

Enable fast-leave processing on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] igmp fast-leave
```

igmp group-policy

Use **igmp group-policy** to configure a multicast group policy on an interface to control the multicast groups that hosts attached to the interface can join.

Use **undo igmp group-policy** to delete the multicast group policy on an interface.

Syntax

igmp group-policy *ipv4-acl-number* [*version-number*]

undo igmp group-policy

Default

No multicast group policy exists on an interface. Hosts attached to the interface can join any multicast groups.

Views

Interface view

Predefined user roles

network-admin

context-admin

Parameters

ipv4-acl-number: Specifies an IPv4 basic or advanced ACL by its number in the range of 2000 to 3999. Hosts can join only the multicast groups that the ACL permits. If the ACL does not exist or does not have valid rules, hosts cannot join any multicast groups.

version-number: Specifies an IGMP version in the range of 1 to 3. By default, this command takes effect on IGMP reports of all versions.

Usage guidelines

A multicast group policy filters IGMP reports to control the multicast groups that the hosts can join.

This command does not take effect on static member interfaces because static member interfaces do not send IGMP reports.

When you configure a rule in the IPv4 ACL, follow these restrictions and guidelines:

- If the **vpn-instance** *vpn-instance* option is specified, the rule does not take effect.
- In a basic ACL, the **source** *source-address source-wildcard* option specifies a multicast group address.
- In an advanced ACL, the **source** *source-address source-wildcard* option specifies a multicast source address. The **destination** *dest-address dest-wildcard* option specifies a multicast group address.

  To match the following IGMP reports, set the **source** *source-address source-wildcard* option to 0.0.0.0:

  - IGMPv1 and IGMPv2 reports.
  - IGMPv3 IS_EX and IGMPv3 TO_EX reports that do not carry multicast source addresses.
- Among the other optional parameters, only the **fragment** keyword and the **time-range** *time-range-name* option take effect.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Configure a multicast group policy on GigabitEthernet 1/0/1 so that hosts attached to the interface can join only multicast group 225.1.1.1.

```
<Sysname> system-view
[Sysname] acl basic 2005
[Sysname-acl-ipv4-basic-2005] rule permit source 225.1.1.1 0
[Sysname-acl-ipv4-basic-2005] quit
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] igmp group-policy 2005
```

igmp last-member-query-count

Use **igmp last-member-query-count** to set the IGMP last member query count on an interface.

Use **undo igmp last-member-query-count** to restore the default.

Syntax

igmp last-member-query-count *count*

undo igmp last-member-query-count

Default

The IGMP last member query count equals the IGMP querier's robustness variable.

Views

Interface view

Predefined user roles

network-admin

context-admin

Parameters

count: Specifies an IGMP last member query count in the range of 1 to 255.

Usage guidelines

You can set the IGMP last member query count for an interface in interface view or globally for all interfaces in IGMP view. For an interface, the interface-specific configuration takes priority over the global configuration.

Examples

Set the IGMP last member query count to 6 on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] igmp last-member-query-count 6
```

Related commands

last-member-query-count (IGMP view)

igmp last-member-query-interval

Use **igmp last-member-query-interval** to set the IGMP last member query interval on an interface.

Use **undo igmp last-member-query-interval** to restore the default.

Syntax

igmp last-member-query-interval *interval*

undo igmp last-member-query-interval

Default

The IGMP last member query interval is 1 second.

Views

Interface view

Predefined user roles

network-admin

context-admin

Parameters

interval: Specifies an IGMP last member query interval in the range of 1 to 25 seconds.

Usage guidelines

You can set the IGMP last member query interval for an interface in interface view or globally for all interfaces in IGMP view. For an interface, the interface-specific configuration takes priority over the global configuration.

Examples

Set the IGMP last member query interval to 6 seconds on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] igmp last-member-query-interval 6
```

igmp max-response-time

Use **igmp max-response-time** to set the maximum response time for IGMP general queries on an interface.

Use **undo igmp max-response-time** to restore the default.

Syntax

igmp max-response-time *time*

undo igmp max-response-time

Default

The maximum response time for IGMP general queries is 10 seconds.

Views

Interface view

Predefined user roles

network-admin

context-admin

Parameters

time: Specifies the maximum response time for IGMP general queries, in the range of 1 to 3174 seconds.

Usage guidelines

You can set the maximum response time for an interface in interface view or globally for all interfaces in IGMP view. For an interface, the interface-specific configuration takes priority over the global configuration.

Examples

Set the maximum response time for IGMP general queries to 25 seconds on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] igmp max-response-time 25
```

Related commands

max-response-time (IGMP view)

igmp non-stop-routing

Use **igmp non-stop-routing** to enable IGMP NSR.

Use **undo igmp non-stop-routing** to disable IGMP NSR.

Syntax

igmp non-stop-routing

undo igmp non-stop-routing

Default

IGMP NSR is disabled.

Views

System view

Predefined user roles

network-admin

context-admin

Examples

Enable IGMP NSR.

```
<Sysname> system-view
[Sysname] igmp non-stop-routing
```

igmp other-querier-present-interval

Use **igmp other-querier-present-interval** to set the IGMP other querier present timer on an interface.

Use **undo igmp other-querier-present-interval** to restore the default.

Syntax

igmp other-querier-present-interval *interval*

undo igmp other-querier-present-interval

Default

The IGMP other querier present timer is calculated by using the following formula:

[IGMP general query interval] × [IGMP querier's robustness variable] + [maximum response time for IGMP general queries] / 2.

Views

Interface view

Predefined user roles

network-admin

context-admin

Parameters

interval: Specifies an IGMP other querier present timer in the range of 1 to 31744 seconds.

Usage guidelines

You can set the IGMP other querier present timer for an interface in interface view or globally for all interfaces in IGMP view. For an interface, the interface-specific configuration takes priority over the global configuration.

Examples

Set the IGMP other querier present timer to 125 seconds on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] igmp other-querier-present-interval 125
```

Related commands

other-querier-present-interval (IGMP view)

igmp proxy enable

Use **igmp proxy enable** to enable IGMP proxying on an interface.

Use to **undo igmp proxy enable** to disable IGMP proxying on an interface.

Syntax

igmp proxy enable

undo igmp proxy enable

Default

IGMP proxying is disabled on an interface.

Views

Interface view

Predefined user roles

network-admin

context-admin

Usage guidelines

This command takes effect only when IP multicast routing is enabled on the public network or for the VPN instance to which the interface belongs.

Examples

Enable IP multicast routing on the public network, and enable IGMP proxying on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] multicast routing-enable
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] igmp proxy enable
```

Related commands

multicast routing

igmp proxy forwarding

Use **igmp proxy forwarding** to enable multicast forwarding on a non-querier interface.

Use **undo igmp proxy forwarding** to disable multicast forwarding on a non-querier interface.

Syntax

igmp proxy forwarding

undo igmp proxy forwarding

Default

Multicast forwarding is disabled for a non-querier interface.

Views

Interface view

Predefined user roles

network-admin

context-admin

Usage guidelines

Typically, only IGMP queriers can forward multicast traffic but non-queriers cannot. This mechanism prevents multicast data from being repeatedly forwarded. If a router interface on the IGMP proxy failed the querier election, enable multicast forwarding on the interface to forward multicast data to attached receivers.

Examples

Enable multicast forwarding on GigabitEthernet 1/0/1. (GigabitEthernet 1/0/1 is a non-querier interface on the IGMP proxy device.)

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] igmp proxy forwarding
```

igmp query-interval

Use **igmp query-interval** to set the IGMP general query interval on an interface.

Use **undo igmp query-interval** to restore the default.

Syntax

igmp query-interval *interval*

undo igmp query-interval

Default

The IGMP general query interval is 125 seconds.

Views

Interface view

Predefined user roles

network-admin

context-admin

Parameters

interval: Specifies an IGMP general query interval in the range of 1 to 31744 seconds.

Usage guidelines

You can set the IGMP general query interval for an interface in interface view or globally for all interfaces in IGMP view. For an interface, the interface-specific configuration takes priority over the global configuration.

Examples

Set the IGMP general query interval to 60 seconds on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] igmp query-interval 60
```

Related commands

query-interval (IGMP view)

igmp robust-count

Use **igmp robust-count** to set the IGMP querier's robustness variable on an interface.

Use **undo igmp robust-count** to restore the default.

Syntax

igmp robust-count *count*

undo igmp robust-count

Default

The IGMP querier's robustness variable is 2.

Views

Interface view

Predefined user roles

network-admin

context-admin

Parameters

count: Specifies an IGMP querier's robustness variable in the range of 1 to 255.

Usage guidelines

The IGMP querier's robustness variable defines the number of times to retransmit queries if packet loss occurs. A higher robustness variable makes the IGMP querier more robust, but it increases timeout time for multicast groups.

You can set the IGMP querier's robustness variable for an interface in interface view or globally for all interfaces in IGMP view. For an interface, the interface-specific configuration takes priority over the global configuration.

Examples

Set the IGMP querier's robustness variable to 5 on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] igmp robust-count 5
```

Related commands

robust-count (IGMP view)

igmp startup-query-count

Use **igmp startup-query-count** to set the IGMP startup query count on an interface.

Use **undo igmp startup-query-count** to restore the default.

Syntax

igmp startup-query-count *count*

undo igmp startup-query-count

Default

The IGMP startup query count equals the IGMP querier's robustness variable.

Views

Interface view

Predefined user roles

network-admin

context-admin

Parameters

count: Specifies an IGMP startup query count in the range of 1 to 255.

Usage guidelines

You can set the IGMP startup query count for an interface in interface view or globally for all interfaces in IGMP view. For an interface, the interface-specific configuration takes priority over the global configuration.

Examples

Set the IGMP startup query count to 5 on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] igmp startup-query-count 5
```

Use **undo igmp startup-query-interval** to restore the default.

Syntax

igmp startup-query-interval *interval*

undo igmp startup-query-interval

Default

The IGMP startup query interval equals one quarter of the IGMP general query interval.

Views

Interface view

Predefined user roles

network-admin

context-admin

Parameters

interval: Specifies an IGMP startup query interval in the range of 1 to 31744 seconds.

Usage guidelines

You can set the IGMP startup query interval for an interface in interface view or globally for all interfaces in IGMP view. For an interface, the interface-specific configuration takes priority over the global configuration.

Examples

Set the IGMP startup query interval to 100 seconds on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] igmp startup-query-interval 100
```

Related commands

startup-query-interval (IGMP view)

igmp static-group

Use **igmp static-group** to configure an interface as a static group member of a multicast group.

Use **undo igmp static-group** to restore the default.

Syntax

igmp static-group *group-address* [**source** *source-address*]

undo igmp static-group { **all** | *group-address* [**source** *source-address*]

Default

An interface is not a static group member of multicast groups.

Views

Interface view

Predefined user roles

network-admin

context-admin

Parameters

group-address: Specifies a multicast group by its IP address in the range of 224.0.1.0 to 239.255.255.255.

source *source-address*: Specifies a multicast source by its IP address. If you do not specify a multicast source, this command configures an interface as a static member of the multicast groups with all multicast source addresses.

all: Specifies all multicast groups that the interface has statically joined.

Usage guidelines

For multicast routing entries to be created, you must specify a multicast source if the specified multicast group is in the SSM group range.

Examples

Configure GigabitEthernet 1/0/1 as a static group member of multicast group 224.1.1.1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] igmp static-group 224.1.1.1
```

Configure GigabitEthernet 1/0/1 as a static group member of multicast source and group (192.168.1.1, 232.1.1.1).

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] igmp static-group 232.1.1.1 source 192.168.1.1
```

igmp version

Use **igmp version** to specify an IGMP version on an interface.

Use **undo igmp version** to restore the default.

Syntax

igmp version *version-number*

undo igmp version

Default

The IGMP version on an interface is 2.

Views

Interface view

Predefined user roles

network-admin

context-admin

Parameters

version-number: Specifies an IGMP version in the range of 1 to 3.

Usage guidelines

CAUTION:
For IGMP to operate correctly, specify the same IGMP version for all devices on the same subnet.

Examples

Specify IGMP version 1 on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] igmp version 1
```

last-member-query-count (IGMP view)

Use **last-member-query-count** to set the IGMP last member query count globally.

Use **undo last-member-query-count** to restore the default.

Syntax

last-member-query-count *count*

undo last-member-query-count

Default

The IGMP last member query count equals the IGMP querier's robustness variable.

Views

IGMP view

Predefined user roles

network-admin

context-admin

Parameters

count: Specifies an IGMP last member query count in the range of 1 to 255.

Usage guidelines

You can set the IGMP last member query count globally for all interfaces in IGMP view or for an interface in interface view. For an interface, the interface-specific configuration takes priority over the global configuration.

Examples

Set the global IGMP last member query count to 6 on the public network.

```
<Sysname> system-view
[Sysname] igmp
[Sysname-igmp] last-member-query-count 6
```

Related commands

igmp last-member-query-count

last-member-query-interval (IGMP view)

Use **undo last-member-query-interval** to restore the default.

Syntax

last-member-query-interval *interval*

undo last-member-query-interval

Default

The IGMP last member query interval is 1 second.

Views

IGMP view

Predefined user roles

network-admin

context-admin

Parameters

interval: Specifies an IGMP last member query interval in the range of 1 to 25 seconds.

Usage guidelines

You can set the IGMP last member query interval globally for all interfaces in IGMP view or for an interface in interface view. For an interface, the interface-specific configuration takes priority over the global configuration.

Examples

Set the global IGMP last member query interval to 6 seconds on the public network.

```
<Sysname> system-view
[Sysname] igmp
[Sysname-igmp] last-member-query-interval 6
```

Related commands

igmp last-member-query-interval

max-response-time (IGMP view)

Use **max-response-time** to set the maximum response time for IGMP general queries globally.

Use **undo max-response-time** to restore the default.

Syntax

max-response-time *time*

undo max-response-time

Default

The maximum response time for IGMP general queries is 10 seconds.

Views

IGMP view

Predefined user roles

network-admin

context-admin

Parameters

time: Specifies the maximum response time for IGMP general queries in the range of 1 to 3174 seconds.

Usage guidelines

You can set the maximum response time globally for all interfaces in IGMP view or for an interface in interface view. For an interface, the interface-specific configuration takes priority over the global configuration.

Examples

#Set the global maximum response time for IGMP general queries to 25 seconds on the public network.

```
<Sysname> system-view
[Sysname] igmp
[Sysname-igmp] max-response-time 25
```

Related commands

igmp max-response-time

other-querier-present-interval (IGMP view)

Use **other-querier-present-interval** to set the IGMP other querier present timer globally.

Use **undo other-querier-present-interval** to restore the default.

Syntax

other-querier-present-interval *interval*

undo other-querier-present-interval

Default

The IGMP other querier present timer is calculated by using the following formula:

[IGMP general query interval] × [IGMP querier's robustness variable] + [maximum response time for IGMP general queries] / 2.

Views

IGMP view

Predefined user roles

network-admin

context-admin

Parameters

interval: Specifies an IGMP other querier present timer in the range of 1 to 31744 seconds.

Usage guidelines

You can set the IGMP other querier present timer globally for all interfaces in IGMP view or for an interface in interface view. For an interface, the interface-specific configuration takes priority over the global configuration.

Examples

Set the global IGMP other querier present timer to 125 seconds on the public network.

```
<Sysname> system-view
[Sysname] igmp
[Sysname-igmp] other-querier-present-interval 125
```

Related commands

igmp other-querier-present-interval

proxy multipath (IGMP view)

Use **proxy multipath** to enable load splitting on an IGMP proxy device.

Use **undo proxy multipath** to disable load splitting on an IGMP proxy device.

Syntax

proxy multipath

undo proxy multipath

Default

The load splitting feature is disabled on the IGMP proxy device.

Views

IGMP view

Predefined user roles

network-admin

context-admin

Usage guidelines

Use this feature when the IGMP proxy device has multiple proxy interfaces. All proxy interfaces on the IGMP proxy device share multicast traffic on a per-group basis. If you do not enable this feature, only the proxy interface with the highest IP address forwards multicast data.

Examples

Enable load splitting on the IGMP proxy device on the public network.

```
<Sysname> system-view
[Sysname] igmp
[Sysname-igmp] proxy multipath
```

query-interval (IGMP view)

Use **query-interval** to set the IGMP general query interval globally.

Use **undo query-interval** to restore the default.

Syntax

query-interval *interval*

undo query-interval

Default

The IGMP general query interval is 125 seconds.

Views

IGMP view

Predefined user roles

network-admin

context-admin

Parameters

interval: Specifies an IGMP general query interval in the range of 1 to 31744 seconds.

Usage guidelines

You can set the IGMP general query interval globally for all interfaces in IGMP view or for an interface in interface view. For an interface, the interface-specific configuration takes priority over the global configuration.

Examples

Set the global IGMP general query interval to 60 seconds on the public network.

```
<Sysname> system-view
[Sysname] igmp
[Sysname-igmp] query-interval 60
```

Related commands

igmp query-interval

reset igmp group

Use **reset igmp group** to clear dynamic IGMP multicast group entries.

Syntax

reset igmp [**vpn-instance** *vpn-instance-name*] **group** { **all** | **interface** *interface-type interface-number* { **all** | *group-address* [**mask** { *mask* | *mask-length* }] [*source-address* [**mask** { *mask* | *mask-length* }]] } }

Views

User view

Predefined user roles

network-admin

context-admin

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command clears dynamic IGMP multicast group entries on the public network.

all: Specifies all interfaces (the first **all**), or all IGMP multicast groups (the second **all**).

interface-type interface-number: Specifies an interface by its type and number.

group-address: Specifies a multicast group by its IP address in the range of 224.0.0.0 to 239.255.255.255.

source-address: Specifies a multicast source address. If you do not specify a multicast source, this command clears dynamic IGMP multicast group entries for all multicast source addresses.

mask: Specifies an address mask. The default is 255.255.255.255.

mask-length: Specifies an address mask length. The default is 32. For a multicast group address, the value range for this argument is 4 to 32. For a multicast source address, the value range for this argument is 0 to 32.

Usage guidelines

CAUTION:
This command might interrupt the multicast information transmission.

Examples

Clear dynamic IGMP multicast group entries for all interfaces on the public network.

```
<Sysname> reset igmp group all
```

Clear all dynamic IGMP multicast group entries for GigabitEthernet 1/0/1 on the public network.

```
<Sysname> reset igmp group interface gigabitethernet 1/0/1 all
```

Clear the dynamic IGMP multicast group entry of group 225.0.0.1 for GigabitEthernet 1/0/1 on the public network.

```
<Sysname> reset igmp group interface gigabitethernet 1/0/1 225.0.0.1
```

Related commands

display igmp group

robust-count (IGMP view)

Use **robust-count** to set the IGMP querier's robustness variable globally.

Use **undo robust-count** to restore the default.

Syntax

robust-count *count*

undo robust-count

Default

The IGMP querier's robustness variable is 2.

Views

IGMP view

Predefined user roles

network-admin

context-admin

Parameters

count: Specifies an IGMP querier's robustness variable in the range of 1 to 255.

Usage guidelines

The IGMP querier's robustness variable defines the number of times to retransmit queries if packet loss occurs. A higher robustness variable makes the IGMP querier more robust, but it increases the timeout time for multicast groups.

You can set the IGMP querier's robustness variable globally for all interfaces in IGMP view or for an interface in interface view. For an interface, the interface-specific configuration takes priority over the global configuration.

Examples

Set the global IGMP querier's robustness variable to 5 on the public network.

```
<Sysname> system-view
[Sysname] igmp
[Sysname-igmp] robust-count 5
```

Related commands

igmp robust-count

ssm-mapping (IGMP view)

Use **ssm-mapping** to configure an IGMP SSM mapping.

Use **undo ssm-mapping** to delete IGMP SSM mappings.

Syntax

ssm-mapping *source-address ipv4-acl-number*

undo ssm-mapping { *source-address* | **all** }

Default

No IGMP SSM mappings exist.

Views

IGMP view

Predefined user roles

network-admin

context-admin

Parameters

source-address: Specifies a multicast source by its IP address.

ipv4-acl-number: Specifies a basic ACL number in the range of 2000 to 2999. Multicast groups in IGMP reports permitted by the ACL are associated with the multicast source. If the ACL does not exist or does not have valid rules, no multicast groups are associated with the multicast source.

all: Specifies all IGMP SSM mappings.

Usage guidelines

When you configure a rule in the IPv4 basic ACL, follow these restrictions and guidelines:

- If the **vpn-instance** *vpn-instance* option is specified, the rule does not take effect.

- The **source** *source-address source-wildcard* option specifies a multicast group address.
- Among the other optional parameters, only the **fragment** keyword and the **time-range** *time-range-name* option take effect.

Examples

Configure an IGMP SSM mapping with multicast source 125.1.1.1 and multicast group range 232.1.1.0/24 on the public network.

```
<Sysname> system-view
[Sysname] acl basic 2001
[Sysname-acl-ipv4-basic-2001] rule permit source 232.1.1.1 0.0.0.255
[Sysname-acl-ipv4-basic-2001] quit
[Sysname] igmp
[Sysname-igmp] ssm-mapping 125.1.1.1 2001
```

Related commands

PIM commands

anycast-rp (PIM view)

Use **anycast-rp** to add an anycast RP member to an Anycast RP set.

Use **undo anycast-rp** to remove an anycast RP member from an Anycast RP set.

Syntax

anycast-rp *anycast-rp-address member-address*

undo anycast-rp *anycast-rp-address member-address*

Default

No Anycast RP sets exist.

Views

PIM view

Predefined user roles

network-admin

context-admin

Parameters

anycast-rp-address: Specifies an Anycast RP address. It must be a legal unicast IP address that is not in the range of 127.0.0.0/8.

member-address: Specifies an Anycast RP member address. It must be a legal unicast IP address that is not in the range of 127.0.0.0/8 and must be different from the Anycast RP address.

Usage guidelines

To add multiple RP member addresses to an Anycast RP set, execute this command multiple times with the same Anycast RP address but different RP member addresses.

To configure multiple Anycast RP sets, execute this command multiple times with different Anycast RP addresses.

Examples

Add Anycast RP members 1.1.0.1 and 1.2.0.1 to Anycast RP set 1.1.0.0 on the public network.

```
<Sysname> system-view
[Sysname] pim
[Sysname-pim] anycast-rp 1.1.0.0 1.1.0.1
[Sysname-pim] anycast-rp 1.1.0.0 1.2.0.1
```

Related commands

display pim rp-info

auto-rp enable (PIM view)

Use **auto-rp enable** to enable Auto-RP listening.

Use **undo auto-rp enable** to disable Auto-RP listening.

Syntax

auto-rp enable

undo auto-rp enable

Default

Auto-RP listening is disabled.

Views

PIM view

Predefined user roles

network-admin

context-admin

Usage guidelines

After Auto-RP listening is enabled, the device can receive and forward Auto-RP announcement and discovery messages, but it cannot send these messages unsolicitedly.

Examples

Enable Auto-RP listening on the public network.

```
<Sysname> system-view
[Sysname] pim
[Sysname-pim] auto-rp enable
```

bidir-pim enable (PIM view)

Use **bidir-pim enable** to enable BIDIR-PIM.

Use **undo bidir-pim enable** to disable BIDIR-PIM.

Syntax

bidir-pim enable

undo bidir-pim enable

Default

BIDIR-PIM is disabled.

Views

PIM view

Predefined user roles

network-admin

context-admin

Usage guidelines

This command takes effect only when IP multicast routing is enabled on the public network or for a VPN instance to which the device belongs.

Examples

Enable IP multicast routing on the public network, and enable BIDIR-PIM.

```
<Sysname> system-view
[Sysname] multicast routing
[Sysname-mrib] quit
```

```
[Sysname] pim
[Sysname-pim] bidir-pim enable
```

Related commands

multicast routing

bidir-rp-limit (PIM view)

Use **bidir-rp-limit** to set the maximum number of BIDIR-PIM RPs.

Use **undo bidir-rp-limit** to restore the default.

Syntax

bidir-rp-limit *limit*

undo bidir-rp-limit

Default

The maximum number of BIDIR-PIM RPs is 128.

Views

PIM view

Predefined user roles

network-admin

context-admin

Parameters

limit: Specifies the maximum number of BIDIR-PIM RPs, in the range of 1 to 128.

Usage guidelines

In a BIDIR-PIM domain, one DF election per RP is implemented on all PIM interfaces. To avoid unnecessary DF elections, do not configure multiple BIDIR-PIM RPs.

This command sets a limit on the number of BIDIR-PIM RPs. If the number of RPs exceeds the limit, excess RPs can be used only for DF election rather than multicast data forwarding.

Examples

Set the maximum number of BIDIR-PIM RPs to 3 on the public network.

```
<Sysname> system-view
[Sysname] pim
[Sysname-pim] bidir-rp-limit 3
```

bsm-fragment enable (PIM view)

Use **bsm-fragment enable** to enable bootstrap message (BSM) semantic fragmentation.

Use **undo bsm-fragment enable** to disable BSM semantic fragmentation.

Syntax

bsm-fragment enable

undo bsm-fragment enable

Default

BSM semantic fragmentation is enabled.

Views

PIM view

Predefined user roles

network-admin

context-admin

Usage guidelines

Disable BSM semantic fragmentation if the PIM-SM or BIDIR-PIM domain contains a device that does not support BSM semantic fragmentation.

Examples

Disable BSM semantic fragmentation on the public network.

```
<Sysname> system-view
[Sysname] pim
[Sysname-pim] undo bsm-fragment enable
```

bsm-reflection enable (PIM view)

Use **bsm-reflection enable** to enable the device to forward BSMs out of their incoming interfaces.

Use **undo bsm-reflection enable** to disable the device from forwarding BSMs out of their incoming interfaces.

Syntax

bsm-reflection enable

undo bsm-reflection enable

Default

The device forwards BSMs out of their incoming interfaces.

Views

PIM view

Predefined user roles

network-admin

context-admin

Usage guidelines

Disable this feature if all the devices in the PIM-SM or BIDIR-PIM domain have consistent routing information.

Examples

Disable the device from forwarding BSMs out of their incoming interfaces on the public network.

```
<Sysname> system-view
[Sysname] pim
[Sysname-pim] undo bsm-reflection enable
```

bsr-policy (PIM view)

Use **bsr-policy** to configure a BSR policy.

Use **undo bsr-policy** to restore the default.

Syntax

bsr-policy *ipv4-acl-number*

undo bsr-policy

Default

No BSR policy exists, and all bootstrap messages are regarded as legal.

Views

PIM view

Predefined user roles

network-admin

context-admin

Parameters

ipv4-acl-number: Specifies an IPv4 basic ACL by its number in the range of 2000 to 2999.

Usage guidelines

A BSR policy filters bootstrap messages to guard against BSR spoofing.

When you configure a rule in the IPv4 basic ACL, follow these restrictions and guidelines:

- If the **vpn-instance** *vpn-instance* option is specified, the rule does not take effect.
- The **source** *source-address source-wildcard* option specifies a BSR address.
- Among the other optional parameters, only the **fragment** keyword and the **time-range** *time-range-name* option take effect.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Configure a BSR policy on the public network so that only the devices on subnet 10.1.1.0/24 can act as the BSR.

```
<Sysname> system-view
[Sysname] acl basic 2000
[Sysname-acl-ipv4-basic-2000] rule permit source 10.1.1.0 0.0.0.255
[Sysname-acl-ipv4-basic-2000] quit
[Sysname] pim
[Sysname-pim] bsr-policy 2000
```

Related commands

c-bsr (PIM view)

c-bsr (PIM view)

Use **c-bsr** to configure a candidate-BSR (C-BSR).

Use **undo c-bsr** to remove the configuration of a C-BSR.

Syntax

c-bsr *ip-address* [**scope** *group-address* { *mask-length* | *mask* }] [**hash-length** *hash-length* | **priority** *priority*] *

undo c-bsr *ip-address* [**scope** *group-address* { *mask-length* | *mask* }]

Default

No C-BSRs exist.

Views

PIM view

Predefined user roles

network-admin

context-admin

Parameters

ip-address: Specifies the IP address of a C-BSR. You must specify the IP address of a local PIM interface.

scope *group-address*: Specifies a multicast group by its IP address in the range of 239.0.0.0 to 239.255.255.255. If you do not specify a multicast group, this command designates the C-BSR to the global-scoped zone.

mask-length: Specifies an address mask length in the range of 8 to 32.

mask: Specifies an address mask.

hash-length *hash-length*: Specifies a hash mask length in the range of 0 to 32. The default setting is 30.

priority *priority*: Specifies a C-BSR priority in the range of 0 to 255. The default setting is 64. The greater the value, the higher the priority.

Usage guidelines

If you execute this command for a zone multiple times, the most recent configuration takes effect.

You can configure the same C-BSR for different zones.

Examples

Configure the interface with IP address 1.1.1.1 as a C-BSR for the global-scoped zone on the public network.

```
<Sysname> system-view
[Sysname] pim
[Sysname-pim] c-bsr 1.1.1.1
```

c-rp (PIM view)

Use **c-rp** to configure a candidate-RP (C-RP).

Use **undo c-rp** to remove the configuration of a C-RP.

Syntax

c-rp *ip-address* [**advertisement-interval** *adv-interval* | **group-policy** *ipv4-acl-number* | **holdtime** *hold-time* | **priority** *priority*] * [**bidir**]

undo c-rp *ip-address*

Default

No C-RPs exist.

Views

PIM view

Predefined user roles

network-admin

context-admin

Parameters

ip-address: Specifies the IP address of a C-RP. You must specify the IP address of a local PIM interface.

advertisement-interval *adv-interval*: Specifies a C-RP advertisement interval in the range of 1 to 65535 seconds. The default value is 60 seconds.

group-policy *ipv4-acl-number*: Specifies an IPv4 basic ACL by its number in the range of 2000 to 2999. If you specify an ACL, this command designates the C-RP to IPv4 multicast groups in C-RP advertisement messages that the ACL permits. The C-RP is designated to all IPv4 multicast groups when one of the following conditions exists:

- You do not specify an ACL.
- The specified ACL does not exist.
- The specified ACL does not have valid rules.

holdtime *hold-time*: Specifies a C-RP lifetime in the range of 1 to 65535 seconds. The default value is 150 seconds.

priority *priority*: Specifies a C-RP priority in the range of 0 to 255. The default setting is 192. The greater the value, the lower the priority.

bidir: Specifies BIDIR-PIM to which the C-RP is designated. If you do not specify this keyword, the C-RP provides services for PIM-SM.

Usage guidelines

To designate a C-RP to multiple multicast group ranges, create multiple rules that specify different multicast group ranges in the ACL.

When you configure a rule in the IPv4 basic ACL, follow these restrictions and guidelines:

- If the **vpn-instance** *vpn-instance* option is specified, the rule does not take effect.
- The **source** *source-address source-wildcard* option specifies a multicast group range.
- Among the other optional parameters, only the **fragment** keyword and the **time-range** *time-range-name* option take effect.

If you execute this command by using the same C-RP address multiple times, the most recent configuration takes effect.

Examples

Configure the interface with IP address 1.1.1.1 as a C-RP for multicast group ranges 225.1.0.0/16 and 226.2.0.0/16 and set its priority to 10 on the public network.

```
<Sysname> system-view
[Sysname] acl basic 2000
[Sysname-acl-ipv4-basic-2000] rule permit source 225.1.0.0 0.0.255.255
[Sysname-acl-ipv4-basic-2000] rule permit source 226.2.0.0 0.0.255.255
[Sysname-acl-ipv4-basic-2000] quit
[Sysname] pim
[Sysname-pim] c-rp 1.1.1.1 group-policy 2000 priority 10
```

crp-policy (PIM view)

Use **crp-policy** to configure a C-RP policy.

Use **undo crp-policy** to restore the default.

Syntax

crp-policy *ipv4-acl-number*

undo crp-policy

Default

No C-RP policy exists, and all C-RP messages are regarded as legal.

Views

PIM view

Predefined user roles

network-admin

context-admin

Parameters

ipv4-acl-number: Specifies an IPv4 advanced ACL number in the range of 3000 to 3999.

Usage guidelines

A C-RP policy filters C-RP advertisement messages to guard against C-RP spoofing.

The device uses only the prefixes of the multicast group ranges in advertisement messages to match the destination field in ACL rules. For example, the multicast group range in an advertisement message is 224.1.0.0/16. If the prefix 224.1.0.0 is in the range specified by the destination field of an ACL rule, the specified C-RPs are designated to this multicast group range.

When you configure a rule in the IPv4 advanced ACL, follow these restrictions and guidelines:

- If the **vpn-instance** *vpn-instance* option is specified, the rule does not take effect.
- The **source** *source-address source-wildcard* option specifies an RP address.
- The **destination** *dest-address dest-wildcard* option specifies a multicast group address.
- Among the other optional parameters, only the **fragment** keyword and the **time-range** *time-range-name* option take effect.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Configure a C-RP policy on the public network so that only devices in the range of 1.1.1.1/24 can be C-RPs for the groups in the range of 225.1.1.0/24.

```
<Sysname> system-view
[Sysname] acl advanced 3000
[Sysname-acl-ipv4-adv-3000] rule permit ip source 1.1.1.1 0.0.0.255 destination 225.1.1.0
0.0.0.255
[Sysname-acl-ipv4-adv-3000] quit
[Sysname] pim
[Sysname-pim] crp-policy 3000
```

c-rp (PIM view)

display interface register-tunnel

Use **display interface register-tunnel** to display register-tunnel interface information.

Syntax

display interface [**register-tunnel** [*interface-number*]] [**brief** [**description** | **down**]]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

register-tunnel [*interface-number*]: Specifies a register-tunnel interface by its number. The device has only one register-tunnel interface, Register-Tunnel 0. If you specify the **register-tunnel** keyword, this command displays information about Register-Tunnel 0 regardless of whether you specify an interface number. If you do not specify the **register-tunnel** keyword, this command displays information about all interfaces.

brief: Displays brief information. If you do not specify this keyword, the command displays detailed information.

description: Displays the full interface description. If you do not specify this keyword, the command displays only the first 27 characters of the interface description.

down: Displays information about the interfaces in down state and the reasons why the interfaces are down. If you do not specify this keyword, the command displays information about interfaces in all states.

Usage guidelines

The register-tunnel interface is a virtual interface that is automatically created by the system. You cannot configure it or delete it, but you can display the interface information by using this command.

In the initial stage of multicast source registration, the register-tunnel interface is used to establish a channel between the source-side DR and the RP to transmit multicast register messages. The process of initial source registration is as follows:

1. After receiving the first multicast data from the source, the source-side DR encapsulates the multicast data into a register message. Then, it forwards the message to the RP through the register-tunnel interface.
2. The register message reaches RP on the register-tunnel interface on the RP. The RP decapsulates the register message and forwards the multicast data to the receiver hosts. At the same time, the RP learns the IP address of the multicast source.
3. The RP sends a join message toward the multicast source to build an SPT.
4. After the SPT is built, the multicast data travels to the RP along the SPT rather than through the register-tunnel interface.

Examples

Display detailed information about Register-Tunnel 0.

```
<Sysname> display interface register-tunnel 0
Register-Tunnel0
```

```
Current state: UP
Line protocol state: DOWN
Description: Register-Tunnel0 Interface
Maximum transmission unit: 1536
Internet protocol processing: Disabled
Physical: Unknown
Last 300 seconds input rate: 0 bytes/sec, 0 bits/sec, 0 packets/sec
Last 300 seconds output rate: 0 bytes/sec, 0 bits/sec, 0 packets/sec
Input: 0 packets, 0 bytes, 0 drops
Output: 0 packets, 0 bytes, 0 drops
```

Display brief information about Register-Tunnel 0.

```
<Sysname> display interface register-tunnel 0 brief
Brief information on interfaces in route mode:
Link: ADM - administratively down; Stby - standby
Protocol: (s) - spoofing
Interface            Link Protocol Primary IP         Description
REG0                 UP   --       --
```

Table 1 Command output

Field	Description
Current state	Physical link state of the interface. This field always displays **UP**.
Line protocol state	Data link layer state of interface. This field always displays **DOWN**.
Description	Description of the interface. It is not configurable.
Maximum transmission unit	MTU of the register-tunnel interface. It is not configurable.
Internet protocol processing: Disabled	The interface is not assigned an IP address and cannot process IP packets.
Physical	Physical type of the interface. This field always displays **Unknown**, because the physical type of the interface is unknown.
Last 300 seconds input rate	Average incoming rate in the last 300 seconds. This field always displays **0**.
Last 300 seconds output rate	Average outgoing rate in the last 300 seconds. This field always displays **0**.
Input	Number of incoming packets, incoming bytes, and discarded packets. This field always displays **0**.
Output	Number of outgoing packets, outgoing bytes, and discarded packets. This field always displays **0**.
Brief information on interfaces in route mode	Brief information about Layer 3 interfaces.
Link	Physical link state of the interface. This field always displays **UP**.
Protocol	Data link layer protocol state of the interface. This field always displays two hyphens (--) because the interface does not support a data link layer protocol.
Primary IP	Primary IP address of the interface. This field always displays two hyphens (**--**) because the interface does not have a primary IP address.
Cause	Cause for the physical link state of an interface to be **DOWN**. This field always displays **Not connected** because no physical connection exists.
Description	Description of the interface. This field is empty because the interface

Field	Description
	cannot be configured with a description.

context-operator

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command displays information about all routes that PIM uses on the public network.

source-address: Specifies a multicast source by its IP address. If you do not specify a multicast source, this command displays information about all routes that PIM uses.

Examples

Display information about all routes that PIM uses on the public network.

```
<Sysname> display pim claimed-route
 RPF-route selecting rule: longest-match

 Route/mask: 7.11.0.0/16 (unicast (direct))
     RPF interface: GigabitEthernet1/0/1, RPF neighbor: 8.0.0.2
     Total number of (S,G) or (*,G) dependent on this route entry: 4
     (7.11.0.10, 225.1.1.1)
     (7.11.0.10, 226.1.1.1)
     (7.11.0.10, 227.1.1.1)
     (*, 228.1.1.1)
 Route/mask: 7.12.0.0/16 (multicast static)
     RPF interface: GigabitEthernet1/0/2, RPF neighbor: 8.0.0.3,
     Config NextHop: 8.0.0.5
     Total number of (S,G) or (*,G) dependent on this route entry: 2
     (7.12.0.10, 226.1.1.1)
     (7.12.0.10, 225.1.1.1)
```

Table 3 Command output

Field	Description
Route/mask	Route entry. Route types in parentheses include: • **igp**—IGP unicast route. • **egp**—EGP unicast route. • **unicast (direct)**—Direct unicast route. • **unicast**—Other unicast route, such as static unicast route. • **mbgp**—MBGP route. • **multicast static**—Static multicast route.
RPF interface	Name of the RPF interface.
RPF neighbor	IP address of the RPF neighbor.
Config NextHop	Address of the configured next hop. This field is displayed only when the static multicast route is configured with a next hop.
Total number of (S,G) or (*,G) dependent on this route entry	Total number of (S, G) or (*, G) entries associated with the RPF route and the entry list.

display pim c-rp

Use **display pim c-rp** to display C-RP information.

Syntax

display pim [**vpn-instance** *vpn-instance-name*] **c-rp** [**local**]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command displays information about learned C-RPs on the public network.

local: Specifies local C-RPs. If you do not specify this keyword, the command displays information about all C-RPs.

Usage guidelines

You can view information about learned C-RPs only on the BSR. On other devices, you can view information about the locally configured C-RPs.

Examples

Display information about learned C-RPs on the public network.

```
<Sysname> display pim c-rp
 Scope: non-scoped
     Group/MaskLen: 224.0.0.0/4
       C-RP address             Priority  HoldTime  Uptime    Expires
       1.1.1.1 (local)          192       150       03:01:36  00:02:29
       2.2.2.2                  192       150       1d:13h    00:02:02
     Group/MaskLen: 226.1.1.0/24 [B] Expires: 00:00:33
     Group/MaskLen: 225.1.0.0/16 [B]
       C-RP Address             Priority  HoldTime  Uptime    Expires
       3.3.3.3                  192       150       12w:5d    00:02:05
```

Display information about the locally configured C-RPs.

```
<Sysname> display pim c-rp local
 Candidate RP: 12.12.12.9(Loop1)
     Priority: 192
     HoldTime: 150
     Advertisement interval: 60
     Next advertisement scheduled at: 00:00:48
```

Table 4 Command output

Field	Description
Group/MaskLen	Multicast group to which the C-RP is designated.
[B]	BIDIR-PIM C-RP. This field is not displayed if the C-RP is a PIM-SM C-RP.
C-RP address	IP address of the C-RP. If the C-RP resides on the device where the

Field	Description
	command is executed, this field displays **(local)** after the address.
Priority	Priority of the C-RP.
HoldTime	Lifetime of the C-RP.
Uptime	Length of time the C-RP has been up: • **w**—Weeks. • **d**—Days. • **h**—Hours.
Expires	Remaining lifetime for the C-RP and the multicast group.
Candidate RP	IP address of the locally configured C-RP.
Advertisement interval	Interval between two advertisement messages sent by the locally configured C-RP.
Next advertisement scheduled at	Remaining time for the locally configured C-RP to send the next advertisement message.

display pim df-info

Use **display pim df-info** to display BIDIR-PIM DF information.

Syntax

display pim [**vpn-instance** *vpn-instance-name*] **df-info** [*rp-address*]

Views

Any view

context-operator

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command displays BIDIR-PIM DF information on the public network.

rp-address: Specifies a BIDIR-PIM RP by its IP address.

Examples

Display BIDIR-PIM DF information on the public network.

```
<Sysname> display pim df-info
RP address: 12.12.12.12
  Interface: GigabitEthernet1/0/4
    State     : Win        DF preference: 10
    DF metric : 1562       DF uptime    : 00:06:59
    DF address: 30.1.1.11 (local)
  Interface: Tunnel2, 100.1.1.12
    State     : Lose       DF preference: 0
```

```
DF metric : 0          DF uptime    : 00:06:59
DF address: 100.1.1.12
```

Table 5 Command output

Field	Description
RP address	IP address of the BIDIR-PIM RP.
Interface	DF interface. If the interface is an NBMA mode-enabled ADVPN tunnel interface, this field also displays the IP address of the remote end.
State	DF election state: • **Win**—The interface wins the DF election. • **Lose**—The interface loses the DF election. • **Offer**—The interface is in the initial state of the DF election. • **Backoff**—The interface is acting as the DF, but there are more appropriate devices running for the DF. This field displays a hyphen (-) if the interface does not participate in the DF election.
DF preference	Advertised route preference for DF election.
DF metric	Advertised route metric for DF election.
DF uptime	Length of time the DF has been up.
DF address	IP address of DF. If the DF resides on the device where the command is executed, this field displays **(local)** after the IP address.

display pim interface

Use **display pim interface** to display PIM information for interfaces.

Syntax

display pim [**vpn-instance** *vpn-instance-name*] **interface** [*interface-type interface-number*] [**verbose**]

context-operator

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command displays PIM information for interfaces on the public network.

interface-type interface-number: Specifies an interface by its type and number. If you do not specify an interface, this command displays PIM information for all interfaces.

verbose: Displays detailed PIM information. If you do not specify this keyword, the command displays brief PIM information.

Examples

Display brief PIM information for all interfaces on the public network.

```
<Sysname> display pim interface
 Interface         NbrCnt  HelloInt  DR-Pri     DR-Address
 GE1/0/1           1       30        1          10.1.1.2
 GE1/0/2           0       30        1          172.168.0.2    (local)
 GE1/0/3           1       30        1          20.1.1.2
```

Table 6 Command output

Field	Description
NbrCnt	Number of PIM neighbors.
HelloInt	Interval for sending hello messages.
DR-Pri	Priority for DR election.
DR-Address	IP address of the DR. If the DR resides on the device where the command is executed, this field displays **(local)** after the address.

Display detailed PIM information for GigabitEthernet 1/0/1 on the public network.

```
<Sysname> display pim interface gigabitethernet 1/0/1 verbose
 Interface: GigabitEthernet1/0/1, 10.1.1.1
     PIM version: 2
     PIM mode: Sparse
     PIM DR: 10.1.1.2
     PIM DR Priority (configured): 1
     PIM neighbors count: 1
     PIM hello interval: 30 s
     PIM LAN delay (negotiated): 500 ms
     PIM LAN delay (configured): 500 ms
     PIM override interval (negotiated): 2500 ms
     PIM override interval (configured): 2500 ms
     PIM neighbor tracking (negotiated): disabled
     PIM neighbor tracking (configured): disabled
     PIM generation ID: 0xF5712241
     PIM require generation ID: disabled
     PIM hello hold interval: 105 s
     PIM assert hold interval: 180 s
     PIM triggered hello delay: 5 s
     PIM J/P interval: 60 s
     PIM J/P hold interval: 210 s
     PIM state-refresh capable (negotiated): enabled
     PIM state-refresh capable (configured): enabled
     PIM state-refresh interval: 60 s
     PIM state-refresh rate limit: 30 s
     PIM state-refresh TTL: 255
     PIM graft retry interval: 3 s
     PIM BSR domain border: disabled
```

```
PIM BFD: disabled
PIM passive: disabled
PIM prune-pending: disabled
Number of routers on network not using DR priority: 0
Number of routers on network not using LAN delay: 0
Number of routers on network not using neighbor tracking: 2
```

Table 7 Command output

Field	Description
PIM version	Version of the PIM protocol.
PIM mode	PIM mode: dense or sparse.
PIM DR	IP address of the DR.
PIM DR Priority (configured)	Configured priority for DR election.
PIM neighbors count	Total number of PIM neighbors.
PIM hello interval	Interval between two hello messages.
PIM LAN delay (negotiated)	Negotiated PIM message propagation delay.
PIM LAN delay (configured)	Configured PIM message propagation delay.
PIM override interval (negotiated)	Negotiated interval for overriding prune messages.
PIM override interval (configured)	Configured interval for overriding prune messages.
PIM neighbor tracking (negotiated)	Negotiated neighbor tracking status: enabled or disabled.
PIM neighbor tracking (configured)	Configured neighbor tracking status: enabled or disabled.
PIM require generation ID	Whether the feature of discarding hello messages without Generation_ID is enabled.
PIM hello hold interval	PIM neighbor lifetime.
PIM assert hold interval	Assert holdtime timer.
PIM triggered hello delay	Maximum delay for sending hello messages.
PIM J/P interval	Interval between two join or prune messages.
PIM J/P hold interval	Joined/pruned state holdtime timer.
PIM state-refresh capable (negotiated)	Negotiated state refresh status.
PIM state-refresh capable (configured)	Configured state refresh status.
PIM state-refresh rate limit	Waiting time for accepting a new state refresh message.
PIM state-refresh TTL	TTL value in state refresh messages.
PIM BSR domain border	Whether a PIM domain border is configured.
PIM BFD	Whether PIM is enabled to work with BFD.
PIM passive	Whether PIM passive mode is enabled on the interface.
PIM prune-pending	Whether PIM prune delay is enabled on the interface.
Number of routers on network not using DR priority	Number of routers that do not use the DR priority field on the subnet where the interface resides.
Number of routers on network not using LAN delay	Number of routers that do not use the LAN delay field on the subnet where the interface resides.
Number of routers on network not using	Number of routers that are not enabled with neighbor tracking

Field	Description
neighbor tracking	on the subnet where the interface resides.

display pim nbma-link

Use **display pim nbma-link** to display remote end information maintained by PIM for ADVPN tunnel interfaces.

Syntax

display pim [**vpn-instance** *vpn-instance-name*] **nbma-link** [**interface** { *interface-type interface-number* }]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command displays remote end information maintained by PIM for ADVPN tunnel interfaces on the public network.

interface *interface-type interface-number*: Specifies an interface by its type and number. If you do not specify an interface, this command displays remote end information maintained by PIM for all ADVPN tunnel interfaces.

Examples

Display remote end information maintained by PIM for ADVPN tunnel interfaces on the public network.

```
<Sysname> display pim nbma-link
Interface: Tunnel1
Number of links: 1
    Remote address: 10.0.0.1
      Private index    : 0XCC000000
      Private interface: Multicast-NBMA0
Interface: Tunnel2
Number of links: 1
    Remote address: 20.0.0.2
      Private index    : 0XCC000001
      Private interface: Multicast-NBMA1
```

Display remote end information maintained by PIM for ADVPN interface **tunnel1** on the public network.

```
<Sysname> display pim nbma-link interface tunnel 1
Interface: Tunnel1
Number of links: 1
    Remote address: 10.0.0.1
```

```
Private index    : 0XCC000000
Private interface: Multicast-NBMA0
```

Table 8 Command output

Field	Description
Interface	Local ADVPN tunnel interface.
Number of links	Number of remote ends.
Remote address	IP address of the remote end.
Private index	Index of the remote end.
Private interface	Interface name of the remote end.

display pim neighbor

Use **display pim neighbor** to display PIM neighbor information.

Syntax

display pim [**vpn-instance** *vpn-instance-name*] **neighbor** [*neighbor-address* | **interface** *interface-type interface-number* | **verbose**] *

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command displays PIM neighbor information on the public network.

neighbor-address: Specifies a PIM neighbor by its IP address. If you do not specify a PIM neighbor, this command displays information about all PIM neighbors.

interface *interface-type interface-number*: Specifies an interface by its type and number. If you do not specify an interface, this command displays PIM neighbor information on all interfaces.

verbose: Displays detailed PIM neighbor information. If you do not specify this keyword, the command displays brief PIM neighbor information.

Examples

Display brief information about all PIM neighbors on the public network.

```
<Sysname> display pim neighbor
 Total Number of Neighbors = 2

 Neighbor        Interface           Uptime   Expires  DR-Priority Mode
 10.1.1.2        GE1/0/1             02:50:49 00:01:31 1           B
 20.1.1.2        GE1/0/2             02:49:39 00:01:42 1           P
```

Display detailed information about the PIM neighbor with IP address 11.110.0.20 on the public network.

```
<Sysname> display pim neighbor 11.110.0.20 verbose
 Neighbor: 11.110.0.20
     Interface: GigabitEthernet1/0/3
     Uptime: 00:00:10
     Expiry time: 00:00:30
     DR Priority: 1
     Generation ID: 0x2ACEFE15
     Holdtime: 105 s
     LAN delay: 500 ms
     Override interval: 2500 ms
     State refresh interval: 60 s
     Neighbor tracking: Disabled
     Bidirectional PIM: Disabled
```

Table 9 Command output

Field	Description
Total Number of Neighbors	Total number of PIM neighbors.
Neighbor	IP address of the PIM neighbor.
Interface	Interface that connects to the PIM neighbor.
Uptime	Length of time the PIM neighbor has been up.
Expires/Expiry time	Remaining lifetime for the PIM neighbor. If the PIM neighbor is always up and reachable, this field displays **never**.
DR-Priority/DR Priority	Priority of the PIM neighbor.
Mode	PIM mode: • **B**—The PIM mode is BIDIR-PIM. • **P**—The RPF proxy vector is enabled. This field is empty if the PIM mode is not BIDIR-PIM and the RPF vector is disabled.
Generation ID	Generation ID of the PIM neighbor. (A random value represents a status change of the PIM neighbor.)
Holdtime	Lifetime of the PIM neighbor. If the PIM neighbor is always up and reachable, this field displays **forever**.
LAN delay	PIM message propagation delay on a shared-media LAN.
Override interval	Interval for overriding prune messages.
State refresh interval	Interval for refreshing state. This field is displayed only when the PIM neighbor operates in the PIM-DM mode and the state refresh capability is enabled.
Neighbor tracking	Neighbor tracking status: enabled or disabled.
Bidirectional PIM	Whether BIDIR-PIM is enabled.

display pim routing-table

Use **display pim routing-table** to display PIM routing entries.

Syntax

display pim [**vpn-instance** *vpn-instance-name*] **routing-table** [*group-address* [**mask** { *mask-length* | *mask* }] | *source-address* [**mask** { *mask-length* | *mask* }] | **flags** *flag-value* | **fsm** | **incoming-interface** *interface-type interface-number* | **mode** *mode-type* | **outgoing-interface** { **exclude** | **include** | **match** } *interface-type interface-number* | **extranet** { **source-vpn-instance** *source-vpn-instance-name* | **source-public-instance** | **receive-vpn-instance** *receive-vpn-instance-name* | **receive-public-instance** }] *

Views

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command displays PIM routing entries on the public network.

group-address: Specifies a multicast group by its IP address in the range of 224.0.0.0 to 239.255.255.255. If you do not specify a multicast group, this command displays PIM routing entries for all multicast groups.

source-address: Specifies a multicast source by its IP address.

mask-length: Specifies an address mask length in the range of 0 to 32. The default value is 32.

mask: Specifies an address mask. The default value is 255.255.255.255.

flags *flag-value*: Specifies a flag. If you do not specify a flag, this command displays PIM routing entries that contain all flags. The following lists the values for the *flag-value* argument and their meanings:

- **act**: Specifies PIM routing entries that have been used for routing data.
- **del**: Specifies PIM routing entries to be deleted.
- **exprune**: Specifies PIM routing entries containing outgoing interfaces pruned by other multicast routing protocols.
- **ext**: Specifies PIM routing entries containing outgoing interfaces provided by other multicast routing protocols.
- **loc**: Specifies PIM routing entries on the devices that reside on the same subnet as the multicast source.
- **niif**: Specifies PIM routing entries containing unknown incoming interfaces.
- **nonbr**: Specifies PIM routing entries with PIM neighbor lookup failure.
- **rpt**: Specifies PIM routing entries on the RPT branches where (S, G) prunes have been sent to the RP.
- **rq**: Specifies PIM routing entries of the receiving side of the data-MDT switchover.
- **spt**: Specifies PIM routing entries on the SPT.
- **sq**: Specifies PIM routing entries of the originator side of data-MDT switchover.

- **swt**: Specifies PIM routing entries in the process of RPT-to-SPT switchover.
- **wc**: Specifies PIM routing entries with wildcards.

fsm: Displays detailed information about the finite state machine.

incoming-interface *interface-type interface-number*: Specifies an incoming interface. If you do not specify an incoming interface, this command displays PIM routing entries that contain all incoming interfaces.

mode *mode-type*: Specifies a PIM mode. If you do not specify a PIM mode, this command displays PIM routing entries in all PIM modes. The available PIM modes include:

- **bidir**: Specifies BIDIR-PIM.
- **dm**: Specifies PIM-DM.
- **sm**: Specifies PIM-SM.
- **ssm**: Specifies PIM-SSM.

outgoing-interface { **exclude** | **include** | **match** } *interface-type interface-number*: Specifies an outgoing interface. If you do not specify an outgoing interface, this command displays PIM routing entries that contain all outgoing interfaces. Whether an outgoing interface is contained in the PIM routing table depends on the following conditions:

- If you specify an excluded interface, this command displays PIM routing entries that do not contain the specified outgoing interface.
- If you specify an included interface, this command displays PIM routing entries that contain the specified outgoing interface.
- If you specify a matching interface, this command displays PIM routing entries that contain only the specified outgoing interface.

extranet: Displays information about the PIM routing entries for MVPN extranet.

- **source-vpn-instance** *source-vpn-instance-name*: Specifies the MPLS L3VPN instance to which the multicast source belongs. The *source-vpn-instance-name* argument is a case-sensitive string of 1 to 31 characters.
- **source-public-instance**: Specifies the public network where the multicast source resides.
- **receive-vpn-instance** *receive-vpn-instance-name*: Specifies the MPLS L3VPN instance to which the multicast receiver belongs. The *receive-vpn-instance-name* argument is a case-sensitive string of 1 to 31 characters.
- **receive-public-instance**: Specifies the public network where the multicast receiver resides.

Examples

Display PIM routing entries on an ADVPN network.

```
<Sysname> display pim routing-table
 Total 0 (*, G) entries; 1 (S, G) entries

 (172.168.0.12, 227.0.0.1)
     RP: 2.2.2.2
     Protocol: pim-sm, Flag: SPT LOC ACT
     UpTime: 02:54:43
     Upstream interface: Tunnel2, 13.1.1.1
         Upstream neighbor: 12.1.1.1
         RPF prime neighbor: 12.1.1.1
     Downstream interface information:
```

```
     Total number of downstream interfaces: 1
         1: Tunnel2, 13.1.1.2
             Protocol: pim-sm, UpTime: 02:54:43, Expires: 00:02:47
```

Display PIM routing entries on the public network.

```
<Sysname> display pim routing-table
 Total 0 (*, G) entries; 1 (S, G) entries

 (172.168.0.12, 227.0.0.1)
     RP: 2.2.2.2
     Protocol: pim-sm, Flag: SPT LOC ACT
     UpTime: 02:54:43
     Upstream interface: GigabitEthernet1/0/1
         Upstream neighbor: NULL
         RPF prime neighbor: NULL
     Downstream interface information:
     Total number of downstream interfaces: 1
         1: GigabitEthernet1/0/2
             Protocol: pim-sm, UpTime: 02:54:43, Expires: 00:02:47
```

Display PIM routing entries for MVPN extranet.

```
<Sysname> display pim vpn-instance vpn1 routing-table extranet receive-vpn-instance vpn2
 Total 1 (*, G) entries; 1 (S, G) entries
 (*, 225.0.0.2)
     RP: 1.2.2.2
     Protocol: pim-sm, Flag: WC
     UpTime: 07:06:11
     Upstream interface: Register-Tunnel0
         Upstream neighbor: NULL
         RPF prime neighbor: NULL
     Downstream interface information:

         2: Extranet (VPN: vpn2)
             Protocol: MD, UpTime: 01:29:07, Expires: -
```

Table 10 Command output

Field	Description
Total 0 (*, G) entries; 1 (S, G) entries	Total number of (*, G) entries, and the total number of (S, G) entries.
(172.168.0.12, 227.0.0.1)	(S, G) entry.
Protocol	PIM mode.
Flag	Flag of the (S, G) entry or (*, G) entry: • **ACT**—The entry has been used for routing data. • **DEL**—The entry is to be removed. • **EXPRUNE**—Some outgoing interfaces are pruned by other multicast routing protocols. • **EXT**—The entry contains outgoing interfaces provided by other multicast routing protocols. • **LOC**—The entry is on a router directly connected to the same subnet with the multicast source. • **NIIF**—The entry contains unknown incoming interfaces. • **NONBR**—The entry has a PIM neighbor lookup failure. • **RPT**—The entry is on an RPT branch where (S, G) prunes have been sent to the RP. • **SPT**—The entry is on the SPT. • **SQ**—The entry triggers the default-MDT to data-MDT switchover. • **SWT**—The entry is in the process of RPT-to-SPT switchover. • **WC**—The entry contains a wildcard.
Uptime	Length of time for which the (S, G) entry or (*, G) entry has been up.
Upstream interface	Upstream (incoming) interface of the (S, G) entry or (*, G) entry. If the upstream interface is an NBMA mode-enabled ADVPN tunnel interface, this field also displays the IP address of the remote end.
Upstream neighbor	Upstream neighbor of the (S, G) entry or (*, G) entry.
RPF prime neighbor	RPF neighbor of the (S, G) or (*, G) entry: • For a (*, G) entry, if the RPF neighbor is the RP, the field displays **NULL**. • For an (S, G) entry, if the RPF neighbor is a router that directly connects to the multicast source, this field displays **NULL**.
Downstream interface information	Information about the downstream interfaces: • Total number of downstream interfaces. • Names of the downstream interfaces. • Protocol type on the downstream interfaces. • Uptime of the downstream interfaces. • Expiration time of the downstream interfaces. • IP addresses of the remote ends associated with the downstream ADVPN tunnel interfaces.
Extranet	PIM routing entry for MVPN extranet. • In the upstream interface list, the source VPN is displayed after **Extranet**. • In the downstream interface list, the receiver VPN is displayed after **Extranet**.

display pim rp-info

Use **display pim rp-info** to display PIM RP information.

Syntax

display pim [**vpn-instance** *vpn-instance-name*] **rp-info** [*group-address*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command displays RP information on the public network.

group-address: Specifies a multicast group by its IP address in the range of 224.0.1.0 to 239.255.255.255. If you do not specify a multicast group, this command displays RP information for all multicast groups.

Examples

Display RP information for multicast group 224.0.1.1 on the public network.

```
<Sysname> display pim rp-info 224.0.1.1
 BSR RP address is: 2.2.2.2
     Priority: 192
     HoldTime: 180
     Uptime: 03:01:10
     Expires: 00:02:30

 Static RP address is: 3.3.3.5
     Preferred: Yes
     Configured ACL: 2003

 RP mapping for this group is: 3.3.3.5

 Anycast-RP 3.3.3.5 members:
     Member address           State
     1.1.0.1                  Active
     1.2.0.2                  Local
     1.2.0.1                  Remote
```

Display RP information for all multicast groups on the public network.

```
<Sysname> display pim rp-info
 BSR RP information:
   Scope: non-scoped
     Group/MaskLen: 224.0.0.0/4
       RP address               Priority  HoldTime  Uptime    Expires
```

```
    1.1.1.1 (local)          192       180       03:01:36  00:02:29
    2.2.2.2                  192       180       1d:13h    00:02:02
  Group/MaskLen: 225.1.0.0/16 [B]
    RP address               Priority  HoldTime  Uptime    Expires
    3.3.3.3                  192       180       12w:5d    00:02:05

Static RP information:
    RP address               ACL   Mode    Preferred
    3.3.3.1                  2000  pim-sm  No
    3.3.3.2                  2001  pim-sm  Yes
    3.3.3.3                  2002  pim-sm  No
    3.3.3.4                        pim-sm  No
    3.3.3.5                  2002  pim-sm  Yes

Anycast-RP information:
    RP address               Member address          State
    3.3.3.5                  1.1.0.1                 Active
    3.3.3.5                  1.1.0.2                 Local
    3.3.3.5                  1.2.0.1                 Remote
```

Table 11 Command output

Field	Description
BSR RP address is	IP address of the RP.
BSR RP information	Information about the RP.
Group/MaskLen	Multicast group to which the RP is designated.
[B]	The RP is a BIDIR-PIM RP. This field is not displayed if the RP is a PIM-SM RP.
RP address	IP address of the RP. If the RP resides on the device where the command is executed, this field displays **(local)** after the address.
Priority	Priority of the RP.
HoldTime	RP lifetime.
Uptime	Length of time the RP has been up.
Expires	Remaining lifetime for the RP.
Preferred	Whether the static RP is preferred.
Configured ACL/ACL	ACL defining the multicast groups to which the static RP is designated.
Mode	RP service mode: PIM-SM or BIDIR-PIM.
RP mapping for this group	IP address of the RP that provides services for the multicast group.
Anycast-RP 3.3.3.5 members	Members of Anycast RP 3.3.3.5.
Member address	IP address of the Anycast RP member.
State	State of the interface from which the member address originates: • **Active**—Activated local interface. • **Local**—Inactivated local interface. • **Remote**—Remote interface.

display pim statistics

Use **display pim statistics** to display statistics for PIM packets.

Syntax

display pim statistics

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Examples

Display statistics for PIM packets.

```
<Sysname> display pim statistics
 Received PIM packets: 3295
 Sent PIM packets    : 5975
                Valid       Invalid        Succeeded   Failed
    Hello     : 3128        0              4333        0
    Reg       : 14          0              0           0
    Reg-stop  : 0           0              0           0
    JP        : 151         0              561         0
    BSM       : 0           0              1081        0
    Assert    : 0           0              0           0
    Graft     : 0           0              0           0
    Graft-ACK: 0            0              0           0
    C-RP      : 0           0              0           0

    AutoRP    : 0           0              0           0
```

Table 12 Command output

Field	Description
Received PIM packets	Total number of received PIM protocol packets.
Sent PIM packets	Total number of sent PIM protocol packets.
Valid	Number of received legal PIM protocol packets.
Invalid	Number of received illegal PIM protocol packets.
Succeeded	Number of PIM protocol packets that were sent successfully.
Failed	Number of PIM protocol packets that failed to be sent.
Hello	Hello message statistics.
Reg	Register message statistics.
Reg-stop	Register-stop message statistics.

Field	Description
JP	Join or prune message statistics.
BSM	Bootstrap message statistics.
Assert	Assert message statistics.
Graft	Graft message statistics.
Graft-ACK	Graft-ACK message statistics.
C-RP	C-RP message statistics.
SRM	State refresh message statistics.
DF	Designated forwarder statistics.
AutoRP	Auto-RP message statistics.

hello-option dr-priority (PIM view)

Use **hello-option dr-priority** to set the DR priority globally.

Use **undo hello-option dr-priority** to restore the default.

Syntax

hello-option dr-priority *priority*

undo hello-option dr-priority

Default

The DR priority is 1.

Views

PIM view

Predefined user roles

network-admin

context-admin

Parameters

priority: Specifies a DR priority in the range of 0 to 4294967295. The greater the value, the higher the priority.

Usage guidelines

You can set the DR priority globally for all interfaces in PIM view or for an interface in interface view. For an interface, the interface-specific configuration takes priority over the global configuration.

Examples

Set the global DR priority to 3 on the public network.

```
<Sysname> system-view
[Sysname] pim
[Sysname-pim] hello-option dr-priority 3
```

Related commands

pim hello-option dr-priority

hello-option holdtime (PIM view)

Use **hello-option holdtime** to set the PIM neighbor lifetime globally.

Use **undo hello-option holdtime** to restore the default.

Syntax

hello-option holdtime *time*

undo hello-option holdtime

Default

The PIM neighbor lifetime is 105 seconds.

Views

PIM view

Predefined user roles

network-admin

context-admin

Parameters

time: Specifies a PIM neighbor lifetime in the range of 1 to 65535 seconds. If you set the value to 65535 seconds, PIM neighbors are always reachable.

Usage guidelines

You can set the PIM neighbor lifetime globally for all interfaces in PIM view or for an interface in interface view. For an interface, the interface-specific configuration takes priority over the global configuration.

Examples

Set the global PIM neighbor lifetime to 120 seconds on the public network.

```
<Sysname> system-view
[Sysname] pim
[Sysname-pim] hello-option holdtime 120
```

Related commands

pim hello-option holdtime

hello-option lan-delay (PIM view)

Use **hello-option lan-delay** to set the PIM message propagation delay on a shared-media LAN globally.

Use **undo hello-option lan-delay** to restore the default.

Syntax

hello-option lan-delay *delay*

undo hello-option lan-delay

Default

The PIM message propagation delay on a shared-media LAN is 500 milliseconds.

Views

PIM view

Predefined user roles

network-admin

context-admin

Parameters

delay: Specifies a PIM message propagation delay on a shared-media LAN, in the range of 1 to 32767 milliseconds.

Usage guidelines

You can set the PIM message propagation delay globally for all interfaces in PIM view or for an interface in interface view. For an interface, the interface-specific configuration takes priority over the global configuration.

Examples

Set the global PIM message propagation delay on a shared-media LAN to 200 milliseconds on the public network.

```
<Sysname> system-view
[Sysname] pim
[Sysname-pim] hello-option lan-delay 200
```

hello-option neighbor-tracking (PIM view)

Use **hello-option neighbor-tracking** to enable neighbor tracking globally.

Use **undo hello-option neighbor-tracking** to disable neighbor tracking globally.

Syntax

hello-option neighbor-tracking

undo hello-option neighbor-tracking

Default

Neighbor tracking is disabled.

Views

PIM view

Predefined user roles

network-admin

context-admin

Usage guidelines

You can enable neighbor tracking globally for all interfaces in PIM view or for an interface in interface view. For an interface, the interface-specific configuration takes priority over the global configuration.

Examples

Enable neighbor tracking globally on the public network.

```
<Sysname> system-view
[Sysname] pim
```

```
[Sysname-pim] hello-option neighbor-tracking
```

Related commands

pim hello-option neighbor-tracking

hello-option override-interval (PIM view)

Use **hello-option override-interval** to set the override interval globally.

Use **undo hello-option override-interval** to restore the default.

Syntax

hello-option override-interval *interval*

undo hello-option override-interval

Default

The override interval is 2500 milliseconds.

Views

PIM view

Predefined user roles

network-admin

context-admin

Parameters

interval: Specifies an override interval in the range of 1 to 65535 milliseconds.

Usage guidelines

You can set the override interval globally for all interfaces in PIM view or for an interface in interface view. For an interface, the interface-specific configuration takes priority over the global configuration.

Examples

Set the global override interval to 2000 milliseconds on the public network.

```
<Sysname> system-view
[Sysname] pim
[Sysname-pim] hello-option override-interval 2000
```

holdtime join-prune (PIM view)

Use **holdtime join-prune** to set the joined or pruned state holdtime globally.

Use **undo holdtime join-prune** to restore the default.

Syntax

holdtime join-prune *time*

undo holdtime join-prune

Default

The joined or pruned state holdtime is 210 seconds.

Views

PIM view

Predefined user roles

network-admin

context-admin

Parameters

time: Specifies a joined or pruned state holdtime in the range of 1 to 65535 seconds.

Usage guidelines

You can set the joined or pruned state holdtime globally for all interfaces in PIM view or for an interface in interface view. For an interface, the interface-specific configuration takes priority over the global configuration.

To prevent the upstream neighbors from aging out, you must set the join or prune interval to be less than the joined or pruned state holdtime.

Examples

Set the global joined or pruned state holdtime to 280 seconds on the public network.

```
<Sysname> system-view
[Sysname] pim
[Sysname-pim] holdtime join-prune 280
```

Related commands

timer join-prune (PIM view)

jp-pkt-size (PIM view)

Use **jp-pkt-size** to set the maximum size of a join or prune message.

Use **undo jp-pkt-size** to restore the default.

Syntax

jp-pkt-size *size*

undo jp-pkt-size

Default

The maximum size of a join or prune message is 1200 bytes.

Views

PIM view

Predefined user roles

network-admin

context-admin

Parameters

size: Specifies the maximum size of a join or prune message, in the range of 100 to 8100 bytes.

Examples

Set the maximum size of a join or prune message to 1500 bytes on the public network.

```
<Sysname> system-view
[Sysname] pim
[Sysname-pim] jp-pkt-size 1500
```

pim

Use **pim** to enter PIM view.

Use **undo pim** to remove all configurations in PIM view.

Syntax

pim [**vpn-instance** *vpn-instance-name*]

undo pim [**vpn-instance** *vpn-instance-name*]

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, you enter public network PIM view.

Examples

Enable IP multicast routing on the public network and enter PIM view of the public network.

```
<Sysname> system-view
[Sysname] multicast routing
[Sysname-mrib] quit
[Sysname] pim
[Sysname-pim]
```

Enable IP multicast routing for VPN instance **mvpn** and enter PIM view of VPN instance **mvpn**.

```

Predefined user roles

network-admin

context-admin

Usage guidelines

This command is not available for PIM-DM.

This command takes effect only when PIM-SM is enabled on the interface on the public network or for the VPN instance to which the device belongs.

Examples

Enable IP multicast routing on the public network, and enable NBMA mode on ADVPN tunnel interface **tunnel2**.

```
<Sysname> system-view
[Sysname] multicast routing
[Sysname-mrib] quit
[Sysname] interface tunnel 2 mode advpn gre
```

```
[Sysname-Tunnel2] pim sm
[Sysname-Tunnel2] pim nbma-mode
```

pim neighbor-policy

Use **pim neighbor-policy** to configure a PIM hello policy.

Use **undo pim neighbor-policy** to restore the default.

Syntax

pim neighbor-policy *ipv4-acl-number*

undo pim neighbor-policy

Default

No PIM hello policy exists on an interface, and all PIM hello messages are regarded as legal.

Views

Interface view

Predefined user roles

network-admin

context-admin

Parameters

ipv4-acl-number: Specifies an IPv4 basic ACL number in the range of 2000 to 2999.

Usage guidelines

A PIM hello policy filters PIM hello messages to guard against hello message spoofing.

When you configure a rule in the IPv4 basic ACL, follow these restrictions and guidelines:

- If the **vpn-instance** *vpn-instance* option is specified, the rule does not take effect.
- The **source** *source-address source-wildcard* option specifies a source IP address.
- Among the other optional parameters, only the **fragment** keyword and the **time-range** *time-range-name* option take effect.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Configure a PIM hello policy on Tunnel 10 so that only the devices on subnet 10.1.1.0/24 can become PIM neighbors of this router.

```
<Sysname> system-view
[Sysname] acl basic 2000
[Sysname-acl-ipv4-basic-2000] rule permit source 10.1.1.0 0.0.0.255
[Sysname-acl-ipv4-basic-2000] quit
[Sysname] interface Tunnel 10
[Sysname-Tunnel10] pim neighbor-policy 2000
```

pim non-stop-routing

Use **pim non-stop-routing** to enable PIM NSR.

Use **undo pim non-stop-routing** to disable PIM NSR.

[Sysname-Tunnel10] pim passive
```

pim prune-pending

Use **pim prune-pending** to enable PIM prune delay on an interface.

Use **undo pim prune-pending** to disable PIM prune delay on an interface.

Syntax

pim prune-pending

undo pim prune-pending

Default

PIM prune delay is disabled on an interface.

Views

Interface view

Predefined user roles

network-admin

context-admin

Usage guidelines

This command takes effect only when PIM-DM or PIM-SM is enabled on the interface.

By default, an interface determines whether to starts the prune delay timer when it receives a prune message based on the number of PIM neighbors it. An interface starts the prune delay timer only when it has more than one PIM neighbor. When the prune delay timer expires, the device remove the receiving interface from the output interface list of the (S, G) entry.

In a DRNI-capable Layer 3 multicast network, the IP addresses of the two DR interfaces on DR devices are the same, the upstream device will consider the DR devices as one PIM neighbor and will not start the prune delay timer. When one DR device sends a prune message to the upstream device, the upstream device immediately remote the DR interface from the output interface list of the (S, G) entry. If the other DR device has receivers connected and the network is complex, the upstream device need to wait a long time to receive prune messages from the DR device. This situation causes multicast traffic interruption for a long time.

This feature allows the device to enable PIM prune delay and start the prune delay timer regardless of the number of PIM neighbors on an interface. The value of the timer is the sum of the override interval (configured by using the **pim hello-option override-interval** command) and the PIM message propagation delay (configured by using the **pim hello-option lan-delay** command).

Examples

Enable PIM prune delay on the public network. Then, enable PIM-DM and enable PIM passive mode on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] multicast routing
[Sysname-mrib] quit
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] pim dm
[Sysname-GigabitEthernet1/0/1] pim prune-pending
```

undo pim triggered-hello-delay

Default

The triggered hello delay is 5 seconds.

Views

Interface view

Predefined user roles

network-admin

context-admin

Parameters

delay: Specifies a triggered hello delay in the range of 1 to 60 seconds.

Examples

Set the triggered hello delay to 3 seconds on Tunnel 10.

```
<Sysname> system-view
[Sysname] interface Tunnel 10
[Sysname-Tunnel10] pim triggered-hello-delay 3
```

register-policy (PIM view)

Use **register-policy** to configure a PIM register policy.

Use **undo register-policy** to restore the default.

Syntax

register-policy *ipv4-acl-number*

undo register-policy

Default

No PIM register policy exists, and all PIM register messages are regarded as legal.

Views

PIM view

Predefined user roles

network-admin

context-admin

Parameters

ipv4-acl-number: Specifies an IPv4 advanced ACL number in the range of 3000 to 3999.

Usage guidelines

A PIM register policy enables an RP to filter PIM register messages so that the RP is designated only to multicast groups permitted by the ACL.

When you configure a rule in the IPv4 advanced ACL, follow these restrictions and guidelines:

- If the **vpn-instance** *vpn-instance* option is specified, the rule does not take effect.
- The **source** *source-address source-wildcard* option specifies a multicast source address.
- The **destination** *dest-address dest-wildcard* option specifies a multicast group range.
- Among the other optional parameters, only the **fragment** keyword and the **time-range** *time-range-name* option take effect.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Configure a PIM register policy on the public network. Then, the device accepts only register messages from the sources on the subnet 10.10.0.0/16 to the groups on the subnet 225.1.0.0/16.

```
<Sysname> system-view
[Sysname] acl advanced 3000
[Sysname-acl-ipv4-adv-3000] rule permit ip source 10.10.0.0 0.0.255.255 destination
225.1.0.0 0.0.255.255
[Sysname-acl-ipv4-adv-3000] quit
[Sysname] pim
[Sysname-pim] register-policy 3000
```

register-suppression-timeout (PIM view)

Use **register-suppression-timeout** to set the register suppression time.

Use **undo register-suppression-timeout** to restore the default.

Syntax

register-suppression-timeout *interval*

undo register-suppression-timeout

Default

The register suppression time is 60 seconds.

Views

PIM view

Predefined user roles

network-admin

context-admin

Parameters

interval: Specifies a register suppression time in the range of 1 to 65535 seconds.

Examples

Set the register suppression time to 70 seconds on the public network.

```
<Sysname> system-view
[Sysname] pim
[Sysname-pim] register-suppression-timeout 70
```

register-whole-checksum (PIM view)

Use **register-whole-checksum** to configure the device to calculate the checksum based on an entire register message.

Use **undo register-whole-checksum** to restore the default.

Syntax

register-whole-checksum

undo register-whole-checksum

Default

The device calculates the checksum based on the register message header.

Views

PIM view

Predefined user roles

network-admin

context-admin

Examples

Configure the device to calculate the checksum based on an entire register message on the public network.

```
<Sysname> system-view
[Sysname] pim
[Sysname-pim] register-whole-checksum
```

snmp-agent trap enable pim

Use **snmp-agent trap enable pim** to enable SNMP notifications for PIM.

Use **undo snmp-agent trap enable pim** to disable SNMP notifications for PIM.

Syntax

snmp-agent trap enable pim [**candidate-bsr-win-election** | **elected-bsr-lost-election** | **neighbor-loss**] *

undo snmp-agent trap enable pim [**candidate-bsr-win-election** | **elected-bsr-lost-election** | **neighbor-loss**] *

Default

SNMP notifications for PIM are enabled.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

candidate-bsr-win-election: Specifies notifications about winning the BSR election.

elected-bsr-lost-election: Specifies notifications about losing the BSR election.

neighbor-loss: Specifies notifications about losing neighbors.

Usage guidelines

If you do not specify an optional keyword, this command enables or disables PIM to generate SNMP notifications.

To report critical PIM events to an NMS, enable SNMP notifications for PIM. For PIM event notifications to be sent correctly, you must also configure SNMP as described in *Network Management and Monitoring Configuration Guide*.

Examples

Disable SNMP notifications for PIM.

```
<Sysname> system-view
[Sysname] undo snmp-agent trap enable pim
```

source-lifetime (PIM view)

Use **source-lifetime** to set the multicast source lifetime.

Use **undo source-lifetime** to restore the default.

Syntax

source-lifetime *time*

undo source-lifetime

Default

The multicast source lifetime is 210 seconds.

Views

PIM view

Predefined user roles

network-admin

context-admin

Parameters

time: Specifies a multicast source lifetime in the range of 0 to 31536000 seconds. If you set the value to 0 seconds, multicast sources never age out.

Examples

Set the multicast source lifetime to 200 seconds on the public network.

```
<Sysname> system-view
[Sysname] pim
[Sysname-pim] source-lifetime 200
```

source-policy (PIM view)

Use **source-policy** to configure a multicast source policy.

Use **undo source-policy** to restore the default.

Syntax

source-policy *ipv4-acl-number*

undo source-policy

Default

No multicast source policy exists. The device does not filter multicast data packets.

Views

PIM view

Predefined user roles

network-admin

context-admin

Parameters

ipv4-acl-number: Specifies an IPv4 basic or advanced ACL number in the range of 2000 to 3999.

Usage guidelines

A multicast source policy filters multicast data packets to control information available to downstream receivers.

When you configure a rule in the IPv4 ACL, follow these restrictions and guidelines:

- If the **vpn-instance** *vpn-instance* option is specified, the rule does not take effect.
- In a basic ACL, the **source** *source-address source-wildcard* option specifies a source IP address.
- In an advanced ACL, the **source** *source-address source-wildcard* option specifies a source IP address. The **destination** *dest-address dest-wildcard* option specifies a multicast group address.
- Among the other optional parameters, only the **fragment** keyword and the **time-range** *time-range-name* option take effect.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Configure a multicast source policy on the public network to accept multicast data from source 10.10.1.2 and to deny multicast data from source 10.10.1.1.

```
<Sysname> system-view
[Sysname] acl basic 2000
[Sysname-acl-ipv4-basic-2000] rule permit source 10.10.1.2 0
[Sysname-acl-ipv4-basic-2000] rule deny source 10.10.1.1 0
[Sysname-acl-ipv4-basic-2000] quit
[Sysname] pim
[Sysname-pim] source-policy 2000
```

spt-switch-threshold (PIM view)

Use **spt-switch-threshold** to configure a criterion for an RPT-to-SPT switchover.

Use **undo spt-switch-threshold** to remove criteria for RPT-to-SPT switchovers.

Syntax

spt-switch-threshold { *traffic-rate* | **immediacy** | **infinity** } [**group-policy** *ipv4-acl-number*]

undo spt-switch-threshold [*traffic-rate* | **immediacy** | **infinity**] [**group-policy** *ipv4-acl-number*]

Default

The first multicast packet triggers an RPT-to-STP switchover.

Views

PIM view

Predefined user roles

network-admin

context-admin

Parameters

traffic-rate: Specifies a traffic rate threshold for triggering an RPT-to-STP switchover, in the range of 1 to 4194304 kbps.

immediacy: Triggers an RPT-to-STP switchover immediately.

infinity: Disables RPT-to-STP switchover.

group-policy *ipv4-acl-number*: Specifies an IPv4 basic ACL number in the range of 2000 to 2999. If you specify an ACL, the configuration applies to the multicast groups that the ACL permits. The configuration applies to all multicast groups when one of the following conditions exists:

- You do not specify an ACL.
- The specified ACL does not exist.
- The specified ACL does not have valid rules.

Usage guidelines

When you configure a rule in the IPv4 basic ACL, follow these restrictions and guidelines:

- If the **vpn-instance** *vpn-instance* option is specified, the rule does not take effect.
- The **source** *source-address source-wildcard* option specifies a multicast group address.
- Among the other optional parameters, only the **fragment** keyword and the **time-range** *time-range-name* option take effect.

You can configure multiple traffic rate thresholds by executing this command multiple times. However, if you specify the same ACL in the command, the most recent configuration takes effect. If the configured traffic rate thresholds are applied to the same multicast group, the first configuration takes effect.

The source-side DR cannot encapsulate multicast packets in register packets sent to the RP. To avoid multicast traffic forwarding failure, do not disable RPT-to-STP switchover on the devices that might become an RP.

Examples

Set the traffic rate threshold to 4 kbps for triggering an RPT-to-STP switchover on the public network.

```
<Sysname> system-view
[Sysname] pim
[Sysname-pim] spt-switch-threshold 4
```

Disable RPT-to-STP switchover on a receiver-side DR on the public network.

```
<Sysname> system-view
[Sysname] pim
[Sysname-pim] spt-switch-threshold infinity
```

ssm-policy (PIM view)

Use **ssm-policy** to configure the SSM group range.

Use **undo ssm-policy** to restore the default.

Syntax

ssm-policy *ipv4-acl-number*

undo ssm-policy

Default

The SSM group range is 232.0.0.0/8.

Views

PIM view

Predefined user roles

network-admin

context-admin

Parameters

ipv4-acl-number: Specifies an IPv4 basic ACL number in the range of 2000 to 2999.

Usage guidelines

This command defines a multicast group range that is used by PIM-SSM. For multicast packets that are permitted by the ACL, the PIM-SSM mode is used. For multicast packets that are not permitted by the ACL, the PIM-SM mode is used.

When you configure a rule in the IPv4 basic ACL, follow these restrictions and guidelines:

- If the **vpn-instance** *vpn-instance* option is specified, the rule does not take effect.
- The **source** *source-address source-wildcard* option specifies a multicast group range.
- Among the other optional parameters, only the **fragment** keyword and the **time-range** *time-range-name* option take effect.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Configure the SSM group range as 232.1.0.0/16.

```
<Sysname> system-view
[Sysname] acl basic 2000
[Sysname-acl-ipv4-basic-2000] rule permit source 232.1.0.0 0.0.255.255
[Sysname-acl-ipv4-basic-2000] quit
[Sysname] pim
[Sysname-pim] ssm-policy 2000
```

state-refresh-interval (PIM view)

Use **state-refresh-interval** to set the state refresh interval.

Use **undo state-refresh-interval** to restore the default.

Syntax

state-refresh-interval *interval*

undo state-refresh-interval

Default

The state refresh interval is 60 seconds.

Views

PIM view

Predefined user roles

network-admin

context-admin

Parameters

interval: Specifies a state refresh interval in the range of 1 to 255 seconds.

Examples

Set the state refresh interval to 70 seconds on the public network.

```
<Sysname> system-view
[Sysname] pim
[Sysname-pim] state-refresh-interval 70
```

state-refresh-rate-limit (PIM view)

state-refresh-ttl (PIM view)

state-refresh-rate-limit (PIM view)

Use **state-refresh-rate-limit** to set the waiting time to accept a new state refresh message.

Use **undo state-refresh-rate-limit** to restore the default.

Syntax

state-refresh-rate-limit *time*

undo state-refresh-rate-limit

Default

The device waits 30 seconds before it accepts a new state refresh message.

Views

PIM view

Predefined user roles

network-admin

context-admin

Parameters

time: Specifies the waiting time to accept a new refresh message, in the range of 1 to 65535 seconds.

Examples

Set the waiting time to 45 seconds to accept a new state refresh message on the public network.

```
<Sysname> system-view
[Sysname] pim
[Sysname-pim] state-refresh-rate-limit 45
```

static-rp (PIM view)

Use **static-rp** to configure a static RP.

Use **undo static-rp** to delete a static RP.

Syntax

static-rp *rp-address* [*ipv4-acl-number* | **bidir** | **preferred**] *

undo static-rp *rp-address*

Default

No static RPs exist.

Views

PIM view

Predefined user roles

network-admin

context-admin

Parameters

rp-address: Specifies the IP address of the static RP. The IP address must be valid and cannot be on the subnet 127.0.0.0/8. For a static PIM-SM RP, you must specify a used IP address. For a static BIDIR-PIM RP, you can specify an unused IP address.

ipv4-acl-number: Specifies an IPv4 basic ACL number in the range of 2000 to 2999. If you specify an ACL, the static RP is designated only to multicast groups that the ACL permits. The static RP is designated to all multicast groups when one of the following conditions exists:

- You do not specify an ACL.
- The specified ACL does not exist.
- The specified ACL does not have valid rules.

bidir: Configures the static RP as a BIDIR-PIM RP. If you do not specify this keyword, this command configures the static RP as a PIM-SM RP.

preferred: Gives priority to the static RP if a dynamic RP also exists on the network. The dynamic RP takes effect only when the static RP fails. If you do not specify this keyword, the dynamic RP has priority, and the static RP takes effect only when the dynamic RP fails.

Usage guidelines

You do not need to enable PIM on an interface that acts as a static RP.

When you configure a rule in the IPv4 basic ACL, follow these restrictions and guidelines:

- If the **vpn-instance** *vpn-instance* option is specified, the rule does not take effect.
- The **source** *source-address source-wildcard* option specifies a multicast group address.
- Among the other optional parameters, only the **fragment** keyword and the **time-range** *time-range-name* option take effect.

When rules in the ACL used by a static RP change, new RPs are dynamically elected for all multicast groups.

You can configure multiple static RPs by using this command multiple times. However, if you specify the same static RP address or use the same ACL in the command, the most recent configuration takes effect. If you configure multiple static RPs for the same multicast group, the static RP with the highest IP address is used.

Examples

Configure the interface with IP address 11.110.0.6 as a static RP for multicast group range 225.1.1.0/24 and give priority to this static RP on the public network.

```
<Sysname> system-view
[Sysname] acl basic 2001
[Sysname-acl-ipv4-basic-2001] rule permit source 225.1.1.0 0.0.0.255
[Sysname-acl-ipv4-basic-2001] quit
[Sysname] pim
[Sysname-pim] static-rp 11.110.0.6 2001 preferred
```

Related commands

display pim rp-info

timer hello (PIM view)

Use **timer hello** to set the hello interval globally.

Use **undo timer hello** to restore the default.

Syntax

timer hello *interval*

undo timer hello

Default

The hello interval is 30 seconds.

Views

PIM view

Predefined user roles

network-admin

context-admin

Parameters

interval: Specifies a hello interval in the range of 0 to 18000 seconds. If you set the value to 0 seconds, the device does not send hello messages.

Usage guidelines

You can set the hello interval globally for all interfaces in PIM view or for an interface in interface view. For an interface, the interface-specific configuration takes priority over the global configuration.

Examples

Set the global hello interval to 40 seconds on the public network.

```
<Sysname> system-view
[Sysname] pim
[Sysname-pim] timer hello 40
```

Related commands

pim timer hello

timer join-prune (PIM view)

Use **timer join-prune** to set the join or prune interval globally.

Use **undo timer join-prune** to restore the default.

Syntax

timer join-prune *interval*

undo timer join-prune

Default

The join or prune interval is 60 seconds.

Views

PIM view

Predefined user roles

network-admin

context-admin

Parameters

interval: Specifies a join or prune interval in the range of 0 to 18000 seconds. If you set the value to 0 seconds, the device does not send join or prune messages.

Usage guidelines

You can set the join or prune interval globally for all interfaces in PIM view or for an interface in interface view. For an interface, the interface-specific configuration takes priority over the global configuration.

The configuration takes effect after the current interval ends.

To prevent the upstream neighbors from expiring, you must set the join or prune interval to be less than the joined or pruned state holdtime.

Examples

Set the global join or prune interval to 80 seconds on the public network.

```
<Sysname> system-view
[Sysname] pim
[Sysname-pim] timer join-prune 80
```

IPv6 multicast routing and forwarding commands

display ipv6 mrib interface

Use **display ipv6 mrib interface** to display information about interfaces maintained by the IPv6 MRIB.

Syntax

display ipv6 mrib [**vpn-instance** *vpn-instance-name*] **interface** [*interface-type interface-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command displays information about interfaces maintained by the IPv6 MRIB on the public network.

interface-type interface-number: Specifies an interface by its type and number. If you do not specify an interface, this command displays information about all interfaces maintained by the IPv6 MRIB.

Examples

Display information about interfaces maintained by the IPv6 MRIB on the public network.

```
<Sysname> display ipv6 mrib interface
 Interface: GigabitEthernet1/0/1
     Index: 0x00004444
     Current state: up
     MTU: 1500
     Type: BROADCAST
     Protocol: MLD/PROXY
     PIM protocol state: Disabled
     Address list:
          1. Local address : FE80:7:11::1/10
             Remote address: ::
             Reference     : 1
             State         : NORMAL
```

Table 1 Command output

Field	Description
Interface	Interface name.
Index	Index number of the interface.
Current state	Current status of the interface: up or down.
MTU	MTU value.
Type	Interface type: • **BROADCAST**—Broadcast link interface. • **P2P**—P2P interface. • **LOOP**—Loopback interface. • **REGISTER**—Register interface. • **NBMA**—NBMA interface. • **MTUNNEL**—Multicast tunnel interface. This field is empty if the interface is Null 0.
Protocol	Protocol running on the interface: MLD or PROXY.
PIM protocol state	Whether IPv6 PIM is enabled: Enabled or Disabled.
Address list	Interface address list.
Local address	Local IP address.
Remote address	Remote end IP address. This field is displayed only when the interface is vlink type.
Reference	Number of times that the address has been used.
State	Status of the interface address: **NORMAL** or **DEL**.

display ipv6 multicast boundary

Use **display ipv6 multicast boundary** to display IPv6 multicast boundary information.

Syntax

display ipv6 multicast [**vpn-instance** *vpn-instance-name*] **boundary** { **group** [*ipv6-group-address* [*prefix-length*]] | **scope** [*scope-id*] } [**interface** *interface-type interface-number*]

context-admin

context-operator

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command displays IPv6 multicast boundary information on the public network.

group: Displays the IPv6 multicast boundary information for the specified groups.

ipv6-group-address: Specifies an IPv6 multicast group address in the range of FFxy::/16, where "x" and "y" represent any hexadecimal numbers in the range of 0 to F. If you do not specify an IPv6 multicast group, this command displays IPv6 multicast boundary information for all IPv6 multicast groups.

prefix-length: Specifies an address prefix length in the range of 8 to 128. The default is 128.

scope: Displays the IPv6 multicast group boundary information in the admin-scoped zone.

scope-id: Specifies an admin-scope zone by its ID in the range of 3 to 15, which is identified by the scope field in the IPv6 multicast group address. If you do not specify an admin-scoped zone, this command displays IPv6 multicast boundary information for all IPv6 admin-scoped zones.

interface *interface-type interface-number*: Specifies an interface by its type and number. If you do not specify an interface, this command displays IPv6 multicast boundary information for all interfaces.

Examples

Display IPv6 multicast boundary information of all IPv6 multicast groups for all interfaces on the public network.

```
<Sysname> display ipv6 multicast boundary group
 Boundary                                                  Interface
 FF1E::/64                                                 GE1/0/1
```

Display IPv6 multicast boundary information in all IPv6 admin-scope zones for all interfaces on the public network.

```
<Sysname> display ipv6 multicast boundary scope
 Boundary            Interface
        3            GigabitEthernet1/0/1
```

Table 2 Command output

Field	Description
Boundary	IPv6 multicast group or IPv6 admin-scoped zone associated with the IPv6 multicast boundary.
Interface	Boundary interface associated with the IPv6 multicast boundary.

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command displays IPv6 multicast fast forwarding entries on the public network.

ipv6-source-address: Specifies an IPv6 multicast source address.

ipv6-group-address: Specifies an IPv6 multicast group address. The value range for this argument is FFxy::/16 (excluding FFx1::/16 and FFx2::/16), where "x" and "y" represent any hexadecimal numbers in the range of 0 to F.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays IPv6 multicast fast forwarding entries for the master device.

Examples

Display IPv6 multicast fast forwarding entries on the public network.

```
<Sysname> display ipv6 multicast fast-forwarding cache
Total 1 entries, 1 matched

(FE1F:60::200, FF0E::1)
     Status     : Enabled
     Source port: 2001                   Destination port: 2002
     Protocol   : 2                      Flag            : 0x2
     Incoming interface: GigabitEthernet1/0/3
     List of 1 outgoing interfaces:
     GigabitEthernet1/0/2
          Status: Enabled              Flag: 0x14
```

Table 3 Command output

Field	Description
Total 1 entries, 1 matched	Total number of (S, G) entries, and the total number of matching (S, G) entries.
(FE1F:60::200, FF0E::1)	(S, G) entry.
Protocol	Protocol number.
Flag	Flag for the (S, G) entry or the outgoing interface of the entry. This field displays one flag or the sum of multiple flags. In this example, the value 0x2 means that the entry has only one flag 0x2. The value 0x14 means that the outgoing interface has flags 0x10 and 0x4. The following flags are available for an entry: • **0x1**—The entry is created because of packets passed through between cards. • **0x2**—The entry is added by IPv6 multicast forwarding. The following flags are available for an outgoing interface: • **0x1**—The interface is added to the entry because of packets passed through between cards. • **0x2**—The interface is added to an existing entry. • **0x4**—The MAC address of the interface is needed for fast forwarding. • **0x8**—The interface is an outgoing interface associated with the incoming VLAN interface. • **0x10**—The interface is associated with the entry.

Field	Description
	• **0x20**—The interface is to be deleted.
Status	Status of the (S, G) entry or the outgoing interface: • **Enabled**—Available. • **Disabled**—Unavailable.
Incoming interface	Incoming interface of the (S, G) entry.
List of 1 outgoing interfaces	Outgoing interface list of the (S, G) entry.

reset ipv6 multicast fast-forwarding cache all

display ipv6 multicast forwarding df-info

Use **display ipv6 multicast forwarding df-info** to display DF information.

Syntax

display ipv6 multicast [**vpn-instance** *vpn-instance-name*] **forwarding df-info** [*ipv6-rp-address*] [**verbose**] [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command displays information about DFs on the public network.

ipv6-rp-address: Specifies an IPv6 BIDIR-PIM RP by its IPv6 address.

verbose: Displays detailed information. If you do not specify this keyword, the command displays brief information about DFs.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays DF information for the master device.

Usage guidelines

In an IPv6 BIDIR-PIM domain, only the DF on each subnet can forward IPv6 multicast data destined for an IPv6 multicast group toward the RP of the group. For more information about DFs, see *IP Multicast Configuration Guide*.

Examples

Display brief DF information on an ADVPN network.

```
<Sysname> display ipv6 multicast forwarding df-info
Total 1 RPs, 1 matched

00001. RP address: 2::2
```

```
     Flags: 0x0
     Uptime: 00:00:14
     RPF interface: LoopBack0
     List of 2 DF interfaces:

```

Table 4 Command output

Field	Description
Total 1 RPs, 1 matched	Total number of RPs, and the total number of matching RPs.
00001	Sequence number of the entry to which the RP is designated.
RP address	IPv6 address of the RP.
MID	ID of the entry to which the RP is designated. Each entry to which the RP is designated has a unique MID.
Flags	Entry flag. This field displays one flag or the sum of multiple flags. In this example, the value 0x0 means that the entry has only one flag 0x0. The following flags are available for an entry: • **0x0**—The entry is in correct state. • **0x4**—The entry fails to update. • **0x8**—DF interface information fails to update for the entry. • **0x40**—The entry is to be deleted.

Field	Description
	• **0x100**—The entry is being deleted. • **0x200**—The entry is in GR state.
Uptime	Length of time for which the entry has been up.
RPF interface	RPF interface to the RP.
List of 1 DF interfaces	DF interface list.
Tunnel2, FE80::1	ADVPN tunnel interface, and the IPv6 link-local address of the remote end.

display ipv6 multicast forwarding event

Use **display ipv6 multicast forwarding event** to display statistics of IPv6 multicast forwarding events.

Syntax

display ipv6 multicast [**vpn-instance** *vpn-instance-name*] **forwarding event** [**slot** *slot-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command displays statistics of IPv6 multicast forwarding events on the public network.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays statistics of IPv6 multicast forwarding events for the master device.

Examples

Display statistics of IPv6 multicast forwarding events on the public network.

```
<Sysname> display ipv6 multicast forwarding event
Total active events sent: 0
Total inactive events sent: 0
Total NoCache events sent: 2
Total NoCache events dropped: 0
Total WrongIF events sent: 0
Total WrongIF events dropped: 0
Total SPT switch events sent: 0
NoCache rate limit: 1024 packets/s
WrongIF rate limit: 1 packets/10s
Total timer of register suppress timeout: 0
```

Table 5 Command output

Field	Description
Total active events sent	Number of times that entry-active events have been sent.
Total inactive events sent	Number of times that entry-inactive events have been sent.
Total NoCache events sent	Number of times that NoCache events have been sent.
Total NoCache events dropped	Number of times that NoCache events have been dropped.
Total WrongIF events sent	Number of times that WrongIF events have been sent.
Total WrongIF events dropped	Number of times that WrongIF events have been dropped.
Total SPT switch events sent	Number of times that SPT-switch events have been sent.
NoCache rate limit	Rate limit for sending NoCache events, in pps.
WrongIF rate limit	Rate limit for sending WrongIF events, in packets per 10 seconds.
Total timer of register suppress timeout	Number of times that the registration suppression has timed out in total.

context-operator

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command displays IPv6 multicast forwarding entries on the public network.

ipv6-source-address: Specifies an IPv6 multicast source address.

ipv6-group-address: Specifies an IPv6 multicast group address in the range of FFxy::/16, where "x" and "y" represent any hexadecimal numbers in the range of 0 to F.

prefix-length: Specifies an address prefix length. The default value is 128. For an IPv6 multicast group address, the value range for this argument is 8 to 128. For an IPv6 multicast source address, the value range for this argument is 0 to 128.

incoming-interface: Specifies the IPv6 forwarding entries that contain the specified incoming interface.

interface-type interface-number: Specifies an interface by its type and number.

outgoing-interface: Specifies the IPv6 forwarding entries that contain the specified outgoing interface.

exclude: Specifies the IPv6 forwarding entries that do not contain the specified interface in the outgoing interface list.

include: Specifies the IPv6 forwarding entries that contain the specified interface in the outgoing interface list.

match: Specifies the IPv6 forwarding entries that contain only the specified interface in the outgoing interface list.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays IPv6 multicast forwarding entries for the master device.

statistics: Displays statistics for the IPv6 multicast forwarding table.

Examples

Display IPv6 multicast forwarding entries on an ADVPN network.

```
<Sysname> display ipv6 multicast forwarding-table
Total 1 entries, 1 matched

00001. (1::1, ff0e::1)
     Flags: 0x0
     Uptime: 00:08:32, Timeout in: 00:03:26
     Incoming interface: Tunnel1, FE80::20:11
     List of 1 outgoing interfaces:
             1:  Tunnel1, FE80::20:12
             2:  Tunnel1, FE80::20:13
     Matched 19648 packets(20512512 bytes), Wrong If 0 packet
     Forwarded 19648 packets(20512512 bytes)
```

Display IPv6 multicast forwarding entries on the public network.

```
<Sysname> display ipv6 multicast forwarding-table
Total 1 entries, 1 matched

00001. (1::1, ff0e::1)
     Flags: 0x0
     Uptime: 00:08:32, Timeout in: 00:03:26
     Incoming interface: Vlan-interface10
          Incoming sub-VLAN: VLAN 11
          Outgoing sub-VLAN: VLAN 12
                             VLAN 13
     List of 1 outgoing interface:
       1: Vlan-interface20
          Sub-VLAN: VLAN 21
                    VLAN 22
```

```
Matched 19648 packets(20512512 bytes), Wrong If 0 packet
Forwarded 19648 packets(20512512 bytes)
```

Table 6 Command output

Field	Description
Total 1 entries, 1 matched	Total number of (S, G) entries, and the total number of matching (S, G) entries.
00001	Sequence number of the (S, G) entry.
(1::1, ff0e::1)	(S, G) entry.
Flags	Entry flag. This field displays one flag or the sum of multiple flags. In this example, the value 0x0 means that the entry has only one flag 0x0. The following flags are available for an entry: • **0x0**—The entry is in correct state. • **0x1**—The entry is in inactive state. • **0x2**—The entry is null. • **0x4**—The entry fails to update. • **0x8**—The outgoing interface information fails to update for the entry. • **0x20**—A register outgoing interface is available. • **0x40**—The entry is to be deleted. • **0x80**—The entry is in registration suppression state. • **0x100**—The entry is being deleted. • **0x200**—The entry is in GR state. • **0x800**—The entry has the associated ND entry for the IPv6 multicast source address. • **0x4000000**—The entry is created by the MLD proxy.
Uptime	Length of time for which the (S, G) entry has been up.
Timeout in	Length of time in which the (S, G) entry will time out.
Incoming interface	Incoming interface of the (S, G) entry.
List of 1 outgoing interfaces	Outgoing interface list of the (S, G) entry.
Tunnel1, FE80::20:12	ADVPN tunnel interface, and the IPv6 link-local address of the remote end.
Matched 19648 packets (20512512 bytes), Wrong If 0 packet	Number of packets (bytes) that match the (S, G) entry, and number of packets with incoming interface errors. The numbers are displayed as 0 if an outgoing interface of the (S, G) entry is on the specified slot.
Forwarded 19648 packets (20512512 bytes)	Number of packets (bytes) that have been forwarded. The numbers are displayed as 0 if an outgoing interface of the (S, G) entry is on the specified slot.

Related commands

context-admin

context-operator

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command displays information about the DF list in IPv6 multicast forwarding entries on the public network.

ipv6-group-address: Specifies an IPv6 multicast address. The value range for this argument is FFxy::/16 (excluding FFx1::/16 and FFx2::/16), where "x" and "y" represent any hexadecimal numbers in the range of 0 to F.

verbose: Displays detailed information. If you do not specify this keyword, the command displays brief information.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays information about the DF list in IPv6 multicast forwarding entries for the master device.

Examples

Display brief information about the DF list in IPv6 multicast forwarding entries on the public network.

```
<Sysname> display ipv6 multicast forwarding-table df-list
Total 1 entries, 1 matched

00001. (::, FF1E::1)
     List of 1 DF interfaces:
       1: GigabitEthernet1/0/1
```

Display detailed information about the DF list in IPv6 multicast forwarding entries on the public network.

```
<Sysname> display ipv6 multicast forwarding-table df-list verbose
Total 1 entries, 1 matched

00001. (::, FF1E::1)
       List of 1 DF interfaces:
         1: GigabitEthernet1/0/1
            Product information: 0x347849f6, 0x14bd6837
```

```
Tunnel  information: 0xc4857986, 0x128a9c8f
```

Table 7 Command output

Field	Description
Total 1 entries, 1 matched	Total number of entries, and the total number of matching entries.
00001	Sequence number of the entry.
(::, FF1E::1)	(*, G) entry.
List of 1 DF interfaces	DF interface list.

display ipv6 multicast routing-table

Use **display ipv6 multicast routing-table** to display IPv6 multicast routing entries.

Syntax

display ipv6 multicast [**vpn-instance** *vpn-instance-name*] **routing-table** [*ipv6-source-address* [*prefix-length*] | *ipv6-group-address* [*prefix-length*] | **incoming-interface** *interface-type interface-number* | **outgoing-interface** { **exclude** | **include** | **match** } *interface-type interface-number*] *

Views

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command displays IPv6 multicast routing entries on the public network.

ipv6-source-address: Specifies an IPv6 multicast source address.

ipv6-group-address: Specifies an IPv6 multicast group address in the range of FFxy::/16, where "x" and "y" represent any hexadecimal numbers in the range of 0 to F.

prefix-length: Specifies an address prefix length. The default is 128. For an IPv6 multicast group address, the value range for this argument is 8 to 128. For an IPv6 multicast source address, the value range for this argument is 0 to 128.

incoming-interface: Displays the IPv6 routing entries that contain the specified incoming interface.

interface-type interface-number: Specifies an interface by its type and number.

outgoing-interface: Displays the IPv6 routing entries that contain the specified outgoing interface.

exclude: Displays the IPv6 routing entries that do not contain the specified interface in the outgoing interface list.

include: Displays the IPv6 routing entries that contain the specified interface in the outgoing interface list.

match: Displays the IPv6 routing entries that contain only the specified interface in the outgoing interface list.

Usage guidelines

IPv6 multicast routing entries are the basis of IPv6 multicast forwarding. You can use this command to view the establishment state of (S, G) entries.

Examples

Display IPv6 multicast routing entries on an ADVPN network.

```
<Sysname> display ipv6 multicast routing-table
 Total 1 entries

00001. (2001::2, FFE3::101)
       Uptime: 00:00:14
       Upstream Interface: Tunnel1, FE80::20:11
       List of 2 downstream interfaces
           1:  Tunnel1, FE80::20:12
           2:  Tunnel1, FE80::20:13
```

Display IPv6 multicast routing entries on the public network.

```
<Sysname> display ipv6 multicast routing-table
 Total 1 entries

 00001. (2001::2, FFE3::101)
       Uptime: 00:00:14
       Upstream Interface: GigabitEthernet1/0/1
       List of 2 downstream interfaces
           1:  GigabitEthernet1/0/2
           2:  GigabitEthernet1/0/3
```

Table 8 Command output

Field	Description
Total 1 entries	Total number of (S, G) entries.
00001	Sequence number of the (S, G) entry.
(2001::2, FFE3::101)	(S, G) entry.
Uptime	Length of time for which the (S, G) entry has been up.
Upstream Interface	Upstream interface at which the (S, G) packets should arrive.
List of 2 downstream interfaces	List of downstream interfaces that forward (S, G) packets.
Tunnel11, FE80::20:12	ADVPN tunnel interface, and the IPv6 link-local address of the remote end.

Related commands

reset ipv6 multicast routing-table

display ipv6 multicast rpf-info

Use **display ipv6 multicast rpf-info** to display RPF information for an IPv6 multicast source.

Syntax

display ipv6 multicast [**vpn-instance** *vpn-instance-name*] **rpf-info** *ipv6-source-address* [*ipv6-group-address*]

Views

Any view

network-admin

network-operator

context-admin

context-operator

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command displays RPF information for an IPv6 multicast source on the public network.

ipv6-source-address: Specifies an IPv6 multicast source address.

ipv6-group-address: Specifies an IPv6 multicast group address in the range of FFxy::/16 (excluding FFx1::/16 and FFx2::/16), where "x" and "y" represent any hexadecimal numbers in the range of 0 to F.

Examples

Display RPF information for IPv6 multicast source 2001::101 on the public network.

```
<Sysname> display ipv6 multicast rpf-info 2001::101
 RPF information about source 2001::101:
     RPF interface: GigabitEthernet1/0/1, RPF neighbor: FE80::A01:101:1
     Referenced prefix/prefix length: 2001::/64
     Referenced route type: igp
     Route selection rule: preference-preferred
     Load splitting rule: disable
     Source AS: 0
     C-multicast route target: 0x0000000000000000
```

Table 9 Command output

Field	Description
RPF information about source 2001::101	RPF information of the IPv6 multicast source 2001::101.
RPF interface	Type and number of the RPF interface.
RPF neighbor	IPv6 address (link-local address) of the RPF neighbor.
Referenced prefix/prefix length	Referenced route and its prefix length.
Referenced route type	Type of the referenced route: • **igp**—IPv6 IGP unicast route. • **egp**—IPv6 EGP unicast route. • **unicast (direct)** —IPv6 directly connected unicast

Field	Description
	route. • **unicast**—Other IPv6 unicast route, such as IPv6 unicast static route. • **mbgp**—IPv6 MBGP route.
Route selection rule	RPF route selection rule: • Route preference. • Longest prefix match.
Load splitting rule	Whether load splitting is enabled.
Source AS	AS number of the source-side PE.
C-multicast route target	Route target attribute value of the C-multicast route.

Related commands

display ipv6 multicast forwarding-table

display ipv6 multicast routing-table

ipv6 multicast boundary

Use **ipv6 multicast boundary** to configure an IPv6 multicast forwarding boundary.

Use **undo ipv6 multicast boundary** to delete an IPv6 multicast forwarding boundary.

Syntax

ipv6 multicast boundary { *ipv6-group-address prefix-length* | **scope** { *scope-id* | **admin-local** | **global** | **organization-local** | **site-local** } }

undo ipv6 multicast boundary { *ipv6-group-address prefix-length*| **all** | **scope** { *scope-id* | **admin-local** | **global** | **organization-local** | **site-local** } }

Default

An interface is not an IPv6 multicast forwarding boundary.

Views

Interface view

Predefined user roles

network-admin

context-admin

Parameters

ipv6-group-address: Specifies an IPv6 multicast group address in the range of FFxy::/16, where "x" and "y" represent any hexadecimal numbers in the range of 0 to F.

prefix-length: Specifies the address prefix length in the range of 8 to 128.

all: Specifies all IPv6 multicast boundaries configured on the interface.

scope-id: Specifies the ID of an admin-scoped zone, in the range of 3 to 15, which is identified by the scope field in the IPv6 multicast group address.

admin-local: Specifies the scoped zone as admin-local, which has a scope ID of 4.

global: Specifies the scoped zone as global, which has a scope ID of 14.

organization-local: Specifies the scoped zone as organization-local, which has a scope ID of 8.

site-local: Specifies the scoped zone as site-local, which has a scope ID of 5.

Usage guidelines

A multicast forwarding boundary sets the boundary condition for the IPv6 multicast groups in the specified address range. If the destination address of an IPv6 multicast packet matches the set boundary condition, the packet is not forwarded.

An interface can act as a forwarding boundary for multiple IPv6 multicast groups in different address ranges. You can implement this by using this command on the interface for each multicast address range. These multicast groups must be in the same scope. The latest configuration of a scope overwrites the previous one.

You do not need to enable IPv6 multicast routing before you execute this command.

Assume that Set A and Set B are both IPv6 multicast forwarding boundary sets with different address ranges, and that B is a subset of A. A takes effect on the interface no matter whether A is configured earlier or later than B.

Examples

Configure GigabitEthernet 1/0/1 as the forwarding boundary of IPv6 multicast groups in the range of FF03::/16.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] ipv6 multicast boundary ff03:: 16
```

Configure GigabitEthernet 1/0/1 as the forwarding boundary of IPv6 multicast groups in the admin-local scope.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] ipv6 multicast boundary scope 4
```

Related commands

display ipv6 multicast boundary

ipv6 multicast forwarding-table cache-unknown per-entry

Use **ipv6 multicast forwarding-table cache-unknown per-entry** to set the maximum number of unknown IPv6 multicast packets that can be cached for an (S, G) entry.

Use **undo ipv6 multicast forwarding-table cache-unknown per-entry** to restore the default.

Syntax

ipv6 multicast forwarding-table cache-unknown per-entry *per-entry-limit*

undo ipv6 multicast forwarding-table cache-unknown per-entry

Default

The device can cache only one unknown IPv6 multicast packet for an (S, G) entry.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

per-entry-limit: Specifies the maximum number of unknown IPv6 multicast packets that can be cached for an (S, G) entry. The value range for this argument is 0 to 256. If you set the value to 0, the device cannot cache unknown IPv6 multicast packets.

Examples

Set the maximum number to 20 for unknown IPv6 multicast packets that can be cached for an (S, G) entry.

```
<Sysname> system-view
[Sysname] ipv6 multicast forwarding-table cache-unknown per-entry 20
```

Related commands

ipv6 multicast forwarding-table cache-unknown total

ipv6 multicast forwarding-table cache-unknown total

Use **ipv6 multicast forwarding-table cache-unknown total** to set the maximum number of all unknown IPv6 multicast packets that can be cached.

Use **undo multicast forwarding-table cache-unknown total** to restore the default.

Syntax

ipv6 multicast forwarding-table cache-unknown total *total-limit*

undo ipv6 multicast forwarding-table cache-unknown total

Default

The device can cache 1024 unknown IPv6 multicast packets in total.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

total-limit: Specifies the maximum number of all unknown IPv6 multicast packets that can be cached. The value range for this argument is 0 to 65535. If you set the value to 0, the device cannot cache unknown IPv6 multicast packets.

Usage guidelines

As a best practice, set the value in this command to be far greater than the value set in the **ipv6 multicast forwarding-table cache-unknown per-entry** command.

Examples

Set the maximum number to 10000 for all unknown IPv6 multicast packets that can be cached.

```
<Sysname> system-view
[Sysname] ipv6 multicast forwarding-table cache-unknown total 10000
```

Related commands

ipv6 multicast forwarding-table cache-unknown per-entry

ipv6 multicast routing

Use **ipv6 multicast routing** to enable IPv6 multicast routing and enter IPv6 MRIB view.

Use **undo ipv6 multicast routing** to disable IPv6 multicast routing.

Syntax

ipv6 multicast routing [**vpn-instance** *vpn-instance-name*]

undo ipv6 multicast routing [**vpn-instance** *vpn-instance-name*]

Default

IPv6 multicast routing is disabled.

Views

System view

Predefined user roles

network-admin

context-admin

parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command enables IPv6 multicast routing on the public network.

Usage guidelines

Other Layer 3 IPv6 multicast commands take effect only when IPv6 multicast routing is enabled on the public network or for the VPN instance to which the device belongs.

The device does not forward any IPv6 multicast packets before IPv6 multicast routing is enabled.

Examples

Enable IPv6 multicast routing on the public network, and enter IPv6 MRIB view.

```
<Sysname> system-view
[Sysname] ipv6 multicast routing
[Sysname-mrib6]
```

Enable IPv6 multicast routing for VPN instance **mvpn**, and enter IPv6 MRIB view.

```
<Sysname> system-view
[Sysname] ipv6 multicast routing vpn-instance mvpn
[Sysname-mrib6-mvpn]
```

load-splitting (IPv6 MRIB view)

Use **load-splitting** to enable IPv6 multicast load splitting.

Use **multicast load-splitting** to restore the default.

Syntax

load-splitting { **source** | **source-group** }

undo load-splitting

Default

IPv6 multicast load splitting is disabled.

Views

IPv6 MRIB view

Predefined user roles

network-admin

context-admin

Parameters

source: Enables IPv6 multicast load splitting based on IPv6 multicast source.

source-group: Enables IPv6 multicast load splitting based on IPv6 multicast source and group.

Examples

Enable IPv6 multicast load splitting based on IPv6 multicast source on the public network.

```
<Sysname> system-view
[Sysname] ipv6 multicast routing
[Sysname-mrib6] load-splitting source
```

longest-match (IPv6 MRIB view)

Use **longest-match** to specify the longest prefix match principle for RPF route selection.

Use **undo longest-match** to restore the default.

Syntax

longest-match

undo longest-match

Default

Route preference is used for RPF route selection. The route with the highest route preference is used as the RPF route.

Views

IPv6 MRIB view

Predefined user roles

network-admin

context-admin

Usage guidelines

This command enables the device to use the matching route with the longest prefix as the RPF route.

Examples

Specify the longest prefix match principle for RPF route selection on the public network.

```
<Sysname> system-view
[Sysname] ipv6 multicast routing
[Sysname-mrib6] longest-match
```

reset ipv6 multicast fast-forwarding cache

Use **reset ipv6 multicast fast-forwarding cache** to clear IPv6 multicast fast forwarding entries.

Syntax

reset ipv6 multicast [**vpn-instance** *vpn-instance-name*] **fast-forwarding cache** { { *ipv6-source-address* | *ipv6-group-address* } * | **all** } [**slot** *slot-number*]

Views

User view

Predefined user roles

network-admin

context-admin

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command clears IPv6 multicast fast forwarding entries on the public network.

ipv6-source-address: Specifies an IPv6 multicast source address.

ipv6-group-address: Specifies an IPv6 multicast group address. The value range for this argument is FFxy::/16 (excluding FFx1::/16 and FFx2::/16), where "x" and "y" represent any hexadecimal numbers in the range of 0 to F.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command clears IPv6 multicast fast forwarding entries for the master device.

all: Specifies all IPv6 multicast fast forwarding entries.

Examples

Clear all IPv6 multicast fast forwarding entries on the public network.

```
<Sysname> reset ipv6 multicast fast-forwarding cache all
```

Clear the IPv6 multicast fast forwarding entry for IPv6 multicast source and group (FE1F:20::2, FF0E::1) on the public network.

```
<Sysname> reset ipv6 multicast fast-forwarding cache fe1f:20::2 ff0e::1
```

Related commands

display ipv6 multicast fast-forwarding cache

reset ipv6 multicast forwarding event

Use **reset ipv6 multicast forwarding event** to clear statistics for IPv6 multicast forwarding events.

Syntax

reset ipv6 multicast [**vpn-instance** *vpn-instance-name*] **forwarding event**

Views

User view

Predefined user roles

network-admin

context-admin

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command clears statistics for the IPv6 multicast forwarding events on the public network.

Examples

Clear statistics for the IPv6 multicast forwarding events on the public network.

```
<Sysname> reset ipv6 multicast forwarding event
```

Related commands

display ipv6 multicast forwarding event

reset ipv6 multicast forwarding-table

Use **reset ipv6 multicast forwarding-table** to clear IPv6 multicast forwarding entries.

Syntax

reset ipv6 multicast [**vpn-instance** *vpn-instance-name*] **forwarding-table** { { *ipv6-source-address* [*prefix-length*] | *ipv6-group-address* [*prefix-length*] | **incoming-interface** { *interface-type interface-number* } } * | **all** }

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command clears IPv6 multicast forwarding entries on the public network.

ipv6-source-address: Specifies an IPv6 multicast source address.

ipv6-group-address: Specifies an IPv6 multicast group address in the range of FFxy::/16, where "x" and "y" represent any hexadecimal numbers in the range of 0 to F.

prefix-length: Specifies the address prefix length. The default value is 128. For an IPv6 multicast group address, the value range for this argument is 8 to 128. For an IPv6 multicast source address, the value range for this argument is 0 to 128.

incoming-interface: Specifies the IPv6 multicast forwarding entries that contain the specified incoming interface.

interface-type interface-number: Specifies an interface by its type and number.

all: Specifies all IPv6 multicast forwarding entries.

Usage guidelines

When you clear an IPv6 multicast forwarding entry, the associated IPv6 multicast routing entry is also cleared.

Examples

Clear IPv6 multicast forwarding entries for IPv6 multicast group FF0E::1 on the public network.

```
<Sysname> reset ipv6 multicast forwarding-table ff0e::1
```

Related commands

display ipv6 multicast forwarding-table

reset ipv6 multicast routing-table

Use **reset ipv6 multicast routing-table** to clear IPv6 multicast routing entries.

Syntax

reset ipv6 multicast [**vpn-instance** *vpn-instance-name*] **routing-table** { { *ipv6-source-address* [*prefix-length*] | *ipv6-group-address* [*prefix-length*] | **incoming-interface** *interface-type interface-number* } * | **all** }

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command clears IPv6 multicast routing entries on the public network.

ipv6-source-address: Specifies an IPv6 multicast source address.

ipv6-group-address: Specifies an IPv6 multicast group address in the range of FFxy::/16, where "x" and "y" represent any hexadecimal numbers in the range of 0 to F.

prefix-length: Specifies an address prefix length. The default is 128. For an IPv6 multicast group address, the value range for this argument is 8 to 128. For an IPv6 multicast source address, the value range for this argument is 0 to 128.

incoming-interface: Specifies the IPv6 multicast routing entries that contain the specified incoming interface.

interface-type interface-number: Specifies an interface by its type and number.

all: Specifies all IPv6 multicast routing entries.

Usage guidelines

When you clear an IPv6 multicast routing entry, the associated IPv6 multicast forwarding entry is also cleared.

Examples

Clear IPv6 multicast routing entries for IPv6 multicast group FF03::101 on the public network.

```
<Sysname> reset ipv6 multicast routing-table ff03::101
```

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command displays information about MLD multicast groups on the public network.

ipv6-group-address: Specifies an IPv6 multicast group address. The value range for this argument is FFxy::/16 (excluding FFx1::/16 and FFx2::/16), where "x" and "y" represent any hexadecimal numbers in the range of 0 to F. If you do not specify an IPv6 multicast group, this command displays information about all MLD multicast groups.

interface *interface-type interface-number*: Specifies an interface by its type and number. If you do not specify an interface, this command displays information about MLD multicast groups for all interfaces.

static: Specifies MLD multicast groups that hosts have joined statically. If you do not specify this keyword, the command displays information about MLD multicast groups that hosts have joined dynamically.

verbose: Displays detailed information about MLD multicast groups.

Examples

Display information about MLD multicast groups that hosts have dynamically joined on the public network.

```
<Sysname> display mld group
MLD groups in total: 1
 GigabitEthernet1/0/1(FE80::101):
  MLD groups reported in total: 1
   Group address: FF03::101
    Last reporter: FE80::10
    Uptime: 00:02:04
    Expires: 00:01:15
```

Table 1 Command output

Field	Description
MLD groups in total	Total number of MLD multicast groups.
MLD groups reported in total	Total number of MLD multicast groups that the hosts attached to the interface have joined dynamically.
Group address	IPv6 multicast group address.
Last reporter	IPv6 address of the receiver host that last reported membership for the group.
Uptime	Length of time since the IPv6 multicast group was joined.
Expires	Remaining lifetime for the IPv6 multicast group. This field displays **Off** if the timer is disabled.

Display detailed information about MLD multicast group FF3E::101 that hosts have statically joined on the public network. In this example, the router is configured with MLD SSM mappings.

```
<Sysname> display mld group ff3e::101 verbose
 GigabitEthernet1/0/1(FE80::101):
  MLD groups reported in total: 1
   Group: FF3E::101
     Uptime: 00:01:46
     Exclude expires: 00:04:16
     Mapping expires: 00:02:16
     Last reporter: FE80::10
     Last-listener-query-counter: 0
     Last-listener-query-timer-expiry: Off
     Mapping last-listener-query-counter: 0
     Mapping last-listener-query-timer-expiry: Off
     Group mode: Exclude
     Version1-host-present-timer-expiry: Off
     Source list (sources in total: 1):
       Source: 10::10
          Uptime: 00:00:09
          V2 expires: 00:04:11
          Mapping expires: 00:02:16
          Last-listener-query-counter: 0
          Last-listener-query-timer-expiry: Off
```

Table 2 Command output

Field	Description
MLD groups reported in total	Total number of MLD multicast groups that the hosts attached to the interface have joined dynamically.
Group	IPv6 multicast group address.
Uptime	Length of time since the IPv6 multicast group was reported.
Exclude expires	Remaining time for the IPv6 multicast group in Exclude mode. This field displays **Off** if the timer is disabled.
Mapping expires	Remaining time for the IPv6 multicast group specified in MLD SSM mappings.

Field	Description
	This field is displayed only when the device is configured with MLD SSM mappings.
Last reporter	IPv6 address of the receiver host that last reported membership for this group.
Last-listener-query-counter	Number of MLD multicast-address-specific queries or MLD multicast-address-and-source-specific queries sent for the group.
Last-listener-query-timer-expiry	Remaining time for the MLD last listener query timer for the multicast group. This field displays **Off** if the timer is disabled.
Mapping last-listener-query-counter	Number of MLD multicast-address-specific queries or MLD multicast-address-and-source-specific queries sent for the IPv6 multicast group specified in MLD SSM mappings. This field is displayed only when the device is configured with MLD SSM mappings.
Mapping last-listener-query-timer-expiry	Remaining time for the last listener query timer of the IPv6 multicast group specified in MLD SSM mappings. This field displays **Off** if the timer is disabled. This field is displayed only when the device is configured with MLD SSM mappings.
Group mode	IPv6 multicast source filtering mode: • **Include**—Include mode. • **Exclude**—Exclude mode. For a device that runs MLDv1: • If MLD SSM mappings are not configured, this field displays **Exclude**. • If MLD SSM mappings are configured, this field displays **Include** or **Exclude** depending on the SSM mappings and the IPv6 multicast groups that the host joins.
Version1-host-present-timer-expiry	Remaining time for the MLDv1 host present timer. This field displays **Off** if the timer is disabled. This field is displayed only when the device runs MLDv2.
Source list (sources in total 1)	List of IPv6 multicast sources and total number of IPv6 multicast sources. This field is displayed only when the device runs MLDv2 or is configured with MLD SSM mappings.
Source	IPv6 multicast source address. This field is displayed only when the device runs MLDv2 or the device is configured with MLD SSM mappings.
Uptime	Length of time since the IPv6 multicast source was reported. This field is displayed only when the device runs MLDv2 or is configured with MLD SSM mappings.
V2 expires	Remaining time for the IPv6 multicast source when the device runs MLDv2. This field displays **Off** if the timer is disabled. This field displays three hyphens (---) if the IPv6 multicast source is specified in MLD SSM mappings. This field is displayed only when the device runs MLDv2 or is configured with MLD SSM mappings.
Mapping expires	Remaining time for the IPv6 multicast sources specified in MLD

Field	Description
	SSM mappings.
Last-listener-query-counter	Number of MLD multicast-address-specific queries or MLD multicast-address-and-source-specific queries sent for the IPv6 multicast source and group. This field is displayed only when the device runs MLDv2 or is configured with MLD SSM mappings.
Last-listener-query-timer-expiry	Remaining time for the last listener query timer for the IPv6 multicast source and group. This field displays **Off** if the timer is disabled. This field is displayed only when the device runs MLDv2 or is configured with MLD SSM mappings.

Display information about the MLD multicast groups that hosts have statically joined on the public network.

```
<Sysname> display mld group static
 Entries in total: 2
  (*, FF03::101)
   Interface: GE1/0/1
   Expires: Never

  (2001::101, FF3E::202)
   Interface: GE1/0/1
   Expires: Never
```

Table 3 Command output

Field	Description
Entries in total	Total number of the IPv6 multicast groups that hosts have joined statically.
(*, FF03::101)	(*, G) entry.
(2001::101, FF3E::202)	(S, G) entry.
Expires	Remaining lifetime for the IPv6 multicast group. This field always displays **Never**, which means that the IPv6 multicast group never expires.

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command displays MLD information for interfaces on the public network.

interface-type interface-number: Specifies an interface by its type and number. If you do not specify an interface, this command displays MLD information for all interfaces.

proxy: Displays the MLD proxy interface information. If you do not specify this keyword, the command displays MLD information for all interfaces.

verbose: Displays detailed MLD information.

Examples

Display detailed MLD information for GigabitEthernet 1/0/1 (non-proxy interface) on the public network.

```
<Sysname> display mld interface gigabitethernet 1/0/1 verbose
 GigabitEthernet1/0/1(FE80::200:AFF:FE01:101):
   MLD is enabled.
   MLD version: 1
   Query interval for MLD: 125s
   Other querier present time for MLD: 255s
   Maximum query response time for MLD: 10s
   Last listener query interval: 1s
   Last listener query count: 2
   Startup query interval: 31s
   Startup query count: 2
   General query timer expiry (hh:mm:ss): 00:00:23
   Querier for MLD: FE80::200:AFF:FE01:101 (This router)
   MLD activity: 1 join(s), 0 done(s)
   IPv6 multicast routing on this interface: Enabled
   Robustness: 2
   Require-router-alert: Disabled
   Fast-leave: Disabled
   Startup-query: Off
   Other-querier-present-timer-expiry (hh:mm:ss): Off
  MLD groups reported in total: 1
```

Display detailed MLD information for all MLD proxy interfaces on the public network.

```
<Sysname> display mld interface proxy verbose
 GigabitEthernet1/0/2(FE80::100:CEF:FE01:101):
   MLD proxy is enabled.
   MLD version: 1
   IPv6 multicast routing on this interface: Enabled
   Require-router-alert: Disabled
   Version1-querier-present-timer-expiry (hh:mm:ss): Off
```

Table 4 Command output

Field	Description
GigabitEthernet1/0/1(FE80::200:AFF:FE01:101)	Interface and its IPv6 link-local address.
MLD is enabled	MLD is enabled on the interface.
MLD version	Version of MLD that the interface runs.
Query interval for MLD	MLD query interval, in seconds.
Other querier present time for MLD	MLD other querier present interval, in seconds.
Maximum query response time for MLD	Maximum response time for MLD general query messages, in seconds.
Last listener query interval	Interval for sending MLD multicast-address-specific queries or MLD multicast-address-and-source-specific queries, in seconds.
Last listener query count	Number of MLD multicast-address-specific queries or MLD multicast-address-and-source-specific queries sent for the group.
Startup query interval	MLD startup query interval, in seconds.
Startup query count	Number of MLD general queries sent on startup.
General query timer expiry	Remaining time for the MLD general query timer. This field displays **Off** if the timer is disabled.
Querier for MLD	IPv6 link-local address of the MLD querier.
MLD activity: 1 join(s), 0 done(s)	MLD activity statistics: • **join(s)**—Total number of IPv6 multicast groups that the interface has joined. • **done(s)**—Total number of IPv6 multicast groups that the interface has left.
IPv6 multicast routing on this interface	Whether IPv6 multicast routing is enabled: Enabled or Disabled.
Robustness	Robustness variable of the MLD querier.
Require-router-alert	Whether the feature of dropping MLD messages without Router-Alert is enabled: Enabled or Disabled.
Fast-leave	Whether fast-leave processing is enabled: Enabled or Disabled.
Startup-query	Whether the MLD querier sends MLD general queries at the startup query interval on startup: • **On**—The MLD querier performs the above action. • **Off**—The MLD querier does not perform the above action.
Other-querier-present-timer-expiry	Remaining time for MLD other querier present timer. This field displays **Off** if the timer is disabled.
MLD groups reported in total	Total number of IPv6 multicast groups that the interface has joined dynamically. This field is not displayed if the interface does not join IPv6 multicast groups.
MLD proxy is enabled	MLD proxying is enabled.

Field	Description
Version1-querier-present-timer-expiry	Remaining time for the MLDv1 querier present timer. This field displays **Off** if the timer is disabled.

display mld proxy group

Use **display mld proxy group** to display information about IPv6 multicast groups maintained by the MLD proxy.

Syntax

display mld [**vpn-instance** *vpn-instance-name*] **proxy group** [*ipv6-group-address* | **interface** *interface-type interface-number*] [**verbose**]

Views

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command displays information about IPv6 multicast groups maintained by the MLD proxy on the public network.

ipv6-group-address: Specifies an IPv6 multicast group by its IPv6 address. The value range for this argument is FFxy::/16 (excluding FFx1::/16 and FFx2::/16), where "x" and "y" represent any hexadecimal numbers in the range of 0 to F. If you do not specify an IPv6 multicast group, this command displays IPv6 multicast group membership entries for all IPv6 multicast groups.

interface *interface-type interface-number*: Specifies an interface by its type and number. If you do not specify an interface, this command displays information about IPv6 multicast groups maintained by the MLD proxy for all interfaces.

verbose: Displays detailed information.

Examples

Display information about IPv6 multicast groups maintained by the MLD proxy on the public network.

```
<Sysname> display mld proxy group
MLD proxy group records in total: 2
 GigabitEthernet1/0/1(FE80::16:1):
  MLD proxy group records in total: 2
   Group address: FF1E::1
    Member state: Idle
    Expires: Off

   Group address: FF1E::2
    Member state: Idle
```

```
    Expires: Off
```

Display detailed information about IPv6 multicast group FF1E::1 maintained by the MLD proxy on the public network.

```
<Sysname> display mld proxy group ff1e::1 verbose
 GigabitEthernet1/0/1(FE80::16:1):
  MLD proxy group records in total: 2
   Group: FF1E::1
     Group mode: Include
     Member state: Idle
     Expires: Off
     Source list (sources in total: 1):
       100::1
```

Table 5 Command output

Field	Description
MLD proxy group records in total	Total number of IPv6 multicast group membership entries maintained by the MLD proxy.
GigabitEthernet1/0/1(FE80::16:1)	Interface and its IPv6 address.
Pending proxy group	Pending IPv6 multicast group membership entries maintained by the MLD proxy.
Group address/Group	IPv6 multicast group address.
Member state	Member host states: • **Delay**—The member host has joined a group and started a delay timer. • **Idle**—The member host has joined a group, but didn't start a delay timer.
Expires	Remaining delay time for a member host to send a responding report. This field displays **Off** if the timer is disabled.
Group mode	IPv6 multicast source filtering mode: • Include. • Exclude.
Source list (sources in total: 1)	List of IPv6 multicast sources in the group membership database maintained by the MLD proxy, and the total number of the IPv6 multicast sources.

display mld proxy routing-table

Use **display mld proxy routing-table** to display IPv6 multicast routing entries maintained by the MLD proxy.

Syntax

display mld [**vpn-instance** *vpn-instance-name*] **proxy routing-table** [*ipv6-source-address* [*prefix-length*] | *ipv6-group-address* [*prefix-length*]] * [**verbose**]

             Protocol: PROXY
             Querier state: Querier
             Join/Prune state: Join

     Non-downstream interfaces: None
```

Table 6 Command output

Field	Description
Total 1 (*, G) entries, 2 (S, G) entries	Total number of (*, G), and the total number of (S, G) entries.
(100::1, FF1E::1)	(S, G) entry.

Field	Description
Upstream interface	Incoming interface of a forwarding entry.
Downstream interfaces (1 in total)	Outgoing interfaces, and the total number of outgoing interfaces.
Non-downstream interfaces (1 in total)	Non-outgoing interfaces, and the total number of non-outgoing interfaces.
1: GigabitEthernet1/0/2	Index of an outgoing interface and the outgoing interface.
Protocol	Protocol type: • **MLD**—Dynamic MLD. • **PROXY**—MLD proxy. • **STATIC**—Static MLD.
Querier state	Querier state: • Querier. • Non-querier.
Join/Prune state	Joined or pruned state of the interface: • **NI**—Default state. • **Join**—Joined state. • **Prune**—Pruned state.

display mld ssm-mapping

Use **display mld ssm-mapping** to display MLD SSM mappings.

Syntax

display mld [**vpn-instance** *vpn-instance-name*] **ssm-mapping** *ipv6-group-address*

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command displays MLD SSM mappings on the public network.

ipv6-group-address: Specifies an IPv6 multicast group by its IPv6 address. The value range for this argument is FFxy::/16 (excluding FFx1::/16 and FFx2::/16), where "x" and "y" represent any hexadecimal numbers in the range of 0 to F.

Examples

Display MLD SSM mappings for IPv6 multicast group FF3E::101 on the public network.

```
<Sysname> display mld ssm-mapping ff3e::101
 Group: FF3E::101
 Source list:
```

```
1::1
1::2
10::1
100::10
```

Table 7 Command output

Field	Description
Group	IPv6 multicast group address.
Source list	List of IPv6 multicast source addresses.

last-listener-query-count (MLD view)

Use **last-listener-query-count** to set the MLD last listener query count globally.

Use **undo last-listener-query-count** to restore the default.

Syntax

mld last-member-query-count *count*

undo mld last-member-query-count

Default

The MLD last listener query count equals the MLD querier's robustness variable.

Views

MLD view

Predefined user roles

network-admin

context-admin

Parameters

count: Specifies an MLD last listener query count in the range of 1 to 255.

Usage guidelines

You can set the MLD last listener query count globally for all interfaces in MLD view or for an interface in interface view. For an interface, the interface-specific configuration takes priority over the global configuration.

Examples

Set the global MLD last listener query count to 6 on the public network.

```
<Sysname> system-view
[Sysname] mld
[Sysname-mld] last-listener-query-count 6
```

Related commands

mld last-listener-query-count

last-listener-query-interval (MLD view)

Use **last-listener-query-interval** to set the MLD last listener query interval globally.

Use **undo last-listener-query-interval** to restore the default.

Syntax

last-listener-query-interval *interval*

undo last-listener-query-interval

Default

The MLD last listener query interval is 1 second.

Views

MLD view

Predefined user roles

network-admin

context-admin

Parameters

interval: Specifies an MLD last listener query interval in the range of 1 to 25 seconds.

Usage guidelines

You can set the MLD last listener query interval globally for all interfaces in MLD view or for an interface in interface view. For an interface, the interface-specific configuration takes priority over the global configuration.

Examples

Set the global MLD last listener query interval to 6 seconds on the public network.

```
<Sysname> system-view
[Sysname] mld
[Sysname-mld] last-listener-query-interval 6
```

Related commands

mld last-listener-query-interval

max-response-time (MLD view)

Use **max-response-time** to set the maximum response time for MLD general queries globally.

Use **undo max-response-time** to restore the default.

Syntax

max-response-time *time*

undo max-response-time

Default

The maximum response time for MLD general queries is 10 seconds.

Views

MLD view

Predefined user roles

network-admin

context-admin

Parameters

time: Specifies the maximum response time for MLD general queries in the range of 1 to 3174 seconds.

Usage guidelines

You can set the maximum response time globally for all interfaces in MLD view or for an interface in interface view. For an interface, the interface-specific configuration takes priority over the global configuration.

Examples

Set the global maximum response time for MLD general queries to 25 seconds on the public network.

```
<Sysname> system-view
[Sysname] mld
[Sysname-mld] max-response-time 25
```

Related commands

mld max-response-time

mld

Use **mld** to enter MLD view.

Use **undo mld** to delete the configurations in MLD view.

Syntax

mld [**vpn-instance** *vpn-instance-name*]

undo mld [**vpn-instance** *vpn-instance-name*]

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command takes effect on the public network.

Examples

Enter MLD view of the public network.

```
<Sysname> system-view
[Sysname] mld
[Sysname-mld]
```

Enter MLD view of VPN instance **mvpn**.

```
<Sysname> system-view
[Sysname] mld vpn-instance mvpn
[Sysname-mld-mvpn]
```

mld enable

Use **mld enable** to enable MLD on an interface.

Use **undo mld enable** to disable MLD on an interface.

Syntax

mld enable

undo mld enable

Default

MLD is disabled on an interface.

Views

Interface view

Predefined user roles

network-admin

context-admin

Usage guidelines

This command takes effect only when IPv6 multicast routing is enabled on the public network or for the VPN instance to which the interface belongs.

Other MLD configurations on the interface take effect only when MLD is enabled on the interface.

Examples

Enable IPv6 multicast routing on the public network, and enable MLD for GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] ipv6 multicast routing
[Sysname-mrib6] quit
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] mld enable
```

Related commands

ipv6 multicast routing

mld fast-leave

Use **mld fast-leave** to enable fast-leave processing on an interface.

Use **undo mld fast-leave** to disable fast-leave processing on an interface.

Syntax

mld fast-leave [**group-policy** *ipv6-acl-number*]

undo mld fast-leave

Default

Fast-leave processing is disabled. The MLD querier sends MLD multicast-address-specific or multicast-address-and-source-specific queries after receiving a done message.

Views

Interface view

Predefined user roles

network-admin

context-admin

Parameters

ipv6-acl-number: Specifies an IPv6 basic ACL by its number in the range of 2000 to 2999. If you specify an ACL, the fast-leave processing feature takes effect only on the IPv6 multicast groups that the ACL permits. The feature takes effect on all IPv6 multicast groups when one of the following conditions exists:

- You do not specify an ACL.
- The specified ACL does not exist.
- The specified ACL does not have valid rules.

Usage guidelines

The fast-leave processing feature enables an MLD querier to suppress MLD multicast-address-specific or multicast-address-and-source-specific queries upon receiving MLD done messages permitted by the ACL.

When you configure a rule in the IPv6 basic ACL, follow these restrictions and guidelines:

- If the **vpn-instance** *vpn-instance* option is specified, the rule does not take effect.
- The **source** *source-address source-prefix* option specifies an IPv6 multicast group address.
- Among the other optional parameters, only the **fragment** keyword and the **time-range** *time-range-name* option take effect.

Examples

Enable fast-leave processing on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] mld fast-leave
```

mld group-policy

Use **mld group-policy** to configure an IPv6 multicast group policy on an interface to control the IPv6 multicast groups that hosts attached to the interface can join.

Use **undo mld group-policy** to delete the IPv6 multicast group policy on an interface.

Syntax

mld group-policy *ipv6-acl-number* [*version-number*]

undo mld group-policy

Default

No IPv6 multicast group policy exists. Hosts attached to the interface can join any IPv6 multicast groups.

Views

Interface view

Predefined user roles

network-admin

context-admin

Parameters

ipv6-acl-number: Specifies an IPv6 basic or advanced ACL by its number in the range of 2000 to 3999. Receiver hosts can join only the IPv6 multicast groups that the ACL permits. If the ACL does not exist or have valid rules, receiver hosts cannot join IPv6 multicast groups.

version-number: Specifies an MLD version number, 1 or 2. By default, this command takes effect on both MLDv1 reports and MLDv2 reports.

Usage guidelines

An IPv6 multicast group policy filters MLD reports to control the IPv6 multicast groups that hosts can join.

This command does not take effect on static member interfaces because static member interfaces do not send MLD reports.

When you configure a rule in the IPv6 ACL, follow these restrictions and guidelines:

- If the **vpn-instance** *vpn-instance* option is specified, the rule does not take effect.
- In a basic ACL, the **source** *source-address source-prefix* option specifies an IPv6 multicast group address.
- In an advanced ACL, the **source** *source-address source-prefix* option specifies an IPv6 multicast source address. The **destination** *dest-address dest-prefix* option specifies an IPv6 multicast group address.

  To match the following MLD reports, set the **source** *source-address source-prefix* option to 0::0:

  - MLDv1 reports.
  - MLDv2 IS_EX and MLDv2 TO_EX reports that do not carry multicast source addresses.
- Among the other optional parameters, only the **fragment** keyword and the **time-range** *time-range-name* option take effect.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Configure an IPv6 multicast group policy on GigabitEthernet 1/0/1 so that hosts attached to the interface can join only IPv6 multicast group FF03::101.

```
<Sysname> system-view
[Sysname] acl ipv6 basic 2005
[Sysname-acl-ipv6-basic-2005] rule permit source ff03::101 128
[Sysname-acl-ipv6-basic-2005] quit
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] mld group-policy 2005
```

mld last-listener-query-count

Use **mld last-listener-query-count** to set the MLD last member query count on an interface.

Use **undo mld last-listener-query-count** to restore the default.

Syntax

mld last-listener-query-count *count*

undo mld last-listener-query-count

Default

The MLD last listener query count equals the MLD querier's robustness variable.

Views

Interface view

Predefined user roles

network-admin

context-admin

Parameters

count: Specifies an MLD last listener query count in the range of 1 to 255.

Usage guidelines

You can set the MLD last listener query count for an interface in interface view or globally for all interfaces in MLD view. For an interface, the interface-specific configuration takes priority over the global configuration.

Examples

Set the MLD last listener query count to 6 on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] mld last-listener-query-count 6
```

Related commands

[Sysname-GigabitEthernet1/0/1] mld max-response-time 25
```

Related commands

max-response-time (MLD view)

mld non-stop-routing

Use **mld non-stop-routing** to enable MLD NSR.

Use **undo mld non-stop-routing** to disable MLD NSR.

Syntax

mld non-stop-routing

undo mld non-stop-routing

Default

MLD NSR is disabled.

Views

System view

Predefined user roles

network-admin

context-admin

Examples

Enable MLD NSR.

```
<Sysname> system-view
[Sysname] mld non-stop-routing
```

mld other-querier-present-timeout

Use **mld other-querier-present-timeout** to set the MLD other querier present timer on an interface.

Use **undo mld other-querier-present-timeout** to restore the default.

Syntax

mld other-querier-present-timeout *time*

undo mld other-querier-present-timeout

Default

The MLD other querier present timer is calculated by using the following formula:

[MLD general query interval] × [MLD querier's robustness variable] + [maximum response time for MLD general queries] / 2.

Views

Interface view

Predefined user roles

network-admin

context-admin

Parameters

time: Specifies an MLD other querier present timer in the range of 1 to 31744 seconds.

Usage guidelines

You can set the MLD other querier present timer for an interface in interface view or globally for all interfaces in MLD view. For an interface, the interface-specific configuration takes priority over the global configuration.

Examples

Set the MLD other querier present timer to 125 seconds on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] mld other-querier-present-timeout 125
```

Related commands

mld proxy enable

Use **mld proxy enable** to enable MLD proxying on an interface.

Use **undo mld proxy enable** to disable MLD proxying on an interface.

Syntax

mld proxy enable

undo mld proxy enable

Default

MLD proxying is disabled on an interface.

Views

Interface view

Predefined user roles

network-admin

context-admin

Usage guidelines

This command takes effect only when IPv6 multicast routing is enabled on the public network or for the VPN instance to which the interface belongs.

Examples

Enable IPv6 multicast routing on the public network, and enable MLD proxying on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] ipv6 multicast routing
[Sysname-mrib6] quit
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] mld proxy enable
```

Related commands

ipv6 multicast routing

mld proxy forwarding

Use **mld proxy forwarding** to enable IPv6 multicast forwarding on a non-querier interface.

Use **undo mld proxy forwarding** to disable IPv6 multicast forwarding on a non-querier interface.

Syntax

mld proxy forwarding

undo mld proxy forwarding

Default

IPv6 multicast forwarding is disabled for a non-querier interface.

Views

Interface view

Predefined user roles

network-admin

context-admin

Usage guidelines

Typically, only MLD queriers can forward IPv6 multicast traffic and non-queriers cannot. This prevents IPv6 multicast data from being repeatedly forwarded. If a router interface on the MLD proxy device failed the querier election, enable multicast forwarding capability on this interface to forward multicast data to attached receivers.

Examples

Enable IPv6 multicast forwarding on GigabitEthernet 1/0/1 (non-querier interface).

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] mld proxy forwarding
```

mld query-interval

Use **mld query-interval** to set the MLD general query interval on an interface.

Use **undo mld query-interval** to restore the default.

Syntax

mld query-interval *interval*

undo mld query-interval

Default

The MLD general query interval is 125 seconds.

Views

Interface view

Predefined user roles

network-admin

context-admin

Parameters

interval: Specifies an MLD general interval in the range of 1 to 31744 seconds.

Usage guidelines

You can set the MLD general interval for an interface in interface view or globally for all interfaces in MLD view. For an interface, the interface-specific configuration takes priority over the global configuration.

Examples

Set the MLD general query interval to 60 seconds on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] mld query-interval 60
```

Related commands

query-interval (MLD view)

mld robust-count

Use **mld robust-count** to set the MLD querier's robustness variable on an interface.

Use **undo mld robust-count** to restore the default.

Syntax

mld robust-count *count*

undo mld robust-count

Default

The MLD querier's robustness variable is 2.

Views

Interface view

Predefined user roles

network-admin

context-admin

Parameters

count: Specifies an MLD querier's robustness variable in the range of 1 to 255.

Usage guidelines

The MLD querier's robustness variable defines the number of times to retransmit MLD queries if packet loss occurs. A higher robustness variable makes the MLD querier more robust, but it increases the timeout time for IPv6 multicast groups.

You can set the MLD querier's robustness variable for an interface in interface view or globally for all interfaces in MLD view. For an interface, the interface-specific configuration takes priority over the global configuration.

Examples

Set the MLD querier's robustness variable to 5 on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] mld robust-count 5
```

Related commands

robust-count (MLD view)

mld startup-query-count

Use **mld startup-query-count** to set the MLD startup query count on an interface.

Use **undo mld startup-query-count** to restore the default.

Syntax

mld startup-query-count *count*

undo mld startup-query-count

Default

The MLD startup query count equals the MLD querier's robustness variable.

Views

Interface view

Predefined user roles

network-admin

context-admin

Parameters

count: Specifies an MLD startup query count in the range of 1 to 255.

Usage guidelines

You can set the MLD startup query count for an interface in interface view or globally for all interfaces in MLD view. For an interface, the interface-specific configuration takes priority over the global configuration.

Examples

Set the MLD startup query count to 5 on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1

startup-query-count (MLD view)

mld startup-query-interval

Use **mld startup-query-interval** to set the MLD startup query interval on an interface.

Use **undo mld startup-query-interval** to restore the default.

Syntax

mld startup-query-interval *interval*

undo mld startup-query-interval

Default

The MLD startup query interval equals one quarter of the MLD general query interval.

Views

Interface view

Predefined user roles

network-admin

context-admin

Parameters

interval: Specifies an MLD startup query interval in the range of 1 to 31744 seconds.

Usage guidelines

You can set the MLD startup query interval for an interface in interface view or globally for all interfaces in MLD view. For an interface, the interface-specific configuration takes priority over the global configuration.

Examples

Set the MLD startup query interval to 100 seconds on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] mld startup-query-interval 100
```

Related commands

startup-query-interval (MLD view)

mld static-group

Use **mld static-group** to configure an interface as a static group member of an IPv6 multicast group.

Use **undo mld static-group** to restore the default.

Syntax

mld static-group *ipv6-group-address* [**source** *ipv6-source-address*]

undo mld static-group { **all** | *ipv6-group-address* [**source** *ipv6-source-address*] }

Default

An interface is not a static member of IPv6 multicast groups.

Views

Interface view

Predefined user roles

network-admin

context-admin

Parameters

ipv6-group-address: Specifies an IPv6 multicast group by its IPv6 address. The value range for this argument is FFxy::/16 (excluding FFx1::/16 and FFx2::/16), where "x" and "y" represent any hexadecimal numbers in the range of 0 to F.

ipv6-source-address: Specifies an IPv6 multicast source by its IPv6 address. If you do not specify an IPv6 multicast source, this command configures an interface as a static group member of the multicast groups with all IPv6 multicast source addresses.

all: Specifies all IPv6 multicast groups that the interface has statically joined.

Usage guidelines

For IPv6 multicast routing entries to be created, specify an IPv6 multicast source address if the specified IPv6 multicast group address is in the SSM group range.

Examples

Configure GigabitEthernet 1/0/1 as a static group member of IPv6 multicast group FF03::101.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] mld static-group ff03::101
```

Configure GigabitEthernet 1/0/1 as a static group member of IPv6 multicast source and group (2001::101, FF3E::202).

```
<Sysname> system-view
```

```
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] mld static-group ff3e::202 source 2001::101
```

mld version

Use **mld version** to specify an MLD version for an interface.

Use **undo mld version** to restore the default.

Syntax

mld version *version-number*

undo mld version

Default

The MLD version is 1.

Views

Interface view

Predefined user roles

network-admin

context-admin

Parameters

version-number: Specifies an MLD version, 1 or 2.

Usage guidelines

CAUTION:
For MLD to operate correctly, specify the same MLD version for all devices on the same subnet.

Examples

Specify MLD version 2 for GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] mld version 2
```

other-querier-present-timeout (MLD view)

Use **other-querier-present-timeout** to set the MLD other querier present timer globally.

Use **undo other-querier-present-timeout** to restore the default.

Syntax

other-querier-present-timeout *time*

undo other-querier-present-timeout

Default

The MLD other querier present timer is calculated by using the following formula:

[MLD general query interval] × [MLD querier's robustness variable] + [maximum response time for MLD general queries] / 2.

Views

MLD view

Predefined user roles

network-admin

context-admin

Parameters

time: Specifies an MLD other querier present timer in the range of 1 to 31744 seconds.

Usage guidelines

You can set the MLD other querier present timer globally for all interfaces in MLD view or for an interface in interface view. For an interface, the interface-specific configuration takes priority over the global configuration.

Examples

Set the global MLD other querier present timer to 125 seconds on the public network.

```
<Sysname> system-view
[Sysname] mld
[Sysname-mld] other-querier-present-timeout 125
```

Related commands

mld other-querier-present-timeout

proxy multipath (MLD view)

Use **proxy multipath** to enable load splitting on the MLD proxy.

Use **undo proxy multipath** to disable load splitting on the MLD proxy.

Syntax

proxy multipath

undo proxy multipath

Default

The load splitting feature is disabled on the MLD proxy.

Views

MLD view

Predefined user roles

network-admin

context-admin

Usage guidelines

Use this feature when the MLD proxy has multiple proxy interfaces. All proxy interfaces on the MLD proxy share IPv6 multicast traffic on a per-group basis. If you do not enable this feature, only the proxy interface with the highest IPv6 address forwards IPv6 multicast traffic.

Examples

Enable load splitting on the MLD proxy device on the public network.

```
<Sysname> system-view
[Sysname] mld
[Sysname-mld] proxy multipath
```

query-interval (MLD view)

Use **query-interval** to set the MLD general query interval globally.

Use **undo query-interval** to restore the default.

Syntax

query-interval *interval*

undo query-interval

Default

The MLD general query interval is 125 seconds.

Views

MLD view

Predefined user roles

network-admin

context-admin

Parameters

interval: Specifies an MLD general query interval in the range of 1 to 31744 seconds.

Usage guidelines

You can set the MLD general query interval globally for all interfaces in MLD view or for an interface in interface view. For an interface, the interface-specific configuration takes priority over the global configuration.

Examples

Set the global MLD general query interval to 60 seconds on the public network.

```
<Sysname> system-view
[Sysname] mld
[Sysname-mld] query-interval 60
```

Related commands

reset mld group

Use **reset mld group** to clear dynamic MLD multicast group entries.

Syntax

reset mld [**vpn-instance** *vpn-instance-name*] **group** { **all** | **interface** *interface-type interface-number* { **all** | *ipv6-group-address* [*prefix-length*] [*ipv6-source-address* [*prefix-length*]] } }

Views

User view

Predefined user roles

network-admin

context-admin

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command clears dynamic MLD multicast group entries on the public network.

all: The first **all** specifies all interfaces, and the second **all** specifies all MLD multicast groups.

interface-type interface-number: Specifies an interface by its type and number.

ipv6-group-address: Specifies an IPv6 multicast group by its IPv6 address. The value range for this argument is FFxy::/16 (excluding FFx1::/16 and FFx2::/16), where "x" and "y" represent any hexadecimal numbers in the range of 0 to F.

ipv6-source-address: Specifies an IPv6 multicast source by its IPv6 address. If you do not specify an IPv6 multicast source, this command clears dynamic MLD multicast group entries for all IPv6 multicast sources.

prefix-length: Specifies an address prefix length. The default is 128. For a multicast source address, the value range for this argument is 0 to 128. For a multicast group address, the value range for this argument is 8 to 128.

Usage guidelines

CAUTION:

This command might interrupt the IPv6 multicast information transmission.

Examples

Clear dynamic MLD multicast groups for all interfaces on the public network.

```
<Sysname> reset mld group all
```

Clear all dynamic MLD multicast group entries for GigabitEthernet 1/0/1 on the public network.

```
<Sysname> reset mld group interface gigabitethernet 1/0/1 all
```

Clear the dynamic entry of the MLD multicast group FF03::101:10 for GigabitEthernet 1/0/1 on the public network.

```
<Sysname> reset mld group interface gigabitethernet 1/0/1 ff03::101:10
```

display mld group

robust-count (MLD view)

Use **robust-count** to set the MLD querier's robustness variable globally.

Use **undo robust-count** to restore the default.

Syntax

robust-count *count*

undo robust-count

Default

The MLD querier's robustness variable is 2.

Views

MLD view

Predefined user roles

network-admin

context-admin

Parameters

count: Specifies an MLD querier's robustness variable in the range of 1 to 255.

Usage guidelines

The MLD querier's robustness variable defines the number of times to retransmit MLD queries if packet loss occurs. A higher robustness variable makes the MLD querier more robust, but it increases the timeout time for IPv6 multicast groups.

You can set the MLD querier's robustness variable globally for all interfaces in MLD view or for an interface in interface view. For an interface, the interface-specific configuration takes priority over the global configuration.

Examples

Set the global MLD querier's robustness variable to 5 on the public network.

```
<Sysname> system-view
[Sysname] mld
[Sysname-mld] robust-count 5
```

Related commands

mld robust-count

ssm-mapping (MLD view)

Use **ssm-mapping** to configure an MLD SSM mapping.

Use **undo ssm-mapping** to delete MLD SSM mappings.

Syntax

ssm-mapping *ipv6-source-address ipv6-acl-number*

undo ssm-mapping { *ipv6-source-address* | **all** }

Default

No MLD SSM mappings exist.

Views

MLD view

Predefined user roles

network-admin

context-admin

Parameters

ipv6-source-address: Specifies an IPv6 multicast source by its IPv6 address.

ipv6-acl-number: Specifies an IPv6 basic ACL number in the range of 2000 to 2999. IPv6 multicast groups in MLD reports permitted by the ACL are associated with the IPv6 multicast source. If the ACL does not exist or does not have valid rules, no IPv6 multicast groups are associated with the IPv6 multicast source.

all: Specifies all MLD SSM mappings.

Usage guidelines

When you configure a rule in the IPv6 basic ACL, follow these restrictions and guidelines:

- If the **vpn-instance** *vpn-instance* option is specified, the rule does not take effect.

- The **source** *source-address source-prefix* **option specifies an** IPv6 multicast group address.
- Among the other optional parameters, only the **fragment keyword and the time-range** *time-range-name* option take effect.

Examples

Configure an MLD SSM mapping with IPv6 multicast source 1::1 and IPv6 multicast group range FF3E::/64 on the public network.

```
<Sysname> system-view
[Sysname] acl ipv6 basic 2001
[Sysname-acl-ipv6-basic-2001] rule permit source ff3e:: 64
[Sysname-acl-ipv6-basic-2001] quit
[Sysname] mld
[Sysname-mld] ssm-mapping 1::1 2001
```

Related commands

display mld ssm-mapping

startup-query-count (MLD view)

Use **startup-query-count** to set the MLD startup query count globally.

Use **undo startup-query-count** to restore the default.

Syntax

startup-query-count *count*

undo startup-query-count

Default

The MLD startup query count equals the MLD querier's robustness variable.

Views

MLD view

Predefined user roles

network-admin

context-admin

Parameters

count: Specifies an MLD startup query count in the range of 1 to 255.

Usage guidelines

You can set the MLD startup query count globally for all interfaces in MLD view or for an interface in interface view. For an interface, the interface-specific configuration takes priority over the global configuration.

Examples

Set the global MLD startup query count to 5 on the public network.

```
<Sysname> system-view
[Sysname] mld
[Sysname-mld] startup-query-count 5
```

Related commands

mld startup-query-count

startup-query-interval (MLD view)

Use **startup-query-interval** to set the MLD startup query interval globally.

Use **undo startup-query-interval** to restore the default.

Syntax

startup-query-interval *interval*

undo startup-query-interval

Default

The MLD startup query interval equals one quarter of the MLD general query interval.

Views

MLD view

Predefined user roles

network-admin

context-admin

Parameters

interval: Specifies an MLD startup query interval in the range of 1 to 31744 seconds.

Usage guidelines

You can set the MLD startup query interval globally for all interfaces in MLD view or for an interface in interface view. For an interface, the interface-specific configuration takes priority over the global configuration.

Examples

Set the global MLD startup query interval to 100 seconds on the public network.

```
<Sysname> system-view
[Sysname] mld
[Sysname-mld] startup-query-interval 100
```

Related commands

mld startup-query-interval

NSFOCUS Firewall Series

NF Network Management and Monitoring Command Reference

NSFOCUS Technologies, Inc.

Document version: 6W600-20230221

Preface

This command reference describes the commands for configuring network management and monitoring features, including system maintenance and debugging (ping, tracert, and system debugging), NQA, NTP, EAA, process monitoring and maintenance, NETCONF, information center, SNMP, NetStream, RMON, flow log, event MIB, fast log output, mirroring, and CWMP.

This preface includes the following topics about the documentation:

Audience

This documentation is intended for:

- Network planners.
- Field technical support and servicing engineers.
- Network administrators.

Conventions

The following information describes the conventions used in the documentation.

Command conventions

Convention	Description
Boldface	**Bold** text represents commands and keywords that you enter literally as shown.
Italic	*Italic* text represents arguments that you replace with actual values.
[ ]	Square brackets enclose syntax choices (keywords or arguments) that are optional.
{ x | y | ... }	Braces enclose a set of required syntax choices separated by vertical bars, from which you select one.
[x | y | ...]	Square brackets enclose a set of optional syntax choices separated by vertical bars, from which you select one or none.
{ x | y | ... } *	Asterisk marked braces enclose a set of required syntax choices separated by vertical bars, from which you select a minimum of one.
[x | y | ...] *	Asterisk marked square brackets enclose optional syntax choices separated by vertical bars, from which you select one choice, multiple choices, or none.
&<1-n>	The argument or keyword and argument combination before the ampersand (&) sign can be entered 1 to n times.
#	A line that starts with a pound (#) sign is comments.

GUI conventions

Convention	Description
Boldface	Window names, button names, field names, and menu items are in Boldface. For example, the **New User** window opens; click **OK**.
>	Multi-level menus are separated by angle brackets. For example, **File** > **Create** > **Folder**.

Symbols

Convention	Description
WARNING!	An alert that calls attention to important information that if not understood or followed can result in personal injury.
CAUTION:	An alert that calls attention to important information that if not understood or followed can result in data loss, data corruption, or damage to hardware or software.
IMPORTANT:	An alert that calls attention to essential information.
NOTE:	An alert that contains additional or supplementary information.
TIP:	An alert that provides helpful information.

Network topology icons

Convention	Description
	Represents a generic network device, such as a router, switch, or firewall.
	Represents a routing-capable device, such as a router or Layer 3 switch.
	Represents a generic switch, such as a Layer 2 or Layer 3 switch, or a router that supports Layer 2 forwarding and other Layer 2 features.
	Represents an access controller, a unified wired-WLAN module, or the access controller engine on a unified wired-WLAN switch.
	Represents an access point.
	Represents a wireless terminator unit.
	Represents a wireless terminator.
	Represents a mesh access point.
	Represents omnidirectional signals.
	Represents directional signals.
	Represents a security product, such as a firewall, UTM, multiservice security gateway, or load balancing device.
	Represents a security module, such as a firewall, load balancing, NetStream, SSL VPN, IPS, or ACG module.

Examples provided in this document

Examples in this document might use devices that differ from your device in hardware model, configuration, or software version. It is normal that the port numbers, sample output, screenshots, and other information in the examples differ from what you have on your device.

Contents

Information center commands

diagnostic-logfile save

Use **diagnostic-logfile save** to manually save diagnostic logs from the diagnostic log file buffer to the diagnostic log file.

Syntax

diagnostic-logfile save

Views

Any view

Predefined user roles

network-admin

context-admin

Usage guidelines

You can specify the directory to save the diagnostic log file by using the **info-center diagnostic-logfile directory** command.

The system clears the diagnostic log file buffer after saving the buffered diagnostic logs to the diagnostic log file.

If the diagnostic log file buffer is empty, this command displays a success message event though no logs are saved to the diagnostic log file.

Examples

Manually save diagnostic logs from the diagnostic log file buffer to the diagnostic log file.

```
<Sysname> diagnostic-logfile save
The contents in the diagnostic log file buffer have been saved to the file
flash:/diagfile/diagfile.log.
```

Related commands

info-center diagnostic-logfile enable

info-center diagnostic-logfile directory

display character-set

Use **display character-set** to display the character set encoding used on the device or the login terminal.

Syntax

display character-set [**terminal**]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

terminal: Displays the character set encoding used on the login terminal. If you do not specify this keyword, this command displays the character set encoding used on the device. By default, the device uses the GB18030 encoding and the encoding cannot be changed.

Usage guidelines

For the user' login terminal to correctly display Chinese characters in log messages received from the device, the device and the terminal must use the same character set encoding.

Use the **display character-set terminal** command to identify the character set encoding used on the login terminal. The device will send test characters in both UTF-8 and GB18030 encodings to the terminal. The test characters will be displayed as 中文 for the character set encoding used on the terminal.

Examples

Display the character set encoding used on the device.

```
<Sysname> system-view
[Sysname] display character-set
Current character set encoding: GB18030
```

Display the character set encoding used on the login terminal.

```
<Sysname> system-view
[Sysname] display character-set terminal
Character set           Test characters
UTF-8                   涓  枸
GB18030                 中文
```

Table 1 Command output

Field	Description
Current character set encoding	Character set encoding used on the device.
Character set	Character set encoding used by the device to send test strings to the terminal. Options are UTF-8 and GB18030.
Test characters	Parsing result of the test characters. The test characters will be displayed as 中文 for the character set encoding used on the login terminal.

Related commands

info-center syslog utf-8 enable

display diagnostic-logfile summary

Use **display diagnostic-logfile summary** to display the diagnostic log file configuration.

Syntax

display diagnostic-logfile summary

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Examples

Display the diagnostic log file configuration.

```
<Sysname> display diagnostic-logfile summary
  Diagnostic log file: Enabled.
  Diagnostic log file size quota: 10 MB
  Diagnostic log file directory: flash:/diagfile
  Writing frequency: 24 hour 0 min 0 sec
```

Table 2 Command output

Field	Description
Diagnostic log file	Status of the diagnostic log file: • **Enabled**—Diagnostic logs can be output to the diagnostic log file. • **Disabled**—Diagnostic logs cannot be output to the diagnostic log file.
Diagnostic log file size quota	Maximum size for the diagnostic log file, in MB.
Log file directory	Directory where the diagnostic log file is saved.
Writing frequency	Interval at which the system saves diagnostic logs from the buffer to the diagnostic log file.

display info-center

Use **`display info-center`** to display information center configuration.

Syntax

`display info-center`

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Examples

Display information center configuration.

```
<Sysname> display info-center
Information Center: Enabled
Console: Enabled
Monitor: Enabled
Log host: Enabled
    192.168.0.1, log output filter: loghost1
```

```
    port number: 5000, host facility: local7
Log buffer: Enabled
    Max buffer size 1024, current buffer size 512,
    Current messages 0, dropped messages 0, overwritten messages 0
Log file: Enabled
Security log file: Enabled
Information timestamp format:
    Log host: Date
    Other output destination: Date
```

display info-center filter

Use **display info-center filter** to display information about log output filters.

Syntax

display info-center filter [*filtername*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

filter-name: Specifies an existing log output filter by its name. If you do not specify a log output filter, this command display information about all log output filters.

Examples

Display information about log output filter **loghost1**.

```
<Sysname> display info-center filter loghost1
 Log output filter: loghost1
 Module                       Rule
 ARP                          Debugging
 CFGLOG                       Deny
 Default                      Informational
```

Table 3 Command output

Field	Description
Log output filter:	Name of the log output filter.
Module	Module to which the log output filter applies.
Rule	Rules in the log output filter.

Related commands

info-center filter

display info-center source

Use **display info-center source** to display the log output rules by source modules.

Syntax

display info-center source [**module** *module-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

module *module-name*: Specifies a module. The *module-name* argument is a case insensitive string that represents the complete module name. To view the names of supported modules, execute the **display info-center source module ?** command. If you do not specify a module, this command displays the log output rules for all modules.

Usage guidelines

By default, the information center outputs logs of different modules according to the default log output rules (see Table 10). You can use the **info-center source** command to change the log output rules. The **display info-center source** command displays the current log output rules of log source modules.

Examples

Display the current log output rules for all modules.

```
<Sysname> display info-center source
 Module   Console       Monitor       Loghost       Logbuffer     Logfile
 ACL      DEBUG         DEBUG         INFO          INFO          INFO
 ADJ4     DEBUG         DEBUG         INFO          INFO          INFO
 ADJ6     DEBUG         DEBUG         INFO          INFO          INFO
```

…

Display the current log output rules for the EDEV module.

```
<Sysname> display info-center source module EDEV
 Module   Console       Monitor       Loghost       Logbuffer     Logfile
 EDEV     DEBUG         DEBUG         INFO          INFO          INFO
```

Table 4 Command output

Field	Description
Module	Module name.
Console	Lowest level of logs that can be output to the console. This field displays **deny** if no logs of the module can be output to the console.
Monitor	Lowest level of logs that can be output to the monitor terminal. This field displays **deny** if no logs of the module can be output to the monitor terminal.
Loghost	Lowest level of logs that can be output to the log host.

	This field displays **deny** if no logs of the module can be output to the log host.
Logbuffer	Lowest level of logs that can be output to the log buffer. This field displays **deny** if no logs of the module can be output to the log buffer.
Logfile	Lowest level of logs that can be output to the log file. This field displays **deny** if no logs of the module can be output to the log file.

Related commands

info-center source

display logbuffer

Use **display logbuffer** to display log buffer information and buffered logs.

Syntax

display logbuffer [**module** *module-name* [**submodule** *submodule-name*]] [**reverse**] [**level** *severity* | **size** *buffersize* | **slot** *slot-number*] * [**last-mins** *mins*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

module *module-name*: Displays information for the log buffer of a module. The *module-name* argument is a case-insensitive string that represents the complete module name. To view the names of supported modules, execute the **display logbuffer module ?** command. If you do not specify a module, this command displays the information for the general log buffer.

submodule *submodule-name*: Displays log buffer information for a submodule of the specified module. The *submodule--name* argument is a case-insensitive string that represents the complete submodule name. To view the names of supported submodules, execute the **display logbuffer module module-name submodule ?** command. If you do not specify a submodule, this command displays log buffer information for all submodules of the specified module.

reverse: Displays log entries chronologically, with the most recent entry at the top. If you do not specify this keyword, the command displays log entries chronologically, with the oldest entry at the top.

level *severity*: Specifies a severity level in the range of 0 to 7. If you do not specify a severity level, this command displays log information for all levels.

Table 5 Log levels

Severity value	Level	Description
0	Emergency	The system is unusable. For example, the system authorization has expired.
1	Alert	Action must be taken immediately. For example, traffic on an interface exceeds the upper limit.

Severity value	Level	Description
2	Critical	Critical condition. For example, the device temperature exceeds the upper limit, the power module fails, or the fan tray fails.
3	Error	Error condition. For example, the link state changes.
4	Warning	Warning condition. For example, an interface is disconnected, or the memory resources are used up.
5	Notification	Normal but significant condition. For example, a terminal logs in to the device, or the device reboots.
6	Informational	Informational message. For example, a command or a **ping** operation is executed.
7	Debugging	Debugging message.

size *buffersize*: Specifies the number of latest logs to be displayed. The value range is 1 to 1024. If you do not specify this option, the command displays all logs in the log buffer.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays information for all member devices.

last-mins *mins*: Displays logs buffered over the last specified period of time. The *mins* argument specifies a time period in the range of 1 to 43200 minutes. If you do not specify a time period, the command displays all logs in the log buffer.

Examples

Display log buffer information and buffered logs.

```
<Sysname> display logbuffer
Log buffer: Enabled
Max buffer size: 1024
Actual buffer size: 512
Dropped messages: 0
Overwritten messages: 718
Current messages: 512
Some messages might not be displayed due to permission issues.
%Jun 17 15:57:09:578 2017 Sysname SYSLOG/7/SYS_RESTART:System restarted --
…
```

Display log buffer information and logs buffered over the last 5 minutes.

```
<Sysname> display logbuffer last-mins 5
Log buffer: Enabled
Max buffer size: 1024
Actual buffer size: 512
Dropped messages: 0
Overwritten messages: 0
Current messages: 191
%Jan  1 01:00:06:784 2018 Sysname SHELL/6/SHELL_CMD:
-Line=vty0-IPAddr=192.168.1.242-User=**; Command is display current-configuration
%Jan  1 01:03:19:691 2018 Sysname SHELL/5/SHELL_LOGIN: VTY logged in from 192.168.1.33.
%Jan  1 01:03:21:269 2018 Sysname SHELL/6/SHELL_CMD:
-Line=vty1-IPAddr=192.168.1.33-User=**; Command is display logbuffer last-mins 5
```

Table 6 Command output

Field	Description
Log buffer	Status of the log buffer: • **Enabled**—Logs can be output to the log buffer. • **Disabled**—Logs cannot be output to the buffer.
Max buffer size	Maximum buffer size supported by the device.
Actual buffer size	Maximum buffer size configured by using the **info-center logbuffer size** command.
Dropped messages	Number of dropped messages.
Overwritten messages	Number of overwritten messages.
Current messages	Number of current messages.
Some messages might not be displayed due to permission issues.	The log information displayed by the **display logbuffer** command varies by user role. For information about user roles, see RBAC configuration in *Fundamentals Configuration Guide*.

Related commands

info-center logbuffer

reset logbuffer

display logbuffer summary

Use **display logbuffer summary** to display the log buffer summary.

Syntax

display logbuffer summary [**level** *severity* | **slot** *slot-number*] *

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

level *severity*: Specifies a severity level in the range of 0 to 7. If you do not specify a severity level, this command displays log information of all levels in the log buffer. For more information about log levels, see Table 5.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays information for all member devices.

Usage guidelines

This command displays only the summary of the general log buffer.

Examples

Display the summary of the log buffer.

```
<Sysname> display logbuffer summary
```

```
Slot EMERG ALERT  CRIT ERROR  WARN NOTIF  INFO DEBUG
   1     0     0     0     7     0    34    38     0
```

Table 7 Command output

Field	Description
EMERG	Represents emergency. For more information, see Table 5.
ALERT	Represents alert. For more information, see Table 5.
CRIT	Represents critical. For more information, see Table 5.
ERROR	Represents error. For more information, see Table 5.
WARN	Represents warning. For more information, see Table 5.
NOTIF	Represents notification. For more information, see Table 5.
INFO	Represents informational. For more information, see Table 5.
DEBUG	Represents debug. For more information, see Table 5.

display logfile summary

Use **`display logfile summary`** to display the log file configuration.

Syntax

`display logfile summary`

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Usage guidelines

This command displays only the general log file configuration.

Examples

Display the log file configuration.

```
<Sysname> display logfile summary
  Log file: Enabled.
  Log file size quota: 10 MB
  Log file directory: flash:/logfile
  Writing frequency: 24 hour 0 min 10 sec
```

Table 8 Command output

Field	Description
Log file	Log file status: • **Enabled**—Logs can be output to the log file. • **Disabled**—Logs cannot be output to the log file.

Field	Description
Log file size quota	Maximum log file size, in MB.
Log file directory	Log file directory.
Writing frequency	Log file writing frequency.

display security-logfile summary

Use **display security-logfile summary** to display the summary of the security log file.

Syntax

display security-logfile summary

Views

Any view

Predefined user roles

security-audit

Usage guidelines

To use this command, a local user must have the security-audit user role. For information about configuring the security-audit user role, see AAA commands in *Security Command Reference*.

Examples

Display the summary of the security log file.

```
<Sysname> display security-logfile summary
  Security log file: Enabled
  Security log file size quota: 10 MB
  Security log file directory: flash:/seclog
  Alarm threshold: 80%
  Current usage: 30%
  Writing frequency: 24 hour 0 min 0 sec
```

Table 9 Command output

Field	Description
Security log file	Status of the security log file: • **Enabled**—Security logs can be output to the security log file. • **Disabled**—Security logs cannot be output to the security log file.
Security log file size quota	Maximum storage space reserved for the security log file.
Security log file directory	Security log file directory.
Alarm threshold	Alarm threshold of the security log file usage.
Current usage	Current usage of the security log file.
Writing frequency	Security log file writing frequency.

Related commands

authorization-attribute (*Security Command Reference*)

enable log updown

Use **enable log updown** to enable an interface to generate link up or link down logs when the interface state changes.

Use **undo enable log updown** to disable an interface from generating link up or link down logs when the interface state changes.

Syntax

enable log updown

undo enable log updown

Default

All interfaces are allowed to generate link up and link down logs.

Views

Interface view

Predefined user roles

network-admin

context-admin

Examples

Disable GigabitEthernet 1/0/1 from generating link up or link down logs.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] undo enable log updown
```

info-center diagnostic-logfile directory

Use **info-center diagnostic-logfile directory** to configure the directory to save the diagnostic log file.

Syntax

info-center diagnostic-logfile directory *dir-name*

Default

The diagnostic log file is saved in the **diagfile** folder under the root directory of the default file system.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

dir-name: Specifies a directory by its name, a string of 1 to 64 characters.

Usage guidelines

The specified directory must have been created.

This command cannot survive an IRF reboot or a master/subordinate switchover.

Examples

Set the diagnostic log file directory to **flash:/test**.

```
<Sysname> mkdir test
Creating directory flash:/test... Done.
<Sysname> system-view
[Sysname] info-center diagnostic-logfile directory flash:/test
```

info-center diagnostic-logfile enable

Use **info-center diagnostic-logfile enable** to enable saving of diagnostic logs to the diagnostic log file.

Use **undo info-center diagnostic-logfile enable** to disable saving of diagnostic logs to the diagnostic log file.

Syntax

info-center diagnostic-logfile enable

undo info-center diagnostic-logfile enable

Default

Saving of diagnostic logs to the diagnostic log file is enabled.

Views

System view

Predefined user roles

network-admin

context-admin

Usage guidelines

This command enables saving diagnostic logs to the diagnostic log file for centralized management. You can view the diagnostic logs to monitor device activities and to troubleshoot problems.

Examples

Enable saving diagnostic logs to the diagnostic log file.

```
<Sysname> system-view
[Sysname] info-center diagnostic-logfile enable
```

info-center diagnostic-logfile frequency

Use **info-center diagnostic-logfile frequency** to configure the interval at which the system saves diagnostic logs from the diagnostic log file buffer to the diagnostic log file.

Use **undo info-center diagnostic-logfile frequency** to restore the default.

Syntax

info-center diagnostic-logfile frequency *freq-sec*

undo info-center diagnostic-logfile frequency

Default

The diagnostic log file saving interval is 86400 seconds.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

freq-sec: Specifies the diagnostic log file saving interval in seconds. The value range is 10 to 86400.

Usage guidelines

The system outputs diagnostic logs to the diagnostic log file buffer, and then saves the buffered logs to the diagnostic log file at the specified interval.

Examples

Set the diagnostic log file saving interval to 600 seconds.

```
<Sysname> system-view
[Sysname] info-center diagnostic-logfile frequency 600
```

Related commands

info-center diagnostic-logfile enable

info-center diagnostic-logfile quota

Use **info-center diagnostic-logfile quota** to set the maximum size for the diagnostic log file.

Use **undo info-center diagnostic-logfile quota** to restore the default.

Syntax

info-center diagnostic-logfile quota *size*

undo info-center diagnostic-logfile quota

Default

The maximum size for the diagnostic log file is 10 MB.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

size: Specifies the maximum size for the diagnostic log file, in MB. The value range is 1 to 10.

Examples

Set the maximum size to 6 MB for the diagnostic log file.

```
<Sysname> system-view
[Sysname] info-center diagnostic-logfile quota 6
```

info-center enable

Use **info-center enable** to enable the information center.

Use **undo info-center enable** to disable the information center.

Syntax

info-center enable

undo info-center enable

Default

The information center is enabled.

Views

System view

Predefined user roles

network-admin

context-admin

Examples

Enable the information center.

```
<Sysname> system-view
[Sysname] info-center enable
Information center is enabled.
```

info-center filter

Use **info-center filter** to create a log output filter.

Use **undo info-center filter** to delete a log output filter.

Syntax

info-center filter *filter-name* { *module-name* | **default** } { **deny** | **level** *severity* }

undo info-center filter *filter-name* [*module-name* | **default**]

Default

No log output filters exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

filter-name: Specifies a name for the log output filter, a case-insensitive string of 1 to 8 characters.

module-name: Specifies a module by its name. To view the names of supported modules, execute the **info-center filter** *filter-name* **?** command.

default: Specifies all supported modules.

deny: Disables log output.

level *severity*: Specifies a log severity level by its name. Supported severity levels are **alert**, **critical**, **debugging**, **emergency**, **error**, **informational**, **notification**, and **warning**. See Table 5 for more information about the log severity levels. The log output filter applies to logs of the specified severity level and all higher levels.

Usage guidelines

A log output filter contains a set of log output filter rules for modules. You can create multiple log output filters. When specifying a log host, you can apply a log output filter to control log output to the log host.

You can also use the **info-center source** command to configure log output rules for the log host output destination. The system chooses the settings to control log output to a log host in the following order:

1. Log output filter specified for the log host by using the **info-center loghost** command.
2. Log output rules configured for the log host output destination by using the **info-center source** command.
3. Default log output rules (see Table 10).

Follow these restrictions and guidelines when you configure a log output filter:

- To set a log output filter rule for a module, use the *module-name* argument to specify the module name.

  If you set log output filter rules for the same module multiple times, the most recent configuration takes effect.
- To set a general log output filter rule for all modules, use the **default** keyword. The general log output filter rule applies to all modules that do not have module-specific filter rules.

  If you set a general log output filter rule multiple times, the most recent configuration takes effect.
- If no general log output filter rule is set, the system outputs logs with severity levels **informational** through **alert** for modules that do not have module-specific filter rules.
- To remove a module-specific log output filter rule, you must use the *module-name* argument. You cannot use the **default** keyword to remove module-specific log output filter rules. If you do not specify any parameters, the entire log output filter is deleted.

Examples

Create log output filter **loghost1**. In the log output filter, enable the ARP module to output logs with severity levels **notification** through **alert**, enable the SNMP module to output logs with severity levels **warning** through **alert**, and disable log output of all other modules.

```
<Sysname> system-view
[Sysname] info-center filter loghost1 arp level notification
[Sysname] info-center filter loghost1 snmp level warning
[Sysname] info-center filter loghost1 default deny
```

Related commands

display info-center filter

info-center loghost

info-center source

info-center format

Use **info-center format** to set the format for logs sent to log hosts.

Use **undo info-center format** to restore the default.

Syntax

info-center format { **cmcc** | **sgcc** | **unicom** }

undo info-center format

Default

Logs are sent to log hosts in non-customized format.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

cmcc: Specifies the China Mobile Communications Corporation (CMCC) format.

sgcc: Specifies the State Grid Corporation of China (SGCC) format.

unicom: Specifies the China Unicom format.

Usage guidelines

Logs can be sent to log hosts in non-customized, China Unicom, SGCC, or CMCC format. For more information about log formats, see information center configuration in *Network Management and Monitoring Configuration Guide*.

Examples

Set the log format to China Unicom for logs sent to log hosts.

```
<Sysname> system-view
[Sysname] info-center format unicom
```

info-center logbuffer

Use **info-center logbuffer** to enable log output to the log buffer.

Use **undo info-center logbuffer** to disable log output to the log buffer.

Syntax

info-center logbuffer

undo info-center logbuffer

Default

Log output to the log buffer is enabled.

Views

System view

Predefined user roles

network-admin

context-admin

Usage guidelines

This command enables log output to log buffers based on the log source modules.

- Logs generated by modules or submodules that have separate log buffers are saved to their respective log buffers.

  For example, session logs are saved to the session log buffer.
- Logs generated by other modules are saved to the general log buffer.

To view log buffer information and buffered logs, use the **display logbuffer** command.

To set the log buffer size, use the **info-center logbuffer size** command.

Examples

Enable log output to the log buffer.

```
<Sysname> system-view
[Sysname] info-center logbuffer
```

Related commands

display logbuffer

info-center enable

info-center logbuffer size

Use **info-center logbuffer size** to set the maximum number of logs that can be buffered.

Use **undo info-center logbuffer size** to restore the default.

Syntax

info-center logbuffer [**module** *module-name*] **size** *buffersize*

undo info-center logbuffer [**module** *module-name*] **size**

Default

A maximum of 512 logs can be buffered.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

module *module-name*: Sets the size for the log buffer of a module. The *module-name* argument is a case-insensitive string that represents the complete module name. To view the names of supported modules, execute the **info-center logbuffer module ?** command. If you do not specify a module, this command sets the size for the general log buffer.

buffersize: Specifies the maximum log buffer size. The value range is 0 to 1024.

Examples

Set the maximum log buffer size to 50.

```
<Sysname> system-view
[Sysname] info-center logbuffer size 50
```

Restore the default maximum log buffer size.

```
<Sysname> system-view
[Sysname] undo info-center logbuffer size
```

Related commands

display logbuffer

info-center enable

info-center logfile directory

Use **info-center logfile directory** to specify the directory to save the log file.

Syntax

info-center logfile directory *dir-name*

Default

The log file is saved in the **logfile** folder under the root directory of the default file system.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

dir-name: Specifies a directory by its name, a string of 1 to 64 characters.

Usage guidelines

The specified log file directory must have been created.

The log file uses the .log extension.

This command cannot survive an IRF reboot or a master/subordinate switchover.

Examples

Set the log file directory to **flash:/test**.

```
<Sysname> mkdir test
Creating directory flash:/test... Done.
<Sysname> system-view
[Sysname] info-center logfile directory flash:/test
```

Related commands

info-center logfile enable

info-center logfile enable

Use **info-center logfile enable** to enable the log file feature.

Use **undo info-center logfile enable** to disable the log file feature.

Syntax

info-center logfile enable

undo info-center logfile enable

Default

The log file feature is enabled.

Views

System view

Predefined user roles

network-admin

context-admin

Usage guidelines

After you configure this command, the system outputs logs to log files according to the log source modules.

- Logs generated by modules or submodules that have separate log files are output to their respective log files.

  For example, session logs are output to the log file named **session.log**.

  The modules and submodules that have separate log files are predefined and they cannot be changed.
- Logs generated by other modules are output to the general log file.

Examples

Enable log output to the log file.

```
<Sysname> system-view
[Sysname] info-center logfile enable
```

info-center logfile frequency

Use **info-center logfile frequency** to configure the interval at which the system saves logs from the log file buffer to the log file.

Use **undo info-center logfile frequency** to restore the default.

Syntax

info-center logfile frequency *freq-sec*

undo info-center logfile frequency

Default

The log file saving interval is 86400 seconds.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

freq-sec: Specifies the log file saving interval in seconds. The value range is 1 to 86400.

Usage guidelines

This command enables the system to automatically save logs in the log file buffer to the log file at the specified interval.

Examples

Set the log file saving interval to 60000 seconds.

```
<Sysname> system-view
```

```
[Sysname] info-center logfile frequency 60000
```

Related commands

info-center logfile enable

info-center logfile module alarm-threshold

Use **info-center logfile module alarm-threshold** to set the log file usage alarm threshold for a module.

Use **undo info-center logfile module alarm-threshold** to restore the default.

Syntax

info-center logfile module *module-name* **alarm-threshold** *usage*

undo info-center logfile module *module-name* **alarm-threshold**

Default

The log file usage alarm threshold is 80% of the log file size. When the log file usage ratio of a module reaches 80%, the system outputs a message to inform the user.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

module *module-name*: Specifies a module. The *module-name* argument is a case insensitive string that represents the complete module name. To view the names of supported modules, execute the **info-center logfile module ?** command.

usage: Specifies an alarm threshold in percentage in the range of 0 to 100. Set the value to 0 to disable the log file usage alarm feature.

Usage guidelines

After you set the alarm threshold for the log file usage of a module, the system outputs a message to inform the user when the threshold is reached. The user can then back up the log file to avoid loss of log data.

Examples

Set the log file usage alarm threshold to 90% of the log file size for the session module.

```
<Sysname> system-view
[Sysname] info-center logfile module SESSION alarm-threshold 90
```

info-center logfile size-quota

Use **info-center logfile size-quota** to set the maximum log file size.

Use **undo info-center logfile size-quota** to restore the default.

Syntax

info-center logfile [**module** *module-name*] **size-quota** *size*

undo info-center logfile [**module** *module-name*] **size-quota**

Default

The maximum log file size for the general log file and module-specific log file is 10 MB and 1 MB, respectively.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

module *module-name*: Sets the maximum log file size for a module. The *module-name* argument is a case-insensitive string that represents the complete module name. To view the names of supported modules, execute the **info-center logfile module ?** command. If you do not specify a module, this command sets the size for the general log file.

size: Specifies the maximum log file size in MB. The value range is 1 to 10.

Examples

Set the maximum log file size to 2 MB.

```
<Sysname> system-view
[Sysname] info-center logfile size-quota 2
```

Related commands

info-center logfile enable

info-center logging suppress duplicates

Use **info-center logging suppress duplicates** to enable duplicate log suppression.

Use **undo info-center logging suppress duplicates** to disable duplicate log suppression.

Syntax

info-center logging suppress duplicates

undo info-center logging suppress duplicates

Default

Duplicate log suppression is disabled.

Views

System view

Predefined user roles

network-admin

context-admin

Usage guidelines

Outputting consecutive duplicate logs wastes system and network resources and increases device maintenance costs. You can enable this feature to suppress output of consecutive duplicate logs.

Examples

Enable duplicate log suppression on device A.

```
<Sysname> system-view
```

```
[Sysname] info-center logging suppress duplicates
```

info-center logging suppress module

Use **info-center logging suppress module** to configure a log suppression rule for a module.

Use **undo info-center logging suppress module** to delete a log suppression rule.

Syntax

info-center logging suppress module *module-name* **mnemonic** { **all** | *mnemonic-value* }

undo info-center logging suppress module *module-name* **mnemonic** { **all** | *mnemonic-value* }

Default

The device does not suppress output of any logs from any modules.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

module-name: Specifies a log source module by its name, a case-insensitive string of 1 to 8 characters. To view the list of available log source modules, use the **info-center logging suppress module ?** command.

mnemonic { **all** | *mnemonic-value* }: Configures a mnemonic filter for log suppression.

- **all**: Suppresses output of all logs of the module.
- *mnemonic-value*: Suppresses output of logs with the specified mnemonic value. The *mnemonic-value* argument is a case-insensitive string of 1 to 32 characters, which must be the complete value contained in the mnemonic field of the log message. Log suppression will fail if a partial mnemonic value is specified.

Usage guidelines

You can configure log suppression rules to filter out the logs that you are not concerned with. A log suppression rule suppresses output of all logs or only logs with a specific mnemonic value for a module.

Examples

Configure a log suppression rule to suppress output of logs with the **shell_login** mnemonic value for the shell module.

```
<Sysname> system-view
[Sysname] info-center logging suppress module shell mnemonic shell_login
```

Related commands

info-center source

info-center loghost

Use **info-center loghost** to specify a log host and to configure output parameters.

Use **undo info-center loghost** to remove a log host.

Syntax

info-center loghost [**vpn-instance** *vpn-instance-name*] { *hostname* | *ipv4-address* | **ipv6** *ipv6-address* } [**facility** *local-number* | **filter** *filter-name* | **format** { **cmcc** | **default** | **sgcc** | **unicom** } | **port** *port-number* | **source-ip** *source-ip-address*] *

undo info-center loghost [**vpn-instance** *vpn-instance-name*] { *hostname* | *ipv4-address* | **ipv6** *ipv6-address* }

Default

No log hosts are specified.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If the log host is on the public network, do not specify this option.

hostname: Specifies a log host by its name, a case-insensitive string of 1 to 253 characters. The host name can contain letters, digits, and special characters including hyphen (-), underscore (_), and dot (.).

ipv4-address: Specifies a log host by its IPv4 address.

ipv6 *ipv6-address*: Specifies a log host by its IPv6 address.

facility *local-number*: Specifies a logging facility from local0 to local7 for the log host. The default value is local7. Logging facilities are used to mark different logging sources, and query and filer logs.

filter *filter-name*: Specifies a log output filter to control log output to the log host. The *filter-name* argument represents the filter name, a case-insensitive string of 1 to 8 characters. If you do not specify a log output filter, the log output rules configured by using the **info-center source** command for the log host destination are used.

format { **cmcc** | **default** | **unicom** | **sgcc** }: Specifies a format for logs sent to log hosts. If you do not specify this keyword, the format specified by the **info-center format** command is used.

- **cmcc**: Specifies the China Mobile Communications Corporation (CMCC) format.
- **default**: Specifies the non-customized format.
- **sgcc**: Specifies the State Grid Corporation of China (SGCC) format.
- **unicom**: Specifies the China Unicom format.

port *port-number*: Specifies the port number of the log host, in the range of 1 to 65535. The default is 514. It must be the same as the value configured on the log host. Otherwise, logs cannot be sent to the log host.

source-ip *source-ip-address*: Specifies the source IP address for logs sent to the specified log hosts. If you do not specify this option, the source IP address specified by the **info-center loghost source** command is used.

Usage guidelines

The **info-center loghost** command takes effect only after the information center is enabled by using **info-center enable** command.

Examples

Output logs to the log host at 1.1.1.1.

```
<Sysname> system-view
[Sysname] info-center loghost 1.1.1.1
```

Related commands

info-center format

info-center source

info-center loghost locate-info with-sn

Use **info-center loghost locate-info with-sn** to add the device serial number to the location field of logs sent to log hosts.

Use **undo info-center loghost locate-info with-sn** to restore the default.

Syntax

info-center loghost locate-info with-sn

undo info-center loghost locate-info with-sn

Default

The device does not add the device serial number to the location field of logs sent to log hosts.

Views

System view

Predefined user roles

network-admin

context-admin

Examples

Add the device serial number to the location field of logs sent to log hosts.

```
<Sysname> system-view
[Sysname] info-center loghost locate-info with-sn
```

info-center loghost source

Use **info-center loghost source** to specify a source IP address for logs sent to log hosts.

Use **undo info-center loghost source** to restore the default.

Syntax

info-center loghost source *interface-type interface-number*

undo info-center loghost source

Default

The source IP address of logs sent to log hosts is the primary IP address of the outgoing interface.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

interface-type interface-number: Specifies an interface by its type and number.

Usage guidelines

The system uses the primary IP address of the specified interface as the source IP address of the logs sent to log hosts.

The **info-center loghost source** command takes effect only after the information center is enabled by using **info-center enable** command.

The source IP address specified by the **info-center loghost source** command applies to all log hosts and that specified by the **info-center loghost** command applies to the specified log hosts. For a log host, the source IP address specified by the **info-center loghost** command takes precedence over that specified by the **info-center loghost source** command.

Examples

Use the IP address of interface Loopback 0 as the source IP address of the logs sent to log hosts.

```
<Sysname> system-view
[Sysname] interface loopback 0
[Sysname-LoopBack0] ip address 2.2.2.2 32
[Sysname-LoopBack0] quit
[Sysname] info-center loghost source loopback 0
```

Related commands

info-center loghost

info-center security-logfile alarm-threshold

Use **info-center security-logfile alarm-threshold** to set the alarm threshold for security log file usage.

Use **undo info-center security-logfile alarm-threshold** to restore the default.

Syntax

info-center security-logfile alarm-threshold *usage*

undo info-center security-logfile alarm-threshold

Default

The alarm threshold for security log file usage is 80. When the usage of the security log file reaches 80%, the system outputs a message to inform the administrator.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

usage: Specifies an alarm threshold. The value must be an integer in the range of 1 to 100.

Usage guidelines

When the security log file is full, the system deletes the oldest logs and then writes new logs to the security log file. This feature helps avoid security log loss by setting an alarm threshold for the security log file usage. When the threshold is reached, the system outputs log information to inform the administrator. The administrator can log in to the device with the security-audit user role and back up the security log file.

Examples

Set the alarm threshold for security log file usage to 90.

```
<Sysname> system-view
[Sysname] info-center security-logfile alarm-threshold 90
```

Related commands

info-center security-logfile size-quota

info-center security-logfile directory

Use **info-center security-logfile directory** to specify the security log file directory.

Syntax

info-center security-logfile directory *dir-name*

Default

The security log file is saved in the **seclog** folder under the root directory of the default file system.

Views

System view

Predefined user roles

security-audit

Parameters

dir-name: Specifies a directory by its name, a string of 1 to 64 characters.

Usage guidelines

The specified directory must have been created.

To use this command, a local user must have the security-audit user role.

This command cannot survive an IRF reboot or a master/subordinate switchover.

Examples

Set the security log file directory to **flash:/test**.

```
<Sysname> mkdir test
Creating directory flash:/test... Done.
<Sysname> system-view
[Sysname] info-center security-logfile directory flash:/test
```

info-center security-logfile enable

Use **info-center security-logfile enable** to enable saving of security logs to the security log file.

Use **undo info-center security-logfile enable** to restore the default.

Syntax

info-center security-logfile enable

undo info-center security-logfile enable

Default

Saving of security logs to the security log file is disabled.

Views

System view

Predefined user roles

network-admin

context-admin

Usage guidelines

This feature enables the system to output security logs to the security log file buffer, and then saves the buffered logs to the security log file regularly.

Examples

Enable saving security logs to the security log file.

```
<Sysname> system-view
[Sysname] info-center security-logfile enable
```

info-center security-logfile frequency

Use **info-center security-logfile frequency** to configure the interval for saving security logs to the security log file.

Use **undo info-center security-logfile frequency** to restore the default.

Syntax

info-center security-logfile frequency *freq-sec*

undo info-center security-logfile frequency

Default

The security log file saving interval is 86400 seconds.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

freq-sec: Specifies the security log file saving interval in seconds. The value range is 10 to 86400 seconds.

Usage guidelines

The system outputs security logs to the security log file buffer, and then saves the buffered logs to the security log file at the specified interval.

Examples

Set the security log file saving interval to 600 seconds.

```
<Sysname> system-view
[Sysname] info-center security-logfile frequency 600
```

Related commands

info-center security-logfile enable

info-center security-logfile size-quota

Use **info-center security-logfile size-quota** to set the maximum size for the security log file.

Use **undo info-center security-logfile size-quota** to restore the default.

Syntax

info-center security-logfile size-quota *size*

undo info-center security-logfile size-quota

Default

The maximum size for the security log file is 10 MB.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

size: Sets the maximum size for the security log file, in MB. The value range is 1 to 10.

Examples

Set the maximum size to 6 MB for the security log file.

```
<Sysname> system-view
[Sysname] info-center security-logfile size-quota 6
```

Related commands

info-center security-logfile alarm-threshold

info-center source

Use **info-center source** to configure a log output rule for a module.

Use **undo info-center source** to restore the default.

Syntax

info-center source { *module-name* | **default** } { **console** | **logbuffer** | **logfile** | **loghost** | **monitor** } { **deny** | **level** *severity* }

undo info-center source { *module-name* | **default** } { **console** | **logbuffer** | **logfile** | **loghost** | **monitor** }

Default

Table 10 lists the default log output rules.

Table 10 Default output rules

Destination	Log source modules	Output switch	Severity
Console	All supported modules	Enabled	Debugging
Monitor terminal	All supported modules	Disabled	Debugging
Log host	All supported modules	Enabled	Informational
Log buffer	All supported modules	Enabled	Informational
Log file	All supported modules	Enabled	Informational

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

module-name: Specifies a module by its name. You can use the **info-center source ?** command to view the modules supported by the device.

default: Specifies all supported modules.

console: Outputs logs to the console.

logbuffer: Outputs logs to the log buffer.

logfile: Outputs logs to the log file.

loghost: Outputs logs to the log host.

monitor: Outputs logs to the monitor terminal.

deny: Disables log output.

level *severity*: Specifies a severity level in the range of 0 to 7. The smaller the severity value, the higher the severity level. See Table 5 for more information. Logs at the specified severity level and higher levels are allowed to be output.

Usage guidelines

If you do not set an output rule for a module, the module uses the output rule set by using the **default** keyword. If no rule is set by using the **default** keyword, the module uses the default output rule.

To modify or remove an output rule set for a module, you must use the *module-name* argument. A new output rule configured by using the **default** keyword does not take effect on the module.

If you execute this command for a module multiple times, the most recent configuration takes effect.

If you execute this command for the **default** modules multiple times, the most recent configuration takes effect.

Examples

Output only VLAN module's information with the emergency level to the console.

```
<Sysname> system-view
[Sysname] info-center source default console deny
```

```
[Sysname] info-center source vlan console level emergency
```

Based on the previous configuration, disable output of VLAN module's information to the console so no system information is output to the console.

```
<Sysname> system-view
[Sysname] undo info-center source vlan console
```

info-center synchronous

Use **info-center synchronous** to enable synchronous information output.

Use **undo info-center synchronous** to disable synchronous information output.

Syntax

info-center synchronous

undo info-center synchronous

Default

Synchronous information output is disabled.

Views

System view

Predefined user roles

network-admin

context-admin

Usage guidelines

System log output interrupts ongoing configuration operations, including obscuring previously entered commands. Synchronous information output shows the obscured commands. It also provides a command prompt in command editing mode, or a [Y/N] string in interaction mode so you can continue your operation from where you were stopped.

Examples

Enable synchronous information output, and then execute the **display current-configuration** command to view the current configuration of the device.

```
<Sysname> system-view
[Sysname] info-center synchronous
Info-center synchronous output is on
[Sysname] display current-
```

At this time, the system receives log information. It displays the log information first, and then displays your previous input, which is **display current-** in this example.

```
%May 21 14:33:19:425 2007 Sysname SHELL/5/SHELL_LOGIN: VTY logged in from 192.168.1.44
[Sysname] display current-
```

Enter **configuration** to complete the **display current-configuration** command, and press the **Enter** key to execute the command.

Enable synchronous information output, and then save the current configuration (enter interactive information).

```
<Sysname> system-view
[Sysname] info-center synchronous
Info-center synchronous output is on
[Sysname] save
```

```
The current configuration will be written to the device. Are you sure? [Y/N]:
```

At this time, the system receives the log information. It displays the log information first and then displays [Y/N].

```
%May 21 14:33:19:425 2007 Sysname SHELL/5/SHELL_LOGIN: VTY logged in from 192.168.1.44
[Y/N]:
```

Enter **Y** or **N** to complete your input.

info-center syslog min-age

Use **info-center syslog min-age** to set the minimum storage period for logs in the log buffer and log file.

Use **undo info-center syslog min-age** to restore the default.

Syntax

info-center syslog [**module** *module-name*] **min-age** *min-age*

undo info-center syslog [**module** *module-name*] **min-age**

Default

The minimum storage period is not set.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

module *module-name*: Sets the minimum storage period for logs in the log buffer and log file of a module. The *module-name* argument is a case-insensitive string that represents the complete module name. To view the names of supported modules, execute the **info-center syslog module ?** command. If you do not specify a module, this command sets the minimum storage period for logs in the general log buffer and general log file.

min-age: Sets the minimum storage period in hours. The value range is 1 to 8760.

Examples

Set the minimum storage period to 168 hours.

```
<Sysname> system-view
[Sysname] info-center syslog min-age 168
```

info-center syslog trap buffersize

Use **info-center syslog trap buffersize** to set the maximum number of log traps that can be stored in the log trap buffer.

Use **undo info-center syslog trap buffersize** to restore the default.

Syntax

info-center syslog trap buffersize *buffersize*

undo info-center syslog trap buffersize

Default

The log trap buffer can store a maximum of 1024 traps.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

buffersize: Specifies the maximum number of log traps that can be stored in the log trap buffer. The value range is 0 to 65535. Value 0 indicates that the device does not buffer log traps.

Usage guidelines

Log traps are SNMP notifications stored in the log trap buffer. After the **snmp-agent trap enable syslog** command is configured, the device sends log messages in SNMP notifications to the log trap buffer. You can view the log traps by accessing the MIB corresponding to the trap buffer.

The default buffer size is usually used. You can adjust the buffer size according to your network condition. New traps overwrite the oldest traps when the log trap buffer is full.

Examples

Set the log trap buffer size to 2048.

```
<Sysname> system-view
[Sysname] info-center syslog trap buffersize 2048
```

Related commands

snmp-agent trap enable syslog

info-center syslog utf-8 enable

Use **info-center syslog utf-8 enable** to enable the information center to use the UTF-8 encoding.

Use **undo info-center syslog utf-8 enable** to restore the default.

Syntax

info-center syslog utf-8 enable

undo info-center syslog utf-8 enable

Default

The information center uses the GB18030 encoding.

Views

System view

Predefined user roles

network-admin

context-admin

Usage guidelines

For the user' login terminal to correctly display Chinese characters in log messages received from the information center, the information center and the terminal must use the same character set encoding.

The information center supports both GB18030 and UTF-8 encodings. By default, the GB18030 encoding is used.

If the login terminal uses the UTF-8 encoding, you can use this command to enable the information center to use the UTF-8 encoding.

Examples

Enable the information center to use the UTF-8 encoding.

```
<Sysname> system-view
[Sysname] info-center syslog utf-8 enable
```

Related commands

display character-set

info-center timestamp

Use **info-center timestamp** to set the timestamp format for logs sent to the console, monitor terminal, log buffer, and log file.

Use **undo info-center timestamp** to restore the default.

Syntax

info-center timestamp { **boot** | **date** | **none** }

undo info-center timestamp

Default

The timestamp format for logs sent to the console, monitor terminal, log buffer, and log file is **date**.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

boot: Sets the timestamp format to xxx.yyy, where xxx is the most significant 32 bits (in milliseconds) and yyy is the least significant 32 bits. For example, 0.21990989 equals Jun 25 14:09:26:881 2007. The **boot** time shows the time since system startup.

date: Sets the timestamp format to MMM DD hh:mm:ss:ms YYYY, such as Dec 8 10:12:21:708 2007. The **date** time shows the current system time.

- MMM: Abbreviations of the months in English, which could be Jan, Feb, Mar, Apr, May, Jun, Jul, Aug, Sep, Oct, Nov, or Dec.
- DD: Date, starting with a space if it is less than 10, for example " 7".
- hh:mm:ss:ms: Local time, with hh in the range of 00 to 23, mm and ss in the range of 00 to 59, and ms in the range of 0 to 999.
- YYYY: Year.

none: Indicates no time information is provided.

Examples

Set the timestamp format to **boot** for logs sent to the console, monitor terminal, log buffer, and log file.

```
<Sysname> system-view
```

```
[Sysname] info-center timestamp boot
```

Related commands

info-center timestamp loghost

info-center timestamp loghost

Use **info-center timestamp loghost** to set the timestamp format for logs sent to log hosts.

Use **undo info-center timestamp loghost** to restore the default.

Syntax

info-center timestamp loghost { **date** [**with-milliseconds**] | **iso** [**with-milliseconds**] | **no-year-date** | **none** }

undo info-center timestamp loghost

Default

The timestamp format for logs sent to log hosts is **date**.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

date: Sets the timestamp format to mmm dd hh:mm:ss yyyy, such as Dec 8 10:12:21 2007. The **date** time shows the current system time.

iso: Sets the ISO 8601 timestamp format, for example, 2009-09-21T15:32:55.

with-milliseconds: Sets the timestamp to be accurate to milliseconds for logs output to log hosts in date or ISO 8601 format. The millisecond value is appended to the time information in the timestamp with a dot as the separator. If you do not specify this keyword, the timestamp in date or ISO 8601 format is accurate to seconds.

- Example of a timestamp in date format with millisecond accuracy: Dec 8 10:12:21.708 2018.
- Example of a timestamp in ISO 8601 format with millisecond accuracy: 2018-09-21T15:32:55.708.

no-year-date: Sets the timestamp format to the current system date and time without year.

none: Indicates that no timestamp information is provided.

Examples

Set the timestamp format to **no-year-date** for logs sent to log hosts.

```
<Sysname> system-view
[Sysname] info-center timestamp loghost no-year-date
```

Related commands

info-center timestamp

info-center trace-logfile quota

Use **info-center trace-logfile quota** to set the maximum size for the trace log file.

Use **undo info-center trace-logfile quota** to restore the default.

Syntax

info-center trace-logfile quota *size*

undo info-center trace-logfile quota

Default

The maximum trace log file size is 1 MB.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

size: Sets the maximum size for the trace log file, in MB.The value range is 1 to 10.

Examples

Set the maximum size to 6 MB for the trace log file.

```
<Sysname> system-view
[Sysname] info-center trace-logfile quota 6
```

logfile save

Use **logfile save** to manually save logs in the log file buffer to the log file.

Syntax

logfile save

Views

Any view

Predefined user roles

network-admin

context-admin

Usage guidelines

You can specify the directory to save the log file by using the **info-center logfile directory** command.

The system clears the log file buffer after saving the buffered logs to the log file automatically or manually.

If the log file buffer is empty, this command displays a success message event though no logs are saved to the log file.

Examples

Manually save logs from the log file buffer to the log file.

```
<Sysname> logfile save
The contents in the log file buffer have been saved to the file flash:/logfile/logfile.log.
```

Related commands

info-center logfile enable

info-center logfile directory

reset logbuffer

Use **reset logbuffer** to clear the log buffer.

Syntax

reset logbuffer [**module** *module-name* [**submodule** *submodule-name*]]

Views

User view

Predefined user roles

network-admin

context-admin

Parameters

module *module-name*: Clears the log buffer of a module. The *module-name* argument is a case-insensitive string that represents the complete module name. To view the names of supported modules, execute the **reset logbuffer module ?** command. If you do not specify a module, this command clears the general log buffer.

submodule *submodule-name*: Clears the log buffer of a submodule of the specified module. The *submodule--name* argument is a case-insensitive string that represents the complete submodule name. To view the names of supported submodules, execute the **display logbuffer module module-name submodule ?** command. If you do not specify a submodule, this command clears the log buffers of all submodules of the specified module.

Examples

Clear the log buffer.

```
<Sysname> reset logbuffer
```

Related commands

display logbuffer

security syslog rate-limit

Use **security syslog rate-limit** to set the maximum number of security logs that can be sent per second.

Use **undo security syslog rate-limit** to restore the default.

Syntax

security syslog rate-limit *max-value*

undo security syslog rate-limit

Default

The device can send a maximum of 1000 security logs per second to the information center.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

max-value: Sets the maximum number of security logs that can be sent per second. The value range for this argument is 0 to 10000. Value 0 indicates that the device does not send security logs to the information center.

Usage guidelines

When the device processes the following security services, a large number of security logs will be generated and sent to the information center, which will cause overload of the information center:

- AFT.
- ASPF.
- Data filtering.
- File filtering.
- URL filtering.
- NAT.
- Session management.
- Anti-virus.
- Application audit and management.
- IPS.
- NetShare Control.
- Server connection detection.
- Attack detection and prevention.

This feature allows you to set the maximum number of security logs that can be sent per second to the information center. With this feature configured, the device will discard the subsequent security logs when the maximum number of security logs that can be sent per second is reached. Please configure the maximum number of security logs that can be sent per second as required.

Examples

Set 1000 as the maximum number of security logs that can be sent per second.

```
<Sysname> system-view
[Sysname] security syslog rate-limit 1000
```

security-logfile save

Use **security-logfile save** to manually save security logs from the security log file buffer to the security log file.

Syntax

security-logfile save

Views

Any view

Predefined user roles

security-audit

Usage guidelines

The system clears the security log file buffer after saving the buffered security logs to the security log file automatically or manually.

If the security log file buffer is empty, this command displays a success message event though no security logs are saved to the security log file.

To use this command, a local user must have the security-audit user role.

Examples

Manually save the security logs in the security log file buffer to the security log file.

```
<Sysname> security-logfile save
The contents in the security log file buffer have been saved to the file
flash:/seclog/seclog.log.
```

authorization-attribute (*Security Command Reference*)

snmp-agent trap enable syslog

Use **snmp-agent trap enable syslog** to enable SNMP notifications for log messages.

Use **undo snmp-agent trap enable syslog** to disable SNMP notifications for log messages.

Syntax

snmp-agent trap enable syslog

undo snmp-agent trap enable syslog

Default

The device does not send SNMP notifications for log messages.

Views

System view

Predefined user roles

network-admin

context-admin

Usage guidelines

This command enables the device to send an SNMP notification for each log message it outputs. The device encapsulates logs in SNMP notifications and then sends them to the SNMP module and the log trap buffer.

For the SNMP module to send the received SNMP notifications correctly, you must also configure SNMP on the device. For more information about SNMP configuration, see the network management and monitoring configuration guide for the device.

To view the traps in the log trap buffer, access the MIB corresponding to the log trap buffer. The log trap buffer size can be set by using the **info-center syslog trap buffersize** command.

Examples

Enable the device to send SNMP notifications for log messages.

```
<Sysname> system-view
[Sysname] snmp-agent trap enable syslog
```

Related commands

info-center syslog trap buffersize

terminal debugging

Use **terminal debugging** to enable output of debugging messages to the current terminal.

Use **undo terminal debugging** to disable output of debugging messages to the current terminal.

Syntax

terminal debugging

undo terminal debugging

Default

Output of debugging messages to the current terminal is disabled.

Views

User view

Predefined user roles

network-admin

context-admin

Usage guidelines

This command enables output of debugging-level log messages to the current terminal.

To enable output of debugging messages to the console, perform the following tasks:

1. Execute the **terminal debugging** command.
2. Enable the information center. The information center is enabled by default.
3. Use a debugging command to enable the related debugging.

To enable output of debugging messages to the monitor terminal, perform the following tasks:

1. Execute the **terminal monitor** and **terminal debugging** commands.
2. Enable the information center. The information center is enabled by default.
3. Use a debugging command to enable the related debugging.

This command takes effect only for the current connection between the terminal and the device. If a new connection is established, the default is restored.

You can also enable output of debugging messages to the current terminal by executing the **terminal logging level 7** command. The **terminal logging level 7** command and the **terminal debugging** command have the following differences:

- The **terminal logging level 7** command enables log output for all log severity levels (levels 0 through 7).
- The **terminal debugging** command enables log output for the following log severity levels:
  - Debugging level (level **7**).
  - Severity level higher than or equal to the level specified in the **terminal logging level** command.

Examples

Enable output of debugging messages to the current terminal.

```
<Sysname> terminal debugging
The current terminal is enabled to display debugging logs.
```

Related commands

terminal logging level

terminal monitor

terminal logging level

Use **terminal logging level** to set the lowest level of logs that can be output to the current terminal.

Use **undo terminal logging level** to restore the default.

Syntax

terminal logging level *severity*

undo terminal logging level

Default

The lowest level of logs that can be output to the current terminal is 6 (Informational).

Views

User view

Predefined user roles

network-admin

context-admin

Parameters

severity: Specifies a log severity level. Valid values are alert, critical, debugging, emergency, error, informational, notification, warning, and digits from 0 to 7.

Usage guidelines

This command enables the device to output logs with a severity level higher than or equal to the specified level to the current terminal. For example, if you set the *severity* argument to 6, logs with a severity value from 0 to 6 are output to the current terminal.

This command takes effect only for the current connection between the terminal and the device. If a new connection is established, the default is restored.

Examples

Configure the device to output logs with the debugging level and higher levels to the current terminal.

```
<Sysname> terminal logging level 7
```

terminal monitor

Use **terminal monitor** to enable log output to the current terminal.

Use **undo terminal monitor** to disable log output to the current terminal.

Syntax

terminal monitor

undo terminal monitor

Default

Log output to the console is enabled, and log output to the monitor terminal is disabled.

Views

User view

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Examples

Display flow log configuration and statistics.

```
<Sysname> display userlog export
Flow:
  Export flow log as UDP Packet.
  Version: 3.0
  Source ipv4 address: 2.2.2.2
  Source ipv6 address:
  Log load balance function: Disabled
  Local time stamp: Disabled
  Number of log hosts: 2

  Log host 1:
    Host/Port: 1.2.3.6/2000
    Total logs/UDP packets exported: 112/87

  Log host 2:
    VPN instance:abc
    Host/Port:1.1.1.1/2000
    Total logs/UDP packets exported: 6553665536/409597846
```

Table 1 Command output

Field	Description
Flow	Flow log configuration and statistics.
Export flow log as UDP Packet	Flow log entries were sent to log hosts in UDP.
Version	Flow log feature version.
Source ipv4/ipv6 address	Source IP address of the flow log packets.

Field	Description
Log load balance function	Load balancing status for flow log packets: • **Enabled**—Flow log packets are distributed among available log hosts. • **Disabled**—Every flow log packet is copied and sent to all available log hosts.
Local time stamp	Whether the use of the local time in the flow log timestamp is enabled or disabled.
Number of log hosts	Total number of log hosts.
Log host	Information about the log host.
VPN instance	VPN instance to which the log host belongs.
Host/port	IP address and port number of the log host.
Total logs	Total number of flow log entries successfully exported and those failed to be exported to the log hosts.
UDP packets exported	Total number of UDP packets successfully sent and those failed to be sent to the log hosts. The UDP packets are used to export flow log entries. A UDP packet can contain multiple flow log entries.

Related commands

`userlog flow export`

display userlog host-group

Use **`display userlog host-group`** to display flow log host group information.

Syntax

`display userlog host-group` [**`ipv6`**] [*`host-group-name`*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

`ipv6`: Specifies an IPv6 flow log host group. Do not configure this keyword if you want to specify an IPv4 flow log host group.

`host-group-name`: Specify a flow log host group by its name, a case-sensitive string of 1 to 63 characters. If you do not specify a log host group, this command displays information about all log host groups.

Examples

Display information about IPv4 flow log host group **test**.

```
<Sysname> display userlog host-group test
Userlog host-group test:
  ACL number: 2000

  Flow log host numbers: 1

    Log host 1:
      VPN-instance: test
      Host/port: 1.1.1.2/2000
```

Display information about all IPv4 flow log host groups.

```
<Sysname> display userlog host-group
There are 2 IPv4 host groups.

Userlog host-group test:
  ACL number: 2000

  Flow log host numbers: 1

    Log host 1:
      VPN-instance: test
      Host/Port: 1.2.3.6/0

Userlog host-group test2:
  ACL name: test

  Flow log host numbers: 1

    Log host 1:
      Host/Port: 1.1.1.1/0
```

Table 2 Command output

Field	Description
Userlog host-group test	Information about a flow log host group.
ACL number/ACL name	ACL used by the log host group to match flow log entries.
Flow log host numbers	Number of flow log hosts in the group.
Log host	Information about a flow log host.
VPN-instance	VPN instance to which the log host belongs. This field is not displayed if no VPN instance is specified for the log host.
Host/Port	IP address and port number of the log host.

userlog host-group host flow

reset userlog flow export

Use **reset userlog flow export** to clear flow log statistics.

Syntax

reset userlog flow export

Views

User view

Predefined user roles

network-admin

context-admin

Examples

Clear flow log statistics.

```
<Sysname> reset userlog flow export
```

Related commands

userlog flow export

userlog flow export host

Use **userlog flow export host** to specify a log host to receive flow log entries.

Use **undo userlog flow export host** to remove a log host.

Syntax

userlog flow export [**vpn-instance** *vpn-instance-name*] **host** { *hostname* | *ipv4-address* | **ipv6** *ipv6-address* } **port** *udp-port*

undo userlog flow export [**vpn-instance** *vpn-instance-name*] **host** { *hostname* | *ipv4-address* | **ipv6** *ipv6-address* }

Default

No log hosts are specified.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If the log host is on the public network, do not specify this option.

hostname: Specifies a log host by its name, a case-insensitive string of 1 to 253 characters. The host name can contain letters, digits, and special characters including hyphen (-), underscore (_), and dot (.).

ipv4-address: Specifies a log host by its IPv4 address. The address must be a valid unicast address and cannot be a loopback address.

ipv6 *ipv6-address*: Specifies a log host by its IPv6 address.

port *udp-port*: Specifies the UDP port number of the log host, in the range of 1 to 65535. As a best practice, use UDP port numbers in the range 1025 to 65535 to avoid collision with well-known UDP port numbers.

Examples

Export flow log entries to UDP port 2000 on the log host at 1.2.3.6.

```
<Sysname> system-view
[Sysname] userlog flow export host 1.2.3.6 port 2000
```

Related commands

display userlog export

userlog flow export load-balancing

Use **userlog flow export load-balancing** to enable load balancing for flow log entries.

Use **undo userlog flow export load-balancing** to restore the default.

Syntax

userlog flow export load-balancing

undo userlog flow export load-balancing

Default

Load balancing is disabled. The device sends a copy of each flow log entry to all available log hosts.

Views

System view

Predefined user roles

network-admin

context-admin

Usage guidelines

In load balancing mode, flow log entries are distributed among log hosts based on the source IP addresses (before NAT) that are recorded in the entries. The flow log entries generated for the same source IP address are sent to the same log host. If a log host goes down, the flow logs sent to it will be lost.

Examples

Enable load balancing for flow logging.

```
<Sysname> system-view
[Sysname] userlog flow export load-balancing
```

Related commands

userlog flow export host

userlog flow export source-ip

Use **userlog flow export source-ip** to specify a source IP address for flow log packets.

Use **undo userlog flow export source-ip** to restore the default.

Syntax

userlog flow export source-ip { *ipv4-address* | **ipv6** *ipv6-address* }

undo userlog flow export source-ip [**ipv6**]

Default

The source IP address of flow log packets is the IP address of their outgoing interface.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

ipv4-address: Specifies an IPv4 address.

ipv6 *ipv6-address*: Specifies an IPv6 address.

Examples

Specify 1.2.1.2 as the source IP address for flow log packets.

```
<Sysname> system-view
[Sysname] userlog flow export source-ip 1.2.1.2
```

Related commands

userlog flow export host

userlog flow export timestamp localtime

Use **userlog flow export timestamp localtime** to configure the device to use the local time in the timestamp of flow logs.

Use **undo userlog flow export timestamp localtime** to restore the default.

Syntax

userlog flow export timestamp localtime

undo userlog flow export timestamp localtime

Default

The device uses the UTC time in the timestamp of flow logs.

Views

System view

Predefined user roles

network-admin

context-admin

Usage guidelines

The device uses either the local time or the UTC time in the timestamp of flow logs.

- **UTC time**—Standard Greenwich Mean Time (GMT).
- **Local time**—Standard GMT plus or minus the time zone offset.

  The time zone offset can be configured by using the **clock timezone** command. For more information, see *Fundamentals Command Reference*.

Examples

Configure the device to use the local time in the timestamp of flow logs.

```
<Sysname> system-view
[Sysname] userlog flow export timestamp localtime
```

userlog flow export version

Use **userlog flow export version** to set the flow log version.

Use **undo userlog flow export version** to restore the default.

Syntax

userlog flow export version *version-number*

undo userlog flow export version

Default

The flow log version is 1.0.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

version-number: Specifies a flow log version. Available options are 1, 3, and 5, which represent version 1.0, version 3.0, and version 5.0.

Usage guidelines

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Set the flow log version to 3.0.

```
<Sysname> system-view
[Sysname] userlog flow export version 3
```

Related commands

userlog flow export host

userlog flow syslog

Use **userlog flow syslog** to specify the information center as the destination for flow log export.

Use **undo userlog flow syslog** to restore the default.

Syntax

userlog flow syslog

undo userlog flow syslog

Default

Flow log entries are not exported.

Views

System view

Predefined user roles

network-admin

context-admin

Usage guidelines

CAUTION:

The device might generate a lot of session logs in a short time. If the session logs are exported to the information center for processing, the information center might consume too much performance, affecting normal operations of the device.

You can export flow log entries to log hosts or the information center, but not both. If both methods are configured, the system exports flow log entries to the information center.

Flow log entries are converted to the syslog format when they are exported to the information center. Their severity level is informational. With the information center, you can specify multiple log output destinations, including the console, log host, and log file.

Log entries in ASCII format are human readable. However, the log data volume is higher in ASCII format than in binary format.

Examples

Specify the information center as the destination for flow log export.

```
<Sysname> system-view
[Sysname] userlog flow syslog
```

Related commands

userlog flow export host

userlog host-group

Use **userlog host-group** to create a flow log host group and enter its view, or enter the view of an existing flow log host group.

Use **undo userlog host-group** to delete a flow log host group.

Syntax

userlog host-group [**ipv6**] *host-group-name* **acl** { **name** *acl-name* | **number** *acl-number* }

undo userlog host-group [**ipv6**] *host-group-name*

Default

No flow log host groups exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

ipv6: Creates an IPv6 flow log host group. Do not configure this keyword if you want to create an IPv4 flow log host group.

host-group-name: Specify a name for the flow log host group, a case-sensitive string of 1 to 63 characters.

acl: Specify an ACL to match the flow log entries to be sent to the flow log host group.

name *acl-name*: Specifies the ACL name, a case-insensitive string of 1 to 63 characters. The ACL name must start with a letter and cannot be **all**.

number *acl-number*: Specifies the ACL number, in the range of 2000 to 3999.

Usage guidelines

The flow log host group feature enables the device to send specific flow logs to specific group of log hosts. This facilitates log filtering and reduces the log sending and processing workload of the device.

A flow log host group uses an ACL to match the flow logs to be sent to it. Make sure the ACL exists and the ACL rules can identify the designated flow logs.

A flow log matches a log host group if it matches the group's ACL, and it is sent only to the log hosts in the matching group.

If a flow log matches multiple log host groups, the device sends the log to the group that comes first in alphabetical order of the matching group names.

If a flow log does not match any log host groups, the device ignores the log host group configuration and sends the log to all configured log hosts.

Examples

Create an IPv4 flow log host group named **test** and specify ACL 2000 for it.

```
<Sysname> system-view
[Sysname] userlog host-group test acl number 2000
[Sysname-userlog-host-group-test]
```

userlog host-group host flow

Use **userlog host-group host flow** to assign a log host to a flow log host group.

Use **undo userlog host-group host flow** to remove a log host from a flow log host group.

Syntax

IPv4 flow log host group view:

userlog host-group [**vpn-instance** *vpn-instance-name*] **host flow** { *hostname* | *ipv4-address* }

undo userlog host-group [**vpn-instace** *vpn-instance-name*] **host flow** { *hostname* | *ipv4-address* }

IPv6 flow log host group view:

userlog host-group [**vpn-instance** *vpn-instance-name*] **host flow ipv6** { *hostname* | *ipv6-address* }

undo userlog host-group [**vpn-instance** *vpn-instance-name*] **host flow ipv6** { *hostname* | *ipv6-address* }

Default

No log hosts exist in a flow log host group.

Views

IPv4 flow log host group view

IPv6 flow log host group view

Predefined user roles

network-admin

context-admin

Parameters

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If the log host is on the public network, do not specify this option.

hostname: Specifies a log host by its name, a case-insensitive string of 1 to 253 characters. The host name can contain letters, digits, hyphens (-), underscores (_), and dots (.).

ipv4-address: Specifies a log host by its IPv4 address. The address must be a valid IPv4 unicast address and cannot be a loopback address.

ipv6 *ipv6-address*: Specifies a log host by its IPv6 address. The address must be a valid IPv6 unicast address and cannot be a loopback address or all zeros.

Usage guidelines

A flow log host group can contain multiple log hosts, and a log host can be assigned to multiple flow log host groups.

Before you assign a log host to a flow log host group, make sure the log host has been configured on the device by using **userlog flow export host** the command.

Examples

Assign a log host to flow log host group **test**.

```
<Sysname> system-view
[Sysname] userlog host-group test acl number 2000
[Sysname-userlog-host-group-test] userlog host-group host flow 1.2.3.6
```

Fast log output commands

customlog character-encoding utf-8

Use **customlog character-encoding utf-8** to configure fast log output to use the UTF-8 encoding.

Use **undo customlog character-encoding** to restore the default.

Syntax

customlog character-encoding utf-8

undo customlog character-encoding

Default

Fast log output uses the GB18030 encoding.

Views

System view

Predefined user roles

network-admin

context-admin

Usage guidelines

For the log host to correctly display Chinese characters in received log messages, make sure the fast log output module uses the same character set encoding as the log host. Fast log output supports using GB18030 and UTF-8 encodings.

Examples

Configure fast log output to use the UTF-8 encoding.

```
<Sysname> system-view
[Sysname] customlog character-encoding utf-8
```

customlog format

Use **customlog format** to enable fast log output.

Use **undo customlog format** to restore the default.

Syntax

customlog format { **aft** | **aft-cmcc** | **aft-telecom** | **aft-unicom** | **attack-defense** | **cntm** | **dns** | **dpi** [**anti-virus** | **audit** | **data-filter** | **file-filter** | **ips** [**sgcc** { **policy-hit** | **signature-update** }] | **netshare** | **sandbox** | **terminal** | **traffic-policy** | **url-filter** [**unicom**]] | **keepalive** **sgcc** | **lb** [**dns-proxy** | **gslb** | **inbound** | **outbound**] | **nat** { **cmcc** | **telecom** | **unicom** } | **packet-filter** [**sgcc**] | **scd** | **security-policy** **sgcc** | **session** | **trusted-access** { **csap** | **iam** [**authorization** | **notification**] } }

undo customlog format { **aft** | **aft-cmcc** | **aft-telecom** | **aft-unicom** | **attack-defense** | **cntm** | **dns** | **dpi** [**anti-virus** | **audit** | **data-filter** | **file-filter** | **ips** | **netshare** | **sandbox** | **terminal** | **traffic-policy** | **url-filter** [**unicom**]] * | **keepalive** | **lb** [**dns-proxy** | **gslb** | **inbound** |

outbound] * | **nat** | **packet-filter** | **scd** | **security-policy** | **session** | **trusted-access** { **csap** | **iam** [**authorization** | **notification**] } } *

Default

Fast log output is disabled.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

aft: Enables fast log output for the AFT module.

attack-defense: Enables fast log output for the attack defense module.

dns: Enables fast log output for the DNS module.

dpi: Enables fast log output for a DPI-related module. If you do not specify a DPI module keyword, this command enables fast log output for all the DPI-related modules.

anti-virus: Specifies the anti-virus module.

audit: Specifies the application audit and management module.

ips: Specifies the intrusion protection system module.

sgcc: Specifies the SGCC format for the specified type of IPS logs. If you do not specify this keyword, the standard format is used for fast output of the IPS logs.

policy-hit: Specifies the IPS policy hit logs.

signature-update: Specifies the IPS signature update logs.

netshare: Specifies the netshare control module.

sandbox: Specifies the sandbox module.

traffic-policy: Specifies the bandwidth management module.

url-filter: Specifies the URL filtering module.

unicom: Specifies the UNICOM format for fast output URL filtering logs. If you do not specify this keyword, the standard format is used to output the logs.

keepalive: Enables fast log output of keepalive logs. After this keyword is specified, the device sends keepalive logs to the log host periodically. If the log host cannot receive the keepalive logs in a specific period of time, the log host determines that the device is down.

lb: Enables fast log output for a load balancing module. If you do not specify a load balancing module, this command enables fast log output for all load balancing modules.

- **dns-proxy**: Specifies the transparent DNS proxy module.
- **gslb**: Specifies the global load balancing module.
- **inbound**: Specifies the inbound link load balancing module.
- **outbound**: Specifies the outbound link load balancing module.

nat: Enables fast log output in a specific format for the NAT module.

- **cmcc**: Specifies the CMCC format.
- **telecom**: Specifies the TELECOM format.

- **unicom**: Specifies the UNICOM format.

packet-filter: Enables fast output of packet matching logs for the packet filter and security policy modules.

scd: Enables fast log output for the service connection detection module.

security-policy: Enables fast output of security policy configuration logs for the security policy module.

session: Enables fast log output for the session management module.

sgcc: Specifies the SGCC format for the specified type of logs. If you do not specify this keyword, the standard format is used for fast output of the logs.

Usage guidelines

The fast log output feature enables fast output of logs to log hosts.

Typically, logs generated by a service module are first sent to the information center, which then outputs the logs to the specified destination (such as to log hosts). When fast log output is configured, logs of service modules are sent directly to log hosts instead of to the information center. Compared to outputting logs to the information center, fast log output saves system resources.

Fast log output, flow log, and information center are exclusive from one another. When the **customlog format** command is configured, the specified service module uses only the fast log output method. For more information about flow log, see "Configuring flow log." For more information about the information center, see "Configuring the information center."

To output logs of the NAT module to a log host, you must specify the log format required by the log host in the **customlog format** and **customlog host** commands. Logs of other modules can be output only in one format. You do not need to specify the format for these logs.

Examples

Enable fast log output for the session management module.

```
<Sysname> system
[Sysname] customlog format session
```

customlog host

Use **customlog host** to configure fast log output parameters.

Use **undo customlog host** to remove the fast log output configuration.

Syntax

customlog host [**vpn-instance** *vpn-instance-name*] { *hostname* | *ipv4-address* | **ipv6** *ipv6-address* } [**port** *port-number*] **export** { **aft** | **attack-defense** | **cmcc-sessionlog** | **cmcc-userlog** | **dns** | **dpi** [**anti-virus** | **audit** | **ips** | **netshare** | **sandbox** | **traffic-policy** | **url-filter**] * | **keepalive** | **lb** [**dns-proxy** | **gslb** | **inbound** | **outbound**] *| **packet-filter** | **scd** | **security-policy** | **session** | **telecom-sessionlog** | **telecom-userlog** | **unicom-sessionlog** | **unicom-userlog** } *

undo customlog host [**vpn-instance** *vpn-instance-name*] { *hostname* | *ipv4-address* | **ipv6** *ipv6-address* } [**port** *port-number*]

Default

Fast log output parameters are not configured.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

vpn-instance *vpn-instance-name*: Specifies the MPLS L3VPN instance to which the log host belongs. The *vpn-instance-name* argument is a case-sensitive string of 1 to 31 characters. If the log host is on the public network, do not specify this option.

hostname: Specifies a log host by its name, a case-insensitive string of 1 to 253 characters. The host name can contain letters, digits, hyphens (-), underscores (_), and dots (.).

ipv4-address: Specifies a log host by its IPv4 address.

ipv6 *ipv6-address*: Specifies a log host by its IPv6 address.

port *port-number*: Specifies the port number of the log host. The value range is 1 to 65535, and the default is 514. The setting must be the same as the port number configured on the log host. Otherwise, the log host cannot receive logs.

export: Specifies a source module for fast log output.

aft: Outputs logs of the AFT module to the log host.

attack-defense: Outputs logs of the attack defense module to the log host.

cmcc-sessionlog: Outputs NAT session logs in CMCC format to the log host.

cmcc-userlog: Outputs NAT444 user logs in CMCC format to the log host.

dns: Outputs DNS logs to the log host.

dpi: Outputs logs of a DPI-related module to the log host. If you specify the **dpi** keyword without a DPI module keyword, this command outputs logs of all the DPI-related modules to the log host.

anti-virus: Specifies the anti-virus module.

audit: Specifies the application audit and management module.

ips: Specifies the intrusion protection system module.

netshare: Specifies the netshare control module.

sandbox: Specifies the sandbox module.

traffic-policy: Specifies the bandwidth management module.

url-filter: Specifies the URL filtering module.

keepalive: Outputs keepalive logs to the log host.

lb: Outputs logs of a load balancing module to the log host. If you do not specify a load balancing module, this command outputs logs of all load balancing modules to the log host.

- **dns-proxy**: Specifies the transparent DNS proxy module.
- **gslb**: Specifies the global load balancing module.
- **inbound**: Specifies the inbound link load balancing module.
- **outbound**: Specifies the outbound link load balancing module.

packet-filter: Outputs packtet matching logs of the packet filter and security policy modules to the log host.

scd: Outputs logs of the server connection detection module to the log host.

security-policy: Outputs security policy configuration logs of the security policy module to the log host.

session: Outputs logs of the session management module to the log host.

telecom-sessionlog: Outputs NAT session logs in TELECOM format to the log host.

telecom-userlog: Outputs NAT444 user logs in TELECOM format to the log host.

unicom-sessionlog: Outputs NAT session logs in UNICOM format to the log host.

unicom-userlog: Outputs NAT444 user logs in UNICOM format to the log host.

Usage guidelines

The **customlog host** command takes effect only after the **customlog format** command is configured.

To output NAT logs to a log host, you must specify the log format required by the log host in the **customlog format** and **customlog host** commands.

Examples

Output logs of the session management module to the log host at 1.1.1.1.

```
<Sysname> system-view
[Sysname] customlog host 1.1.1.1 port 1000 export session
```

customlog host source

Use **customlog host source** to specify a source IP address for fast log output.

Use **undo customlog host source** to restore the default.

Syntax

customlog host source *interface-type interface-number*

undo customlog host source

Default

The source IP address of fast output logs is the primary IP address of the outgoing interface.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

interface-type interface-number: Specifies a source interface by its type and number. The interface's primary IP address will be used as the source IP address of fast output logs.

Usage guidelines

Configure this command when you need to filter logs according to their source IP addresses on the log host.

The **customlog host source** command takes effect only after the **customlog format** and **customlog host** commands are configured.

Examples

Use the IP address of Loopback 0 as the source IP address of fast output logs.

```
<Sysname> system-view
[Sysname] interface loopback 0
```

```
[Sysname-LoopBack0] ip address 2.2.2.2 32
[Sysname-LoopBack0] quit
[Sysname] customlog host source loopback 0
```

customlog timestamp

Use **customlog timestamp localtime** to configure the timestamp of fast output logs to show the system time.

Use **undo customlog timestamp localtime** to restore the default.

Syntax

customlog timestamp localtime

undo customlog timestamp localtime

Default

The timestamp of fast output logs shows the Greenwich Mean Time (GMT).

Views

System view

Predefined user roles

network-admin

context-admin

Examples

Configure the timestamp of fast output logs to show the system time.

```
<Sysname> system-view
[Sysname] customlog timestamp localtime
```

customlog with-sn

Use **customlog with-sn** to configure the device to carry its serial number in fast output logs.

Use **undo customlog with-sn** to restore the default.

Syntax

customlog with-sn

undo customlog with-sn

Default

The device does not carry its serial number in fast output logs.

Views

System view

Predefined user roles

network-admin

context-admin

Usage guidelines

This feature enables a device to add a serial number (SN) field to fast output log messages, helping users to identify the devices that sent the log messages.

This feature is not applicable to fast output logs in TELECOM, CMCC, and UNICOM formats.

Examples

Configure the device to carry its serial number in fast output logs.

```
<Sysname> system-view
[Sysname] customlog with-sn
```

Session-based NetStream commands

display session-based netstream aggregation-cache

Use **display session-based netstream aggregation-cache** to display session-based NetStream statistics.

Syntax

display session-based netstream aggregation-cache { **app** | **app-profile** | **app-user** } *

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

app: Specifies the app aggregation mode.

app-profile: Specifies the app-profile aggregation mode.

app-user: Specifies the app-user aggregation mode.

Usage guidelines

To display session-based NetStream statistics in an aggregation mode, you must enable the aggregation mode by using the **session-based netstream aggregation** command.

Examples

Display statistics about session-based NetStream in app aggregation mode.

```
<Sysname> display session-based netstream aggregation-cache app
Active entries                                 :1
Timeout time for session-based NetStream entries :10
------------------------------------------------------------------------------
AppID      InPkts     InBytes    OutPkts    OutBytes
------------------------------------------------------------------------------
22742      4          240        4          240
Total   Sessions : 1
Current Sessions : 1
SubsCribers      : 1
```

Display statistics about session-based NetStream in app-profile aggregation mode.

```
<Sysname> display session-based netstream aggregation-cache app-profile
Active entries                                 :1
Timeout time for session-based NetStream entries :10
------------------------------------------------------------------------------
AppID      ProfileID  InPkts     InBytes    OutPkts    OutBytes
------------------------------------------------------------------------------
```

```
22742      0          4          240        4          240
Current Sessions : 1
New     Sessions : 0
```

Display statistics about session-based NetStream in app-user aggregation mode.

```
<Sysname> display session-based netstream aggregation-cache app-user
Active entries                                  :1
Timeout time for session-based NetStream entries :10
------------------------------------------------------------------------------
AppID      UserIp           InPkts     InBytes    OutPkts    OutBytes
------------------------------------------------------------------------------
22742      8.8.8.8          4          240        4          240
Total   Sessions : 1
Current Sessions : 1
```

Table 1 Command output

Field	Description
Active entries	Number of active session-based NetStream entries.
Timeout time for session-based NetStream entries	Maximum period of time in minutes a session-based NetStream entry can be cached before being exported to NetStream servers.
App ID	Application layer protocol ID.
UserIP	User IP address.
ProfileID	Traffic rule ID in bandwidth management.
InPkts	Number of upstream packets.
InBytes	Number of upstream bytes.
OutPkts	Number of downstream packets.
OutBytes	Number of downstream bytes.
Total sessions	Total number of sessions.
New sessions	Number of new sessions established in the current statistics collection interval.
Current sessions	Number of concurrent sessions at the time the **display session-based netstream aggregation-cache** command was executed.
SubsCribers	Total number of users in the current statistics collection interval.

Related commands

session-based netstream aggregation

session-based netstream aggregation

Use **session-based netstream aggregation** to enable session-based NetStream aggregation modes.

Use **undo session-based netstream aggregation** to disable session-based NetStream aggregation modes.

Syntax

session-based netstream aggregation { **app** | **app-profile** | **app-user** } *

undo session-based netstream aggregation { **app** | **app-profile** | **app-user** } *

Default

All session-based NetStream aggregation modes are disabled.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

app: Specifies the app aggregation mode, which aggregates traffic by application layer protocol ID.

app-profile: Specifies the app-profile aggregation mode, which aggregates traffic by application layer protocol ID and profile ID.

app-user: Specifies the app-user aggregation mode, which aggregates traffic by application layer protocol ID and user IP address.

Examples

Enable the app aggregation mode for session-based NetStream aggregation.

```
<Sysname> system-view
[Sysname] session-based netstream aggregation app
```

Related commands

display session-based netstream aggregation-cache

session-based netstream enable

Use **session-based netstream enable** to enable session-based NetStream.

Use **undo session-based netstream enable** to disable session-based NetStream.

Syntax

session-based netstream enable

undo session-based netstream enable

Views

System view

Default

Session-based NetStream is disabled.

Predefined user roles

network-admin

context-admin

Examples

Enable session-based NetStream.

```
<Sysname> system-view
```

```
[Sysname] session-based netstream enable
```

session-based netstream export host

Use **session-based netstream export host** to specify a destination host for session-based NetStream data export.

Use **undo session-based netstream export host** to restore the default.

Syntax

session-based netstream export host *ip-address udp-port* [**vpn-instance** *vpn-instance-name*]

undo session-based netstream export host

Default

No destination host is specified for session-based NetStream data export.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

ip-address: Specifies the IP address of the destination host.

udp-port: Specifies the destination UDP port number in the range of 0 to 65535.

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance to which the destination host belongs. The *vpn-instance-name* argument is a case-sensitive string of 1 to 31 characters. If the destination host is on the public network, do not specify this option.

Examples

Export session-based NetStream data to UDP port 9020 on host 172.16.1.1.

```
<Sysname> system-view
[Sysname] session-based netstream export host 172.16.1.1 9020
```

session-based netstream export source ip

Use **session-based netstream export source ip** to specify a source IP address for session-based NetStream packets.

Use **undo session-based netstream export source ip** to restore the default.

Syntax

session-based netstream export source ip *ip-address*

undo session-based netstream export source ip

Default

The source IP address of session-based NetStream packets is the primary IP address of the output interface.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

ip-address: Specifies an IP address.

Examples

Specify 172.16.1.1 as the source IP address for session-based NetStream packets.

```
<Sysname> system-view
[Sysname] session-based netstream export source ip 172.16.1.1
```

session-based netstream timeout

Use **session-based netstream timeout** to set the aging timer for session-based NetStream entries.

Use **undo session-based netstream timeout** to restore the default.

Syntax

session-based netstream timeout *minutes*

undo session-based netstream timeout

Default

A session-based NetStream entry is automatically aged out and exported after being cached for 5 minutes.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

minutes: Sets the aging timer in minutes. The value range is 1 to 10.

Usage guidelines

When the aging timer for a session-based NetStream entry expires, statistics about the entry is cleared from the cache and exported to the NetStream servers.

Examples

Set the aging timer for session-based NetStream entries to 5 minutes.

```
<Sysname> system-view
[Sysname] session-based netstream timeout 10
```

Contents

Cloud connection commands

The following compatibility matrixes show the support of hardware platforms for cloud connections:

Model	Cloud connection compatibility
NFNX5-HD6480, NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB1780, NFNX3-HDB3080, NFNX3-HDB1180, NFNX3-HDB1480	Yes
NFNX3-HDB680, NFNX3-HDB1080	No

cloud-management backup-server domain

Use **cloud-management backup-server domain** to specify a backup cloud server by its domain name.

Use **undo cloud-management backup-server domain** to remove one or all backup cloud servers.

Syntax

cloud-management backup-server domain *domain-name* [**vpn-instance** *vpn-instance-name*] [**source-ip** *ipv4-address*]

undo cloud-management backup-server domain [*domain-name*]

Default

No backup cloud server is specified.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

domain-name: Specifies a backup cloud server by its domain name, a case-sensitive string of 1 to 253 characters. If you do not specify this parameter in the **undo cloud-management backup-server domain** command, all backup cloud servers will be deleted.

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify this option, the backup cloud server is on the public network.

source-ip *ipv4-address*: Specifies the source IPv4 address for the device that connects to the backup cloud server. It must be the same as the IPv4 address configured on the device. If you do not specify this option, the device uses the primary IPv4 address of the egress interface to connect to the backup cloud server.

Usage guidelines

Before configuring this command, make sure a DNS server is configured to translate domain names.

If you execute this command multiple times to configure a backup cloud server with the same domain name, the most recent configuration takes effect.

You can specify one primary server by using the **cloud-management server domain** command and a maximum of eight backup servers by repeating the **cloud-management backup-server domain** command.

When establishing a cloud connection, the device connects to one of the primary and backup servers according to the sequence in which they are specified. The first specified server has the highest priority. When the connected server fails, the device switches to another server and does not switch back to the original server even if the original server recovers.

To view the connected server, execute the **display cloud-management state** command.

Examples

Specify the server with domain name **123.com** as a backup cloud server.

```
<Sysname> system-view
[Sysname] cloud-management backup-server domain 123.com
```

Related commands

display cloud-management state

cloud-management keepalive

Use **cloud-management keepalive** to set the keepalive interval for the local device to send keepalive packets to the cloud server.

Use **undo cloud-management keepalive** to restore the default.

Syntax

cloud-management keepalive *interval*

undo cloud-management keepalive

Default

The keepalive interval is 180 seconds.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

interval: Specifies the keepalive interval in the range of 10 to 600 seconds.

Usage guidelines

If the device does not receive a response from the cloud server within three keepalive intervals, the device sends a registration request to re-establish the cloud connection.

Examples

Set the keepalive interval to 360 seconds.

```
<Sysname> system-view
[Sysname] cloud-management keepalive 360
```

cloud-management ping

Use **cloud-management ping** to set the interval at which the local device sends ping packets to the cloud server.

Use **undo cloud-management ping** to restore the default.

Syntax

cloud-management ping *interval*

undo cloud-management ping

Default

The local device sends ping packets to the cloud server at intervals of 60 seconds.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

interval: Specifies the interval at which the local device sends ping packets to the cloud server, in the range of 10 to 600 seconds.

Usage guidelines

After the connection to the cloud server is established, the local device sends ping packets to the server periodically to prevent NAT entry aging. Reduce the interval value if the network condition is poor or the NAT entry aging time is short.

The cloud server does not respond to ping packets.

Examples

Configure the local device to send ping packets to the cloud server at intervals of 120 seconds.

```
<Sysname> system-view
[Sysname] cloud-management ping 120
```

cloud-management server domain

Use **cloud-management server domain** to specify the primary cloud server by its domain name.

Use **undo cloud-management server domain** to restore the default.

Syntax

cloud-management server domain *domain-name* [**vpn-instance** *vpn-instance-name*] [**source-ip** *ipv4-address*]

undo cloud-management server domain

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

domain-name: Specifies the primary cloud server by its domain name, a case-sensitive string of 1 to 253 characters.

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify this option, the primary cloud server is on the public network.

source-ip *ipv4-address*: Specifies the source IPv4 address for the device that connects to the primary cloud server. It must be the same as the IPv4 address configured on the device. If you do not specify this option, the device uses the primary IPv4 address of the egress interface to connect to the primary cloud server.

Usage guidelines

Before configuring this command, make sure a DNS server is configured to translate domain names.

If you execute the command multiple times, the most recent configuration takes effect.

Examples

Specify the server with domain name **lvzhouv3.**nsfocus.com.cn as the primary cloud server.

```
<Sysname> system-view
[Sysname] cloud-management server domain lvzhouv3.nsfocus.com.cn
```

Related commands

display cloud-management state

cloud-management server password

Use **cloud-management server password** to set the password for establishing cloud connections to the ADWAN server.

Use **cloud-management server password** to restore the default.

Syntax

cloud-management server password { **cipher** | **simple** } *string*

undo cloud-management server password

Default

No password is set for establishing cloud connections to the ADWAN server.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

cipher: Specifies the password in encrypted form.

simple: Specifies the password in plaintext form. For security purposes, the password specified in plaintext form will be stored in encrypted form.

string: Specifies the password. The plaintext form is a case-sensitive string of 1 to 63 characters. The encrypted form is a case-sensitive string of 1 to 117 characters.

Usage guidelines

After you change the password, the device terminates the cloud connections that have been established (if any) and uses the new password to establish cloud connections.

Examples

Set the password for establishing cloud connections to the ADWAN server to **12345678** in plaintext format.

```
<Sysname> system-view
[Sysname] cloud-management server password simple 12345678
```

cloud-management server port

Use **cloud-management server port** to specify the TCP port number used to establish cloud connections.

Use **undo cloud-management server port** to restore the default.

Syntax

cloud-management server port *port-number*

undo cloud-management server port

Default

TCP port number 19443 is used to establish cloud connections.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

port-number: Specifies a TCP port number in the range of 1 to 65535.

Usage guidelines

After you change the port number, the device terminates the cloud connections that have been established (if any) and uses the new port number to establish cloud connections.

Examples

Specify the TCP port number used to establish cloud connections as 80.

```
<Sysname> system-view
[Sysname] cloud-management server port 80
```

cloud-management unbinding-code

Use **cloud-management unbinding-code** to send the verification code for device unbinding to the cloud server.

Syntax

cloud-management unbinding-code *code*

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

code: Specifies the verification code obtained from the cloud server. The verification code is a case-sensitive string of 16 characters.

Usage guidelines

A device can be registered on the cloud server by only one user.

To register a device that has been registered by another user, you need to take the following steps:

1. Obtain a verification code for device unbinding from the cloud server.
2. Execute this command on the device to send the verification code to the cloud server.
3. Register the device on the cloud server.

Examples

Send the verification code for device unbinding to the cloud server.

```
[Sysname] cloud-management unbinding-code A6B9C3C2D5A8Z1S7
```

Table 1 Command output

Field	Description
Cloud connection state	Cloud connection state: **Unconnected**, **Request**, and **Established**.
Device state	Local device state: • **Idle**—In idle state. • **Connecting**—Connecting to the cloud server. • **Request_CAS_url**—Sent a central authentication service (CAS) URL request. • **Request_CAS_url_success**—Requesting CAS URL succeeded. • **Request_CAS_TGT**—Sent a ticket granting ticket (TGT) request. • **Request_CAS_TGT_success**—Requesting TGT succeeded. • **Request_CAS_ST**—Sent a service ticket (ST) request. • **Request_CAS_ST_success**—Requesting ST succeeded. • **Request_cloud_auth**—Sent an authentication request. • **Request_cloud_auth_success**—Authentication succeeded. • **Register**—Sent a registration request. • **Register_success**—Registration succeeded. • **Request**—Sent a handshake request. • **Request_success**—Handshake succeeded.
Cloud server address	IP address of the cloud server.
Cloud server domain name	Domain name of the cloud server.
Cloud server port	TCP port number used to establish cloud connections.
Connected at	Time when the cloud connection was established.
Duration	Duration since the establishment of the cloud connection.
Process state	Cloud connection processing state: • DNS not parsed. • DNS parsed. • Message not sent. • Message sent. • Message not received. • Message received.
Failure reason	Cloud connection failure reason: • DNS parse failed. • Socket connection failed. • SSL creation failed. • Sending CAS url request failed.

Field	Description
	• Sending CAS TGT failed. • Sending CAS ST failed. • Sending cloud auth failed. • Sending register failed. • Processing CAS url response failed. • Processing CAS TGT response failed. • Processing CAS ST response failed. • Processing cloud auth response failed. • Processing register response failed. • Sending handshake request failed. • Processing handshake failed. • Sending websocket request failed. • Processing websocket packet failed.
Last down reason	Reason for the most recent cloud connection interruption: • Device or process rebooted. • Socket connection error. • Configuration changed. • Received websocket close packet from cloud. • Keepalive expired. • Packet processing failed. • Main connection went down. • Cloud reset connection. • Memory reached threshold.
Last down at	Time when the cloud connection went down most recently.
Last report failure reason	Reason for the most recent cloud connection packet sending failure: • Tunnel is being deleted. • Tunnel socket is invalid. • Failed to convert string to json. • Failed to convert json to string. • Failed to create message node. • Tunnel is not ready. • Failed to create packet buffer. • SSL sending failure. If the reason is SSL sending failure, one of the following detailed reason will be displayed: • ssl error none. • ssl error ssl. • ssl error read. • ssl error write. • ssl error x509 lookup. • ssl error syscall. • ssl error zero return. • ssl error connect. • ssl error accept.
Last report failure at	Time when the most recent cloud connection packet sending failure occurred.
Dropped packets after reaching buffer limit	Number of packets that are dropped because the CMTNL buffer limit is reached.
Total dropped packets	Total number of dropped packets.

Field	Description
Last report incomplete reason	Reason for the most recent unfinished packet sending: • Interrupted system call. • Socket buffer is full.
Last report incomplete at	Time when the most recent unfinished packet sending occurred.
Buffer full count	Number of times that the buffer becomes full.

Contents

Port mirroring commands

The following compatibility matrixes show the support of hardware platforms for port mirroring:

Models	Feature compatibility
NFNX5-HD6480	Yes only on GE 1/0/0 through GE 1/0/13, XGE 1/0/18, XGE 1/0/19, GE 1/0/22 through GE 1/0/29, and interfaces on cards in four interface card slots
NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280	Yes only on GE 1/0/0 through GE 1/0/23, XGE 1/0/24, and XGE 1/0/25
NFNX3-HDB1780, NFNX3-HDB3080	Yes only on GE 1/0/0 through GE1/0/23, GE 1/0/25, XGE 1/0/26, and XGE 1/0/27
NFNX3-HDB1180, NFNX3-HDB1480, NFNX3-HDB680, NFNX3-HDB1080	No

display mirroring-group

Use **`display mirroring-group`** to display mirroring group information.

Syntax

`display mirroring-group` { *`group-id`* | **`all`** | **`local`** }

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

`group-id`: Specifies a mirroring group by its ID.

The following compatibility matrixes show the value ranges for the mirroring group ID:

Models	Value range
NFNX5-HD6480, NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB680, NFNX3-HDB1080	1 and 2
NFNX3-HDB1780, NFNX3-HDB3080, NFNX3-HDB1180, NFNX3-HDB1480	1

`all`: Specifies all mirroring groups.

`local`: Specifies local mirroring groups.

Usage guidelines

Mirroring group information includes the type, status, and content of a mirroring group. It is sorted by mirroring group number.

Examples

Display information about all mirroring groups.

```
<Sysname> display mirroring-group all
Mirroring group 1:
    Type: Local
    Status: Active
    Mirroring port:
        GigabitEthernet1/0/1  Inbound
    Monitor port: GigabitEthernet1/0/2
```

Table 1 Command output

Field	Description
Mirroring group	ID of the mirroring group.
Type	Type of the mirroring group: Local.
Status	Status of the mirroring group: • **Active**—The mirroring group has taken effect. • **Incomplete**—The mirroring group configuration is not complete and does not take effect.
Mirroring port	Source port.
Monitor port	Destination port.

mirroring-group

Use **mirroring-group** to create a mirroring group.

Use **undo mirroring-group** to delete mirroring groups.

Syntax

mirroring-group *group-id* **local**

undo mirroring-group { *group-id* | **all** | **local** }

Default

No mirroring groups exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

group-id: Specifies a mirroring group ID.

The following compatibility matrixes show the value ranges for the mirroring group ID:

Models	Value range
NFNX5-HD6480, NFNX3-HDB3280, NFNX5-T6280,	1 and 2

Models	Value range
NFNX5-HD5280, NFNX3-HDB680, NFNX3-HDB1080	
NFNX3-HDB1780, NFNX3-HDB3080, NFNX3-HDB1180, NFNX3-HDB1480	1

`local`: Specifies local mirroring groups.

`all`: Specifies all mirroring groups.

Examples

Create local mirroring group 1.

```
<Sysname> system-view
[Sysname] mirroring-group 1 local
```

mirroring-group mirroring-port (interface view)

Use **`mirroring-group mirroring-port`** to configure a port as a source port for a mirroring group.

Use **`undo mirroring-group mirroring-port`** to restore the default.

Syntax

`mirroring-group` *`group-id`* **`mirroring-port`** { **`both`** | **`inbound`** | **`outbound`** }

`undo mirroring-group` *`group-id`* **`mirroring-port`**

Default

A port does not act as a source port for any mirroring groups.

Views

Interface view

Predefined user roles

network-admin

context-admin

Parameters

`group-id`: Specifies a mirroring group by its ID.

The following compatibility matrixes show the value ranges for the mirroring group ID:

Models	Value range
NFNX5-HD6480, NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB680, NFNX3-HDB1080	1 and 2
NFNX3-HDB1780, NFNX3-HDB3080, NFNX3-HDB1180, NFNX3-HDB1480	1

`both`: Mirrors both received and sent packets.

`inbound`: Mirrors only received packets.

`outbound`: Mirrors only sent packets.

Usage guidelines

A Layer 2 or Layer 3 aggregate interface cannot be configured as a source port for a mirroring group.

A source port cannot be used as a monitor port.

Examples

Create local mirroring group 1 to monitor the bidirectional traffic of port GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] mirroring-group 1 local
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] mirroring-group 1 mirroring-port both
```

Related commands

mirroring-group

mirroring-group mirroring-port (system view)

Use **mirroring-group mirroring-port** to configure source ports for a mirroring group.

Use **undo mirroring-group mirroring-port** to remove source ports from a mirroring group.

Syntax

mirroring-group *group-id* **mirroring-port** *interface-list* { **both** | **inbound** | **outbound** }

undo mirroring-group *group-id* **mirroring-port** *interface-list*

Default

No source port is configured for a mirroring group.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

group-id: Specifies a mirroring group by its ID.

The following compatibility matrixes show the value ranges for the mirroring group ID:

Models	Value range
NFNX5-HD6480, NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB680, NFNX3-HDB1080	1 and 2
NFNX3-HDB1780, NFNX3-HDB3080, NFNX3-HDB1180, NFNX3-HDB1480	1

interface-list: Specifies a space-separated list of up to eight interface items. Each item specifies an interface by its type and number or specifies a range of interfaces in the form of *interface-type interface-number1* **to** *interface-type interface-number2*.

When you specify a range of interfaces, the interfaces must be of the same type and on the same slot. The start interface number must be identical to or lower than the end interface number.

both: Mirrors both received and sent packets.

inbound: Mirrors only received packets.

outbound: Mirrors only sent packets.

Usage guidelines

A Layer 2 or Layer 3 aggregate interface cannot be configured as a source port for a mirroring group.

A source port cannot be used as a monitor port.

Examples

Create local mirroring group 1 to monitor the bidirectional traffic of GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] mirroring-group 1 local
[Sysname] mirroring-group 1 mirroring-port gigabitethernet 1/0/1 both
```

Related commands

mirroring-group

mirroring-group monitor-port (interface view)

Use **mirroring-group monitor-port** to configure a port as the monitor port for a mirroring group.

Use **undo mirroring-group monitor-port** to restore the default.

Syntax

mirroring-group *group-id* **monitor-port**

undo mirroring-group *group-id* **monitor-port**

Default

A port does not act as the monitor port for any mirroring groups.

Views

Interface view

Predefined user roles

network-admin

context-admin

Parameters

group-id: Specifies a mirroring group by its ID.

The following compatibility matrixes show the value ranges for the mirroring group ID:

Models	Value range
NFNX5-HD6480, NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB680, NFNX3-HDB1080	1 and 2
NFNX3-HDB1780, NFNX3-HDB3080, NFNX3-HDB1180, NFNX3-HDB1480	1

Usage guidelines

Do not enable the spanning tree feature on the monitor port of a mirroring group.

A Layer 2 or Layer 3 aggregate interface cannot be configured as the monitor port for a mirroring group.

Use a monitor port only for port mirroring, so the data monitoring device receives and analyzes only the mirrored traffic.

The member port of an existing mirroring group cannot be configured as a monitor port.

Examples

Create local mirroring group 1 and configure GigabitEthernet 1/0/1 as its monitor port.

```
<Sysname> system-view
[Sysname] mirroring-group 1 local
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] mirroring-group 1 monitor-port
```

Related commands

mirroring-group

mirroring-group monitor-port (system view)

Use **mirroring-group monitor-port** to configure the monitor ports for a mirroring group.

Use **undo mirroring-group monitor-port** to remove the monitor ports from a mirroring group.

Syntax

mirroring-group *group-id* **monitor-port** *interface-type interface-number*

undo mirroring-group *group-id* **monitor-port** *interface-type interface-number*

Default

No monitor port is configured for a mirroring group.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

group-id: Specifies a mirroring group by its ID.

The following compatibility matrixes show the value ranges for the mirroring group ID:

Models	Value range
NFNX5-HD6480, NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB680, NFNX3-HDB1080	1 and 2
NFNX3-HDB1780, NFNX3-HDB3080, NFNX3-HDB1180, NFNX3-HDB1480	1

interface-type interface-number: Specifies an interface by its type and number.

Usage guidelines

Do not enable the spanning tree feature on the monitor port of a mirroring group.

Use a monitor port only for port mirroring, so the data monitoring device receives only the mirrored traffic.

The member port of an existing mirroring group cannot be configured as a monitor port.

Examples

Create local mirroring group 1 and configure GigabitEthernet 1/0/1 as its monitor port.

```
<Sysname> system-view
[Sysname] mirroring-group 1 local
[Sysname] mirroring-group 1 monitor-port gigabitethernet 1/0/1
```

Packet capture commands

display packet-capture status

Use **display packet-capture status** to display packet capture settings and status information.

Syntax

display packet-capture status

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Examples

Display packet capture settings and status information.

```
<Sysname> display packet-capture status
  Capture status: Started
  Filter: ACL 3000
          Interface GigabitEthernet 1/0/1
```

Table 1 Command output

Field	Description
Capture status	Packet capture status: • **Started**—Packet capture is started. • **Stopped**—Packet capture is stopped. • **Saving**—The device is saving captured packets to a file.
Filter	Filtering settings: • **ACL**—Captures packets permitted by an advanced ACL. • **ACL IPv6**—Captures packets permitted by an IPv6 advanced ACL. • **Interface**—Captures packets received or sent by an interface. If packet capture is not started, the command does not display this field.

Related commands

packet-capture start

packet-capture stop

packet-capture max-bytes

Use **packet-capture max-bytes** to set the maximum packet size for a packet capture record.

Use **undo packet-capture max-bytes** to restore the default.

Syntax

packet-capture max-bytes *bytes*

undo packet-capture max-bytes

Default

The maximum packet size is 1600 bytes for a packet capture record.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

bytes: Specifies the maximum packet size for a packet capture record in bytes. The value range is 512 to 4096.

Usage guidelines

The device captures only the specified maximum number of bytes from a packet. The remaining part of the packet is ignored. To capture all bytes of packets, make sure the maximum packet size for a packet capture record is equal to or greater than the interface MTU.

You can configure packet capture parameters only when packet capture is not started.

Examples

Set the maximum packet size to 1500 bytes for a packet capture record.

```
<Sysname> system-view
[Sysname] packet-capture max-bytes 1500
```

packet-capture max-file-packets

Use **packet-capture max-file-packets** to set the maximum number of packet capture records for a file.

Use **undo packet-capture max-file-packets** to restore the default.

Syntax

packet-capture max-file-packets *number*

undo packet-capture max-file-packets

Default

The maximum number of packet capture records for a file is 100.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

number: Specifies the maximum number of packet capture records for a file. The value range is 100 to 1000.

Usage guidelines

The system first saves packet capture records to memory. After the maximum number of packet capture records for a file is reached, the system saves the records to a file and clears the records in memory.

A greater value for this argument requires more memory space. If the available memory space is limited, decrease the value.

You can configure packet capture parameters only when packet capture is not started.

Examples

Set the maximum number of packet capture records for a file to 500.

```
<Sysname> system-view
[Sysname] packet-capture max-file-packets 500
```

packet-capture start

Use **packet-capture start** to start packet capture.

Syntax

packet-capture start [**acl** { *acl-number* | **ipv6** *acl-number* } | **interface** *interface-type interface-number*] *

Default

Packet capture is not started.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

acl: Captures packets permitted by an advanced ACL.

acl-number: Specifies an IPv4 advanced ACL by its number in the range of 3000 to 3900.

ipv6 *acl-number*: Specifies an IPv6 advanced ACL by its number in the range of 3000 to 3900.

interface *interface-type interface-number*: Captures packets received or sent by an interface.

Usage guidelines

Start packet capture only when necessary. Packet capture affects device performance.

To save .cap files on the device, back up existing .cap files on the device before starting packet capture. The system automatically deletes existing .cap files in the same .cap file directory after you start packet capture.

If you do not specify any options, the device captures all received and sent packets.

On a non-default context, you cannot start packet capture on a shared interface.

Examples

Start packet capture. Use ACL 3000 to identify the packets to be captured.

```
<Sysname> system-view
[Sysname] packet-capture start acl 3000
```

```
The operation will delete .cap files in storage path,continue?[y/n]
```

packet-capture stop

Use **packet-capture stop** to stop packet capture.

Syntax

packet-capture stop [**immediately**]

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

immediately: Stops packet capture and captured-packet saving. If you do not specify this keyword, the device saves captured packets to a file before stopping packet capture.

Usage guidelines

Saving packet capture records to a file takes time. The **packet-capture stop** command without the **immediately** keyword saves all packet capture records to a file before stopping packet capture. If you do not want to use the packet capture records in memory, execute the **packet-capture stop immediately** command.

Examples

Stop packet capture.

```
<Sysname> system-view
[Sysname] packet-capture stop
```

Stop packet capture immediately.

```
<Sysname> system-view
[Sysname] packet-capture stop immediately
```

packet-capture storage

Use **packet-capture storage** to specify the storage directory for the .cap files.

Use **undo packet-capture storage** to restore the default.

Syntax

packet-capture storage { **local** [**limit** *limit-space*] | **remote** *serverpath* [**vpn-instance** *vpn-instance-name*] [**user** *username* [**password** { **cipher** | **simple** } *string*]] }

undo packet-capture storage

Default

The storage directory is the **pcap** directory of the default file system on the master.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

local: Saves the .cap files on the device.

limit *limit-space*: Specifies the maximum storage space for .cap files in KB. The value range is 1024 to 10240. The default is 4096. After the maximum storage space is reached, the system stops capturing packets.

remote: Saves the .cap files to a remote file server.

serverpath: Specifies a directory on an FTP or TFTP server, a case-sensitive string of up to 253 characters. Valid characters include letters, digits, hyphens (-), underscores (_), colons (:), forward slashes (/), and dots (.).

vpn-instance *vpn-instance-name*: Specifies the VPN instance to which the FTP or TFTP server belongs. The *vpn-instance-name* argument specifies the VPN instance name, a case-sensitive string of 1 to 31 characters. If the FTP or TFTP server belongs to the public network, do not specify this option.

user *username*: Specifies the username used to access the FTP server, a case-sensitive string of up to 255 characters. It cannot contain forward slashes (/), backward slashes (\), vertical bars (|), colons (:), asterisks (*), question marks (?), left angle brackets (<), right angle brackets (>), or at signs (@). This option is required if an FTP server is used to save the .cap files.

password: Specifies the password used to access the FTP server.

cipher: Specifies a password in encrypted form.

simple: Specifies a password in plaintext form. For security purposes, the password specified in plaintext form will be stored in encrypted form.

string: Specifies the password string, case sensitive. A password in encrypted form can have up to 255 characters. A password in plaintext form can have up to 373 characters.

Usage guidelines

The storage space of the storage media on the device is limited. As a best practice, use a remote file server to save the .cap files.

You can configure packet capture parameters only when packet capture is not started.

Examples

Set the storage directory for the .cap files to **ftp://1.1.1.2**. Specify the username and password for accessing the FTP server

```
<Sysname> system-view
[Sysname] packet-capture storage remote ftp://1.1.1.2 user user123 password simple 123
```

Contents

NQA commands

NQA client commands

advantage-factor

Use **advantage-factor** to set the advantage factor to be used for calculating Mean Opinion Scores (MOS) and Calculated Planning Impairment Factor (ICPIF) values.

Use **undo advantage-factor** to restore the default.

Syntax

advantage-factor *factor*

undo advantage-factor

Default

The advantage factor is 0.

Views

Voice operation view

Predefined user roles

network-admin

context-admin

Parameters

factor: Specifies the advantage factor in the range of 0 to 20.

Usage guidelines

The evaluation of voice quality depends on users' tolerance for voice quality. For users with higher tolerance for voice quality, use the **advantage-factor** command to set an advantage factor. When the system calculates the ICPIF value, it subtracts the advantage factor to modify ICPIF and MOS values for voice quality evaluation.

Examples

Set the advantage factor to 10 for the voice operation.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type voice
[Sysname-nqa-admin-test-voice] advantage-factor 10
```

agent-type

Use **agent-type** to specify the SNMP agent type for the SNMP DCA operation.

Use **undo agent-type** to restore the default.

Syntax

agent-type { **net-snmp** | **user-defined** | **windows** }

undo agent-type

Default

The default SNMP agent type is Net-SNMP.

Views

SNMP DCA template view

Predefined user roles

network-admin

context-admin

Parameters

net-snmp: Specifies the Net-SNMP agent type.

user-defined: Specifies the user-defined agent type.

windows: Specifies the Windows agent type.

Usage guidelines

The SNMP DCA operation monitors the performance of a device running an SNMP agent. It collects the CPU, memory, and disk usage from the SNMP agent and determines the device performance based on the collected object values and their associated thresholds and weights.

Different SNMP agent types use different OIDs for the CPU, memory, and disk usage objects. Make sure the SNMP agent type specified in the SNMP DCA template matches the type of the SNMP agent to be monitored.

For Net-SNMP or Windows SNMP agents, the NQA client has built-in OIDs to collect the CPU, memory, and disk usage objects. You can use the **cpu**, **memory**, and **disk** commands to set the thresholds and weights for these objects. You can also use the **oid** command to configure custom SNMP objects.

For SNMP agents of the user-defined type, the NQA client does not have predefined SNMP objects to collect. You must use the **oid** command to configure the interested SNMP objects and their associated thresholds and weights.

Examples

Set the SNMP agent type to Windows for SNMP DCA template **test**.

```
<Sysname> system-view
[Sysname] nqa template snmpdca test
[Sysname-nqatplt-snmpdca-test] agent-type windows
```

Related commands

cpu

disk

memory

oid

codec-type

Use **codec-type** to configure the codec type for the voice operation.

Use **undo codec-type** to restore the default.

Syntax

codec-type { **g711a** | **g711u** | **g729a** }

undo codec-type

Default

The codec type for the voice operation is G.711 A-law.

Views

Voice operation view

Predefined user roles

network-admin

context-admin

Parameters

g711a: Specifies G.711 A-law codec type.

g711u: Specifies G.711 μ-law codec type

g729a: Specifies G.729 A-law codec type.

Examples

Set the codec type to **g729a** for the voice operation.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type voice
[Sysname-nqa-admin-test-voice] codec-type g729a
```

community read

Use **community read** to specify the community name for the SNMP operation.

Use **undo community read** to restore the default.

Syntax

community read { **cipher** | **simple** } *community-name*

undo community read

Default

The SNMP operation uses the community name **public**.

Views

SNMP operation view

SNMP template view

SNMP DCA template view

Predefined user roles

network-admin

context-admin

Parameters

cipher: Specifies a community name in encrypted form.

simple: Specifies a community name in plaintext form. For security purposes, the community name specified in plaintext form will be stored in encrypted form.

community-name: Specifies the community name. Its plaintext form is a case-sensitive string of 1 to 32 characters. Its encrypted form is a case-sensitive string of 33 to 73 characters.

Usage guidelines

You must specify the community name for the SNMP operation when both of the following conditions exist:

- The SNMP operation uses the SNMPv1 or SNMPv2c agent.
- The SNMPv1 or SNMPv2c agent is configured with a read-only or read-write community name.

The specified community name must be the same as the community name configured on the SNMP agent.

The community name configuration is not required if the SNMP operation uses the SNMPv3 agent.

For more information about SNMP, see "Configuring SNMP."

Examples

Specify **readaccess** as the community name for the SNMP operation.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type snmp
[Sysname-nqa-admin-test-snmp] community read simple readaccess
```

cpu

Use **cpu** to specify the threshold and weight for the CPU usage object.

Use **undo cpu** to restore the default.

Syntax

cpu { **threshold** *threshold-value* | **weight** *weight-value* } *

undo cpu

Default

The CPU usage threshold is 80 and the weight is 3.

Views

SNMP DCA template view

Predefined user roles

network-admin

context-admin

Parameters

threshold *threshold-value*: Specifies the CPU usage threshold in the range of 0 to 100. A threshold of 0 means that CPU usage is not used as a metric for measuring the SNMP agent performance.

weight *weight-value*: Specifies the weight of the CPU usage object. The value range is 0 to 100. A weight of 0 means that CPU usage is not used as a metric for measuring the SNMP agent performance.

Usage guidelines

This command takes effect only on SNMP agents of the Net-SNMP or Windows agent type.

The NQA client automatically obtains the CPU usage from the SNMP agent of the Net-SNMP or Windows type in the SNMP DCA operation.

Examples

Set both the threshold and weight of the CPU usage object to 90.

```
<Sysname> system-view
[Sysname] nqa template snmpdca test
[Sysname-nqatplt-snmpdca-test] cpu threshold 90 weight 90
```

Related commands

agent-type

data-fill

Use **data-fill** to configure the payload fill string for probe packets.

Use **undo data-fill** to restore the default.

Syntax

data-fill *string* [**raw**]

undo data-fill

Default

The default payload fill string is the hexadecimal string 00010203040506070809.

Views

ICMP/UDP echo operation view

Path jitter/UDP jitter/voice operation view

ICMP/TCP/UDP template view

TWAMP Light client-session view

Predefined user roles

network-admin

context-admin

Parameters

string: Specifies a case-sensitive string of 1 to 200 characters.

raw: Fills the packet payload with the specified payload fill string without truncation or repetition to fit the payload size. This keyword is available only in UDP template view.

Usage guidelines

How the string is filled depends on the operation type.

- For the ICMP echo operation, the string fills the whole payload of an ICMP echo request.
- For the UDP echo operation, the first five bytes in the payload of a UDP packet are for special purpose. The string fills the remaining part of payload.
- For the UDP jitter operation, the first 68 bytes in the payload of a UDP packet are for special purpose. The string fills the remaining part of the payload.
- For the voice operation, the first 16 bytes in the payload of a UDP packet are for special purpose. The string fills the remaining part of the payload.
- For the path jitter operation, the first four bytes in the payload of an ICMP echo request are for special purpose. The string fills the remaining part of payload.

With the **raw** keyword specified, the payload fill string will be used exactly as specified to fill the packet payload.

Without the **raw** keyword, the payload fill string will be truncated at the end or cyclically repeated to fit the payload size of the probe packet.

For example, if you configure the payload fill string as **abcd**:

- Probe packet with a payload size of 3 bytes will be filled with **abc**.
- Probe packet with a payload size of 6 bytes will be filled with **adcdab**.

In UDP template view, the probe packets without the **raw** keyword specified contain special characters. For a destination device other than an NSFOCUS device, provide the **raw** keyword because it can identify only probe packets without any special characters contained. Make sure the payload fill string specified on the client can be identified by the destination device.

If the destination device is an NSFOCUS device, the **raw** keyword is not a must because the NSFOCUS device can identify the probe packets that contain special characters. As a best practice, do not specify the **raw** keyword.

Examples

Specify **abcd** as the payload fill string for ICMP echo requests.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type icmp-echo
[Sysname-nqa-admin-test-icmp-echo] data-fill abcd
```

In TCP template view, specify **abcd** as the payload fill string for probe packets.

```
<Sysname> system-view
[Sysname] nqa template tcp tcptplt
[Sysname-nqatplt-tcp-tcptplt] data-fill abcd
```

data-size

Use **data-size** to set the payload size for each probe packet.

Use **undo data-size** to restore the default.

Syntax

data-size *size*

undo data-size

Default

The default payload size of a probe packet for different operations is described in Table 1.

Table 1 Default payload size of a probe packet

Operation type	Codec type	Default size (bytes)
ICMP echo	N/A	100
UDP echo	N/A	100
UDP jitter	N/A	100
UDP tracert	N/A	100
Path jitter	N/A	100
Voice	G.711 A-law	172
Voice	G.711 μ-law	172
Voice	G.729 A-law	32

Operation type	Codec type	Default size (bytes)
TWAMP Light	N/A	142

Views

ICMP/UDP echo operation view

UDP tracert operation view

Path jitter/UDP jitter/voice operation view

ICMP/UDP template view

TWAMP Light client-session view

Predefined user roles

network-admin

context-admin

Parameters

size: Specifies the payload size in bytes. The value range for the *size* argument varies by operation type.

- For the ICMP echo, UDP echo, or UDP tracert operation, the value range is 20 to 65507.
- For the UDP jitter or path jitter operation, the value range is 68 to 65507.
- For the voice operation, the value range is 16 to 65507.
- 44 to 1518 for TWAMP Light tests.

Usage guidelines

In ICMP echo and path jitter operations, the command sets the payload size for each ICMP echo request.

In UDP echo, UDP jitter, UDP tracert, and voice operations, the command sets the payload size for each UDP packet.

In TWAMP Light tests, the payload size cannot be larger than the MTU size of any interface on the test link.

Examples

Set the payload size to 80 bytes for each ICMP echo request.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type icmp-echo
[Sysname-nqa-admin-test-icmp-echo] data-size 80
```

In ICMP template view, set the payload size to 80 bytes for each probe packet.

```
<Sysname> system-view
[Sysname] nqa template icmp icmptplt
[Sysname-nqatplt-icmp-icmptplt] data-size 80
```

description

Use **description** to configure a description for an NQA operation, such as the operation type or purpose.

Use **undo description** to restore the default.

Syntax

description *text*

undo description

Default

No description is configured for an NQA operation.

Parameters

text: Specifies a description, a case-sensitive string of 1 to 200 characters.

Examples

Configure the description as **icmp-probe** for the ICMP echo operation.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type icmp-echo
[Sysname-nqa-admin-test-icmp-echo] description icmp-probe
```

In ICMP template view, configure the description as **icmp-probe** for the NQA operation.

```
<Sysname> system-view
[Sysname] nqa template icmp icmptplt
[Sysname-nqatplt-icmp-icmptplt] description icmp-probe
```

destination ip

Use **destination ip** to configure the destination IPv4 address for the operation.

Use **undo destination ip** to restore the default.

Syntax

destination ip *ip-address*

undo destination ip

Default

No destination IPv4 address is configured for an operation.

context-admin

Parameters

ipv6-address: Specifies the destination IPv6 address for the operation. IPv6 link-local addresses are not supported.

Examples

Specify 1::1 as the destination IPv6 address for the ICMP echo operation.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type icmp-echo
[Sysname-nqa-admin-test-icmp-echo] destination ipv6 1::1
```

In ICMP template view, specify 1::1 as the destination IPv6 address for the operation.

```
<Sysname> system-view
[Sysname] nqa template icmp icmptplt
[Sysname-nqatplt-icmp-icmptplt] destination ipv6 1::1
```

destination mac

Use **destination mac** to specify the destination MAC address for the operation.

Use **undo destination mac** to restore the default.

Syntax

destination mac *mac-address*

undo destination mac

Default

No destination MAC address is specified.

Views

TWAMP Light client-session view

Predefined user roles

network-admin

context-admin

Parameters

mac-address: Specifies the destination MAC address in the format of H-H-H. For example, to use 000f-00e2-0001 as the destination MAC address, set this argument to f-e2-1.

Usage guidelines

In TWAMP Light client-session view, specify 0001-0002-0003 as the destination MAC address for the TWAMP Light test.

```
<Sysname> system-view
[Sysname] nqa twamp-light client
[Sysname-nqa-twamp-light-client] test-session 1
[Sysname-nqa-twamp-light-client-session1] destination mac 1-2-3
```

destination port

Use **destination port** to configure the destination port number for the operation.

Use **undo destination port** to restore the default.

Syntax

destination port *port-number*

undo destination port

Default

The destination port numbers for NQA operations are as follows:

- 33434 for the UDP tracert operation.
- 161 for the SNMP operation.

No destination port number is configured for other types of operations.

The destination port numbers for NQA templates are as follows:

- 53 for the DNS template.
- 143 for the IMAP template.
- 110 for the POP3 template.
- 1812 for the RADIUS authentication template.
- 1813 for the RADIUS accounting template.
- 5060 for the SIP template.
- 25 for the SMTP template.
- 161 for the SNMP template.
- 161 for the SNMP DCA template.
- 9201 for the WAP template.

No destination port number is configured for other types of NQA templates.

Predefined user roles

network-admin

context-admin

Parameters

port-number: Specifies the destination port number for the operation, in the range of 1 to 65535.

Usage guidelines

For a TCP half open template, this command is required only if the **port-detect enable** command is configured.

Examples

Set the destination port number to 9000 for the UDP echo operation.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type udp-echo
[Sysname-nqa-admin-test-udp-echo] destination port 9000
```

In TCP template view, set the destination port number to 9000 for the NQA operation.

```
<Sysname> system-view
```

```
[Sysname] nqa template tcp tcptplt
[Sysname-nqatplt-tcp-tcptplt] destination port 9000
```

Related commands

port-detect enable

disconnect-mode

Use **disconnect-mode** to set a TCP connection termination mode.

Use **undo disconnect-mode** to restore the default.

Syntax

disconnect-mode { **fin** | **rst** }

undo disconnect-mode

Default

The TCP operation uses the RST mode to terminate TCP connections.

Views

TCP template view

Predefined user roles

network-admin

context-admin

Parameters

fin: Sets the FIN mode for TCP connection termination.

rst: Sets the RST mode for TCP connection termination.

Usage guidelines

A TCP operation includes two processes: establishing a TCP connection through the three-way handshake and terminating the TCP connection. When both processes complete, the TCP operation succeeds.

You can use the command to set the connection termination mode for the TCP operation:

- **RST mode**—The server terminates the TCP connection after receiving the RST request from the client.
- **FIN mode**—The server terminates the TCP connection after the four-way handshake between the client and the server.

  Use the FIN mode when the RST mode is not supported on the client.

Examples

In TCP template view, set the FIN mode for TCP connection termination.

```
<Sysname> system-view
[Sysname] nqa template tcp test
[Sysname-nqatplt-tcp-test] disconnect-mode fin
```

disk

Use **disk** to specify the threshold and weight for the disk usage object.

Use **undo disk** to restore the default.

Syntax

disk { **threshold** *threshold-value* | **weight** *weight-value* } *

undo disk

Default

The disk usage threshold is 90 and the weight is 4.

Views

SNMP DCA template view

Predefined user roles

network-admin

context-admin

Parameters

threshold *threshold-value*: Specifies the disk usage threshold in the range of 0 to 100. A threshold of 0 means that disk usage is not used as a metric for measuring the SNMP agent performance.

weight *weight-value*: Specifies the weight of the disk usage object in the range of 0 to 100. A weight of 0 means that disk usage is not used as a metric for measuring the SNMP agent performance.

Usage guidelines

This command takes effect only on SNMP agents of the Net-SNMP or Windows agent type.

The NQA client automatically obtains the disk usage from the SNMP agent of the Net-SNMP or Windows type in the SNMP DCA operation.

Examples

Set both the threshold and weight of the disk usage object to 90.

```
<Sysname> system-view
[Sysname] nqa template snmpdca test
[Sysname-nqatplt-snmpdca-test] disk threshold 90 weight 90
```

agent-type

display nqa history

Use **display nqa history** to display the history records of NQA operations.

Syntax

display nqa history [*admin-name operation-tag*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

admin-name operation-tag: Specifies an NQA operation by its administrator name and operation tag. The *admin-name* argument represents the name of the administrator who creates the NQA operation. The *operation-tag* argument represents the operation tag. Each of the arguments is a case-insensitive string of 1 to 32 characters that cannot contain hyphens (-). If you do not specify an NQA operation, the command displays the history records of all NQA operations.

Usage guidelines

The **display nqa history** command does not display the results or statistics of the following operations:

- ICMP jitter.
- Path jitter.
- UDP jitter.
- Voice.

To view the results or statistics of the ICMP jitter, path jitter, UDP jitter, and voice operations, use the **display nqa result** or **display nqa statistics** command.

Examples

Display the history records of the UDP tracert operation with administrator name **administrator** and operation tag **tracert**.

```
<Sysname> display nqa history administrator tracert
NQA entry (admin administrator, tag tracert) history records:
Index      TTL  Response  Hop IP          Status          Time
1          2    328       4.1.1.1         Succeeded       2013-09-09 14:46:06.2
1          2    328       4.1.1.1         Succeeded       2013-09-09 14:46:05.2
1          2    328       4.1.1.1         Succeeded       2013-09-09 14:46:04.2
1          1    328       3.1.1.2         Succeeded       2013-09-09 14:46:03.2
1          1    328       3.1.1.1         Succeeded       2013-09-09 14:46:02.2
1          1    328       3.1.1.1         Succeeded       2013-09-09 14:46:01.2
```

Display the history records of the NQA operation with administrator name **administrator** and operation tag **test**.

```
<Sysname> display nqa history administrator test
NQA entry (admin administrator, tag test) history records:
  Index      Response     Status           Time
  10         329          Succeeded        2011-04-29 20:54:26.5
  9          344          Succeeded        2011-04-29 20:54:26.2

  5          328          Succeeded        2011-04-29 20:54:24.8
  4          328          Succeeded        2011-04-29 20:54:24.5
  3          328          Succeeded        2011-04-29 20:54:24.1
  2          328          Succeeded        2011-04-29 20:54:23.8
  1          328          Succeeded        2011-04-29 20:54:23.4
```

Table 2 Command output

Field	Description
Index	History record ID. The history records in one UDP tracert operation have the same ID.
TTL	If the routing table bypass feature is not enabled in the operation, this field displays the TTL value in the probe packet. If the routing table bypass feature is enabled, the value of this field varies by the **init-ttl** command. However, the actual TTL value in the probe packet is fixed at 1.
Response	Round-trip time if the operation succeeds, timeout time upon timeout, or 0 if the operation cannot be completed, in milliseconds.
Hop IP	IP address of the node that sent the reply packet.
Status	Status of the operation result: • Succeeded. • Unknown error. • Internal error. • Timeout.
Time	Time when the operation was completed.

display nqa reaction counters

Use **display nqa reaction counters** to display the current monitoring results of reaction entries.

Syntax

display nqa reaction counters [*admin-name operation-tag* [*item-number*]]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

admin-name operation-tag: Specifies an NQA operation by its administrator name and operation tag. The *admin-name* argument represents the name of the administrator who creates the NQA operation. The *operation-tag* argument represents the operation tag. Each of the arguments is a case-insensitive string of 1 to 32 characters that cannot contain hyphens (-). If you do not specify an NQA operation, the command displays the current monitoring results of reaction entries for all NQA operations.

item-number: Specifies a reaction entry by its ID in the range of 1 to 10. If you do not specify a reaction entry, the command displays the results of all reaction entries.

Usage guidelines

The result fields display hyphens (-) if the threshold type is the average value or if the monitored performance metric is ICPIF or MOS of the voice operation.

The monitoring results of an operation are accumulated, and are not cleared after the operation completes.

Examples

Display the monitoring results of all reaction entries of the ICMP echo operation with administrator name **admin** and operation tag **test**.

```
<Sysname> display nqa reaction counters admin test
NQA entry (admin admin, tag test) reaction counters:
  Index  Checked Element  Threshold Type  Checked Num  Over-threshold Num
  1      probe-duration   accumulate      12           4
  2      probe-duration   average         -            -
  3      probe-duration   consecutive     160          56
  4      probe-fail       accumulate      12           0
  5      probe-fail       consecutive     162          2
```

Table 3 Command output

Field	Description
Index	ID of a reaction entry.
Checked Element	Monitored performance metric. The available performance metrics vary by NQA operation type. For more information, see Table 4 and Table 5.
Threshold Type	Threshold type.
Checked Num	Number of targets that have been monitored for data collection.
Over-threshold Num	Number of threshold violations.

Table 4 Monitored performance metrics for ARP/DHCP/DLSw/DNS/FTP/HTTP/ICMP echo/SNMP/TCP/UDP echo operations

Monitored performance metric	Threshold type	Collect data in	Checked Num	Over-threshold Num
probe-duration	accumulate	Probes after the operation starts.	Number of completed probes.	Number of probes with duration exceeding the threshold.
	average	N/A	N/A	N/A
	consecutive	Probes after the operation starts.	Number of completed probes.	Number of probes with duration exceeding the threshold.
probe-fail	accumulate	Probes after the operation starts.	Number of completed probes.	Number of probe failures.
	consecutive	Probes after the operation starts.	Number of completed probes.	Number of probe failures.

Table 5 Monitored performance metrics for ICMP jitter/UDP jitter/voice operations

Monitored performance metric	Threshold type	Collect data in	Checked Num	Over-threshold Num
RTT	accumulate	Packets sent after the operation starts.	Number of sent packets.	Number of packets with round-trip time exceeding threshold.
	average	N/A	N/A	N/A
jitter-DS/jitter-SD	accumulate	Packets sent after the operation starts.	Number of sent packets.	Number of packets with the one-way jitter exceeding the threshold.
	average	N/A	N/A	N/A
OWD-DS/OWD-SD	N/A	Packets sent after the operation starts.	Number of sent packets.	Number of packets with the one-way delay exceeding the threshold.
packet-loss	accumulate	Packets sent after the operation starts.	Number of sent packets.	Total packet loss.
ICPIF/MOS (available only for the voice operation)	N/A	N/A	N/A	N/A

display nqa result

Use **`display nqa result`** to display the most recent result of an NQA operation.

Syntax

`display nqa result` [*`admin-name operation-tag`*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

`admin-name operation-tag`: Specifies an NQA operation by its administrator name and operation tag. The *`admin-name`* argument represents the name of the administrator who creates the NQA operation. The *`operation-tag`* argument represents the operation tag. Each of the arguments is a case-insensitive string of 1 to 32 characters that cannot contain hyphens (-). If you do not specify an NQA operation, the command displays the most recent results of all NQA operations.

Examples

Display the most recent result of the ARP operation with administrator name **admin** and operation tag **test**.

```
<Sysname> display nqa result admin test
NQA entry (admin admin, tag test) test results:
```

```
    Send operation times: 1              Receive response times: 1
    Min/Max/Average round trip time: 35/35/35
    Square-Sum of round trip time: 1225
    Last succeeded probe time: 2011-05-29 10:50:33.2
  Extended results:
    Packet loss ratio: 0%
    Failures due to timeout: 0
    Failures due to internal error: 0
    Failures due to other errors: 0
```

Display the most recent result of the TCP operation with administrator name **admin** and operation tag **test**.

```
<Sysname> display nqa result admin test
NQA entry (admin admin, tag test) test results:
    Send operation times: 1              Receive response times: 1
    Min/Max/Average round trip time: 35/35/35
    Square-Sum of round trip time: 1225
    Last succeeded probe time: 2011-05-29 10:50:33.2
  Extended results:
    Packet loss ratio: 0%
    Failures due to timeout: 0
    Failures due to disconnect: 0
    Failures due to no connection: 0
    Failures due to internal error: 0
    Failures due to other errors: 0
```

Display the most recent result of the ICMP jitter operation with administrator name **admin** and operation tag **test**.

```
<Sysname> display nqa result admin test
NQA entry (admin admin, tag test) test results:
    Send operation times: 10             Receive response times: 10
    Min/Max/Average round trip time: 1/2/1
    Square-Sum of round trip time: 13
    Last packet received time: 2015-03-09 17:40:29.8
  Extended results:
    Packet loss ratio: 0.0%
    Failures due to timeout: 0
    Failures due to internal error: 0
    Failures due to other errors: 0
    Packets out of sequence: 0
    Packets arrived late: 0
  ICMP-jitter results:
   RTT number: 10
    Min positive SD: 0                   Min positive DS: 0
    Max positive SD: 0                   Max positive DS: 0

```

Table 6 Command output

Field	Description
NQA entry (admin admin, tag test) test results	NQA operation results.
Data collecting in progress	The operation is in progress.
Path jitter result is not available	No result is generated for the operation.
Send operation times	Number of operations.
Receive response times	Number of response packets received.
Min/Max/Average round trip time	Minimum/maximum/average round-trip time in milliseconds.
Square-Sum of round trip time	Square sum of round-trip time.
Last succeeded probe time	Time when the last successful probe was completed. If no probes are successful in an operation, the field displays **0**. This field is not available for UDP jitter, path jitter, and voice operations.
Last packet received time	Time when the last response packet was received. If no response packets in a probe were received, the field displays **0**. This field is available only for UDP jitter and voice operations.
Extended results	Results of extended items.
Packet loss ratio	Average packet loss ratio. For ICMP jitter, UDP jitter, and voice operations, the accuracy of the field value is 0.1%.
Failures due to timeout	Number of timeout occurrences in an operation.
Failures due to disconnect	Number of disconnections by the peer.
Failures due to no connection	Number of failures to connect with the peer.
Failures due to internal error	Number of failures due to internal errors.
Failures due to other errors	Failures due to other errors.
Packets out of sequence	Number of failures due to out-of-sequence packets.
ICMP-jitter results	ICMP jitter operation results. This field is available only for the ICMP jitter operation.
Packets arrived late	Number of response packets received after a probe times out.
UDP-jitter results	UDP jitter operation results. This field is available only for the UDP jitter operation.
Voice results	Voice operation results. This field is available only for the voice operation.
RTT number	Number of response packets received.
Min positive SD	Minimum positive jitter from source to destination.
Min positive DS	Minimum positive jitter from destination to source.
Max positive SD	Maximum positive jitter from source to destination.
Max positive DS	Maximum positive jitter from destination to source.
Positive SD number	Number of positive jitters from source to destination.
Positive DS number	Number of positive jitters from destination to source.

Field	Description
Positive SD sum	Sum of positive jitters from source to destination.
Positive DS sum	Sum of positive jitters from destination to source.
Positive SD average	Average positive jitters from source to destination.
Positive DS average	Average positive jitters from destination to source.
Positive SD square-sum	Square sum of positive jitters from source to destination.
Positive DS square-sum	Square sum of positive jitters from destination to source.
Min negative SD	Minimum absolute value among negative jitters from source to destination.
Min negative DS	Minimum absolute value among negative jitters from destination to source.
Max negative SD	Maximum absolute value among negative jitters from source to destination.
Max negative DS	Maximum absolute value among negative jitters from destination to source.
Negative SD number	Number of negative jitters from source to destination.
Negative DS number	Number of negative jitters from destination to source.
Negative SD sum	Sum of absolute values of negative jitters from source to destination.
Negative DS sum	Sum of absolute values of negative jitters from destination to source.
Negative SD average	Average absolute value of negative jitters from source to destination.
Negative DS average	Average absolute value of negative jitters from destination to source.
Negative SD square-sum	Square sum of negative jitters from source to destination.
Negative DS square-sum	Square sum of negative jitters from destination to source.
SD average	Average value of jitters from source to destination.
DS average	Average value of jitters from destination to source.
One way results	Unidirectional delay. This field is available only for the ICMP jitter, UDP jitter, and voice operations.
Max SD delay	Maximum delay from source to destination.
Max DS delay	Maximum delay from destination to source.
Min SD delay	Minimum delay from source to destination.
Min DS delay	Minimum delay from destination to source.
Number of SD delay	Number of delays from source to destination.
Number of DS delay	Number of delays from destination to source.
Sum of SD delay	Sum of delays from source to destination.
Sum of DS delay	Sum of delays from destination to source.
Square-Sum of SD delay	Square sum of delays from source to destination.

Field	Description
Square-Sum of DS delay	Square sum of delays from destination to source.
SD lost packets	Number of lost packets from the source to the destination.
DS lost packets	Number of lost packets from the destination to the source.
Lost packets for unknown reason	Number of lost packets for unknown reasons.
Voice scores	Voice parameters. This field is available only for the voice operation.
MOS value	MOS value calculated for the voice operation.
ICPIF value	ICPIF value calculated for the voice operation.
Hop IP	IP address of the hop. This field is available only for the path jitter operation.
Path-jitter results	Path jitter operation results. This field is available only for the path jitter operation.
Jitter number	Number of jitters. This field is available only for the path jitter operation.
Min/Max/Average jitter	Minimum/maximum/average jitter in milliseconds. This field is available only for the path jitter operation.
Positive jitter number	Number of positive jitter. This field is available only for the path jitter operation.
Min/Max/Average positive jitter	Minimum/maximum/average positive jitter in milliseconds. This field is available only for the path jitter operation.
Sum/Square-Sum positive jitter	Sum/square sum of the positive jitter. This field is available only for the path jitter operation.
Negative jitter number	Number of negative jitter. This field is available only for the path jitter operation.
Min/Max/Average negative jitter	Minimum/maximum/average negative jitter in milliseconds. This field is available only for the path jitter operation.
Sum/Square-Sum negative jitter	Sum/square sum of the negative jitter. This field is available only for the path jitter operation.
TTL	If the routing table bypass feature is not enabled in the operation, this field displays the TTL value in the probe packet. If the routing table bypass feature is enabled, the value of this field varies by the **`init-ttl`** command. However, the actual TTL value in the probe packet is fixed at 1.
Hop IP	IP address of the node that sent the reply packet.
Time	Time when the NQA client received the reply packet.

Field	Description
Status	Status of the Y.1564 operation or a test in the Y.1564 operation. The value can be: • **Succeeded**. • **Failed**. • **In progress**. • **Aborted**—The test was manually aborted. • **Timeout**. • **Unknown error**. This field displays two hyphens (**--**) for a test whose status is meaningless..
Last test	Last completed test. The value can be: • **CIR test** • **PIR test** • **Traffic policing test** • **Service performance test**
Estimated total time	Total time that the Y.1564 operation was estimated to take, in seconds.
Actual test time used	Actual time taken to complete the Y.1564 operation, in seconds. **NOTE:** The timer used to measure the test start time and end time is accurate to 1 second. Therefore, a difference of up to 1 second might exist between the value displayed in this field and the time duration between the start and end of the test.
CIR test (with the step of 1)	Information about the CIR test with a step count of 1. The number of steps in a CIR test can be set to any value in the range of 1 to 1000.
Start time	Start time of the test.
End time	End time of the test.
Min/Max/Average IR(Kbps)	Minimum, maximum, and average information rates in kbps.
Min/Max/Average FTD(us)	Minimum, maximum, and average frame transfer delays, in μs.
Min/Max/Average FDV(us)	Minimum, maximum, and average frame delay variations, in μs.
FL count/FLR	Number of lost frames and the frame loss ratio.
Packets out of order	Number of out-of-order packets.
Severely Err Secs/AVAIL	Total number of severely errored seconds (SESs) and the network availability ratio (AVAIL). A severely errored second occurs when the ratio of lost frames during a one-second interval exceeds 50%. AVAIL is calculated as follows: AVAIL = Total seconds in available periods / total seconds taken by the test. • The network is in an unavailable period after 10 consecutive SESs are recorded. The unavailable period ends when 10 consecutive non-SESs are recorded. • The network is in an available period after 10 consecutive non-SESs. The available period ends when 10 consecutive SESs are recorded. By default, the test is considered to start in an available period.
PIR test (color green)	Statistics about the green frames in the PIR test.

Field	Description
PIR test (color yellow)	Statistics about the yellow frames in the PIR test.
PIR test (total)	Summary statistics about the PIR test.
PIR test (color-blind)	Statistics about the PIR test in non-color-aware mode.
Traffic policing test (color green)	Statistics about the green frames in the traffic policing test.
Traffic policing test (color yellow)	Statistics about the yellow frames in the traffic policing test.
Traffic policing test (total)	Summary statistics about the traffic policing test.
Traffic policing test (color-blind)	Statistics about the traffic policing test in non-color-aware mode.
Service performance test	Statistics about the service performance test.
Basic results	Results of basic items.
Throughput results	Throughput operation results.
Frame-loss results	Frame loss operation results.
Latency results	Latency operation results.
Initial speed(Kbps)	Initial rate for sending probe packets, in kbps.
Speed granularity(Kbps)	Granularity of rate adjustment, in kbps.
Probe duration(s)	Duration of a probe, in seconds.
Probe interval(s)	Intervals at which probes are performed, in seconds.
Allowed-loss-ratio	Maximum packet loss rate supported.
Frame size(Byte)	Frame size in bytes.
Current speed(Kbps)	Current rate in kbps.
Frame-loss(Loss/Tx)	Frame loss rate.
Min-latency(us)	Minimum latency in microseconds.
Max-latency(us)	Maximum latency in microseconds.
Avg-latency(us)	Average latency in microseconds.
Min-jitter(ns)	Minimum jitter in nanoseconds.
Max-jitter(ns)	Maximum jitter in nanoseconds.
Avg-jitter(ns)	Average jitter in nanoseconds.
Sent packets	Number of packets sent.
Received packets	Number of packets received.
Status	Probe result: • **Succeeded**. • **Failed**.
Time	Time when the probe was completed.

display nqa statistics

Use **display nqa statistics** to display NQA operation statistics.

Syntax

display nqa statistics [*admin-name operation-tag*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

admin-name operation-tag: Specifies an NQA operation by its administrator name and operation tag. The *admin-name* argument represents the name of the administrator who creates the NQA operation. The *operation-tag* argument represents the operation tag. Each of the arguments is a case-insensitive string of 1 to 32 characters that cannot contain hyphens (-).

Usage guidelines

The statistics are generated after the NQA operation completes. If you execute the **display nqa statistics** command before the operation completes, the statistics are displayed as all 0s.

If a reaction entry is configured, the command displays the monitoring results of the reaction entry in the period specified by the **statistics internal** command. The result fields display hyphens (-) if the threshold type is average value or if the monitored performance metric is ICPIF or MOS for the voice operation.

If you do not specify an NQA operation, this command displays statistics for all NQA operations.

Examples

Display the statistics for the ARP operation with administrator name **admin** and operation tag **test**.

```
<Sysname> display nqa statistics admin test
NQA entry (admin admin, tag test) test statistics:
  NO. : 1
    Start time: 2007-01-01 09:30:20.0
    Life time: 2 seconds
    Send operation times: 1              Receive response times: 1
    Min/Max/Average round trip time: 13/13/13
    Square-Sum of round trip time: 169
  Extended results:
    Packet loss ratio: 0%
    Failures due to timeout: 0
    Failures due to internal error: 0
    Failures due to other errors: 0
```

Display the statistics for the TCP operation with administrator name **admin** and operation tag **test**.

```
<Sysname> display nqa statistics admin test
NQA entry (admin admin, tag test) test statistics:
  NO. : 1
    Start time: 2007-01-01 09:30:20.0
    Life time: 2 seconds
    Send operation times: 1              Receive response times: 1
    Min/Max/Average round trip time: 13/13/13
```

```
    Square-Sum of round trip time: 169
  Extended results:
    Packet loss ratio: 0%
    Failures due to timeout: 0
    Failures due to disconnect: 0
    Failures due to no connection: 0
    Failures due to internal error: 0
    Failures due to other errors: 0
```

Display the statistics for the ICMP jitter operation with administrator name **admin** and operation tag **test**.

```
<Sysname> display nqa statistics admin test
NQA entry (admin admin, tag test) test statistics:
  NO. : 1
    Start time: 2015-03-09 17:42:10.7
    Life time: 156 seconds
    Send operation times: 1560           Receive response times: 1560
    Min/Max/Average round trip time: 1/2/1
    Square-Sum of round trip time: 1563
  Extended results:
    Packet loss ratio: 0.0%

Table 7 Command output

Field	Description
No.	Statistics group ID.
Start time	Time when the operation started.
Life time	Duration of the operation in seconds.
Send operation times	Number of probe packets sent.
Receive response times	Number of response packets received.
Min/Max/Average round trip time	Minimum/maximum/average round-trip time in milliseconds.
Square-Sum of round trip time	Square sum of round-trip time.
Packet loss ratio	Average packet loss ratio. For ICMP jitter, UDP jitter, and voice operations, the accuracy of the field value is 0.1%.
Failures due to timeout	Number of timeout occurrences in an operation.
Failures due to disconnect	Number of disconnections by the peer.
Failures due to no connection	Number of failures to connect with the peer.
Failures due to internal error	Number of failures due to internal errors.
Failures due to other errors	Failures due to other errors.
Packets out of sequence	Number of failures due to out-of-sequence packets.
Packets arrived late	Number of response packets received after a probe times out.
ICMP-jitter results	ICMP jitter operation results. This field is available only for the ICMP jitter operation.
UDP-jitter results	UDP jitter operation results. This field is available only for the UDP jitter operation.
Voice results	Voice operation results. This field is available only for the voice operation.
RTT number	Number of response packets received.
Min positive SD	Minimum positive jitter from source to destination.
Min positive DS	Minimum positive jitter from destination to source.
Max positive SD	Maximum positive jitter from source to destination.
Max positive DS	Maximum positive jitter from destination to source.
Positive SD number	Number of positive jitters from source to destination.
Positive DS number	Number of positive jitters from destination to source.

Field	Description
Positive SD sum	Sum of positive jitters from source to destination.
Positive DS sum	Sum of positive jitters from destination to source.
Positive SD average	Average positive jitters from source to destination.
Positive DS average	Average positive jitters from destination to source.
Positive SD square-sum	Square sum of positive jitters from source to destination.
Positive DS square-sum	Square sum of positive jitters from destination to source.
Min negative SD	Minimum absolute value among negative jitters from source to destination.
Min negative DS	Minimum absolute value among negative jitters from destination to source.
Max negative SD	Maximum absolute value among negative jitters from source to destination.
Max negative DS	Maximum absolute value among negative jitters from destination to source.
Negative SD number	Number of negative jitters from source to destination.
Negative DS number	Number of negative jitters from destination to source.
Negative SD sum	Sum of absolute values of negative jitters from source to destination.
Negative DS sum	Sum of absolute values of negative jitters from destination to source.
Negative SD average	Average absolute value of negative jitters from source to destination.
Negative DS average	Average absolute value of negative jitters from destination to source.
Negative SD square-sum	Square sum of negative jitters from source to destination.
Negative DS square-sum	Square sum of negative jitters from destination to source.
SD average	Average value of jitters from source to destination.
DS average	Average value of jitters from destination to source.
One way results	Unidirectional delay result. This field is available only for the ICMP jitter, UDP jitter, and voice operations.
Max SD delay	Maximum delay from source to destination.
Max DS delay	Maximum delay from destination to source.
Min SD delay	Minimum delay from source to destination.
Min DS delay	Minimum delay from destination to source.
Number of SD delay	Number of delays from source to destination.
Number of DS delay	Number of delays from destination to source.
Sum of SD delay	Sum of delays from source to destination.

Field	Description
Sum of DS delay	Sum of delays from destination to source.
Square-Sum of SD delay	Square sum of delays from source to destination.
Square-Sum of DS delay	Square sum of delays from destination to source.
SD lost packets	Number of lost packets from the source to the destination.
DS lost packets	Number of lost packets from the destination to the source.
Lost packets for unknown reason	Number of lost packets for unknown reasons.
Voice scores	Voice parameters. This field is available only for the voice operation.
Max MOS value	Maximum MOS value.
Min MOS value	Minimum MOS value.
Max ICPIF value	Maximum ICPIF value.
Min ICPIF value	Minimum ICPIF value.
Reaction statistics	Statistics about the reaction entry in the counting interval.
Index	ID of a reaction entry.
Checked Element	Monitored element.
Threshold Type	Threshold type.
Checked Num	Number of targets that have been monitored for data collection.
Over-threshold Num	Number of threshold violations.
Path	Serial number for the path in the path jitter operation. This field is available only for the path jitter operation.
Hop IP	IP address of the hop. This field is available only for the path jitter operation.
Path-jitter results	Path jitter operation results. This field is available only for the path jitter operation.
Jitter number	Number of jitters. This field is available only for the path jitter operation.
Min/Max/Average jitter	Minimum/maximum/average positive jitter in milliseconds. This field is available only for the path jitter operation.
Positive jitter number	Number of positive jitters. This field is available only for the path jitter operation.
Min/Max/Average positive jitter	Minimum/maximum/average positive jitter in milliseconds. This field is available only for the path jitter operation.
Sum/Square-Sum positive jitter	Sum/square sum of positive jitters. This field is available only for the path jitter operation.
Negative jitter number	Number of negative jitters. This field is available only for the path jitter operation.

Field	Description
Min/Max/Average negative jitter	Minimum/maximum/average negative jitter in milliseconds. This field is available only for the path jitter operation.
Sum/Square-Sum negative jitter	Sum/square sum of negative jitters. This field is available only for the path jitter operation.

Table 8 Monitored performance metrics for ARP/DHCP/DLSw/DNS/FTP/HTTP/ICMP echo/SNMP/TCP/UDP echo operations

Monitored performance metric	Threshold type	Collect data in	Checked Num	Over-threshold Num
probe-duration	accumulate	Probes in the counting interval.	Number of completed probes.	Number of probes of which the duration exceeds the threshold.
	average	N/A	N/A	N/A
	consecutive	Probes in the counting interval.	Number of completed probes.	Number of probes of which the duration exceeds the threshold.
probe-fail	accumulate	Probes in the counting interval.	Number of completed probes.	Number of probe failures.
	consecutive	Probes in the counting interval.	Number of completed probes.	Number of probe failures.

Table 9 Monitored performance metrics for ICMP jitter/UDP jitter/voice operations

Monitored performance metric	Threshold type	Collect data in	Checked Num	Over-threshold Num
RTT	accumulate	Packets sent in the counting interval.	Number of sent packets.	Number of packets of which the round-trip time exceeds the threshold.
	average	N/A	N/A	N/A
jitter-DS/jitter-SD	accumulate	Packets sent in the counting interval.	Number of sent packets.	Number of packets of which the one-way jitter exceeds the threshold.
	average	N/A	N/A	N/A
OWD-DS/OWD-SD	N/A	Packets sent in the counting interval.	Number of sent packets.	Number of packets of which the one-way delay exceeds the threshold.
packet-loss	accumulate	Packets sent in the counting interval.	Number of sent packets.	Number of packet loss.
ICPIF/MOS (available only for the voice operation)	N/A	N/A	N/A	N/A

Related commands

`statistics interval`

display nqa twamp-light client

Use **display nqa twamp-light client** to display test session information on the TWAMP Light client.

Syntax

display nqa twamp-light client [**test-session** *session-id* | **verbose**]

The following compatibility matrixes show the support of hardware platforms for this command:

Models	Command compatibility
NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB1780, NFNX3-HDB3080, NFNX3-HDB680, NFNX3-HDB1080	Yes

Parameters

test-session *session-id*: Displays detailed information about a test session by its ID. The value range is 1 to 256.

verbose: Displays detailed information about all TWAMP Light test sessions.

Usage guidelines

If you do not specify any keywords, this command displays brief information about all test sessions.

Examples

Display brief information about all test sessions.

```
<Sysname> display nqa twamp-light client
Brief information about all test sessions:
Total sessions: 1
Active sessions: 1
------------------------------------------------------------------------------
ID    Status     Source IP/Port         Destination IP/Port
1     Active     10.2.2.1/10000         10.2.2.2/20000
```

Display detailed information about all test sessions.

```
<Sysname> display nqa twamp-light client verbose
Session ID                          : 1
  Status                            : Active

Table 10 Command output

Field	Description
Total sessions	Total number of test sessions.
Active sessions	Number of active sessions.
Session ID	Session ID.
Status	Test status: • **Active**—The TWAMP Light test is active. • **Inactive**—The TWAMP Light test is not active.
Session type	Test session type: • On-demand. • Permanent.
Source interface	Source AC interface of the test session.
Service instance	Ethernet service instance bound to source interface. The Ethernet service instance on the client must be consistent with that on the server.
Source IP	Source IPv4 address of the test session.
Source IPv6	Source IPv6 address of the test session.
Destination IP	Destination IPv4 address of the test session.
Destination IPv6	Destination IPv6 address of the test session.
Source port	Source port number of the test session.
Destination port	Destination port number of the test session.

Field	Description
Source MAC	Source MAC address of the test session.
Destination MAC	Destination MAC address of the test session.
VLAN ID	VLAN ID of the test session.
Service VLAN ID	Outer VLAN ID of the test session.
Customer VLAN ID	Inner VLAN ID of the test session.
ToS	Type of Service of the test session.
Padding length	Padding length of the test session.
Timestamp format	Timestamp format: **NTP** or **PTP**.
VPN instance	MPLS L3VPN instance name.
Priority 802.1p	802.1p priority.
Last start time	Start time of the most recent TWAMP Light test. If the test does not start, this field displays **Never**.
Last stop time	Stop time of the most recent TWAMP Light test. If the test does not complete, this field displays **Never**.
Packet sending interval(ms)	Packet sending interval of the TWAMP Light test, in milliseconds.
Timeout(sec)	Timeout time of the reflected packet within a TWAMP Light test, in seconds.
Duration(sec)	Duration of the TWAMP Light test, in seconds. This field is available only for the on-demand test that is configured with test duration.
Packets sent	Number of sent packets in the TWAMP Light test. This field is available only for the on-demand test that is configured with the number of packets to be sent.
Statistics interval(ms)	Statistics collection interval of the TWAMP Light test, in milliseconds.
Monitor time(ms)	Packet monitoring time of the TWAMP Light test, in milliseconds. The value of this field is specified by the **start** command in TWAMP Light sender view.

Related commands

test-session

display nqa twamp-light client statistics

Use **display nqa twamp-light client statistics** to display test session statistics on the TWAMP Light client, including two-way delay, two-way jitter, and two-way packet loss.

Syntax

display nqa twamp-light client statistics { **two-way-delay** | **two-way-loss** } **test-session** *session-id*

The following compatibility matrixes show the support of hardware platforms for this command:

Parameters

`two-way-delay`: Displays statistics about two-way delay and two-way jitter.

`two-way-loss`: Displays statistics about two-way packet loss.

`session-id`: Specifies a session ID. The value must be an integer, in the range of 1 to 256.

Examples

Display statistics about two-way delay and two-way jitter for the specified TWAMP Light test session.

```
<Sysname> display nqa twamp-light client statistics two-way-delay test-session 1
Latest two-way delay statistics(us):
    Index        Delay(Avg)   Jitter(Avg)   SD-jitter(Avg)   DS-jitter(Avg)
    98           3930         941           2992             3054

context-operator

Parameters

`session-id`: Specifies a session by its ID. The value range is 1 to 256. If you do not specify this argument, the command displays all statistics information about the specified session.

item-number: Specifies a reaction entry ID in the range of 1 to 10. If you do not specify a reaction entry, the command displays the current monitoring results of all reaction entries.

Usage guidelines

If you do not specify any parameters, this command displays the monitoring results of reaction entries for all TWAMP Light test sessions.

Examples

Display the current monitoring results of the reaction entries for TWAMP Light test session 1.

```
<Sysname> display nqa twamp-light client test-session reaction counters 1
Reaction counters for session 1:
Index: 1
  Checked element: two-way-delay
  Lower-threshold: 5
  Upper-threshold: 50
  Action type: trap-only
  Check-objects: 1
  Threshold violations: 1
```

Table 13 Command output

Field	Description
Index	ID of a reaction entry.
Checked element	Monitored performance metric.
Lower-threshold	Lower limit of the threshold.
Upper-threshold	Upper limit of the threshold.
Action type	Action for the threshold violation event: • **Trap-only**—Displays results on the terminal display and meanwhile sends SNMP trap messages to the NMS. • **none**—Displays results on the terminal display.
Checked-objects	Number of packets that have been monitored.
Threshold violations	Number of threshold violations.

expect { data | hex-data }

Use **expect** { **data** | **hex-data** } to configure the expected response string to determine a successful NQA operation.

Use **undo expect** { **data** | **hex-data** } to restore the default.

Syntax

expect { **data** | **hex-data** } *string* [{ **offset** | **strict-offset** } *number*]

undo expect { **data** | **hex-data** }

Default

No expected response string is configured to determine a successful NQA operation.

Views

HTTP/HTTPS/TCP/UDP/WAP template view

Predefined user roles

network-admin

context-admin

Parameters

data: Specifies a data string.

hex-data: Specifies a hexadecimal string. This keyword is available only in TCP, UDP and WAP template views.

string: Specifies the string.

- If the **data** keyword is specified, the string is case-sensitive and can contain 1 to 200 characters.
- If the **hex-data** keyword is specified, the string is case-insensitive and can contain any even number of characters in the range of 2 to 200.

offset *number*: Specifies the offset in bytes after which the first match operation starts. The value range for the *number* argument is 0 to 1000, and the default value is 0.

strict-offset *number*: Specifies the strict offset in bytes. The value range for the *number* argument is 0 to 1000, and the default value is 0.

Usage guidelines

Upon receiving a response packet, the NQA client searches the packet payload for the expected string. In whichever cases, the NQA client marks the NQA operation as successful if a match is found. If no match is found, it marks the NQA operation as failed.

- If both the offset and the strict offset are not configured, the NQA client starts the first match operation from the beginning byte of the payload. If no match is found, it starts another match operation from the second byte of the payload. The process continues until a match is found or the last payload byte is tried.
- If an offset is configured, the NQA client starts the first match operation after the specified offset bytes. If no match is found, it continues the match operation as if no offset was configured.
- If a strict offset is configured, the NQA client starts the first match operation after the specified strict offset bytes. If no match is found, it starts another match operation from the second byte after the strict offset bytes. The process continues until a match is found or the last payload byte is tried.

Expected string check takes place in the following conditions:

- For features that use the HTTP or HTTPS template, the NQA client checks for the expected string if the response contains the Content-Length header. The expected string check starts from the Content-Length header field.
- For features that use the TCP or UDP template, the NQA client checks for the expected string if the **data-fill** command is configured.

For features that use the UDP template, the start byte of the offset depends on whether the **raw** keyword is specified in the **data-fill** command:

- If the **raw** keyword is specified, the start byte of the offset is the first byte of the packet payload.
- If the **raw** keyword is not specified, the start byte of the offset is the sixth byte of the packet payload. The first five bytes of the UDP packet payload identify the probe packet type.

For the WAP template that has a destination URL specified, you must configure the expected response data. The system checks for the expected string in the WSP replies (starting from the Headers field) to determine whether the WAP operation is successful.

An NQA operation result varies by the configuration of the expected status code and string that determine a successful NQA operation:

- If both these settings are configured, the NQA operation is successful when the NQA response packet matches both the criteria. Otherwise, the operation fails.
- If either the expected status code or string is configured, the NQA operation is successful when the NQA response packet matches the configured criterion. Otherwise, the operation fails.

For the HTTP or HTTPS template, do not configure both this command and the **expect** { **failed-data** | **hex-failed-data** } command.

For the TCP or UDP template, you can also use the **expect** { **failed-data** | **hex-failed-data** } command to configure the expected string in the response of a failed NQA operation. If both the **expect** { **data** | **hex-data** } and **expect** { **failed-data** | **hex-failed-data** } commands are configured, only the **expect** { **failed-data** | **hex-failed-data** } command takes effect.

Examples

In HTTP template view, specify **welcome!** as expected response string to determine a successful NQA operation.

```
<Sysname> system-view
[Sysname] nqa template http httptplt
[Sysname-nqatplt-http-httptplt] expect data welcome!
```

expect { failed-data | hex-failed-data }

Use **expect** { **failed-data** | **hex-failed-data** } to configure the expected response string to determine a failed NQA operation.

Use **undo expect** { **failed-data** | **hex-failed-data** } to restore the default.

Syntax

expect { **failed-data** | **hex-failed-data** } *string* [{ **offset** | **strict-offset** } *number*]

undo expect { **failed-data** | **hex-failed-data** }

Default

No expected response string is configured to determine a failed NQA operation.

Views

HTTP template view

HTTPS template view

TCP template view

UDP template view

Predefined user roles

network-admin

context-admin

Parameters

failed-data: Specifies a data string.

hex-failed-data: Specifies a hexadecimal string.

string: Specifies the string.

- If the **failed-data** keyword is specified, the string is case-sensitive and can contain 1 to 200 characters.
- If the **hex-failed-data** keyword is specified, the string is case-insensitive and can contain any even number of characters in the range of 2 to 200.

offset *number*: Specifies the offset in bytes after which the first match operation starts. The value range for the *number* argument is 0 to 1000, and the default value is 0. If you do not specify an offset, the match operation starts from the beginning byte of the payload.

strict-offset *number*: Specifies the strict offset in bytes. The value range for the *number* argument is 0 to 1000, and the default value is 0.

Usage guidelines

Upon receiving a response packet, the NQA client performs the match process as follows:

1. It first compares expected failed string with the search scope in the packet payload.
   - If the string is longer than the search scope, the operation is marked as failed.
   - If the string is shorter than the search scope, the NQA client goes to the following step.
2. The client searches for the expected string in the search scope.
   - If a match is found, the operation is marked as failed.
   - If no match is found, the operation is marked as successful.

The NQA client performs the match process only once if no offset is specified or the strict offset is specified. If the offset is specified, the client will start another match process for the whole payload if no match is found for the first round.

This command takes effect only if the **data-fill** command is also configured.

For features that use the UDP template, the start byte of the offset depends on whether the **raw** keyword is specified in the **data-fill** command:

- If the **raw** keyword is specified, the start byte of the offset is the first byte of the packet payload.
- If the **raw** keyword is not specified, the start byte of the offset is the sixth byte of the packet payload. The first five bytes of the UDP packet payload identify the probe packet type.

An NQA operation result varies by the configuration of the expected status code and string that determine a failed NQA operation:

- If both these settings are configured, the NQA operation fails when the NQA response packet matches both the criteria. Otherwise, the operation is successful.
- If either the expected status code or string is configured, the NQA operation fails when the NQA response packet matches the configured criterion. Otherwise, the operation is successful.

For the HTTP or HTTPS template, do not configure both this command and the **expect** { **failed-data** | **hex-failed-data** } command.

For the TCP or UDP template, you can also use the **expect** { **data** | **hex-data** } command to configure the expected string in the response of a successful NQA operation. If both the **expect** { **data** | **hex-data** } and **expect** { **failed-data** | **hex-failed-data** } commands are configured, only the **expect** { **failed-data** | **hex-failed-data** } command takes effect.

Examples

In TCP template view, specify **error** as expected response string to determine a failed NQA operation.

```
<Sysname> system-view
[Sysname] nqa template tcp tcptplt
```

```
[Sysname-nqatplt-tcp-tcptplt] expect failed-data error
```

expect failed-status

Use **expect failed-status** to configure the expected status code to determine a failed NQA operation.

Use **undo expect failed-status** to restore the default.

Syntax

expect failed-status *status-list*

undo expect failed-status [*status-list*]

Default

No expected status code is configured to determine a failed NQA operation.

Views

HTTP/HTTPS template view

Predefined user roles

network-admin

context-admin

Parameters

status-list: Specifies a space-separated list of up to 10 status code items. Each item specifies a status code or a range of status codes in the form of *status-number1* **to** *status-number2*. The value ranges for both the *status-number1* and *status-number2* arguments are 0 to 999. The value for the *status-number2* argument must be equal to or greater than the value for the *status-number1* argument.

Usage guidelines

The status code in the probe packet is a three-digit field in decimal notation which includes the server status information. The first digit defines the class of response.

An NQA operation result varies by the configuration of the expected status code and string that determine a failed NQA operation:

- If both these settings are configured, the NQA operation fails when the NQA response packet matches both the criteria. Otherwise, the operation is successful.
- If either the expected status code or string is configured, the NQA operation fails when the NQA response packet matches the configured criterion. Otherwise, the operation is successful.

Do not configure both this command and the **expect status** command.

Examples

In HTTP template view, set the expected status codes to 300, and 400 to 500.

```
<Sysname> system-view
[Sysname] nqa template http tplt
[Sysname-nqatplt-http-tplt] expect failed-status 300 400 to 500
```

expect ip

Use **expect ip** to specify the expected IPv4 address.

Use **undo expect ip** to restore the default.

Syntax

expect ip *ip-address*

undo expect ip

Default

No expected IPv4 address is specified.

Views

DNS template view

Predefined user roles

network-admin

context-admin

Parameters

ip-address: Specifies the expected IPv4 address for a DNS echo request.

Usage guidelines

During a DNS operation, the NQA client compares the expected IPv4 address with the IPv4 address resolved by the DNS server. If they are the same, it considers the DNS server legal.

Examples

In DNS template view, specify 1.1.1.1 as the expected IPv4 address.

```
<Sysname> system-view
[Sysname] nqa template dns dnstplt
[Sysname-nqatplt-dns-dnstplt] expect ip 1.1.1.1
```

expect ipv6

Use **expect ipv6** to specify the expected IPv6 address.

Use **undo expect ipv6** to restore the default.

Syntax

expect ipv6 *ipv6-address*

undo expect ipv6

Default

No expected IPv6 address is specified.

Views

DNS template view

Predefined user roles

network-admin

context-admin

Parameters

ip-address: Specifies the expected IPv6 address for a DNS echo request.

Usage guidelines

During a DNS operation, the NQA client compares the expected IPv6 address with the IPv6 address resolved by the DNS server. If they are the same, it considers the DNS server legal.

Examples

In DNS template view, specify 1::1 as the expected IPv6 address.

```
<Sysname> system-view
[Sysname] nqa template dns dnstplt
[Sysname-nqatplt-dns-dnstplt] expect ipv6 1::1
```

expect status

Use **expect status** to configure the expected status code to determine a successful NQA operation.

Use **undo expect status** to restore the default.

Syntax

expect status *status-list*

undo expect status [*status-list*]

Default

No expected status code is configured to determine a successful NQA operation.

Views

HTTP/HTTPS/RTSP/SIP template view

Predefined user roles

network-admin

context-admin

Parameters

status-list: Specifies a space-separated list of up to 10 status code items. Each item specifies a status code or a range of status codes in the form of *status-num* 1 **to** *status-num 2*. The value ranges for both the *status-num* 1 and *status-num 2* arguments are 0 to 999. The value for the *status-num* 2 argument must be equal to or greater than the value for the *status-num* 1 argument.

Usage guidelines

The status code in the probe packet is a three-digit field in decimal notation which includes the server status information. The first digit defines the class of response.

An NQA operation result varies by the configuration of the expected status code and string that determine a successful NQA operation:

- If both these settings are configured, the NQA operation is successful when the NQA response packet matches both the criteria. Otherwise, the operation fails.
- If either the expected status code or string is configured, the NQA operation is successful when the NQA response packet matches the configured criterion. Otherwise, the operation fails.

For the HTTP or HTTPS template, do not configure both this command and the **expect status** command.

Examples

In HTTP template view, set the expected status codes to 200, 300, and 400 to 500.

```
<Sysname> system-view
[Sysname] nqa template http httptplt
[Sysname-nqatplt-http-httptplt] expect status 200 300 400 to 500
```

filename

Use **filename** to specify a file to be transferred between the FTP server and the FTP client.

Use **undo filename** to restore the default.

Syntax

filename *filename*

undo filename

Default

No file is specified.

Views

FTP operation view

FTP template view

Predefined user roles

network-admin

context-admin

Parameters

filename: Specifies the name of a file, a case-insensitive string of 1 to 200 characters that cannot contain slashes (/).

Examples

Specify **config.txt** as the file to be transferred between the FTP server and the FTP client for the FTP operation.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type ftp
[Sysname-nqa-admin-test-ftp] filename config.txt
```

In FTP template view, specify **config.txt** as the file to be transferred between the FTP server and the FTP client.

```
<Sysname> system-view
[Sysname] nqa template ftp ftptplt
[Sysname-nqatplt-ftp-ftptplt] filename config.txt
```

frequency

Use **frequency** to specify the interval at which the NQA operation repeats.

Use **undo frequency** to restore the default.

Syntax

frequency *interval*

undo frequency

Default

In NQA operation view, the interval between two consecutive voice or path jitter operations is 60000 milliseconds. The interval between two consecutive operations of other types is 0 milliseconds.

In NQA template view, the interval for two consecutive operations is 5000 milliseconds.

Views

ICMP echo/TCP/UDP echo operation view

ARP/DHCP/DLSw/DNS/FTP/HTTP/SNMP operation view

UDP tracert operation view

ICMP jitter/path jitter/UDP jitter/voice operation view

Any NQA template view

Predefined user roles

network-admin

context-admin

Parameters

interval: Specifies the interval between two consecutive operations, in the range of 0 to 604800000 milliseconds. An interval of 0 milliseconds configures NQA to perform the operation only once, and not to generate any statistics.

Usage guidelines

After an NQA operation starts, it repeats at the specified interval. However, when the interval is reached, but the current operation is not completed or not timed out, the next operation does not start.

Examples

Configure the ICMP echo operation to repeat every 1000 milliseconds.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type icmp-echo
[Sysname-nqa-admin-test-icmp-echo] frequency 1000
```

In DNS template view, configure the DNS operation to repeat every 1000 milliseconds.

```
<Sysname> system-view
[Sysname] nqa template dns dnstplt
[Sysname-nqatplt-dns-dnstplt] frequency 1000
```

Related commands

probe timeout

frequency-adjustment

Use **frequency-adjustment** to specify the adjusted interval for NQA to start two consecutive NQA operations after a failed operation.

Use **undo frequency-adjustment** to restore the default.

Syntax

frequency-adjustment *adj-interval*

undo frequency-adjustment

Default

No adjusted interval is specified.

Views

Any NQA template view

Predefined user roles

network-admin

context-admin

Parameters

adj-interval: Specifies the adjusted interval in the range of 0 to 604800000 milliseconds.

Usage guidelines

By default, the operation interval is determined by the **frequency** command and does not change regardless of the operation result. This command enables the device to adjust the interval for the next two operations after an NQA operation fails. This mechanism allows for detecting the server status in a timely manner.

The next operation starts only when the last operation is completed and the interval is reached.

Examples

In HTTP template view, set the adjusted interval to 1000 milliseconds.

```
<Sysname> system-view
[Sysname] nqa template http tplt
[Sysname-nqatplt-http-tplt] frequency-adjustment 1000
```

hex-data-fill

Use **hex-data-fill** to configure a hexadecimal string to fill the probe packet payload.

Use **undo hex-data-fill** to restore the default.

Syntax

hex-data-fill *hex* [**raw**]

undo hex-data-fill

Default

The default hexadecimal packet payload fill string is 00010203040506070809.

Views

TCP template view

UDP template view

TWAMP Light client-session view

Predefined user roles

network-admin

context-admin

Parameters

hex: Specifies a hexadecimal string, which is case-insensitive and can contain any even number of characters in the range of 2 to 200.

raw: Fills the payload with the specified hexadecimal string without truncation or repetition to fit the payload size. This keyword is available only in UDP template view.

Usage guidelines

With the **raw** keyword specified, the hexadecimal string will be used exactly as specified to fill the packet payload.

Without the **raw** keyword, the hexadecimal string will be truncated at the end or cyclically repeated to fit the payload size of the probe packet.

For example, if you configure the hexadecimal payload fill string as **abcd**:

- Probe packet with a payload size of 3 bytes will be filled with **abc**.
- Probe packet with a payload size of 6 bytes will be filled with **adcdab**.

In UDP template view, the probe packets without the **raw** keyword specified contain special characters. For a destination device other than an NSFOCUS device, provide the **raw** keyword because it can identify only probe packets without any special characters contained. Make sure the payload fill string specified on the client can be identified by the destination device.

If the destination device is an NSFOCUS device, the **raw** keyword is not a must because the NSFOCUS device can identify the probe packets that contain special characters. As a best practice, do not specify the **raw** keyword.

Examples

In TCP template view, specify **abcd** as the hexadecimal payload fill string.

```
<Sysname> system-view
[Sysname] nqa template tcp tcptplt
[Sysname-nqatplt-tcp-tcptplt] hex-data-fill abcd
```

history-record enable

Use **history-record enable** to enable the saving of history records for the NQA operation.

Use **undo history-record enable** to disable the saving of history records.

Syntax

history-record enable

undo history-record enable

Default

The saving of history records is enabled only for the UDP tracert operation.

Views

ICMP echo/TCP/UDP echo operation view

ARP/DHCP/DLSw/DNS/FTP/HTTP/SNMP operation view

UDP tracert operation view

Predefined user roles

network-admin

context-admin

Usage guidelines

To display the history records of the NQA operation, use the **display nqa history** command.

The **undo** form of the command also removes existing history records of an NQA operation.

Examples

Enable the saving of history records for the NQA operation.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type icmp-echo
[Sysname-nqa-admin-test-icmp-echo] history-record enable
```

Related commands

display nqa history

history-record keep-time

Use **history-record keep-time** to set the lifetime of history records for an NQA operation.

Use **undo history-record keep-time** to restore the default.

Syntax

history-record keep-time *keep-time*

undo history-record keep-time

Default

The history records of an NQA operation are kept for 120 minutes.

Views

ICMP echo/TCP/UDP echo operation view

ARP/DHCP/DLSw/DNS/FTP/HTTP/SNMP operation view

UDP tracert operation view

Predefined user roles

network-admin

context-admin

Parameters

keep-time: Specifies how long the history records can be saved. The value range is 1 to 1440 minutes.

Usage guidelines

When an NQA operation completes, the timer starts. All records are removed when the lifetime is reached.

Examples

Set the lifetime of the history records to 100 minutes for the ICMP echo operation.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type icmp-echo
[Sysname-nqa-admin-test-icmp-echo] history-record keep-time 100
```

history-record number

Use **history-record number** to set the maximum number of history records that can be saved for an NQA operation.

Use **undo history-record number** to restore the default.

Syntax

history-record number *number*

undo history-record number

Default

A maximum of 50 history records can be saved for an NQA operation.

Views

ICMP echo/TCP/UDP echo operation view

ARP/DHCP/DLSw/DNS/FTP/HTTP/SNMP operation view

UDP tracert operation view

Predefined user roles

network-admin

context-admin

Parameters

number: Specifies the maximum number of history records that can be saved for an NQA operation. The value range is 0 to 50.

Usage guidelines

If the number of history records for an NQA operation exceeds the maximum number, earliest history records are removed.

Examples

Set the maximum number of history records to 10 for the ICMP echo operation.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type icmp-echo
[Sysname-nqa-admin-test-icmp-echo] history-record number 10
```

init-ttl

Use **init-ttl** to set the TTL value for UDP packets in the start round of the UDP tracert operation.

Use **undo init-ttl** to restore the default.

Syntax

init-ttl *value*

undo init-ttl

Default

The NQA client sends a UDP packet with the TTL value 1 to start the UDP tracert operation.

Views

UDP tracert operation view

Predefined user roles

network-admin

context-admin

Parameters

value: Specifies the TTL value in the range of 1 to 255.

Examples

Set the TTL value to 5 for the UDP packets in the start round.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type udp-tracert
```

```
[Sysname-nqa-admin-test-udp-tracert] init-ttl 5
```

key

Use **key** to set the shared key for secure RADIUS authentication and accounting.

Use **undo key** to restore the default.

Syntax

key { **cipher** | **simple** } *string*

undo key

Default

No shared key is configured for secure RADIUS authentication or accounting.

Views

RADIUS authentication template view

RADIUS accounting template view

Predefined user roles

network-admin

context-admin

Parameters

cipher: Specifies a key in encrypted form.

simple: Specifies a key in plaintext form. For security purposes, the key specified in plaintext form will be stored in encrypted form.

string: Specifies the shared key string. Its plaintext form is a case-sensitive string of 1 to 64 characters. Its encrypted form is a case-sensitive string of 1 to 117 characters.

Usage guidelines

Make sure the NQA client and the RADIUS authentication and accounting server have the same shared key.

Examples

In RADIUS template view, set the shared key to **abc** in plain text for secure RADIUS authentication.

```
<Sysname> system-view
[Sysname] nqa template radius radiustplt
[Sysname-nqatplt-radius-radiustplt] key simple abc
```

lsr-path

Use **lsr-path** to specify a loose source routing (LSR) path.

Use **undo lsr-path** to restore the default.

Syntax

lsr-path *ip-address*&<1-8>

undo lsr-path

Default

No LSR path is configured.

Views

Path jitter operation view

Predefined user roles

network-admin

context-admin

Parameters

ip-address&<1-8>: Specifies a space-separated list of up to eight IP addresses. Each IP address represents a hop on the path.

Usage guidelines

The path jitter operation first uses tracert to detect each hop to the destination. It then sends ICMP echo requests to measure the delay and jitters from the source to each node. If multiple routes exist between the source and destination, the operation uses the path specified by using **lsr-path** command.

Examples

Specify 10.1.1.20 and 10.1.2.10 as the hops on the LSR path for the path jitter operation.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type path-jitter
[Sysname-nqa-admin-test- path-jitter] lsr-path 10.1.1.20 10.1.2.10
```

mailbox

Use **mailbox** to specify the mailbox name to be used in the IMAP operation.

Use **undo mailbox** to restore the default.

Syntax

mailbox *mailbox-name*

undo mailbox

Default

The IMAP operation uses the mailbox name INBOX.

Views

IMAP template view

Predefined user roles

network-admin

context-admin

Parameters

mailbox-name: Specifies the mailbox name, a case-sensitive string of 1 to 64 characters.

Examples

Set the mailbox name to **fortest1** for IMAP template **imaptplt**.

```
<Sysname> system-view
[Sysname] nqa template imap imaptplt
[Sysname-nqatplt-imap-imaptplt] mailbox fortest1
```

max-failure

Use **max-failure** to set the maximum number of consecutive probe failures in a UDP tracert operation.

Use **undo max-failure** to restore the default.

Syntax

max-failure *times*

undo max-failure

Default

A UDP tracert operation stops and fails when it detects five consecutive probe failures.

Views

UDP tracert operation view

Predefined user roles

network-admin

context-admin

Parameters

times: Specifies the maximum number in the range of 0 to 255. When this argument is set to 0 or 255, the UDP tracert operation does not stop when consecutive probe failures occur.

Usage guidelines

When a UDP tracert operation detects the maximum number of consecutive probe failures, the operation fails and stops probing the path.

Examples

Set the maximum number of consecutive probe failures to 20 in a UDP tracert operation.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type udp-tracert
[Sysname-nqa-admin-test-udp-tracert] max-failure 20
```

memory

Use **memory** to specify the threshold and weight for the memory usage object.

Use **undo memory** to restore the default.

Syntax

memory { **threshold** *threshold-value* | **weight** *weight-value* } *

undo memory

Default

The memory usage threshold is 70 and the weight is 2.

Views

SNMP DCA template view

Predefined user roles

network-admin

context-admin

Parameters

threshold *threshold-value*: Specifies the memory usage threshold in the range of 0 to 100. A threshold of 0 means that memory usage is not used as a metric for measuring the SNMP agent performance.

weight *weight-value*: Specifies the weight of the memory usage object in the range of 0 to 100. A weight of 0 means that memory usage is not used as a metric for measuring the SNMP agent performance.

Usage guidelines

This command takes effect only on SNMP agents of the Net-SNMP or Windows agent type.

The NQA client automatically obtains the memory usage from the SNMP agent of the Net-SNMP or Windows type in the SNMP DCA operation.

Examples

Set both the threshold and weight of the memory usage object to 90.

```
<Sysname> system-view
[Sysname] nqa template snmpdca test
[Sysname-nqatplt-snmpdca-test] memory threshold 90 weight 90
```

Related commands

agent-type

mode

Use **mode** to set the data transmission mode for the FTP operation.

Use **undo mode** to restore the default.

Syntax

mode { **active** | **passive** }

undo mode

Default

The FTP operation uses the data transmission mode **active**.

Views

FTP operation view

FTP template view

Predefined user roles

network-admin

context-admin

Parameters

active: Sets the data transmission mode to active. The FTP server initiates a connection request.

passive: Sets the data transmission mode to passive. The FTP client initiates a connection request.

Examples

Set the data transmission mode to **passive** for the FTP operation.

```
<Sysname> system-view
```

```
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type ftp
[Sysname-nqa-admin-test-ftp] mode passive
```

In FTP template view, set the data transmission mode to **passive** for the FTP operation.

```
<Sysname> system-view
[Sysname] nqa template ftp ftptplt
[Sysname-nqatplt-ftp-ftptplt] mode passive
```

next-hop ip

Use **next-hop ip** to specify the next hop IPv4 address for probe packets.

Use **undo next-hop ip** to restore the default.

Syntax

next-hop ip *ip-address*

undo next-hop ip

Default

No next hop IPv4 address is specified for probe packets.

Views

ICMP echo operation view

DNS/ICMP/TCP half open template view

Predefined user roles

network-admin

context-admin

Parameters

ip-address: Specifies the IPv4 address of the next hop.

Usage guidelines

If the next hop IPv4 address is not configured, the device searches the routing table to determine the next hop IPv4 address for the probe packets.

Examples

Specify 10.1.1.1 as the next hop IPv4 address for the ICMP echo operation.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type icmp-echo
[Sysname-nqa-admin-test-icmp-echo] next-hop ip 10.1.1.1
```

next-hop ipv6

Use **next-hop ipv6** to specify the next hop IPv6 address for probe packets.

Use **undo next-hop ipv6** to restore the default.

Syntax

next-hop ipv6 *ipv6-address*

undo next-hop ipv6

Default

No next hop IPv6 address is specified for probe packets.

Views

ICMP echo operation view

DNS/ICMP/TCP half open template view

Predefined user roles

network-admin

context-admin

Parameters

ipv6-address: Specifies the IPv6 address of the next hop. IPv6 link-local addresses are not supported.

Usage guidelines

If the next hop IPv6 address is not configured, the device searches the routing table to determine the next hop IPv6 address for the probe packets.

Examples

Specify 10::1 as the next hop IPv6 address for the ICMP echo operation.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type icmp-echo
[Sysname-nqa-admin-test-icmp-echo] next-hop ipv6 10::1
```

no-fragment enable

Use **no-fragment enable** to enable the no-fragmentation feature.

Use **undo no-fragment enable** to disable the no-fragmentation feature.

Syntax

no-fragment enable

undo no-fragment enable

Default

The no-fragmentation feature is disabled.

Views

UDP tracert operation view

Predefined user roles

network-admin

context-admin

Usage guidelines

The no-fragmentation feature sets the DF field to 1. Packets with the DF field set cannot be fragmented during the forwarding process.

You can use this command to test the path MTU of a link.

Examples

Enable the no-fragmentation feature for the UDP tracert operation.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type udp-tracert
[Sysname-nqa-admin-test-udp-tracert] no-fragment enable
```

nqa

Use **nqa** to create an NQA operation and enter its view, or enter the view of an existing NQA operation.

Use **undo nqa** to remove the operation.

Syntax

nqa entry *admin-name operation-tag*

undo nqa { **all** | **entry** *admin-name operation-tag* }

Default

No NQA operations exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

admin-name operation-tag: Specifies an NQA operation by its administrator name and operation tag. The *admin-name* argument represents the name of the administrator who creates the NQA operation. The *operation-tag* argument represents the operation tag. Each of the arguments is a case-insensitive string of 1 to 32 characters that cannot contain hyphens (-).

all: Removes all NQA operations, NQA templates, and Y.1564 operation groups that do not contain any Y.1564 operations.

Examples

Create an NQA operation with administrator name **admin** and operation tag **test**, and enter NQA operation view.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test]
```

nqa agent enable

Use **nqa agent enable** to enable the NQA client.

Use **undo nqa agent enable** to disable the NQA client and stop all operations being performed.

Syntax

nqa agent enable

undo nqa agent enable

Default

The NQA client is enabled.

Views

System view

Predefined user roles

network-admin

context-admin

Examples

Enable the NQA client.

```
<Sysname> system-view
[Sysname] nqa agent enable
```

Related commands

nqa server enable

nqa schedule

Use **nqa schedule** to configure scheduling parameters for an NQA operation.

Use **undo nqa schedule** to stop the operation.

Syntax

nqa schedule *admin-name operation-tag* **start-time** { *hh*:*mm*:*ss* [*yyyy/mm/dd* | *mm/dd/yyyy*] | **now** } **lifetime** { *lifetime* | **forever** } [**recurring**]

undo nqa schedule *admin-name operation-tag*

Default

No schedule is configured for an NQA operation.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

admin-name operation-tag: Specifies an NQA operation by its administrator name and operation tag. The *admin-name* argument represents the name of the administrator who creates the NQA operation. The *operation-tag* argument represents the operation tag. Each of the arguments is a case-insensitive string of 1 to 32 characters that cannot contain hyphens (-).

start-time: Specifies the start time and date of the NQA operation.

hh:*mm*:*ss*: Specifies the start time of an NQA operation.

yyyy/mm/dd: Specifies the start date of an NQA operation. The default value is the current system time, and the value for the *yyyy* argument is in the range of 2000 to 2035.

mm/dd/yyyy: Specifies the start date of an NQA operation. The default value is the current system time, and the value for the *yyyy* argument is in the range of 2000 to 2035.

now: Starts the operation immediately.

lifetime: Specifies the duration of an operation.

lifetime: Specifies the duration of an operation in seconds. The value range is 1 to 2147483647.

forever: Performs the operation until you stop it by using the **undo nqa schedule** command.

recurring: Runs the operation automatically at the start time and for the specified duration. If you do not specify this keyword, the NQA operation is performed only once at the specified date and time.

Usage guidelines

You cannot enter the view of a scheduled NQA operation. If you want to enter such a view, use the **undo nqa schedule** command to stop the NQA operation first.

The NQA operation works between the specified start time and the end time (the start time plus operation duration). If the specified start time is ahead of the system time, the operation starts immediately. If both the specified start time and end time are ahead of the system time, the operation does not start. To display the current system time, use the **display clock** command.

Specify a lifetime long enough for an operation to complete.

Examples

Schedule the operation with administrator name **admin** and operation tag **test** to start on 08:08:08 2008/08/08 and last 1000 seconds.

```
<Sysname> system-view
[Sysname] nqa schedule admin test start-time 08:08:08 2008/08/08 lifetime 1000 recurring
```

Use **undo nqa template** to remove an NQA template.

Syntax

nqa template { **arp** | **dns** | **ftp** | **http** | **https** | **icmp** | **imap** | **pop3** | **radius** | **radius-account** | **rtsp** | **sip** | **smtp** | **snmp** | **snmpdca** | **ssl** | **tcp** | **tcphalfopen** | **udp** | **wap** } *name*

undo nqa template { **arp** | **dns** | **ftp** | **http** | **https** | **icmp** | **imap** | **pop3** | **radius** | **radius-account** | **rtsp** | **sip** | **smtp** | **snmp** | **snmpdca** | **ssl** | **tcp** | **tcphalfopen** | **udp** | **wap** } *name*

Default

No NQA templates exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

arp: Specifies the ARP template.

dns: Specifies the DNS template.

ftp: Specifies the FTP template.

http: Specifies the HTTP template.

https: Specifies the HTTPS template.

icmp: Specifies the ICMP template.

imap: Specifies the IMAP template.

pop3: Specifies the POP3 template.

radius: Specifies the RADIUS authentication template.

radius-account: Specifies the RADIUS accounting template.

rtsp: Specifies the RTSP template.

sip: Specifies the SIP template.

smtp: Specifies the SMTP template.

snmp: Specifies the SNMP template.

snmpdca: Specifies the SNMP DCA template.

ssl: Specifies the SSL template.

tcp: Specifies the TCP template.

tcphalfopen: Specifies the TCP half open template.

udp: Specifies the UDP template.

wap: Specifies the WAP template.

name: Specifies the name of the NQA template, a case-insensitive string of 1 to 32 characters.

Examples

Create an ICMP template named **icmptplt**, and enter its view.

```
<Sysname> system-view
[Sysname] nqa template icmp icmptplt
[Sysname-nqatplt-icmp-icmptplt]
```

nqa twamp-light client

Use **nqa twamp-light client** to enable the TWAMP Light client and enter its view, or enter the view of the enabled TWAMP Light client.

Use **undo nqa twamp-light client** to disable the TWAMP Light client.

Syntax

nqa twamp-light client

undo nqa twamp-light client

The following compatibility matrixes show the support of hardware platforms for this command:

Models	Command compatibility
NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB1780, NFNX3-HDB3080, NFNX3-HDB680, NFNX3-HDB1080	Yes
NFNX3-HDB1180, NFNX3-HDB1480	No

Default

The TWAMP Light client is disabled.

Views

System view

Predefined user roles

network-admin

context-admin

Usage guidelines

The Two-Way Active Measurement Protocol (TWAMP) measures network performance in the complex networks. To create test sessions, you must first use the **nqa twamp-light client** command to enter TWAMP Light client view.

The **undo nqa twamp-light client** command disables the TWAMP Light client and deletes the test sessions on the TWAMP Light client.

Examples

Enable the TWAMP Light client and enter its view.

```
<Sysname> system-view
[Sysname] nqa twamp-light client
[Sysname-nqa-twamp-light-client]
```

nqa twamp-light sender

Use **nqa twamp-light sender** to enable the TWAMP Light sender and enter its view, or enter the view of the enabled TWAMP Light sender.

Use **undo nqa twamp-light sender** to disable the TWAMP Light sender.

Syntax

nqa twamp-light sender

undo nqa twamp-light sender

The following compatibility matrixes show the support of hardware platforms for this command:

Models	Command compatibility
NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB1780, NFNX3-HDB3080, NFNX3-HDB680, NFNX3-HDB1080	Yes
NFNX3-HDB1180, NFNX3-HDB1480	No

Default

The TWAMP Light sender is disabled.

Views

System view

Predefined user roles

network-admin

context-admin

Usage guidelines

In the TWAMP Light sender view, you can start or stop a TWAMP Light test.

Examples

Enable the TWAMP Light sender and enter its view.

```
<Sysname> system-view
[Sysname] nqa twamp-light sender
[Sysname-nqa-twamp-light-sender]
```

oid

Use **oid** to configure a custom SNMP object and set the threshold and weight for the object.

Use **undo oid** to remove an SNMP object.

Syntax

oid *oid* **threshold** *threshold-value* **weight** *weight-value*

undo oid *oid*

Default

No custom SNMP object is configured.

Views

SNMP DCA template view

Predefined user roles

network-admin

context-admin

Parameters

oid: Specifies the OID. The value is a string of 1 to 255 characters.

threshold *threshold-value*: Specifies the threshold for the object. The value range is 0 to 100. A threshold of 0 means that the object is not used as a metric for measuring the performance of the SNMP agent.

weight *weight-value*: Specifies the weight for the object. The value range is 0 to 100. A weight of 0 means that the object is not used as a metric for measuring the performance of the SNMP agent.

Usage guidelines

For SNMP agents of the user-defined type, the SNMP DCA does not have any predefined SNMP objects to collect. You must use the **oid** command to configure the interested SNMP objects and their associated thresholds and weights. A maximum of eight SNMP objects can be configured.

For SNMP agents of the Net-SNMP and Windows types, the NQA client automatically obtains the values for CPU, memory, and disk usage objects from the SNMP agent during the SNMP DCA operation.

Examples

In SNMP DCA template view, configure an SNMP object and set the threshold and weight for the object.

```
<Sysname> system-view
[Sysname] nqa template snmpdca test
[Sysname-nqatplt-snmpdca-test] oid 1.3.6.1.4.1.2021.11.11.0 threshold 90 weight 90
```

Related commands

agent-type

operation (FTP operation view)

Use **operation** to specify the operation type for the FTP operation.

Use **undo operation** to restore the default.

Syntax

operation { **get** | **put** }

undo operation

Default

The FTP operation type is **get**.

Views

FTP operation view

FTP template view

Predefined user roles

network-admin

context-admin

Parameters

get: Gets a file from the FTP server.

put: Transfers a file to the FTP server.

Usage guidelines

When you perform the **put** operation with the **filename** command configured, make sure the file exists on the NQA client.

If you get a file from the FTP server, make sure the file specified in the URL exists on the FTP server. The NQA client does not save the file obtained from the FTP server.

Use a small file for the FTP operation. A big file might result in transfer failure because of timeout, or might affect other services for occupying much network bandwidth.

Examples

Set the operation type to **put** for the FTP operation.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type ftp
[Sysname-nqa-admin-test-ftp] operation put
```

In FTP template view, set the operation type to **put** for the FTP operation.

```
<Sysname> system-view
```

```
[Sysname] nqa template ftp ftptplt
[Sysname-nqatplt-ftp-ftptplt] operation put
```

Syntax

operation { **get** | **post** | **raw** }

undo operation

Default

The HTTP operation type is **get**.

Views

HTTP operation view

HTTP template view

Predefined user roles

network-admin

context-admin

Parameters

get: Gets data from the HTTP server.

post: Transfers data to the HTTP server.

raw: Sends the RAW request to the HTTP server.

Usage guidelines

The HTTP operation uses HTTP requests as probe packets.

For the **get** or **post** operation, the content in the request is obtained from the URL specified by the **url** command.

For the **raw** operation, the content in the request is configured in raw request view. You can use the **raw-request** command to enter the raw request view.

Examples

Set the operation type to **raw** for the HTTP operation.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type http
[Sysname-nqa-admin-test-http] operation raw
```

In HTTP template view, set the operation type to **raw** for the HTTP operation.

```
<Sysname> system-view
[Sysname] nqa template http httptplt
[Sysname-nqatplt-http-httptplt] operation raw
```

out interface

Use **out interface** to specify the output interface for probe packets.

Use **undo out interface** to restore the default.

Syntax

out interface *interface-type interface-number*

undo out interface

Default

The output interface for probe packets is not specified. The NQA client determines the output interface based on the routing table lookup.

Views

ICMP echo operation view

DHCP operation view

UDP tracert operation view

UDP jitter operation view

DNS/ICMP/TCP half open template view

Predefined user roles

network-admin

context-admin

Parameters

interface-type interface-number: Specifies an interface by its type and number.

Usage guidelines

For successful operation, the specified output interface must be up.

The **out interface** command does not take effect if the **next-hop** command is configured in the ICMP echo operation, DNS template, ICMP template, or TCP half open template.

Examples

password

Use **password** to specify a password.

Use **undo password** to restore the default.

Syntax

password { **cipher** | **simple** } *string*

undo password

Default

No password is specified.

Views

FTP/HTTP/HTTPS/IMAP/POP3/RADIUS authentication template view

Predefined user roles

network-admin

context-admin

Parameters

cipher: Specifies a password in encrypted form.

simple: Specifies a password in plaintext form. For security purposes, the password specified in plaintext form will be stored in encrypted form.

string: Specifies the password. The value of the argument varies as follows:

- For FTP, HTTP, and HTTPS operations, the plaintext form of the password is a case-sensitive string of 1 to 32 characters. The encrypted form of the password is a case-sensitive string of 1 to 73 characters.
- For RADIUS templates, the plaintext form of the password is a case-sensitive string of 1 to 64 characters. The encrypted form of the password is a case-sensitive string of 1 to 117 characters.
- For IMAP and POP3 templates, the plaintext form of the password is a string of 1 to 40 characters. The encrypted form of the password is a string of 1 to 85 characters.

Examples

Set the FTP login password to **ftpuser**.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type ftp
[Sysname-nqa-admin-test-ftp] password simple ftpuser
```

Set the FTP login password to **ftpuser** in FTP template view.

```
<Sysname> system-view
[Sysname] nqa template ftp ftptplt
[Sysname-nqatplt-ftp-ftptplt] password simple ftpuser
```

Related commands

username

port-detect enable

Use **port-detect enable** to enable port detection.

Use **undo port-detect enable** to disable port detection.

Syntax

port-detect enable

undo port-detect enable

Default

Port detection is disabled.

Views

TCP half open/UDP template view

Predefined user roles

network-admin

context-admin

Usage guidelines

In the TCP half open operation, port detection probes whether the listening port of the TCP service on the destination device is available. If the NQA client receives the SYN-ACK packet from the destination device within the probe timeout time after sending a SYN packet, the TCP half open operation succeeds. If the NQA client does not receive the SYN-ACK packet from the destination device within the probe timeout time, the TCP half open operation fails.

In the UDP operation, port detection probes whether the listening port of the UDP service on the destination device is available. If the NQA client does not receive any ICMP port unreachable messages within the probe timeout time, the UDP operation succeeds. If the client receives an ICMP port unreachable message, the UDP operation fails.

If the destination device is an NSFOCUS device, you must also perform the following tasks for the UDP operation:

- Execute the **ip unreachables enable** command on the destination device to enable sending ICMP destination unreachable messages.
- Execute the **data-fill** or **hex-data-fill** command on the NQA client with the **raw** keyword specified.

To set the probe timeout time, execute the **probe timeout** command.

For port detection to take effect, you must use the **destination port** command to configure the destination port.

Examples

Enable port detection in TCP half open template **tplt**.

```
<Sysname> system-view
[Sysname] nqa template tcphalfopen tplt
[Sysname-nqatplt-tcphalfopen-tplt] port-detect enable
```

Related commands

priority 8021p

Use **priority 8021p** to set the 802.1p priority for probe packets.

Use **undo priority 8021p** to restore the default.

Syntax

priority 8021p *value*

undo priority 8021p

Default

The 802.1p priority of probe packets is 0.

Views

TWAMP Light client-session view

Predefined user roles

network-admin

context-admin

Parameters

value: Specifies the 802.1p priority value in the range of 0 to 7.

Usage guidelines

To test the service quality for specific packet priorities in a congested Layer 2 network, you can use this command to specify the priorities.

For more information about 802.1p priority, see QoS in *ACL and QoS Configuration Guide*.

Examples

Set the 802.1p priority to 1 for probe packets in the TWAMP Light test.

```
<Sysname> system-view
[Sysname] nqa twamp-light client
[Sysname-nqa-twamp-light-client] test-session 1
[Sysname-nqa-twamp-light-client-session1] priority 8021p 1
```

probe count

Use **probe count** to specify the probe times.

Use **undo probe count** to restore the default.

Syntax

probe count *times*

undo probe count

Default

In an UDP tracert operation, the NQA client sends three probe packets to each hop along the path. In other types of operations, the NQA client performs one probe to the destination per operation.

Views

ICMP echo/TCP/UDP echo operation view

ARP/DHCP/DLSw/DNS/FTP/HTTP/SNMP operation view

UDP tracert operation view

ICMP jitter/UDP jitter operation view

Predefined user roles

network-admin

context-admin

Parameters

times: Specifies the probe times.

- For the UDP tracert operation, this argument specifies the times of probes to each hop along the path. The value range for this argument is 1 to 10.
- For other types of operations, this argument specifies the times of probes to the destination per operation. The value range for this argument is 1 to 15.

Usage guidelines

The following describes how NQA performs different types of operations:

- A TCP or DLSw operation sets up a connection.
- An ICMP jitter or UDP jitter operation sends a number of probe packets. The number of probe packets is set by using the **probe packet-number** command.
- An FTP, HTTP, DHCP, or DNS operation completes an independent task in each probe. For example, an FTP operation uploads or downloads a file in each probe, and an HTTP operation gets a Web page in each probe.
- An ICMP echo operation sends an ICMP echo request.
- An ARP operation sends an ARP request.
- A UDP echo operation sends a UDP packet.
- An SNMP operation sends one SNMPv1 packet, one SNMPv2c packet, and one SNMPv3 packet.
- A path jitter operation is accomplished in the following steps:
  a. The operation uses tracert to obtain the path from the NQA client to the destination. A maximum of 64 hops can be detected.
  b. The NQA client sends ICMP echo requests to each hop along the path. The number of ICMP echo requests is set by using the **probe packet-number** command.
- A UDP tracert operation determines the routing path from the source to the destination. The number of probe packets sent to each hop is set by using the **probe count** command.

If an operation is to perform multiple probes, the NQA client starts a new probe in one of the following conditions:

- The NQA client receives responses to packets sent in the last probe.
- The probe timeout time expires.

This command is not available for the voice or path jitter operations. Each of these operations performs only one probe.

Examples

Configure the ICMP echo operation to perform 10 probes.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type icmp-echo
[Sysname-nqa-admin-test-icmp-echo] probe count 10
```

probe packet-interval

Use **probe packet-interval** to configure the packet sending interval in the probe.

Use **undo probe packet-interval** to restore the default.

Syntax

probe packet-interval *interval*

undo probe packet-interval

Default

The packet sending interval is 20 milliseconds.

Views

ICMP jitter/path jitter/UDP jitter/voice operation view

Predefined user roles

network-admin

context-admin

Parameters

interval: Specifies the sending interval in the range of 10 to 60000 milliseconds.

Examples

Configure the UDP jitter operation to send packets every 100 milliseconds.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type udp-jitter
[Sysname-nqa-admin-test-udp-jitter] probe packet-interval 100
```

probe packet-number

Use **probe packet-number** to set the number of packets to be sent in a UDP jitter, path jitter, or voice probe.

Use **undo probe packet-number** to restore the default.

Syntax

probe packet-number *number*

undo probe packet-number

Default

An ICMP jitter, UDP jitter, or path jitter operation sends 10 packets probe and a voice operation sends 1000 packets per probe.

Views

ICMP jitter/path jitter/UDP jitter/voice operation view

Predefined user roles

network-admin

context-admin

Parameters

number: Specifies the number of packets to be sent per probe. Available value ranges include:

- 10 to 1000 for the ICMP jitter, UDP jitter, and path jitter operations.
- 10 to 60000 for the voice operation.

Examples

Configure the UDP jitter probe to send 100 packets.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type udp-jitter
[Sysname-nqa-admin-test-udp-jitter] probe packet-number 100
```

probe packet-timeout

Use **probe packet-timeout** to set the timeout time for waiting for a response in the UDP jitter, path jitter, or voice operation.

Use **undo probe packet-timeout** to restore the default.

Syntax

probe packet-timeout *timeout*

undo probe packet-timeout

Default

The response timeout time for the UDP jitter or path jitter operation is 3000 milliseconds.

The response timeout time for the voice operation is 5000 milliseconds.

Views

ICMP jitter/path jitter/UDP jitter/voice operation view

Predefined user roles

network-admin

context-admin

Parameters

timeout: Specifies the timeout time in milliseconds. The value range is 10 to 3600000.

Examples

Set the response timeout time to 100 milliseconds in the UDP jitter operation.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type udp-jitter
[Sysname-nqa-admin-test-udp-jitter] probe packet-timeout 100
```

probe timeout

Use **probe timeout** to set the probe timeout time.

Use **undo probe timeout** to restore the default.

Syntax

probe timeout *timeout*

undo probe timeout

Default

The timeout time of a probe is 3000 milliseconds.

Views

ICMP echo/TCP/UDP echo operation view

ARP/DHCP/DLSw/DNS/FTP/HTTP/SNMP operation view

UDP tracert operation view

Any NQA template view

Predefined user roles

network-admin

context-admin

Parameters

timeout: Specifies the probe timeout time in milliseconds. The value range for this argument varies as follows:

- For FTP and HTTP operations, the value range is 10 to 86400000.
- For DHCP, DNS, DLSw, ICMP echo, SNMP, TCP, UDP echo, and UDP tracert operations, the value range is 10 to 3600000.
- For FTP, HTTP, and HTTPS templates, the value range is 10 to 86400000.
- For other types of NQA templates, the value range is 10 to 3600000.

Usage guidelines

If a probe does not complete within the period, the probe is timed out.

To make this command to take effect, the interval specified in the **frequency** command must be greater than that specified in this command.

Examples

Set the probe timeout time to 10000 milliseconds for the ICMP echo operation.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type icmp-echo
[Sysname-nqa-admin-test-icmp-echo] probe timeout 10000
```

In HTTP template view, set the probe timeout time to 10000 milliseconds for the HTTP operation.

```
<Sysname> system-view
[Sysname] nqa template http httptplt
[Sysname-nqatplt-http-httptplt] probe timeout 10000
```

Related commands

frequency

proxy-url

Use **proxy-url** to specify the URL of the HTTP or HTTPS proxy server.

Use **undo proxy-url** to restore the default.

Syntax

proxy-url *url*

undo proxy-url

Default

The URL of the HTTP or HTTPS proxy server is not specified.

Views

HTTP template view

HTTPS template view

Predefined user roles

network-admin

context-admin

Parameters

url: Specifies the proxy server URL, a case-sensitive string of 1 to 255 characters.

- The URL of the HTTP proxy server is in the format of http://host or http://host:port.
- The URL of the HTTPS proxy server is in the format of https://host or https://host:port.

The *host* parameter in the URL represents the host name of the server, which must meet the following requirements:

- Case sensitive.
- Valid characters are letters, digits, hyphens (-), underscores (_), and dots (.), but consecutive dots (.) are not allowed.
- Must be a dot-separated series of labels. Each label can contain 1 to 63 characters.

Usage guidelines

After the HTTP or HTTPS proxy server URL is specified, the NQA client will send probe packets to the HTTP or HTTPS proxy server, which acts on behalf of the HTTP or HTTPS server.

If proxy servers are required for Internet access, you must specify the URL of the HTTP or HTTPS proxy server for successful HTTP or HTTPS operations.

Examples

In HTTP template view, specify **http://www.company.com** as the URL of the HTTP proxy server.

```
<Sysname> system-view
[Sysname] nqa template http httptplt
[Sysname-nqatplt-http-httptplt] proxy-url http://www.company.com
```

raw-request

Use **raw-request** to enter raw request view and specify the content of an HTTP or HTTPS request.

Use **undo raw-request** to restore the default.

Syntax

raw-request

undo raw-request

Default

The contents of an HTTP or HTTPS raw request are not specified.

Views

HTTP operation view

HTTP/HTTPS template view

Predefined user roles

network-admin

context-admin

Usage guidelines

This command places you in raw request view and deletes the previously configured request content.

If the HTTP or HTTPS operation type is set to **raw**, you must configure this command. In raw request view, use the **text** command to configure the request content to be sent to the HTTP or HTTPS server. For successful HTTP or HTTPS operations, make sure the raw request content is valid and does not contain aliases set by using the **alias** command. For more information about the command, see CLI in *Fundamentals Command Reference*.

Examples

Enter raw request view and specify the content of a GET request for the HTTP operation.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type http
[Sysname-nqa-admin-test-http] raw-request
[Sysname-nqa-admin-test-http-raw-request] GET /sdn/ui/app/index HTTP/1.0\r\nHost:
172.0.0.2\r\n\r\n
```

In HTTP template view, enter raw request view and specify the content of a POST request for the HTTP operation.

```
<Sysname> system-view
[Sysname] nqa template http httptplt
[Sysname-nqatplt-http-httptplt] raw-request
[Sysname-nqatplt-http-httptplt-raw-request] POST /sdn/ui/app/index HTTP/1.0\r\nHost:
 172.0.0.2\r\nAuthorization: Basic cm9vdDoxMjM0NTY=\r\n\r\n
```

reaction checked-element { jitter-ds | jitter-sd }

Use **reaction checked-element** { **jitter-ds** | **jitter-sd** } to configure a reaction entry for monitoring one-way jitter in the NQA operation.

Use **undo reaction** to delete a reaction entry.

Syntax

reaction *item-number* **checked-element** { **jitter-ds** | **jitter-sd** } **threshold-type** { **accumulate** *accumulate-occurrences* | **average** } **threshold-value** *upper-threshold lower-threshold* [**action-type** { **none** | **trap-only** }]

undo reaction *item-number*

Default

No reaction entries for monitoring one-way jitter exist.

Views

ICMP jitter/UDP jitter/voice operation view

Predefined user roles

network-admin

context-admin

Parameters

item-number: Assigns an ID to the reaction entry, in the range of 1 to 10.

jitter-ds: Specifies the destination-to-source jitter of each probe packet as the monitored element (or performance metric).

jitter-sd: Specifies source-to-destination jitter of each probe packet as the monitored element.

threshold-type: Specifies a threshold type.

accumulate *accumulate-occurrences*: Checks the total number of threshold violations in the operation. The value range is 1 to 14999 for the ICMP jitter and UDP jitter operations, and 1 to 59999 for the voice operation.

average: Checks the average one-way jitter.

threshold-value: Specifies threshold range in milliseconds.

upper-threshold: Specifies the upper limit in the range of 0 to 3600000.

lower-threshold: Specifies the lower limit in the range of 0 to 3600000. It must not be greater than the upper limit.

action-type: Specifies the action to be triggered. The default action is **none**.

none: Specifies the action of displaying results on the terminal display.

trap-only: Specifies the action of displaying results on the terminal display and meanwhile sending SNMP trap messages to the NMS.

Usage guidelines

You cannot edit a reaction entry after it is created. To change the attributes in a reaction entry, use the **undo reaction** command to delete the entry, and then configure a new one.

Only successful probe packets are monitored. Statistics about failed probe packets are not collected.

Examples

Create reaction entry 1 for monitoring the average destination-to-source jitter of UDP jitter packets, and set the upper limit to 50 milliseconds and the lower limit to 5 milliseconds. Before the NQA operation starts, the initial state of the reaction entry is invalid. After the operation, the average destination-to-source jitter is checked against the threshold range. If it exceeds the upper limit, the state of the reaction entry is set to over-threshold. If it is below the lower limit, the state is set to below-threshold. Once the state of the reaction entry changes, a trap message is generated and sent to the NMS.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type udp-jitter
[Sysname-nqa-admin-test-udp-jitter] reaction 1 checked-element jitter-ds threshold-type average threshold-value 50 5 action-type trap-only
```

Create reaction entry 2 for monitoring the destination-to-source jitter of UDP jitter probe packets, and set the upper limit to 50 milliseconds, and the lower limit to 5 milliseconds. Before the NQA operation starts, the initial state of the reaction entry is invalid. After the operation, the destination-to-source jitter is checked against the threshold range. If the total number of threshold violations reaches or exceeds 100, the state of the entry is set to over-threshold. Otherwise, the state of the entry is set to below-threshold. Once the state of the reaction entry changes, a trap message is generated and sent to the NMS.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type udp-jitter
[Sysname-nqa-admin-test-udp-jitter] reaction 2 checked-element jitter-ds threshold-type accumulate 100 threshold-value 50 5 action-type trap-only
```

reaction checked-element { owd-ds | owd-sd }

Use **reaction checked-element** { **owd-ds** | **owd-sd** } to configure a reaction entry for monitoring the one-way delay.

Use **undo reaction** to delete a reaction entry.

Syntax

reaction *item-number* **checked-element** { **owd-ds** | **owd-sd** } **threshold-value** *upper-threshold lower-threshold*

undo reaction *item-number*

Default

No reaction entries for monitoring the one-way delay exist.

Views

ICMP jitter/UDP jitter/voice operation view

Predefined user roles

network-admin

context-admin

Parameters

item-number: Assigns an ID to the reaction entry, in the range of 1 to 10.

owd-ds: Specifies the destination-to-source delay of each probe packet as the monitored element.

owd-sd: Specifies the source-to-destination delay of each probe packet as the monitored element.

threshold-value: Specifies threshold range in milliseconds.

upper-threshold: Specifies the upper limit in the range of 0 to 3600000.

lower-threshold: Specifies the lower limit in the range of 0 to 3600000. It must not be greater than the upper limit.

Usage guidelines

You cannot edit a reaction entry after it is created. To change the attributes in a reaction entry, use the **undo reaction** command to delete the entry, and then configure a new one.

Only successful probe packets are monitored. Statistics about failed probe packets are not collected.

No actions can be configured for a reaction entry of monitoring one-way delays. To display the monitoring results and statistics, use the **display nqa reaction counters** and **display nqa statistics** commands.

Examples

Create reaction entry 1 for monitoring the destination-to-source delay of every UDP jitter packet, and set the upper limit to 50 milliseconds and lower limit to 5 milliseconds. Before the NQA operation starts, the initial state of the reaction entry is invalid. The destination-to-source delay is calculated after the response to the probe packet arrives. If the delay exceeds the upper limit, the state of the reaction entry is set to over-threshold. If it is below the lower limit, the state is set to below-threshold. Once the state of the reaction entry changes, a trap message is generated and sent to the NMS.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type udp-jitter
[Sysname-nqa-admin-test-udp-jitter] reaction 1 checked-element owd-ds threshold-value 50
5
```

reaction checked-element icpif

Use **reaction checked-element icpif** to configure a reaction entry for monitoring the ICPIF value in the voice operation.

Use **undo reaction** to delete a reaction entry.

Syntax

reaction *item-number* **checked-element icpif threshold-value** *upper-threshold lower-threshold* [**action-type** { **none** | **trap-only** }]

undo reaction *item-number*

Default

No reaction entries for monitoring ICPIF values exist.

Views

context-admin

Parameters

item-number: Assigns an ID to the reaction entry, in the range of 1 to 10.

threshold-value: Specifies threshold range.

upper-threshold: Specifies the upper limit in the range of 1 to 100.

lower-threshold: Specifies the lower limit in the range of 1 to 100. It must not be greater than the upper limit.

action-type: Specifies what action to be triggered. The default action is **none**.

none: Specifies the action of displaying results on the terminal display.

trap-only: Specifies the action of displaying results on the terminal display and meanwhile sending SNMP trap messages to the NMS.

Usage guidelines

You cannot edit a reaction entry after it is created. To change the attributes in a reaction entry, use the **undo reaction** command to delete the entry, and then configure a new one.

Examples

Create reaction entry 1 for monitoring the ICPIF value in the voice operation, and set the upper limit to 50 and lower limit to 5. Before the voice operation starts, the initial state of the reaction entry is invalid. After the operation, the ICPIF value is checked against the threshold range. If it exceeds the upper limit, the state of the reaction entry is set to over-threshold. If it is below the lower limit, the state is set to below-threshold. Once the state of the reaction entry changes, a trap message is generated and sent to the NMS.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type voice
[Sysname-nqa-admin-test-voice] reaction 1 checked-element icpif threshold-value 50 5
action-type trap-only
```

reaction checked-element mos

Use **reaction checked-element mos** to configure a reaction entry for monitoring the MOS value in the voice operation.

Use **undo reaction** to delete a reaction entry.

Syntax

reaction *item-number* **checked-element mos threshold-value** *upper-threshold lower-threshold* [**action-type** { **none** | **trap-only** }]

undo reaction *item-number*

Default

No reaction entries for monitoring the MOS value exist.

Views

Voice operation view

Predefined user roles

network-admin

context-admin

Parameters

item-number: Assigns an ID to the reaction entry, in the range of 1 to 10.

threshold-value: Specifies threshold range.

upper-threshold: Specifies the upper limit in the range of 1 to 500.

lower-threshold: Specifies the lower limit in the range of 1 to 500. It must not be greater than the upper limit.

action-type: Specifies what action to be triggered. The default action is **none**.

none: Specifies the action of displaying results on the terminal display.

trap-only: Specifies the action of displaying results on the terminal display and meanwhile sending SNMP trap messages to the NMS.

Usage guidelines

You cannot edit a reaction entry after it is created. To change the attributes in a reaction entry, use the **undo reaction** command to delete the entry, and then configure a new one.

For the MOS threshold, the number is expressed in three digits representing ones, tenths, and hundredths. For example, to express a MOS threshold of 1, enter 100.

Examples

Create reaction entry 1 for monitoring the MOS value of the voice operation, and set the upper limit to 2 and lower limit to 1. Before the NQA operation starts, the initial state of the reaction entry is invalid. After the operation, the MOS value is checked against the threshold range. If it exceeds the upper limit, the state of the reaction entry is set to over-threshold. If it is below the lower limit, the state is set to below-threshold. Once the state of the reaction entry changes, a trap message is generated and sent to the NMS.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type voice
[Sysname-nqa-admin-test-voice] reaction 1 checked-element mos threshold-value 200 100
action-type trap-only
```

reaction checked-element packet-loss

Use **reaction checked-element packet-loss** to configure a reaction entry for monitoring packet loss in UDP jitter or voice operation.

Use **undo reaction** to delete a reaction entry.

Syntax

reaction *item-number* **checked-element packet-loss threshold-type accumulate** *accumulate-occurrences* [**action-type** { **none** | **trap-only** }]

undo reaction *item-number*

Default

No reaction entries for monitoring packet loss exist.

Views

ICMP jitter/UDP jitter/voice operation view

Predefined user roles

network-admin

context-admin

Parameters

item-number: Assigns an ID to the reaction entry, in the range of 1 to 10.

threshold-type: Specifies a threshold type.

accumulate *accumulate-occurrences*: Specifies the total number of lost packets in the operation. The value range is 1 to 15000 for the ICMP jitter and UDP jitter operations and 1 to 60000 for the voice operation.

action-type: Specifies what action to be triggered. The default action is **none**.

none: Specifies the action of displaying results on the terminal display.

trap-only: Specifies the action of displaying results on the terminal display and meanwhile sending SNMP trap messages to the NMS.

Usage guidelines

You cannot edit a reaction entry after it is created. To change the attributes in a reaction entry, use the **undo reaction** command to delete the entry, and then configure a new one.

Examples

Create reaction entry 1 for monitoring packet loss in the UDP jitter operation. Before the NQA operation starts, the initial state of the reaction entry is invalid. After the operation, the total number of the lost packets is checked against the threshold. If the number reaches or exceeds 100, the state of the reaction entry is set to over-threshold. Otherwise, the state is set to below-threshold. Once the state of the reaction entry changes, a trap message is generated and sent to the NMS.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type udp-jitter
[Sysname-nqa-admin-test-udp-jitter] reaction 1 checked-element packet-loss
threshold-type accumulate 100 action-type trap-only
```

reaction checked-element probe-duration

Use **reaction checked-element probe-duration** to configure a reaction entry for monitoring the probe duration.

Use **undo reaction** to delete a reaction entry.

Syntax

reaction *item-number* **checked-element probe-duration threshold-type** { **accumulate** *accumulate-occurrences* | **average** | **consecutive** *consecutive-occurrences* } **threshold-value** *upper-threshold lower-threshold* [**action-type** { **none** | **trap-only** }]

undo reaction *item-number*

Default

No reaction entries for monitoring the probe duration exist.

Views

ARP/DHCP/DLSw/DNS/FTP/HTTP/SNMP operation view

Predefined user roles

network-admin

context-admin

Parameters

item-number: Assigns an ID to the reaction entry, in the range of 1 to 10.

threshold-type: Specifies a threshold type.

accumulate *accumulate-occurrences*: Checks the total number of threshold violations. The value range is 1 to 15.

average: Checks the average probe duration.

consecutive *consecutive-occurrences*: Specifies the number of consecutive threshold violations after the NQA operation starts. The value range is 1 to 16.

threshold-value: Specifies threshold range in milliseconds.

upper-threshold: Specifies the upper limit in the range of 0 to 3600000.

lower-threshold: Specifies the lower limit in the range of 0 to 3600000. It must not be greater than the upper threshold.

action-type: Specifies what action to be triggered. The default action is **none**.

none: Specifies the action of displaying results on the terminal display.

trap-only: Specifies the action of displaying results on the terminal display and meanwhile sending SNMP trap messages to the NMS. This keyword is not available for the DNS operation.

Usage guidelines

You cannot edit a reaction entry after it is created. To change the attributes in a reaction entry, use the **undo reaction** command to delete the entry, and then configure a new one.

Only successful probe packets are monitored. Statistics about failed probe packets are not collected.

Examples

Create reaction entry 1 for monitoring the average probe duration of ICMP echo operation, and set the upper limit to 50 milliseconds and lower limit to 5 milliseconds. Before the NQA operation starts, the initial state of the reaction entry is invalid. After the operation, the average probe duration is checked. If it exceeds the upper limit, the state is set to over-threshold. If it is below the lower limit, the state of the reaction entry is set to below-threshold. Once the state of the reaction entry changes, a trap message is generated and sent to the NMS.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type icmp-echo
[Sysname-nqa-admin-test-icmp-echo] reaction 1 checked-element probe-duration
threshold-type average threshold-value 50 5 action-type trap-only
```

Create reaction entry 2 for monitoring the probe duration of ICMP echo operation, and set the upper limit to 50 milliseconds and the lower limit to 5 milliseconds. Before the NQA operation starts, the initial state of the reaction entry is invalid. After the operation, the accumulated probe duration is checked against the threshold range. If the total number of threshold violations reaches or exceeds

10, the state of the entry is set to over-threshold. If it is below the lower threshold, the state of the entry is set to below-threshold. Once the state of the reaction entry changes, a trap message is generated and sent to the NMS.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type icmp-echo
[Sysname-nqa-admin-test-icmp-echo] reaction 2 checked-element probe-duration
threshold-type accumulate 10 threshold-value 50 5 action-type trap-only
```

Create reaction entry 3 for monitoring the probe duration time of ICMP echo operation, and set the upper limit to 50 milliseconds and the lower limit to 5 milliseconds. Before the NQA operation starts, the initial state of the reaction entry is invalid. After the operation, the consecutive probe duration is checked against the threshold range. If the total number of consecutive threshold violations reaches or exceeds 10, the state of the entry is set to over-threshold. If it is below the lower threshold, the state of the entry is set to below-threshold. Once the state of the reaction entry changes, a trap message is generated and sent to the NMS.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type icmp-echo
[Sysname-nqa-admin-test-icmp-echo] reaction 3 checked-element probe-duration
threshold-type consecutive 10 threshold-value 50 5 action-type trap-only
```

reaction checked-element probe-fail (for trap)

Use **reaction checked-element probe-fail** to configure a reaction entry for monitoring the probe failures of the operation.

Use **undo reaction** to delete a reaction entry.

Syntax

reaction *item-number* **checked-element probe-fail threshold-type** { **accumulate** *accumulate-occurrences* | **consecutive** *consecutive-occurrences* } [**action-type** { **none** | **trap-only** }]

undo reaction *item-number*

Default

No reaction entries for monitoring probe failures exist.

Views

ICMP jitter/UDP jitter/voice operation view

Predefined user roles

network-admin

context-admin

Parameters

item-number: Assigns an ID to the reaction entry, in the range of 1 to 10.

threshold-type: Specifies a threshold type.

accumulate *accumulate-occurrences*: Checks the total number of threshold violations.

The value range for the *accumulate-occurrences* argument varies by operation type:

- 1 to 15000 for the ICMP jitter and UDP jitter operations.
- 1 to 60000 for the voice operation.

average: Checks the packet average round-trip time.

threshold-value: Specifies threshold range in milliseconds.

upper-threshold: Specifies the upper limit in the range of 0 to 3600000.

lower-threshold: Specifies the lower limit in the range of 0 to 3600000. It must not be greater than the upper limit.

action-type: Specifies what action to be triggered. The default action is **none**.

none: Specifies the action of displaying results on the terminal display.

trap-only: Specifies the action of displaying results on the terminal display and meanwhile sending SNMP trap messages to the NMS.

Usage guidelines

You cannot edit a reaction entry after it is created. To change the attributes in a reaction entry, use the **undo reaction** command to delete the entry, and then configure a new one.

Only successful probe packets are monitored. Statistics about failed probe packets are not collected.

Examples

Create reaction entry 1 for monitoring the average round-trip time of UDP jitter probe packets, and set the upper limit to 50 milliseconds and lower limit to 5 milliseconds. Before the NQA operation starts, the initial state of the reaction entry is invalid. After the operation, the average packet round-trip time is checked. If it exceeds the upper limit, the state is set to over-threshold. If it is below the lower limit, the state is set to below-threshold. Once the reaction entry state changes, a trap message is generated and sent to the NMS.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type udp-jitter
[Sysname-nqa-admin-test-udp-jitter] reaction 1 checked-element rtt threshold-type
average threshold-value 50 5 action-type trap-only
```

Create reaction entry 2 for monitoring the round-trip time of UDP jitter probe packets, and set the upper limit to 50 milliseconds and lower limit to 5 milliseconds. Before the NQA operation starts, the initial state of the reaction entry is invalid. After the operation, the packet round-trip time is checked. If the total number of threshold violations reaches or exceeds 100, the state of the entry is set to over-threshold. Otherwise, the state of the entry is set to below-threshold. Once the state of the reaction entry changes, a trap message is generated and sent to the NMS.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type udp-jitter
[Sysname-nqa-admin-test-udp-jitter] reaction 1 checked-element rtt threshold-type
accumulate 100 threshold-value 50 5 action-type trap-only
```

reaction checked-element two-way-delay

Use **reaction checked-element two-way-delay** to configure a reaction entry for monitoring the two-way delay in the TWAMP Light tests.

Use **undo reaction trap** to delete a reaction entry.

Syntax

reaction *item-number* **checked-element two-way-delay threshold-value** *upper-threshold lower-threshold* [**action-type** { **none** | **trap-only** }]

undo reaction *item-number*

Models	Command compatibility
NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB1780, NFNX3-HDB3080, NFNX3-HDB680, NFNX3-HDB1080	Yes
NFNX3-HDB1180, NFNX3-HDB1480	No

Default

No reaction entries for monitoring two-way delay exist.

Views

TWAMP Light client-session view

Predefined user roles

network-admin

context-admin

Parameters

item-number: Assigns an ID to the reaction entry, in the range of 1 to 10.

threshold-value: Specifies threshold range in microseconds.

upper-threshold: Specifies the upper limit in the range of 2 to 1000000.

lower-threshold: Specifies the lower limit in the range of 1 to 999999. It must not be greater than the upper limit.

action-type: Specifies the action to be triggered. The default action is **none**.

none: Specifies the action of displaying results on the terminal display.

trap-only: Specifies the action of displaying results on the terminal display and sending SNMP trap messages to the NMS.

Usage guidelines

You cannot edit a reaction entry after it is created. To change the attributes in a reaction entry, use the **undo reaction** command to delete the entry, and then configure a new one.

Only successful probe packets are monitored. Statistics about failed probe packets are not collected.

In a TWAMP test, the device monitors the test result, and starts the monitoring time when either of the following conditions is met:

- The monitoring result goes beyond the threshold upper limit.
- The monitoring result drops below the threshold lower limit from a monitoring result higher than the lower limit.

If either condition is always true during the monitoring time, a threshold violation occurs. To set the monitoring time, use the **monitor-time** keyword in the **start** command.

Examples

Create reaction entry 1 for monitoring the two-way delay of probe packets, and set the upper limit to 50 microseconds and the lower limit to 5 microseconds.

```
<Sysname> system-view
[Sysname] nqa twamp-light client
[Sysname-nqa-twamp-light-client] test-session 1
[Sysname-nqa-twamp-light-client-session1] reaction 1 checked-element two-way-delay
threshold-value 50 5 action-type trap-only
```

threshold-value 1000 500 action-type trap-only
```

Related commands

start (Twamp Light sender view)

reaction trap

Use **reaction trap** to configure the sending of traps to the NMS under specific conditions.

Use **undo reaction trap** to restore the default.

Syntax

reaction trap { **path-change** | **probe-failure** *consecutive-probe-failures* | **test-complete** | **test-failure** [*accumulate-probe-failures*] }

undo reaction trap { **path-change** | **probe-failure** | **test-complete** | **test-failure** }

Default

No traps are sent to the NMS.

Views

ICMP echo/TCP/UDP echo operation view

ARP/DHCP/DLSw/DNS/FTP/HTTP/SNMP operation view

UDP tracert operation view

ICMP jitter/UDP jitter/voice operation view

Predefined user roles

network-admin

context-admin

Parameters

path-change: Sends a trap when the UDP tracert operation detects a different path to the destination.

probe-failure *consecutive-probe-failures*: Sends a trap to the NMS if the number of consecutive probe failures in an operation is greater than or equal to *consecutive-probe-failures*. The value range for the *consecutive-probe-failures* argument is 1 to 15. The system counts the number of consecutive probe failures for each operation, so multiple traps might be sent.

test-complete: Sends a trap to indicate that the operation is completed. A UDP tracert operation is considered completed when the path to the destination is determined.

test-failure: Sends a trap when an operation fails. For operations other than UDP tracert operation, the system counts the total number of probe failures in an operation. If the number reaches or exceeds the value for the *accumulate-probe-failures* argument, a trap is sent for the operation failure.

accumulate-probe-failures: Specifies the total number of probe failures in an operation. The value range is 1 to 15. This argument is not supported by the UDP tracert operation.

Usage guidelines

The ARP operation supports the **probe-failure**, **test-complete**, and **test-failure** keywords.

The ICMP jitter, UDP jitter, and voice operations support only the **test-complete** keyword.

The following parameters are not available for the UDP tracert operation:

- The **probe-failure** *consecutive-probe-failures* option.
- The *accumulate-probe-failures* argument.

Examples

Configure the system to send a trap if five or more consecutive probe failures occur in an ICMP echo operation.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type icmp-echo
[Sysname-nqa-admin-test-icmp-echo] reaction trap probe-failure 5
```

reaction trigger per-probe

Use **reaction trigger per-probe** to configure the probe result sending on a per-probe basis.

Use **undo reaction trigger per-probe** to restore the default.

Syntax

reaction trigger per-probe

undo reaction trigger per-probe

Default

The probe result is sent to the feature that uses the template after three consecutive failed or successful probes.

Views

DNS/ICMP/TCP half open template view

Predefined user roles

network-admin

context-admin

Usage guidelines

The feature enables the NQA client to send the probe result to the feature that uses the NQA template every time a probe is completed.

If you execute this command and the **reaction trigger probe-fail** command multiple times, the most recent configuration takes effect.

If you execute this command and the **reaction trigger probe-pass** command multiple times, the most recent configuration takes effect.

Examples

In ICMP template view, configure the probe result sending on a per-probe basis.

```
<Sysname> system-view
[Sysname] nqa template icmp icmptplt
[Sysname-nqatplt-icmp-icmptplt] reaction trigger per-probe
```

Related commands

reaction trigger probe-fail

reaction trigger probe-pass

reaction trigger probe-fail

Use **reaction trigger probe-fail** to set the number of consecutive probe failures to determine an operation failure.

Use **undo reaction trigger probe-fail** to restore the default.

Syntax

reaction trigger probe-fail *count*

undo reaction trigger probe-fail

Default

The NQA client notifies the feature of the operation failure when the number of consecutive probe failures reaches 3.

Views

Any NQA template view

Predefined user roles

network-admin

context-admin

Parameters

count: Specifies the number of consecutive probe failures, in the range of 1 to 15.

Usage guidelines

If the number of consecutive probe failures is reached, the NQA client notifies the feature that uses the NQA template of the operation failure.

If you execute this command and the **reaction trigger per-probe** command multiple times, the most recent configuration takes effect.

Examples

In HTTP template view, configure the NQA client to notify the feature of the operation failure when the number of consecutive probe failures reaches 5.

```
<Sysname> system-view
[Sysname] nqa template http httptplt
[Sysname-nqatplt-http-httptplt] reaction trigger probe-fail 5
```

Related commands

reaction trigger per-probe

reaction trigger probe-pass

reaction trigger probe-pass

Use **reaction trigger probe-pass** to set the number of consecutive successful probes to determine a successful operation event.

Use **undo reaction trigger probe-pass** to restore the default.

Syntax

reaction trigger probe-pass *count*

undo reaction trigger probe-pass

Default

The NQA client notifies the feature of the successful operation event if the number of consecutive successful probes reaches 3.

Views

Any NQA template view

Predefined user roles

network-admin

context-admin

Parameters

count: Specifies the number of consecutive successful probes, in the range of 1 to 15.

Usage guidelines

If number of consecutive successful probes is reached, the NQA client notifies the feature that uses the template of the successful operation event.

If you execute this command and the **reaction trigger per-probe** command multiple times, the most recent configuration takes effect.

Examples

In HTTP template view, configure the NQA client to notify the feature of the successful operation event if the number of consecutive successful probes reaches 5.

```
<Sysname> system-view
[Sysname] nqa template http httptplt
[Sysname-nqatplt-http-httptplt] reaction trigger probe-pass 5
```

Related commands

reaction trigger probe-fail

request-method

Use **request-method** to specify the request method for the RTSP operation.

Use **undo request-method** to restore the default.

Syntax

request-method { **describe** | **options** }

undo request-method

Default

The **options** request method is used.

Views

RTSP template view

Predefined user roles

network-admin

context-admin

Parameters

describe: Specifies the DESCRIBE request method. A DESCRIBE request returns information on a particular object identified by a URL.

options: Specifies the OPTIONS request method. An OPTIONS request returns the request types that the RTSP server will accept.

Usage guidelines

For an RTSP template that uses the DESCRIBE request method, you must use the **url** command to specify the path of a file located on the RTSP server.

Examples

In RTSP template view, set the RTSP request method to DESCRIBE.

```
<Sysname> system-view
[Sysname] nqa template rtsp rtsptplt
[Sysname-nqatplt-rtsp-rtsptplt] request method describe
```

Related commands

url

reset nqa twamp-light statistics

Use **reset nqa twamp-light statistics** to clear the TWAMP Light test sessions.

Syntax

reset nqa twamp-light statistics { **all** | **test-session** *session-id* }

The following compatibility matrixes show the support of hardware platforms for this command:

Models	Command compatibility
NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB1780, NFNX3-HDB3080, NFNX3-HDB680, NFNX3-HDB1080	Yes
NFNX3-HDB1180, NFNX3-HDB1480	No

Views

User view

Predefined user roles

network-admin

context-admin

Parameters

all: Clears statistics about all TWAMP Light test sessions.

test-session *session-id*: Specifies a session by its ID. The value range is 1 to 256.

Usage guidelines

Use the command with caution. Once being cleared, the test session cannot be recovered.

Examples

Clear statistics about all TWAMP Light test sessions.

```
<Sysname> reset nqa twamp-light statistics all
```

Related commands

display nqa twamp-light client statistic

resolve-target

Use **resolve-target** to specify the domain name to be resolved in the DNS operation.

Use **undo resolve-target** to restore the default.

Syntax

resolve-target *domain-name*

undo resolve-target

Default

The domain name to be resolved in the DNS operation is not specified.

Views

DNS operation view

DNS template view

Predefined user roles

network-admin

context-admin

Parameters

domain-name: Specifies the domain name to be resolved. It is a dot-separated case-sensitive string of 1 to 255 characters including letters, digits, hyphens (-), and underscores (_) (for example, aabbcc.com). Each part consists of 1 to 63 characters, and consecutive dots (.) are not allowed.

Examples

Specify **domain1** as the domain name to be resolved.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type dns
[Sysname-nqa-admin-test-dns] resolve-target domain1
```

In DNS template view, specify **domain1** as the domain name to be resolved.

```
<Sysname> system-view
[Sysname] nqa template dns dnstplt
[Sysname-nqatplt-dns-dnstplt] resolve-target domain1
```

resolve-type

Use **resolve-type** to configure the domain name resolution type.

Use **undo resolve-type** to restore the default.

Syntax

resolve-type { **A** | **AAAA** }

undo resolve-type

Default

The domain name resolution type is type A.

Views

DNS template view

Predefined user roles

network-admin

context-admin

Parameters

A: Specifies the type A queries. A type A query resolves a domain name to a mapped IPv4 address.

AAAA: Specifies the type AAAA queries. A type AAAA query resolves a domain name to a mapped IPv6 address.

Examples

In DNS template view, set the domain name resolution type to **A**.

```
<Sysname> system-view
[Sysname] nqa template dns dnstplt
[Sysname-nqatplt-dns-dnstplt] resolve-type A
```

resource-release { data-fill | hex-data-fill }

Use to **resource-release { data-fill | hex-data-fill }** to enable the NQA client to send a resource release notification packet to the NQA server when an NQA operation is complete.

Use **undo resource-release** to restore the default.

Syntax

resource-release { **data-fill** | **hex-data-fill** } *string*

undo resource-release

Default

The NQA client does not send resource release notifications to the NQA server when an NQA operation is complete.

Views

TCP/UDP template view

Predefined user roles

network-admin

context-admin

Parameters

data-fill: Specifies a payload fill string.

hex-data-fill: Specifies a hexadecimal payload fill string.

string: Specifies the payload fill string.

- If the **data-fill** keyword is specified, the payload fill string is case-sensitive and can contain 1 to 200 characters.
- If the **hex-data-fill** keyword is specified, the payload fill string is case-insensitive and can contain any even number of characters in the range of 2 to 200.

Usage guidelines

With this command configured, the NQA client sends a resource release notification packet containing the specified payload to the NQA server when the NQA operation is complete. The NQA server will then terminate the connection for the NQA operation and release the resources assigned to the operation.

Examples

In TCP template view, enable the NQA client to send a resource release notification packet containing payload **abcd** to the NQA server.

```
<Sysname> system-view
[Sysname] nqa template tcp tcptplt
[Sysname-nqatplt-tcp-tcptplt] resource-release data-fill abcd
```

reth-member probe enable

Use **reth-member probe enable** to enable link connectivity probing for a redundant Ethernet (Reth) member interface.

Use **undo reth-member probe enable** to disable link connectivity probing for a Reth member interface.

Syntax

reth-member probe enable

undo reth-member probe enable

Default

The link connectivity probing is disabled for Reth member interfaces.

Views

ICMP echo operation view

Predefined user roles

network-admin

context-admin

Usage guidelines

If you configure an ICMP echo operation for a Reth interface, only Reth interfaces can be configured as the output interface for probe packets by default.

With this command configured, both Reth interfaces and Reth member interfaces can be configured as output interface for probe packets.

- If you configure a Reth interface as the output interface, the device send probe packets out of the Reth interface. The operation tests the link connectivity between the Reth interface and the peer device.
- If you configure a Reth member interface, whatever it is active or inactive, as the output interface, the device sends probe packets out of the configured member interface. The operation tests the link connectivity between the member interface and the peer.

To probe the link connectivity for two Reth member interfaces with their peers respectively, you can configure two ICMP echo operations, each using one Reth member interface as the output interface.

Examples

Enable link connectivity probing between a Reth member interface and its peer.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type icmp-echo
[Sysname-nqa-admin-test-icmp-echo] reth-member probe enable
```

Related commands

out interface

route-option bypass-route

Use **route-option bypass-route** to enable the routing table bypass feature to test the connectivity to the direct destination.

Use **undo route-option bypass-route** to disable the routing table bypass feature.

Syntax

route-option bypass-route

undo route-option bypass-route

Default

The routing table bypass feature is disabled.

Views

ICMP echo/TCP/UDP echo operation view

DLSw/DNS/FTP/HTTP/SNMP operation view

UDP tracert operation view

ICMP jitter/UDP jitter/voice operation view

Predefined user roles

network-admin

context-admin

Usage guidelines

When the routing table bypass feature is enabled, the following events occur:

- The routing table is not searched. Packets are sent to the destination on a directly connected network.
- The TTL value in the probe packet is set to 1. The TTL set in the **ttl** command does not take effect.

This command does not take effect if the destination address of the NQA operation is an IPv6 address.

Examples

Enable the routing table bypass feature.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type icmp-echo
[Sysname-nqa-admin-test-icmp-echo] route-option bypass-route
```

source interface (TWAMP Light client-session view)

Use **source interface** to specify the source AC interface for probe frames.

Use **undo source interface** to restore the default.

Syntax

source interface *interface-type interface-number* [**service-instance** *instance-id*]

undo source interface

Default

No source AC interface is specified for probe frames.

Views

TWAMP Light client-session view

Predefined user roles

network-admin

context-admin

Parameters

interface-type interface-number: Specifies a Layer 2 interface by its type and number.

service-instance *instance-id*: Specifies an Ethernet service instance by its ID in the range of 1 to 4096. The AC interface is identified by the combination of the Layer 2 interface and the Ethernet service instance.

Usage guidelines

On an L2VPN network, you can execute this command to bind an Ethernet service instance to the Layer 2 Ethernet interface to create a source AC interface for sending probe packets.

On a Layer 3 network, you can execute this command to use the Layer 3 Ethernet interface as the source interface for sending probe packets.

Follow these guidelines when you configure this command:

- The specified interface must be up.
- If the *interface-type interface-number* argument represents a Layer 2 interface, the **service-instance** *instance-id* option is required.
- If the *interface-type interface-number* argument represents a Layer 3 interface, the following rules apply:
  - In an MPLS L3VPN network, do not specify the **service-instance** *instance-id* option.
  - In an MPLS L2VPN network, the **service-instance** *instance-id* option is optional. This option takes effect if the Layer 3 interface switches to a Layer 2 interface. In this case, you do not have to stop the operation and reconfigure this command. The operation restarts automatically by using the new source AC after the MPLS L2VPN configuration is modified.

Examples

In TWAMP Light client-session view, specify GigabitEthernet 1/0/1 as the source AC interface.

```
<Sysname> system-view
[Sysname] nqa twamp-light client
[Sysname-nqa-twamp-light-client] test-session 1
[Sysname-nqa-twamp-light-client-session1] source interface gigabitethernet 1/0/1
```

Related commands

source ip

source interface

Use **source interface** to specify the IP address of an interface as the source IP address of probe packets.

Use **undo source interface** to restore the default.

Syntax

source interface *interface-type interface-number*

undo source interface

Default

The probe packets take the primary IP address of the outgoing interface as their source IP address.

Views

ICMP echo operation view

UDP tracert operation view

ICMP template view

Predefined user roles

network-admin

context-admin

Parameters

interface-type interface-number: Specifies an interface by its type and number.

Usage guidelines

The specified interface must be up. If the interface is down, no probe requests can be sent out.

If you execute this command and the **source ip** or **source ipv6** command for an ICMP echo operation or ICMP template multiple times, the most recent configuration takes effect.

If you execute this command and the **source ip** command for a UDP tracert operation multiple times, the most recent configuration takes effect.

Examples

Specify the IP address of interface GigabitEthernet 1/0/1 as the source IP address of ICMP echo request packets.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type icmp-echo
[Sysname-nqa-admin-test-icmp-echo] source interface gigabitethernet 1/0/1
```

In ICMP template view, specify the IP address of the interface GigabitEthernet 1/0/1 as the source IP address of ICMP echo request packets.

```
<Sysname> system-view
[Sysname] nqa template icmp icmptplt
[Sysname-nqatplt-icmp-icmptplt] source interface gigabitethernet 1/0/1
```

Related commands

source ip

source ipv6

source ip

Use **source ip** to configure the source IPv4 address for probe packets.

Use **undo source ip** to restore the default.

Syntax

source ip *ip-address*

undo source ip

Default

The probe packets take the primary IP address of their output interface as the source IPv4 address.

Views

ICMP echo/TCP/UDP echo operation view

UDP tracert operation view

ICMP jitter/path jitter/UDP jitter/voice operation view

TWAMP Light client-session view

Any NQA template view

Predefined user roles

network-admin

context-admin

Parameters

ip-address: Specifies the source IPv4 address for probe packets.

Usage guidelines

The specified source IP address must be the IPv4 address of a local interface, and the local interface must be up. Otherwise, no probe packets can be sent out.

For an NQA template, if the source and destination addresses have different IP versions, the source address does not take effect.

If you execute the **source interface** and **source ip** commands multiple times for the following types of NQA operations or templates, the most recent configuration takes effect:

- ICMP echo operation.
- UDP tracert operation.
- ICMP template.

Examples

Specify 10.1.1.1 as the source IPv4 address for ICMP echo requests.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type icmp-echo
[Sysname-nqa-admin-test-icmp-echo] source ip 10.1.1.1
```

In ICMP template view, specify 10.1.1.1 as the source IPv4 address for ICMP echo requests.

```
<Sysname> system-view
[Sysname] nqa template icmp icmptplt
[Sysname-nqatplt-icmp-icmptplt] source ip 10.1.1.1
```

Related commands

source interface

source ipv6

Use **source ipv6** to configure the source IPv6 address for probe packets.

Use **undo source ipv6** to restore the default.

Syntax

source ipv6 *ipv6-address*

undo source ipv6

Default

For the TWAMP Light test, no source IPv6 address is specified. For NQA operations, the probe packets take the IPv6 address of their output interface as the source IPv6 address.

Views

ICMP echo/TCP/UDP echo/UDP jitter operation view

DNS/FTP/HTTP/HTTPS/ICMP/IMAP/POP3/RADIUS authentication/RADIUS accounting/RTSP/SMTP/SNMP/SNMP DCA/SSL/TCP/TCP half open/UDP/WAP template view

TWAMP Light client-session view

Predefined user roles

network-admin

context-admin

Parameters

ipv6-address: Specifies the source IPv6 address for probe packets. IPv6 link-local addresses are not supported.

Usage guidelines

The specified source IPv6 address must be the IPv6 address of a local interface. The local interface must be up. Otherwise, no probe packets can be sent out.

For an NQA template, if the source and destination addresses have different IP versions, the source address does not take effect.

If you execute the **source interface** and **source ipv6** commands multiple times for an ICMP echo operation or ICMP template, the most recent configuration takes effect.

Examples

Specify 1::1 as the source IPv6 address for the ICMP echo operation.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type icmp-echo
[Sysname-nqa-admin-test-icmp-echo] source ipv6 1::1
```

In ICMP template view, specify 1::1 as the source IPv6 address for ICMP echo requests.

```
<Sysname> system-view
[Sysname] nqa template icmp icmptplt
[Sysname-nqatplt-icmp-icmptplt] source ipv6 1::1
```

Related commands

source interface

source mac

Use **source mac** to specify the source MAC address for probe frames.

Use **undo source mac** to restore the default.

Syntax

source mac *mac-address*

undo source mac

Default

For the TWAMP Light test, no source MAC address is specified.

For supported NQA operations, the probe packets take the MAC address of the egress interface as the source MAC address.

Views

TWAMP Light client-session view

Predefined user roles

network-admin

context-admin

Parameters

mac-address: Specifies the source MAC address in the format of H-H-H. For example, to use 000f-00e2-0001 as the source MAC address, set this argument to f-e2-1.

Examples

In TWAMP Light client-session view, set the source MAC address of probe frames to 1-1-1.

```
<Sysname> system-view
[Sysname] nqa twamp-light client
[Sysname-nqa-twamp-light-client] test-session 1
[Sysname-nqa-twamp-light-client-session1] source mac 1-1-1
```

source port

Use **source port** to configure the source port number for probe packets.

Use **undo source port** to restore the default.

Syntax

source port *port-number*

undo source port

Default

The system automatically selects an unused port number as the source port number.

Views

UDP echo operation view

SNMP operation view

UDP tracert operation view

UDP jitter/voice operation view

TWAMP Light client-session view

DNS template view

Predefined user roles

network-admin

context-admin

Parameters

port-number: Specifies the source port number in the range of 1 to 65535.

Usage guidelines

For TWAMP Light tests, you must configure this command. For other operation types, as a best practice, use the default setting.

For the operation to succeed, make sure the specified port number is not used by any services on the device.

- To obtain the IPv4 addresses and the port numbers in use on this device, see the **Local Addr:port** field in the output from the **display tcp** and **display udp** commands.

- To obtain the IPv6 addresses and the port numbers in use on this device, see the **LAddr->port** field in the output from the **display ipv6 tcp** and **display ipv6 udp** commands.

Examples

Set the source port number to 8000 for probe packets in the UDP echo operation.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type udp-echo
[Sysname-nqa-admin-test-udp-echo] source port 8000
```

In DNS template view, set the source port number to 8000 for probe packets in the DNS operation.

```
<Sysname> system-view
[Sysname] nqa template dns dnstplt
[Sysname-nqatplt-dns-dnstplt] source port 8000
```

ssl-client-policy

Use **ssl-client-policy** to specify an SSL client policy for an HTTPS or SSL template.

Use **undo ssl-client-policy** to restore the default.

Syntax

ssl-client-policy *policy-name*

undo ssl-client-policy

Default

No SSL client policy is specified for an HTTPS or SSL template.

Views

HTTPS/SSL template view

Predefined user roles

network-admin

context-admin

Parameters

policy-name: Specifies an SSL client policy by its name, a case-insensitive string of 1 to 31 characters.

Usage guidelines

In the HTTPS or SSL operation, the NQA client uses the specified SSL client policy to establish an SSL connection to the server.

Examples

Specify SSL client policy **policy** for SSL template **ssltplt**.

```
<Sysname> system-view
[Sysname] nqa template ssl ssltplt
```

```
[Sysname-nqatplt-ssl-ssltplt] ssl-client-policy policy
```

start (TWAMP Light sender view)

Use **start** to start the TWAMP Light test.

Syntax

start test-session *session-id* { **permanent** | **duration** *duration* | **packet-count** *count* } [**tx-interval** { **10** | **100** | **1000** | **30000** }] [**time-out** *timeout*] [[**statistics-interval** *statistics-interval*] **monitor-time** *time*]

The following compatibility matrixes show the support of hardware platforms for this command:

Models	Command compatibility
NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB1780, NFNX3-HDB3080, NFNX3-HDB680, NFNX3-HDB1080	Yes
NFNX3-HDB1180, NFNX3-HDB1480	No

Default

The TWAMP Light test is not started.

Views

TWAMP Light sender view

Predefined user roles

network-admin

context-admin

Parameters

test-session *session-id*: Specifies a TWAMP Light test session by its ID. The value range is 1 to 256.

permanent: Runs a TWAMP Light test permanently.

duration *duration*: Specifies the duration for a TWAMP Light test, in the range of 60 to 300 in seconds.

packet-count *count*: Specifies the number of packets to be sent, in the range of 100 to 30000.

tx-interval { **10** | **100** | **1000** | **30000** }: Specifies a list of up to four packet sending intervals. Valid intervals are 10, 100, 1000, and 30000 milliseconds. The default packet sending interval is 100 milliseconds.

time-out *timeout*: Specifies the timeout time of the reflected packet within a TWAMP Light test, in seconds. The value range is 1 to 10. The default timeout time is 5 seconds.

statistics-interval *interval*: Specifies a statistics collection interval for the TWAMP Light test in milliseconds. The value must be an integer multiple of 10 milliseconds. The value range is 1000 to 6000000. The default statistics collection interval varies by packet sending interval. For more information, see Table 14.

monitor-time *time*: Specifies the packet monitoring time for the TWAMP Light test in milliseconds. The packet monitoring time must be an integer multiple of the statistics collection interval. The value range is 1000 to 86400000.

Usage guidelines

The TWAMP Light test includes on-demand test and permanent test.

- The on-demand test is manually scheduled. It allows a single performance measurement.
- A permanent test, once being started, does not stop unless you execute the **stop** command in the Twamp Light sender view to stop it manually.

In a TWAMP test, the device monitors the test result, and starts the monitoring time when either of the following conditions is met:

- The monitoring result goes beyond the threshold upper limit.
- The monitoring result drops below the threshold lower limit from a monitoring result higher than the lower limit.

If either condition is always true during the monitoring time, a threshold violation occurs.

The monitoring time varies by the **monitor-time** *time* option in this command:

- If you specify this option, the monitoring time for packet loss, delay, and jitter uses the specified value.
- If you do not specify this option, the default monitoring time for packet loss, delay, and jitter is used. The default monitoring time varies by the packet sending interval. For more information, see Table 14.

To set the upper and lower limits, use the reaction entry threshold monitoring commands for the TWAMP Light test.

In the TWAMP Light test, a test session is identified by the combination of source IP address, source port number, destination IP address, and destination port number. To ensure the test result, do not specify the same combination for multiple test sessions.

With the **data-fill** command configured, the packet sending interval cannot be 10 or 100 milliseconds.

To prevent empty reported test statistics, set the test interval no less than the packet sending interval.

Table 14 Default values for the statistics collection interval and monitoring time

Packet sending interval (milliseconds)	Default test interval (seconds)	Default monitoring time for two-way packet loss (seconds)	Default monitoring time for two-way delay and jitter (seconds)
10	2	60	2
100	20	60	20
1 s	200	200	200
30 s	600	600	600

Examples

Start the TWAMP Light test and allow the device to send 3000 packets.

```
<Sysname> system-view
[Sysname] nqa twamp-light sender
[Sysname-nqa-twamp-light-sender] start test-session 1 packet-count 3000
```

statistics hold-time

Use **statistics hold-time** to set the hold time of statistics groups for an NQA operation.

Use **undo statistics hold-time** to restore the default.

Syntax

statistics hold-time *hold-time*

undo statistics hold-time

Default

The hold time of statistics groups for an NQA operation is 120 minutes.

Views

ICMP echo/TCP/UDP echo operation view

ARP/DHCP/DLSw/DNS/FTP/HTTP/SNMP operation view

ICMP jitter/path jitter/UDP jitter/voice operation view

Predefined user roles

network-admin

context-admin

Parameters

hold-time: Specifies the hold time in minutes, in the range of 1 to 1440.

Usage guidelines

A statistics group is deleted when its hold time expires.

Examples

Set the hold time to 3 minutes for statistics groups of the ICMP echo operation.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type icmp-echo
[Sysname-nqa-admin-test-icmp-echo] statistics hold-time 3
```

statistics interval

Use **statistics interval** to set the statistics collection interval for an NQA operation.

Use **undo statistics interval** to restore the default.

Syntax

statistics interval *interval*

undo statistics interval

Default

The statistics collection interval is 60 minutes.

Views

ICMP echo/TCP/UDP echo operation view

ARP/DHCP/DLSw/DNS/FTP/HTTP/SNMP operation view

ICMP jitter/path jitter/UDP jitter/voice operation view

Predefined user roles

network-admin

context-admin

Parameters

interval: Specifies the interval in minutes, in the range of 1 to 35791394.

Usage guidelines

NQA forms statistics within the same collection interval as a statistics group. To display information about the statistics groups, use the **display nqa statistics** command.

Examples

Configure NQA to collect the ICMP echo operation statistics every 2 minutes.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type icmp-echo
[Sysname-nqa-admin-test-icmp-echo] statistics interval 2
```

statistics max-group

Use **statistics max-group** to set the maximum number of statistics groups that can be saved.

Use **undo statistics max-group** to restore the default.

Syntax

statistics max-group *number*

undo statistics max-group

Default

A maximum of two statistics groups can be saved.

Views

ICMP echo/TCP/UDP echo operation view

ARP/DHCP/DLSw/DNS/FTP/HTTP/SNMP operation view

ICMP jitter/path jitter/UDP jitter/voice operation view

Predefined user roles

network-admin

context-admin

Parameters

number: Specifies the maximum number of statistics groups, in the range of 0 to 100. To disable statistics collection, set the value to 0.

Usage guidelines

When the maximum number of statistics groups is reached and a new statistics group is to be saved, the earliest statistics group is deleted.

Examples

Configure NQA to save a maximum of five statistics groups for the ICMP echo operation.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type icmp-echo
[Sysname-nqa-admin-test-icmp-echo] statistics max-group 5
```

stop (TWAMP Light sender view)

Use **stop** to stop the TWAMP Light test.

Syntax

stop { **all** | **test-session** *session-id* }

The following compatibility matrixes show the support of hardware platforms for this command:

Models	Command compatibility
NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB1780, NFNX3-HDB3080, NFNX3-HDB680, NFNX3-HDB1080	Yes
NFNX3-HDB1180, NFNX3-HDB1480	No

Views

TWAMP Light sender view

Predefined user roles

network-admin

context-admin

Parameters

all: Stops the all TWAMP Light test sessions.

test-session *session-id*: Specifies the ID of a TWAMP Light test session. The value range is 1 to 256.

Examples

Stop the TWAMP Light test of the session 1.

```
<Sysname> system-view
[Sysname] nqa twamp-light sender
[Sysname-nqa-twamp-light-sender] stop test-session 1
```

Related commands

start (TWAMP Light sender view)

target-only

Use **target-only** to perform the path jitter operation only on the destination address.

Use **undo target-only** to restore the default.

Syntax

target-only

undo target-only

Default

NQA performs the path jitter operation to the destination hop by hop.

Views

Path jitter operation view

Predefined user roles

network-admin

context-admin

Examples

Perform the path jitter operation only on the destination address.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type path-jitter
[Sysname-nqa-admin-test-path-jitter] target-only
```

test-accuracy

Use **test-accuracy** to set the timing precision level on the TWAMP Light client.

Use **undo test-accuracy** to restore the default.

Syntax

test-accuracy { **microsecond** | **millisecond** }

undo test-accuracy

The following compatibility matrixes show the support of hardware platforms for this command:

Models	Command compatibility
NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB1780, NFNX3-HDB3080, NFNX3-HDB680, NFNX3-HDB1080	Yes
NFNX3-HDB1180, NFNX3-HDB1480	No

Default

The TWAMP Light client uses the microsecond precision.

Views

TWAMP Light client view

Predefined user roles

network-admin

context-admin

Parameters

microsecond: Specifies the microsecond precision.

millisecond: Specifies the millisecond precision.

Usage guidelines

This command controls the timing precision for TWAMP Light client tests. If a device does not support the microsecond precision due to hardware limitation, a measurement error might occur. In this case, you can use this command to adjust the timing precision level.

Before you execute this command, make sure the TWAMP Light client is not performing any TWAMP Light test sessions.

Examples

Set the millisecond precision on the TWAMP Light client.

```
<Sysname> system-view
[Sysname] nqa twamp-light client
[Sysname-nqa-twamp-light-client] test-accuracy millisecond
```

test-session (TWAMP Light client view)

Use **test-session** to create a test session on TWAMP Light client and enter the client-session view, or enter the client-session view of an existing test session on the TWAMP Light client.

Use **undo test-session** to delete a test session on the TWAMP Light client.

Syntax

test-session *session-id*

undo test-session *session-id*

The following compatibility matrixes show the support of hardware platforms for this command:

Models	Command compatibility
NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB1780, NFNX3-HDB3080, NFNX3-HDB680, NFNX3-HDB1080	Yes
NFNX3-HDB1180, NFNX3-HDB1480	No

Default

No test sessions exist on the TWAMP Light client.

Views

TWAMP Light client view

Predefined user roles

network-admin

context-admin

Parameters

session-id: Specifies a test session by its ID. The value range is 1 to 256.

Usage guidelines

To start a TWAMP Light test, perform the following tasks in sequence:

1. Create a test session on the TWAMP Light client and complete the settings.
2. Use the **nqa twamp-light sender** command to enter the TWAMP Light sender view, and start the test session.

Examples

Specify a test session **test-session 1** on the TWAMP Light client and enter the client-session view.

```
<Sysname> system-view
[Sysname] nqa twamp-light client
[Sysname-nqa-twamp-light-client] test-session 1
[Sysname-nqa-twamp-light-client-session1]
```

timestamp-format

Use **timestamp-format** to specify the timestamp format for probe packets in the TWAMP Light test.

Use **undo timestamp-format** to restore the default.

Syntax

timestamp-format { **ntp** | **ptp** }

undo timestamp-format

The following compatibility matrixes show the support of hardware platforms for this command:

Models	Command compatibility
NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB1780, NFNX3-HDB3080, NFNX3-HDB680, NFNX3-HDB1080	Yes
NFNX3-HDB1180, NFNX3-HDB1480	No

Default

The timestamp format for probe packets in the TWAMP Light test is PTP.

Views

TWAMP Light client-session view

Predefined user roles

network-admin

context-admin

Parameters

ntp: Specifies the NTP format.

ptp: Specifies the PTP format.

Usage guidelines

This command allows you to specify a timestamp format for the probe packet in the TWAMP Light test. The time accuracy in the PTP format is higher than that in the NTP format. This makes the TWAMP Light test result more accurate.

If the time is not synchronized through NTP or PTP, or the TWAMP Light test sender and responder use different timestamp formats, the TWAMP Light test can still be performed, but the test result accuracy might be affected.

Examples

Specify the timestamp format as NTP for the TWAMP Light test.

```
<Sysname> system-view
[Sysname] nqa twamp-light client
```

```
[Sysname-nqa-twamp-light-client] test-session 1
[Sysname-nqa-twamp-light-client-session1] timestamp-format ntp
```

tos

Use **tos** to set the ToS value in the IP header for probe packets.

Use **undo tos** to restore the default.

Syntax

tos *value*

undo tos

Default

The ToS value in the IP header of probe packets is 0.

Views

Any operation view

DNS/FTP/HTTP/HTTPS/ICMP/IMAP/POP3/RADIUS authentication/RADIUS accounting/RTSP/SIP/SMTP/SNMP/SNMP DCA/SSL/TCP/TCP half open/UDP/WAP template view

Predefined user roles

network-admin

context-admin

Parameters

value: Specifies the ToS value in the range of 0 to 255.

Examples

In ICMP echo operation view, set the ToS value to 1 in the IP header for probe packets.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type icmp-echo
[Sysname-nqa-admin-test-icmp-echo] tos 1
```

In ICMP template view, set the ToS value to 1 in the IP header for probe packets.

```
<Sysname> system-view
[Sysname] nqa template icmp icmptplt
[Sysname-nqatplt-icmp-icmptplt] tos 1
```

transport-protocol

Use **transport-protocol** to specify the transport protocol used by the SIP operation.

Use **undo transport-protocol** to restore the default.

Syntax

transport-protocol { **tcp** | **udp** }

undo transport-protocol

Default

UDP is used.

Views

SIP template view

Predefined user roles

network-admin

context-admin

Parameters

tcp: Specifies TCP as the transport protocol.

udp: Specifies UDP as the transport protocol.

Usage guidelines

After you change the transport protocol for a SIP template, the system stops the ongoing SIP operation that uses the template and starts a new SIP operation by using the new transport protocol.

Examples

Specify TCP as the transport protocol for SIP template **siptplt**.

```
<Sysname> system-view
[Sysname] nqa template sip siptplt
[Sysname-nqatplt-sip-siptplt] transport-protocol tcp
```

ttl

Use **ttl** to set the maximum number of hops that the probe packets can traverse.

Use **undo ttl** to restore the default.

Syntax

ttl *value*

undo ttl

Default

The maximum number of hops is 30 for probe packets of the UDP tracert operation, and is 20 for probe packets of other types of operations.

Views

ICMP echo/TCP/UDP echo operation view

DLSw/DNS/FTP/HTTP/SNMP operation view

UDP tracert operation view

ICMP jitter/UDP jitter/voice operation view

DNS/FTP/HTTP/HTTPS/ICMP/IMAP/POP3/RADIUS authentication/RADIUS accounting/RTSP/SIP/SMTP/SNMP/SNMP DCA/SSL/TCP/TCP half open/UDP/WAP template view

Predefined user roles

network-admin

context-admin

Parameters

value: Specifies the TTL value in the range of 1 to 255. For the UDP tracert operation, this setting represents the maximum TTL value that can be carried in the probe packets. For other type of operations, this setting determines the maximum number of hops that the probe packets can traverse.

Usage guidelines

The **route-option bypass-route** command sets the TTL to 1 for probe packets. If you configure both the **route-option bypass-route** and **ttl** commands for an operation, the **ttl** command does not take effect.

For a successful UDP tracert operation, make sure the specified TTL value is not smaller than the value set in the **init-ttl** command.

Examples

Set the maximum number of hops to 16 for probe packets in the ICMP echo operation.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type icmp-echo
[Sysname-nqa-admin-test-icmp-echo] ttl 16
```

In ICMP template view, set the maximum number of hops to 16 for probe packets.

```
<Sysname> system-view
[Sysname] nqa template icmp icmptplt
[Sysname-nqatplt-icmp-icmptplt] ttl 16
```

type

Use **type** to specify an NQA operation type and enter its view.

Syntax

type { **arp** | **dhcp** | **dlsw** | **dns** | **ftp** | **http** | **icmp-echo** | **icmp-jitter** | **path-jitter** | **snmp** | **tcp** | **udp-echo** | **udp-jitter** | **udp-tracert** | **voice** }

Default

No operation type is specified.

Views

NQA operation view

Predefined user roles

network-admin

context-admin

Parameters

arp: Specifies the ARP operation type.

dhcp: Specifies the DHCP operation type.

dlsw: Specifies the DLSw operation type.

dns: Specifies the DNS operation type.

ftp: Specifies the FTP operation type.

http: Specifies the HTTP operation type.

icmp-echo: Specifies the ICMP echo operation type.

icmp-jitter: Specifies the ICMP jitter operation type.

path-jitter: Specifies the path jitter operation type.

snmp: Specifies the SNMP operation type.

tcp: Specifies the TCP operation type.

udp-echo: Specifies the UDP echo operation type.

udp-jitter: Specifies the UDP jitter operation type.

udp-tracert: Specifies the UDP tracert operation type.

voice: Specifies the voice operation type.

Usage guidelines

You can specify only one type for an NQA operation. After that, you can configure the operation type-related settings for the NQA operation. To change the type of the NQA operation, remove the NQA operation in system view, and then re-create the NQA operation.

Examples

Specify FTP as the NQA operation type and enter FTP operation view.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type ftp
[Sysname-nqa-admin-test-ftp]
```

url

Use **url** to specify the URL of the destination.

Use **undo url** to restore the default.

Syntax

url *url*

undo url

Default

The destination URL is not specified.

Views

FTP/HTTP operation view

ICMP echo operation view

UDP jitter operation view

FTP/HTTP/HTTPS/RTSP/WAP template view

Predefined user roles

network-admin

context-admin

Parameters

url: Specifies the destination URL, a case-sensitive string of 1 to 255 characters.

Usage guidelines

The following table shows the URL format requirement for different NQA operations:

Operation	URL format	Default port number
HTTP operation	http://*host*/*resource* http://*host*:*port*/*resource*	80
HTTPS operation	https://host/resource https://*host*:*port*/*resource*	443
FTP operation	ftp://*host/filename* ftp://*host*:*port*/*filename*	21
ICMP echo operation	*protocol*://*host*:*port* The *host* paramter is required. The *protocol* and *port* parameters can be unspecified or any values.	N/A
UDP jitter operation	*protocol*://*host*:*port* The *host* and *port* parameters are required. The *protocol* parameter can be unspecified or any value.	N/A
RTSP operation	rtsp*://host/resource* rtsp*://host:port/resource*	554
WAP operation	http*://host/filename* http*://host:port /filename* https*://host/resource* https*://host:port/resource*	N/A

The *host* parameter in the URL represents the host name of the destination server, which must meet the following requirements:

- Case sensitive.
- Valid characters are letters, digits, hyphens (-), underscores (_), and dots (.), but consecutive dots (.) are not allowed.
- Must be a dot-separated series of labels. Each label can contain 1 to 63 characters.

The *port* parameter in the URL, if specified, represents the port number on the destination server that provides the service.

For description about the *filename* parameter, see *Fundamentals Configuration Guide*.

For the **url** command to take effect in the WAP operation, you must configured the **expect** { **data** | **hex-data** } command in WAP template view.

For the ICMP echo operation, the **url** command and the **destination ip** command are mutually exclusive.

For the UDP jitter operation, the **url** command is mutually exclusive with the **destination ip** command and the **destination port** command.

Examples

Configure the URL that the HTTP operation visits as **http://www.company.com/index.html**.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type http
[Sysname-nqa-admin-test-http] url http://www.company.com/index.html
```

In HTTP template view, configure the URL that the HTTP operation visits as **http://www.company.com/index.html**.

```
<Sysname> system-view
[Sysname] nqa template http httptplt
[Sysname-nqatplt-http-httptplt] url http://www.company.com/index.html
```

username

Use **username** to specify a username.

Use **undo username** to restore the default.

Syntax

username *username*

undo username

Default

No username is configured.

Views

FTP/HTTP operation view

FTP/HTTP/HTTPS/IMAP/POP3/RADIUS authentication/RADIUS accounting template view

Predefined user roles

network-admin

context-admin

Parameters

username: Specifies the case-sensitive username.

- The FTP, HTTP, or HTTPS username is a string of 1 to 32 characters.
- The POP3 or IMAP username is a string of 1 to 40 characters in the format of username@domain.com.
- The RADIUS authentication or accounting username is a string of 1 to 253 characters.

Examples

Set the FTP login username to **administrator**.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type ftp
[Sysname-nqa-admin-test-ftp] username administrator
```

Set the FTP login username to **administrator** in FTP template view.

```
<Sysname> system-view
[Sysname] nqa template ftp ftptplt
[Sysname-nqatplt-ftp-ftptplt] username administrator
```

Related commands

operation

password

version (HTTP/HTTPS operation view/HTTPS template view)

Use **version** to specify the version used in the HTTP or HTTPS operation.

Use **undo version** to restore the default.

Syntax

version { **v1.0** | **v1.1** }

undo version

Default

Version 1.0 is used in the HTTP operation or HTTPS operation.

Views

HTTP operation view

HTTP/HTTPS template view

Predefined user roles

network-admin

context-admin

Parameters

v1.0: Uses version 1.0.

v1.1: Uses version 1.1.

Examples

Configure the HTTP operation to use the HTTP version 1.1.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type http
[Sysname-nqa-admin-test-http] version v1.1
```

version (SNMP DCA template view)

Use **version** to specify the SNMP version used in the SNMP DCA operation.

Use **undo version** to restore the default.

Syntax

version { **v1** | **v2c** }

undo version

Default

SNMPv1 is used.

Views

SNMP DCA template view

Predefined user roles

network-admin

context-admin

Parameters

v1: Specifies SNMPv1.

v2c: Specifies SNMPv2c.

Usage guidelines

For the SNMP DCA operation to work correctly, the specified SNMP version must match the version of the SNMP agent to be monitored.

Examples

In SNMP DCA template view, set the SNMP version to SNMPv2c.

```
<Sysname> system-view
[Sysname] nqa template snmpdca test
[Sysname-nqatplt-snmpdca-test] version v2c
```

vlan

Use **vlan** to specify a VLAN for probe frames.

Use **undo vlan** to restore the default.

Syntax

vlan { *vlan-id* | **s-vid** *vlan-id* **c-vid** *vlan-id* }

undo vlan

Default

No VLAN is specified for probe frames.

Views

TWAMP Light client-session view

Predefined user roles

network-admin

context-admin

Parameters

vlan-id: Specifies a VLAN for the probe packet by its ID in the range of 1 to 4094.

s-vid: Specifies an inner VLAN ID.

c-vid: Specifies an outer VLAN ID.

Usage guidelines

After you specify a VLAN for the frame loss, throughput, or latency operation, the operation sends probe frames in the specified VLAN.

You can use this command to specify an inner VLAN ID or outer VLAN ID as needed.

Examples

Configure the TWAMP Light test to send probe frames in VLAN 3.

```
<Sysname> system-view
[Sysname] nqa twamp-light client
[Sysname-nqa-twamp-light-client] test-session 1
[Sysname-nqa-twamp-light-client-session1] vlan 3
```

vpn-instance

Use **vpn-instance** to apply the operation to a VPN instance.

Use **undo vpn-instance** to restore the default.

Syntax

vpn-instance *vpn-instance-name*

undo vpn-instance

Default

The operation is performed on the public network.

Views

Predefined user roles

network-admin

context-admin

Parameters

vpn-instance-name: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters.

Usage guidelines

After you specify a VPN instance, the NQA operation is performed in the specified VPN instance.

Examples

Apply the ICMP echo operation to **vpn1**.

```
<Sysname> system-view
[Sysname] nqa entry admin test
[Sysname-nqa-admin-test] type icmp-echo
[Sysname-nqa-admin-test-icmp-echo] vpn-instance vpn1
```

In FTP template view, apply the FTP operation to **vpn1**.

```
<Sysname> system-view
[Sysname] nqa template ftp ftptplt
[Sysname-nqatplt-ftp-ftptplt] vpn-instance vpn1
```

NQA server commands

IMPORTANT:

Configure the NQA server only for UDP jitter, TCP, UDP echo, and voice operations.

display nqa server

Use **display nqa server status** to display NQA server status.

Syntax

display nqa server

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Examples

Display NQA server status.

```
<Sysname> display nqa server
NQA server status: Enabled
TCP connect:
   IP address: 2.2.2.2
   Port: 2000
   ToS:200
   VPN instance: -
UDP echo:
   IP address: 3.3.3.3
   Port: 3000
   ToS: 255
   VPN instance: -
```

Table 15 Command output

Field	Description
NQA server status	Whether the NQA server is enabled.
TCP connect	Information about the TCP listening service on the NQA server.
UDP echo	Information about the UDP listening service on the NQA server.
IP address	IP address specified for the TCP/UDP listening service on the NQA server.
Port	Port number specified for the TCP/UDP listening service on the NQA server.
ToS	ToS value in reply packets sent by the NQA server.
VPN instance	Name of the VPN instance to which the IP address that the NQA server listens on belongs. This field displays a hyphen (-) if the NQA server listens on a public IP address.

display nqa twamp-light responder

Use **display nqa twamp-light responder** to display test sessions on the TWAMP Light responder.

Syntax

display nqa twamp-light responder [**test-session** *session-id*]

The following compatibility matrixes show the support of hardware platforms for this command:

Models	Command compatibility
NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB1780, NFNX3-HDB3080, NFNX3-HDB680, NFNX3-HDB1080	Yes

Table 16 Command output

Field	Description
Session ID	Test session ID.
Status	TWAMP Light responder status: • **Active**—The TWAMP Light responder is active. • **Inactive**—The TWAMP Light responder is not active.
Interface	Interface that reflects the test packets.
Service instance	Ethernet service instance bound to the interface. The Ethernet service instance on the responder must be consistent with that on the client.
Destination IP	Destination IP address in the reflected packet.
Destination IPv6	Destination IPv6 address in the reflected packet.
Source IP	Source IP address in the reflected packet.
Source IPv6	Source IPv6 address in the reflected packet.
Destination port	Destination port number in the reflected packet.
Source port	Source port number in the reflected packet.
VPN instance	MPLS L3VPN instance name.
Destination MAC	Destination MAC address in the reflected packet.
Source MAC	Source MAC address in the reflected packet.
VLAN ID	VLAN ID in the reflected packet.
Service VLAN ID	Outer VLAN ID or VLAN ID range in the reflected packet.
Customer VLAN ID	Inner VLAN ID or VLAN ID range in the reflected packet.
Timestamp format	Timestamp format: • **AUTO**—The TWAMP Light responder selects a timestamp format

	automatically if you do not set a timestamp format by using the **test-session** command. • **NTP.** • **PTP.**
Description	Description about the test session.

Related commands

nqa reflector

test-session (TWAMP Light responder view)

nqa server enable

Use **nqa server enable** to enable the NQA server.

Use **undo nqa server enable** to disable the NQA server.

Syntax

nqa server enable

undo nqa server enable

Default

The NQA server is disabled.

Views

System view

Predefined user roles

network-admin

context-admin

Examples

Enable the NQA server.

```
<Sysname> system-view
[Sysname] nqa server enable
```

nqa server tcp-connect

Use **nqa server tcp-connect** to configure a TCP listening service to enable the NQA server to listen to a port on an IP address.

Use **undo nqa server tcp-connect** to remove a TCP listening service.

Syntax

nqa server tcp-connect { *ipv4-address* | **ipv6** *ipv6-address* } *port-number* [**vpn-instance** *vpn-instance-name*] [**tos** *tos*]

undo nqa server tcp-connect { *ipv4-address* | **ipv6** *ipv6-address* } *port-number* [**vpn-instance** *vpn-instance-name*]

Default

No TCP listening services exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

ipv4-address: Specifies the IPv4 address for the TCP listening service.

ipv6 *ipv6-address*: Specifies the IPv6 address for the TCP listening service.

port-number: Specifies the port number for the TCP listening service, in the range of 1 to 65535.

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify this option, the NQA server listens on a public IP address.

tos *tos*: Specifies the ToS value in the IP header for reply packets. The value range is 0 to 255, and the default value is 0.

Usage guidelines

Use this command on the NQA server only for the TCP and DLSw operations. For the DLSw operation, the port number for the TCP listening service on the NQA server must be 2065. Otherwise, the DLSw operation fails.

When you configure the IP address and port number for a TCP listening service on the NQA server, follow these restrictions and guidelines:

- The IP address, port number, and VPN instance must be unique on the NQA server and match the configuration on the NQA client.
- The IP address must be the address of an interface on the NQA server.
- To ensure successful NQA operations and avoid affecting existing services, do not configure the TCP listening service on well-known ports from 1 to 1023.

Examples

Configure a TCP listening service to enable the NQA server to listen to port 9000 on the IP address 169.254.10.2.

```
<Sysname> system-view
[Sysname] nqa server tcp-connect 169.254.10.2 9000
```

Related commands

nqa server udp-echo

Use **nqa server udp-echo** to configure a UDP listening service to enable the NQA server to listen to a port on an IP address.

Use **undo nqa server udp-echo** to remove the UDP listening service created.

Syntax

nqa server udp-echo { *ipv4-address* | **ipv6** *ipv6-address* } *port-number* [**vpn-instance** *vpn-instance-name*] [**tos** *tos*]

undo nqa server udp-echo { *ipv4-address* | **ipv6** *ipv6-address* } *port-number* [**vpn-instance** *vpn-instance-name*]

Default

No UDP listening services exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

ipv4-address: Specifies the IPv4 address for the UDP listening service.

ipv6 *ipv6-address*: Specifies the IPv6 address for the UDP listening service.

port-number: Specifies the port number for the UDP listening service, in the range of 1 to 65535.

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify this option, the NQA server listens on a public IP address.

tos *tos*: Specifies the ToS value in the IP header for reply packets. The value range for this argument is 0 to 255, and the default value is 0.

Usage guidelines

Use this command on the NQA server only for the UDP jitter, UDP echo, and voice operations.

When you configure the IP address and port number for a UDP listening service on the NQA server, follow these restrictions and guidelines:

- The IP address, port number, and VPN instance must be unique on the NQA server and match the configuration on the NQA client.
- The IP address must be the address of an interface on the NQA server.
- To ensure successful NQA operations and avoid affecting existing services, do not configure the UDP listening service on well-known ports from 1 to 1023.

The high performance mode greatly increases the speed at which the NQA server replies to probe packets of the UDP jitter operation. However, the NQA server cannot process probe packets exceeding 100 bytes in this mode. UDP jiiter operations to the NQA server might fail if the probe packet size exceeds 100 bytes.

Examples

Configure a UDP listening service to enable the NQA server to listen to port 9000 on IP address 169.254.10.2.

```
<Sysname> system-view
[Sysname] nqa server udp-echo 169.254.10.2 9000
```

nqa twamp-light responder

Use **nqa twamp-light responder** to enable the TWAMP Light responder and enter its view, or enter the view of the enabled TWAMP Light responder.

Use **undo nqa twamp-light responder** to disable the TWAMP Light responder.

Syntax

nqa twamp-light responder

undo nqa twamp-light responder

Default

The TWAMP Light responder is disabled.

Views

System view

Predefined user roles

network-admin

context-admin

Usage guidelines

In TWAMP Light responder view, you can create a test session to interact with the test session on the TWAMP Light client.

The **undo nqa twamp-light responder** command disables the responder and deletes all test sessions on the responder.

Examples

Enable the TWAMP Light responder and enter its view.

```
<Sysname> system-view
[Sysname] nqa twamp-light responder
[Sysname-nqa-twamp-light-responder]
```

test-session (TWAMP Light responder view)

Use **test-session** to create a test session on the TWAMP Light responder.

Use **undo test-session** to delete a test session on the TWAMP Light responder.

Syntax

test-session *session-id* [**interface** *interface-type interface-number* [**service-instance** *instance-id*]] { { **ip** | **ipv6** } **destination** *address* **source** *address* **destination-port** *port-number* **source-port** *port-number* [**vpn-instance** *vpn-instance-name*] | **destination-mac** *mac-address* **source-mac** *mac-address* } * [**vlan** { *vlan-id* | **s-vid** *vlan-id* **c-vid** *vlan-id* } | **timestamp-format** { **ntp** | **ptp** } | **description** *text*] *

undo test-session *session-id*

The following compatibility matrixes show the support of hardware platforms for this command:

Models	Command compatibility
NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB1780, NFNX3-HDB3080, NFNX3-HDB680,	Yes

Models	Command compatibility
NFNX3-HDB1080	
NFNX3-HDB1180, NFNX3-HDB1480	No

Default

No test sessions exist on the TWAMP Light responder.

Views

TWAMP Light responder view

Predefined user roles

network-admin

context-admin

Parameters

session-id: Specifies a test session by its ID. The value range is 1 to 256.

interface *interface-type interface-number*: Specifies a reflecting interface by its type and number.

service-instance *instance-id*: Specifies an Ethernet service instance by its ID, in the range of 1 to 4096.

ip: Specifies an IPv4 address.

ipv6: Specifies an IPv6 address.

destination: Specifies a destination address for the packets to be reflected.

source: Specifies a source address for the packets to be reflected.

destination-port *port-number*: Specifies a destination UDP port number for the packets to be reflected, in the range of 1 to 65535.

source-port *port-number*: Specifies a source UDP port number for the packets to be reflected, in the range of 1 to 65535.

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify this option, the operation is performed on the public network.

destination-mac: Specifies a destination MAC address for the packets to be reflected.

source-mac: Specifies a source MAC address for the packets to be reflected.

mac-address: Specifies a MAC address in the format H-H-H. For example, to use 000f-00e2-0001 as the destination MAC address, set this argument to f-e2-1.

vlan: Specifies a VLAN, service VLAN ID, or customer VLAN ID for the packets to be reflected.

- *vlan-id*: Specifies a VLAN ID, in the range of 1 to 4094.
- **s-vid**: Specifies a service VLAN ID.
- **c-vid**: Specifies a customer VLAN ID.

timestamp-format: Specifies the timestamp format for the TWAMP Light responder. If you do not specify a timestamp format, the default value AUTO is used and the TWAMP Light responder selects a timestamp format automatically.

- **ntp**: Specifies the NTP format.
- **ptp**: Specifies the PTP format.

timestamp-format: Specifies the timestamp format for the TWAMP Light responder.

- **ntp**: Specifies the NTP format.
- **ptp**: Specifies the PTP format.

description *text*: Specifies a description for the test session, a case-sensitive string of 1 to 200 characters.

Usage guidelines

The test session on the TWAMP Light responder interacts with the test session on the TWAMP Light client.

The following settings specified in this command must be consistent with those on the TWAMP Light client:

- Source IP address.
- Destination IP address.
- Source UDP port number.
- Destination UDP port number.
- VPN instance name.

If the specified test session ID does not exist, this command creates a new test session. If you specify an existing session ID, you are modifying the test session.

You can specify the same interface or Ethernet service instance for different test sessions.

If you want to edit or delete the interface or Ethernet service instance in an existing reflector, you must delete the reflector and reconfigure it.

Except for the interface and Ethernet service instance, you can edit or delete other parameters.

If you do not specify any optional parameters in the **undo** command, you are deleting the test session. If all configurations about the session are deleted, the test session will be deleted.

Examples

Create a test session **test-session 1** on the TWAMP Light responder. Specify source IPv4 address 1.1.1.1, destination IPv4 address 2.2.2.2, source port 3000, destination port 3001, and VPN instance **vpn1** for the test session.

```
<Sysname> system-view
[Sysname] nqa twamp-light responder
[Sysname-nqa-twamp-light-responder] test-session 1 ip destination 2.2.2.2 source 1.1.1.1
destination-port 3001 source-port 3000 vpn-instance vpn1
```

Contents

Track commands

delay

Use **delay** to set the period of time that the Track module must wait before notifying the application module of track entry state changes.

Use **undo delay** to remove the notification delay configuration.

Syntax

delay { **negative** *negative-time* | **positive** *positive-time* } *

undo delay

Default

The Track module notifies the application module immediately when the track entry state changes.

Views

Track view

Predefined user roles

network-admin

context-admin

Parameters

negative *negative-time*: Specifies the delay for notifying the application module that the track entry state has changed to Negative. The *negative-time* argument represents the negative state notification delay in the range of 1 to 300 seconds.

positive *positive-time*: Specifies the delay for notifying the application module that the track entry state has changed to Positive. The *positive-time* argument represents the positive state notification delay in the range of 1 to 300 seconds.

Usage guidelines

If the Track module immediately notifies the application module of a track entry state change but the route convergence is not complete, a communication failure might occur. In such cases, you can set a notification delay to avoid immediate notification of track entry state changes.

The notification delay settings do not take effect if the track entry is not associated with an application module.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Set the negative state notification delay to 50 seconds and the positive state notification delay to 30 seconds for Boolean OR tracked list 101.

```
<Sysname> system-view
[Sysname] track 101 list boolean or
[Sysname-track-101] delay negative 50 positive 30
```

display track

Use **display track** to display track entry information.

Syntax

display track { *track-entry-number* | **all** [**negative** | **positive**] } [**brief**]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

track-entry-number: Specifies a track entry by its ID in the range of 1 to 1024.

all: Specifies all track entries.

negative: Displays information about track entries in Negative state.

positive: Displays information about track entries in Positive state.

brief: Displays brief information about track entries.

Examples

Display information about all track entries.

```
<Sysname> display track all
Track ID: 1
  State: Positive
  Duration: 0 days 0 hours 0 minutes 7 seconds
  Tracked object type: NQA
  Notification delay: Positive 20, Negative 30 (in seconds)
  Tracked object:
    NQA entry: admin test
    Reaction: 10
    Remote IP/URL: 2.2.2.2
    Local IP: 1.1.1.1
    Interface: GigabitEthernet1/0/1
  Tracked by:
    Track-list 6
    Track-list 7
```

```
Track ID: 2
  State: NotReady
  Duration: 0 days 0 hours 0 minutes 32 seconds
  Tracked object type: BFD
  Notification delay: Positive 20, Negative 30 (in seconds)
  Tracked object:
    BFD session mode: Echo
    Outgoing interface: GigabitEthernet1/0/1
    VPN instance name: --
    Remote IP: 192.168.40.1
    Local IP: 192.168.40.2
Track ID: 3
  State: Negative
  Duration: 0 days 0 hours 0 minutes 32 seconds
  Tracked object type: Interface
  Notification delay: Positive 20, Negative 30 (in seconds)
  Tracked object:
    Interface: GigabitEthernet1/0/2
    Protocol: IPv4
  Tracked by:
    Track-list 6
    Track-list 7
Track ID: 5
  State: Positive
  Duration: 0 days 0 hours 0 minutes 32 seconds
  Tracked object type: Route
  Notification delay: Positive 20, Negative 30 (in seconds)
  Tracked object:
    IP route: 0.0.0.0/0 reachability
    VPN instance name: --
    Protocol: Static
    Nexthop interface : GigabitEthernet1/0/3
Track ID: 6
  State: Positive
  Duration: 0 days 0 hours 0 minutes 32 seconds
  Tracked object type: Percentage threshold list
  Notification delay: Positive 20, Negative 30 (in seconds)
  Threshold: Positive 40, Negative 30
  Percentage of positive objects: 50%
  Tracked objects:
    Object 1: Positive
    Object 3: Negative
Track ID: 7
  State: Positive
  Duration: 0 days 0 hours 0 minutes 32 seconds
  Tracked object type: Weight threshold list
  Notification delay: Positive 20, Negative 30 (in seconds)
  Threshold: Positive 50, Negative 30
```

```
  Positive weight/total weight: 50/80
  Tracked objects:
    Object 1: Positive, Weight: 50
Object 3: Negative, Weight: 30
Track ID: 8
  State: Positive
  Duration: 0 days 0 hours 0 minutes 32 seconds
  Tracked object type: Boolean and list
  Notification delay: Positive 20, Negative 30 (in seconds)
  Tracked objects:
    Object 1: Positive
    Object 3: Negative(not)
    Object 10: NotReady(not)
```

Display brief information about track entries in Negative state.

```
<Sysname> display track all negative brief
ID   Status   Type      Remote IP/URL   Local IP        Interface
1    Negative Interface --              --              GE1/0/1
10   Negative Interface --              --              GE1/0/2
12   Negative List      --              --              --
```

Table 1 Command output

Field	Description
Track ID	ID of a track entry.
ID	ID of a track entry.
State	States of a track entry: • **Positive**—The tracked object operates correctly. • **NotReady**—The tracked object is invalid. • **Negative**—The tracked object is abnormal.
Duration	Time period during which the track entry stays in the state.
Type	Tracked object type: • **BFD Echo**—Echo-mode BFD. • **BFDStatic**—Static BFD. • **Interface**. • **Route**. • **NQA**. • **List**—Tracked list. This field is displayed only when the **`display track brief`** command is executed.

Field	Description
Tracked object type	Tracked object type: • **BFD**—Dynamic BFD. • **BFD static**—Static BFD. • **Interface**. • **Route**. • **NQA**. • **Boolean and list**—Boolean AND list. • **Boolean or list**—Boolean OR list. • **Percentage threshold list**. • **Weight threshold list**.
Notification delay: Positive 20, Negative 30 (in seconds)	• The Track module notifies the application modules that the status of the track entry changes to Positive after a delay time of 20 seconds. • The Track module notifies the application modules that the status of the track entry changes to Negative after a delay time of 30 seconds.
Threshold: Positive 40, Negative 30	Positive and negative state thresholds. This field is displayed only when the tracked object type is **Percentage threshold list** or **Weight threshold list**.
Percentage of positive objects	Percentage of Positive objects in the tracked list. This field is displayed only when the tracked object type is **Percentage threshold list**.
Positive weight/total weight: 50/80	Weight of Positive objects to the total weight of all objects in the tracked list. This field is displayed only when the tracked object type is **Weight threshold list**.
Tracked object	Tracked object associated with the track entry.
NQA entry	NQA operation associated with the track entry.
Reaction	Reaction entry associated with the track entry.
BFD session mode	BFD session mode. Only echo mode is supported.
Outgoing interface	Outgoing interface of the packets.
VPN instance name	Name of the VPN instance to which the packets belong. If the packets belong to the public network, two consecutive hyphens (--) are displayed.
Remote IP/URL	Remote IP address or URL. If no remote IP address or URL exists, two consecutive hyphens (--) are displayed.
Local IP	Local IP address. If no local IP address exists, two consecutive hyphens (--) are displayed.
Interface	Interface to be monitored. If no interface is to be monitored, two consecutive hyphens (--) are displayed.
Protocol	Link states or Layer 3 protocol states of the monitored interface: • **None**—Link status of the monitored interface. • **IPv4**—IPv4 protocol status of the monitored Layer 3 interface. • **IPv6**—IPv6 protocol status of the monitored Layer 3 interface.
IP route	Route associated with the track entry.

Field	Description
Protocol	Protocol type of the route. If the route does not exist, **N/A** is displayed.
Nexthop interface	Next hop of the route. If the route does not exist, **N/A** is displayed.
Object 10 : Positive	State of a tracked object: **Positive**, **NotReady**, or **Negative**. If the tracked object type is **Weight threshold list**, the weight of the object is also displayed. If the **(not)** attribute is displayed, the tracked list will negate the state of the object.
Tracked by	Track entries that are tracking the track entry (tracked object).
Track-list 6	Tracked list that is tracking the track entry (tracked object).

Related commands

track bfd

track interface

track interface physical

track interface protocol

track ip route reachability

track nqa

object

Use **object** to add a track entry as an object to a tracked list.

Use **undo object** to remove the object from a tracked list.

Syntax

object *track-entry-number* [**not**] [**weight** *weight*]

undo object *track-entry-number*

Default

A tracked list does not contain any objects.

Views

Track view

Predefined user roles

network-admin

context-admin

Parameters

track-entry-number: Specifies a track entry by its ID in the range of 1 to 1024.

not: Negates the state of the object. For example, the tracked list regards the object as Negative when the object is in Positive state. This keyword is supported only by a Boolean list.

weight *weight*: Assigns a weight in the range of 1 to 255 to the object. This keyword is supported only by a weight threshold list. The default weight is 10.

Usage guidelines

The track entry ID of the object cannot be the same as the ID of the tracked list to which the object is added.

You can add a maximum of 16 objects to a tracked list.

Loops between track entries are not allowed. For example, after you add track entry 1 (object 1) to tracked list 2 and track entry 2 (object 2) to tracked list 3, you cannot add track entry 3 (object 3) to tracked list 1 because a loop will be created.

Examples

Create Boolean AND list 100 and add track entries 1 and 2 as tracked objects to the list.

```
<Sysname> system-view
[Sysname] track 100 list boolean and
[Sysname-track-100] object 1
[Sysname-track-100] object 2 not
```

Related commands

track list boolean

track list threshold percentage

track list threshold weight

threshold percentage

Use **threshold percentage** to set the threshold values used to determine the state of a percentage threshold list.

Use **undo threshold percentage** to restore the default.

Syntax

threshold percentage { **negative** *negative-threshold* | **positive** *positive-threshold* } *

undo threshold percentage

Default

The negative state threshold is 0% and the positive state threshold is 1%.

Views

Track view

Predefined user roles

network-admin

context-admin

Parameters

negative *negative-threshold*: Specifies the negative state threshold in the range of 0 to 100. The percentage of Positive objects must be equal to or smaller than the configured negative state threshold for the tracked list to be set to the Negative state.

positive *positive-threshold*: Specifies the positive state threshold in the range of 0 to 100. The percentage of Positive objects must be equal to or greater than the configured positive state threshold for the tracked list to be set to the Positive state. The *positive-threshold* must be greater than the *negative-threshold.*

Usage guidelines

The state of a percentage threshold list remains unchanged if the percentage of Positive objects is below the positive state threshold and above the negative state threshold.

This command is supported only by a percentage threshold list.

Examples

Set the negative state threshold to 30% and the positive state threshold to 50% for percentage threshold list 1.

```
<Sysname> system-view
[Sysname] track 1 list threshold percentage
[Sysname-track-1] threshold percentage negative 30 positive 50
```

Related commands

track list threshold percentage

threshold weight

Use **threshold weight** to set the threshold values used to determine the state of a weight threshold list.

Use **undo threshold weight** to restore the default.

Syntax

threshold weight { **negative** *negative-threshold* | **positive** *positive-threshold* } *

undo threshold weight

Default

The negative state threshold is 0 and the positive state threshold is 1.

Views

Track view

Predefined user roles

network-admin

context-admin

Parameters

negative *negative-threshold*: Specifies the negative state threshold in the range of 0 to 255. The total weight of Positive objects must be equal to or smaller than the configured negative state threshold for the tracked list to be set to the Negative state.

positive *positive-threshold*: Specifies the positive state threshold in the range of 0 to 255. The total weight of Positive objects must be equal to or greater than the configured positive state threshold for the tracked list to be set to the Positive state. The *positive-threshold* must be greater than the *negative-threshold.*

Usage guidelines

The state of a weight threshold list remains unchanged if the total weight of Positive objects is below the positive state threshold and above the negative state threshold.

This command is supported only by a weight threshold list.

Examples

Set the negative state threshold to 30 and the positive state threshold to 50 for weight threshold list 1.

```
<Sysname> system-view
[Sysname] track 1 list threshold weight
[Sysname-track-1] threshold weight negative 30 positive 50
```

Related commands

track list threshold weight

track bfd

Use **track bfd** to create a track entry associated with a BFD session and enter track entry view, or enter the view of an existing track entry.

Use **undo track** to remove the track entry and all configurations from its view.

Syntax

track *track-entry-number* **bfd echo interface** *interface-type interface-number* **remote ip** *remote-ip-address* **local ip** *local-ip-address*

undo track *track-entry-number*

Default

No track entries exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

track-entry-number: Specifies the track entry ID in the range of 1 to 1024.

interface *interface-type interface-number*: Specifies the outgoing interface by its type and number of the BFD echo packets.

remote ip *remote-ip-address*: Specifies the destination IP address of the BFD echo packets.

local ip *local-ip-address*: Specifies the source IP address of the BFD echo packets.

Usage guidelines

To create a track entry, you must specify the tracked object type, which is **bfd** in this command.

To enter the view of an existing track entry, use the **track** *track-entry-number* command. The tracked object type is not required.

To modify the settings of a track entry, execute the **undo track** command to remove the track entry, and then create the track entry again.

When you associate Track with BFD, the virtual IP address of a VRRP group cannot be the local or remote address of a BFD session.

Examples

Associate track entry 1 with BFD to monitor the link between local IP address 192.168.40.2 and remote IP address 192.168.40.1 by sending BFD echo packets through GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] track 1 bfd echo interface gigabitethernet 1/0/1 remote ip 192.168.40.1 local ip 192.168.40.2
[Sysname-track-1]
```

display track

track interface

Use **track interface** to create a track entry associated with the link state of an interface and enter track entry view, or enter the view of an existing track entry.

Use **undo track** to remove the track entry and all configurations from its view.

Syntax

track *track-entry-number* **interface** *interface-type interface-number*

undo track *track-entry-number*

Default

No track entries exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

track-entry-number: Specifies the track entry ID in the range of 1 to 1024.

interface-type interface-number: Specifies an interface by its type and number.

Usage guidelines

To create a track entry, you must specify the tracked object type, which is **interface** in this command.

To enter the view of an existing track entry, use the **track** *track-entry-number* command. The tracked object type is not required.

When you associate Track with interface management to monitor the link status of an interface, the track entry state changes as follows:

- The track entry state is Positive if the link state of the interface is up.
- The track entry state is Negative if the link state of the interface is down.

To display the link state of an interface, use the **display ip interface brief** command.

To modify the settings of a track entry, execute the **undo track** command to remove the track entry, and then create the track entry again.

Examples

Create track entry 1 and associate it with the link state of interface GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] track 1 interface gigabitethernet 1/0/1
```

```
[Sysname-track-1]
```

track interface physical

Use **track interface physical** to create a track entry associated with the physical state of an interface and enter track entry view, or enter the view of an existing track entry.

Use **undo track** to remove the track entry and all configurations from its view.

Syntax

track *track-entry-number* **interface** *interface-type interface-number* **physical**

undo track *track-entry-number*

Default

No track entries exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

track-entry-number: Specifies the track entry ID in the range of 1 to 1024.

interface-type interface-number: Specifies an interface by its type and number.

Usage guidelines

To create a track entry, you must specify the tracked object type, which is **interface physical** in this command.

To enter the view of an existing track entry, use the **track** *track-entry-number* command. The tracked object type is not required.

To modify the settings of a track entry, execute the **undo track** command to remove the track entry, and then create the track entry again.

Examples

Create track entry 1 and associate it with the physical state of GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] track 1 interface gigabitethernet 1/0/1 physical
[Sysname-track-1]
```

track interface protocol

Use **track interface protocol** to create a track entry associated with the protocol state of an interface and enter track entry view, or enter the view of an existing track entry.

Use **undo track** to remove the track entry and all configurations from its view.

Syntax

track *track-entry-number* **interface** *interface-type interface-number* **protocol** { **ipv4** | **ipv6** }

undo track *track-entry-number*

Default

No track entries exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

track-entry-number: Specifies the track entry ID in the range of 1 to 1024.

interface-type interface-number: Specifies an interface by its type and number.

ipv4: Monitors the IPv4 protocol state. When the IPv4 protocol state of an interface is up, the state of the track object is Positive. When the IPv4 protocol state of an interface is down, the state of the track object is Negative. To display the IPv4 protocol state of an interface, use the **display ip interface brief** command.

ipv6: Monitors the IPv6 protocol state. When the IPv6 protocol state of an interface is up, the state of the track object is Positive. When the IPv6 protocol state of an interface is down, the state of the track object is Negative. To display the IPv6 protocol state of an interface, use the **display ipv6 interface brief** command.

Usage guidelines

To create a track entry, you must specify the tracked object type, which is **interface protocol** in this command.

To enter the view of an existing track entry, use the **track** *track-entry-number* command. The tracked object type is not required.

To modify the settings of a track entry, execute the **undo track** command to remove the track entry, and then create the track entry again.

Examples

Create track entry 1 and associate it with the IPv4 protocol state of interface GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] track 1 interface gigabitethernet 1/0/1 protocol ipv4
[Sysname-track-1]
```

track ip route reachability

Use **track ip route reachability** to create a track entry associated with a route entry and enter track entry view, or enter the view of an existing track entry.

Use **undo track** to remove the track entry and all configurations from its view.

Syntax

track *track-entry-number* **ip route** [**vpn-instance** *vpn-instance-name*] *ip-address* { *mask-length* | *mask* } **reachability**

undo track *track-entry-number*

Default

No track entries exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

track-entry-number: Specifies the track entry ID in the range of 1 to 1024.

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify this option, this command creates the track entry for routes on the public network.

ip-address: Specifies the IP address of the route entry associated with the track entry in dotted decimal notation.

mask-length: Specifies the mask length in the range of 0 to 32.

mask: Specifies the mask of the IP address, in dotted decimal notation.

Usage guidelines

To create a track entry, you must specify the tracked object type, which is **ip route reachability** in this command.

To enter the view of an existing track entry, use the **track** *track-entry-number* command. The tracked object type is not required.

To modify the settings of a track entry, execute the **undo track** command to remove the track entry, and then create the track entry again.

Route management does not immediately notify the Track module of the route status changes when the following conditions are met:

- An active/standby device switchover or a RIB process switchover has occurred.
- The status of the monitored route entry is changed before the routing protocol completes the graceful restart.

You can resolve the problem by configuring the nonstop routing feature.

Examples

Create track entry 1 to monitor the status of the route entry 10.1.1.0/24.

```
<Sysname> system-view
[Sysname] track 1 ip route 10.1.1.0 24 reachability
```

```
[Sysname-track-1]
```

track list boolean

Use **track list boolean** to create a Boolean tracked list and enter its view, or enter the view of an existing tracked list.

Use **undo track** to remove the tracked list and all configurations from its view.

Syntax

track *track-entry-number* **list boolean** { **and** | **or** }

undo track *track-entry-number*

Default

No tracked lists exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

track-entry-number: Specifies an ID for the tracked list in the range of 1 to 1024.

and: Calculates the tracked list state by using the Boolean AND operation.

or: Calculates the tracked list state by using the Boolean OR operation.

Usage guidelines

The state of a Boolean list is determined by the tracked object states based on the Boolean AND or Boolean OR operation.

- **Boolean AND list**—The tracked list is set to the Positive state only when all objects are in Positive state. If one or more objects are in Negative state, the tracked list is set to the Negative state.
- **Boolean OR list**—The tracked list is set to the Positive state if any object is in Positive state. If all objects are in Negative state, the tracked list is set to the Negative state.

To create a track entry, you must specify the tracked object type, which is **list boolean** in this command.

To enter the view of an existing track entry, use the **track** *track-entry-number* command. The tracked object type is not required.

To modify the settings of a track entry, execute the **undo track** command to remove the track entry, and then create the track entry again.

Examples

Create Boolean OR list 101 and enter its view.

```
<Sysname> system-view
```

```
[Sysname] track 101 list boolean or
[Sysname-track-101]
```

track nqa

Use **track nqa** to create a track entry associated with the reaction entry of an NQA operation and enter track entry view, or enter the view of an existing track entry.

Use **undo track** to remove the track entry and all configurations from its view.

Syntax

track *track-entry-number* **nqa entry** *admin-name operation-tag* **reaction** *item-number*

undo track *track-entry-number*

Default

No track entries exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

track-entry-number: Specifies the track entry ID in the range of 1 to 1024.

entry *admin-name operation-tag*: Specifies the NQA operation to be associated with the track entry. The *admin-name* argument specifies the name of the NQA operation administrator who creates the NQA operation, and is a case-insensitive string of 1 to 32 characters. The *operation-tag* argument specifies the NQA operation tag, and is a case-insensitive string of 1 to 32 characters.

reaction *item-number*: Specifies the reaction entry to be associated with the track entry. The *item-number* argument is the reaction entry ID in the range of 1 to 10.

Usage guidelines

To create a track entry, you must specify the tracked object type, which is **nqa** in this command.

To enter the view of an existing track entry, use the **track** *track-entry-number* command. The tracked object type is not required.

To modify the settings of a track entry, execute the **undo track** command to remove the track entry, and then create the track entry again.

Examples

Create track entry 1 and associate it with reaction entry 3 of NQA operation **admin-test**.

```
<Sysname> system-view
[Sysname] track 1 nqa entry admin test reaction 3
[Sysname-track-1]
```

BFD commands

Basic BFD commands

bfd authentication-mode

Use **bfd authentication-mode** to configure the BFD authentication mode for single-hop BFD control packets.

Use **undo bfd authentication-mode** to restore the default.

Syntax

bfd authentication-mode { **hmac-md5** | **hmac-mmd5** | **hmac-msha1** | **hmac-sha1** | **m-md5** | **m-sha1** | **md5** | **sha1** | **simple** } *key-id* { **cipher** | **plain** } *string*

undo bfd authentication-mode

Default

Single-hop BFD control packets are not authenticated.

Views

Interface view

BFD template view

Static BFD session view

Predefined user roles

network-admin

context-admin

Parameters

hmac-md5: Specifies the HMAC MD5 algorithm.

hmac-mmd5: Specifies the HMAC Meticulous MD5 algorithm.

hmac-msha1: Specifies the HMAC Meticulous SHA1 algorithm.

hmac-sha1: Specifies the HMAC SHA1 algorithm.

m-md5: Specifies the Meticulous MD5 algorithm.

m-sha1: Specifies the Meticulous SHA1 algorithm.

md5: Specifies the MD5 algorithm.

sha1: Specifies the SHA1 algorithm.

simple: Specifies the simple authentication mode.

key-id: Sets the authentication key ID in the range of 1 to 255.

cipher: Specifies a key in encrypted form.

plain: Specifies a key in plaintext form. For security purposes, the key specified in plaintext form will be stored in encrypted form.

string: Specifies the key. Its plaintext form is a case-sensitive string of 1 to 16 characters. Its encrypted form is a case-sensitive string of 33 to 53 characters.

Usage guidelines

Use this command to enhance BFD session security.

If this command is executed in static BFD session view, it takes effect only on static BFD sessions used for single-hop detection.

BFD version 0 does not support this command. The configuration does not take effect.

Examples

Configure GigabitEthernet 1/0/1 to perform simple authentication for single-hop BFD control packets, setting the authentication key ID to **1** and plaintext key to **123456**.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] bfd authentication-mode simple 1 plain 123456
```

Related commands

bfd static

bfd demand enable

Use **bfd demand enable** to enable the Demand BFD session mode.

Use **undo bfd demand enable** to restore the default.

Syntax

bfd demand enable

undo bfd demand enable

Default

The BFD session is in Asynchronous mode.

Views

Interface view

Static BFD session view

Predefined user roles

network-admin

context-admin

Usage guidelines

In Demand mode, the device periodically sends BFD control packets. If the peer end is operating in Asynchronous mode (default), the peer end stops sending BFD control packets. If the peer end is operating in Demand mode, both ends stop sending BFD control packets. As a best practice, configure the **bfd echo enable** command together with this command to detect connectivity by sending Echo packets. If the device does not receive any Echo packets from the peer end, it considers the session down.

In Asynchronous mode, the device periodically sends BFD control packets. The device considers that the session is down if it does not receive any BFD control packets within a specific interval.

If this command is executed in static BFD session view, it takes effect only on static BFD sessions used for single-hop detection.

BFD version 0 does not support this command. The configuration does not take effect.

Examples

Enable the Demand BFD session mode on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] bfd demand enable
```

Related commands

bfd echo enable

bfd detect-interface first-fail-timer

Use **bfd detect-interface first-fail-timer** to configure the timer that delays reporting the first BFD session establishment failure to the data link layer.

Use **undo bfd detect-interface first-fail-timer** to restore the default.

Syntax

bfd detect-interface first-fail-timer *seconds*

undo bfd detect-interface first-fail-timer

Default

The first BFD session establishment failure is not reported to the data link layer.

Views

Interface view

Predefined user roles

network-admin

context-admin

Parameters

seconds: Specifies the timeout time that reports the first BFD session establishment failure to the data link layer. The value range for this argument is 1 to 10000 seconds.

Usage guidelines

If the BFD session fails to be established when the timer expires, BFD reports the failure to the data link layer and sets the data link layer state of the interface to DOWN(BFD). This behavior rapidly identifies the interfaces for which BFD sessions fail to be established. In this case, the BFD session state is displayed as Down in the **display bfd session** command output. The line protocol state of the interface is displayed as DOWN(BFD) in the **display interface** command output.

If you execute the **bfd detect-interface source-ip** command on the local end, the BFD session for detecting the local interface state fails to be established when the following conditions exist:

- The **bfd detect-interface source-ip** command is not executed on the remote end.
- The local and remote ends have mismatching BFD authentication settings.

Examples

Configure the timer that delays reporting the first BFD session establishment failure as 10 seconds for GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] bfd detect-interface first-fail-timer 10
```

Related commands

bfd detect-interface source-ip

display interface (*Interface Command Reference*)

bfd detect-interface source-ip

Use **bfd detect-interface source-ip** to associate the interface state with BFD and specify the source IP address for BFD control packets.

Use **undo bfd detect-interface** to remove the association between the interface state and BFD.

Syntax

bfd detect-interface source-ip *ip-address* [**discriminator local** *local-value* **remote** *remote-value*] [**template** *template-name*]

undo bfd detect-interface

Default

The interface state is not associated with BFD. BFD does not set the link layer protocol of the interface to DOWN(BFD) state when detecting a failure.

Views

Interface view

Predefined user roles

network-admin

context-admin

Parameters

ip-address: Specifies the source IP address for BFD control packets, in dotted decimal notation.

discriminator: Specifies BFD session discriminators. If you do not specify discriminators, the device obtains BFD session discriminators through autonegotiation.

local *local-value*: Specifies the local discriminator. The value range for the *local-value* argument is 1 to 32768.

remote *remote-value*: Specifies the remote discriminator in the range of 1 to 4294967295.

template *template-name*: Specifies a template by its name, a case-sensitive string of 1 to 63 characters. If you specify a nonexistent template or do not specify a template, the BFD session uses the BFD parameters configured in interface view. If you first specify a nonexistent template and then create the template, the BFD session uses the parameters configured in the template.

Usage guidelines

By creating a BFD session for single-hop detection through exchange of BFD control packets, this feature implements fast link detection. When BFD detects a link fault, it sets the link layer protocol state to DOWN(BFD). This behavior helps applications relying on the link layer protocol state achieve fast convergence.

The source IP address of control packets is specified manually, and the destination IP address is fixed at 224.0.0.184. As a best practice, specify the IP address of the interface as the source IP address. If the interface does not have an IP address, specify a unicast IP address other than 0.0.0.0 as the source IP address.

You can associate the state of the following interfaces with BFD:

- Layer 3 Ethernet interfaces and subinterfaces. For BFD detection to take effect, do not execute this command on both a Layer 3 Ethernet interface and its subinterface.
- Layer 3 aggregate interfaces, Layer 3 aggregate subinterfaces, and member ports (Layer 3 Ethernet interfaces only) in a Layer 3 aggregation group.

To configure this command on the preceding interfaces at the same time, you must manually specify the local and remote discriminators on each of the interfaces. As a best practice, do not configure this command on these interfaces at the same time.

- VLAN interfaces.

If the peer device does not support obtaining BFD session discriminators through autonegotiation, you must specify the discriminators on both the local and peer devices. Without the discriminators, the BFD session cannot come up.

The BFD session discriminators must match on the local and peer devices. For example, if you configure **bfd detect-interface source-ip** 20.1.1.1 **discriminator local** 513 **remote** 514 on the local device, you must configure **bfd detect-interface source-ip** 20.1.1.2 **discriminator local** 514 **remote** 513 on the peer device.

The local discriminators of BFD sessions for interfaces on the same device must be different.

To modify your configuration, remove it by using the **undo** form of the command and then execute the **bfd detect-interface source-ip** command again.

The echo function does not take effect on BFD sessions associated with interface states.

If you specify an existing template for this command, the **bfd demand enable** command cannot take effect.

Examples

Associate GigabitEthernet 1/0/1 with BFD to detect the interface state, and specify the source IP address as 20.1.1.1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] bfd detect-interface source-ip 20.1.1.1
```

Related commands

bfd demand enable

bfd echo enable

bfd template

bfd detect-interface special-processing

Use **bfd detect-interface special-processing** to enable special processing for BFD sessions.

Use **undo bfd detect-interface special-processing** to disable special processing for BFD sessions.

Syntax

bfd detect-interface special-processing [**admin-down** | **authentication-change** | **session-up**] *

undo bfd detect-interface special-processing [**admin-down** | **authentication-change** | **session-up**] *

Default

All types of special processing for BFD sessions are disabled.

Views

Interface view

Predefined user roles

network-admin

context-admin

Parameters

admin-down: Notifies a session down event to the data link layer upon receipt of a BFD packet with the State field as AdminDown. This keyword helps rapidly discover interfaces on which BFD sessions are manually shut down. If you do not specify this keyword, the device sets the BFD session state to Down, but does not notify the session down event to the data link layer.

authentication-change: Immediately sets the session to down state upon a local authentication information change. This keyword helps rapidly discover interfaces with authentication information changes. If you do not specify this keyword, the device sets the session to down state if authentication information inconsistency still persists after a period of time.

session-up: Ignores authentication information inconsistency when the local session is up. If a large number of BFD sessions exist, examining authentication information consistency affects device performance. If you do not specify this keyword, the device examines authentication information in incoming BFD packets when the local session state is up. If the authentication information does not match on the two ends, the BFD session is declared down.

Usage guidelines

If you do not specify any parameters, this command enables or disables all types of special processing.

Examples

Enable all types of special processing for BFD sessions on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] bfd detect-interface special-processing admin-down
authentication-change session-up
```

bfd detect-multiplier

Use **bfd detect-multiplier** to set the single-hop detection time multiplier for control packet mode and echo packet mode.

Use **undo bfd detect-multiplier** to restore the default.

Syntax

bfd detect-multiplier *value*

undo bfd detect-multiplier

Default

The single-hop detection time multiplier is 5 for control packet mode and echo packet mode.

Views

Interface view

BFD template view

Static BFD session view

Predefined user roles

network-admin

context-admin

Parameters

value: Specifies a detection time multiplier. The value range for this argument is 3 to 50.

Usage guidelines

The detection time multiplier determines the maximum number of concurrent BFD packets (including control packets and echo packets) that can be discarded.

Table 1 Detection interval calculation method

Mode	Detection interval
Echo packet mode	Detection time multiplier of the sender × actual packet sending interval of the sender
Control packet mode BFD session in asynchronous mode	Detection time multiplier of the receiver × actual packet sending interval of the receiver
Control packet mode BFD session in demand mode	Detection time multiplier of the sender × actual packet sending interval of the sender

If this command is executed in static BFD session view, it takes effect only on static BFD sessions used for single-hop detection.

Examples

Set the single-hop detection time multiplier for control packet mode and the detection time multiplier for echo packet mode to 6 on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] bfd detect-multiplier 6
```

bfd echo enable

Use **bfd echo enable** to enable the echo function.

Use **undo bfd echo enable** to disable the echo function.

Syntax

bfd echo [**receive** | **send**] **enable**

undo bfd echo [**receive** | **send**] **enable**

Default

The echo function is disabled.

Views

Interface view

Static BFD session view

Predefined user roles

network-admin

context-admin

Parameters

receive: Specifies the echo packet receiving capability.

send: Specifies the echo packet sending capability.

Usage guidelines

If you enable the echo function for a BFD session in which control packets are sent and the session comes up, BFD performs the following operations:

- Periodically sends echo packets to detect link connectivity.
- Decreases the control packet receiving rate at the same time.

To enable only the echo packet receiving capability, use the **bfd echo receive enable** command.

To enable only the echo packet sending capability, use the **bfd echo send enable** command.

If you do not specify the **receive** or **send** keyword, the command enables both the echo packet receiving and sending capabilities.

The echo function does not take effect on BFD sessions associated with interface states.

The echo function does not take effect on control-mode BFD sessions established with IPv6 link-local addresses.

If this command is executed in static BFD session view, it takes effect only on static BFD sessions used for single-hop detection.

BFD version 0 does not support this command. The configuration does not take effect.

Examples

Enable the echo function on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] bfd echo enable
```

bfd echo-source-ip

Use **bfd echo-source-ip** to configure the source IP address of BFD echo packets.

Use **undo bfd echo-source-ip** to remove the configured source IP address of BFD echo packets.

Syntax

bfd echo-source-ip *ip-address*

undo bfd echo-source-ip

Default

No source IP address is configured for BFD echo packets.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

ip-address: Specifies the source IP address of BFD echo packets. The source IP address must be a valid unicast IPv4 address in dotted decimal notation.

Usage guidelines

Make sure the source IP address is not on the same network segment as any local interfaces. This avoids the following situations:

- A large number of ICMP redirect packets might be sent from the peer, resulting in link congestion.
- With malformed packet attack detection and prevention enabled, the local end might filter echo packets sent from the peer as malformed packets, resulting in BFD session establishment failure. For more information about malformed packet attack detection and prevention, see attack detection and prevention in *Security Configuration Guide*.

Examples

Configure the source IP address of BFD echo packets as 8.8.8.8.

```
<Sysname> system-view
[Sysname] bfd echo-source-ip 8.8.8.8
```

bfd echo-source-ipv6

Use **bfd echo-source-ipv6** to configure the source IPv6 address of BFD echo packets.

Use **undo bfd echo-source-ipv6** to remove the configured source IPv6 address of BFD echo packets.

Syntax

bfd echo-source-ipv6 *ipv6-address*

undo bfd echo-source-ipv6

Default

No source IPv6 address is configured for BFD echo packets.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

ipv6-address: Specifies the source IPv6 address for BFD echo packets.

Usage guidelines

The source IPv6 address of echo packets can only be a global unicast address.

Make sure the source IPv6 address is not on the same network segment as any local interfaces. This avoids the following situations:

- A large number of ICMPv6 redirect packets might be sent from the peer, resulting in link congestion.
- With malformed packet attack detection and prevention enabled, the local end might filter echo packets sent from the peer as malformed packets, resulting in BFD session establishment failure. For more information about malformed packet attack detection and prevention, see attack detection and prevention in *Security Configuration Guide*.

Examples

Configure the source IPv6 address of BFD echo packets as 80::2.

```
<Sysname> system-view
[Sysname] bfd echo-source-ipv6 80::2
```

bfd init-fail timer

Use **bfd init-fail-timer** to set the delay timer for BFD to notify upper-layer protocols of session establishment failures.

Use **undo bfd init-fail-timer** to restore the default.

Syntax

bfd init-fail-timer *seconds*

undo bfd init-fail-timer

Default

BFD does not notify upper-layer protocols of session establishment failures.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

seconds: Specifies the delay time in the range of 5 to 600 seconds. After the delay time, BFD notifies the upper-layer protocol of session establishment failures.

Usage guidelines

CAUTION:

For session establishment failures caused by configuration mismatches at the two ends, this command can cause the upper-layer protocol to act incorrectly. Therefore, use this command with caution. BFD status mismatch and BFD authentication configuration mismatch are examples of configuration mismatches.

This command takes effect only for control packet mode.

In some cases, for an upper-layer protocol to act correctly, BFD must notify the upper-layer protocol of session establishment failures.

Examples

Set the delay timer to 10 seconds for BFD to notify upper-layer protocols of session establishment failures.

```
<Sysname> system-view
[Sysname] bfd init-fail-timer 10
```

bfd min-echo-receive-interval

Use **bfd min-echo-receive-interval** to set the minimum interval for receiving BFD echo packets.

Use **undo bfd min-echo-receive-interval** to restore the default.

Syntax

bfd min-echo-receive-interval *interval*

undo bfd min-echo-receive-interval

Default

The minimum interval for receiving BFD echo packets is 400 milliseconds.

Views

Interface view

BFD template view

Static BFD session view

Predefined user roles

network-admin

context-admin

Parameters

interval: Specifies the minimum interval for receiving BFD echo packets, in milliseconds. The value takes 0 or is in the range of 100 to 1000.

Usage guidelines

This command sets the BFD echo packet receiving interval, which is the actual BFD echo packet sending interval.

The local end stops sending echo packets after autonegotiation with the remote end if the following conditions are met:

- The echo function is enabled on the local end.
- The minimum interval for receiving BFD echo packets is set to 0 milliseconds on the remote end.

If this command is executed in static BFD session view, it takes effect only on static BFD sessions used for single-hop detection.

Examples

Set the minimum interval for receiving BFD echo packets to 500 milliseconds on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] bfd min-echo-receive-interval 500
```

bfd min-receive-interval

Use **bfd min-receive-interval** to set the minimum interval for receiving single-hop BFD control packets.

Use **undo bfd min-receive-interval** to restore the default.

Syntax

bfd min-receive-interval *interval*

undo bfd min-receive-interval

Default

The minimum interval for receiving single-hop BFD control packets is 400 milliseconds.

Views

Interface view

BFD template view

Static BFD session view

Predefined user roles

network-admin

context-admin

Parameters

interval: Specifies the minimum interval for receiving single-hop BFD control packets, in milliseconds. The value range for this argument is 100 to 1000.

Usage guidelines

Use this command to prevent the control packet sending rate of the peer end from exceeding the control packet receiving rate of the local end.

The actual control packet sending interval of the peer end takes the greater value between the following values:

- Minimum interval for transmitting BFD control packets on the peer end.
- Minimum interval for receiving BFD control packets on the local end.

If this command is executed in static BFD session view, it takes effect only on static BFD sessions used for single-hop detection.

Examples

Set the minimum interval for receiving single-hop BFD control packets to 500 milliseconds on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] bfd min-receive-interval 500
```

bfd min-transmit-interval

Use **bfd min-transmit-interval** to set the minimum interval for transmitting single-hop BFD control packets.

Use **undo bfd min-transmit-interval** to restore the default.

Syntax

bfd min-transmit-interval *interval*

undo bfd min-transmit-interval

Default

The minimum interval for transmitting single-hop BFD control packets is 400 milliseconds.

Views

Interface view

BFD template view

Static BFD session view

Predefined user roles

network-admin

context-admin

Parameters

interval: Specifies the minimum interval for transmitting single-hop BFD control packets, in milliseconds. The value range for this argument is 100 to 1000.

Usage guidelines

Use this command to prevent the BFD packet sending rate from exceeding the device capability.

The actual BFD control packet transmitting interval on the local end is the greater value between the following values:

- Minimum interval for transmitting BFD control packets on the local end.
- Minimum interval for receiving BFD control packets on the peer end.

If this command is executed in static BFD session view, it takes effect only on static BFD sessions used for single-hop detection.

Examples

Set the minimum interval for transmitting single-hop BFD control packets to 500 milliseconds on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] bfd min-transmit-interval 500
```

bfd multi-hop authentication-mode

Use **bfd multi-hop authentication-mode** to configure the authentication mode for multihop BFD control packets.

Use **undo bfd multi-hop authentication-mode** to restore the default.

Syntax

bfd multi-hop authentication-mode { **hmac-md5** | **hmac-mmd5** | **hmac-msha1** | **hmac-sha1** | **m-md5** | **m-sha1** | **md5** | **sha1** | **simple** } *key-id* { **cipher** | **plain** } *string*

undo bfd multi-hop authentication-mode

Default

No authentication is performed.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

hmac-md5: Specifies the HMAC MD5 algorithm.

hmac-mmd5: Specifies the HMAC Meticulous MD5 algorithm.

hmac-msha1: Specifies the HMAC Meticulous SHA1 algorithm.

hmac-sha1: Specifies the HMAC SHA1 algorithm.

m-md5: Specifies the Meticulous MD5 algorithm.

m-sha1: Specifies the Meticulous SHA1 algorithm.

md5: Specifies the MD5 algorithm.

sha1: Specifies the SHA1 algorithm.

simple: Specifies the simple authentication mode.

key-id: Sets the authentication key ID in the range of 1 to 255.

cipher: Specifies a key in encrypted form.

plain: Specifies a key in plaintext form. For security purposes, the key specified in plaintext form will be stored in encrypted form.

string: Specifies the key. Its plaintext form is a case-sensitive string of 1 to 16 characters. Its encrypted form is a case-sensitive string of 33 to 53 characters.

Usage guidelines

Use this command to enhance BFD session security.

BFD version 0 does not support this command. The configuration does not take effect.

Examples

Configure the simple authentication mode for multihop BFD control packets, setting the authentication key ID to 1 and key to **123456**.

```
<Sysname> system-view
[Sysname] bfd multi-hop authentication-mode simple 1 plain 123456
```

bfd multi-hop destination-port

Use **bfd multi-hop destination-port** to configure the destination port number for multihop BFD control packets.

Use **undo bfd multi-hop destination-port** to restore the default.

Syntax

bfd multi-hop destination-port *port-number*

undo bfd multi-hop destination-port

Default

The destination port number for multihop BFD control packets is 4784.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

port-number: Specifies the destination port number of multihop BFD control packets, 3784 or 4784.

Usage guidelines

IANA assigned port number 4784 to BFD for multihop BFD detection in control packet mode. By default, NSFOCUS devices use 4784 as the destination port number for multihop BFD control packets, while devices from other vendors might use 3784. To avoid BFD session establishment failures, make sure the devices on both ends of the BFD session use the same destination port number for multihop BFD control packets.

This command applies to only new multihop BFD sessions in control packet mode.

Examples

Specify the destination port number for multihop BFD control packets as 3784.

```
<Sysname> system-view
[Sysname] bfd multi-hop destination-port 3784
```

bfd multi-hop detect-multiplier

Use **bfd multi-hop detect-multiplier** to set the multihop detection time multiplier for control packet mode and echo packet mode.

Use **undo bfd multi-hop detect-multiplier** to restore the default.

Syntax

bfd multi-hop detect-multiplier *value*

undo bfd multi-hop detect-multiplier

Default

The multihop detection time multiplier is 5 for control packet mode and echo packet mode.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

value: Specifies the multihop detection time multiplier in the range of 3 to 50.

Usage guidelines

The detection time multiplier determines the maximum number of concurrent BFD control packets that can be discarded.

Table 2 Detection interval calculation method

Mode	Detection interval
Echo packet mode	Detection time multiplier of the sender × actual packet sending interval of the sender
Control packet mode BFD session in asynchronous mode	Detection time multiplier of the receiver × actual packet sending interval of the receiver
Control packet mode BFD session in demand mode	Detection time multiplier of the sender × actual packet sending interval of the sender

Examples

Set the multihop detection time multiplier to 6.

```
<Sysname> system-view
[Sysname] bfd multi-hop detect-multiplier 6
```

bfd multi-hop min-echo-receive-interval

Use **bfd multi-hop min-echo-receive-interval** to set the minimum interval for receiving multihop BFD echo packets.

Use **undo bfd multi-hop min-echo-receive-interval** to restore the default.

Syntax

bfd multi-hop min-echo-receive-interval *interval*

undo bfd multi-hop min-echo-receive-interval

Default

The minimum interval for receiving multihop BFD echo packets is 400 milliseconds.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

interval: Specifies the minimum interval for receiving multihop BFD echo packets, in milliseconds. The value takes 0 or is in the range of 100 to 1000.

Usage guidelines

The interval for receiving multihop BFD echo packets is also the interval for sending multihop BFD echo packets. By executing this command, you can control both the receiving interval and sending interval for multihop BFD echo packets.

This command takes effect only on static BFD sessions for multihop detection with echo packets.

Examples

Set the minimum interval for receiving multihop BFD echo packets to 500 milliseconds.

```
<Sysname> system-view
[Sysname] bfd multi-hop min-echo-receive-interval 500
```

Related commands

bfd static

bfd multi-hop min-receive-interval

Use **bfd multi-hop min-receive-interval** to set the minimum interval for receiving multihop BFD control packets.

Use **undo bfd multi-hop min-receive-interval** to restore the default.

Syntax

bfd multi-hop min-receive-interval *interval*

undo bfd multi-hop min-receive-interval

Default

The minimum interval for receiving multihop BFD control packets is 400 milliseconds.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

interval: Specifies the minimum interval for receiving multihop BFD control packets, in milliseconds. The value range for this argument is 100 to 1000.

Usage guidelines

Use this command to prevent the packet sending rate of the peer end from exceeding the packet receiving capability (minimum control packet receiving interval) of the local end. If the receiving capability is exceeded, the peer end dynamically adjusts the BFD control packet sending interval to the minimum control packet receiving interval of the local end.

Examples

Set the minimum interval for receiving multihop BFD control packets to 500 milliseconds.

```
<Sysname> system-view
[Sysname] bfd multi-hop min-receive-interval 500
```

bfd multi-hop min-transmit-interval

Use **bfd multi-hop min-transmit-interval** to set the minimum interval for transmitting multihop BFD control packets.

Use **undo bfd multi-hop min-transmit-interval** to restore the default.

Syntax

bfd multi-hop min-transmit-interval *interval*

undo bfd multi-hop min-transmit-interval

Default

The minimum interval for transmitting multihop BFD control packets is 400 milliseconds.

Views

System view

Predefined user roles

network-admin

Parameters

interval: Specifies the minimum interval for transmitting multihop BFD control packets, in milliseconds. The value range for this argument is 100 to 1000.

Usage guidelines

Use this command to prevent the BFD packet sending rate from exceeding the device capability.

The actual BFD control packet transmitting interval on the local end is the greater value between the following values:

- Minimum interval for transmitting BFD control packets on the local end.
- Minimum interval for receiving BFD control packets on the peer end.

Examples

Set the minimum interval for transmitting multihop BFD control packets to 500 milliseconds.

```
<Sysname> system-view
[Sysname] bfd multi-hop min-transmit-interval 500
```

bfd session init-mode

Use **bfd session init-mode** to configure the mode for establishing a BFD session.

Use **undo bfd session init-mode** to restore the default.

Syntax

bfd session init-mode { **active** | **passive** }

undo bfd session init-mode

Default

BFD uses the **active** mode.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

active: Specifies the active mode. In active mode, BFD actively transmits BFD control packets to the remote device, regardless of whether it receives a BFD control packet from the remote device.

passive: Specifies the passive mode. In passive mode, BFD does not actively transmit a BFD control packet to the remote end; it transmits a BFD control packet only after receiving a BFD control packet from the remote end.

Usage guidelines

A minimum of one end must operate in active mode for a BFD session to be established.

BFD version 0 does not support this command. The configuration does not take effect.

Examples

Configure the session establishment mode as **passive**.

```
<Sysname> system-view
[Sysname] bfd session init-mode passive
```

bfd static

Use **bfd static** to create a static BFD session and enter its view, or enter the view of an existing static BFD session.

Use **undo bfd static** to delete a static BFD session and all its settings.

Syntax

Static BFD session for single-hop detection with IPv4 control packets:

bfd static *session-name* [**peer-ip** *ipv4-address* **interface** *interface-type interface-number* **source-ip** *ipv4-address* **discriminator local** *local-value* **remote** *remote-value*]

undo bfd static *session-name*

Static BFD session for multihop detection with IPv4 control packets:

bfd static *session-name* [**peer-ip** *ipv4-address* [**vpn-instance** *vpn-instance-name*] **source-ip** *ipv4-address* **discriminator local** *local-value* **remote** *remote-value*]

undo bfd static *session-name*

Static BFD session for single-hop detection with IPv4 echo packets:

bfd static *session-name* [**peer-ip** *ipv4-address* **interface** *interface-type interface-number* **destination-ip** *ipv4-address* [**source-ip** *ipv4-address*] **one-arm-echo discriminator** { **local** *local-value* | **auto** }]

undo bfd static *session-name*

Static BFD session for multihop detection with IPv4 echo packets:

bfd static *session-name* [**peer-ip** *ipv4-address* [**vpn-instance** *vpn-instance-name*] **destination-ip** *ipv4-address* [**source-ip** *ipv4-address*] **one-arm-echo discriminator** { **local** *local-value* | **auto** }]

undo bfd static *session-name*

Static BFD session for single-hop detection with IPv6 control packets:

bfd static *session-name* [**peer-ipv6** *ipv6-address* **interface** *interface-type interface-number* **source-ipv6** *ipv6-address* **discriminator local** *local-value* **remote** *remote-value*]

undo bfd static *session-name*

Static BFD session for multihop detection with IPv6 control packets:

bfd static *session-name* [**peer-ipv6** *ipv6-address* [**vpn-instance** *vpn-instance-name*] **source-ipv6** *ipv6-address* **discriminator local** *local-value* **remote** *remote-value*]

undo bfd static *session-name*

Static BFD session for single-hop detection with IPv6 echo packets:

bfd static *session-name* [**peer-ipv6** *ipv6-address* **interface** *interface-type interface-number* **destination-ipv6** *ipv6-address* [**source-ipv6** *ipv6-address*] **one-arm-echo discriminator** { **local** *local-value* | **auto** }]

undo bfd static *session-name*

Static BFD session for multihop detection with IPv6 echo packets:

bfd static *session-name* [**peer-ipv6** *ipv6-address* [**vpn-instance** *vpn-instance-name*] **destination-ipv6** *ipv6-address* [**source-ipv6** *ipv6-address*] **one-arm-echo discriminator** { **local** *local-value* | **auto** }]

undo bfd static *session-name*

Static BFD session for single-hop detection with IPv4 echo packets (the peer address is fixed at 224.0.0.184):

bfd static *session-name* [**peer-ip default-ip interface** *interface-type interface-number* **source-ip** *ip-address* **discriminator local** *discr-value* **remote** *discr-value*]

undo bfd static *session-name*

Default

No static BFD sessions exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

session-name: Specifies a static BFD session name, a case-sensitive string of 1 to 64 characters.

peer-ip *ipv4-address*: Specifies the peer IPv4 address in dotted decimal notation. It must be a valid unicast IPv4 address. For a static BFD session in control packet mode, the peer IPv4 address and the source IPv4 address determine the path to be detected. For a static BFD session in echo packet mode, the peer IPv4 address and the destination IPv4 address determine the path to be detected.

peer-ipv6 *ipv6-address*: Specifies the peer IPv6 address. For a static BFD session in control packet mode, the peer IPv6 address and the source IPv6 address determine the path to be detected. For a static BFD session in echo packet mode, the peer IPv6 address and the destination IPv6 address determine the path to be detected.

default-ip: Specifies the peer IPv4 address as 224.0.0.184.

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify this option, the static BFD session belongs to the public network.

interface *interface-type interface-number*: Specifies an interface by its type and number. BFD uses the specified interface as the outgoing interface for outgoing packets.

destination-ip *ipv4-address*: Specifies the destination IPv4 address for echo packets, in dotted decimal notation. It must be a valid unicast IPv4 address of the local end.

destination-ipv6 *ipv6-address*: Specifies the destination IPv6 address for echo packets. It must be the IPv6 address of the local end.

source-ip *ipv4-address*: Specifies the source IPv4 address for BFD packets, in dotted decimal notation. It must be a valid unicast IPv4 address.

source-ipv6 *ipv6-address*: Specifies the source IPv6 address for BFD packets.

one-arm-echo: Specifies the static BFD session mode as echo packet mode.

discriminator: Specifies BFD session discriminators.

local *local-value*: Specifies the local discriminator in the range of 1 to 32768.

remote *remote-value*: Specifies the remote discriminator in the range of 1 to 4294967295.

auto: Enables the device to automatically assign local discriminator values to static BFD sessions.

Usage guidelines

By working with Track, a static BFD session can provide fast failure detection. For more information about Track association with BFD, see Track in *Network Management and Monitoring Configuration Guide*.

If a static BFD session in control packet mode is created on the peer device, you must use this command to create a static BFD session on the local device. The BFD session discriminators must match on the local and peer devices. For example, if you configure **bfd static** abc **peer-ip** 20.1.1.1 **vpn-instance** vpn1 **source-ip** 20.1.1.2 **discriminator local** 513 **remote** 514 on the local device, you must configure **bfd static** bcd **peer-ip** 20.1.1.2 **vpn-instance** vpn1 **source-ip** 20.1.1.1 **discriminator local** 514 **remote** 513 on the peer device.

When creating a static BFD session, you must specify a peer IP address. The system checks only the format of the IP address but not its correctness. If the peer IPv4 or IPv6 address is incorrect, the static BFD session cannot be established.

You need to create a static BFD session on only the local device if you use the echo packet mode to perform detection. As a best practice, specify the source IP address for echo packets when creating a static BFD session. Make sure the specified source IP address does not belong to the subnet where a local interface resides. Without a source IP address specified, the device uses the IP address specified in the **bfd echo-source-ip** or **bfd echo-source-ipv6** command as the source IP address of echo packets.

To use a static BFD session in control packet for single-hop detection, you must perform the following configuration:

- Specify the IP address of the peer interface for the **peer-ip**/**peer-ipv6** parameter.
- Specify the IP address of the local interface for the **source-ip**/**source-ipv6** parameter.

The **bfd static** *session-name* command without any parameters specified can only be used to enter the view of an existing static BFD session.

To modify a static BFD session, delete it and then configure a new static BFD session.

If you do not specify a VPN instance or an interface, the device performs multihop detection in the public network.

To detect network layer connectivity, execute the following commands:

- **bfd static** *session-name* **peer-ip** *ipv4-address* **interface** *interface-type interface-number* **source-ip** *ipv4-address* **discriminator local** *local-value* **remote** *remote-value*

  For the static BFD session to be successfully established, make sure the IPv4 addresses of the local and peer interfaces where the static BFD session resides are used as the source and peer IPv4 addresses, respectively.
- **bfd static** *session-name* **peer-ipv6** *ipv6-address* **interface** *interface-type interface-number* **source-ipv6** *ipv6-address* **discriminator local** *local-value* **remote** *remote-value*

  For the static BFD session to be successfully established, make sure the IPv6 addresses of the local and peer interfaces where the static BFD session resides are used as the source and peer IPv6 addresses, respectively.

To detect data link layer connectivity, execute the following command:

- **bfd static** *session-name* **peer-ip default-ip interface** *interface-type interface-number* **source-ip** *ip-address* **discriminator local** *discr-value* **remote** *discr-value*

  If the **process-interface-status** command is also executed, BFD sets the interface state to DOWN(BFD) when detecting a link failure. Specify the IP address of the interface as the source IP address. If the interface does not have an IP address, specify a unicast IP address other than 0.0.0.0 as the source IP address. An interface can use only one static BFD session to detect data link layer connectivity.

For a static BFD session in control packet mode, the source IP address of BFD packets is the IP address specified for the **source-ip**/**source-ipv6** keyword, and the destination IP address is the IP address specified for the **peer-ip**/**peer-ipv6** keyword.

For a static BFD session in echo packet mode, the source IP address of BFD packets is the IP address specified for the **source-ip**/**source-ipv6** keyword, and the destination IP address is the IP address specified for the **destination-ip**/**destination-ipv6** keyword.

BFD supports detecting data link connectivity for the following interface types:

- Layer 3 Ethernet interfaces and subinterfaces. For BFD detection to take effect, do not execute this command on both a Layer 3 Ethernet interface and its subinterface.

- Layer 3 aggregate interfaces, Layer 3 aggregate subinterfaces, and member ports in a Layer 3 aggregation group. For BFD detection to take effect, do not execute this command on any two of the interface types at the same time.
- VLAN interfaces.

Different static BFD sessions cannot have the same local discriminator.

Examples

Create a static BFD session and enter its view. The static BFD session detects the path between 1.1.1.1 and 1.1.1.2 and uses GigabitEthernet 1/0/1 to send BFD packets with source IP address 1.1.1.1 and destination IP address is 1.1.1.2. The local discriminator is 1537, and the remote discriminator is 2048.

```
<Sysname> system-view
[Sysname] bfd static aaaa peer-ip 1.1.1.2 interface gigabitethernet 1/0/1 source-ip
1.1.1.1 discriminator local 1537 remote 2048
[Sysname-bfd-static-session-abc]
```

Create a static BFD session and enter its view. The static BFD session detects the path between 1.1.1.1 and 1.1.1.2 and uses GigabitEthernet 1/0/1 to send BFD packets with source IP address 9.9.9.9 and destination IP address is 1.1.1.2.

```
<Sysname> system-view
[Sysname] bfd static abc peer-ip 1.1.1.1 interface gigabitethernet 1/0/1 destination-ip
1.1.1.2 source-ip 9.9.9.9 one-arm-echo discriminator auto
[Sysname-bfd-static-session-abc]
```

Parameters

discriminator local *local-value*: Specifies a BFD session by its local discriminator in the range of 1 to 4294967295.

name *session-name*: Specifies a static BFD session by its name, a case-sensitive string of 1 to 64 characters.

dynamic: Specifies dynamic BFD sessions.

static: Specifies static BFD sessions.

control: Specifies BFD sessions in control mode.

echo: Specifies BFD sessions in echo mode.

ip: Specifies BFD sessions used to detect IPv4 links.

ipv6: Specifies BFD sessions used to detect IPv6 links.

state: Displays BFD sessions by session state.

down: Specifies BFD sessions in Down state.

admin-down: Specifies BFD sessions in AdminDown state.

init: Specifies BFD sessions in Init state.

up: Specifies BFD sessions in Up state.

discriminator remote *remote-value*: Specifies a BFD session by its remote discriminator in the range of 1 to 4294967295.

peer-ip *ipv4-address*: Specifies a BFD session by the peer IPv4 address in dotted decimal notation.

peer-ipv6 *ipv6-address*: Specifies a BFD session by the peer IPv6 address.

vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify this option, the command displays information for the BFD sessions of the public network.

verbose: Displays detailed BFD session information.

Usage guidelines

If you do not specify the **dynamic** or **static** keyword, this command displays all dynamic and static BFD sessions.

Examples

Display brief information about all BFD sessions.

```
<Sysname> display bfd session
 Total sessions: 9        Up sessions: 9        Init mode: Active

 IPv4 session working in control packet mode:

 LD/RD           SourceIP        DestinationIP   State   Holdtime    Interface
 513/513         1.1.1.1         1.1.1.2         Up      2297ms      GE1/0/1

 IPv6 session working in control packet mode:

      Local discr: 513                  Remote discr: 513
        Source IP: FE80::20C:29FF:FED4:7171
   Destination IP: FE80::20C:29FF:FE72:AC4D
    Session state: Up                      Interface: GE1/0/1
        Hold time: 2142ms

 IPv4 static session working in control packet mode:

 LD/RD           SourceIP        DestinationIP   State   Holdtime    Interface
 1017/7101       2.1.1.1         2.1.1.2         Up      4988ms      GE1/0/1

 IPv6 static session working in control packet mode:

      Local discr: 1226                 Remote discr: 6221
        Source IP: 12::1
   Destination IP: 12::2
```

```
     Session state: Up                     Interface: GE1/0/1
         Hold time: 4812ms

IPv4 static session working in echo mode:

 LD              SourceIP        DestinationIP   State   Holdtime    Interface
 1226            192.168.51.1    192.168.51.5    Up      4238ms      GE1/0/1

 IPv6 static session working in echo mode:

       Local discr: 2012
         Source IP: 15::1
    Destination IP: 15::5
     Session state: Up                     Interface: GE1/0/1
         Hold time: 4626ms
```

Table 3 Command output

Field	Description
Total sessions	Total number of BFD sessions.
Up sessions	Total number of active BFD sessions.
Init mode	BFD operating mode: **Active** or **Passive**.
IPv4 session working in control packet mode	BFD session type and operating mode: • **IPv4 session working in control packet mode**. • **IPv4 session working in echo mode**. • **IPv6 session working in control packet mode**. • **IPv6 session working in echo mode**. • **IPv4 static session working in control packet mode**. • **IPv4 static session working in echo mode**. • **IPv6 static session working in control packet mode**. • **IPv6 static session working in echo mode.**
LD/RD	Local discriminator/Remote discriminator of the session.
Source IP	Source IPv4 address of the session.
Destination IP	Destination IPv4 address of the session.
State	Session state: **Down**, **Init**, **Adown**, or **Up**.
Holdtime	Length of time before session detection timer expires. For a BFD session in **Down** state, this field displays **0ms**.
Interface	Name of the interface of the session.
Local discr	Local discriminator of the session.
Remote discr	Remote discriminator of the session.
Session state	Session state: **Down**, **Adown**, **Init**, or **Up**.
Hold time	Length of time before session detection timer expires. For a BFD session in **Down** state, this field displays **0ms**.

Display detailed information about all BFD sessions.

```
<Sysname> display bfd session verbose
```

Table 4 Command output

Field	Description
Total sessions	Total number of BFD sessions.
Up sessions	Total number of active BFD sessions.
Init mode	BFD operating mode: Active or Passive.
IPv4 session working in control packet mode	BFD session type and operating mode: • **IPv4 session working in control packet mode**. • **IPv4 session working in echo mode**. • **IPv6 session working in control packet mode**. • **IPv6 session working in echo mode**. • **IPv4 static session working in control packet mode**. • **IPv4 static session working in echo mode**. • **IPv6 static session working in control packet mode**. • **IPv6 static session working in echo mode**.
Local discr	Local ID of the session.
Remote discr	Remote ID of the session.
Source IP	Source IP address of the session.
Destination IP	Destination IP address of the session.
Session state	Session state: **Down**, **Init**, or **Up**.
Interface	Name of the interface of the session.
Min Tx interval	Minimum transmit interval.
Min Rx interval	Minimum receive interval.
Actual Tx interval	Actual transmit interval.
Detection time	Actual session detection timer.
Rx count	Number of packets received.
Tx count	Number of packets sent.
Connection type	Connection type of the interface: Direct or indirect.
Up duration	Time period for which the session has been up.
Hold time	Length of time before session detection timer expires. For a BFD session in down state, this field displays **0ms**.
Auth mode	Session authentication mode.
Connect type	Connection type of the interface: Direct or indirect.
Up duration	Time period for which the session has been up.

Field	Description
Detection mode	Detection mode: • **Async**—Asynchronous mode. • **Demand**—Demand mode. • **Async/Echo**—Asynchronous mode with echo function enabled. • **Demand/Echo**—Demand mode with echo function enabled.
Slot	Slot number of the card where the BFD session resides.
Protocol	Protocol associated with BFD: • **OSPF**. • **ISIS_BR_L1**—IS-IS with the network type as broadcast and the router type as Level 1. • **ISIS_BR_L2**—IS-IS with the network type as broadcast and the router type as Level 2. • **ISIS_P2P**—IS-IS with the network type as P2P. • **ISIS6_BR_L1**—IPv6 IS-IS with the network type as broadcast and the router type as Level 1. • **ISIS6_BR_L2**—IPv6 IS-IS with the network type as broadcast and the router type as Level 2. • **ISIS6_P2P**—IPv6 IS-IS with the network type as P2P. • **BGP**. • **STATIC4**—IPv4 static routing. • **TRACK**—Track. • **RIP**. • **IPFRR**—FIB IP FRR. • **MAD**. • **OSPFv3**. • **BGP4+**. • **PIM**. • **STATIC6**—IPv6 static routing. • **RIPNG**—RIPng. • **Interface**—Interface state. • **TUNNEL**. • **STATIC_IPv4**—IPv4 static BFD session. • **STATIC_IPv6**—IPv6 static BFD session.
Diag info	Diagnostic information about the session: • **No Diagnostic**. • **Control Detection Time Expired**—A control-mode BFD session goes down because local detection times out. • **Echo Function Failed**—An echo-mode BFD session goes down, because local detection times out or the source IP address of echo packets is deleted. • **Neighbor Signaled Session Down**—The remote end notifies the local end of BFD session down. • **Administratively Down**—The local system prevents a BFD session from being established.

first-fail-timer

Use **first-fail-timer** to configure the timer that delays reporting the first BFD session establishment failure to the data link layer.

Use **undo first-fail-timer** to restore the default.

Syntax

first-fail-timer *seconds*

undo first-fail-timer

The following compatibility matrixes show the support of hardware platforms for this command:

Models	Command compatibility
NFNX5-HD6480, NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB1780, NFNX3-HDB3080	No
NFNX3-HDB1180, NFNX3-HDB1480, NFNX3-HDB680, NFNX3-HDB1080	Yes

Default

The first BFD session establishment failure is not reported to the data link layer.

Views

Static BFD session view

Predefined user roles

network-admin

context-admin

Parameters

seconds: Specifies the timeout time that reports the first BFD session establishment failure to the data link layer. The value range for this argument is 1 to 10000 seconds.

Usage guidelines

This command takes effect only on static BFD sessions after you configure the **process-interface-status** command.

If the static BFD session fails to be established when the timer expires, BFD reports the failure to the data link layer and sets the data link layer state of the interface to DOWN(BFD). This behavior rapidly identifies the interfaces for which BFD sessions fail to be established. In this case, the BFD session state is displayed as Down in the **display bfd session** command output. The line protocol state of the interface is displayed as DOWN(BFD) in the **display interface** command output.

If you execute the command on the local end, the BFD session for detecting the local interface state fails to be established when the following conditions exist:

- The command is not executed on the remote end.
- The local and remote ends have mismatching BFD authentication settings.

Examples

Configure the timer that delays reporting the first BFD session establishment failure as 100 seconds.

```
<Sysname> system-view
[Sysname] bfd static abc peer-ip default-ip interface gigabitethernet 1/0/1 source-ip
10.1.1.1 discriminator local 1 remote 1
[Sysname-bfd-static-session-1] first-fail-timer 100
```

Related commands

bfd static

display interface (*Interface Command Reference*)

processing-interface-status

process-interface-status

Use **process-interface-status** to associate the interface state with a static BFD session.

Use **undo process-interface-status** to restore the default.

Syntax

process-interface-status

undo process-interface-status

The following compatibility matrixes show the support of hardware platforms for this command:

Models	Command compatibility
NFNX5-HD6480, NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB1780, NFNX3-HDB3080	No
NFNX3-HDB1180, NFNX3-HDB1480, NFNX3-HDB680, NFNX3-HDB1080	Yes

Default

The state of a static BFD session does not affect the state of the data link layer of the interface.

Views

Static BFD session view

Predefined user roles

network-admin

context-admin

Usage guidelines

This command enables a static BFD session with peer address 224.0.0.184 to set the link layer protocol of the interface to DOWN(BFD) when detecting a link failure. To display information about the link layer protocol state, use the **display interface** command.

Examples

Associate the state of GigabitEthernet 1/0/1 with static BFD session **abc**.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname] bfd static abc peer-ip default-ip interface gigabitethernet 1/0/1 source-ip
10.1.1.1 discriminator local 1 remote 1
[Sysname-bfd-static-session-abc] process-interface-status
```

Related commands

bfd static

display interface

reset bfd session statistics

Use **reset bfd session statistics** to clear the BFD session statistics.

Syntax

reset bfd session statistics

Views

User view

Predefined user roles

network-admin

context-admin

Examples

Clear the BFD session statistics.

```
<Sysname> reset bfd session statistics
```

snmp-agent trap enable bfd

Use **snmp-agent trap enable bfd** to enable SNMP notifications for BFD.

Use **undo snmp-agent trap enable bfd** to disable SNMP notifications for BFD.

Syntax

snmp-agent trap enable bfd

undo snmp-agent trap enable bfd

Default

All SNMP notifications are enabled for BFD.

Views

System view

Predefined user roles

network-admin

context-admin

Usage guidelines

To report critical BFD events to an NMS, enable SNMP notifications for BFD. For BFD event notifications to be sent correctly, you must also configure SNMP as described in the network management and monitoring configuration guide for the device.

Examples

Disable SNMP notifications for BFD.

```
<Sysname> system-view
[Sysname] undo snmp-agent trap enable bfd
```

special-processing

Use **special-processing** to enable special processing for a static BFD session used to detect data link layer connectivity.

Use **undo special-processing** to disable special processing for the static BFD session.

Syntax

special-processing [**admin-down** | **authentication-change** | **session-up**] *

undo special-processing [**admin-down** | **authentication-change** | **session-up**] *

The following compatibility matrixes show the support of hardware platforms for this command:

Models	Command compatibility
NFNX5-HD6480, NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB1780, NFNX3-HDB3080	No
NFNX3-HDB1180, NFNX3-HDB1480, NFNX3-HDB680, NFNX3-HDB1080	Yes

Default

All types of special processing are disabled for a static BFD session used to detect data link layer connectivity.

Views

Static BFD session view

Predefined user roles

network-admin

context-admin

Parameters

admin-down: Notifies a session down event to the data link layer upon receipt of a BFD packet with the State field as AdminDown. This keyword helps rapidly discover interfaces on which BFD sessions are manually shut down. If you do not specify this keyword, the device sets the BFD session state to Down, but does not notify the session down event to the data link layer.

authentication-change: Immediately sets the session to down state upon a local authentication information change. This keyword helps rapidly discover interfaces with authentication information changes. If you do not specify this keyword, the device sets the session to down state if authentication information inconsistency still persists after a period of time.

session-up: Ignores authentication information inconsistency when the local session is up. If a large number of BFD sessions exist, examining authentication information consistency affects device performance. If you do not specify this keyword, the device examines authentication information in incoming BFD packets when the local session state is up. If the authentication information does not match on the two ends, the BFD session is declared down.

Usage guidelines

If you do not specify any parameters, this command enables or disables all types of special processing.

Examples

Enable all types of special processing for a static BFD session whose outgoing interface is GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] bfd static abc peer-ip default-ip interface gigabitethernet 1/0/1 source-ip 10.1.1.1 discriminator local 1 remote 1
[Sysname-bfd-static-session-1] special-processing
```

Monitor Link commands

display monitor-link group

Use **display monitor-link group** to display information about monitor link groups.

Syntax

display monitor-link group { *group-id* | **all** }

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

group-id: Specifies a monitor link group by its ID. The value range for this argument is 1 to 16.

all: Specifies all monitor link groups.

Usage guidelines

This command does not display information about ports that belong to a link aggregation group.

Examples

Display information about all monitor link groups.

```
<Sysname> display monitor-link group all
Monitor link protocol status: Disabled
Monitor link group 1 information:
  Group status     : N/A
  Downlink up-delay: 0(s)
  Last-up-time     : -
  Last-down-time   : -

  Member                    Role       Status
  ------------------------------------------------
  GE1/0/1                   UPLINK     UP
  GE1/0/2                   DOWNLINK   UP
```

Table 1 Command output

Field	Description
Monitor link protocol status	Whether Monitor Link is enabled: • Enabled. • Disabled.

Field	Description
Group status	Monitor link group status: • **DOWN**. • **UP**. • **N/A**—Monitor Link is disabled globally. The monitor link group does not operate.
Downlink up-delay	Switchover delay of the downlink interfaces in the monitor link group, in seconds.
Last-up-time	Last time when the monitor link group came up.
Last-down-time	Last time when the monitor link group went down.
Member	Member interfaces of the monitor link group.
Role	Interface role, which can be uplink interface or downlink interface.
Status	Member interface state: • **DOWN**. • **DOWN (Monitor Link)**—The member interface is shut down by Monitor Link. • **UP**.

downlink up-delay

Use **`downlink up-delay`** to set the switchover delay for the downlink interfaces in a monitor link group.

Use **`undo downlink up-delay`** to restore the default.

Syntax

`downlink up-delay` *`delay`*

`undo downlink up-delay`

Default

The switchover delay is 0 seconds. The downlink interfaces come up as soon as an uplink interface in the monitor link group comes up.

Views

Monitor link group view

Predefined user roles

network-admin

context-admin

Parameters

`delay`: Sets the switchover delay in the range of 1 to 300 seconds.

Usage guidelines

To avoid frequent state changes of downlink interfaces in the event that the uplink interfaces in the monitor link group flap, you can configure a switchover delay. The switchover delay is the time that the downlink interfaces wait before they come up following an uplink interface.

Examples

Set the switchover delay to 50 seconds for the downlink interfaces in monitor link group 1.

```
<Sysname> system-view
[Sysname] monitor-link group 1
[Sysname-mtlk-group1] downlink up-delay 50
```

monitor-link disable

Use **monitor-link disable** to disable Monitor Link globally.

Use **undo monitor-link disable** to enable Monitor Link globally.

Syntax

monitor-link disable

undo monitor-link disable

Default

Monitor Link is enabled globally.

Views

System view

Predefined user roles

network-admin

context-admin

Usage guidelines

All monitor link groups can operate only after you enable Monitor Link globally. When you disable Monitor Link globally, all monitor link groups cannot operate and the downlink interfaces brought down by the monitor link groups resume their original states.

Examples

Disable Monitor Link globally.

```
<Sysname> system-view
[Sysname] monitor-link disable
```

monitor-link group

Use **monitor-link group** to create a monitor link group and enter its view, or enter the view of an existing monitor link group.

Use **undo monitor-link group** to remove a monitor link group.

Syntax

monitor-link group *group-id*

undo monitor-link group *group-id*

Default

No monitor link groups exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

group-id: Specifies a monitor link group ID. The value range for this argument is 1 to 16.

Examples

Create monitor link group 1 and enter its view.

```
<Sysname> system-view
[Sysname] monitor-link group 1
[Sysname-mtlk-group1]
```

port

Use **port** to assign an interface to a monitor link group.

Use **undo port** to remove an interface from a monitor link group.

Syntax

port *interface-type* { *interface-number* | *interface-number.subnumber* } { **downlink** | **uplink** }

undo port *interface-type interface-number*

Default

No member interfaces exist in a monitor link group.

Views

Monitor link group view

Predefined user roles

network-admin

context-admin

Parameters

interface-type: Specifies an interface by its type.

interface-number: Specifies an interface by its number.

interface-number.subnumber: Specifies an existing subinterface by its number.

downlink: Specifies a downlink interface.

uplink: Specifies an uplink interface.

Usage guidelines

You can assign an interface to only one monitor link group.

You can also assign an interface to a monitor link group by using the **port monitor-link group** command in interface view.

If you have configured an interface as the downlink interface of a monitor link group, do not configure its subinterfaces as the uplink interfaces of any monitor link group.

Because the state of subinterfaces is associated with the state of the interface, do not add them to the same monitor link group.

If you have configured a Selected port of an aggregation group as the downlink interface of a monitor link group, do not configure an Unselected port of the aggregation group as the uplink interface of the monitor link group.

Do not assign an aggregate interface and member ports of the aggregate group to the same monitor link group.

Examples

Configure GigabitEthernet 1/0/1 as an uplink interface and GigabitEthernet 1/0/2 as a downlink interface for monitor link group 1.

```
<Sysname> system-view
[Sysname] monitor-link group 1
[Sysname-mtlk-group1] port gigabitethernet 1/0/1 uplink
[Sysname-mtlk-group1] port gigabitethernet 1/0/2 downlink
```

Related commands

port monitor-link group

port monitor-link group

Use **port monitor-link group** to assign an interface to a monitor link group.

Use **undo port monitor-link group** to remove an interface from a monitor link group.

Syntax

port monitor-link group *group-id* { **downlink** | **uplink** }

undo port monitor-link group *group-id*

Default

An interface is not a monitor link group member.

Views

Layer 2 Ethernet interface view

Parameters

group-id: Specifies a monitor link group by its ID. The value range for this argument is 1 to 16.

downlink: Specifies a downlink interface.

uplink: Specifies an uplink interface.

Usage guidelines

You can assign an interface to only one monitor link group.

You can also assign an interface to a monitor link group by using the **port** command in monitor link group view.

If you have configured an interface as the downlink interface of a monitor link group, do not configure its subinterfaces as the uplink interfaces of any monitor link group.

Because the state of subinterfaces is associated with the state of the interface, do not add the interface and its subinterfaces to the same monitor link group.

If you have configured a Selected port of an aggregation group as the downlink interface of a monitor link group, do not configure an Unselected port of the aggregation group as the uplink interface of the monitor link group.

Do not assign an aggregate interface and member ports of the aggregate group to the same monitor link group.

Examples

Configure GigabitEthernet 1/0/1 as an uplink interface and GigabitEthernet 1/0/2 as a downlink interface for monitor link group 1.

```
<Sysname> system-view
[Sysname] monitor-link group 1
[Sysname-mtlk-group1] quit
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] port monitor-link group 1 uplink
[Sysname-GigabitEthernet1/0/1] quit
[Sysname] interface gigabitethernet 1/0/2
[Sysname-GigabitEthernet1/0/2] port monitor-link group 1 downlink
```

display smart-link flush

Use **display smart-link flush** to display information about the received flush messages.

Syntax

display smart-link flush

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Examples

Display information about the received flush messages.

```
<Sysname> display smart-link flush
 Received flush packets                          : 10
 Receiving interface of the last flush packet    : GigabitEthernet1/0/1
 Receiving time of the last flush packet         : 19:19:03 2012/04/21
 Device ID of the last flush packet              : 000f-e200-8500
 Control VLAN of the last flush packet           : 1
```

Table 1 Command output

Field	Description
Received flush packets	Total number of received flush messages.
Receiving interface of the last flush packet	Port that received the last flush message.
Receiving time of the last flush packet	Time when the last flush message was received.
Device ID of the last flush packet	Device ID carried in the last flush message.
Control VLAN of the last flush packet	Control VLAN ID carried in the last flush message.

Related commands

reset smart-link statistics

display smart-link group

Use **display smart-link group** to display information about the specified or all smart link groups.

Syntax

display smart-link group { *group-id* | **all** }

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

group-id: Specifies a smart link group by its ID. The value range for this argument is 1 to 48.

all: Displays information about all smart link groups.

Examples

Display information about smart link group 1.

```
<Sysname> display smart-link group 1
Smart link group 1 information:
  Device ID       : 0011-2200-0001
  Preemption mode : None
  Preemption delay: 1(s)
  Control VLAN    : 1
  Protected VLAN  : Reference Instance 2, 4

  Member                  Role      State   Flush-count     Last-flush-time
  ------------------------------------------------------------------------------
  GE1/0/1                 PRIMARY   ACTIVE  1               16:45:20 2012/04/21
  GE1/0/2                 SECONDARY STANDBY 2               16:37:20 2012/04/21
```

Table 2 Command output

Field	Description
Preemption mode	Preemption mode: • **None**—Preemption disabled. • **Role**—Role preemption mode. • **Speed**—**Speed preemption mode.**
Preemption delay	Preemption delay time, in seconds.
Control-VLAN	Control VLAN ID.
Protected VLAN	Protected VLANs of the smart link group. Referenced Multiple Spanning Tree Instances (MSTIs) are displayed. To view the VLANs mapped to the referenced MSTIs, use the **display stp region-configuration** command.
Member	Member port of the smart link group.
Role	Port role: primary or secondary.
State	Port state: active, down, or standby.
Flush-count	Number of transmitted flush messages.
Last-flush-time	Time when the last flush message was transmitted (NA indicates that no flush message has been transmitted).

flush enable

Use **flush enable** to enable flush update.

Use **undo flush enable** to disable flush update.

Syntax

flush enable [**control-vlan** *vlan-id*]

undo flush enable

Default

Flush update is enabled for smart link groups, and VLAN 1 is used for flush message transmission.

Views

Smart link group view

Predefined user roles

network-admin

context-admin

Parameters

control-vlan *vlan-id*: Specifies the control VLAN used for transmitting flush messages. The *vlan-id* argument represents the control VLAN ID and is in the range of 1 to 4094.

Usage guidelines

You must configure different control VLANs for different smart link groups.

- Make sure the configured control VLAN already exists, and assign the smart link group member ports to the control VLAN.
- The control VLAN of a smart link group must also be one of its protected VLANs. Do not remove the control VLAN. Otherwise, flush messages cannot be sent correctly.

Examples

Disable flush update for smart link group 1.

```
<Sysname> system-view
[Sysname] smart-link group 1
[Sysname-smlk-group1] undo flush enable
```

Related commands

smart-link flush enable

port

Use **port** to assign a port to a smart link group and specify the port role.

Use **undo port** to remove a port from a smart link group.

Syntax

port *interface-type interface-number* { **primary** | **secondary** }

undo port *interface-type interface-number*

Default

No member ports exist in a smart link group.

Views

Smart link group view

Predefined user roles

network-admin

context-admin

Parameters

interface-type interface-number: Specifies a port by its type and number, which can be a Layer 2 Ethernet interface or Layer 2 aggregate interface.

primary: Specifies a port as the primary port.

secondary: Specifies a port as the secondary port.

Usage guidelines

Before configuring member ports for a smart link group, you must configure protected VLANs for the smart link group.

Disable the spanning tree feature on the ports you want to add to the smart link group. You cannot enable the spanning tree feature on a smart link group member port.

If you configure a port as both an aggregation group member and a smart link group member, only the aggregation group member configuration takes effect. The port is not shown in the output from the **display smart-link group** command. The smart link group member configuration takes effect after the port leaves the aggregation group.

You can also assign a port to a smart link group by using the **port smart-link group** command in interface view.

Examples

Configure GigabitEthernet 1/0/1 as the secondary port of smart link group 1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] undo stp enable
[Sysname-GigabitEthernet1/0/1] quit
[Sysname] smart-link group 1
[Sysname-smlk-group1] protected-vlan reference-instance 0
[Sysname-smlk-group1] port gigabitethernet 1/0/1 secondary
```

Related commands

port smart-link group

port smart-link group

Use **undo port smart-link group** to remove a port from a smart link group.

Syntax

port smart-link group *group-id* { **primary** | **secondary** }

undo port smart-link group *group-id*

Default

A port is not a smart link group member.

Views

Layer 2 Ethernet interface view

Layer 2 aggregate interface view

Predefined user roles

network-admin

context-admin

Parameters

group-id: Specifies a smart link group by its ID. The value range for this argument is 1 to 48.

primary: Specifies the port as the primary port.

secondary: Specifies the port as the secondary port.

Usage guidelines

Before configuring member ports for a smart link group, you must configure protected VLANs for the smart link group.

Disable the spanning tree feature on the ports you want to add to the smart link group. You cannot enable the spanning tree feature on a smart link group member port.

If you configure a port as both an aggregation group member and a smart link group member, only the aggregation group member configuration takes effect. The port is not shown in the output from the **display smart-link group** command. The smart link group member configuration takes effect after the port leaves the aggregation group.

You can assign a port to a smart link group by using the **port** command in smart link group view.

Examples

Configure GigabitEthernet 1/0/1 as the primary port of smart link group 1.

```
<Sysname> system-view
[Sysname] smart-link group 1
[Sysname-smlk-group1] protected-vlan reference-instance 0
[Sysname-smlk-group1] quit
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] undo stp enable
[Sysname-GigabitEthernet1/0/1] port smart-link group 1 primary
```

Configure Layer 2 aggregate interface 1 as the primary port of smart link group 1.

```
<Sysname> system-view
[Sysname] smart-link group 1
[Sysname-smlk-group1] protected-vlan reference-instance 0
[Sysname-smlk-group1] quit
[Sysname] interface bridge-aggregation 1
[Sysname-Bridge-Aggregation1] undo stp enable
[Sysname-Bridge-Aggregation1] port smart-link group 1 primary
```

Related commands

port

preemption delay

Use **preemption delay** to set the preemption delay.

Use **undo preemption delay** to restore the default.

Syntax

preemption delay *delay*

undo preemption delay

Default

The preemption delay is 1 second.

Views

Smart link group view

Predefined user roles

network-admin

context-admin

Parameters

delay: Specifies the preemption delay in the range of 0 to 300 seconds.

Usage guidelines

Preemption delay is the period of time that the primary port waits before taking over to collaborate with the switchover of upstream devices.

The preemption delay configuration takes effect only after a preemption mode is configured.

Examples

Enable role preemption and set the preemption delay to 10 seconds.

```
<Sysname> system-view
[Sysname] smart-link group 1
[Sysname-smlk-group1] preemption mode role
[Sysname-smlk-group1] preemption delay 10
```

Related commands

preemption mode

preemption mode

Use **preemption mode** to configure a preemption mode for a smart link group.

Use **undo preemption mode** to restore the default.

Syntax

preemption mode { **role** | **speed** [**threshold** *threshold-value*] }

undo preemption mode

Default

No preemption mode is configured for a smart link group.

Views

Smart link group view

Predefined user roles

network-admin

context-admin

Parameters

role: Specifies the role preemption mode, which enables the primary port to transition to forwarding state after the primary link recovers.

speed: Specifies the speed preemption mode.

threshold *threshold-value*: Specifies the speed preemption threshold in percentage. The value range for the *threshold-value* argument is 1 to 10000.

Usage guidelines

If you specify the speed preemption mode, the following conditions occur when the primary link recovers:

- If you specify the **threshold** *threshold-value* option, the primary port transitions to forwarding state when the following condition is met:

  The difference between the primary port speed and the secondary port speed equals or exceeds the threshold value (in percentage) of the secondary port speed.
- If you do not specify the **threshold** *threshold-value* option, the primary port transitions to forwarding state when the primary port speed exceeds the secondary port speed.

Examples

Configure the role preemption mode.

```
<Sysname> system-view
[Sysname] smart-link group 1
[Sysname-smlk-group1] preemption mode role
```

Configure the speed preemption mode and specify the speed preemption threshold as 1000.

```
<Sysname> system-view
[Sysname] smart-link group 1
[Sysname-smlk-group1] preemption mode speed threshold 1000
```

protected-vlan

Use **protected-vlan** to configure protected VLANs for a smart link group.

Use **undo protected-vlan** to remove the protected VLAN of a smart link group.

Syntax

protected-vlan reference-instance *instance-id-list*

undo protected-vlan [**reference-instance** *instance-id-list*]

Default

A smart link group does not have protected VLANs.

Views

Smart link group view

Predefined user roles

network-admin

context-admin

Parameters

reference-instance *instance-id-list*: Specifies a space-separated list of up to 10 MSTI items. Each item specifies an MSTI ID or a range of MSTI IDs in the form of *instance-id 1* **to** *instance-id 2*. The value range for MSTI IDs is 0 to 4094. 0 represents the common internal

spanning tree (CIST). The *instance-id 2* must be equal to or greater than *instance-id 1*. You can use the **display stp region-configuration** command to display instance-to-VLAN mappings.

Usage guidelines

You must configure all VLANs to which the member ports of a smart link group belongs as protected VLANs.

If the VLAN-to-MSTI mappings change, the protected VLANs change.

To remove protected VLAN configuration, follow these restrictions and guidelines:

- If you specify the **reference-instance** *instance-id-list* option, the **undo protected-vlan** command removes configuration of VLANs mapped to the specified MSTIs. If you do not specify the **reference-instance** *instance-id-list* option, the command removes configuration of all protected VLANs.
- If a smart link group has member ports, you cannot remove protected VLAN configuration. If a smart link group does not have member ports, you can remove protected VLAN configuration.

Examples

Map VLANs 1 through 30 to MSTI 1, and activate the MST region configuration. Configure the VLANs mapped to MSTI 1 as the protected VLANs of smart link group 1.

```
<Sysname> system-view
[Sysname] stp region-configuration
[Sysname-mst-region] instance 1 vlan 1 to 30
[Sysname-mst-region] active region-configuration
[Sysname-mst-region] quit
[Sysname] smart-link group 1
[Sysname-smlk-group1] protected-vlan reference-instance 1
```

Parameters

group-id: Specifies a smart link group ID. The value range for this argument is 1 to 48.

Usage guidelines

You cannot remove a smart link group with member ports.

Examples

Create smart link group 1 and enter its view.

```
<Sysname> system-view
[Sysname] smart-link group 1
[Sysname-smlk-group1]
```

Contents

Interface backup commands

backup interface

Use **backup interface** to specify a backup interface for an interface.

Use **undo backup interface** to remove a backup interface.

Syntax

backup interface *interface-type interface-number* [*priority*]

undo backup interface *interface-type interface-number*

Default

An interface does not have backup interfaces.

Views

Interface view

Predefined user roles

network-admin

context-admin

Parameters

interface-type interface-number: Specifies a backup interface by its type and number.

priority: Assigns a priority to the backup interface. The value range is 0 to 255, and the default is 0. The greater the value, the higher the priority.

Usage guidelines

Use this command on the primary interface to specify its backup interfaces. If you also configure the traffic thresholds, the primary and backup interfaces operate in load balancing mode. If you do not configure the traffic thresholds, the primary and backup interfaces operate in strict active/standby mode.

Backup interface priority is used for interface backup to make interface activation or deactivation decisions when the primary interface fails or is overloaded. Backup interfaces are activated in descending order of priority, with the highest-priority interface deactivated first. In contrast, they are deactivated in ascending order of priority, with the lowest-priority interface deactivated first.

Once a backup interface is activated to forward traffic, only the primary interface can preempt it. A higher-priority backup interface cannot preempt a lower-priority backup interface that has taken over the primary interface.

Use Table 1 when you configure primary and backup interfaces.

Table 1 Restrictions on the primary and backup interfaces

Item	Restrictions
Maximum number of primary interfaces/device	10.
Backup interfaces/primary interface	3.

Item	Restrictions
Configuration restrictions	• An interface can only be the backup of one interface. • A primary interface cannot be configured as a backup interface at the same time. • A main interface and its subinterfaces cannot be the backup of each other. • The primary and backup interfaces cannot be members of a logical link. For example, they cannot be members of a Layer 3 aggregation group.

This command and the **backup track** command are mutually exclusive.

- If you have configured the **backup interface** command on the primary interface, you cannot configure the **backup track** command on the primary or backup interface.
- If you have associated a backup interface with a track entry, you cannot configure the **backup interface** command on it or specify it as a backup interface by using the **backup interface** command.

Examples

Specify GigabitEthernet 1/0/2 as a backup interface of GigabitEthernet 1/0/1, with a priority of 50.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] backup interface gigabitethernet 1/0/2 50
```

Related commands

backup track

backup threshold

Use **backup threshold** to configure traffic thresholds on a primary interface for load sharing.

Use **undo backup threshold** to restore the default.

Syntax

backup threshold *upper-threshold lower-threshold*

undo backup threshold

Default

No traffic thresholds are configured.

Views

Interface view

Predefined user roles

network-admin

context-admin

Parameters

upper-threshold: Specifies the upper threshold as a percentage of bandwidth available on the primary interface. The value range is 1 to 99.

lower-threshold: Specifies the lower threshold as a percentage of bandwidth available on the primary interface. The value range is 1 to 99.

NOTE:

To set the bandwidth used for load sharing calculation in this command, use the **bandwidth** command on the primary interface.

Usage guidelines

Before you can use this command on an interface, you must specify a minimum of one backup interface for the interface.

This command enables a primary interface and its backup interfaces to be load shared. In load sharing mode, interface backup regularly compares the amount of traffic with the thresholds.

- When the amount of traffic on the primary interface exceeds the upper threshold, the backup interfaces are activated to share load in descending order of backup priority.
- When the total amount of traffic on all the load-shared interfaces drops below the lower threshold, the backup interfaces are deactivated in ascending order of priority. As a best practice, configure the lower threshold smaller than half of the upper threshold to prevent link flapping from causing frequent interface switchovers.
- When the primary interface goes down, the active/standby mode applies. Only the highest-priority interface is activated.

You can configure the traffic polling interval by using the **backup timer flow-check** command.

NOTE:

- "Traffic" on an interface refers to the amount of incoming or outgoing traffic, whichever is higher.
- If two backup interfaces have the same priority, the one configured first has preference.

Examples

On GigabitEthernet 1/0/1, set the upper and lower traffic thresholds to 80 and 20, respectively.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] backup threshold 80 20
```

Related commands

backup interface

backup timer flow-check

backup timer delay

Use **backup timer delay** to set interface state switchover delay timers on a primary interface.

Use **undo backup timer delay** to restore the default.

Syntax

backup timer delay *up-delay down-delay*

undo backup timer delay

Default

Both up and down delay timers are 5 seconds.

Views

Interface view

Predefined user roles

network-admin

context-admin

Parameters

up-delay: Specifies the number of seconds that the primary or backup interface must wait before it can come up. The value range is 1 to 65535 seconds.

down-delay: Specifies the number of seconds that the active primary or backup interface must wait before it is set to down state. The value range is 1 to 65535 seconds.

Usage guidelines

Before you can use this command on an interface, you must specify at least one backup interface for the interface.

The switchover delay mechanism prevents link flapping from causing frequent interface switchovers. When the link of the active interface fails, the interface state does not change immediately. Instead, a down delay timer starts. If the link recovers before the timer expires, the interface state does not change. If the link is still down when the timer expires, the interface state changes to down.

Examples

Specify GigabitEthernet 1/0/2 as a backup of GigabitEthernet 1/0/1, and set both up and down delay timers to 10 seconds.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] backup interface gigabitethernet 1/0/2
[Sysname-GigabitEthernet1/0/1] backup timer delay 10 10
```

Related commands

backup interface

backup timer flow-check

Use **backup timer flow-check** to configure the traffic polling interval on a primary interface.

Use **undo backup timer flow-check** to restore the default.

Syntax

backup timer flow-check *interval*

undo backup timer flow-check

Default

The traffic polling interval is 30 seconds.

Views

Interface view

Predefined user roles

network-admin

context-admin

Parameters

interval: Specifies a traffic polling interval in the range of 30 to 600 seconds.

Usage guidelines

Before you can use this command on an interface, you must specify at least one backup interface for the interface.

This command takes effect when the primary and backup interfaces operate in load sharing mode. Interface backup compares the amount of traffic with the thresholds at this interval to determine whether to activate or deactivate a backup interface.

Examples

Set the traffic polling interval to 60 seconds on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] backup timer flow-check 60
```

Related commands

backup interface

backup track

Use **backup track** to associate a backup interface with a track entry.

Use **undo backup track** to restore the default.

Syntax

backup track *track-entry-number*

undo backup track

Default

An interface is not associated with a track entry.

Views

Interface view

Predefined user roles

network-admin

context-admin

Parameters

track-entry-number: Specifies a track entry ID in the range of 1 to 1024.

Usage guidelines

To change the state of a backup interface response to the link state of the primary interface, use this command. For the setting to work, you must configure the track entry to monitor the state of the primary link. For more information about configuring a track entry, see *Network Management and Monitoring Configuration Guide*.

You can associate an interface with only one track entry. If you execute this command multiple times, the most recent configuration takes effect.

You can create the associated track entry before or after the association. The association takes effect after the track entry is created.

To maintain performance, limit the number of associations to 64.

This command and the **backup interface** command are mutually exclusive.

- If you have configured the **backup interface** command on the primary interface, you cannot configure the **backup track** command on the primary or backup interface.

- If you have associated a backup interface with a track entry, you cannot configure the **backup interface** command on it or specify it as a backup interface by using the **backup interface** command.

Examples

Associate GigabitEthernet 1/0/1 with track entry 1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] backup track 1
```

Use **display interface-backup state** to display state information for primary and backup interfaces.

Syntax

display interface-backup state

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Examples

Display state information for primary and backup interfaces.

```
<Sysname> display interface-backup state
Interface: GE1/0/1
  UpDelay: 10 s
  DownDelay: 5 s
  Upper threshold: 80
  Lower threshold: 20
State: DOWN
  Backup interfaces:
    GE1/0/2             Priority: 30   State: UP_DELAY
    GE1/0/3             Priority: 20   State: STANDBY

IB Track Information:
  GE1/0/4             Track: 1  State: STANDBY
  GE1/0/5             Track: 2  State: UP
```

Table 2 Command output

Field	Description
Interface	Name of the primary interface.

Field	Description
UpDelay	The number of seconds that elapse after the primary interface goes down before the backup interface is activated.
DownDelay	The number of seconds that elapse after the primary interface comes up before the backup interface is deactivated.
Upper threshold	The upper traffic threshold specified as a percentage of bandwidth available on the primary interface. When the traffic on the primary interface exceeds the upper threshold, the backup interfaces are activated to share load in descending order of backup priority.
Lower threshold	The lower traffic threshold specified as a percentage of bandwidth available on the primary interface. When the total amount of traffic on all the load-shared interfaces drops below the lower threshold, the backup interfaces are deactivated in ascending order of priority.
State	State of the primary interface: • **UP**—The interface is both administratively and physically up. • **DOWN**—The interface is administratively up, but its physical state is down (possibly because no physical link exists or the link has failed). • **UP_DELAY**—The interface has recovered, and it is waiting to preempt the active backup interface. • **DOWN_DELAY**—The interface has failed, and it is waiting to be taken over by a backup interface. During this period, packet loss occurs on the primary interface. The interface can forward traffic only when it is in UP state.
Backup interfaces	Backup interfaces assigned to the primary interface.
Priority	Priority of the backup interface.
State	State of the backup interface: • **UP**—The interface is both administratively and physically up. • **DOWN**—The interface is administratively up, but its physical state is down (possibly because no physical link exists or the link has failed). • **UP_DELAY**—The backup interface is waiting to take over the primary interface. • **DOWN_DELAY**—The interface is waiting to be preempted by the primary interface that has recovered. • **STANDBY**—The interface is on standby while the primary interface is operating correctly. The interface can forward traffic only when it is in UP state.
IB Track Information	Associations of backup interfaces and track entries.
Track	Track entry ID associated with the backup interface.
State	State of the backup interface associated with a track entry: • **INVALID**—The backup role of the interface has not taken effect, for example, because the track entry has not been created. • **UP**—The interface is both administratively and physically up. • **DOWN**—The interface is administratively up, but its physical state is down (possibly because no physical link exists or the link has failed). • **STANDBY**—The backup interface is on standby while the primary link is operating correctly.

display interface-backup statistics

Use **display interface-backup statistics** to display traffic statistics for load-shared interfaces.

Syntax

display interface-backup statistics

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Examples

Display traffic statistics for load-shared interfaces.

```
<Sysname> display interface-backup statistics
Interface: GigabitEthernet1/0/2
  Statistics interval: 30 s
  Bandwidth: 100000000 bps
  ActiveTotalIn: 102 bytes
  ActiveTotalOut: 108 bytes
  ActiveIntervalIn: 102 bytes
  ActiveIntervalOut: 108 bytes
  Active used bandwidth: 28 bps
  TotalIn: 102 bytes
  TotalOut: 108 bytes
  TotalIntervalIn: 102 bytes
  TotalIntervalOut: 108 bytes
  Total used bandwidth: 28 bps
```

Table 3 Command output

Field	Description
Interface	Name of the primary interface.
Statistics interval	Traffic polling interval, in seconds.
Bandwidth	Expected bandwidth (in bps) of the primary interface. This bandwidth is used for load sharing computation. You can use the **bandwidth** command in interface view to set its value.
PrimaryTotalIn	Cumulative sum of incoming bytes on the primary interface at the most recent traffic polling.
PrimaryTotalOut	Cumulative sum of outgoing bytes on the primary interface at the most recent traffic polling.
PrimaryIntervalIn	Number of incoming bytes on the primary interface for the most recent polling interval.
PrimaryIntervalOut	Number of outgoing bytes on the primary interface for the most recent polling interval.

Field	Description
Primary used bandwidth	The primary interface's used bandwidth that was counted in load sharing computation.
TotalIn	Cumulative sum of incoming bytes on the load-shared primary and backup interfaces at the most recent traffic polling.
TotalOut	Cumulative sum of outgoing bytes on the load-shared primary and backup interfaces at the most recent traffic polling.
TotalIntervalIn	Number of incoming bytes on the load-shared primary and backup interfaces for the most recent polling interval.
TotalIntervalOut	Number of outgoing bytes on the load-shared primary and backup interfaces for the most recent polling interval.
Total used bandwidth	Total used bandwidth (in bps) of the load-shared primary and backup interfaces for the most recent polling interval.

Contents

Interface collaboration commands

collaboration-group

Use **collaboration-group** to create a collaboration group and enter its view, or enter the view of an existing collaboration group.

Use **undo collaboration-group** to delete a collaboration group.

Syntax

collaboration-group *group-id*

undo collaboration-group *group-id*

Default

No collaboration groups exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

group-id: Specifies a collaboration group ID. The value range for this argument is 1 to 16.

Usage guidelines

Interface collaboration assigns different interfaces on a device to a collaboration group and associates the states of these interfaces. All member interfaces in a collaboration group can or cannot transmit packets.

Collaboration groups take effect only when Monitor Link is enabled globally.

You must remove all member interfaces from a collaboration group before deleting the collaboration group.

Examples

Create collaboration group 1 and enter its view.

```
<Sysname> system-view
[Sysname] collaboration-group 1
[Sysname-collaboration-group1]
```

collaboration-group clean

Use **collaboration-group clean** to remove ineffective member interfaces from all collaboration groups.

Syntax

collaboration-group clean

Views

System view

Predefined user roles

network-admin

context-admin

Usage guidelines

A member interface in a collaboration group becomes ineffective when the card that hosts the interface is removed or changed to another slot or the ID of the IRF member device that hosts the interface changes. This command prevents an ineffective interface from causing all other member interfaces in the same collaboration group to go down.

An ineffective interface cannot be automatically assigned to the original collaboration group when its hosting card is reinstalled or changed back to the original slot or the IRF member ID is changed back to the original ID. You must assign it to the original collaboration group manually.

Examples

Remove ineffective member interfaces from all collaboration groups.

```
<Sysname> system-view
[Sysname] collaboration-group clean
```

display collaboration-group

Use **display collaboration-group** to display information about collaboration groups.

Syntax

display collaboration-group { *group-id* | **all** } [**verbose**]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

group-id: Specifies a collaboration group by its ID. The value range for this argument is 1 to 16.

all: Specifies all collaboration groups.

verbose: Displays detailed information. If you do not specify this keyword, the command displays brief information.

Examples

Display brief information about all collaboration groups.

```
<Sysname> display collaboration-group all
  Group ID                Group status
  1                       DOWN
  2                       DOWN
```

Display detailed information about all collaboration groups.

```
<Sysname> display collaboration-group all verbose
Collaboration group protocol status: Enabled
Collaboration group 1 information:
```

```
Group status     : DOWN
Member up delay  : 0 seconds
Last up time     : 16:55:34 2017/04/05
Last down time   : 16:57:22 2017/04/05
Member                    Status
GE1/0/1                   DOWN
GE1/0/2                   Collaboration-down
```

Table 1 Command output

Field	Description
Group status	Collaboration group status: • **DOWN**. • **UP**. • **N/A**—Monitor Link is disabled globally. The collaboration group does not take effect. • **UP-Pending**—The collaboration group is transitioning from **DOWN** to **UP**. It takes 10 seconds for the system to determine the collaboration group state (**DOWN** or **UP**).
Collaboration group protocol status	Whether interface collaboration is enabled globally: • Enabled. • Disabled.
Member up delay	Delay time for the member interfaces in the collaboration group to come up after a device restart, in seconds.
Last up time	Last time when the collaboration group came up.
Last down time	Last time when the collaboration group went down.
Member	Member interfaces of the collaboration group.
Status	Member interface status: • **UP**—The interface is up. • **DOWN**—The interface is down. To identify cause, use the **display interface** command. • **Collaboration-down**—The interface is shut down by interface collaboration. • **Not available**—The interface is ineffective because the hosting card is not in position.

port

Use **port** to assign an interface to a collaboration group.

Use **undo port** to remove an interface from a collaboration group.

Syntax

port *interface-type interface-number*

undo port *interface-type interface-number*

Default

No member interfaces exist in a collaboration group.

Views

Collaboration group view

Predefined user roles

network-admin

context-admin

Parameters

interface-type interface-number: Specifies an interface by its type and number.

Usage guidelines

You can assign an interface to only one collaboration group.

For a collaboration group to work correctly, do not assign its member interfaces to a redundancy group.

Do not add both Selected ports and Unselected ports in a dynamic aggregation group to the same collaboration group.

If you have configured a member interface as the uplink/downlink interface of a monitor link group, do not configure any other member interface in the same collaboration group as the downlink/uplink interface of any monitor link group.

You can also assign an interface to a collaboration group by using the **port collaboration-group** command in interface view.

Examples

Assign GigabitEthernet 1/0/1 to collaboration group 1.

```
<Sysname> system-view
[Sysname] collaboration-group 1
[Sysname-collaboration-group1] port gigabitethernet 1/0/1
```

Related commands

port collaboration-group

port collaboration-group

Use **port collaboration-group** to assign the current interface to a collaboration group.

Use **undo port collaboration-group** to remove the current interface from a collaboration group.

Syntax

port collaboration-group *group-id*

undo collaboration-group *group-id*

Default

The interface is not a collaboration group member.

Views

Layer 2 Ethernet interface view

Layer 3 Ethernet interface view

Layer 2 aggregate interface view

Layer 3 aggregate interface view

Predefined user roles

network-admin

context-admin

Parameters

group-id: Specifies a collaboration group by its ID. The value range for this argument is 1 to 16.

Usage guidelines

You can assign an interface to only one collaboration group.

To assign an interface to a collaboration group by using this command, make sure the collaboration group have been created.

For a collaboration group to work correctly, do not assign its member interfaces to a redundancy group.

Do not add both Selected ports and Unselected ports in a dynamic aggregation group to the same collaboration group.

If you have configured a member interface as the uplink/downlink interface of a monitor link group, do not configure any other member interface in the same collaboration group as the downlink/uplink interface of any monitor link group.

You can also assign an interface to a collaboration group by using the **port** command in collaboration group view.

Examples

Assign GigabitEthernet 1/0/1 to collaboration group 1.

```
<Sysname> system-view
[Sysname] collaboration-group 1
[Sysname-collaboration-group1] quit
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] port collaboration-group 1
```

Related commands

port

up-delay

Use **up-delay** to set the delay time for the member interfaces in a collaboration group to come up after a device restart.

Use **undo up-delay** to restore the default.

Syntax

up-delay *delay*

undo up-delay

Default

The delay time is 0 seconds. The member interfaces come up as soon as the device restarts.

Views

Collaboration group view

Predefined user roles

network-admin

context-admin

Parameters

delay: Specifies the delay time in the range of 1 to 3600 seconds.

Usage guidelines

This command enables the member interfaces to come up after a configurable delay time upon a device restart.

Examples

Set the delay time to 10 seconds for the member interfaces in collaboration group 1.

```
<Sysname> system-view
[Sysname] collaboration-group 1
[Sysname-collaboration-group1] up-delay 10
```

Contents

Ping, tracert, and system debugging commands

debugging

Use **debugging** to enable debugging for a module.

Use **undo debugging** to disable debugging for a module or for all modules.

Syntax

debugging *module-name* [*option*]

undo debugging { **all** | *module-name* [*option*] }

Default

Debugging is disabled for all modules.

Views

User view

Predefined user roles

network-admin

context-admin

Parameters

module-name: Specifies a module by its name, such as **arp** or **device**. For a list of supported modules, use the **debugging ?** command.

option: Specifies the debugging option for a module. Available options vary by module. To display the debugging options supported by a module, use the **debugging** *module-name* **?** command.

all: Specifies all modules.

Usage guidelines

CAUTION:

Output of excessive debugging messages increases the CPU usage and downgrades the system performance. To guarantee system performance, enable debugging only for modules that are in an exceptional condition.

The system sends generated debug messages to the device information center, which then sends the messages to appropriate destinations based on the log output configuration. For more information about the information center, see *Network Management and Monitoring Configuration Guide*.

Examples

Enable debugging for the device management module.

```
<Sysname> debugging dev
This command is CPU intensive and might affect ongoing services. Are you sure you want to continue? [Y/N]:Y
```

Related commands

display debugging

debugging-auto-off enable cpu-usage-alarm

Use **debugging-auto-off enable cpu-usage-alarm** to enable the debugging-auto-off feature to automatically disable all types of debugging when the CPU usage reaches or exceeds the lowest CPU usage alarm threshold.

Use **undo debugging enable cpu-usage-alarm** to disable the debugging-auto-off feature from automatically disabling all types of debugging when the CPU usage reaches or exceeds the lowest CPU usage alarm threshold.

Syntax

debugging-auto-off enable cpu-usage-alarm

undo debugging-auto-off enable cpu-usage-alarm

Default

The debugging-auto-off feature is disabled.

Views

User view

Predefined user roles

network-admin

context-admin

Usage guidelines

Excessive output from debugging commands might affect system performance. To guarantee system performance, enable the debugging-auto-off feature to automatically disable all types of debugging when the CPU usage reaches or exceeds the lowest CPU usage alarm threshold. The CPU usage alarm thresholds are set by using the **monitor cpu-usage threshold** command.

The device does not automatically enable all types of debugging after the CPU usage drops to or below the CPU usage recovery threshold. To enable debugging for a module or all modules, use the **debugging** command.

Examples

Enable the debugging-auto-off feature to automatically disable all types of debugging when the CPU usage reaches or exceeds the lowest CPU usage alarm threshold.

```
<Sysname> debugging-auto-off enable cpu-usage-alarm
```

Related commands

display debugging-auto-off

monitor cpu-usage threshold (*Fundamentals Command Reference*)

display debugging

Use **display debugging** to display the enabled debugging features for a module or for all modules.

Syntax

display debugging [*module-name*]

Views

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

module-name: Specifies a module by its name. For a list of supported modules, use the **display debugging ?** command. If you do not specify a module name, this command displays the enabled debugging features for all modules.

Examples

Display all enabled debugging features.

```
<Sysname> display debugging
DEV debugging switch is on
```

Related commands

debugging

display debugging-auto-off

Use **display debugging-auto-off** to display the enabling status of the debugging-auto-off feature.

Syntax

display debugging-auto-off

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Usage guidelines

To conserve system resources, the device automatically disables all types of debugging in the following situations:

- All users have gone offline.
- The CPU usage reaches or exceeds the lowest CPU usage alarm threshold.

The device always automatically disables all types of debugging when all users have gone offline. This mechanism is not user configurable.

To enable the device to automatically disable all types of debugging when the CPU usage reaches or exceeds the lowest CPU usage alarm threshold, use the **debugging-auto-off enable cpu-usage-alarm** command.

Examples

Display the enabling status of the debugging-auto-off feature.

```
<Sysname> display debugging-auto-off
```

```
Occasions for the system to automatically turn off all debugging:
 When all users log out: Enabled
 When the CPU usage reaches or exceeds the CPU usage alarm threshold: Disabled
```

Table 1 Command output

Field	Description
Occasions for the system to automatically turn off all debugging	Situations where the device automatically disables all types of debugging.
When all users log out: Enabled	The debugging-auto-off feature is always enabled for the situation where all users have gone offline.
The CPU usage reaches or exceeds the CPU usage alarm threshold: Enabled	The debugging-auto-off feature is enabled for the situation where the CPU usage reaches or exceeds the lowest CPU usage alarm threshold.
The CPU usage reaches or exceeds the CPU usage alarm threshold: Disabled	The debugging-auto-off feature is disabled for the situation where the CPU usage reaches or exceeds the lowest CPU usage alarm threshold.

Related commands

debugging-auto-off enable cpu-usage-alarm

ping

Use **ping** to test the reachability of the destination IP address and display ping statistics.

Syntax

ping [**ip**] [**-a** *source-ip* | **-c** *count* | **-f** | **-h** *ttl* | **-i** *interface-type interface-number* | **-m** *interval* | **-n** | **-p** *pad* | **-q** | **-r** | **-s** *packet-size* | **-t** *timeout* | **-tos** *tos* | **-v** | **-vpn-instance** *vpn-instance-name*] * *host*

Views

Any view

Predefined user roles

network-admin

context-admin

Parameters

ip: Distinguishes between a destination host name and the **ping** command keywords if the name of the destination host is **i**, **ip**, **ipv**, **ipv6**, **l**, **ls**, or **lsp**. For example, you must use the command in the form of **ping ip ip** instead of **ping ip** if the destination host name is **ip**.

-a *source-ip*: Specifies an IP address of the device as the source IP address of ICMP echo requests. If you do not specify this option, the source IP address of ICMP echo requests is the primary IP address of the outbound interface.

-c *count*: Specifies the number of ICMP echo requests that are sent to the destination. The value range is 1 to 4294967295, and the default is 5.

-f: Sets the "Don't Fragment" bit in the IP header.

-h *ttl*: Specifies the TTL value of ICMP echo requests. The value range is 1 to 255, and the default is 255.

-i *interface-type interface-number*: Specifies the source interface of ICMP echo requests. If you do not specify this option, the system looks up the routing table or forwarding table

for a matching route and uses the output interface of that route as the source interface of ICMP echo requests.

-m *interval*: Specifies the interval (in milliseconds) to send ICMP echo requests. The value range is 1 to 65535, and the default is 200.

-n: Disables domain name resolution for the *host* argument. If the *host* argument represents the host name of the destination, and if this keyword is not specified, the device translates *host* into an address.

-p *pad*: Specifies the value of the **pad** field in an ICMP echo request, in hexadecimal format, 1 to 8 bits. The *pad* argument is in the range of 0 to ffffffff. If the specified value is less than 8 bits, 0s are added in front of the value to extend it to 8 bits. For example, if *pad* is configured as 0x2f, then the packets are padded with 0x0000002f to make the total length of the packet meet the requirements of the device. By default, the padded value starts from 0x01 up to 0xff, where another round starts again if necessary, such as 0x010203…feff01….

-q: Displays only the summary statistics. If this keyword is not specified, the system displays all the ping statistics.

-r: Records the addresses of the hops (up to 9) the ICMP echo requests passed. If this keyword is not specified, the addresses of the hops that the ICMP echo requests passed are not recorded.

-s *packet-size*: Specifies the length (in bytes) of ICMP echo requests (excluding the IP packet header and the ICMP packet header). The value range for the *packet-size* argument is 20 to 8100. The default setting is 56 bytes.

-t *timeout*: Specifies the timeout time (in milliseconds) of an ICMP echo reply. The value range is 0 to 65535, and the default is 2000. If the source does not receive an ICMP echo reply within the timeout, it considers the ICMP echo reply timed out.

-tos *tos*: Specifies the ToS value of ICMP echo requests. The value range is 0 to 255, and the default is 0.

-v: Displays non-ICMP echo reply packets. If this keyword is not specified, the system does not display non-ICMP echo reply packets.

-vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance to which the destination belongs. The *vpn-instance-name* argument represents the VPN instance name, a case-sensitive string of 1 to 31 characters. If the destination is on the public network, do not specify this option.

host: Specifies the IP address or host name of the destination. The host name is a case-insensitive string of 1 to 253 characters. It can contain letters, digits, and special characters such as hyphen (-), underscore (_), and dot (.).

Usage guidelines

To ping a device identified by its host name, configure the DNS settings on the device first. If the DNS settings are not configured, the ping operation fails.

To abort the ping operation during the execution of the command, press **Ctrl+C**.

Examples

Test whether the device with an IP address of 1.1.2.2 is reachable.

```
<Sysname> ping 1.1.2.2
Ping 1.1.2.2 (1.1.2.2): 56 data bytes, press CTRL+C to break
56 bytes from 1.1.2.2: icmp_seq=0 ttl=254 time=2.137 ms
56 bytes from 1.1.2.2: icmp_seq=1 ttl=254 time=2.051 ms
56 bytes from 1.1.2.2: icmp_seq=2 ttl=254 time=1.996 ms
56 bytes from 1.1.2.2: icmp_seq=3 ttl=254 time=1.963 ms
56 bytes from 1.1.2.2: icmp_seq=4 ttl=254 time=1.991 ms
```

```
--- Ping statistics for 1.1.2.2 ---
5 packet(s) transmitted, 5 packet(s) received, 0.0% packet loss
round-trip min/avg/max/std-dev = 1.963/2.028/2.137/0.062 ms
```

Test whether the device with an IP address of 1.1.2.2 in VPN instance **vpn1** is reachable.

```
<Sysname> ping -vpn-instance vpn1 1.1.2.2
Ping 1.1.2.2 (1.1.2.2): 56 data bytes, press CTRL+C to break
56 bytes from 1.1.2.2: icmp_seq=0 ttl=254 time=2.137 ms
56 bytes from 1.1.2.2: icmp_seq=1 ttl=254 time=2.051 ms
56 bytes from 1.1.2.2: icmp_seq=2 ttl=254 time=1.996 ms
56 bytes from 1.1.2.2: icmp_seq=3 ttl=254 time=1.963 ms
56 bytes from 1.1.2.2: icmp_seq=4 ttl=254 time=1.991 ms

--- Ping statistics for 1.1.2.2 in VPN instance vpn1 ---
5 packet(s) transmitted, 5 packet(s) received, 0.0% packet loss
round-trip min/avg/max/std-dev = 1.963/2.028/2.137/0.062 ms
```

Test whether the device with an IP address of 1.1.2.2 is reachable. Only results are displayed.

```
<Sysname> ping -q 1.1.2.2
Ping 1.1.2.2 (1.1.2.2): 56 data bytes, press CTRL+C to break

--- Ping statistics for 1.1.2.2 ---
5 packet(s) transmitted, 5 packet(s) received, 0.0% packet loss
round-trip min/avg/max/std-dev = 1.962/2.196/2.665/0.244 ms
```

Test whether the device with an IP address of 1.1.2.2 is reachable. The IP addresses of the hops that the ICMP packets passed in the path are displayed.

```
<Sysname> ping -r 1.1.2.2
Ping 1.1.2.2 (1.1.2.2): 56 data bytes, press CTRL+C to break
56 bytes from 1.1.2.2: icmp_seq=0 ttl=254 time=4.685 ms
RR:      1.1.2.1
         1.1.2.2
         1.1.1.2
         1.1.1.1
56 bytes from 1.1.2.2: icmp_seq=1 ttl=254 time=4.834 ms  (same route)
56 bytes from 1.1.2.2: icmp_seq=2 ttl=254 time=4.770 ms  (same route)
56 bytes from 1.1.2.2: icmp_seq=3 ttl=254 time=4.812 ms  (same route)
56 bytes from 1.1.2.2: icmp_seq=4 ttl=254 time=4.704 ms  (same route)

--- Ping statistics for 1.1.2.2 ---
5 packet(s) transmitted, 5 packet(s) received, 0.0% packet loss
round-trip min/avg/max/std-dev = 4.685/4.761/4.834/0.058 ms
```

The output shows the following information:

- The destination is reachable.
- The route is 1.1.1.1 <-> {1.1.1.2; 1.1.2.1} <-> 1.1.2.2.

Table 2 Command output

Field	Description
Ping 1.1.2.2 (1.1.2.2): 56 data bytes, press CTRL+C to break	Test whether the device with IP address 1.1.2.2 is reachable. There are 56 bytes in each ICMP echo request. Press escape key **Ctrl+C** to abort the ping operation. The escape key is configurable by using the **escape-key** command. For more information about this command, see login management commands in *Fundamentals Command Reference*.
56 bytes from 1.1.2.2: icmp_seq=0 ttl=254 time=4.685 ms	Received ICMP echo replies from the device whose IP address is 1.1.2.2. If no echo reply is received within the timeout period, no information is displayed. • **bytes**—Number of bytes in the ICMP echo reply. • **icmp_seq**—Packet sequence, used to determine whether a segment is lost, disordered or repeated. • **ttl**—TTL value in the ICMP echo reply. • **time**—Response time.
RR:	Routers through which the ICMP echo request passed. They are displayed in inversed order, which means the router with a smaller distance to the destination is displayed first.
--- Ping statistics for 1.1.2.2 ---	Statistics on data received and sent in the ping operation.
--- Ping statistics for 1.1.2.2 in VPN instance vpn1 ---	Ping statistics for a device in a VPN instance.
5 packet(s) transmitted	Number of ICMP echo requests sent.
5 packet(s) received	Number of ICMP echo replies received.
0.0% packet loss	Percentage of unacknowledged packets to the total packets sent.
round-trip min/avg/max/std-dev = 4.685/4.761/4.834/0.058 ms	Minimum/average/maximum/standard deviation response time, in milliseconds.

ping ipv6

Use **ping ipv6** to test the reachability of the destination IPv6 address and display IPv6 ping statistics.

Syntax

ping ipv6 [**-a** *source-ipv6* | **-c** *count* | **-i** *interface-type interface-number* | **-m** *interval* | **-q** | **-s** *packet-size* | **-t** *timeout* | **-tc** *traffic-class*| **-v** | **-vpn-instance** *vpn-instance-name*] * *host*

context-admin

Parameters

-a *source-ipv6*: Specifies an IPv6 address of the device as the source IP address of ICMP echo requests. If you do not specify this option, the source IPv6 address of ICMP echo requests is the IPv6 address of the outbound interface. See RFC 3484 for information about the address selection rule.

-c *count*: Specifies the number of ICMPv6 echo requests that are sent to the destination. The value range is 1 to 4294967295, and the default is 5.

-i *interface-type interface-number*: Specifies the source interface of ICMPv6 echo requests. If you do not specify this option, the system looks up the routing table or forwarding table for a matching route and uses the output interface of that route as the source interface of ICMPv6 echo requests. You must specify this option if the destination address is a multicast address or a link-local address.

-m *interval*: Specifies the interval (in milliseconds) to send an ICMPv6 echo reply. The value range is 1 to 65535, and the default is 1000.

-q: Displays only the summary statistics. If you do not specify this keyword, the system displays all the ping statistics.

-s *packet-size*: Specifies the length (in bytes) of ICMPv6 echo requests (excluding the IPv6 packet header and the ICMPv6 packet header). The value range for the *packet-size* argument is 20 to 8100. The default setting is 56 bytes.

-t *timeout*: Specifies the timeout time (in milliseconds) of an ICMPv6 echo reply. The value range is 0 to 65535, and the default is 2000.

-tc *traffic-class*: Specifies the traffic class value in an ICMPv6 packet. The value range is 0 to 255 and the default is 0.

-v: Displays detailed information (including the **dst** field and the **idx** field) about ICMPv6 echo replies. If this keyword is not specified, the system only displays brief information (not including the **dst** field and the **idx** field) about ICMPv6 echo replies.

-vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance to which the destination belongs. The *vpn-instance-name* argument represents the VPN instance name, a case-sensitive string of 1 to 31 characters. If the destination is on the public network, do not specify this option.

host: Specifies the IPv6 address or host name of the destination. The host name is a case-insensitive string of 1 to 253 characters. It can contain letters, digits, and special characters such as hyphen (-), underscore (_), and dot (.).

Usage guidelines

To ping a device identified by its host name, configure the DNS settings on the device first. If the DNS settings are not configured, the IPv6 ping operation fails.

To abort the IPv6 ping operation during the execution of the command, press **Ctrl+C**.

Examples

Test whether the IPv6 address (2001::2) is reachable.

```
<Sysname> ping ipv6 2001::2
Ping6(56 data bytes) 2001::1 --> 2001::2, press CTRL+C to break
56 bytes from 2001::2, icmp_seq=0 hlim=64 time=62.000 ms
56 bytes from 2001::2, icmp_seq=1 hlim=64 time=23.000 ms
56 bytes from 2001::2, icmp_seq=2 hlim=64 time=20.000 ms
56 bytes from 2001::2, icmp_seq=3 hlim=64 time=4.000 ms
56 bytes from 2001::2, icmp_seq=4 hlim=64 time=16.000 ms

--- Ping6 statistics for 2001::2 ---
5 packet(s) transmitted, 5 packet(s) received, 0.0% packet loss
round-trip min/avg/max/std-dev = 4.000/25.000/62.000/20.000 ms
```

Test whether the IPv6 address (2001::2) is reachable. Only the statistics are displayed.

```
<Sysname> ping ipv6 –q 2001::2
```

```
Ping6(56 data bytes) 2001::1 --> 2001::2, press CTRL+C to break

--- Ping6 statistics for 2001::2 ---
5 packet(s) transmitted, 5 packet(s) received, 0.0% packet loss
round-trip min/avg/max/std-dev = 4.000/25.000/62.000/20.000 ms
```

Test whether the IPv6 address (2001::2) is reachable. Detailed ping information is displayed.

```
<Sysname> ping ipv6 –v 2001::2
Ping6(56 data bytes) 2001::1 --> 2001::2, press CTRL+C to break
56 bytes from 2001::2, icmp_seq=0 hlim=64 dst=2001::1 idx=3 time=62.000 ms
56 bytes from 2001::2, icmp_seq=1 hlim=64 dst=2001::1 idx=3 time=23.000 ms
56 bytes from 2001::2, icmp_seq=2 hlim=64 dst=2001::1 idx=3 time=20.000 ms
56 bytes from 2001::2, icmp_seq=3 hlim=64 dst=2001::1 idx=3 time=4.000 ms
56 bytes from 2001::2, icmp_seq=4 hlim=64 dst=2001::1 idx=3 time=16.000 ms

--- Ping6 statistics for 2001::2 ---
5 packet(s) transmitted, 5 packet(s) received, 0.0% packet loss
round-trip min/avg/max/std-dev = 4.000/25.000/62.000/20.000 ms
```

Table 3 Command output

Field	Description
Ping6(56 data bytes) 2001::1 --> 2001::2, press CTRL+C to break	An ICMPv6 echo reply with a data length of 56 bytes is sent from 2001::1 to 2001::2. Press escape key **Ctrl+C** to abort the IPv6 ping operation. The escape key is configurable by using the **escape-key** command. For more information about this command, see login management commands in *Fundamentals Command Reference*.
56 bytes from 2001::2, icmp_seq=1 hlim=64 dst=2001::1 idx=3 time=62.000 ms	Received ICMPv6 echo replies from the device whose IPv6 address is 2001::2. • The number of data bytes is 56. • The packet sequence is 1. • The hop limit value is 64. • The destination address is 2001::1. Specify the **-v** keyword to display this field. • The index for the packet inbound interface is 3. Specify the **-v** keyword to display this field. • The response time is 62 milliseconds.
--- Ping6 statistics for 2001::2 ------	Statistics on data received and sent in an IPv6 ping operation.
5 packet(s) transmitted	Number of ICMPv6 echo requests sent.
5 packet(s) received	Number of ICMPv6 echo replies received.
0.0% packet loss	Percentage of unacknowledged packets to the total packets sent.
round-trip min/avg/max/ std-dev =4.000/25.000/62.000/20.000 ms	Minimum/average/maximum/standard deviation response time, in milliseconds.

tracert

Use **tracert** to trace the path that the IPv4 packets traverse from source to destination.

Syntax

tracert [**-a** *source-ip* | **-f** *first-ttl* | **-i** *interface-type interface-number* | **-m** *max-ttl* | **-p** *port* | **-q** *packet-number* | **-t** *tos* | **-vpn-instance** *vpn-instance-name* [**-resolve-as** { **global** | **none** | **vpn** }] | **-w** *timeout*] * *host*

Views

Any view

Predefined user roles

network-admin

context-admin

Parameters

-a *source-ip*: Specifies an IP address of the device as the source IP address of probe packets. If you do not specify this option, the source IP address of probe packets is the primary IP address of the outbound interface.

-f *first-ttl*: Specifies the TTL of the first packet sent to the destination. The value range is 1 to 255, and the default is 1. It must be no greater than the value of the *max-ttl* argument.

-i *interface-type interface-number*: Specifies the source interface of probe packets. If you do not specify this option, the system looks up the routing table or forwarding table for a matching route and uses the output interface of that route as the source interface of probe packets.

-m *max-ttl*: Specifies the maximum number of hops allowed for a probe packet. The value range is 1 to 255, and the default is 30. It must be no smaller than the value of the *first-ttl* argument.

-p *port*: Specifies an invalid UDP port of the destination. The value range is 1 to 65535, and the default is 33434.

-q *packet-number*: Specifies the number of probe packets to send per hop. The value range is 1 to 65535, and the default is 3.

-t *tos*: Specifies the ToS value of probe packets. The value range is 0 to 255, and the default is 0.

-vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance to which the destination belongs. The *vpn-instance-name* argument represents the VPN instance name, a case-sensitive string of 1 to 31 characters. If the destination is on the public network, do not specify this option.

-resolve-as: Specifies a routing table for autonomous system (AS) resolution. Tracert searches the specified routing table for the AS that each hop along the path belongs to. If you do not specify this keyword, the global routing table is used. If the AS information is found, this command displays the AS number next to the address of the hop in the probe result.

- **global**: Specifies the global routing table.
- **none**: Disables AS resolution.
- **vpn**: Specifies the VPN routing table.

-w *timeout*: Specifies the timeout time in milliseconds of the reply packet for a probe packet. The value range is 1 to 65535, and the default is 5000.

host: Specifies the IP address or host name of the destination. The host name is a case-insensitive string of 1 to 253 characters. It can contain letters, digits, and special characters such as hyphen (-), underscore (_), and dot (.).

Usage guidelines

After identifying network failure with the **ping** command, use the **tracert** command to locate failed nodes.

If the destination address is on the public network, you do not need to specify the **-resolve-as** keyword to obtain the AS information. The device automatically uses the global routing table for AS resolution.

If the destination address is on a private network, address information of intermediate hops might be stored in either the global routing table or the VPN routing table. To learn the AS path that the packets traverse, execute the **tracert** command twice, once with the **-resolve-as global** keywords and again with the **-resolve-as vpn** keywords.

The output from the **tracert** command includes IP addresses of all the Layer 3 devices that the packets traverse from source to destination. Asterisks (* * *) are displayed if the device cannot reply with an ICMP error message. The reason might be the destination is unreachable or sending ICMP timeout/destination unreachable packets is disabled.

Before starting a tracert operation, you must enable sending of ICMP destination unreachable messages on the intermediate devices between the source and destination. The tracert operation stops if any of the following ICMP destination unreachable messages is received:

- **!N**—Network unreachable.
- **!H**—Destination host unreachable.
- !**P**—Protocol unreachable. The protocol number is unknown.
- **!F**—Fragmentation needed. This message indicates that packet fragmentation is needed but the "Don't Fragment" bit is set on an immediate device.
- **!W**—Destination host unknown.
- **!Q**—Network unreachable for ToS.
- **!T**—Host unreachable for ToS.
- **!X**—Communication administratively prohibited by filtering policies.
- **!V**—Host precedence violation.
- **!C**—Precedence cutoff in effect.

To abort the tracert operation during the execution of the command, press **Ctrl+C**.

Examples

Display the path that the packets traverse from source to destination (1.1.2.2).

```
<Sysname> tracert 1.1.2.2
traceroute to 1.1.2.2 (1.1.2.2), 30 hops at most, 40 bytes each packet, press CTRL+C to break
 1  1.1.1.2 (1.1.1.2) 673 ms 425 ms 30 ms
 2  1.1.2.2 (1.1.2.2) [AS 100] 580 ms 470 ms 80 ms
```

Display the path that the packets traverse from source to destination (1.1.3.2) in VPN instance vpn1, as well as the AS information of the hops along the path.

```
<Sysname> tracert –vpn-instance vpn1 –resolve-as vpn 1.1.3.2
traceroute to 1.1.3.2 (1.1.3.2), 30 hops at most, 40 bytes each packet, press CTRL+C to break
 1  1.1.1.2 (1.1.1.2) 673 ms 425 ms 30 ms
 2  1.1.2.2 (1.1.2.2) 580 ms 470 ms 80 ms
 3  1.1.3.2 (1.1.3.2) [AS 65535] 530 ms 472 ms 380 ms
```

Table 4 Command output

Field	Description
traceroute to 1.1.2.2 (1.1.2.2)	Display the route that the IP packets traverse from the current device to the device whose IP address is 1.1.2.2.

Field	Description
hops at most	Maximum number of hops of the probe packets, which can be set by the **-m** keyword.
bytes each packet	Number of bytes of a probe packet.
press CTRL+C to break	During the execution of the command, press escape key **Ctrl+C** to abort the tracert operation. The escape key is configurable by using the **escape-key** command. For more information about this command, see login management commands in *Fundamentals Command Reference*.
2 1.1.2.2 (1.1.2.2) [AS 100] 580 ms 470 ms 80 ms	Probe result of the probe packets that contain a TTL value of 2, including the following information about the second hop: • Domain name of the hop. If no domain name is configured, the IP address is displayed as the domain name. • IP address of the hop. The IP address is displayed in parentheses. • Number of the AS that the hop belongs to. The AS number appears only when it is found for the hop in the specified routing table. • The round-trip time of the probe packets. The number of packets that can be sent in each probe can be set by using the **-q** keyword.

tracert ipv6

Use **tracert ipv6** to display the path that the IPv6 packets traverse from source to destination.

Syntax

tracert ipv6 [**-f** *first-hop* | **-i** *interface-type interface-number* | **-m** *max-hops* | **-p** *port* | **-q** *packet-number* | **-t** *traffic-class* | **-vpn-instance** *vpn-instance-name* [**-resolve-as** { **global** | **none** | **vpn** }] | **-w** *timeout*] * *host*

Views

Any view

Predefined user roles

network-admin

context-admin

Parameters

-f *first-hop*: Specifies the TTL value of the first packet. The value range is 1 to 255, and the default is 1. The value must be no greater than the value of the *max-hops* argument.

-i *interface-type interface-number*: Specifies the source interface of probe packets. If you do not specify this option, the system looks up the routing table or forwarding table for a matching route and uses the output interface of that route as the source interface of probe packets. You must specify this option if the destination address is a multicast address or a link-local address.

-m *max-hops*: Specifies the maximum number of hops allowed for a packet. The value range is 1 to 255, and the default is 30. The value must be no smaller than the value of the *first-hop* argument.

-p *port*: Specifies an invalid UDP port of the destination. The value range is 1 to 65535, and the default is 33434.

-q *packet-number*: Specifies the number of probe packets sent each time. The value range is 1 to 65535, and the default is 3.

-t *traffic-class*: Specifies the traffic class value in an IPv6 probe packet. The value range is 0 to 255, and the default is 0.

-vpn-instance *vpn-instance-name*: Specifies an MPLS L3VPN instance to which the destination belongs. The *vpn-instance-name* argument represents the VPN instance name, a case-sensitive string of 1 to 31 characters. If the destination is on the public network, do not specify this option.

-resolve-as: Specifies a routing table for AS resolution. Tracert searches the specified routing table for the AS that each hop along the path belongs to. If you do not specify this keyword, the global routing table is used. If the AS information is found, this command displays the AS number next to the address of the hop in the probe result.

- **global**: Specifies the global routing table.
- **none**: Disables AS resolution.
- **vpn**: Specifies the VPN routing table.

-w *timeout*: Specifies the timeout time (in milliseconds) of the reply packet of a probe packet. The value range is 1 to 65535, and the default is 5000.

host: Specifies the IPv6 address or host name of the destination. The host name is a case-insensitive string of 1 to 253 characters. It can contain letters, digits, and special characters such as hyphen (-), underscore (_), and dot (.).

Usage guidelines

After identifying network failure with the **ping ipv6** command, you can use the **tracert ipv6** command to locate failed nodes.

If the destination address is on the public network, you do not need to specify the **-resolve-as** keyword to obtain the AS information. The device automatically uses the global routing table for AS resolution.

If the destination address is on a private network, address information of intermediate hops might be stored in either the global routing table or the VPN routing table. To learn the AS path that the packets traverse, execute the **tracert ipv6** command twice, once with the **-resolve-as global** keywords and again with the **-resolve-as vpn** keywords.

The output from the **tracert ipv6** command includes IPv6 addresses of all the Layer 3 devices that the packets traverse from source to destination. Asterisks (* * *) are displayed if the device cannot reply with an ICMP error message. The reason might be the destination is unreachable or sending ICMP timeout/destination unreachable packets is disabled.

Before starting an IPv6 tracert operation, you must enable sending of ICMPv6 destination unreachable messages on the intermediate devices between the source and destination. The IPv6 tracert operation stops if any of the following ICMPv6 destination unreachable messages is received:

- **!N**—No route to destination.
- **!P**—Communication with destination administratively prohibited by filtering policies.
- **!A**—Address unreachable. The unreachable reason is unknown.
- **!S**—Beyond scope of source address. This message is displayed if the probe packet has a link-local source address and a non-link-local destination address. Such a packet cannot be delivered to the destination without leaving the scope of the source address.

To abort the tracert operation during the execution of the command, press **Ctrl+C**.

Examples

Display the path that the packets traverse from source to destination (2001:3::2).

```
<Sysname> tracert ipv6 2001:3::2
traceroute to 2001:3::2(2001:3::2), 30 hops at most, 60 byte packets, press CTRL+C to break
 1  2001:1::2  0.661 ms  0.618 ms  0.579 ms
```

```
 2  2001:2::2 [AS 100]  0.861 ms  0.718 ms  0.679 ms
 3  2001:3::2 [AS 200]  0.822 ms  0.731 ms  0.708 ms
```

Display the path that the packets traverse from source to destination (2001:3::2) in VPN instance vpn1, as well as the AS information of the hops along the path.

```
<Sysname> tracert ipv6 –vpn-instance vpn1 –resolve-as vpn 2001:3::2
traceroute to 2001:3::2(2001:3::2), 30 hops at most, 60 byte packets , press CTRL+C to
break
1  2001:1::2  0.661 ms  0.618 ms  0.579 ms
2  2001:2::2  0.861 ms  0.718 ms  0.679 ms
3  2001:3::2 [AS 65535]  0.822 ms  0.731 ms  0.708 ms
```

Table 5 Command output

Field	Description
traceroute to 2001:3::2	Display the route that the IPv6 packets traverse from the current device to the device whose IP address is 2001:3:2.
hops at most	Maximum number of hops of the probe packets, which can be set by the **-m** keyword.
byte packets	Number of bytes of a probe packet.
press CTRL+C to break	During the execution of the command, press escape key **Ctrl+C** to abort the IPv6 tracert operation. The escape key is configurable by using the **escape-key** command. For more information about this command, see login management commands in *Fundamentals Command Reference*.
2 2001:2::2 [AS 100] 0.861 ms 0.718 ms 0.679 ms	Probe result of the probe packets that contain a hoplimit value of 2, including the following information about the second hop: • IPv6 address of the hop. • Number of the AS the hop belongs to. The AS number appears only when it is found for the hop in the specified routing table. • The round-trip time of the probe packets. The number of packets that can be sent in each probe can be set by using the **-q** keyword.

Contents

NTP commands

The device is inadequate in clock precision. As a best practice, do not use the device as a time server to synchronize the time of the other devices.

NTP is supported only on the following Layer 3 interfaces:

- Layer 3 Ethernet interfaces.
- Layer 3 Ethernet subinterfaces.
- Layer 3 aggregate interfaces.
- Layer 3 aggregate subinterfaces.
- VLAN interfaces.
- Tunnel interfaces.

display ntp-service ipv6 sessions

Use **display ntp-service ipv6 sessions** to display information about all IPv6 NTP associations.

Syntax

display ntp-service ipv6 sessions [**verbose**]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

verbose: Displays detailed information about all IPv6 NTP associations. If you do not specify this keyword, the command displays only brief information about the IPv6 NTP associations.

Examples

Display brief information about all IPv6 NTP associations.

```
<Sysname> display ntp-service ipv6 sessions
Notes: 1 source(master), 2 source(peer), 3 selected, 4 candidate, 5 configured.

 Source:   [125]3000::32
 Reference: 127.127.1.0          Clock stratum: 2
 Reachabilities: 1               Poll interval: 64
 Last receive time: 6            Offset: -0.0
 Roundtrip delay: 0.0            Dispersion: 0.0

 Total sessions : 1
```

Table 1 Command output

Field	Description
[12345]	• **1**—Clock source selected by the system (the current reference source). • **2**—The stratum level of the clock source is less than or equal to 15. • **3**—The clock source has survived the clock selection algorithm. • **4**—The clock source is a candidate clock source. • **5**—The clock source was created by a command.
Source	IPv6 address of the NTP server. If this field displays **::**, the IPv6 address of the NTP server has not been resolved successfully.

Reference	Reference clock ID of the NTP server:
	• If the reference clock is the local clock, the value of this field is related to the value of the **Clock stratum** field:
	  ◦ When the value of the **Clock stratum** field is 0 or 1, this field displays **LOCL**.
	  ◦ When the **Clock stratum** field has another value, this field displays the MD5 digest value of the first 32 bits of the IPv6 address. The MD5 digest value is in dotted decimal format.
	• If the reference clock is the clock of another device on the network, this field displays the MD5 digest value of the first 32 bits of the IPv6 address. The MD5 digest value is in dotted decimal format. If this field displays **INIT**, the local device has not established a connection with the NTP server.

Clock stratum	Stratum level of the NTP server, which determines the clock accuracy. The value is in the range of 1 to 16. A lower stratum level represents higher clock accuracy. A stratum 16 clock is not synchronized and cannot be used as a reference clock.
Reachabilities	Reachability count of the NTP server. 0 indicates that the NTP server is unreachable.
Poll interval	Polling interval in seconds. It is the maximum interval between successive NTP messages.
Last receive time	Length of time from when the last NTP message was received or when the local clock was last updated to the current time. Time is in seconds by default. • If the time length is greater than 2048 seconds, it is displayed in minutes (m). • If the time length is greater than 300 minutes, it is displayed in hours (h). • If the time length is greater than 96 hours, it is displayed in days (d). • If the time length is greater than 999 days, it is displayed in years (y). If the time when the most recent NTP message was received or when the local clock was updated most recently is behind the current time, this field displays a hyphen (-).
Offset	Offset of the system clock relative to the reference clock, in milliseconds.
Roundtrip delay	Roundtrip delay from the local device to the clock source, in milliseconds.
Dispersion	Maximum error of the system clock relative to the reference source.
Total sessions	Total number of associations.

Display detailed information about all IPv6 NTP associations.

```
<Sysname> display ntp-service ipv6 sessions verbose
```

```

```

Table 2 Command output

Field	Description
Clock source	IPv6 address of the clock source. If this field displays **::**, the IPv6 address of the NTP server has not been resolved successfully.
Clock stratum	Stratum level of the NTP server, which determines the clock precision. The value is in the range of 1 to 16. A lower stratum level represents higher clock accuracy. A stratum 16 clock is not synchronized and cannot be used as a reference clock.

Clock status	Status of the clock source corresponding to this association:
	• **configured**—The association was created at the CLI.
	• **dynamic**—The association is established dynamically.
	• **master**—The clock source is the primary NTP server of the current system.
	• **selected**—The clock source has survived the clock selection algorithm.
	• **candidate**—The clock source is the candidate reference source.
	• **sane**—The clock source has passed authentication and its clock will be used as the reference clock.
	• **insane**—The clock source has not passed authentication, or it has passed authentication but its clock will not be used as the reference clock.
	• **valid**—The clock source is valid, which means the clock source meets the following requirements:
	  ○ It has been authenticated and synchronized.
	  ○ Its stratum level is valid.
	  ○ Its root delay and root dispersion values are within their ranges.
	• **invalid**—The clock source is invalid.
	• **unsynced**—The clock source has not been synchronized or the value of the stratum level is invalid.

Field	Description

Reference clock ID	• If the reference clock is the local clock, the value of this field is related to the value of the Clock stratum field:
	  ○ When the value of the Clock stratum field is 0 or 1, this field displays **LOCL**.
	  ○ When the Clock stratum field has another value, this field displays the MD5 digest value of the first 32 bits of the IPv6 address. The MD5 digest value is in dotted decimal format.
	• If the reference clock is the clock of another device on the network, this field displays the MD5 digest value of the first 32 bits of the IPv6 address. The MD5 digest value is in dotted decimal format. If this field displays **INIT**, the local device has not established a connection with the NTP server.

VPN instance	VPN instance of the NTP server. If the NTP server is in a public network, this field displays **Not specified**.
Local mode	Operation mode of the local device: • **unspec**—The mode is unspecified. • **sym_active**—Active mode. • **sym_passive**—Passive mode. • **client**—Client mode. • **server**—Server mode. • **broadcast**—Broadcast or multicast server mode. • **bclient**—Broadcast or multicast client mode.
local poll interval	Polling interval for the local device, in seconds. The value displayed is a power of 2. For example, if the displayed value is 6, the poll interval of the local device is 2^6, or 64 seconds.
peer mode	Operation mode of the peer device: • **unspec**—The mode is unspecified. • **sym_active**—Active mode. • **sym_passive**—Passive mode. • **client**—Client mode. • **server**—Server mode. • **broadcast**—Broadcast or multicast server mode. • **bclient**—Broadcast or multicast client mode.
peer poll interval	Polling interval for the peer device, in seconds. The value displayed is a power of 2. For example, if the displayed value is 6, the polling interval of the local device is 2^6, or 64 seconds.
Offset	Offset of the system clock relative to the reference clock, in milliseconds.
roundtrip delay	Roundtrip delay from the local device to the clock source, in milliseconds.
dispersion	Maximum error of the system clock relative to the reference clock.
Root roundtrip delay	Roundtrip delay from the local device to the primary NTP server, in milliseconds.
root dispersion	Maximum error of the system clock relative to the primary reference clock, in milliseconds.
Reachabilities	Reachability count of the clock source. 0 indicates that the clock source is unreachable.
sync distance	Synchronization distance relative to the upper-level clock, in seconds, and calculated from dispersion and roundtrip delay values.
Precision	Accuracy of the system clock.
version	NTP version in the range of 1 to 4.

Field	Description
source interface	Source interface. If the source interface is not specified, this field displays **Not specified**.
Reftime	Reference timestamp in the NTP message.
Orgtime	Originate timestamp in the NTP message.
Rcvtime	Receive timestamp in the NTP message.
Xmttime	Transmit timestamp in the NTP message.
Filter order	Dispersion information.
Reference clock status	Status of the local clock. The field is displayed only when you use the **ntp-service refclock-master** command to set the local clock as a reference clock. When the reach field of the local clock is 255, the field is displayed as **working normally**. Otherwise, the field is displayed as **working abnormally**.
Total sessions	Total number of associations.

display ntp-service sessions

Use **display ntp-service sessions** to display information about all IPv4 NTP associations.

Syntax

display ntp-service sessions [**verbose**]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

verbose: Displays detailed information about all IPv4 NTP associations. If you do not specify this keyword, the command displays only brief information about the NTP associations.

Usage guidelines

When a device is operating in NTP broadcast or multicast server mode, the **display ntp-service sessions** command does not display the IPv4 NTP association information corresponding to the broadcast or multicast server. However, the associations are counted in the total number of associations.

Examples

Display brief information about all IPv4 NTP associations.

```
<Sysname> display ntp-service sessions
       source          reference       stra reach poll  now offset  delay disper
**************************************************************************
[12345]LOCAL(0)        LOCL               0     1   64    - 0.0000 0.0000 7937.9
    [5]0.0.0.0         INIT              16     0   64    - 0.0000 0.0000 0.0000
```

```
Notes: 1 source(master), 2 source(peer), 3 selected, 4 candidate, 5 configured.
 Total sessions: 1
```

Table 3 Command output

Field	Description
source	• When the reference clock is the local clock, the field displays **LOCAL** (*number*). It indicates that the IP address of the local clock is 127.127.1.*number*, where *number* represents the NTP process number in the range of 0 to 3. • When the reference clock is the clock of another device, the field displays the IP address of the NTP server. If this field displays **0.0.0.0**, the IP address of the NTP server has not been resolved successfully.

reference	Reference clock ID of the NTP server:
	• If the reference clock is the local clock, the value of this field is related to the value of the **stra** field:
	  ○ When the value of the **stra** field is 0 or 1, this field displays **LOCL**.
	  ○ When the **stra** field has another value, this field displays the IP address of the local clock.
	• If the reference clock is the clock of another device on the network, this field displays the IP address of the device. If the device supports IPv6, this field displays the MD5 digest of the first 32 bits of the IPv6 address of the device. If this field displays **INIT**, the local device has not established a connection with the NTP server.

stra	Stratum level of the clock source, which determines the clock accuracy. The value is in the range of 1 to 16. The clock accuracy decreases from stratum 1 to stratum 16. A stratum 1 clock has the highest precision, and a stratum 16 clock is not synchronized and cannot be used as a reference clock.
reach	Reachability count of the clock source. 0 indicates that the clock source is unreachable.
poll	Polling interval in seconds. It is the maximum interval between successive NTP messages.
now	Length of time from when the last NTP message was received or when the local clock was last updated to the current time. Time is in seconds by default. • If the time length is greater than 2048 seconds, it is displayed in minutes (m). • If the time length is greater than 300 minutes, it is displayed in hours (h). • If the time length is greater than 96 hours, it is displayed in days (d). • If the time length is greater than 999 days, it is displayed in years (y). If the time when the most recent NTP message was received or when the local clock was updated most recently is behind the current time, this field displays a hyphen (-).
offset	Offset of the system clock relative to the reference clock, in milliseconds.
delay	Roundtrip delay from the local device to the NTP server, in milliseconds.
disper	Maximum error of the system clock relative to the reference source, in milliseconds.
[12345]	• **1**—Clock source selected by the system (the current reference source). • **2**—The stratum level of the clock source is less than or equal to 15. • **3**—The clock source has survived the clock selection algorithm. • **4**—The clock source is a candidate clock source. • **5**—The clock source was created by a configuration command.
Total sessions	Total number of associations.

Display detailed information about all IPv4 NTP associations.

```

```

Table 4 Command output

Field	Description
Clock source	IP address of the NTP server. If this field displays **0.0.0.0**, the IP address of the NTP server has not been resolved successfully.
Clock stratum	Stratum level of the NTP server, which determines the clock accuracy. The value is in the range of 1 to 16. A lower stratum level represents greater clock accuracy. A stratum 16 clock is not synchronized and cannot be used as a reference clock.

Clock status	Status of the clock source corresponding to this association:
	• **configured**—The association was created by a configuration command.
	• **dynamic**—The association is established dynamically.
	• **master**—The clock source is the primary NTP server of the current system.
	• **selected**—The clock source has survived the clock selection algorithm.
	• **candidate**—The clock source is the candidate reference source.
	• **sane**—The clock source has passed authentication and its clock will be used as the reference clock.
	• **insane**—The clock source has not passed authentication, or it has passed authentication but its clock will not be used as the reference clock.
	• **valid**—The clock source is valid, which means the clock source meets the following requirements:
	  ○ It has been authenticated and synchronized.
	  ○ Its stratum level is valid.
	  ○ Its root delay and root dispersion values are within their ranges.
	• **invalid**—The clock source is invalid.
	• **unsynced**—The clock source has not been synchronized or the value of the stratum level is invalid.

Field	Description

Reference clock ID	Reference clock ID of the NTP server:
	• If the reference clock is the local clock, the value of this field is related to the value of the **Clock** stratum field:
	  ○ When the value of the **Clock** stratum field is 0 or 1, this field displays **LOCL**.
	  ○ When the **Clock** stratum field has another value, this field displays the IP address of the local clock.
	• If the reference clock is the clock of another device on the network, this field displays the IP address of the device. If the device supports IPv6, this field displays the MD5 digest of the first 32 bits of the IPv6 address of the device. If this field displays **INIT**, the local device has not established a connection with the NTP server.

VPN instance	VPN instance to which the NTP server belongs. If the NTP server is in a public network, the field displays **Not specified**.
Local mode	Operation mode of the local device: • **unspec**—The mode is unspecified. • **active**—Active mode. • **passive**—Passive mode. • **client**—Client mode. • **server**—Server mode. • **broadcast**—Broadcast or multicast server mode. • **bclient**—Broadcast or multicast client mode.
local poll interval	Polling interval of the local device, in seconds. The value displayed is a power of 2. For example, if the displayed value is 6, the poll interval of the local device is 2^6, or 64 seconds.
Peer mode	Operation mode of the peer device: • **unspec**—The mode is unspecified. • **active**—Active mode. • **passive**—Passive mode. • **client**—Client mode. • **server**—Server mode. • **broadcast**—Broadcast or multicast server mode. • **bclient**—Broadcast or multicast client mode.
peer poll interval	Polling interval of the peer device, in seconds. The value displayed is a power of 2. For example, if the displayed value is 6, the poll interval of the local device is 2^6, or 64 seconds.
Offset	Offset of the system clock relative to the reference clock, in milliseconds.
roundtrip delay	Roundtrip delay from the local device to the NTP server, in milliseconds.
dispersion	Maximum error of the system clock relative to the reference clock.
Root roundtrip delay	Roundtrip delay from the local device to the primary NTP server, in milliseconds.
root dispersion	Maximum error of the system clock relative to the primary reference clock, in milliseconds.
Reachabilities	Reachability count of the clock source. 0 indicates that the clock source is unreachable.
sync distance	Synchronization distance relative to the upper-level clock, in seconds, and calculated from dispersion and roundtrip delay values.
Precision	Accuracy of the system clock.

Field	Description
version	NTP version in the range of 1 to 4.
source interface	Source interface. If the source interface is not specified, this field is **Not specified**.
Reftime	Reference timestamp in the NTP message.
Orgtime	Originate timestamp in the NTP message.
Rcvtime	Receive timestamp in the NTP message.
Xmttime	Transmit timestamp in the NTP message.
Filter order	Sample information order.
Reference clock status	Status of the local clock. The field is displayed only when you use the **ntp-service refclock-master** command to set the local clock as a reference clock. When the reach field of the local clock is 255, the field is displayed as **working normally**. Otherwise, the field is displayed as **working abnormally**.
Total sessions	Total number of associations.

display ntp-service status

Use **display ntp-service status** to display NTP service status.

Syntax

display ntp-service status

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Examples

Display NTP service status after time synchronization.

```
<Sysname> display ntp-service status
 Clock status: synchronized
 Clock stratum: 2
 System peer: LOCAL(0)
 Local mode: client
 Reference clock ID: 127.127.1.0
 Leap indicator: 00
 Clock jitter: 0.000977 s
 Stability: 0.000 pps
 Clock precision: 2^-18
 Root delay: 0.00000 ms
 Root dispersion: 3.96367 ms
 Reference time: d0c5fc32.92c70b1e  Wed, Dec 29 2010 18:28:02.573
```

```
System poll interval: 64 s
```

Display the NTP service status when time is not synchronized.

```
<Sysname> display ntp-service status
 Clock status: unsynchronized
 Clock stratum: 16
 Reference clock ID: none
 Clock jitter: 0.000000 s
 Stability: 0.000 pps
 Clock precision: 2^-18
 Clock precision:
 Root delay: 0.00000 ms
 Root dispersion: 0.00002 ms
 Reference time: d0c5fc32.92c70b1e  Wed, Dec 29 2010 18:28:02.573
 System poll interval: 8 s
```

Table 5 Command output

Field	Description
Clock status	Status of the system clock: • **synchronized**—The system clock has been synchronized. • **unsynchronized**—The system clock has not been synchronized.
Clock stratum	Stratum level of the system clock.
System peer	IP address of the selected NTP server.
Local mode	Operation mode of the local device: • **unspec**—The mode is unspecified. • **active**—Active mode. • **passive**—Passive mode. • **client**—Client mode. • **server**—Server mode. • **broadcast**—Broadcast or multicast server mode. • **bclient**—Broadcast or multicast client mode.
Reference clock ID	For an IPv4 NTP server: The field represents the IP address of the remote server when the local device is synchronized to a remote NTP server. The field represents the local clock when the local device uses the local clock as the reference source. • When the local clock has a stratum level of 1, this field displays **LOCL**. • When the local clock has any other stratum, this field displays the IP address of the local clock. For an IPv6 NTP server: The field represents the MD5 digest of the first 32 bits of the IPv6 address of the remote server when the local device is synchronized to a remote IPv6 NTP server. The field represents the local clock when the local device uses the local clock as the reference source. • When the local clock has a stratum level of 1, this field displays **LOCL**. • When the local clock has any other stratum, this field displays the MD5 digest of the first 32 bits of the IPv6 address of the local clock.

Field	Description
Leap indicator	Alarming status: • **00**—Normal. • **01**—Leap second, indicates that the last minute in a day has 61 seconds. • **10**—Leap second, indicates that the last minute in a day has 59 seconds. • **11**—Time is not synchronized.
Clock jitter	Difference between the system clock and reference clock, in seconds.
Stability	Clock frequency stability. A lower value represents better stability.
Clock precision	Accuracy of the system clock.
Root delay	Roundtrip delay from the local device to the primary NTP server, in milliseconds.
Root dispersion	Maximum error of the system clock relative to the primary NTP server, in milliseconds.
Reference time	Reference timestamp.
System poll interval	System polling interval in seconds.

display ntp-service trace

Use **display ntp-service trace** to display brief information about each NTP server from the local device back to the primary NTP server.

Syntax

display ntp-service trace [**source** *interface-type interface-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

source *interface-type interface-number*: Specifies the source interface for sending NTP packets to trace each NTP server from the local device back to the primary NTP server. The source IP address of the NTP packets is the IPv4 address/IPv6 address of the specified source interface. If the IP address of an NTP server is a link-local address, the link-local address of the outgoing interface of NTP packets is used as the source IP address of the NTP packets. If you do not specify this option, the interface that sends the tracing NTP packets acts as the source interface.

Usage guidelines

To trace back to the primary NTP server from the source interface, make sure the source interface and the NTP servers from the local device to the primary NTP server are reachable to each other.

Examples

Display brief information about each NTP server from the local device back to the primary NTP server.

```
<Sysname> display ntp-service trace
Server     127.0.0.1
```

```
Stratum    3, jitter  0.000, synch distance 0.0000.
Server     3000::32
Stratum    2 , jitter 790.00, synch distance 0.0000.
RefID      127.127.1.0
```

The output shows that server 127.0.0.1 is synchronized to server 3000::32, and server 3000::32 is synchronized to the local clock.

Table 6 Command output

Field	Description
Server	IP address of the NTP server.
Stratum	Stratum level of the NTP server.
jitter	Root mean square (RMS) value of the clock offset relative to the upper-level clock, in milliseconds.
synch distance	Synchronization distance relative to the upper-level NTP server, in seconds, calculated from dispersion and roundtrip delay values.
RefID	Identifier of the primary NTP server. When the stratum level of the primary reference clock is 0, it is displayed as **LOCL**. Otherwise, it is displayed as the IP address of the primary reference clock.

Related commands

ntp-service ipv6 source

ntp-service ipv6 unicast-peer

ntp-service ipv6 unicast-server

ntp-service source

ntp-service unicast-peer

ntp-service unicast-server

ntp-service acl

Use **ntp-service acl** to configure the right for peer devices to access the IPv4 NTP services on the local device.

Use **undo ntp-service** to remove the configured IPv4 NTP service access right.

Syntax

ntp-service { **peer** | **query** | **server** | **synchronization** } **acl** *ipv4-acl-number*

undo ntp-service { **peer** | **query** | **server** | **synchronization** } [**acl** *ipv4-acl-number*]

Default

The right for the peer devices to access the IPv4 NTP services on the local device is **peer**.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

peer: Allows time requests and NTP control queries (such as alarms, authentication status, and time server information) from a peer device and allows the local device to synchronize itself to a peer device.

query: Allows only NTP control queries from a peer device to the local device.

server: Allows time requests and NTP control queries from a peer device, but does not allow the local device to synchronize itself to a peer device.

synchronization: Allows only time requests from a peer device.

acl *ipv4-acl-number*: Specifies an IPv4 ACL by its number. The peer devices that match the IPv4 ACL have the access right specified in the command. The *ipv4-acl-number* argument represents an IPv4 basic ACL number in the range of 2000 to 2999 or an IPv4 advanced ACL number in the range of 3000 to 3999.

Usage guidelines

When the device receives an IPv4 NTP request, it matches the request against the access rights in order from the least restrictive to the most restrictive: **peer**, **server**, **synchronization**, and **query**.

- If no IPv4 NTP access control is configured, the **peer** access right applies.
- If the IP address of the peer device matches a **permit** statement in an IPv4 ACL, the access right is granted to the peer device. If a **deny** statement or no IPv4 ACL is matched, no access right is granted.
- If no IPv4 ACL is specified for an access right or the IPv4 ACL specified for the access right is not created, the access right is not granted.
- If none of the IPv4 ACLs specified for the access rights is created, the **peer** access right applies.
- If none of the IPv4 ACLs specified for the access rights contains rules, no access right is granted.

The **ntp-service acl** command provides minimal security for a system running NTP. A more secure method is NTP authentication.

Examples

Configure the peer devices on subnet 10.10.0.0/16 to have full access to the local device.

```
<Sysname> system-view
[Sysname] acl basic 2001
[Sysname-acl-ipv4-basic-2001] rule permit source 10.10.0.0 0.0.255.255
[Sysname-acl-ipv4-basic-2001] quit
[Sysname] ntp-service peer acl 2001
```

Related commands

ntp-service authentication enable

ntp-service authentication-keyid

ntp-service reliable authentication-keyid

ntp-service authentication enable

Use **ntp-service authentication enable** to enable NTP authentication.

Use **undo ntp-service authentication enable** to disable NTP authentication.

Syntax

ntp-service authentication enable

undo ntp-service authentication enable

Default

NTP authentication is disabled.

Views

System view

Predefined user roles

network-admin

context-admin

Usage guidelines

Enable NTP authentication in networks that require time synchronization security to make sure NTP clients are synchronized only to authenticated NTP servers.

To authenticate an NTP server, set an authentication key and specify it as a trusted key.

Examples

Enable NTP authentication.

```
<Sysname> system-view
[Sysname] ntp-service authentication enable
```

Related commands

ntp-service authentication-keyid

ntp-service reliable authentication-keyid

ntp-service authentication-keyid

Use **ntp-service authentication-keyid** to set an NTP authentication key.

Use **undo ntp-service authentication-keyid** to remove an NTP authentication key.

Syntax

ntp-service authentication-keyid *keyid* **authentication-mode md5** { **cipher** | **simple** } *string* [**acl** *ipv4-acl-number* | **ipv6 acl** *ipv6-acl-number*] *

undo ntp-service authentication-keyid *keyid*

Default

No NTP authentication key exists.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

keyid: Specifies an authentication key ID in the range of 1 to 4294967295.

authentication-mode md5: Specifies the MD5 authentication algorithm.

cipher: Specifies an authentication key in encrypted form.

simple: Specifies an authentication key in plaintext form. For security purposes, the authentication key specified in plaintext form will be stored in encrypted form.

string: Specifies a case-sensitive authentication key. Its plaintext form is a string of 1 to 32 characters. Its encrypted form is a string of 1 to 73 characters.

acl *ipv4-acl-number*: Specifies an IPv4 basic ACL by its number in the range of 2000 to 2999. Only the devices permitted by the ACL can use the key ID for authentication.

ipv6 acl *ipv6-acl-number*: Specifies an IPv6 basic ACL by its number in the range of 2000 to 2999. Only the devices permitted by the ACL can use the key ID for authentication.

Usage guidelines

NTP authentication must be enabled on an NTP network that requires time synchronization security. NTP authentication ensures that NTP clients are synchronized only to authenticated NTP time servers.

The key ID in the message from the peer device identifies the key used for authentication. The **acl** *ipv4-acl-number* or **acl** *ipv6-acl-number* option is used to identify the peer device that can use the key ID.

- If the specified IPv4 or IPv6 ACL does not exist, any device can use the key ID for authentication.
- If the specified IPv4 or IPv6 ACL does not contain any rules, no device can use the key ID for authentication.

To ensure a successful NTP authentication, configure the same key ID and key on the time server and client. Make sure the peer device is allowed to use the key ID for authentication on the local device.

After you specify an NTP authentication key, use the **ntp-service reliable authentication-keyid** command to configure the key as a trusted key. The key automatically changes to untrusted after you delete the key. In this case, you do not need to execute the **undo ntp-service reliable authentication-keyid** command.

You can set a maximum of 128 authentication keys by executing the command.

Examples

Set a plaintext MD5 authentication key, with the key ID of **10** and key value of **BetterKey**.

```
<Sysname> system-view
[Sysname] ntp-service authentication enable
[Sysname] ntp-service authentication-keyid 10 authentication-mode md5 simple BetterKey
```

Related commands

ntp-service authentication enable

ntp-service reliable authentication-keyid

ntp-service broadcast-client

Use **ntp-service broadcast-client** to configure the device to operate in NTP broadcast client mode and use the current interface to receive NTP broadcast packets.

Use **undo ntp-service broadcast-client** to remove the configuration.

Syntax

ntp-service broadcast-client

undo ntp-service broadcast-client

Default

The device does not operate in any NTP association mode.

Views

Interface view

Predefined user roles

network-admin

context-admin

Usage guidelines

After you configure the command, the device listens to NTP messages sent by the NTP broadcast server and is synchronized based on the received NTP messages.

If you have configured the device to operate in broadcast client mode on an interface with the command, do not add the interface to any aggregate group. To add the interface to an aggregate group, remove the configuration of the command.

Examples

Configure the device to operate in broadcast client mode and receive NTP broadcast messages on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] ntp-service broadcast-client
```

Related commands

ntp-service broadcast-server

ntp-service broadcast-server

Use **ntp-service broadcast-server** to configure the device to operate in NTP broadcast server mode and use the current interface to send NTP broadcast packets.

Use **undo ntp-service broadcast-server** to remove the configuration.

Syntax

ntp-service broadcast-server [**authentication-keyid** *keyid* | **version** *number*] *

undo ntp-service broadcast-server

Default

The device does not operate in any NTP association mode.

Views

Interface view

Predefined user roles

network-admin

context-admin

Parameters

authentication-keyid *keyid*: Specifies the key ID to be used for sending broadcast messages to broadcast clients. The value range for the *keyid* argument is 1 to 4294967295. If you do not specify this option, the local device cannot synchronize broadcast clients enabled with NTP authentication.

version *number*: Specifies the NTP version. The value range for the *number* argument is 1 to 4, and the default is 4.

Usage guidelines

After you configure the command, the device periodically sends NTP messages to the broadcast address 255.255.255.255.

If you have configured the device to operate in broadcast server mode on an interface with the command, do not add the interface to any aggregate group. To add the interface to an aggregate group, remove the configuration of the command.

Examples

Configure the device to operate in broadcast server mode and send NTP broadcast messages on GigabitEthernet 1/0/1, using key 4 for encryption. Set the NTP version to 4.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] ntp-service broadcast-server authentication-keyid 4
version 4
```

Related commands

ntp-service broadcast-client

ntp-service dscp

Use **ntp-service dscp** to set a DSCP value for IPv4 NTP packets.

Use **undo ntp-service dscp** to restore the default.

Syntax

ntp-service dscp *dscp-value*

undo ntp-service dscp

Default

The DSCP value for IPv4 NTP packets is 48.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

dscp-value: Sets a DSCP value in the range of 0 to 63 for IPv4 NTP packets.

Usage guidelines

The DSCP value is included in the ToS field of an IPv4 packet to identify the packet priority.

Examples

Set the DSCP value for IPv4 NTP packets to **30**.

```
<Sysname> system-view
[Sysname] ntp-service dscp 30
```

ntp-service enable

Use **ntp-service enable** to enable the NTP service.

Use **undo ntp-service enable** to disable the NTP service.

Syntax

ntp-service enable

undo ntp-service enable

Default

The NTP service is disabled.

Views

System view

Predefined user roles

network-admin

context-admin

Examples

Enable the NTP service.

```
<Sysname> system-view
[Sysname] ntp-service enable
```

ntp-service inbound enable

Use **ntp-service inbound enable** to enable an interface to receive NTP messages.

Use **undo ntp-service inbound enable** to disable an interface from receiving NTP messages.

Syntax

ntp-service inbound enable

undo ntp-service inbound enable

Default

An interface receives NTP messages.

Views

Interface view

Predefined user roles

network-admin

context-admin

Usage guidelines

Execute the **undo ntp-service inbound enable** command on an interface in the following cases:

- You do not want the interface to synchronize the peer device in the corresponding subnet.
- You do not want the device to be synchronized by the peer device in the subnet corresponding to the interface.

Examples

Disable GigabitEthernet 1/0/1 from receiving NTP messages.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] undo ntp-service inbound enable
```

ntp-service ipv6 acl

Use **ntp-service ipv6 acl** to configure the right for the peer devices to access the IPv6 NTP services of the local device.

Use **undo ntp-service ipv6** to remove the configured IPv6 NTP service access right.

Syntax

ntp-service ipv6 { **peer** | **query** | **server** | **synchronization** } **acl** *ipv6-acl-number*

undo ntp-service ipv6 { **peer** | **query** | **server** | **synchronization** } [**acl** *ipv6-acl-number*]

Default

The right for the peer devices to access the IPv6 NTP services on the local device is **peer**.

Views

System view

Predefined user roes

network-admin

context-admin

Parameters

peer: Allows time requests and NTP control queries (such as alarms, authentication status, and time server information) and allows the local device to synchronize itself to a peer device.

query: Allows only NTP control queries from a peer device to the local device.

server: Allows time requests and NTP control queries, but does not allow the local device to synchronize itself to a peer device.

synchronization: Allows only time requests from a system whose address passes the access list criteria.

ipv6-acl-number: Specifies an IPv6 ACL by its number. The peer devices that match the IPv6 ACL have the access right specified in the command. The *ipv6-acl-number argument* represents a basic IPv6 ACL number in the range of 2000 to 2999 or an advanced IPv6 ACL number in the range of 3000 to 3999.

Usage guidelines

When the device receives an IPv6 NTP request, it matches the request against the access rights in order from the least restrictive to the most restrictive: **peer**, **server**, **synchronization**, and **query**.

- If no IPv6 NTP access control is configured, the **peer** access right applies.
- If the IP address of the peer device matches a **permit** statement in an IPv6 ACL, the access right is granted to the peer device. If a **deny** statement or no IPv6 ACL is matched, no access right is granted.
- If no IPv6 ACL is specified for an access right or the IPv6 ACL specified for the access right is not created, the access right is not granted.

- If none of the IPv6 ACLs specified for the access rights is created, the **peer** access right applies.
- If none of the IPv6 ACLs specified for the access rights contains rules, no access right is granted.

The **ntp-service ipv6 acl** command provides a minimum security method. NTP authentication is more secure.

Examples

Configure the peer devices on subnet 2001::1 to have full access to the local device.

```
<Sysname> system-view
[Sysname] acl ipv6 basic 2001
[Sysname-acl-ipv6-basic-2001] rule permit source 2001::1 64
[Sysname-acl-ipv6-basic-2001] quit
[Sysname] ntp-service ipv6 peer acl 2001
```

Parameters

dscp-value: Specifies a DSCP value in the range of 0 to 63 for IPv6 NTP packets.

Usage guidelines

The DSCP value is included in the Traffic Class field of an IPv6 packet to identify the packet priority.

Examples

Set the DSCP value for IPv6 NTP packets to **30**.

```
<Sysname> system-view
[Sysname] ntp-service ipv6 dscp 30
```

ntp-service ipv6 inbound enable

Use **ntp-service ipv6 inbound enable** to enable an interface to receive IPv6 NTP messages.

Use **undo ntp-service ipv6 inbound enable** to disable an interface from receiving IPv6 NTP messages.

Syntax

ntp-service ipv6 inbound enable

undo ntp-service ipv6 inbound enable

Default

An interface receives IPv6 NTP messages.

Views

Interface view

Predefined user roles

network-admin

context-admin

Usage guidelines

Execute the **undo ntp-service ipv6 inbound enable** command on an interface in the following cases:

- You do not want the interface to synchronize the peer devices in the corresponding subnet.
- You do not want the device to be synchronized by the peer devices in the subnet corresponding to the interface.

Examples

Disable GigabitEthernet 1/0/1 from receiving IPv6 NTP messages.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] undo ntp-service ipv6 inbound enable
```

ntp-service ipv6 multicast-client

Use **ntp-service ipv6 multicast-client** to configure the device to operate in IPv6 NTP multicast client mode and use the current interface to receive IPv6 NTP multicast packets.

Use **undo ntp-service ipv6 multicast-client** to remove the configuration.

Syntax

ntp-service ipv6 multicast-client *ipv6-address*

undo ntp-service ipv6 multicast-client *ipv6-address*

Default

The device does not operate in any NTP association mode.

Views

Interface view

Predefined user roles

network-admin

context-admin

Parameters

ipv6-address: Specifies an IPv6 multicast address. An IPv6 broadcast client and an IPv6 broadcast server must be configured with the same multicast address.

Usage guidelines

After you configure the command, the device listens to IPv6 NTP messages using the specified multicast address as the destination address. It is synchronized based on the received IPv6 NTP messages.

If you have configured the device to operate in IPv6 multicast client mode on an interface by using the command, do not add the interface to any aggregate group. To add the interface to an aggregate group, remove the configuration of the command.

Examples

Configure the device to operate in IPv6 multicast client mode and receive IPv6 NTP multicast messages with the destination FF21::1 on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] ntp-service ipv6 multicast-client ff21::1
```

Related commands

Use **ntp-service ipv6 multicast-server** to configure the device to operate in IPv6 NTP multicast server mode and use the current interface to send IPv6 NTP multicast packets.

Use **undo ntp-service ipv6 multicast-server** to remove the configuration.

Syntax

ntp-service ipv6 multicast-server *ipv6-address* [**authentication-keyid** *keyid* | **ttl** *ttl-number*] *

undo ntp-service ipv6 multicast-server *ipv6-address*

Default

The device does not operate in any NTP association mode.

Views

Interface view

Predefined user roles

network-admin

context-admin

Parameters

ipv6-address: Specifies an IPv6 multicast address. An IPv6 multicast client and server must be configured with the same multicast address.

authentication-keyid *keyid*: Specifies the key ID to be used for sending multicast messages to multicast clients. The value range for the *keyid* argument is 1 to 4294967295. If you do not specify this option, the local device cannot synchronize clients enabled with NTP authentication.

ttl *ttl-number*: Specifies the TTL of NTP multicast messages. The value range for the *ttl-number* argument is 1 to 255, and the default is 16.

Usage guidelines

After you configure the command, the device periodically sends NTP messages to the specified IPv6 multicast address.

If you have configured the device to operate in IPv6 multicast server mode on an interface with the command, do not add the interface to any aggregate group. To add the interface to an aggregate group, remove the configuration of the command.

Examples

Configure the device to operate in IPv6 multicast server mode and send IPv6 NTP multicast messages on GigabitEthernet 1/0/1 to the multicast address FF21::1, using key 4 for encryption.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] ntp-service ipv6 multicast-server ff21::1
```

Related commands

ntp-service ipv6 multicast-client

ntp-service ipv6 source

Use **ntp-service ipv6 source** to specify a source interface for IPv6 NTP messages.

Use **undo ntp-service ipv6 source** to restore the default.

Syntax

ntp-service ipv6 source *interface-type interface-number*

undo ntp-service ipv6 source

Default

No source interface is specified for IPv6 NTP messages. The device automatically selects the source IP address for IPv6 NTP messages. For more information, see *RFC 3484*.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

interface-type interface-number: Specifies an interface by its type and number.

Usage guidelines

If you specify a source interface for IPv6 NTP messages, the device uses the IPv6 address of the source interface as the source address to send IPv6 NTP messages. Consequently, the destination address of the IPv6 NTP response messages is the address of the source interface.

When the device responds to an IPv6 NTP request, the source IPv6 address of the NTP response is always the IPv6 address of the interface that has received the IPv6 NTP request.

If you do not want the IPv6 address of an interface on the local device to become the destination address for response messages, use the command to specify another interface as the source interface for IPv6 NTP messages.

The source interface for IPv6 NTP messages can also be specified in the following ways:

- In NTP client/server mode, if you have specified the source interface for IPv6 NTP messages in the **ntp-service ipv6 unicast-server** command, the specified interface acts as the source interface for IPv6 NTP messages.
- In NTP symmetric active/passive mode, if you have specified the source interface for IPv6 NTP messages in the **ntp-service ipv6 unicast-peer** command, the specified interface acts as the source interface for IPv6 NTP messages.
- In NTP multicast mode, if you have configured the **ntp-service ipv6 multicast-server** command on an interface, the interface acts as the source interface for NTP multicast messages.

If the specified source interface is down, the device does not send IPv6 NTP messages.

Examples

Specify the source interface of IPv6 NTP messages as GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] ntp-service ipv6 source gigabitethernet 1/0/1
```

ntp-service ipv6 unicast-peer

Use **ntp-service ipv6 unicast-peer** to specify an IPv6 symmetric-passive peer for the device.

Use **undo ntp-service ipv6 unicast-peer** to remove the IPv6 symmetric-passive peer specified for the device.

Syntax

ntp-service ipv6 unicast-peer { *peer-name* | *ipv6-address* } [**vpn-instance** *vpn-instance-name*] [**authentication-keyid** *keyid* | **maxpoll** *maxpoll-interval* | **minpoll** *minpoll-interval* | **priority** | **source** *interface-type interface-number*] *

undo ntp-service ipv6 unicast-peer { *peer-name* | *ipv6-address* } [**vpn-instance** *vpn-instance-name*]

Default

No IPv6 symmetric-passive peer is specified.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

peer-name: Specifies a symmetric-passive peer by its host name, a case-insensitive string of 1 to 253 characters. Valid characters are letters, digits, hyphens (-), underscores (_), and periods (.).

ipv6-address: Specifies a symmetric-passive peer by its IPv6 address. It must be a unicast address, rather than a multicast address.

vpn-instance *vpn-instance-name*: Specifies the MPLS L3VPN instance to which the symmetric-passive peer belongs. The *vpn-instance-name* argument is a case-sensitive string of 1 to 31 characters. If the symmetric-passive peer is on the public network, do not specify this option.

authentication-keyid *keyid*: Specifies the key ID to be used for sending NTP messages to the peer. The value range for the *keyid* argument is 1 to 4294967295. If you do not specify this option, the local device and the peer do not authenticate each other.

maxpoll *maxpoll-interval*: Specifies the maximum polling interval. The value range for the *maxpoll-interval* argument is 4 to 17, to which base 2 is raised to get the interval in seconds. The maximum polling interval is in the range of 2^4 to 2^{17} (16 to 131072) seconds. The default value for the *maxpoll-interval* argument is 6 and the default maximum polling interval is 2^6 (64) seconds.

minpoll *minpoll-interval*: Specifies the minimum polling interval. The value range for the *minpoll-interval* argument is 4 to 17, to which base 2 is raised to get the interval in seconds. The minimum polling interval is in the range of 2^4 to 2^{17} (16 to 131072) seconds. The default value for the *minpoll-interval* argument is 6 and the default minimum polling interval is 2^6 (64) seconds.

priority: Specifies the peer specified by *ipv6-address* or *peer-name* as the first choice under the same condition.

source *interface-type interface-number*: Specifies the source interface for IPv6 NTP messages. If the specified passive peer address is not a link local address, the source IPv6 address for IPv6 NTP messages sent by the local device is the IPv6 address of the specified source interface. If the specified passive peer address is a link local address, the IPv6 NTP messages are sent from the specified source interface, and the source address of the messages is the link local address of the interface. The *interface-type interface-number* argument represents the interface type and number. If you do not specify an interface, the device automatically selects the source IPv6 address of IPv6 NTP messages. For more information, see *RFC 3484*.

Usage guidelines

When you specify an IPv6 passive peer for the device, the device and its IPv6 passive peer can be synchronized to each other. If their clocks are in synchronized state, the clock with a high stratum level is synchronized to the clock with a lower stratum level.

To synchronize the PE to a PE or CE in a VPN instance, provide the **vpn-instance** *vpn-instance-name* option in the command.

If you include the **vpn-instance** *vpn-instance-name* option in the **undo ntp-service ipv6 unicast-peer** command, the command removes the symmetric-passive peer in the specified VPN instance. If you do not include the **vpn-instance** *vpn-instance-name* option in the command, the command removes the symmetric-passive peer on the public network.

If the specified IPv6 address of the passive peer is a link local address, you must specify the source interface for NTP messages and cannot specify a VPN instance for the passive peer.

If the specified IPv6 address of the passive peer is a link local address, you must specify the source interface for NTP messages and cannot specify a VPN instance for the passive peer.

After you specify an IPv6 symmetric-passive peer for a device, the device polls and synchronize its time with the peer device at the minimum polling interval. If the time discrepancy between the two remains in the acceptable range, the system gradually increases the polling interval until the maximum polling interval is reached. If the time discrepancy exceeds the acceptable range repeatedly, the polling interval decreases gradually.

The polling interval configuration takes effect when the next polling starts.

Examples

Specify the device with the IPv6 address of 2001::1 as the symmetric-passive peer of the local device, and specify the source interface for IPv6 NTP messages as GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] ntp-service ipv6 unicast-peer 2001::1 source gigabitethernet 1/0/1
```

Syntax

ntp-service ipv6 unicast-server { *server-name* | *ipv6-address* } [**vpn-instance** *vpn-instance-name*] [**authentication-keyid** *keyid* | **maxpoll** *maxpoll-interval* | **minpoll** *minpoll-interval* | **priority** | **source** *interface-type interface-number*] *

undo ntp-service ipv6 unicast-server { *server-name* | *ipv6-address* } [**vpn-instance** *vpn-instance-name*]

Default

No IPv6 NTP server is specified.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

server-name: Specifies an NTP server by its host name, a case-insensitive string of 1 to 253 characters. Valid characters are letters, digits, hyphens (-), underscores (_), and periods (.).

ipv6-address: Specifies an NTP server by its IPv6 address. It must be a unicast address, rather than a multicast address.

vpn-instance *vpn-instance-name*: Specifies the MPLS L3VPN instance to which the NTP server belongs. The *vpn-instance-name* argument is a case-sensitive string of 1 to 31 characters. If the NTP server is on the public network, do not specify this option.

authentication-keyid *keyid*: Specifies the key ID to be used for sending NTP messages to the NTP server. The value range for the *keyid* argument is 1 to 4294967295. If you do not specify this option, the local device and NTP server do not authenticate each other.

maxpoll *maxpoll-interval*: Specifies the maximum polling interval. The value range for the *maxpoll-interval* argument is 4 to 17, to which base 2 is raised to get the interval in seconds. The maximum polling interval is in the range of 2^4 to 2^{17} (16 to 131072) seconds. The default value for the *maxpoll-interval* argument is 6 and the default maximum polling interval is 2^6 (64) seconds.

minpoll *minpoll-interval*: Specifies the minimum polling interval. The value range for the *minpoll-interval* argument is 4 to 17, to which base 2 is raised to get the interval in seconds. The minimum polling interval is in the range of 2^4 to 2^{17} (16 to 131072) seconds. The default value for the *minpoll-interval* argument is 6 and the default minimum polling interval is 2^6 (64) seconds.

priority: Specifies this NTP server as the first choice under the same condition.

source *interface-type interface-number*: Specifies the source interface for IPv6 NTP messages. If the specified IPv6 NTP server address is not a link local address, the source IPv6

address for IPv6 NTP messages sent by the local device to the NTP server is the IPv6 address of the specified source interface. If the specified IPv6 NTP server address is a link local address, the IPv6 NTP messages are sent from the specified source interface, and the source address of the messages is the link local address of the interface. The *interface-type interface-number* argument represents the interface type and number. If you do not specify an interface, the device automatically selects the source IPv6 address of IPv6 NTP messages. For more information, see *RFC 3484*.

Usage guidelines

When you specify an IPv6 NTP server for the device, the device is synchronized to the IPv6 NTP server, but the IPv6 NTP server is not synchronized to the device.

To synchronize the PE to a PE or CE in a VPN instance, specify the **vpn-instance** *vpn-instance-name* option in the command.

If you include the **vpn-instance** *vpn-instance-name* option in the **undo ntp-service unicast-server** command, the command removes the NTP server in the specified VPN. If you do not include the **vpn-instance** *vpn-instance-name* option in the command, the command removes the NTP server on the public network.

If the specified IPv6 address of the NTP server is a link local address, you must specify the source interface for NTP messages and cannot specify a VPN instance for the NTP server.

After you specify an IPv6 NTP server for a device, the device polls and synchronizes its time with the server at the minimum polling interval. If the time discrepancy between the two remains in the acceptable range, the system gradually increases the polling interval until the maximum polling interval is reached. If the time discrepancy exceeds the acceptable range repeatedly, the polling interval decreases gradually.

The polling interval configuration takes effect when the next polling starts.

Examples

Specify the IPv6 NTP server 2001::1 for the device.

```
<Sysname> system-view
[Sysname] ntp-service ipv6 unicast-server 2001::1
```

ntp-service max-dynamic-sessions

Use **ntp-service max-dynamic-sessions** to set the maximum number of dynamic NTP sessions.

Use **undo ntp-service max-dynamic-sessions** to restore the default.

Syntax

ntp-service max-dynamic-sessions *number*

undo ntp-service max-dynamic-sessions

Default

The maximum number of dynamic NTP sessions is 100.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

number: Sets the maximum number of dynamic NTP associations, in the range of 0 to 100.

Usage guidelines

A device can have a maximum of 128 concurrent associations, including static associations and dynamic associations. A static association refers to an association that a user has manually created by using an NTP command. A dynamic association is a temporary association created by the system during operation.

This command limits the number of dynamic NTP associations and prevents dynamic NTP associations from occupying too many system resources.

Examples

Set the maximum number of dynamic NTP associations to 50.

```
<Sysname> system-view
[Sysname] ntp-service max-dynamic-sessions 50
```

Related commands

display ntp-service sessions

ntp-service multicast-client

Use **ntp-service multicast-client** to configure the device to operate in NTP multicast client mode and use the current interface to receive NTP multicast packets.

Use **undo ntp-service multicast-client** to remove the configuration.

Syntax

ntp-service multicast-client [*ip-address*]

undo ntp-service multicast-client [*ip-address*]

Default

The device does not operate in any NTP association mode.

Views

Interface view

Predefined user roles

network-admin

context-admin

Parameters

ip-address: Specifies a multicast IP address. The default is 224.0.1.1. A multicast server and client must be configured with the same multicast IP address.

Usage guidelines

After you configure the command, the device listens to NTP messages using the specified multicast address as the destination address.

If you have configured the device to operate in multicast client mode on an interface with the command, do not add the interface to any aggregate group. To add the interface to an aggregate group, remove the configuration of the command.

Examples

Configure the device to operate in multicast client mode and receive NTP multicast messages on GigabitEthernet 1/0/1, and set the multicast address to 224.0.1.1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1

context-admin

Parameters

ip-address: Specifies a multicast IP address. The default is 224.0.1.1. A multicast server and client must be configured with the same multicast IP address.

authentication-keyid *keyid*: Specifies the key ID to be used for sending multicast messages to multicast clients. The value range for the *keyid* argument is 1 to 4294967295. If you do not specify this option, the local device cannot synchronize multicast clients enabled with NTP authentication.

ttl *ttl-number*: Specifies the TTL of NTP multicast messages. The value range for the *ttl-number* argument is 1 to 255. The default value is 16.

version *number*: Specifies the NTP version. The value range for the *number* argument is 1 to 4. The default value is 4.

Usage guidelines

After you configure the command, the device periodically sends NTP messages to the specified multicast address.

If you have configured the device to operate in multicast server mode on an interface with the command, do not add the interface to any aggregate group. To add the interface to an aggregate group, remove the configuration of the command.

Examples

Configure the device to operate in multicast server mode and send NTP multicast messages on GigabitEthernet 1/0/1 to the multicast address 224.0.1.1, using key 4 for encryption. Set the NTP version to 4.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] ntp-service multicast-server 224.0.1.1 version 4
authentication-keyid 4
```

Related commands

ntp-service refclock-master

Use **ntp-service refclock-master** to configure the local clock as the reference source.

Use **undo ntp-service refclock-master** to remove the configuration.

Syntax

ntp-service refclock-master [*ip-address*] [*stratum*]

undo ntp-service refclock-master [*ip-address*]

Default

The device does not use its local clock as the reference clock.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

ip-address: IP address of the local clock, 127.127.1.*u*, where *u* is the NTP process ID in the range of 0 to 3. The default value is 127.127.1.0.

stratum: Stratum level of the local clock, in the range of 1 to 15. The default value is 8. A lower stratum level represents higher clock accuracy.

Usage guidelines

Typically an NTP server that gets its time from an authoritative time source, such as an atomic clock has stratum 1 and operates as the primary time server to provide time synchronization for other devices in the network. The accuracy of each server is the stratum, with the topmost level (primary servers) assigned as one and each level downwards (secondary servers) in the hierarchy assigned as one greater than the preceding level.

If the devices in a network cannot synchronize to an authoritative time source, you can perform the following tasks:

- Select a device that has a relatively accurate clock from the network.
- Use the local clock of the device as the reference clock to synchronize other devices in the network.

Use the command with caution to avoid time errors. As a best practice, set the local clock time to a correct value before you execute the command.

Examples

Specify the local clock as the reference source, with the stratum level 2.

```
<Sysname> system-view
[Sysname] ntp-service refclock-master 2
```

ntp-service reliable authentication-keyid

Use **ntp-service reliable authentication-keyid** to specify an authentication key as a trusted key.

Use **undo ntp-service reliable authentication-keyid** to remove the configuration.

Syntax

ntp-service reliable authentication-keyid *keyid*

undo ntp-service reliable authentication-keyid *keyid*

Default

No trusted key is specified.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

keyid: Specifies an authentication key by its ID in the range of 1 to 4294967295.

Usage guidelines

When NTP authentication is enabled, a client can be synchronized only to a server that can provide a trusted authentication key.

Before you use the command, make sure NTP authentication is enabled and an authentication key is configured. The key automatically changes to untrusted after you delete the key. In this case, you do not need to execute the **undo ntp-service reliable authentication-keyid** command.

You can set a maximum of 128 keys by executing the command.

Examples

Enable NTP authentication, specify the MD5 algorithm, with the key ID of 37 and key value of **BetterKey**.

```
<Sysname> system-view
[Sysname] ntp-service authentication enable
[Sysname] ntp-service authentication-keyid 37 authentication-mode md5 simple BetterKey
```

Specify this key as a trusted key.

```
[Sysname] ntp-service reliable authentication-keyid 37
```

Related commands

ntp-service authentication enable

ntp-service authentication-keyid

interface-type interface-number: Specifies an interface by its type and number.

Usage guidelines

If you specify a source interface for NTP messages, the device uses the primary IP address of the specified interface as the source IP address to send NTP messages. Consequently, the destination address of the NTP response messages is the primary IP address of the source interface.

When the device responds to an NTP request, the source IP address of the NTP response is always the IP address of the interface that has received the NTP request.

If you do not want the IP address of an interface on the local device to become the destination address for response messages, use the command to specify another interface as the source interface for NTP messages.

If you have specified the source interface for NTP messages in the **ntp-service unicast-server** or **ntp-service unicast-peer** command, the specified source interface is used as the source interface for NTP messages.

If you have configured the **ntp-service broadcast-server** or **ntp-service multicast-server** command in an interface view, the interface is used as the source interface for broadcast or multicast NTP messages.

If the specified source interface is down, the device does not send NTP messages.

Examples

Specify the source interface for NTP messages as GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] ntp-service source gigabitethernet 1/0/1
```

ntp-service time-offset-threshold

Use **ntp-service time-offset-threshold** to set the time offset thresholds for outputting logs and traps during time synchronization.

Use **undo ntp-service time-offset-threshold** to restore the default.

Syntax

ntp-service time-offset-threshold { **log** *log-threshold* | **trap** *trap-threshold* }*

undo ntp-service time-offset-threshold

Default

No time offset thresholds are set for outputting logs and traps during time synchronization.

Views

System view

Predefined user roles

network-admin

Parameters

log *log-threshold*: Specifies the time offset threshold for outputting logs during time synchronization, in the range of 128 to 60000 milliseconds.

trap *trap-threshold*: Specifies the time offset threshold for outputting traps during time synchronization, in the range of 128 to 60000 milliseconds.

Usage guidelines

By default, the system synchronizes the NTP client's time to the server and outputs a log and a trap when the time offset exceeds 128 ms for multiple times.

After you set the thresholds, the system synchronizes the client's time to the server when the time offset exceeds 128 ms, but outputs logs and traps only when the time offset exceeds the specified thresholds, respectively.

Examples

Set the NTP time-offset thresholds for outputting logs and traps to 500 ms and 600 ms, respectively.

```
<Sysname> system-view
[Sysname] ntp-service time-offset-threshold log 500 trap 600
```

ntp-service unicast-peer

Use **ntp-service unicast-peer** to specify a symmetric-passive peer for the device.

Use **undo ntp-service unicast-peer** to remove the symmetric-passive peer specified for the device.

Syntax

ntp-service unicast-peer { *peer-name* | *ip-address* } [**vpn-instance** *vpn-instance-name*] [**authentication-keyid** *keyid* | **maxpoll** *maxpoll-interval* | **minpoll** *minpoll-interval* | **priority** | **source** *interface-type interface-number* | **version** *number*] *

undo ntp-service unicast-peer { *peer-name* | *ip-address* } [**vpn-instance** *vpn-instance-name*]

Default

No symmetric-passive peer is specified.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

peer-name: Specifies a symmetric-passive peer by its host name, a case-insensitive string of 1 to 253 characters. Valid characters are letters, digits, hyphens (-), underscores (_), and periods (.).

ip-address: Specifies a symmetric-passive peer by its IP address. It must be a unicast address, rather than a broadcast address, a multicast address, or the IP address of the local clock.

vpn-instance *vpn-instance-name*: Specifies the MPLS L3VPN instance to which the symmetric-passive peer belongs. The *vpn-instance-name* argument is a case-sensitive string of 1 to 31 characters. If the symmetric-passive peer is on the public network, do not specify this option.

authentication-keyid *keyid*: Specifies the key ID to be used for sending NTP messages to the peer. The value range for the *keyid* argument is 1 to 4294967295. If you do not specify this option, the local device and the peer do not authenticate each other.

maxpoll *maxpoll-interval*: Specifies the maximum polling interval. The value range for the *maxpoll-interval* argument is 4 to 17, to which base 2 is raised to get the interval in seconds. The maximum polling interval is in the range of 2^4 to 2^{17} (16 to 131072) seconds. The default value for the *maxpoll-interval* argument is 6 and the default maximum polling interval is 2^6 (64) seconds.

minpoll *minpoll-interval*: Specifies the minimum polling interval. The value range for the *minpoll-interval* argument is 4 to 17, to which base 2 is raised to get the interval in seconds. The minimum polling interval is in the range of 2^4 to 2^{17} (16 to 131072) seconds. The default value for the *minpoll-interval* argument is 6 and the default minimum polling interval is 2^6 (64) seconds.

priority: Specifies the peer specified by *ip-address* or *peer-name* as the first choice under the same condition.

source *interface-type interface-number*: Specifies the source interface for NTP messages. In an NTP message the local device sends to its peer, the source IP address is the primary IP address of this interface. The *interface-type interface-number* argument represents the interface type and number. If you do not specify this option, the device searches the routing table for the outgoing interface and uses the primary IP address of the outgoing interface as the source IP address of the NTP messages.

version *number*: Specifies the NTP version. The value range for the *number* argument is 1 to 4. The default value is 4.

Usage guidelines

When you specify a passive peer for the device, the device and its passive peer can be synchronized to each other. If their clocks are in synchronized state, the clock with a high stratum level is synchronized to the clock with a lower stratum level.

To synchronize the PE to a PE or CE in a VPN instance, provide **vpn-instance** *vpn-instance-name* in your command.

If you include **vpn-instance** *vpn-instance-name* in the **undo ntp-service unicast-peer** command, the command removes the symmetric-passive peer in the specified VPN instance. If you do not include **vpn-instance** *vpn-instance-name* in the command, the command removes the symmetric-passive peer on the public network.

After you specify a symmetric-passive peer for a device, the device polls and synchronizes its time with the peer device at the minimum polling interval. If the time discrepancy between the two remains in the acceptable range, the system gradually increases the polling interval until the maximum polling interval is reached. If the time discrepancy exceeds the acceptable range repeatedly, the polling interval decreases gradually.

The polling interval configuration takes effect when the next polling starts.

Examples

Specify the device with the IP address of 10.1.1.1 as the symmetric-passive peer of the local device, and configure the local device to run NTP version 4. Specify the source interface of NTP messages as GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] ntp-service unicast-peer 10.1.1.1 version 4 source gigabitethernet 1/0/1
```

Default

No NTP server is specified.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

server-name: Specifies an NTP server by its host name, a case-insensitive string of 1 to 253 characters. Valid characters are letters, digits, hyphens (-), underscores (_), and periods (.).

ip-address: Specifies an NTP server by its IP address. It must be a unicast address, rather than a broadcast address, a multicast address, or the IP address of the local clock.

vpn-instance *vpn-instance-name*: Specifies the MPLS L3VPN instance to which the NTP server belongs. The *vpn-instance-name* argument is a case-sensitive string of 1 to 31 characters. If the NTP server is on the public network, do not specify this option.

authentication-keyid *keyid*: Specifies the key ID to be used for sending NTP messages to the NTP server. The value range for the *keyid* argument is 1 to 4294967295. If you do not specify this option, the local device and NTP server do not authenticate each other.

maxpoll *maxpoll-interval*: Specifies the maximum polling interval. The value range for the *maxpoll-interval* argument is 4 to 17, to which base 2 is raised to get the interval in seconds. The maximum polling interval is in the range of 2^4 to 2^{17} (16 to 131072) seconds. The default value for the *maxpoll-interval* argument is 6 and the default maximum polling interval is 2^6 (64) seconds.

minpoll *minpoll-interval*: Specifies the minimum polling interval. The value range for the *minpoll-interval* argument is 4 to 17, to which base 2 is raised to get the interval in seconds. The minimum polling interval is in the range of 2^4 to 2^{17} (16 to 131072) seconds. The default value for the *minpoll-interval* argument is 6 and the default minimum polling interval is 2^6 (64) seconds.

priority: Specifies this NTP server as the first choice under the same condition.

source *interface-type interface-number*: Specifies the source interface for NTP messages. For an NTP message the local device sends to the NTP server, the source IP address is the primary IP address of this interface. The *interface-type interface-number* argument represents the interface type and number. If you do not specify this option, the device searches the routing table for the outgoing interface and uses the primary IP address of the outgoing interface as the source IP address of the NTP messages.

version *number*: Specifies the NTP version. The value range for the *number* argument is 1 to 4. The default value is 4.

Usage guidelines

When you specify an NTP server for the device, the device is synchronized to the NTP server, but the NTP server is not synchronized to the device.

To synchronize the PE to a PE or CE in a VPN instance, provide **vpn-instance** *vpn-instance-name* in your command.

If you include the **vpn-instance** *vpn-instance-name* option in the **undo ntp-service unicast-server** command, the command removes the NTP server in the specified VPN instance. If you do not include the **vpn-instance** *vpn-instance-name* option in the command, the command removes the NTP server on the public network.

After you specify an NTP server for a device, the device polls and synchronizes its time with the server at the minimum polling interval. If the time discrepancy between the two remains in the acceptable range, the system gradually increases the polling interval until the maximum polling interval is reached. If the time discrepancy exceeds the acceptable range repeatedly, the polling interval decreases gradually.

The polling interval configuration takes effect when the next polling starts.

Examples

Specify NTP server 10.1.1.1 for the device, and configure the device to run NTP version 4.

```
<Sysname> system-view
[Sysname] ntp-service unicast-server 10.1.1.1 version 4
```

Display information about all IPv6 SNTP associations.

```
<Sysname> display sntp ipv6 sessions
SNTP server: 2001::1
Stratum: 16
Version: 4
Last receive time: No packet was received.

SNTP server: 2001::100
Stratum: 3
Version: 4
Last receive time: Fri, Oct 21 2011 11:28:28.058 (Synced)
```

Table 7 Command output

Field	Description
SNTP server	SNTP server (NTP server). If this field displays **::**, the IPv6 address of the NTP server has not been resolved successfully.
Stratum	Stratum level of the NTP server, which determines the clock accuracy. It is in the range of 1 to 16. A lower stratum level represents a higher clock accuracy. A clock with stratum level 16 is not synchronized.
Version	SNTP version.
Last receive time	Time when the last message was received: • **Synced**—The local clock is synchronized to the NTP server. • **No packet was received**—The device has not received any SNTP session information from the server.

display sntp sessions

Use **display sntp sessions** to display information about all IPv4 SNTP associations.

Examples

Display information about all IPv4 SNTP associations.

```
<Sysname> display sntp sessions
SNTP server     Stratum   Version    Last receive time
1.0.1.11        2         4          Tue, May 17 2011  9:11:20.833 (Synced)
```

Table 8 Command output

Field	Description
SNTP server	SNTP server (NTP server). If this field displays **0.0.0.0**, the IP address of the NTP server has not been resolved successfully.
Stratum	Stratum level of the NTP server, which determines the clock accuracy. It is in the range of 1 to 16. A lower stratum level represents higher clock accuracy. A clock with stratum level 16 is not synchronized.
Version	SNTP version.
Last receive time	Time when the last message was received. Synced means the local clock is synchronized to the NTP server.

sntp authentication enable

Use **sntp authentication enable** to enable SNTP authentication.

Use **undo sntp authentication enable** to disable SNTP authentication.

Syntax

sntp authentication enable

undo sntp authentication enable

Default

SNTP authentication is disabled.

Views

System view

Predefined user roles

network-admin

context-admin

Usage guidelines

You need to enable SNTP authentication in networks that require time synchronization security to make sure SNTP clients are synchronized only to authenticated NTP servers.

To authenticate an NTP server, set an authentication key and specify it as a trusted key.

Examples

Enable SNTP authentication.

```
<Sysname> system-view
[Sysname] sntp authentication enable
```

Related commands

sntp authentication-keyid

Use **sntp authentication-keyid** to set an SNTP authentication key.

Use **undo sntp authentication-keyid** to remove an SNTP authentication key.

Syntax

sntp authentication-keyid *keyid* **authentication-mode md5** { **cipher** | **simple** } *string* [**acl** *ipv4-acl-number* | **ipv6 acl** *ipv6-acl-number*] *

undo sntp authentication-keyid *keyid*

Default

No SNTP authentication key exists.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

keyid: Specifies an authentication key ID in the range of 1 to 4294967295.

authentication-mode md5: Specifies the MD5 authentication algorithm.

cipher: Specifies an authentication key in encrypted form.

simple: Specifies an authentication key in plaintext form. For security purposes, the authentication key specified in plaintext form will be stored in encrypted form.

string: Specifies a case-sensitive authentication key. Its plaintext form is a string of 1 to 32 characters. Its encrypted form is a string of 1 to 73 characters.

acl *ipv4-acl-number*: Specifies an IPv4 basic ACL by its number in the range of 2000 to 2999. Only the devices permitted by the ACL can use the key ID for authentication.

ipv6 acl *ipv6-acl-number*: Specifies an IPv6 basic ACL by its number in the range of 2000 to 2999. Only the devices permitted by the ACL can use the key ID for authentication.

Usage guidelines

SNTP authentication must be enabled on an SNTP network that requires time synchronization security. SNTP authentication ensures that SNTP clients are synchronized only to authenticated NTP time servers.

The key ID in the message from the peer device identifies the key used for authentication. The **acl** *ipv4-acl-number* or **acl** *ipv6-acl-number* option is used to identify the peer device that can use the key ID.

- If the specified IPv4 or IPv6 ACL does not exist, any device can use the key ID for authentication.
- If the specified IPv4 or IPv6 ACL does not contain any rules, no device can use the key ID for authentication.

To ensure a successful authentication, configure the same key ID and key on the time server and client. Make sure the peer device is allowed to use the key ID for authentication on the local device.

After you configure an SNTP authentication key, use the **sntp reliable authentication-keyid** command to set it as a trusted key. The key automatically changes to untrusted after you delete the key. In this case, you do not need to execute the **undo sntp-service reliable authentication-keyid** command.

You can set a maximum of 128 authentication keys by executing the command.

Examples

Set an MD5 authentication key, with the key ID of **10** and key value of **BetterKey**. Input the key in plain text.

```
<Sysname> system-view
[Sysname] sntp authentication enable
[Sysname] sntp authentication-keyid 10 authentication-mode md5 simple BetterKey
```

sntp ipv6 unicast-server

Use **sntp ipv6 unicast-server** to specify an IPv6 NTP server for the device.

Use **undo sntp ipv6 unicast-server** to remove the IPv6 NTP server specified for the device.

Syntax

sntp ipv6 unicast-server { *server-name* | *ipv6-address* } [**vpn-instance** *vpn-instance-name*] [**authentication-keyid** *keyid* | **source** *interface-type interface-number*] *

undo sntp ipv6 unicast-server { *server-name* | *ipv6-address* } [**vpn-instance** *vpn-instance-name*]

Default

No IPv6 NTP server is specified.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

server-name: Specifies an NTP server by its host name, a case-insensitive string of 1 to 253 characters. Valid characters are letters, digits, hyphens (-), underscores (_), and periods (.).

ipv6-address: Specifies an NTP server by its IPv6 address.

vpn-instance *vpn-instance-name*: Specifies MPLS L3VPN instance to which the NTP server belongs. The *vpn-instance-name* argument is a case-sensitive string of 1 to 31 characters. If the NTP server is on the public network, do not specify this option.

authentication-keyid *keyid*: Specifies the key ID to be used for sending NTP messages to the NTP server. The value range for the *keyid* argument is 1 to 4294967295. If you do not specify this option, the local device and NTP server do not authenticate each other.

source *interface-type interface-number*: Specifies the source interface for IPv6 NTP messages. If the specified IPv6 NTP server address is not a link local address, the source IPv6 address for IPv6 NTP messages sent by the local device to the NTP server is the IPv6 address of the specified source interface. If the specified IPv6 NTP server address is a link local address, the IPv6 NTP messages are sent from the specified source interface, and the source address of the messages is the link local address of the interface. The *interface-type interface-number* argument represents the interface type and number. If you do not specify an interface, the device automatically selects the source IPv6 address of IPv6 NTP messages. For more information, see *RFC 3484*.

Usage guidelines

When you specify an IPv6 NTP server for the device, the device is synchronized to the NTP server, but the NTP server is not synchronized to the device.

To synchronize the PE to a PE or CE in a VPN instance, provide the **vpn-instance** *vpn-instance-name* option in your command.

If you include the **vpn-instance** *vpn-instance-name* option in the **undo ntp-service unicast-server** command, the command removes the NTP server in the specified VPN instance. If you do not include the **vpn-instance** *vpn-instance-name* option in the command, the command removes the NTP server on the public network.

If the specified IPv6 address of the NTP server is a link local address, you must specify the source interface for NTP messages and cannot specify a VPN instance for the NTP server.

Examples

Specify the IPv6 NTP server 2001::1 for the device.

```
<Sysname> system-view
[Sysname] sntp ipv6 unicast-server 2001::1
```

undo sntp reliable authentication-keyid *keyid*

Default

No trusted key is specified.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

keyid: Specifies an authentication key by its ID in the range of 1 to 4294967295.

Usage guidelines

If SNTP is enabled, the SNTP client is synchronized only to an NTP server that provides a trusted key.

Before you use the command, make sure SNTP authentication is enabled and an authentication key is configured. The key automatically changes to untrusted after you delete the key. In this case, you do not need to execute the **undo sntp-service reliable authentication-keyid** command.

Examples

Enable NTP authentication, and specify the MD5 encryption algorithm, with the key ID of 37 and key value of **BetterKey**.

```
<Sysname> system-view
[Sysname] sntp authentication enable
[Sysname] sntp authentication-keyid 37 authentication-mode md5 simple BetterKey
```

Specify this key as a trusted key.

```
[Sysname] sntp reliable authentication-keyid 37
```

sntp time-offset-threshold

Use **sntp time-offset-threshold** to set the time offset thresholds for outputting logs and traps during time synchronization.

Use **undo sntp-service time-offset-threshold** to restore the default.

Syntax

sntp time-offset-threshold { **log** *log-threshold* | **trap** *trap-threshold* }*

undo sntp time-offset-threshold

Default

No time offset thresholds are set for outputting logs and traps during time synchronization.

Views

System view

Predefined user roles

network-admin

Parameters

log *log-threshold*: Specifies the time offset threshold for outputting logs during time synchronization, in the range of 128 to 60000 milliseconds.

trap *trap-threshold*: Specifies the time offset threshold for outputting traps during time synchronization, in the range of 128 to 60000 milliseconds.

Usage guidelines

After you set the thresholds, the system synchronizes the client's time to the server when the time offset exceeds 128 ms, but outputs logs and traps only when the time offset exceeds the specified thresholds, respectively.

Examples

Set the time offset thresholds for outputting logs and traps during time synchronization of 500 ms and 600 ms, respectively.

```
<Sysname> system-view
[Sysname] sntp time-offset-threshold log 500 trap 600
```

sntp unicast-server

Use **sntp unicast-server** to specify an NTP server for the device.

Use **undo sntp unicast-server** to remove an NTP server specified for the device.

Syntax

sntp unicast-server { *server-name* | *ip-address* } [**vpn-instance** *vpn-instance-name*] [**authentication-keyid** *keyid* | **source** *interface-type interface-number* | **version** *number*] *

undo sntp unicast-server { *server-name* | *ip-address* } [**vpn-instance** *vpn-instance-name*]

Default

No NTP server is specified.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

server-name: Specifies an NTP server by its host name, a case-insensitive string of 1 to 253 characters. Valid characters are letters, digits, hyphens (-), underscores (_), and periods (.).

ip-address: Specifies an NTP server by its IP address. It must be a unicast address, rather than a broadcast address, a multicast address, or the IP address of the local clock.

vpn-instance *vpn-instance-name*: Specifies the MPLS L3VPN instance VPN to which the NTP server belongs. The *vpn-instance-name* argument is a case-sensitive string of 1 to 31 characters. If the NTP server is on the public network, do not specify this option.

authentication-keyid *keyid*: Specifies the key ID to be used for sending NTP messages to the NTP server. The value range for the *keyid* argument is 1 to 4294967295. If you do not specify this option, the local device and NTP server do not authenticate each other.

source *interface-type interface-number*: Specifies the source interface for NTP messages. In an NTP message the local device sends to the NTP server, the source IP address is the primary IP address of this interface. The *interface-type interface-number* argument represents the interface type and number.

version *number*: Specifies the NTP version. The value range for the *number* argument is 1 to 4. The default value is 4.

Usage guidelines

When you specify an NTP server for the device, the device is synchronized to the NTP server, but the NTP server is not synchronized to the device.

To synchronize the PE to a PE or CE in a VPN instance, provide **vpn-instance** *vpn-instance-name* in your command.

If you include the **vpn-instance** *vpn-instance-name* option in the **undo ntp-service unicast-server** command, the command removes the NTP server in the specified VPN instance. If you do not include the **vpn-instance** *vpn-instance-name* option in the command, the command removes the NTP server on the public network.

Examples

Specify NTP server 10.1.1.1 for the device, and configure the device to run NTP version 4.

```
<Sysname> system-view
[Sysname] sntp unicast-server 10.1.1.1 version 4
```

Contents

EAA commands

action cli

Use **action cli** to add a CLI action to a monitor policy.

Use **undo action** to remove an action.

Syntax

action *number* **cli** *command-line*

undo action *number*

Default

A monitor policy does not contain any actions.

Views

CLI-defined policy view

Predefined user roles

network-admin

context-admin

Parameters

number: Specifies an action ID in the range of 0 to 231.

cli *command-line*: Specifies the command line to be executed when the event occurs. You can enter abbreviated forms of command keywords, but you must make sure the forms can uniquely identify the command keywords. For example, you can enter **dis cu** for the **display current-configuration** command.

Usage guidelines

You can configure a series of actions to be executed in response to the event specified in a monitor policy. EAA executes the actions in ascending order of action IDs. When you add actions to a policy, you must make sure the execution order is correct. If two actions have the same ID, the most recent one takes effect.

To execute a command in a view other than user view, you must define actions required for accessing the target view before defining the command execution action. In addition, you must number the actions in the order they should be executed, starting with entering system view.

For example, to shut down an interface, you must create the following actions in order:

1. Action to enter system view.
2. Action to enter interface view.
3. Action to shut down the interface.

When you define an action, you can specify a value or specify a variable name for an argument. For more information about using EAA environment variables, see "rtm environment."

Examples

Configure a CLI action for the CLI-defined policy **test** to shut down GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] rtm cli-policy test
[Sysname-rtm-test] action 1 cli system-view
[Sysname-rtm-test] action 2 cli interface gigabitethernet 1/0/1
```

```
[Sysname-rtm-test] action 3 cli shutdown
```

action reboot

Use **action reboot** to add a reboot action to a monitor policy.

Use **undo action** to remove an action.

Syntax

action *number* **reboot** [**slot** *slot-number*]

undo action *number*

Default

A monitor policy does not contain any actions.

Views

CLI-defined policy view

Predefined user roles

network-admin

context-admin

Parameters

number: Specifies an action ID in the range of 0 to 231.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, the command reboots the IRF fabric.

Usage guidelines

The reboot action configured with this command reboots devices or cards without saving the running configuration. If you want to save the running configuration, use the **action cli** command to configure reboot actions.

You can configure a series of actions to be executed in response to the event specified in a monitor policy. EAA executes the actions in ascending order of action IDs. When you add actions to a policy, you must make sure the execution order is correct. If two actions have the same ID, the most recent one takes effect.

When you define an action, you can specify a value or specify a variable name for an argument. For more information about using EAA environment variables, see "rtm environment."

Examples

Configure an action for the CLI-defined policy **test** to reboot the specified slot.

<Sysname> system-view

```
[Sysname] rtm cli-policy test
[Sysname-rtm-test] action 3 reboot slot 1
```

action switchover

Use **action switchover** to add an active/standby switchover action to a monitor policy.

Use **undo action** to remove an action.

Syntax

action *number* **switchover**

undo action *number*

Default

A monitor policy does not contain any actions.

Views

CLI-defined policy view

Predefined user roles

network-admin

context-admin

Parameters

number: Specifies an action ID in the range of 0 to 231.

Usage guidelines

You can configure a series of actions to be executed in response to the event specified in a monitor policy. EAA executes the actions in ascending order of action IDs. When you add actions to a policy, you must make sure the execution order is correct. If two actions have the same ID, the most recent one takes effect.

This command does not trigger a master/subordinate switchover in either of the following situations:

- No subordinate device is configured.
- The subordinate device is not in up state.

Examples

Configure an action for the CLI-defined policy **test** to perform an active/standby switchover.

```
<Sysname> system-view
[Sysname] rtm cli-policy test
[Sysname-rtm-test] action 3 switchover
```

action syslog

Use **action syslog** to add a Syslog action to a monitor policy.

Use **undo action** to remove an action.

Syntax

action *number* **syslog priority** *priority* **facility** *local-number* **msg** *msg-body*

undo action *number*

Default

A monitor policy does not contain any actions.

Views

CLI-defined policy view

Predefined user roles

network-admin

context-admin

Parameters

number: Specifies an action ID in the range of 0 to 231.

priority *priority*: Specifies the log severity level in the range of 0 to 7. A lower value represents a higher severity level.

facility *local-number*: Specifies a logging facility by its facility number in the range of local0 to local7. Facility numbers are used by a log host to identify log creation facilities for filtering log messages.

msg *msg-body*: Configures the log message body.

Usage guidelines

EAA sends log messages to the information center. You can configure the information center to output these messages to certain destinations. For more information about the information center, see "Configuring the information center."

You can configure a series of actions to be executed in response to the event specified in a monitor policy. EAA executes the actions in ascending order of action IDs. When you add actions to a policy, you must make sure the execution order is correct. If two actions have the same ID, the most recent one takes effect.

When you define an action, you can specify a value or specify a variable name for an argument. For more information about using EAA environment variables, see "rtm environment."

Examples

Configure an action for the CLI-defined policy **test** to send a log message "hello" with a severity of 7 from the facility device **local3**.

```
<Sysname> system-view
[Sysname] rtm cli-policy test
[Sysname-rtm-test] action 3 syslog priority 7 facility local3 msg hello
```

commit

Use **commit** to enable a CLI-defined monitor policy.

Syntax

commit

Default

No CLI-defined monitor policies are enabled.

Views

CLI-defined policy view

Predefined user roles

network-admin

context-admin

Usage guidelines

You must execute this command for a CLI-defined monitor policy to take effect.

After changing the settings in a policy that has been enabled, you must re-execute this command for the changes to take effect.

Examples

Enable CLI-defined monitor policy **test**.

```
<Sysname> system-view
[Sysname] rtm cli-policy test
[Sysname-rtm-test] commit
```

display rtm environment

Use **display rtm environment** to display user-defined EAA environment variables and their values.

Syntax

display rtm environment [*var-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

var-name: Specifies a user-defined EAA environment variable by its name, a case-sensitive string of 1 to 63 characters. The name can contain digits, letters, and the underscore sign (_), but its leading character cannot be the underscore sign. If you do not specify a variable, this command displays all user-defined EAA environment variables.

Examples

Display all user-defined EAA environment variables.

```
<Sysname> display rtm environment
Name              Value
save_cmd          save main force
show_run_cmd      display current-configuration
```

Table 1 Command output

Field	Description
Name	Name of a user-defined EAA environment variable. This field displays a maximum of 30 characters. To display a user-defined EAA environment variable name of more than 30 characters, use the **display current-configuration** command.
Value	Value of the user-defined EAA environment variable. This field displays a maximum of 30 characters. To display a user-defined EAA environment variable value of more than 30 characters, use the **display current-configuration** command.

display rtm policy

Use **display rtm policy** to display information about EAA monitor policies.

Syntax

display rtm policy { **active** | **registered** [**verbose**] } [*policy-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

active: Specifies policies that are executing the actions.

registered: Specifies policies that have been created.

verbose: Displays detailed information about monitor policies.

policy-name: Specifies a policy by its name, a case-sensitive string of 1 to 63 characters. If you do not specify a policy, the command displays information about all monitor policies.

Usage guidelines

To display the running configuration of CLI-defined monitor policies, execute the **display current-configuration** command in any view or execute the **display this** command in CLI-defined monitor policy view.

Examples

Display monitor policies that are executing the actions.

```
<Sysname> display rtm policy active
JID   Type  Event      TimeActive           PolicyName
507   CLI   INTERFACE  Aug 29 14:55:55 2013 test
```

Table 2 Command output

Field	Description
JID	Job ID, displayed only when you specify the **active** keyword.
Type	Policy creation method: • **TCL**—The policy was configured by using Tcl. • **CLI**—The policy was configured from the CLI.
Event	Event type, including CLI, hotplug, interface, process, SNMP, SNMP-Notification, Syslog, and track.
TimeActive	Time when the monitor policy was triggered.
PolicyName	Name of the monitor policy.

Display brief information about all created monitor policies.

```
<Sysname> display rtm policy registered
Total number: 1
Type  Event      TimeRegistered       PolicyName
CLI              Aug 29 14:54:50 2013 test
```

Table 3 Command output

Field	Description
Total number	Total number of the monitor policies.
Type	Policy creation method: • **TCL**—The policy was configured by using Tcl. • **CLI**—The policy was configured from the CLI.
Event	Event type, including CLI, hotplug, interface, process, SNMP, SNMP-Notification, Syslog, and track.

Field	Description
TimeRegistered	Time when the monitor policy was created.
PolicyName	Name of the monitor policy.

Display detailed information about all monitor policies.

```
<Sysname> display rtm policy registered verbose
  Total number: 1

   Policy Name: test
   Policy Type: CLI
    Event Type:
TimeRegistered: Aug 29 14:54:50 2013
     User-role: network-operator
                network-admin
```

Table 4 Command output

Field	Description
Total number	Total number of the monitor polices.
PolicyName	Name of the monitor policy.
Policy Type	Policy creation method: • **TCL**—The policy was configured by using Tcl. • **CLI**—The policy was configured from the CLI.
Event Type	Event type, including CLI, hotplug, interface, process, SNMP, SNMP-Notification, Syslog, and track.
TimeRegistered	Time when the policy was created.
User-role	User roles for executing the monitor policy. To execute the monitor policy, an administrator must have a minimum of one of the displayed user roles.

event cli

Use **event cli** to configure a CLI event for a CLI-defined monitor policy.

Use **undo event** to delete the event in a CLI-defined monitor policy.

Syntax

event cli { **async** [**skip**] | **sync** } **mode** { **execute** | **help** | **tab** } **pattern** *regular-exp*

undo event

Default

No CLI event is configured.

Views

CLI-defined policy view

Predefined user roles

network-admin

context-admin

Parameters

async [**skip**]: Enables or disables the system to execute the command that triggers the policy. If you specify the **skip** keyword, the system executes the actions in the policy without executing the command that triggers the policy. If you do not specify the **skip** keyword, the system executes both the actions in the policy and the command entered at the CLI.

sync: Enables the system to execute the command that triggers the event only if the policy has been executed successfully.

mode { **execute** | **help** | **tab** }: Specifies the CLI operation to monitor:

- **execute**: Triggers the policy when a matching command is entered.
- **help**: Triggers the policy when a question mark (?) is entered at a matching command line.
- **tab**: Triggers the policy when the **Tab** key is pressed to complete a parameter in a matching command line.

pattern *regular-exp*: Specifies a regular expression for matching commands that trigger the policy. For more information about using regular expressions, see CLI in *Fundamentals Configuration Guide*.

Usage guidelines

Use CLI event monitor policies to monitor operations performed at the CLI.

You can configure only one event for a monitor policy. If the monitor policy already contains an event, the new event replaces the old event.

Examples

Configure a CLI-defined policy to monitor execution of commands that contain the **display interface brief** string. Enable the system to execute the actions in the policy without executing the command that triggers the policy.

```
<Sysname>system-view
[Sysname] rtm cli-policy test
[Sysname-rmt-test] event cli async skip mode execute pattern display interface brief
```

Configure a CLI-defined policy to monitor the use of the **Tab** key at command lines that contain the **display interface brief** string. Enable the system to execute the actions in the policy and display the complete parameter when **Tab** is pressed at a policy-matching command line.

```
<Sysname> system-view
[Sysname] rtm cli-policy test
[Sysname-rmt-test] event cli async mode tab pattern display interface brief
```

Configure a CLI-defined policy to monitor the use of the question mark (?) at command lines that contain the **display interface brief** string. Enable the system to execute a policy-matching command line only if the actions in the policy are executed successfully when a question mark is entered at the command line.

```
<Sysname>system-view
[Sysname] rtm cli-policy test
[Sysname-rmt-test] event cli sync mode help pattern display interface brief
```

event hotplug

Use **event hotplug** to configure an IRF member device join or leave event.

Use **undo event** to delete the event in a CLI-defined monitor policy.

Syntax

event hotplug [**insert** | **remove**] **slot** *slot-number*

undo event

Default

No hotplug event is configured.

Views

CLI-defined policy view

Predefined user roles

network-admin

context-admin

Parameters

insert: Specifies the IRF member device join event.

remove: Specifies the IRF member device leave event.

slot *slot-number*: Specifies an IRF member device by its member ID.

Usage guidelines

After you configure the event, the monitor policy is triggered when the member device joins or leaves the IRF fabric. If you do not specify the **insert** or **remove** keyword, EAA monitors the member device for joining or leaving the IRF fabric.

You can configure only one event entry for a monitor policy. If the monitor policy already contains an event entry, the new event entry replaces the old event entry.

Examples

Configure a CLI-defined policy to monitor the member device for joining or leaving the IRF fabric.

```
<Sysname> system-view
[Sysname] rtm cli-policy test
[Sysname-rtm-test] event hotplug slot 1
```

event interface

Use **event interface** to configure an interface event for a CLI-defined monitor policy.

Use **undo event** to delete the event in a CLI-defined monitor policy.

Syntax

event interface *interface-type interface-number* **monitor-obj** *monitor-obj* **start-op** *start-op* **start-val** *start-val* **restart-op** *restart-op* **restart-val** *restart-val* [**interval** *interval*]

undo event

Default

No interface event is configured.

Views

CLI-defined policy view

Predefined user roles

network-admin

context-admin

Parameters

interface-type interface-number: Specifies an interface by its type and number.

monitor-obj *monitor-obj*: Specifies the traffic statistic to be monitored on the interface. For keywords available for the *monitor-obj* argument, see Table 5.

start-op *start-op*: Specifies the operator for comparing the monitored traffic statistic with the start threshold. The start threshold is crossed if the comparison result meets the condition. For keywords available for the *start-op* argument, see Table 6.

start-val *start-val*: Specifies the start threshold to be compared with the monitored traffic statistic. The value range is 0 to 4294967295.

restart-op *restart-op*: Specifies the operator for comparing the monitored traffic statistic with the restart threshold. The restart threshold is crossed if the comparison result meets the condition. For keywords available for the *restart-op* argument, see Table 6.

restart-val *restart-val*: Specifies the restart threshold to be compared with the monitored traffic statistic. The value range is 0 to 4294967295.

interval *interval*: Specifies the interval to sample the monitored traffic statistic for a comparison. The value range is 1 to 4294967295, in seconds. The default value is 300.

Table 5 Monitored objects

Monitored traffic statistic	Description
input-drops	Number of discarded incoming packets during the sampling interval
input-errors	Number of incoming error packets during the sampling interval
output-drops	Number of discarded outgoing packets during the sampling interval
output-errors	Number of outgoing error packets during the sampling interval
rcv-bps	Receive rate, in bps during the sampling interval
rcv-broadcasts	Number of incoming broadcasts during the sampling interval
rcv-pps	Receive rate, in packets per second
tx-bps	Transmit rate, in bps
tx-pps	Transmit rate, in packets per second

Table 6 Comparison operators

Comparison operator	Description
eq	Equal to
ge	Greater than or equal to
gt	Greater than
le	Less than or equal to
lt	Less than
ne	Not equal to

Usage guidelines

Use interface event monitor policies to monitor traffic statistics on an interface.

You can configure only one event for a monitor policy. If the monitor policy already contains an event, the new event replaces the old event.

EAA executes an interface event policy when the monitored interface traffic statistic crosses the start threshold in the following situations:

- The statistic crosses the start threshold for the first time.
- The statistic crosses the start threshold each time after it crosses the restart threshold.

The following is the interface event monitor process of EAA:

1. Compares the traffic statistic sample with the start threshold at sampling intervals until the start threshold is crossed.
2. Executes the policy.
3. Compares the traffic statistic sample with the restart threshold at sampling intervals until the restart threshold is crossed.
4. Compares the traffic statistic sample with the start threshold at sampling intervals until the start threshold is crossed.
5. Executes the policy again.

This process cycles for the monitor policy to be executed and re-executed.

Examples

Configure a CLI-defined policy to monitor the incoming error packet statistic on GigabitEthernet 1/0/1 every 60 seconds. Set the start threshold to 1000 and the restart threshold to 50. Enable EAA to execute the policy when the statistic exceeds 1000 for the first time. Enable EAA to re-execute the policy if the statistic exceeds 1000 each time after the statistic has dropped below 50.

```
<Sysname> system-view
[Sysname] rtm cli-policy test
[Sysname-rtm-test] event interface gigabitethernet 1/0/1 monitor-obj input-errors
start-op gt start-val 1000 restart-op lt restart-val 50 interval 60
```

event process

Use **event process** to configure a process event for a CLI-defined monitor policy.

Use **undo event** to delete the event in a CLI-defined monitor policy.

Syntax

event process { **exception** | **restart** | **shutdown** | **start** } [**name** *process-name* [**instance** *instance-id*]] [**slot** *slot-number*]

undo event

Default

No process event is configured.

Views

CLI-defined policy view

Predefined user roles

network-admin

context-admin

Parameters

exception: Monitors the specified process for exceptional events. EAA executes the policy when an exception occurs to the monitored process.

restart: Monitors the specified process for restart events. EAA executes the policy when the monitored process restarts.

shutdown: Monitors the specified process for shutdown events. EAA executes the policy when the monitored process is shut down.

start: Monitors the specified process for start events. EAA executes the policy when the monitored process starts.

name *process-name*: Specifies a user-mode process by its name. The process can be one that is running or not running. If you do not specify a name, this command monitors all use-mode processes.

instance *instance-id*: Specifies a process instance ID in the range of 0 to 4294967295. The instance ID can be one that has not been created yet. If you do not specify an instance, EAA monitors all instances of the process.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command applies to the IRF fabric.

Usage guidelines

Use process event monitor policies to monitor process state changes. These changes can result from manual operations or automatic system operations.

You can configure only one event for a monitor policy. If the monitor policy already contains an event, the new event replaces the old event.

Examples

Configure a CLI-defined policy to monitor all instances of the process **snmpd** for restart events.

```
<Sysname>system-view
[Sysname] rtm cli-policy test
[Sysname-rtm-test] event process restart name snmpd
```

event snmp oid

Use **event snmp oid** to configure an SNMP event for a CLI-defined monitor policy.

Use **undo event** to delete the event in a CLI-defined monitor policy.

Syntax

event snmp oid *oid* **monitor-obj** { **get** | **next** } **start-op** *start-op* **start-val** *start-val* **restart-op** *restart-op* **restart-val** *restart-val* [**interval** *interval*]

undo event

Default

No SNMP event is configured.

Views

CLI-defined policy view

Predefined user roles

network-admin

context-admin

Parameters

oid *oid*: Specifies the OID of the monitored MIB variable, a string of 1 to 256 characters.

monitor-obj { **get** | **next** }: Specifies the SNMP operation used for sampling variable values. The **get** keyword represents the SNMP get operation, and the **next** keyword represents the SNMP getNext operation.

start-op *start-op*: Specifies the operator for comparing the sampled value with the start threshold. The start threshold is crossed if the comparison result meets the condition. For keywords available for the *start-op* argument, see Table 6.

start-val *start-val*: Specifies the start threshold to be compared with the sampled value. The *start-val* argument can be any data type supported by SNMP, including numerals and character strings. The value range for the *start-val* argument is a string of 1 to 512 characters. If the threshold value contains spaces, you must enclose the value in quotation marks (" ").

restart-op *op*: Specifies the operator for comparing the sampled value with the restart threshold. The restart threshold is crossed if the comparison result meets the condition. For keywords available for the *start-op* argument, see Table 6.

restart-op *restart-val*: Specifies the restart threshold to be compared with the sampled value. The *restart-val* argument can be any data type supported by SNMP, including numerals and character strings. The value range for the *restart-val* argument is a string of 1 to 512 characters. If the threshold value contains spaces, you must enclose the value in quotation marks (" ").

interval *interval*: Specifies the sampling interval in the range of 1 to 4294967295, in seconds. The default value is 300.

Usage guidelines

Use SNMP event monitor policy to monitor value changes of MIB variables.

You can configure only one event for a monitor policy. If the monitor policy already contains an event, the new event replaces the old event.

EAA executes an SNMP event policy when the monitored MIB variable's value crosses the start threshold in the following situations:

- The monitored variable's value crosses the start threshold for the first time.
- The monitored variable's value crosses the start threshold each time after it crosses the restart threshold.

The following is the SNMP event monitor process of EAA:

1. Compares the variable sample with the start threshold at sampling intervals until the start threshold is crossed.
2. Executes the policy.
3. Compares the variable sample with the restart threshold at sampling intervals until the restart threshold is crossed.
4. Compares the variable sample with the start threshold at sampling intervals until the start threshold is crossed.
5. Executes the policy again.

This process cycles for the monitor policy to be executed and re-executed.

For the command to take effect, enable SNMP before you execute this command. The device automatically deletes this command after you disable SNMP.

Examples

Configure a CLI-defined policy to get the value of the MIB variable **1.3.6.4.9.9.42.1.2.1.6.4** every five seconds. Set the start threshold to 1 and the restart threshold to 2. Enable EAA to execute the policy when the value changes to 1 for the first time. Enable EAA to re-execute the policy if the value changes to 1 each time after the value has changed to 2.

```
<Sysname> system-view
[Sysname] rtm cli-policy test
[Sysname-rtm-test] event snmp oid 1.3.6.4.9.9.42.1.2.1.6.4 monitor-obj get start-op eq
start-val 1 restart-op eq restart-val 2 interval 5
```

event snmp-notification

Use **event snmp-notification** to configure an SNMP-Notification event for a CLI-defined policy.

Use **undo event** to remove the event in a CLI-defined policy.

Syntax

event snmp-notification oid *oid* **oid-val** *oid-val* **op** *op* [**drop**]

undo event

Default

No SNMP-Notification event is configured.

Views

CLI-defined policy view

Predefined user roles

network-admin

context-admin

Parameters

oid *oid*: Specifies the OID of the monitored MIB variable, a string of 1 to 256 characters.

oid-val *oid-val*: Specifies the threshold to be compared with the sampled value. The *oid-val* argument can be any data type supported by SNMP, including numerals and character strings. The value range for the *oid-val* argument is a string of 1 to 512 characters. If the threshold value contains spaces, you must enclose the value in quotation marks (" ").

op *op*: Specifies the operator for comparing the sampled value with the threshold. The policy is executed if the comparison result meets the condition. For keywords available for the *start-op* argument, see Table 6.

drop: Drops the notification if the comparison result meets the condition. If you do not specify this keyword, the system sends the notification.

Usage guidelines

Use SNMP-Notification event monitor policies to monitor variables in SNMP notifications.

EAA executes an SNMP-Notification event monitor policy when the value of the monitored variable in an SNMP notification meets the specified condition.

You can configure only one event for a monitor policy. If the monitor policy already contains an event, the new event replaces the old event.

For the command to take effect, enable SNMP before you execute this command. The device automatically deletes this command after you disable SNMP.

Examples

Configure a CLI-defined policy to monitor SNMP notifications that contain the use name variable **1.3.6.1.4.1.25506.2.2.1.1.2.1.0**. Enable the system to execute the policy and drop the SNMP notification if the use name variable value is **admin**.

```
<Sysname> system-view
[Sysname] rtm cli-policy test
[Sysname-rtm-test] event snmp-notification oid 1.3.6.1.4.1.25506.2.2.1.1.2.1.0 oid-val
admin op eq drop
```

event syslog

Use **event syslog** to configure a Syslog event for a CLI-defined monitor policy.

Use **undo event** to delete the event in a CLI-defined monitor policy.

Syntax

event syslog priority { *priority* | **all** } **msg** *msg* **occurs** *times* **period** *period*

undo event

Default

No Syslog event is configured.

Views

CLI-defined policy view

Predefined user roles

network-admin

context-admin

Parameters

priority { *priority* | **all** }: Specifies the severity level for matching log messages.

- *priority*: Specifies the lowest severity level for matching log messages. It is an integer in the range of 0 to 7. A lower number represents higher severity level. For example, specify a severity level of 3 to match log messages from level 3 to level 0.
- **all:** Represents any severity level from 0 to 7.

msg *msg*: Specifies a regular expression to match the logs. The *msg* argument represents a regular expression, a string of 1 to 255 characters.

occurs *times* **period** *period*: Executes the policy if the number of log matches over an interval exceeds the limit. The *times* argument specifies the maximum number of log matches in the range of 1 to 32. The *period* argument specifies an interval in the range of 1 to 4294967295 seconds.

Usage guidelines

Use Syslog event monitor policies to monitor log messages.

EAA executes a Syslog event monitor policy when the number of matching logs over an interval reaches the limit.

NOTE:

EAA does not count log messages generated by the RTM module when it counts log matches.

You can configure only one event for a monitor policy. If the monitor policy already contains an event, the new event replaces the old event.

A regular expression can contain the special characters described in Table 7.

Table 7 Special characters supported in a regular expression

Characters	Meaning	Examples
^	Matches the beginning of a line.	"^u" matches all lines beginning with "u". A line beginning with "Au" is not matched.
$	Matches the end of a line.	"u$" matches all lines ending with "u". A line ending with "uA" is not matched.

Characters	Meaning	Examples
. (period)	Matches any single character.	".s" matches "as" and "bs".
*	Matches the preceding character or string zero, one, or multiple times.	"zo*" matches "z" and "zoo", and "(zo)*" matches "zo" and "zozo".
+	Matches the preceding character or string one or multiple times.	"zo+" matches "zo" and "zoo", but not "z".
|	Matches the preceding or succeeding string.	"def|int" matches a line containing "def" or "int".
( )	Matches the string in the parentheses, usually used together with the plus sign (+) or asterisk sign (*).	"(123A)" matches "123A". "408(12)+" matches "40812" and "408121212", but not "408".
\N	Matches the preceding strings in parentheses, with the *Nth* string repeated once.	"(string)\1" matches a string containing "stringstring". "(string1)(string2)\2" matches a string containing "string1string2string2". "(string1)(string2)\1\2" matches a string containing " string1string2string1string2".
[ ]	Matches a single character in the brackets.	"[16A]" matches a string containing 1, 6, or A; "[1-36A]" matches a string containing 1, 2, 3, 6, or A (- is a hyphen). To match the character "]", put it immediately after "[", for example, []abc]. There is no such limit on "[".
[^]	Matches a single character that is not in the brackets.	"[^16A]" matches a string that contains one or more characters except for 1, 6, or A, such as "abc". A match can also contain 1, 6, or A (such as "m16"), but it cannot contain these three characters only (such as 1, 16, or 16A).
{n}	Matches the preceding character *n* times. The number *n* must be a nonnegative integer.	"o{2}" matches "food", but not "Bob".
{n,}	Matches the preceding character *n* times or more. The number *n* must be a nonnegative integer.	"o{2,}" matches "foooood", but not "Bob".
{n,m}	Matches the preceding character *n* to *m* times or more. The numbers *n* and *m* must be nonnegative integers and *n* cannot be greater than *m*.	" o{1,3}" matches "fod", "food", and "foooood", but not "fd".
\<	Matches a string that starts with the pattern following \<. A string that contains the pattern is also a match if the characters preceding the pattern are not digits, letters, or underscores.	"\<do" matches "domain" and "doa".
\>	Matches a string that ends with the pattern preceding \>. A string that contains the pattern is also a match if the characters following the pattern are not digits, letters, or underscores.	"do\>" matches "undo" and "cdo".
\b	Matches a word that starts with the pattern following \b or ends with the pattern preceding \b.	"er\b" matches "never", but not "verb" or "erase". "\ber" matches "erase", but not "verb" or "never".

Characters	Meaning	Examples
\B	Matches a word that contains the pattern but does not start or end with the pattern.	"er\B" matches "verb", but not "never" or "erase".
\w	Same as [A-Za-z0-9_], matches a digit, letter, or underscore.	"v\w" matches "vlan" and "service".
\W	Same as [^A-Za-z0-9_], matches a character that is not a digit, letter, or underscore.	"\Wa" matches "-a", but not "2a" or "ba".
\	Escape character. If a special character listed in this table follows \, the specific meaning of the character is removed.	"\\" matches a string containing "\", "\^" matches a string containing "^", and "\\b" matches a string containing "\b".

Examples

Configure a CLI-defined policy to monitor Syslog messages for level 3 to level 0 messages that contain the **down** string. Enable the policy to execute when five log matches are found within 6 seconds.

```
<Sysname> system-view
[Sysname] rtm cli-policy test
[Sysname-rtm-test] event syslog priority 3 msg down occurs 5 period 6
```

event track

Use **event track** to configure a track event for a CLI-defined monitor policy.

Use **undo event** to delete the event in a CLI-defined monitor policy.

Syntax

event track *track-list* **state** { **negative** | **positive** } [**suppress-time** *suppress-time*]

undo event

Default

A CLI-defined policy does not contain a track event.

Views

CLI-defined policy view

Predefined user roles

network-admin

context-admin

Parameters

track-list: Specifies a space-separated list of up to 16 track items. Each item specifies a track entry number or a range of track entry numbers in the form of *track-entry-number* **to** *track-entry-number*. The value range for the *track-entry-number* argument is 1 to 1024.

state { **negative** | **positive** }: Monitors state change of the track entries.

- **negative**: Triggers the policy when the states of the track entries change from Positive to Negative.

- **positive**: Triggers the policy when the states of the track entries change from Negative to Positive.

suppress-time *suppress-time*: Sets a suppress time in the range of 1 to 4294967295, in seconds. The default value is 0.

Usage guidelines

Use track event monitor policies to monitor state change of track entries. If you specify one track entry for a policy, EAA triggers the policy when the state of the track entry changes from Positive to Negative or from Negative to Positive. If you specify multiple track entries for a policy, EAA triggers the policy only when the state of all the track entries changes from Positive to Negative or Negative to Positive.

If you set a suppress time for a track event monitor policy, the timer starts when the policy is triggered. The system does not process the messages that report the track entry positive-to-negative or negative-to-positive state change until the timer times out.

For example, to automatically disconnect the sessions between the local device and its down link BGP peers when the sessions between the local device and its uplink BGP peers are disconnected, you can configure a track event monitor policy as follows:

- Configure a track event for the policy and specify track entries to monitor the links between the local device and its uplink BGP peers.
- Add the CLI action **peer ignore** to the policy to disable BGP session establishment between the local device and its downlink BGP peers.

You can configure only one event entry for a monitor policy. If the monitor policy already contains an event entry, the new event entry replaces the old event entry.

Examples

Create CLI-defined monitor policy **test**. Configure a track event for the policy that occurs when the states of track entry 1 to track entry 8 change from Positive to Negative. Set the suppress time to 180 seconds for the policy.

```
<Sysname> system-view
[Sysname] rtm cli-policy test
[Sysname-rtm-test] event track 1 to 8 state negative suppress-time 180
```

rtm cli-policy

Use **rtm cli-policy** to create a CLI-defined EAA monitor policy and enter its view, or enter the view of an existing CLI-defined EAA monitor policy.

Use **undo rtm cli-policy** to delete a CLI-defined monitor policy.

Syntax

rtm cli-policy *policy-name*

undo rtm cli-policy *policy-name*

Default

No CLI-defined monitor policies exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

policy-name: Specifies the name of a CLI-defined monitor policy, a case-sensitive string of 1 to 63 characters.

Usage guidelines

You must create a CLI-defined monitor policy before you can use the CLI to configure settings in the policy.

For a CLI-defined monitor policy to take effect, you must execute the **commit** command after you complete configuring the policy.

You can execute this command multiple times to create multiple CLI-defined monitor policies. Make sure the CLI-defined monitor policies that are executed at the same time do not have conflicting actions. If the actions conflict, the system executes the actions randomly.

You can assign the same name to a CLI-defined policy and a Tcl-defined policy.

Examples

Create a CLI-defined policy and enter its view.

```
<Sysname> system-view
[Sysname] rtm cli-policy test
```

Related commands

commit

rtm environment

Use **rtm environment** to configure an EAA environment variable.

Use **undo rtm environment** to delete a user-defined EAA environment variable.

Syntax

rtm environment *var-name var-value*

undo rtm environment *var-name*

Default

No user-defined EAA environment variables exist.

The system provides the variables in Table 8. You cannot create, delete, or modify these system-defined variables.

Table 8 System-defined EAA environment variables by event type

Event	Variable name and description
Any event	_event_id: Event ID. _event_type: Event type. _event_type_string: Event type description. _event_time: Time when the event occurs. _event_severity: Severity level of an event.
CLI	_cmd: Commands that are matched.
Syslog	_syslog_pattern: Log message content.
Hotplug	_slot: ID of the member device that joins or leaves the IRF fabric.
Interface	_ifname: Interface name.

Event	Variable name and description
SNMP	_oid: OID of the MIB variable where an SNMP operation is performed. _oid_value: Value of the MIB variable.
SNMP-Notification	_oid: OID that is included in the SNMP notification.
Process	_process_name: Process name.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

var-name: Specifies a user-defined EAA environment variable by its name, a case-sensitive string of 1 to 63 characters. The name can contain digits, letters, and the underscore sign (_), but its leading character cannot be the underscore sign.

var-value: Specifies the variable value.

Usage guidelines

When you define an action, you can enter a variable name with a leading dollar sign (**$***variable_name*) instead of entering a value for an argument. EAA will replace the variable name with the variable value when it performs the action.

For an action argument, you can specify a list of variable names in the form of **$***variable_name1***$***variable_name2...***$***variable_nameN.*

Examples

Create an environment variable: set its name to **if** and set its value to **interface**.

```
<Sysname> system-view
[Sysname] rtm environment if interface
```

rtm scheduler suspend

Use **rtm scheduler suspend** to suspend all monitor policies, including CLI monitor policies and Tcl monitor policies.

Use **undo rtm scheduler suspend** to resume monitor policies.

Syntax

rtm scheduler suspend

undo rtm scheduler suspend

Views

System view

Predefined user roles

network-admin

context-admin

Usage guidelines

You need to suspend the monitor policies under the following circumstances:

- The monitor policies are triggered frequently, affecting the system services and performance.
- The Tcl script of a policy needs to be revised.

After you execute this command, EAA will not execute the policies even if the trigger conditions are met.

This command does not suspend a running monitor policy until all its actions are executed.

Examples

Suspend monitor policies.

```
<Sysname> system-view
[Sysname] rtm scheduler suspend
```

rtm tcl-policy

Use **rtm tcl-policy** to create a Tcl-defined policy and bind it to a Tcl script file.

Use **undo rtm tcl-policy** to delete a Tcl policy.

Syntax

rtm tcl-policy *policy-name tcl-filename*

undo rtm tcl-policy *policy-name*

Default

No Tcl policies exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

policy-name: Specifies a policy name, a case-sensitive string of 1 to 63 characters.

tcl-filename: Specifies a .tcl script file name. The file name is case sensitive. You must ensure that the file is available on a storage medium of the device.

Usage guidelines

When you use this command to create a Tcl-defined policy, follow these guidelines:

Make sure the script file is saved on all IRF member devices. This practice ensures that the policy can run correctly after a master/subordinate switchover occurs or the member device where the script file resides leaves the IRF.

This command both creates and enables the specified Tcl-defined monitor policy. To revise the Tcl script of a Tcl-defined policy, you must suspend all monitor policies first, and then resume the policies after you finish revising the script. The system cannot execute a Tcl-defined policy if you edit its Tcl script without suspending all monitor policies.

To bind a Tcl-defined policy to a different Tcl script file:

1. Execute the **undo rtm tcl-policy** command to delete the Tcl policy.
2. Create the Tcl policy again, and then bind it to the new Tcl script file.

You can assign the same policy name to a CLI-defined policy and a Tcl-defined policy. However, you cannot assign the same name to policies that are the same type.

Examples

Create a Tcl policy and bind it to a Tcl script file.

```
<Sysname> system-view
[Sysname] rtm tcl-policy test test.tcl
```

running-time

Use **running-time** to configure the action runtime of a CLI-defined policy.

Use **undo running-time** to restore the default.

Syntax

running-time *time*

undo running-time

Default

The action runtime of a CLI-defined policy is 20 seconds.

Views

CLI-defined policy view

Predefined user roles

network-admin

context-admin

Parameters

time: Specifies the action runtime in the range of 0 to 31536000 seconds. If you specify 0, the policy runs its actions forever once the policy is triggered.

Usage guidelines

The action runtime limits the amount of time that the monitor policy runs its actions from the time it is triggered. When the runtime is reached, the system stops executing the actions even if the execution is not finished.

This setting prevents an incorrectly defined policy from running its actions permanently to occupy resources.

Examples

Set the action runtime to **60** seconds for CLI-defined policy **test**.

```
<Sysname> system-view
[Sysname] rtm cli-policy test
[Sysname-rtm-test] running-time 60
```

user-role

Use **user-role** to assign a user role to a CLI-defined policy.

Use **undo user-role** to remove a user role from a CLI-defined policy.

Syntax

user-role *role-name*

undo user-role *role-name*

Default

A monitor policy contains user roles that its creator had at the time of policy creation.

Views

CLI-defined policy view

Predefined user roles

network-admin

context-admin

Parameters

role-name: Specifies a user role by its name, a case-sensitive string of 1 to 63 characters.

Usage guidelines

For EAA to execute an action in a monitor policy, you must assign the policy the user role that has access to the action-specific commands and resources. If EAA lacks access to an action-specific command or resource, EAA does not perform the action and all the subsequent actions.

For example, a monitor policy has four actions numbered from 1 to 4. The policy has user roles that are required for performing actions 1, 3, and 4, but it does not have the user role required for performing action 2. When the policy is triggered, EAA executes only action 1.

A monitor policy supports a maximum of 64 valid user roles. User roles added after this limit is reached do not take effect.

An EAA policy cannot have both the **security-audit** user role and any other user roles. Any previously assigned user roles are automatically removed when you assign the **security-audit** user role to the policy. The previously assigned **security-audit** user role is automatically removed when you assign any other user roles to the policy.

Examples

Assign user roles to a CLI-defined policy.

```
<Sysname> system-view
[Sysname] rtm cli-policy test
[Sysname-rtm-test] user-role network-admin
[Sysname-rtm-test] user-role admin
```

Contents

Process monitoring and maintenance commands

The **display memory**, **display process**, **display process cpu**, **monitor process** and **monitor thread** commands display information about both user processes and kernel threads. In these commands, "process" refers to both user processes and kernel threads.

display exception context

Use **display exception context** to display context information of process exceptions.

Syntax

display exception context [**count** *value*] [**slot** *slot-number* [**cpu** *cpu-number*]]

Views

Any view

Predefined user roles

network-admin

context-admin

Parameters

count *value*: Specifies the number of context information entries, in the range of 1 to 20. The default value is 1.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays context information of process exceptions on the IRF master device.

cpu *cpu-number*: Specifies a CPU by its number.

Usage guidelines

The system generates a context information entry for each process exception. A context information entry includes the process ID, the crash time, the core dump file directory, stack information, and register information.

Examples

Display the exception context information on the x86-based 32-bit terminal.

```
<Sysname> display exception context

Table 1 Command output

Filed	Description
Crashed PID	ID of the crashed process.
Crash signal	Signals that led to the crash: • **SIGABRT**—Abort. • **SIGBUS**—Bus error. • **SIGFPE**—Erroneous arithmetic operation. • **SIGILL**—Illegal hardware instructions. • **SIGQUIT**—Quit signal sent by the controlling terminal. • **SIGSEGV**—Invalid memory access. • **SIGSYS**—Invalid system call. • **SIGTRAP**—Trap message. • **SIGXCPU**—CPU usage limit exceeded. • **SIGXFSZ**—File size limit exceeded. • **SIGUNKNOW**—Unknown reason.
Crash time	Time when the crash occurred.
Core file path	Directory where the core dump file is saved.
Backtrace stopped	All stack information has been displayed.

Related commands

`reset exception context`

display exception filepath

Use **`display exception filepath`** to display the core dump file directory.

Syntax

`display exception filepath` [**`slot`** *`slot-number`* [**`cpu`** *`cpu-number`*]]

Views

Any view

Predefined user roles

network-admin

context-admin

Parameters

`slot` *`slot-number`*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays the core dump file directory on the master device.

cpu *cpu-number*: Specifies a CPU by its number.

Examples

Display the core dump file directory on the specified slot.

```
<Sysname> display exception filepath slot 1
The exception filepath on slot 1 is flash:.
```

display kernel deadloop

Use **display kernel deadloop** to display kernel thread deadloop information.

Syntax

display kernel deadloop *show-number* [*offset*] [**verbose**] [**slot** *slot-number* [**cpu** *cpu-number*]]

Views

Any view

Predefined user roles

network-admin

Parameters

show-number: Specifies the number of deadloops to display, in the range of 1 to 20.

offset: Specifies the offset between the starting deadloop and the most recent deadloop, in the range of 0 to 19. The default value is 0.

verbose: Displays detailed information. If you do not specify this keyword, the command displays brief information.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays kernel thread deadloop information on the master device.

cpu *cpu-number*: Specifies a CPU by its number.

Usage guidelines

This command is supported only on the default context.

Examples

Display brief information about the most recent kernel thread deadloop.

```
<Sysname> display kernel deadloop 1
----------------- Deadloop record 1 -----------------
Description          : BUG: soft lockup - CPU#0 stuck for 61! [comsh: 16306]

Table 2 Command output

Field	Description
Description	Description for the kernel thread deadloop, including the CPU number, thread running time, thread name, and thread number.
Recorded at	Time when the kernel thread deadloop was recorded, with microsecond precision.
Occurred at	Time when the kernel thread deadloop occurred, with microsecond

Field	Description
	precision.
Instruction address	Instruction address for the kernel thread deadloop.
Thread	Name and number of the kernel thread deadloop.
Context	Context for the kernel thread deadloop.
Cpu	Number of the CPU where the kernel thread ran.
VCPU ID	Number of the CPU core where the kernel thread ran.
Kernel module info	Information about kernel modules that had been loaded when the kernel thread deadloop was detected, including: • **Module name**—Kernel module name. • **Module address**—Memory address of the module.
Last 5 thread switches	Last five kernel thread switches on the CPU before the kernel thread deadloop was detected, including kernel thread name and kernel thread switching time with microsecond precision.
Register content	Register information: • **Reg**—Name of a register. • **Val**—Value saved in a register.
Dump stack	Stack information.
Call trace	Function call stack information, which shows the instruction address of a called function at each level.
Instruction dump	Instruction code when the kernel thread deadloop was detected. **ffffffff** indicates an illegitimate instruction code.
No information to display	No kernel thread deadloop information.

Related commands

`reset kernel deadloop`

display kernel deadloop configuration

Use **`display kernel deadloop configuration`** to display kernel thread deadloop detection configuration.

Syntax

`display kernel deadloop configuration` [**`slot`** *`slot-number`* [**`cpu`** *`cpu-number`*]]

Views

Any view

Predefined user roles

network-admin

Parameters

`slot` *`slot-number`*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays the kernel thread deadloop detection configuration for the master device.

`cpu` *`cpu-number`*: Specifies a CPU by its number.

Usage guidelines

This command is supported only on the default context.

Examples

Display kernel thread deadloop detection configuration.

```
<Sysname> display kernel deadloop configuration
Thread dead loop detection: Enabled
Dead loop timer (in seconds): 20
Cores with dead loop detection enabled: 0-1
Dead loop action threshold: 2 consecutive dead loops
Threads excluded from monitoring: 1
  TID:     15   Name: co0
```

Table 3 Command output

Field	Description
Dead loop timer (in seconds): *n*	Time interval (in seconds) to identify a kernel thread deadloop. A kernel thread deadloop occurs if a kernel thread runs more than *n* seconds.
Threads excluded from monitoring	Kernel threads excluded from kernel thread deadloop detection. This field appears only if the **monitor kernel deadloop exclude-thread** command is configured.
Name	Kernel thread name.
TID	Kernel thread number.
No thread is excluded from monitoring	All kernel threads are monitored by kernel thread deadloop detection.

display kernel exception

Use **display kernel exception** to display kernel thread exception information.

Syntax

display kernel exception *show-number* [*offset*] [**verbose**] [**slot** *slot-number* [**cpu** *cpu-number*]]

Views

Any view

Predefined user roles

network-admin

Parameters

show-number: Specifies the number of kernel exceptions to display, in the range of 1 to 20.

offset: Specifies the offset between the starting exception and the most recent exception, in the range of 0 to 19. The default value is 0.

verbose: Displays detailed information. If you do not specify this keyword, the command displays brief information.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays kernel thread exception information of the master device.

cpu *cpu-number*: Specifies a CPU by its number.

Usage guidelines

This command is supported only on the default context.

If an exception occurs to a running kernel thread, the system automatically records the exception information.

Examples

Display brief information about the most recent kernel thread exception.

```
<Sysname> display kernel exception 1
----------------- Exception record 1 -----------------
Description          : Oops[#0]
Recorded at          : 2017-05-01  11:16:00.823018

```

For more information about the command output, see Table 2.

Related commands

reset kernel exception

display kernel reboot

Use **display kernel reboot** to display reboot information of member devices.

Syntax

display kernel reboot *show-number* [*offset*] [**verbose**] [**slot** *slot-number* [**cpu** *cpu-number*]]

Views

Any view

Predefined user roles

network-admin

Parameters

show-number: Specifies the number of reboots to display, in the range of 1 to 20.

offset: Specifies the offset between the starting reboot and the most recent reboot, in the range of 0 to 19. The default value is 0.

verbose: Displays detailed information. If you do not specify this keyword, the command displays brief information.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays reboot information of the master device. Reboot information of member devices is recorded in the memory of the master device. If the master device is powered off, the reboot information is lost.

cpu *cpu-number*: Specifies a CPU by its number.

Usage guidelines

This command is supported only on the default context.

Examples

Display brief information about the most recent reboot.

```
<Sysname> display kernel reboot 1
----------------- Reboot record 1 -----------------
Recorded at          : 2013-05-01  11:16:00.823018

Table 4 Command output

Field	Description
Recorded at	Time when the reboot was recorded, with microsecond precision.
Occurred at	Time when the reboot occurred, with microsecond precision.
Reason	Reboot reason.
Thread	Name and number of the kernel thread that was running when the reboot occurred.
Context	Context where the reboot occurred.
Slot	Number of the slot that triggered the reboot.
Target Slot	Number of the rebooted slot.
Cpu	Number of the CPU that triggered the reboot.

Field	Description
Target CPU	Number of the CPU that rebooted.
VCPU ID	Number of the CPU core that triggered the reboot.
Kernel module info	Information about kernel modules that had been loaded when the reboot occurred, including the kernel module names and memory addresses.
Last 5 thread switches	Last five kernel thread switches that occurred on the CPU before the reboot, including the kernel thread names and kernel thread switching time points, with microsecond precision.
Dump stack	Stack information for the threads that were running when the reboot occurred.
Call trace	Function call stack information.
No information to display	No reboot information exists.

Related commands

reset kernel reboot

display kernel starvation

Use **display kernel starvation** to display kernel thread starvation information.

Syntax

display kernel starvation *show-number* [*offset*] [**verbose**] [**slot** *slot-number* [**cpu** *cpu-number*]]

Views

Any view

Predefined user roles

network-admin

Parameters

show-number: Specifies the number of thread starvations to display, in the range of 1 to 20.

offset: Specifies the offset between the starting starvation and the most recent starvation, in the range of 0 to 19. The default value is 0.

verbose: Displays detailed information. If you do not specify this keyword, the command displays brief information.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays kernel thread starvation information of the master device.

cpu *cpu-number*: Specifies a CPU by its number.

Usage guidelines

This command is supported only on the default context.

Examples

Display brief information about the most recent kernel thread starvation.

```
<Sysname> display kernel starvation 1
----------------- Starvation record 1 -----------------
Description          : INFO: task comsh: 16306 blocked for more than 10 seconds.
Recorded at          : 2013-05-01  11:16:00.823018
Occurred at          : 2013-05-01  11:16:00.823018
```

```

For detailed information about the command output, see Table 2.

Related commands

reset kernel starvation

display kernel starvation configuration

Use **display kernel starvation configuration** to display kernel thread starvation detection configuration.

Syntax

display kernel starvation configuration [**slot** *slot-number* [**cpu** *cpu-number*]]

Views

Any view

Predefined user roles

network-admin

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays kernel thread starvation detection configuration on the master device.

cpu *cpu-number*: Specifies a CPU by its number.

Usage guidelines

This command is supported only on the default context.

Examples

Display kernel thread starvation detection configuration.

```
<Sysname> display kernel starvation configuration
Thread starvation detection: Disabled
Starvation timer (in seconds): 10
Threads excluded from monitoring: 1
  TID:    123   Name: co0
```

Table 5 Command output

Field	Description
Starvation timer (in seconds): *n*	Time interval (in seconds) to identify a kernel thread starvation. A kernel thread starvation occurs if a kernel thread does not run within *n* seconds.
Threads excluded from monitoring	Kernel threads excluded from kernel thread starvation detection.
Name	Kernel thread name.
TID	Kernel thread number.

Related commands

monitor kernel starvation enable

monitor kernel starvation exclude-thread

monitor kernel starvation time

display process

Use **display process** to display process state information.

Syntax

display process [**all** | **job** *job-id* | **name** *process-name*] [**slot** *slot-number* [**cpu** *cpu-number*]]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

all: Specifies all processes. With the **all** keyword or without any parameters, the command displays state information for all processes.

job *job-id*: Specifies a process by its job ID, in the range of 1 to 2147483647. Each process has a fixed job ID.

name *process-name*: Specifies a process by its name, a case-insensitive string of 1 to 15 characters that must not contain question marks or spaces.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays process state information on the master device.

cpu *cpu-number*: Specifies a CPU by its number.

Examples

Display state information for the process **scmd**.

```
<Sysname> display process name scmd
                              Job ID: 1
                                 PID: 1
                          Parent JID: 0
                          Parent PID: 0
                     Executable path: /sbin/scmd
                            Instance: 0
                             Respawn: OFF
                       Respawn count: 1
               Max. spawns per minute: 0
                         Last started: Wed Jun  1 14:45:46 2013
                       Process state: sleeping
                           Max. core: 0
                                ARGS: -
```

```
   TID  LAST_CPU    Stack      PRI    State   HH:MM:SS:MSEC  Name
     1      0          0K      120      S     0:0:5:220      scmd
```

Table 6 Command output

Field	Description
Job ID	Job ID of the process. The job ID never changes.
PID	Number of the process. The number identifies the process, and it might change as the process restarts.
Parent JID	Job ID of the parent process.
Parent PID	Number of the parent process.
Executable path	Executable path of the process. For a kernel thread, this field displays a hyphen (-).
Instance	Instance number of the process. Whether a process can run multiple instances depends on the software implementation.
Respawn	Indicates whether the process restarts when an error occurs: • **ON**—The process automatically restarts. • **OFF**—The process does not automatically restarts.
Respawn count	Times that the process has restarted. The starting value is 1.
Max. spawns per minute	Maximum number of times that the process can restart within one minute. If the threshold is reached, the system automatically shuts down the process.
Last started	Time when the most recent restart occurred.
Process state	State of the process: • **running**—Running or waiting in the queue. • **sleeping**—Interruptible sleep. • **traced** or **stopped**—Stopped. • **uninterruptible sleep**—Uninterruptible sleep. • **zombie**—The process has quit, but some resources are not released.
Max. core	Maximum number of core dump files that the process can create. 0 indicates that the process never creates a core dump file. A process creates a core dump file after it abnormally restarts. If the number of core dump files reaches the maximum value, no more core dump files are created. Core dump files are helpful for troubleshooting.
ARGS	Parameters carried by the process during startup. If the process carries no parameters, this field displays a hyphen (-).
TID	Thread ID.
LAST_CPU	Number of the CPU on which the process is last scheduled.
Stack	Stack size.
PRI	Thread priority.
State	Thread state: • **R**—Running. • **S**—Sleeping. • **T**—Traced or stopped. • **D**—Uninterruptible sleep. • **Z**—Zombie.
HH:MM:SS:MSEC	Running time since the most recent start.

Name	Process name.

Display state information for all processes.

```
<Sysname> display process all

Table 7 Command output

Field	Description
JID	Job ID of a process. It never changes.
PID	Number of a process.
%CPU	CPU usage in percentage (%).
%MEM	Memory usage in percentage (%).
STAT	State of a process: • **R**—Running. • **S**—Sleeping. • **T**—Traced or stopped. • **D**—Uninterruptible sleep. • **Z**—Zombie.
PRI	Priority of a process for scheduling.
TTY	TTY used by a process. It displays a hyphen (-) for non-default contexts.
HH:MM:SS	Running time since the most recent start. If the running time reaches or exceeds 100 hours, this field displays only the number of hours.
COMMAND	Name and parameters of a process. If square brackets ([ ]) exist in a process name, the process is a kernel thread.

display process cpu

Use **display process cpu** to display CPU usage of all processes.

Syntax

display process cpu [**slot** *slot-number* [**cpu** *cpu-number*]]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays CPU usage of all processes on the master device.

cpu *cpu-number*: Specifies a CPU by its number.

Examples

Display CPU usage for all processes.

```
<Sysname> display process cpu
CPU utilization in 5 secs: 16.8%; 1 min: 4.7%; 5 mins: 4.7%
    JID      5Sec      1Min      5Min    Name
      1      0.0%      0.0%      0.0%    scmd
      2      0.0%      0.0%      0.0%    [kthreadd]
      3      0.1%      0.0%      0.0%    [ksoftirqd/0]
```

...

Table 8 Command output

Field	Description
CPU utilization in 5 secs: 16.8%; 1 min: 4.7%; 5 mins: 4.7%	System CPU usage within the last 5 seconds, 1 minute, and 5 minutes.
JID	Job ID of a process. It never changes.
5Sec	CPU usage of the process within the last 5 seconds.
1Min	CPU usage of the process within the last minute.
5Min	CPU usage of the process within the last 5 minutes.
Name	Name of the process. If square brackets ([ ]) exist in a process name, the process is a kernel thread.

display process log

Use **display process log** to display log information for all user processes.

Syntax

display process log [**slot** *slot-number* [**cpu** *cpu-number*]]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays log information for all user processes on the master device.

cpu *cpu-number*: Specifies a CPU by its number.

Examples

Display log information for all user processes.

```
<Sysname> display process log
Process       JobID  PID    Abort Core Exit Kill StartTime      EndTime

pkg_update    122    122    N     N    0    --   12-17 07:10:30 12-17 07:10:31
```

Table 9 Command output

Field	Description
Process	Name of a user process.
JobID	Job ID of a user process.
PID	ID of a user process.
Abort	Indicates whether the process exited abnormally: • **Y**—Yes. • **N**—No.
Core	Indicates whether the process can generate core dump files: • **Y**—Yes. • **N**—No.
Exit	Process exit code. This field displays two hyphens (--) if the process was killed by a signal.
Kill	Code of the signal that killed the process. This field displays two hyphens (--) if the process exited instead of being killed.
StartTime	Time when the user process started.
EndTime	Time when the user process ended.

display process memory

Use **display process memory** to display memory usage of all user processes.

Syntax

display process memory [**slot** *slot-number* [**cpu** *cpu-number*]]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays memory usage of all user processes on the master device.

cpu *cpu-number*: Specifies a CPU by its number.

Usage guidelines

When a user process starts, it requests the following types of memory from the system:

- **Text memory**—Stores code for the user process.
- **Data memory**—Stores data for the user process.
- **Stack memory**—Stores temporary data.
- **Dynamic memory**—Heap memory dynamically assigned and released by the system according to the needs of the user process. To view dynamic memory information, execute the **display process memory heap** command.

Examples

Display memory usage for all user processes.

```
<Sysname> display process memory
   JID       Text      Data      Stack    Dynamic    Name
     1        384      1800         16         36    scmd
     2          0         0          0          0    [kthreadd]
     3          0         0          0          0    [ksoftirqd/0]
     4          0         0          0          0    [watchdog/0]
     5          0         0          0          0    [events/0]
     6          0         0          0          0    [khelper]
    29          0         0          0          0    [kblockd/0]
    49          0         0          0          0    [vzmond]
    52          0         0          0          0    [pdflush]
---- More ----
```

Table 10 Command output

Field	Description
JID	Job ID of a process. It never changes.
Text	Text memory used by the user process, in KB. The value for a kernel thread is 0.

Field	Description
Data	Data memory used by the user process, in KB. The value for a kernel thread is 0.
Stack	Stack memory used by the user process, in KB. The value for a kernel thread is 0.
Dynamic	Dynamic memory used by the user process, in KB. The value for a kernel thread is 0.
Name	Name of the user process. If square brackets ([ ]) exist in a process name, the process is a kernel thread.

Related commands

display process memory heap

display process memory heap address

display process memory heap size

display process memory heap

Use **display process memory heap** to display the heap memory usage of a user process.

Syntax

display process memory heap job *job-id* [**verbose**] [**slot** *slot-number* [**cpu** *cpu-number*]]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

job *job-id*: Specifies a user process by its job ID, in the range of 1 to 2147483647.

verbose: Displays detailed information. If you do not specify this keyword, the command displays brief information.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays the heap memory usage of the user process on the master device.

cpu *cpu-number*: Specifies a CPU by its number.

Usage guidelines

Heap memory comprises fixed-sized blocks such as 16-byte or 64-byte blocks. It stores data and variables used by the user process. When a user process starts, the system dynamically allocates heap memory to the process.

Each memory block has an address represented in hexadecimal format, which can be used to access the memory block. You can view memory block addresses by using the **display process memory heap size** command, and view memory block contents by using the **display process memory heap address** command.

Examples

Display brief information about heap memory usage for the process identified by job ID 1.

```
<Sysname> display process memory heap job 1
Total virtual memory heap space(in bytes) :  2228224
Total physical memory heap space(in bytes) :  262144
Total allocated memory(in bytes)          :  161576
```

Display detailed information about heap memory usage for the process identified by job ID 1.

```
<Sysname> display process memory heap job 1 verbose
Heap usage:
Size       Free      Used     Total     Free Ratio
16         8         52       60        13%
64         3         1262     1265      0.2%
128        2         207      209       1%
512        3         55       58        5.1%
4096       3         297      300       1%
8192       1         19       20        5%
81920      0         1        1         0%
Summary:
Total virtual memory heap space (in bytes)  :  2293760
Total physical memory heap space (in bytes) :  58368
Total allocated memory (in bytes)           :  42368
```

Table 11 Command output

Field	Description
Size	Size of each memory block, in bytes.
Free	Number of free memory blocks.
Used	Number of used memory blocks.
Total	Total number of memory blocks.
Free Ratio	Ratio of free memory to total memory. It helps identify fragment information.

Related commands

display process memory

display process memory heap address

display process memory heap size

display process memory heap address

Use **display process memory heap address** to display heap memory content starting from a specified memory block for a process.

Syntax

display process memory heap job *job-id* **address** *starting-address* **length** *memory-length* [**slot** *slot-number* [**cpu** *cpu-number*]]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

job *job-id*: Specifies a user process by its job ID, in the range of 1 to 2147483647.

address *starting-address*: Specifies the starting memory block by its address.

length *memory-length*: Specifies the memory block length in the range of 1 to 1024 bytes.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays heap memory content information on the master device.

cpu *cpu-number*: Specifies a CPU by its number.

Usage guidelines

When a user process runs abnormally, the command helps locate the problem.

Examples

Display 128-byte memory block content starting from the memory block 0xb7e30580 for the process **job 1**.

```
<Sysname> display process memory heap job 1 address b7e30580 length 128
B7E30580:  14 00 EF FF 00 00 00 00 E4 39 E2 B7 7C 05 E3 B7  .........9..|...
B7E30590:  14 00 EF FF 2F 73 62 69 6E 2F 73 6C 62 67 64 00  ..../sbin/slbgd.

B7E305E0:  14 00 EF FF 00 00 00 00 04 3E E2 B7 CC 05 E3 B7  .........>......
B7E305F0:  14 00 EF FF 2F 73 62 69 6E 2F 6E 74 70 64 00 00  ..../sbin/ntpd..
```

Related commands

display process memory heap

display process memory heap size

display process memory heap size

Use **display process memory heap size** to display the addresses of heap memory blocks with a specified size used by a process.

Syntax

display process memory heap job *job-id* **size** *memory-size* [**offset** *offset-size*] [**slot** *slot-number* [**cpu** *cpu-number*]]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

job *job-id*: Specifies a process by its job ID, in the range of 1 to 2147483647.

size *memory-size*: Specifies the memory block size in the range of 1 to 4294967295.

offset *offset-size*: Specifies an offset in the range of 0 to 4294967295. The default value is 128. For example, suppose the system allocates 100 16-byte memory blocks to process job 1, and the process has used 66 blocks. Then if you execute the **display process memory heap job** *1* **size** *16* **offset** *50* command, the output shows the addresses of the 51st through 66th 16-byte blocks used by the process.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays heap memory block address information on the master device.

cpu *cpu-number*: Specifies a CPU by its number.

Usage guidelines

The command displays memory block addresses in hexadecimal format. To view memory block content, execute the **display process memory heap address** command.

Examples

Display the addresses of 16-byte memory blocks used by process job 1.

```
<Sysname> display process memory heap job 1 size 16
0xb7e300c0  0xb7e300d0  0xb7e300e0  0xb7e300f0
0xb7e30100  0xb7e30110  0xb7e30120  0xb7e30130
0xb7e30140  0xb7e30150  0xb7e30160  0xb7e30170
0xb7e30180  0xb7e30190  0xb7e301a0  0xb7e301b0
0xb7e301c0  0xb7e301d0  0xb7e301e0  0xb7e301f0
0xb7e30200  0xb7e30210  0xb7e30220  0xb7e30230
```

Display the addresses of 16-byte memory blocks starting from the fifth block used by process job 1.

```
<Sysname> display process memory heap job 1 size 16 offset 4
0xb7e30100  0xb7e30110  0xb7e30120  0xb7e30130
0xb7e30140  0xb7e30150  0xb7e30160  0xb7e30170
0xb7e30180  0xb7e30190  0xb7e301a0  0xb7e301b0
0xb7e301c0  0xb7e301d0  0xb7e301e0  0xb7e301f0
0xb7e30200  0xb7e30210  0xb7e30220  0xb7e30230
```

Related commands

display process memory heap

display process memory heap address

exception filepath

Use **exception filepath** to specify the directory for saving core dump files.

Use **undo exception filepath** to remove the specified directory.

Syntax

exception filepath *directory*

undo exception filepath *directory*

Default

The directory for saving core dump files is the root directory of the default file system. For more information about the default file system, see file system management in *Fundamentals Configuration Guide*.

Views

User view

Predefined user roles

network-admin

Parameters

directory: Specifies the directory for saving core dump files. The directory must be the root directory of a file system.

Usage guidelines

This command is supported only on the default context.

The system will save core dump files to the **core** folder in the specified directory on the master. If the **core** folder does not exist in the specified directory, the system creates the **core** folder before saving core dump files.

You can use the command to change the directory if there are different types of storage media on the device.

If no directory is specified or the specified directory is not accessible, the system cannot save core dump files.

Examples

Set the directory for saving core dump files.

```
<Sysname> exception filepath flash:/
```

Related commands

display exception filepath

process core

monitor kernel deadloop action threshold

Use **monitor kernel deadloop action threshold** to set kernel thread deadloop protection thresholds.

Use **undo monitor kernel deadloop action threshold** to restore default settings.

Syntax

monitor kernel deadloop action threshold *threshold* [**slot** *slot-number* [**cpu** *cpu-number*]]

undo monitor kernel deadloop action threshold [**slot** *slot-number* [**cpu** *cpu-number*]]

Default

The kernel thread deadloop protection threshold is 1. The device takes protection actions immediately after detecting a kernel thread deadloop.

Views

System view

Predefined user roles

network-admin

Parameters

threshold: Specifies the number of kernel thread deadloops for triggering protection actions, in the range of 1 to 20.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command applies to the master device.

cpu *cpu-number*: Specifies a CPU by its number.

Usage guidelines

This command is supported only on the default context.

When the number of detected kernel thread deadloops reaches the kernel thread deadloop protection threshold, the device takes protection actions to remove the deadloops.

Examples

Set the kernel thread deadloop protection threshold to 5.

```
<Sysname> system-view
[Sysname] monitor kernel deadloop action threshold 5
```

Related commands

display kernel deadloop configuration

monitor kernel deadloop enable

monitor kernel deadloop enable

Use **monitor kernel deadloop enable** to enable kernel thread deadloop detection.

Use **undo monitor kernel deadloop enable** to disable kernel thread deadloop detection.

Syntax

monitor kernel deadloop enable [**slot** *slot-number* [**cpu** *cpu-number* [**core** *core-number*&<1-64>]]]

undo monitor kernel deadloop enable [**slot** *slot-number* [**cpu** *cpu-number*]]

Default

Kernel thread deadloop detection is enabled.

Views

System view

Predefined user roles

network-admin

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command applies to the master device.

cpu *cpu-number*: Specifies a CPU by its number.

core *core-number*&<1-64>: Specifies a maximum of 64 cores by their numbers. If you do not specify this option, all cores on the CPU are specified.

Usage guidelines

CAUTION:

Use this command only under the guidance of NSFOCUS Support. Inappropriate configuration can cause system breakdown. As a best practice, leave the default unchanged.

This command is supported only on the default context.

Kernel threads share resources in kernel space. If a kernel thread monopolizes the CPU for a long time, other threads cannot run, resulting in a deadloop.

This command enables the device to detect deadloops. If a thread occupies the CPU regularly, the device determines that a deadloop has occurred, logs the event, and reboots to resolve the issue.

Examples

Enable kernel thread deadloop detection.

```
<Sysname> system-view
[Sysname] monitor kernel deadloop enable
```

Related commands

display kernel deadloop

display kernel deadloop configuration

monitor kernel deadloop exclude-thread

monitor kernel deadloop time

monitor kernel deadloop exclude-thread

Use **monitor kernel deadloop exclude-thread** to exclude a kernel thread from kernel thread deadloop detection.

Use **undo monitor kernel deadloop exclude-thread** to include a kernel thread in kernel thread deadloop detection.

Syntax

monitor kernel deadloop exclude-thread *tid* [**slot** *slot-number* [**cpu** *cpu-number*]]

undo monitor kernel deadloop exclude-thread [*tid*] [**slot** *slot-number* [**cpu** *cpu-number*]]

Default

Kernel thread deadloop detection monitors all kernel threads.

Views

System view

Predefined user roles

network-admin

Parameters

tid: Specifies a kernel thread by its ID, in the range of 1 to 2147483647. If you do not specify a kernel thread, the **undo** command restores the default.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command applies to the master device.

cpu *cpu-number*: Specifies a CPU by its number.

Usage guidelines

This command is supported only on the default context.

Use this command only under the guidance of NSFOCUS Support. Inappropriate configuration can cause system breakdown. As a best practice, leave the default unchanged.

You can exclude up to 128 kernel threads from kernel thread deadloop detection.

Examples

Exclude kernel thread 15 from kernel thread deadloop detection.

```
<Sysname> system-view
[Sysname]monitor kernel deadloop exclude-thread 15
```

Related commands

display kernel deadloop configuration

display kernel deadloop

monitor kernel deadloop enable

monitor kernel deadloop time

Use **monitor kernel deadloop time** to set the interval for identifying a kernel thread deadloop.

Use **undo monitor kernel deadloop time** to restore the default.

Syntax

monitor kernel deadloop time *time* [**slot** *slot-number* [**cpu** *cpu-number*]]

undo monitor kernel deadloop time [**slot** *slot-number* [**cpu** *cpu-number*]]

Default

The interval for identifying a kernel thread deadloop is 28 seconds.

Views

System view

Predefined user roles

network-admin

Parameters

time *time*: Specifies the interval for identifying a kernel thread deadloop, in the range of 1 to 65535 seconds.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command applies to the master device.

cpu *cpu-number*: Specifies a CPU by its number.

Usage guidelines

This command is supported only on the default context.

Use this command only under the guidance of NSFOCUS Support. Inappropriate configuration can cause system breakdown. As a best practice, leave the default unchanged.

If a kernel thread runs for the specified interval, kernel thread deadloop detection determines that a deadloop has occurred.

Examples

Set the interval for identifying a kernel thread deadloop to 8 seconds.

```
<Sysname> system-view
[Sysname] monitor kernel deadloop time 8
```

Related commands

display kernel deadloop configuration

display kernel deadloop

monitor kernel deadloop enable

monitor kernel starvation enable

Use **monitor kernel starvation enable** to enable kernel thread starvation detection.

Use **undo monitor kernel starvation enable** to disable kernel thread starvation detection.

Syntax

monitor kernel starvation enable [**slot** *slot-number* [**cpu** *cpu-number*]]

undo monitor kernel starvation enable [**slot** *slot-number* [**cpu** *cpu-number*]]

Default

Kernel thread starvation detection is disabled.

Views

System view

Predefined user roles

network-admin

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command applies to the master device.

cpu *cpu-number*: Specifies a CPU by its number.

Usage guidelines

CAUTION:

Use this command only under the guidance of NSFOCUS Support. Inappropriate configuration can cause system breakdown. As a best practice, leave the default unchanged.

This command is supported only on the default context.

Starvation occurs when a thread is unable to access shared resources.

The command enables the system to detect and report thread starvation. If a thread is not executed within an interval, the system considers that a starvation has occurred, and outputs a starvation message.

Thread starvation does not impact system operation. A starved thread can automatically run when certain conditions are met.

Examples

Enable kernel thread starvation detection.

```
<Sysname> system-view
```

```
[Sysname] monitor kernel starvation enable
```

Syntax

monitor kernel starvation time *time* [**slot** *slot-number* [**cpu** *cpu-number*]]

undo monitor kernel starvation time [**slot** *slot-number* [**cpu** *cpu-number*]]

Default

The interval for identifying a kernel thread starvation is 120 seconds.

Views

System view

Predefined user roles

network-admin

Parameters

time *time*: Specifies the interval for identifying a kernel thread starvation, in the range of 1 to 65535 seconds.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command applies to the master device.

cpu *cpu-number*: Specifies a CPU by its number.

Usage guidelines

This command is supported only on the default context.

Use this command only under the guidance of NSFOCUS Support. Inappropriate configuration can cause system breakdown. As a best practice, leave the default unchanged.

If a thread is not executed within the specified interval, the system considers that a starvation has occurred, and outputs a starvation message.

Examples

Set the interval for identifying a kernel thread starvation to 120 seconds.

```
<Sysname> system-view
[Sysname] monitor kernel starvation time 120
```

Related commands

display kernel starvation

display kernel starvation configuration

monitor kernel starvation enable

monitor process

Use **monitor process** to display process statistics.

Syntax

monitor process [**dumbtty**] [**iteration** *number*] [**slot** *slot-number* [**cpu** *cpu-number*]]

Views

Any view

Predefined user roles

network-admin

context-admin

Parameters

dumbtty: Specifies dumbtty mode. In this mode, the command displays process statistics in descending order of CPU usage without refreshing statistics. If you do not specify this keyword, the command displays statistics for the top 10 processes in descending order of CPU usage in an interactive mode, and refreshes statistics every 5 seconds by default.

iteration *number*: Specifies the number of display times, in the range of 1 to 4294967295. If you specify the **dumbtty** keyword, the *number* argument is 1 by default. If neither the **dumbtty** keyword nor the *number* argument is specified, there is no limit to the display times and process statistics are refreshed every 5 seconds.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays process statistics for the master device.

cpu *cpu-number*: Specifies a CPU by its number.

Usage guidelines

If you do not specify the **dumbtty** keyword, the command displays process statistics in an interactive mode. In this mode, the system automatically determines the number of displayed processes according to the screen size, and does not display exceeding processes. You can also input interactive commands as shown in Table 12 to perform relevant operations.

Table 12 Interactive commands

Commands	Description
? or h	Displays help information that includes available interactive commands.
1	Displays state information for physical CPUs. For example, if you enter 1 for the first time, the state of each physical CPU is displayed in a separate row. If you enter 1 again, the average value of all CPU states is displayed. If you enter 1 for the third time, separate states are displayed. By default, the average value of all CPU states is displayed.
c	Sorts processes by CPU usage in descending order, which is the default setting.
d	Sets the interval for refreshing process statistics, in the range of 1 to 2147483647 seconds. The default value is 5 seconds.
f	Sorts processes by the number of open files in descending order. Files are identified by file descriptors (FDs).
k	Kills a process. Because the command can impact system operation, be cautious to use it.
l	Refreshes the screen.
m	Sorts processes by memory usage in descending order.
n	Changes the maximum number of processes displayed within a screen, in the range of 0 to 2147483647. The default value is 10. A value of 0 means no limit. Only processes not exceeding the screen size can be displayed.

Commands	Description
q	Quits the interactive mode.
t	Sorts processes by running time in descending order.
<	Moves sort field to the next left column.
>	Moves sort field to the next right column.

Examples

Display process statistics in dumbtty mode. In this mode, the system displays process statistics once, and then returns to command view.

```

The system refreshes process statistics every 5 seconds. You can enter interactive commands to perform operation as follows:

- Enter **h** or a question mark (?) to display help information as follows:

```
Help for interactive commands:
      ?,h    Show the available interactive commands
        1    Toggle SMP view: '1' single/separate states
        c    Sort by the CPU field(default)
        d    Set the delay interval between screen updates
        f    Sort by number of open files
        k    Kill a job
        l    Refresh the screen
        m    Sort by memory used
        n    Set the maximum number of processes to display
        q    Quit the interactive display
        t    Sort by run time of processes since last restart
        <    Move sort field to the next left column
        >    Move sort field to the next right column
Press any key to continue
```

- Enter **d**, and then enter a number to modify the refresh interval. If you enter **3**, statistics are refreshed every 3 seconds.

```
Enter the delay interval between updates(1~2147483647): 3
```

- Enter **n**, and then enter a number to modify the maximum number of displayed processes. If you enter **5**, statistics for five processes are displayed.

```
Enter the max number of processes to display(0 means unlimited): 5
428 processes; 561 threads; 2336 fds

```

- Enter **q** to quit interactive mode.

Table 13 Command output

Field	Description
84 processes; 107 threads; 683 fds	Numbers of processes, threads, and open files.
JID	Job ID of a process, which never changes.
PID	ID of a process.
PRI	Priority level of a process.
State	State of a process: • **R**—Running. • **S**—Sleeping. • **T**—Traced or stopped. • **D**—Uninterruptible sleep. • **Z**—Zombie.
FDs	Number of open files for a process.
MEM	Memory usage. It displays **0** for a kernel thread.
HH:MM:SS	Running time of a process since last restart.
CPU	CPU usage of a process.
Name	Name of a process. If square brackets ([ ]) exist in a process name, the process

	is a kernel thread.

monitor thread

Use **monitor thread** to display thread statistics.

Syntax

monitor thread [**dumbtty**] [**iteration** *number*] [**slot** *slot-number* [**cpu** *cpu-number*]]

Views

Any view

Predefined user roles

network-admin

context-admin

Parameters

dumbtty: Specifies dumbtty mode. In this mode, the command displays all thread statistics in descending order of CPU usage without refreshing statistics. If you do not specify the keyword, the command displays statistics for top 10 processes in descending order of CPU usage in an interactive mode, and refreshes statistics every 5 seconds by default.

iteration *number*: Specifies the number of display times, in the range of 1 to 4294967295. If you specify the **dumbtty** keyword, the *number* argument is 1 by default. If neither the **dumbtty** keyword nor the *number* argument is specified, there is no limit to the display times.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays thread statistics for the master device.

cpu *cpu-number*: Specifies a CPU by its number.

Usage guidelines

If you do not specify the **dumbtty** keyword, the command displays thread statistics in an interactive mode. In this mode, the system automatically determines the number of displayed thread processes according to the screen size and does not display exceeding processes. You can also input interactive commands as shown in Table 14 to perform relevant operations.

Table 14 Interactive commands

Commands	Description
? or h	Displays help information that includes available interactive commands.
1	Displays one of the following items in turn when you press **1** again and again: • Values of parameters of physical CPUs. • Average values of parameters of all CPUs. By default, the command displays the average values of parameters of all CPUs.
c	Sorts statistics by CPU usage in descending order. By default, the command sorts statistics by CPU usage in descending order.
d	Sets the interval for refreshing statistics. The default interval is 5 seconds.
k	Kills a process. Because the command can impact system operation, be cautious when you use it.
l	Refreshes the screen.
n	Changes the maximum number of threads displayed within a screen, in the range of 0

	to 2147483647. The default value is 10. A value of 0 means no limit. Only threads not exceeding the screen size can be displayed.
q	Quits interactive mode.
t	Sorts statistics by the running time since the latest startup.
<	Moves sort field to the next left column.
>	Moves sort field to the next right column.

Examples

Display thread statistics in dumbtty mode.

```
<Sysname> monitor thread dumbtty
84 processes; 107 threads
Thread states: 1 running, 106 sleeping, 0 stopped, 0 zombie

```

- Enter **h** or a question mark (?) to display help information as follows:

  ```
  Help for interactive commands:
  ```

```
        ?,h      Show the available interactive commands
          1      Toggle SMP view: '1' single/separate states
          c      Sort by the CPU field(default)
          d      Set the delay interval between screen updates
          k      Kill a job
          l      Refresh the screen
          n      Set the maximum number of threads to display
          q      Quit the interactive display
          t      Sort by run time of threads since last restart
          <      Move sort field to the next left column
          >      Move sort field to the next right column
Press any key to continue
```

- Enter **d**, and then enter a number to modify the refresh interval. If you enter **3**, statistics are refreshed every 3 seconds.

  ```
  Enter the delay interval between screen updates (1~2147483647): 3
  ```

- Enter **n**, and then enter a number to modify the maximum number of displayed threads. If you enter **5**, statistics for five threads are displayed.

  ```
  Enter the max number of threads to display(0 means unlimited): 5
  84 processes; 107 threads
  Thread states: 1 running, 106 sleeping, 0 stopped, 0 zombie
  CPU states: 93.26% idle, 0.99% user, 4.23% kernel, 1.49% interrupt
  Memory: 755M total, 417M available, page size 4K
      JID    TID  LAST_CPU  PRI  State  HH:MM:SS   MAX    CPU    Name
     1176   1176      0     120    R    00:00:02     1   3.71%   top
        1      1      0     120    S    00:00:06     1   0.92%   scmd

  ```

- Enter **k** and then enter a JID to kill a thread. If you enter **881**, the thread with the JID of 881 is killed.

  ```
  Enter the JID to kill: 881
  83 processes; 106 threads
  Thread states: 1 running, 105 sleeping, 0 stopped, 0 zombie
  CPU states: 96.26% idle, 0.54% user, 2.63% kernel, 0.54% interrupt
  Memory: 755M total, 418M available, page size 4K
      JID    TID  LAST_CPU  PRI  State  HH:MM:SS   MAX    CPU    Name
     1176   1176      0     120    R    00:00:04     1   1.86%   top
      866    866      0     120    S    00:00:14     1   0.87%   devd
        1      1      0     120    S    00:00:07     1   0.49%   scmd
      730    730      0       0    S    00:00:04     1   0.12%   [DIBC]
      762    762      0     120    S    00:00:22     1   0.12%   [MNET]
  ```

- Enter **q** to quit interactive mode.

Table 15 Command output

Field	Description
84 processes; 107 threads	Numbers of processes and threads.
JID	Job ID of a thread, which never changes.

TID	ID of a thread.
LAST_CPU	Number of the CPU on which the most recent thread scheduling occurs.
PRI	Priority level of a thread.
State	State of a thread: • **R**—Running. • **S**—Sleeping. • **T**—Traced or stopped. • **D**—Uninterruptible sleep. • **Z**—Zombie.
HH:MM:SS	Running time of a thread since last restart.
MAX	Longest time that a single thread scheduling occupies the CPU, in milliseconds.
CPU	CPU usage of a thread.
Name	Name of a thread. If square brackets ([ ]) exist in a thread name, the thread is a kernel thread.

process core

Use **process core** to enable or disable a process to generate core dump files for exceptions and set the maximum number of core dump files.

Syntax

process core { **maxcore** *value* | **off** } { **job** *job-id* | **name** *process-name* } [**slot** *slot-number* [**cpu** *cpu-number*]]

Views

User view

Default

A process generates a core dump file for the first exception and does not generate any core dump files for subsequent exceptions.

Predefined user roles

network-admin

context-admin

Parameters

off: Disables core dump file generation.

maxcore *value*: Enables core dump file generation and sets the maximum number of core dump files, in the range of 1 to 10.

name *process-name*: Specifies a process by its name, a case-insensitive string of 1 to 15 characters.

job *job-id*: Specifies a process by its job ID, in the range of 1 to 2147483647. The job ID does not change after the process restarts.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command applies to the master device.

cpu *cpu-number*: Specifies a CPU by its number.

Usage guidelines

The command applies to all instances of a process.

The command enables the system to generate a core dump file each time the specified process crashes until the maximum number of core dump files is reached. A core dump file records the exception information.

Because core dump files consume system storage resources, you can disable core dump file generation for processes for which you do not need to review exception information.

Examples

Disable core dump file generation for process **routed**.

```
<Sysname> process core off name routed
```

Enable core dump file generation for process **routed** and set the maximum number of core dump files to 5.

```
<Sysname> process core maxcore 5 name routed
```

Related commands

display exception context

exception filepath

reset exception context

Use **reset exception context** to clear context information for process exceptions.

Syntax

reset exception context [**slot** *slot-number* [**cpu** *cpu-number*]]

Views

User view

Predefined user roles

network-admin

context-admin

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command clears context information for process exceptions on the IRF master device.

cpu *cpu-number*: Specifies a CPU by its number.

Examples

Clear context information for exceptions.

```
<Sysname> reset exception context
```

Related commands

display exception context

reset kernel deadloop

Use **reset kernel deadloop** to clear kernel thread deadloop information.

Syntax

reset kernel deadloop [**slot** *slot-number* [**cpu** *cpu-number*]]

Views

Contents

NETCONF commands

display netconf service

Use **display netconf service** to display current NETCONF service status and global NETCONF service statistics.

Syntax

display netconf service

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Examples

Display the current NETCONF service status and global NETCONF service statistics.

```
<Sysname> display netconf service
NETCONF over SOAP over HTTP: Enabled (port 80)
NETCONF over SOAP over HTTPS: Enabled (port 443)
NETCONF over SSH: Enabled (port 830)
NETCONF over Telnet: Enabled
NETCONF over Console: Enabled
SOAP timeout: 10 minutes    Agent timeout: 10 minutes
Active sessions: 1
Service statistics:
NETCONF start time: 2015-10-10T08:08:08
Output notifications: 50
Output RPC errors: 20
Dropped sessions: 0
Sessions: 100
Received bad hellos: 0
Received RPCs: 1000
Received bad RPCs: 20
```

Table 1 Command output

Field	Description
SOAP timeout	NETCONF session idle timeout time for NETCONF over SOAP over HTTP sessions and NETCONF over SOAP over HTTPS sessions.
Agent timeout	NETCONF session idle timeout time for NETCONF over SSH sessions, NETCONF over Telnet sessions, and NETCONF over console sessions.
Active sessions	Number of active NETCONF sessions.

NETCONF start time	Time when the NETCONF service was started.
Output notifications	Number of subscribed notifications output by the device.
Output RPC errors	Number of erroneous RPC requests output by the device.
Dropped sessions	Number of NETCONF sessions dropped due to timeout or abnormal network disconnection.
Sessions	Number of established NETCONF sessions.
Received bad hellos	Number of received erroneous hello messages.
Received RPCs	Total number of RPC requests received by the device.
Received bad RPCs	Number of received erroneous RPC requests.

display netconf session

Use **`display netconf session`** to display NETCONF session status and statistics.

Syntax

`display netconf session`

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Examples

Display NETCONF session status and statistics.

```
<Sysname> display netconf session
Session ID: 1 Session type: Agent
Username: test
Login time: 2015-10-10T08:08:08
Client IP address: 192.168.1.1
Session statistics:
Received RPCs    : 10          Received bad RPCs   : 0
    Output RPC errors: 10          Output notifications: 0
Session ID: 2 Session type: SOAP
Username: test
Login time: 2015-10-10T08:08:08
Client IP address: 192.168.1.1
Session statistics:
    Received RPCs    : 10         Received bad RPCs   : 0
    Output RPC errors: 10         Output notifications: 0
```

Table 2 Command output

Field	Description
Session ID	ID of the NETCONF session.
Session type	NETCONF session type: • **soap**—NETCONF over SOAP over HTTP or NETCONF over SOAP over HTTPS. • **agent**—NETCONF over SSH, NETCONF over Telnet, or NETCONF over console.
Username	Username used by the NETCONF client to establish the session. If the session type is **agent** and login authentication was not performed, this field displays a hyphen (-).
Login time	Time when the NETCONF session was established.
Client IP address	IP address of the NETCONF client. This field displays a hyphen (-) for NETCONF over console sessions.
Received RPCs	Number of received RPC requests.
Received bad RPCs	Number of received erroneous RPC requests.
Output RPC errors	Number of erroneous RPC requests output by the device.
Output notifications	Number of subscribed notifications output by the device.

netconf capability specific-namespace

Use **netconf capability specific-namespace** to configure the device to use module-specific namespaces.

Use **undo netconf capability specific-namespace** to restore the default.

Syntax

netconf capability specific-namespace

undo netconf capability specific-namespace

Default

The device uses the common namespace.

Views

System view

Predefined user roles

network-admin

context-admin

Usage guidelines

NETCONF supports both the common namespace and module-specific namespaces. The common namespace is incompatible with module-specific namespaces. To set up a NETCONF session, the device and the client must use the same type of namespaces. By default, the common namespace is used. If the client does not support the common namespace, use this command to configure the device to use module-specific namespaces.

For this command to take effect, you must reestablish the NETCONF session.

Examples

Configure the device to use module-specific namespaces.

```
<Sysname> system-view
[Sysname] netconf capability specific-namespace
```

netconf idle-timeout

Use **netconf idle-timeout** to set the NETCONF session idle timeout time.

Use **undo netconf idle-timeout** to restore the default.

Syntax

netconf { **soap** | **agent** } **idle-timeout** *minute*

undo netconf { **soap** | **agent** } **idle-timeout**

Default

The NETCONF session idle timeout time is 10 minutes for NETCONF over SOAP over HTTP sessions and NETCONF over SOAP over HTTPS sessions.

The NETCONF session idle timeout time is 0 minutes for NETCONF over SSH sessions, NETCONF over Telnet sessions, and NETCONF over console sessions. The sessions never time out.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

soap: Specifies the NETCONF over SOAP over HTTP sessions and NETCONF over SOAP over HTTPS sessions.

agent: Specifies the NETCONF over SSH sessions, NETCONF over Telnet sessions, and NETCONF over console sessions.

minute: Specifies the NETCONF session idle timeout time in minutes. The value range is as follows:

- 1 to 999 for NETCONF over SOAP over HTTP sessions and NETCONF over SOAP over HTTPS sessions.
- 0 to 999 for NETCONF over SSH sessions, NETCONF over Telnet sessions, and NETCONF over console sessions. To disable the timeout feature, set this argument to 0.

Usage guidelines

If no NETCONF packets are exchanged on a NETCONF session within the NETCONF session idle timeout time, the device tears down the session.

Examples

Set the NETCONF session idle timeout time to 20 minutes for NETCONF over SOAP over HTTP sessions and NETCONF over SOAP over HTTPS sessions.

```
<Sysname> system-view
[Sysname] netconf soap idle-timeout 20
```

netconf log

Use **netconf log** to enable NETCONF logging.

Use **undo netconf log** to remove the configuration for the specified NETCONF operation sources and NETCONF operations.

Syntax

netconf log source { **all** | { **agent** | **soap** | **web** } * } { **protocol-operation** { **all** | { **action** | **config** | **get** | **session** | **set** | **syntax** | **others** } * } | **row-operation** | **verbose** }

undo netconf log source { **all** | { **agent** | **soap** | **web** } * } { **protocol-operation** { **all** | { **action** | **config** | **get** | **session** | **set** | **syntax** | **others** } * } | **row-operation** | **verbose** }

Default

NETCONF logging is disabled.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

source: Specifies a NETCONF operation source that represents clients that use a protocol.

- **all**: Specifies NETCONF clients that use all protocols.
- **agent**: Specifies clients that use Telnet, SSH, NETCONF over console, or NETCONF over SSH.
- **soap**: Specifies clients that use SOAP over HTTP, or SOAP over HTTPS.
- **web**: Specifies clients that use Web.

protocol-operation: Logs requests and replies for specific types of NETCONF operations.

- **all**: Specifies all types of NETCONF operations.
- **action**: Specifies the <action> operation.
- **config**: Specifies the configuration-related NETCONF operations, including the <CLI>, <save>, <load>, <rollback>, <lock>, <unlock>, and <save-point> operations.
- **get**: Specifies the data retrieval-related NETCONF operations, including the <get>, <get-config>, <get-bulk>, <get-bulk-config>, and <get-sessions> operations.
- **session**: Specifies session-related NETCONF operations, including the <kill-session> and <close-session> operations, and capability exchanges by hello messages.
- **set**: Specifies all <edit-config> operations.
- **syntax**: Specifies the requests that include XML and schema errors.
- **others**: Specifies NETCONF operations except for those specified by keywords **action**, **config**, **get**, **set**, **session**, and **syntax**.

row-operation: Logs row operations for <action> and <edit-config> operations.

verbose: Logs detailed information about requests and replies for types of NETCONF operations, including packet contents of format-correct requests and error information about failed <edit-config> operations.

Usage guidelines

If you specify the **protocol-operation** keyword, the device logs each of the matching operation and the operation result.

For example, if you perform a NETCONF operation to create VLANs 3 through 5, the device outputs the following log messages:

```
%Mar 21 17:11:34:479 2017 Sysname XMLSOAP/6/XML_REQUEST: test from 192.168.100.198,
session id 2,message-id 100, receive edit-config request.
%Mar 21 17:11:34:483 2017 Sysname XMLSOAP/6/EDIT-CONFIG: test from 192.168.100.198,
session id 2,message-id 100, execute success.
```

If you specify the **row-operation** keyword, the device logs each row operation and the operation result for an <action> or <edit-config> operation. For example, if you perform a NETCONF operation to create VLANs 3 through 5, the device outputs the following log messages:

```
%Mar 31 17:50:02:608 2017 Sysname XMLSOAP/6/EDIT-CONFIG: User (test, 192.168.100.20,
session ID 1), message ID=100, operation=create VLAN/VLANs (ID=3), result=Succeeded. No
attributes.
%Mar 31 17:50:02:609 2017 Sysname XMLSOAP/6/EDIT-CONFIG: User (test, 192.168.100.20,
session ID 1), message ID=100, operation=create VLAN/VLANs (ID=4), result=Succeeded. No
attributes.
%Mar 31 17:50:02:611 2017 Sysname XMLSOAP/6/EDIT-CONFIG: User (test, 192.168.100.20,
session ID 1), message ID=100, operation=create VLAN/VLANs (ID=5), result=Succeeded. No
attributes.
```

For NETCONF to correctly send the generated logs to the information center, you must also configure the information center. For information about information center configuration, see *Network Management and Monitoring Configuration Guide*.

Examples

Configure the device to log NETCONF edit-config information sourced from agent clients.

```
<Sysname> system-view
[Sysname] netconf log source agent protocol-operation set
```

netconf soap acl

Use **netconf soap acl** to apply an ACL to control NETCONF over SOAP access.

Use **undo netconf soap acl** to restore the default.

Syntax

netconf soap { **http** | **https** } [**ipv6**] **acl** { *acl-number* | **name** *acl-name* }

undo netconf soap { **http** | **https** } [**ipv6**] **acl**

Default

No ACL is applied to control NETCONF over SOAP access.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

http: Applies an ACL to control NETCONF over SOAP over HTTP access.

https: Applies an ACL to control NETCONF over SOAP over HTTPS access.

ipv6: Specifies an IPv6 ACL. To specify an IPv4 ACL, do not specify this keyword. This keyword is supported only if you have specified the **http** keyword.

acl-number: Specifies an ACL by its number in the range of 2000 to 2999.

name *acl-name*: Specifies an ACL by its name. The *acl-name* argument is a case-insensitive string of 1 to 63 characters. It must start with an English letter. To avoid confusion, it cannot be **all**.

Usage guidelines

To control NETCONF over SOAP access, specify an ACL that exists and has rules.

- If the specified ACL exists and has rules, only clients permitted by the ACL can establish NETCONF over SOAP sessions.
- If no ACL is applied or the applied ACL does not exist or does not have rules, all NETCONF clients can establish NETCONF over SOAP sessions.

If you execute the **netconf soap http acl** command multiple times, the most recent configuration takes effect. The same is true for the **netconf soap https acl** command.

Examples

Use IPv4 ACL 2001 to allow only NETCONF clients from subnet 10.10.0.0/16 to establish NETCONF over SOAP over HTTP sessions.

```
<Sysname> system-view
[Sysname] acl basic 2001
[Sysname-acl-ipv4-basic-2001] rule permit source 10.10.0.0 0.0.255.255
[Sysname-acl-ipv4-basic-2001] quit
[Sysname] netconf soap http acl 2001
```

Use IPv6 ACL 2002 to allow only NETCONF clients from subnet 6::2/64 to establish NETCONF over SOAP over HTTP sessions.

```
<Sysname> system-view
[Sysname] acl ipv6 basic 2002
[Sysname-acl-ipv6-basic-2002] rule deny source 6::2 64
[Sysname-acl-ipv6-basic-2002] quit
[Sysname] netconf soap http ipv6 acl 2002
```

netconf soap domain

Use **netconf soap domain** to specify a mandatory authentication domain for NETCONF users.

Use **undo netconf soap domain** to restore the default.

Syntax

netconf soap domain *domain-name*

undo netconf soap domain

Default

No mandatory authentication domain is specified for NETCONF users.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

domain-name: Specifies an ISP domain by its name, a case-insensitive string of 1 to 255 characters. For information about ISP domains, see AAA in *Security Configuration Guide*.

Usage guidelines

You can use either of the following methods to specify an authentication domain:

- Execute the **netconf soap domain** command to specify a mandatory authentication domain. After this command is executed, all NETCONF users are placed in the domain for authentication.
- Add an authentication domain to the <UserName> parameter of a SOAP request. The authentication domain takes effect only on the current request.

The authentication domain specified by using this command takes precedence over the authentication domain specified by the <UserName> parameter of a SOAP request.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Specify mandatory authentication domain **my-domain** for NETCONF users.

```
<Sysname> system-view
[Sysname] netconf soap domain my-domain
```

netconf soap enable

Use **netconf soap enable** to enable NETCONF over SOAP.

Use **undo netconf soap enable** to disable NETCONF over SOAP.

Syntax

netconf soap { **http** | **https** } **enable**

undo netconf soap { **http** | **https** } **enable**

Default

NETCONF over SOAP is disabled.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

http: Specifies NETCONF over SOAP over HTTP.

https: Specifies NETCONF over SOAP over HTTPS.

Usage guidelines

This command enables the device to resolve NETCONF messages that are encapsulated with SOAP in HTTP or HTTPS packets.

Examples

Enable NETCONF over SOAP over HTTP.

```
<Sysname> system-view
```

```
[Sysname] netconf soap http enable
```

netconf soap http port

Use **netconf soap http port** to specify a port to listen for NETCONF over SOAP over HTTP session requests.

Use **undo netconf soap http port** to restore the default.

Syntax

netconf soap http port *port-number*

undo netconf soap http port

Default

The device uses port 80 to listen for NETCONF over SOAP over HTTP session requests.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

*port-numbe*r: Specifies a port by its number in the range of 1 to 65535.

Usage guidelines

Executing this command causes existing NETCONF over SOAP sessions to become ineffective. You must re-establish the sessions again.

Examples

Use port 1000 to listen for NETCONF over SOAP over HTTP session requests.

```
<Sysname> system-view
[Sysname] netconf soap http port 1000
```

netconf soap https ssl-server-policy

Use **netconf soap https ssl-server-policy** to apply an SSL server policy to the NETCONF over SOAP over HTTPS service.

Use **undo netconf soap https ssl-server-policy** to restore the default.

Syntax

netconf soap https ssl-server-policy *policy-name*

undo netconf soap https ssl-server-policy

Default

No SSL server policy is applied to the NETCONF over SOAP over HTTPS service.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

policy-name: Specifies an SSL server policy name, a string of 1 to 31 characters.

Usage guidelines

The NETCONF over SOAP over HTTPS service will use the SSL server policy to enhance service security. For more information about SSL server policies, see SSL configuration in *Security Configuration Guide*.

You can configure this command only when NETCONF over SOAP over HTTPS is disabled.

This command takes effect after you enable NETCONF over SOAP over HTTPS.

If you execute this command multiple times, the most recent configuration takes effect.

After NETCONF over SOAP over HTTPS is enabled, changes to the applied SSL server policy do not affect established NETCONF over SOAP over HTTPS sessions. The changes affect only NETCONF over SOAP over HTTPS sessions established after the changes are made.

Examples

Apply SSL server policy **myssl** to the NETCONF over SOAP over HTTPS service.

```
<Sysname> system-view
[Sysname] netconf soap https ssl-server-policy myssl
```

Related commands

netconf soap enable

ssl server-policy (*Security Command Reference*)

netconf ssh acl

Use **netconf ssh acl** to apply an IPv4 ACL to control NETCONF over SSH access.

Use **undo netconf ssh acl** to restore the default.

Syntax

netconf ssh acl { *ipv4-acl-number* | **name** *ipv4-acl-name* }

undo netconf ssh acl

Default

No IPv4 ACL is applied to control NETCONF over SSH access.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

ipv4-acl-number: Specifies an IPv4 ACL by its number in the range of 2000 to 2999.

name *ipv4-acl-name*: Specifies an IPv4 ACL by its name. The *ipv4-acl-name* argument is a case-insensitive string of 1 to 63 characters. It must start with an English letter. To avoid confusion, it cannot be **all**.

Usage guidelines

To control NETCONF over SSH access, specify an ACL that exists and has rules.

- If the specified ACL exists and has rules, only clients permitted by the ACL can establish NETCONF over SSH sessions.
- If no ACL is applied, all NETCONF clients can establish NETCONF over SSH sessions.
- If the applied ACL does not exist or does not have rules, no NETCONF clients can establish NETCONF over SSH sessions.

For more information about ACL configuration, see *ACL and QoS Configuration Guide*.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Use IPv4 ACL 2001 to allow only NETCONF clients from subnet 10.10.0.0/16 to establish NETCONF over SSH sessions.

```
<Sysname> system-view
[Sysname] acl basic 2001
[Sysname-acl-ipv4-basic-2001] rule permit source 10.10.0.0 0.0.255.255
[Sysname-acl-ipv4-basic-2001] quit
[Sysname] netconf ssh acl 2001
```

Related commands

netconf soap acl

netconf ssh server enable

Use **netconf ssh server enable** to enable NETCONF over SSH.

Use **undo netconf ssh server enable** to disable NETCONF over SSH.

Syntax

netconf ssh server enable

undo netconf ssh server enable

Default

NETCONF over SSH is disabled.

Views

System view

Predefined user roles

network-admin

context-admin

Usage guidelines

This feature allows you to use an SSH client to invoke NETCONF as an SSH subsystem. Then, you can directly use XML messages to perform NETCONF operations without using the **xml** command.

Before you execute this command, configure the authentication mode for users as **scheme** on the device. Then, the NETCONF-over-SSH-enabled user terminals can access the device through NETCONF over SSH.

Only capability set **urn:ietf:params:netconf:base:1.0** is available. It is supported by both the device and user terminals.

Examples

Enable NETCONF over SSH.

```
<Sysname> system-view
[Sysname] netconf ssh server enable
```

netconf ssh server port

Use **netconf ssh server port** to specify a port to listen for NETCONF over SSH session requests.

Use **undo netconf ssh server port** to restore the default.

Syntax

netconf ssh server port *port-number*

undo netconf ssh server port

Default

The device uses port 830 to listen for NETCONF over SSH session requests.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

*port-numbe*r: Specifies a port by its number in the range of 1 to 65535.

Usage guidelines

Make sure the specified port is not being used by other services.

Examples

Use port 800 to listen for NETCONF over SSH session requests.

```
<Sysname> system-view
[Sysname] netconf ssh server port 800
```

reset netconf service statistics

Use **reset netconf service statistics** to clear current global NETCONF service statistics.

Syntax

reset netconf service statistics

```

Related commands

`display netconf session`

xml

Use **`xml`** to enter XML view.

Syntax

`xml`

Views

User view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Usage guidelines

In XML view, use NETCONF messages to configure the device or obtain data from the device. The NETCONF operations you can perform depend on the user roles you have, as shown in Table 3.

Table 3 NETCONF operations available for the predefined user roles

User role	NETCONF operations
network-admin context-admin	All NETCONF operations
network-operator	• Get

User role	NETCONF operations
Context-operator	• Get-bulk • Get-bulk-config • Get-config • Get-sessions • Close-session

To ensure the format correctness of NETCONF messages in XML view, do not enter NETCONF messages manually. Copy and paste the messages.

While the device is performing a NETCONF operation, do not perform any other operations, such as pasting a NETCONF message or pressing **Enter**.

For the device to identify NETCONF messages, you must add end mark **]]>]]>** at the end of each NETCONF message.

After you enter XML view, the device automatically advertises its NETCONF capabilities to the client. In response, you must configure the client to notify the device of its supported NETCONF capabilities. After the capability exchange, you can use the client to configure the device.

NETCONF messages must comply with the XML format requirements and semantic and syntactic requirements in the NETCONF XML API reference for the device. As a best practice, use third-party software to generate NETCONF messages to ensure successful configuration.

To quit XML view, use a NETCONF message instead of the **quit** command.

If you have configured a shortcut key (**Ctrl + C**, by default) by using the **escape-key** command in user line/user line class view, the NETCONF message should not contain the shortcut key string. If the NETCONF message contains the shortcut key string, relevant configurations in XML view might be affected. For example, in user line view, you configured "a" as the shortcut key by using the **escape-key a** command. When a NETCONF message includes the character "a," only the contents after the last "a" in the message can be processed.

Examples

Enter XML view.

```
<Sysname> xml
<?xml version="1.0" encoding="UTF-8"?><hello
xmlns="urn:ietf:params:xml:ns:netconf:base:1.0"><capabilities><capability>urn:ietf:pa
rams:netconf:base:1.1</capability><capability>urn:ietf:params:netconf:writable-runnin
g</capability><capability>urn:ietf:params:netconf:capability:notification:1.0</capabi
lity><capability>urn:ietf:params:netconf:capability:validate:1.1</capability><capabil
ity>urn:ietf:params:netconf:capability:interleave:1.0</capability><capability>urn:nsf
ocus:params:netconf:capability:nsfocus-netconf-ext:1.0</capability></capabilities><se
ssion-id>1</session-id></hello>]]>]]>
```

Notify the device of the NETCONF capabilities supported on the client.

```
<hello xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
  <capabilities>
    <capability>
           urn:ietf:params:netconf:base:1.0
    </capability>
  </capabilities>
</hello>]]>]]>
```

Quit XML view.

```
<rpc message-id="101" xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
  <close-session/>
</rpc>]]>]]>
```

<Sysname>

Contents

SNMP commands

The SNMP agent sends notifications (traps and informs) to inform the NMS of significant events, such as link state changes and user logins or logouts. Unless otherwise stated, the **trap** keyword in the command line includes both traps and informs.

display snmp-agent community

Use **display snmp-agent community** to display information about SNMPv1 or SNMPv2c communities.

Syntax

display snmp-agent community [**read** | **write**]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

read: Specifies SNMP read-only communities.

write: Specifies SNMP read and write communities.

Usage guidelines

If you do not specify the **read** or **write** keyword, this command displays information about all SNMPv1 and SNMPv2c communities.

SNMPv1 and SNMPv2c communities can be created in the following ways:

- Created by using the **snmp-agent community** command.
- Automatically created by the system for SNMPv1 and SNMPv2c users that have been assigned to an existing SNMP group.

This command displays information only about communities created and saved in plaintext form.

Examples

Display information about all SNMPv1 and SNMPv2c communities.

```
<Sysname> display snmp-agent community
   Community name: aa
       Group name: aa
       ACL:2001
       Storage-type: nonVolatile
       Context name: con1

   Community name: bb
       Role name: bb
       Storage-type: nonVolatile
```

```
   Community name: userv1
       Group name: testv1
       Storage-type: nonvolatile
Community name: cc
       Group name: cc
       ACL name: testacl
       Storage-type: nonVolatile
```

Table 1 Command output

Field	Description
Community name	Community name created by using the **snmp-agent community** command or username created by using the **snmp-agent usm-user { v1 | v2c }** command.
Group name	SNMP group name. • If the community is created by using the **snmp-agent community** command in VACM mode, the group name is the same as the community name. • If the community is created by using the **snmp-agent usm-user { v1 | v2c }** command, the name of the group that has the user is displayed.
Role name	User role name for the community. If the community is created by using the **snmp-agent community** command in RBAC mode, a user role can be bound to the community name.
ACL	Number of the IPv4 ACL. This field appears only when an IPv4 ACL number is specified for the SNMPv1 or SNMPv2c community.
ACL name	Name of the IPv4 ACL. This field appears only when an IPv4 ACL name is specified for the SNMPv1 or SNMPv2c community.
IPV6 ACL	Number of the IPv6 ACL. This field appears only when an IPv6 ACL number is specified for the SNMPv1 or SNMPv2c community.
IPV6 ACL name	Name of the IPv6 ACL. This field appears only when an IPv6 ACL name is specified for the SNMPv1 or SNMPv2c community.
Storage-type	Storage type: • **volatile**—Settings are lost when the system reboots. • **nonVolatile**—Settings remain after the system reboots. • **permanent**—Settings remain after the system reboots and can be modified but not deleted. • **readOnly**—Settings remain after the system reboots and cannot be modified or deleted. • **other**—Any other storage type.
Context name	SNMP context: • If a mapping between the SNMP community and an SNMP context is configured, the SNMP context is displayed. • If no mapping between the SNMP community and an SNMP context exists, this field is empty.

Related commands

snmp-agent community

snmp-agent usm-user { **v1** | **v2c** }

display snmp-agent context

Use **display snmp-agent context** to display SNMP contexts.

Syntax

display snmp-agent context [*context-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

context-name: Specifies an SNMP context by its name, a case-sensitive string of 1 to 32 characters. If you do not specify this argument, the command displays all SNMP contexts.

Examples

Display all SNMP contexts.

```
<Sysname> display snmp-agent context
   testcontext
```

Related commands

snmp-agent context

display snmp-agent group

Use **display snmp-agent group** to display information about SNMP groups.

Syntax

display snmp-agent group [*group-name*]

Views

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

group-name: Specifies an SNMPv1, SNMPv2c, or SNMPv3 group name. It is a case-sensitive string of 1 to 32 characters. If you do not specify a group, this command displays information about all SNMP groups.

Examples

Display information about all SNMP groups.

```
<Sysname> display snmp-agent group
   Group name: groupv3
       Security model: v3 noAuthnoPriv
       Readview: ViewDefault
       Writeview: <no specified>
       Notifyview: <no specified>
       Storage-type: nonvolatile
        ACL name: testacl
```

Table 2 Command output

Field	Description
Group name	SNMP group name.
Security model	Security model of the SNMP group: • **authPriv**—Authentication with privacy. • **authNoPriv**—Authentication without privacy. • **noAuthNoPriv**—No authentication, no privacy. Security model of an SNMPv1 or SNMPv2c group can only be noAuthNoPriv.
Readview	Read-only MIB view accessible to the SNMP group.
Writeview	Write MIB view accessible to the SNMP group.
Notifyview	Notify MIB view for the SNMP group. The SNMP users in the group can send notifications only for the nodes in the notify MIB view.
Storage-type	Storage type, including **volatile**, **nonvolatile**, **permanent**, **readOnly**, and **other**. For more information, see Table 1.
ACL	Number of the IPv4 ACL. This field appears only when an IPv4 ACL number is specified for the SNMP group.
ACL name	Name of the IPv4 ACL. This field appears only when an ACL name is specified for the SNMP group.
IPv6 ACL	Number of the IPv6 ACL. This field appears only when an IPv6 ACL number is specified for the SNMP group.
IPV6 ACL name	Name of the IPv6 ACL. This field appears only when an IPv6 ACL name is specified for the SNMP group.

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Usage guidelines

Every SNMP entity has one SNMP engine to provide services for sending and receiving messages, authenticating and encrypting messages, and controlling access to managed objects.

An SNMP engine ID uniquely identifies an SNMP entity in an SNMP domain.

Examples

Display the local SNMP engine ID.

```
<Sysname> display snmp-agent local-engineid
   SNMP local engine ID: 800063A2800084E52BED7900000001
```

Related commands

snmp-agent local-engineid

display snmp-agent mib-node

Use **display snmp-agent mib-node** to display SNMP MIB node information.

Syntax

display snmp-agent mib-node [**details** | **index-node** | **trap-node** | **verbose**]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

details: Specifies detailed MIB node information, including node name, last octet of an OID string, and name of the next leaf node.

index-node: Specifies SNMP MIB tables, and node names and OIDs of MIB index nodes.

trap-node: Specifies node names and OIDs of MIB notification nodes, and node names and OIDs of notification objects.

verbose: Specifies detailed information about SNMP MIB nodes, including node names, OIDs, node types, permissions to MIB nodes, data types, MORs, and parent, child, and sibling nodes.

Usage guidelines

If you do not specify any keywords, this command displays information about all SNMP MIB nodes, including node name, OID, and permissions to MIB nodes.

The SNMP software package includes different MIB files. Support for MIBs varies by SNMP software versions.

Examples

Display SNMP MIB node information.

```
<Sysname> display snmp-agent mib-node

iso<1>(NA)
  |-std<1.0>(NA)
   |-iso8802<1.0.8802>(NA)
    |-ieee802dot1<1.0.8802.1>(NA)
     |-ieee802dot1mibs<1.0.8802.1.1>(NA)
      ...
```

Table 3 Command output

Field	Description
-std	MIB node name
<1.0>	MIB node OID
(NA)	Access right to the MIB node: • **NA**—Not accessible • **NF**—Notifications • **RO**—Read-only access • **RW**—Read and write access • **RC**—Read-write-create access • **WO**—Write-only access
*	Leaf node or MIB table node

Display detailed MIB node information.

```
<Sysname> display snmp-agent mib-node details

 iso(1)(dot1xPaeSystemAuthControl)
  |-std(0)(dot1xPaeSystemAuthControl)
   |-iso8802(8802)(dot1xPaeSystemAuthControl)
    |-ieee802dot1(1)(dot1xPaeSystemAuthControl)
     |-ieee802dot1mibs(1)(dot1xPaeSystemAuthControl)
      ...
```

Table 4 Command output

Field	Description
-std	MIB node name
(0)	Last bit of the MIB OID string
(lldpMessageTxInterval)	Name of the leaf node
*	Leaf node or MIB table node

Display MIB table names, and node names and OIDs of MIB index nodes.

```
<Sysname> display snmp-agent mib-node index-node

Table          |dot1xPaePortTable
Index          ||dot1xPaePortNumber

OID            ||||1.0.8802.1.1.2.1.2.3
Name           |||lldpStatsRemTablesDrops
OID            ||||1.0.8802.1.1.2.1.2.4
Name           |||lldpStatsRemTablesAgeouts
OID            ||||1.0.8802.1.1.2.1.2.5
...
```

Table 6 Command output

Field	Description
Name	MIB notification node name
OID	MIB notification node OID
Trap Object	Name and OID of a notification object

Display detailed information about SNMP MIB nodes, including node names, OIDs, node types, permissions to MIB nodes, data types, MORs, and parent, child, and sibling nodes.

```
<Sysname> display snmp-agent mib-node verbose

Name           |iso
OID            ||1
Properties     ||NodeType:   Other
```

```
              ||AccessType: NA
              ||DataType:   NA
              ||MOR:        0x00000000
Parent        ||
First child   ||std
Next leaf     ||dot1xPaeSystemAuthControl
Next sibling  ||
...
```

Table 7 Command output

Field	Description
Name	MIB node name.
OID	MIB node OID.
Properties	MIB node properties.
NodeType	MIB node types: • **Table**—Table node. • **Row**—Row node in a MIB table. • **Column**—Column node in a MIB table. • **Leaf**—Leaf node. • **Group**—Group node (parent node of a leaf node). • **Trapnode**—Notification node. • **Other**—Other node types.
AccessType	Access right to the MIB node: • **NA**—Not accessible. • **NF**—Supports notifications. • **RO**—Supports read-only access. • **RW**—Supports read and write access. • **RC**—Supports read-write-create access. • **WO**—Supports write-only access.
DataType	Data type of the MIB node: • **Integer**—An integer. • **Integer32**—A 32-bit integer. • **Unsigned32**—A 32-bit integer with no mathematical sign. • **Gauge**—A non-negative integer that might increase or decrease. • **Gauge32**—A 32-bit non-negative integer that might increase or decrease. • **Counter**—A non-negative integer that might increase but not decrease. • **Counter32**—A 32-bit non-negative integer that might increase but not decrease. • **Counter64**—A 64-bit non-negative integer that might increase but not decrease. • **Timeticks**—A non-negative integer for time keeping. • **Octstring**—An octal string. • **OID**—Object identifier. • **IPaddress**—A 32-bit IP address. • **Networkaddress**—A network IP address. • **Opaque**—Any data. • **Userdefined**—User-defined data. • **BITS**—Bit enumeration. • **NA**—Other data type.
MOR	MOR for the MIB node.

Field	Description
Parent	Name of the parent node.
First child	Name of the first leaf node.
Next leaf	Name of the next leaf node.
Next sibling	Name of the next sibling node.
Allow	Operation types allowed: • **get/set/getnext**—All operations. • **get**—Get operation. • **set**—Set operation. • **getnext**—GetNext operation.
Value range	Value range of the MIB node.
Index	Table index. This field appears only for a table node.

display snmp-agent mib-view

Use **display snmp-agent mib-view** to display MIB views.

Syntax

display snmp-agent mib-view [**exclude** | **include** | **viewname** *view-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

exclude: Displays the subtrees excluded from any MIB view.

include: Displays the subtrees included in any MIB view.

viewname *view-name*: Displays information about the specified MIB view. The *view-name* argument is a case-sensitive string of 1 to 32 characters.

Usage guidelines

If you do not specify any parameters, this command displays all MIB views.

Examples

Display all MIB views.

```
<Sysname> display snmp-agent mib-view
   View name: ViewDefault
       MIB Subtree: iso
       Subtree mask:
```

```
    Storage-type: nonVolatile
    View Type: included
    View status: active

View name: ViewDefault
    MIB Subtree: snmpUsmMIB
    Subtree mask:
    Storage-type: nonVolatile
    View Type: excluded
    View status: active

View name: ViewDefault
    MIB Subtree: snmpVacmMIB
    Subtree mask:
    Storage-type: nonVolatile
    View Type: excluded
    View status: active

View name: ViewDefault
    MIB Subtree: snmpModules.18
    Subtree mask:
    Storage-type: nonVolatile
    View Type: excluded
    View status: active
```

ViewDefault is the default MIB view. The output shows that except for the MIB objects in the **snmpUsmMIB**, **snmpVacmMIB**, and **snmpModules.18** subtrees, all the MIB objects in the **iso** subtree are accessible.

Table 8 Command output

Field	Description
View name	MIB view name.
MIB Subtree	MIB subtree covered by the MIB view.
Subtree mask	MIB subtree mask.
Storage-type	Type of the medium (see Table 1) where the subtree view is stored.
View Type	Access privilege for the MIB subtree in the MIB view: • **Included**—All objects in the MIB subtree are accessible in the MIB view. • **Excluded**—None of the objects in the MIB subtree is accessible in the MIB view.
View status	Status of the MIB view: • **active**—MIB view is effective. • **inactive**—MIB view is ineffective. The objects in the MIB view are not accessible, but they can send notifications.

Related commands

snmp-agent mib-view

display snmp-agent remote

Use **display snmp-agent remote** to display engine IDs of the remote SNMP entities.

Syntax

display snmp-agent remote [{ *ipv4-address* | **ipv6** *ipv6-address* } [**vpn-instance** *vpn-instance-name*]]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

ipv4-address: Specifies a remote SNMP entity by its IPv4 address.

ipv6 *ipv6-address*: Specifies a remote SNMP entity by its IPv6 address.

vpn-instance *vpn-instance-name*: Specifies the MPLS L3VPN instance to which the remote SNMP entity belongs. The *vpn-instance-name* argument represents the VPN instance name, a case-sensitive string of 1 to 31 characters. If the remote SNMP entity belongs to the public network, do not specify this option.

Usage guidelines

Every SNMP entity has one SNMP engine to provide services for sending and receiving messages, authenticating and encrypting messages, and controlling access to managed objects.

An SNMP engine ID uniquely identifies an SNMP entity in an SNMP domain.

If you do not specify a remote SNMP entity, this command displays the engine IDs of all remote SNMP entities.

Examples

Display engine IDs of all remote SNMP entities.

```
<Sysname> display snmp-agent remote
   Remote engineID: 800063A28000A0FC00580400000001
       IPv4 address: 1.1.1.1
       VPN instance: vpn1
```

Table 9 Command output

Field	Description
Remote engineID	Remote SNMP engine ID you have configured using the **snmp-agent remote** command.
IPv4 address	IPv4 address of the remote SNMP entity.
IPv6 address	IPv6 address of the remote SNMP entity. This field is displayed if the remote SNMP entity is configured with an IPv6 address.
VPN instance	This field is available only if a VPN instance has been specified for the remote SNMP entity in the **snmp-agent remote** command.

Related commands

Examples

Display SNMP message statistics.

```
<Sysname> display snmp-agent statistics
  1684 messages delivered to the SNMP entity.
  5 messages were for an unsupported version.
  0 messages used an unknown SNMP community name.
  0 messages represented an illegal operation for the community supplied.
  0 ASN.1 or BER errors in the process of decoding.
  1679 messages passed from the SNMP entity.
  0 SNMP PDUs had badValue error-status.
  0 SNMP PDUs had genErr error-status.
  0 SNMP PDUs had noSuchName error-status.
  0 SNMP PDUs had tooBig error-status (Maximum packet size 1500).
  16544 MIB objects retrieved successfully.
  2 MIB objects altered successfully.
  7 GetRequest-PDU accepted and processed.
  7 GetNextRequest-PDU accepted and processed.
  1653 GetBulkRequest-PDU accepted and processed.
  1669 GetResponse-PDU accepted and processed.
  2 SetRequest-PDU accepted and processed.
  0 Trap PDUs accepted and processed.
  0 alternate Response Class PDUs dropped silently.
  0 forwarded Confirmed Class PDUs dropped silently.
```

Table 10 Command output

Field	Description
messages delivered to the SNMP entity	Number of messages that the SNMP agent has received.
messages were for an unsupported version	Number of messages that are not supported by the SNMP agent version.

Field	Description
messages used an unknown SNMP community name	Number of messages that used an unknown SNMP community name.
messages represented an illegal operation for the community supplied	Number of messages carrying an operation that the community has no right to perform.
ASN.1 or BER errors in the process of decoding	Number of messages that had ASN.1 or BER errors during decoding.
messages passed from the SNMP entity	Number of messages sent by the SNMP agent.
SNMP PDUs had badValue error-status	Number of PDUs with a BadValue error.
SNMP PDUs had genErr error-status	Number of PDUs with a genErr error.
SNMP PDUs had noSuchName error-status	Number of PDUs with a NoSuchName error.
SNMP PDUs had tooBig error-status	Number of PDUs with a TooBig error (the maximum packet size is 1500 bytes).
MIB objects retrieved successfully	Number of MIB objects that have been successfully retrieved.
MIB objects altered successfully	Number of MIB objects that have been successfully modified.
GetRequest-PDU accepted and processed	Number of GetRequest requests that have been received and processed.
GetNextRequest-PDU accepted and processed	Number of getNext requests that have been received and processed.
GetBulkRequest-PDU accepted and processed	Number of getBulk requests that have been received and processed.
GetResponse-PDU accepted and processed	Number of get responses that have been received and processed.
SetRequest-PDU accepted and processed	Number of set requests that have been received and processed.
Trap PDUs accepted and processed	Number of notifications that have been received and processed.
alternate Response Class PDUs dropped silently	Number of dropped response packets.
forwarded Confirmed Class PDUs dropped silently	Number of forwarded packets that have been dropped.

display snmp-agent sys-info

Use **display snmp-agent sys-info** to display SNMP agent system information.

Syntax

display snmp-agent sys-info [**contact** | **location** | **version**] *

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

contact: Displays the system contact.

location: Displays the physical location of the device.

version: Displays the SNMP agent version.

Usage guidelines

If you do not specify any keywords, this command displays all SNMP agent system information.

Examples

Display all SNMP agent system information.

```
<Sysname> display snmp-agent sys-info
   The contact information of the agent:
       NSFOCUS

   The location information of the agent:
       Beijing, China

   The SNMP version of the agent:
       SNMPv3
```

Related commands

snmp-agent sys-info

display snmp-agent trap queue

Use **display snmp-agent trap queue** to display basic information about the trap queue.

Syntax

display snmp-agent trap queue

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Examples

Display the trap queue configuration and usage status.

```
<Sysname> display snmp-agent trap queue
   Queue size: 100
   Message number: 6
```

Related commands

snmp-agent trap life

snmp-agent trap queue-size

display snmp-agent trapbuffer drop

Use **display snmp-agent trapbuffer drop** to display SNMP notifications drop records.

Syntax

display snmp-agent trapbuffer drop

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Usage guidelines

When an SNMP notification is dropped from the SNMP trap queue, information about the notification is recorded in the SNMP trap buffer.

Examples

Display SNMP notifications drop records.

```
<Sysname> display snmp-agent trapbuffer drop
Current messages:1
Wed Dec 14 10:49:52:656 2019 Notification
nsfocusCfgManEventlog(1.3.6.1.4.1.25506.2.4.2.1) dropped.
```

Current messages in the command output indicates the total number of SNMP notifications drop records in the SNMP trap buffer.

Related commands

reset snmp-agent trapbuffer

display snmp-agent trapbuffer send

Use **display snmp-agent trapbuffer send** to display SNMP notifications sending records.

Syntax

display snmp-agent trapbuffer send

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Usage guidelines

After an SNMP notification is sent, information about the notification is recorded in the SNMP trap buffer. The information includes the content, destination IP address, and sending result of the notification.

Examples

Display SNMP notifications sending records.

```
<Sysname> display snmp-agent trapbuffer send
Current messages:2
Fri Jul 31 10:31:17 2020 Notification nsfocusLogOut(1.3.6.1.4.1.25506.2.2.1.1.3.0.2) failed to be sent to 19.16.11.89.
Fri Jul 31 10:31:17 2020 Notification nsfocusLogOut(1.3.6.1.4.1.25506.2.2.1.1.3.0.2) sent to 192.168.11.89 successfully.
```

Current messages in the command output indicates the total number of SNMP notifications sending records in the SNMP trap buffer.

Related commands

reset snmp-agent trapbuffer

display snmp-agent trap-list

Use **display snmp-agent trap-list** to display SNMP notifications enabling status for modules.

Syntax

display snmp-agent trap-list

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Usage guidelines

If a module has multiple sub-modules and SNMP notifications are enabled for one of its sub-modules, the command output shows that the module is SNMP notifications-enabled.

To determine whether a module supports SNMP notifications, execute the **snmp-agent trap enable ?** command.

The **display snmp-agent trap-list** command output varies by the **snmp-agent trap enable** command configuration and the module configuration.

Examples

Display SNMP notifications enabling status for modules.

```
<Sysname> display snmp-agent trap-list
   arp notification is disabled.
…
```

Related commands

snmp-agent trap enable

display snmp-agent usm-user

Use **display snmp-agent usm-user** to display SNMPv3 user information.

Syntax

display snmp-agent usm-user [**engineid** *engineid* | **group** *group-name* | **username** *user-name*] *

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

engineid *engineid*: Specifies an SNMP engine ID. The engine ID is case insensitive. When an SNMPv3 user is created, the system records the local SNMP entity engine ID. The user becomes invalid when the engine ID changes, and it becomes valid again when the recorded engine ID is restored.

group *group-name*: Specifies an SNMP group by its name. The group name is case sensitive.

username *user-name*: Specifies an SNMPv3 user by its name. The username is case sensitive.

Usage guidelines

This command displays only SNMPv3 users that you have created by using the **snmp-agent usm-user v3** command. To display SNMPv1 or SNMPv2c users created by using the **snmp-agent usm-user** { **v1** | **v2c** } command, use the **display snmp-agent community** command.

Examples

Display information about all SNMPv3 users.

```
<Sysname> display snmp-agent usm-user
   Username: userv3
   Group name: mygroupv3
       Engine ID: 800063A203000FE240A1A6
       Storage-type: nonVolatile
       UserStatus: active
       ACL: 2000

   Username: userv3
   Group name: mygroupv3
       Engine ID: 8000259503000BB3100A508
       Storage-type: nonVolatile
       UserStatus: active
       ACL name: testacl
```

```
Username: userv3code
Role name: groupv3code
           network-operator
    Engine ID: 800063A203000FE240A1A6
    Storage-type: nonVolatile
    UserStatus: active

Username: userv3code
Role name: snmprole
           network-operator
    Engine ID: 800063A280000002BB0001
    Storage-type: nonVolatile
    UserStatus: active
```

Table 11 Command output

Field	Description
Username	SNMP username.
Group name	SNMP group name.
Role name	SNMP user role name.
Engine ID	Engine ID that the SNMP agent used when the SNMP user was created.
Storage-type	Storage type: • **volatile**. • **nonvolatile**. • **permanent**. • **readOnly**. • **other**. For more information about these storage types, see Table 1.
UserStatus	SNMP user status: • **active**—The SNMP user is effective. • **notInService**—The SNMP user is correctly configured but not activated. • **notReady**—The SNMP user configuration is incomplete. • **other**—Any other status.
ACL	Number of the IPv4 ACL. This field appears only when an IPv4 ACL is specified for the SNMPv3 user.
ACL name	Name of the IPv4 ACL. This field appears only when an IPv4 ACL is specified for the SNMPv3 user.
IPv6 ACL	Number of the IPv6 ACL. This field appears only when an IPv6 ACL number is specified for the SNMPv3 user.
IPV6 ACL name	Name of the IPv6 ACL. This field appears only when an IPv6 ACL name is specified for the SNMPv3 user.

snmp-agent usm-user v3

enable snmp trap updown

Use **enable snmp trap updown** to enable link state notifications on an interface.

Use **undo enable snmp trap updown** to disable link state notifications on an interface.

Syntax

enable snmp trap updown

undo enable snmp trap updown

Default

Link state notifications are enabled.

Views

Interface view

Predefined user roles

network-admin

context-admin

Usage guidelines

For an interface to generate linkUp/linkDown notifications when its state changes, you must also enable the linkUp/linkDown notification function globally by using the **snmp-agent trap enable standard** [**linkdown** | **linkup**] * command.

Examples

Enable GigabitEthernet 1/0/1 to send linkUp/linkDown SNMP traps to 10.1.1.1 in the community **public**.

```
<Sysname> system-view
[Sysname] snmp-agent trap enable
[Sysname] snmp-agent target-host trap address udp-domain 10.1.1.1 params securityname
public
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] enable snmp trap updown
```

Related commands

display snmp-agent trapbuffer drop

display snmp-agent trapbuffer send

snmp virtual-access visible

Use **snmp virtual-access visible** to enable virtual access (VA) interface query and configuration by using MIB objects.

Use **undo snmp virtual-access visible** to restore the default.

Syntax

snmp virtual-access visible

undo snmp virtual-access visible

Default

VA interfaces cannot be queried and configured by using MIB objects.

Views

System view

Predefined user roles

network-admin

context-admin

Usage guidelines

By default, VA interfaces cannot be queried and configured by using MIB objects. The device ignores the query and configuration requests from the NMS for VA interfaces. This not only enhances the device efficiency to obtain other interface information and improves user experiences, but also reduces the device workload and avoids waster of CPU resources.

For more information about VA interfaces, see PPP configuration in *Layer 2—WAN Access Configuration Guide*.

To enable VA interface query and configuration by using MIB objects, execute this command.

Examples

Enable VA interface query and configuration by using MIB objects.

```
<Sysname> system-view
[Sysname] snmp virtual-access visible
```

snmp-agent

Use **snmp-agent** to enable the SNMP agent.

Use **undo snmp-agent** to disable the SNMP agent.

Syntax

snmp-agent

undo snmp-agent

Default

The SNMP agent is disabled.

Views

System view

Predefined user roles

network-admin

context-admin

Usage guidelines

The SNMP agent is automatically enabled when you execute any command that begins with **snmp-agent** except for the **snmp-agent calculate-password** command.

The SNMP agent will fail to be enabled when the port that the agent will listen on is used by another service. You can use the **snmp-agent port** command to specify a listening port. To view the UDP port use information, execute the **display udp verbose** command.

If you disable the SNMP agent, the SNMP settings do not take effect. The **display current-configuration** command does not display the SNMP settings and the SNMP settings will not be saved in the configuration file. For the SNMP settings to take effect, enable the SNMP agent.

Examples

Enable the SNMP agent.

```
<Sysname> system-view
[Sysname] snmp-agent
```

Related commands

display udp verbose (see IP performance optimization commands in *Layer 3—IP Services Configuration Guide*)

snmp-agent port

snmp-agent { inform | trap } source

Use **snmp-agent** { **inform** | **trap** } **source** to specify a source IP address for the informs or traps sent by the SNMP agent.

Use **undo snmp-agent** { **inform** | **trap** } **source** to restore the default.

Syntax

snmp-agent { **inform** | **trap** } **source** *interface-type* { *interface-number* | *interface-number*.*subnumber* }

undo snmp-agent { **inform** | **trap** } **source**

Default

The SNMP agent uses the IP address of the outgoing interface as the source IP address of notifications.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

inform: Specifies informs.

trap: Specifies traps.

interface-type { *interface-number* | *interface-number.subnumber* }: Specifies an interface by its type and number. The *interface-number* argument specifies a main interface number. The *subnumber* argument specifies a subinterface number in the range of 1 to 4094.

Usage guidelines

The **snmp-agent source** command enables the SNMP agent to use the primary IP address of an interface or subinterface as the source IP address in all its SNMP informs or traps, regardless of their outgoing interfaces. An NMS can use this IP address to filter all the informs or traps sent by the SNMP agent.

The source IP address configured by using this command will be used for notifications sent to all NMSs. The source IP address configured by using the **snmp-agent target-host** command will be used for notifications sent to the specified NMS. For a notification sent to a particular NMS, the source IP address specified by using the **snmp-agent target-host** command overrides that specified by using this command.

Make sure the specified interface has been created and assigned a valid IP address. The configuration will fail if the interface has not been created and will take effect only after a valid IP address is assigned to the specified interface.

Examples

Configure the primary IP address of GigabitEthernet 1/0/1 as the source address of SNMP traps.

```
<Sysname> system-view
[Sysname] snmp-agent trap source gigabitethernet 1/0/1
```

Configure the primary IP address of GigabitEthernet 1/0/2 as the source address of SNMP informs.

```
<Sysname> system-view
[Sysname] snmp-agent inform source gigabitethernet 1/0/2
```

Related commands

snmp-agent target-host

snmp-agent trap enable

snmp-agent calculate-password

Use **snmp-agent calculate-password** to calculate the encrypted form for a key in plaintext form.

Syntax

snmp-agent calculate-password *plain-password* **mode** { **3desmd5** | **3dessha** | **md5** | **sha** } { **local-engineid** | **specified-engineid** *engineid* }

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

plain-password: Specifies a key in plaintext form. The *plain-password* argument is a case-sensitive string of 1 to 64 characters.

mode: Specifies an authentication algorithm and encryption algorithm. The device supports the HMAC-MD5 and HMAC-SHA1 authentication algorithms. The HMAC-MD5 algorithm is faster than the HMAC-SHA1 algorithm. The HMAC-SHA1 algorithm provides more security than the HMAC-MD5 algorithm. The AES, 3DES, and DES encryption algorithms (in descending order of security strength) are available for the device. A more secure algorithm calculates slower. DES is enough to meet general security requirements.

- **3desmd5**: Calculates the encrypted form for the encryption key by using the 3DES encryption algorithm and HMAC-MD5 authentication algorithm.
- **3dessha**: Calculates the encrypted form for the encryption key by using the 3DES encryption algorithm and HMAC-SHA1 authentication algorithm.
- **md5**: Calculates the encrypted form for the authentication key or encryption key by using the HMAC-MD5 authentication algorithm and AES or DES encryption algorithm. When the HMAC-MD5 authentication algorithm is used, you can get the same authentication key or encryption key in encrypted form regardless of whether the AES or DES encryption algorithm is used.
- **sha**: Calculates the encrypted form for the authentication key or encryption key by using HMAC-SHA1 authentication algorithm and AES or DES encryption algorithm. When the HMAC-SHA1 authentication algorithm is used, you can get the same authentication key or encryption key in encrypted form regardless of whether the AES or DES encryption algorithm is used.

local-engineid: Uses the local engine ID to calculate the encrypted form for the key. You can configure the local engine ID by using the **snmp-agent local-engineid** command.

specified-engineid *engineid*: Uses a user-defined engine ID to calculate the encrypted form for the key. The *engineid* argument is an even number of case-insensitive hexadecimal characters. All-zero and all-F strings are invalid. The even number is in the range of 10 to 64.

Usage guidelines

Make sure the SNMP agent is enabled before you execute the **snmp-agent calculate-password** command.

For security purposes, use the encrypted-form key generated by using this command when you create SNMPv3 users by specifying the **cipher** keyword in the **snmp-agent usm-user v3** command.

The encrypted form of the key is valid only under the engine ID specified for key conversion.

Examples

Use the local engine ID and the HMAC-SHA1 algorithm to calculate the encrypted form for key **authkey**.

```
<Sysname> system-view
[Sysname] snmp-agent calculate-password authkey mode sha local-engineid
The encrypted key is: 09659EC5A9AE91BA189E5845E1DDE0CC
```

Related commands

snmp-agent local-engineid

snmp-agent usm-user v3

snmp-agent community

Use **snmp-agent community** to configure an SNMPv1 or SNMPv2c community.

Use **undo snmp-agent community** to delete an SNMPv1 or SNMPv2c community.

Syntax

In VACM mode:

snmp-agent community { **read** | **write** } [**simple** | **cipher**] *community-name* [**mib-view** *view-name*] [**acl** { *ipv4-acl-number* | **name** *ipv4-acl-name* } | **acl ipv6** { *ipv6-acl-number* | **name** *ipv6-acl-name* }] *

undo snmp-agent community [**cipher**] *community-name*

In RBAC mode:

snmp-agent community [**simple** | **cipher**] *community-name* **user-role** *role-name* [**acl** { *ipv4-acl-number* | **name** *ipv4-acl-name* } | **acl ipv6** { *ipv6-acl-number* | **name** *ipv6-acl-name* }] *

undo snmp-agent community [**cipher**] *community-name*

Default

No SNMPv1 or SNMPv2c communities exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

read: Assigns the specified community read-only access to MIB objects. A read-only community can only inquire MIB information.

write: Assigns the specified community read and write access to MIB objects. A read and write community can configure MIB information.

simple: Specifies a community name in plaintext form. For security purposes, the community name specified in plaintext form will be stored in encrypted form.

cipher: Specifies a community name in encrypted form.

community-name: Specifies the community name. The plaintext form is a case-sensitive string of 1 to 32 characters. The encrypted form is a case-sensitive string of 33 to 73 characters. Input a string as escape characters after a backslash (\).

mib-view *view-name*: Specifies the MIB view available for the community. The *view-name* argument represents a MIB view name, a case-sensitive string of 1 to 32 characters. A MIB view represents a set of accessible MIB objects. If you do not specify a view, the specified community can access the MIB objects in the default MIB view **ViewDefault**.

user-role *role-name*: Specifies a user role name for the community, a case-sensitive string of 1 to 63 characters.

acl: Specifies a basic or advanced IPv4 ACL for the community.

ipv4-acl-number: Specifies a basic or advanced IPv4 ACL by its number. The basic IPv4 ACL number is in the range of 2000 to 2999. The advanced IPv4 ACL number is in the range of 3000 to 3999.

name *ipv4-acl-name*: Specifies a basic or advanced IPv4 ACL by its name, a case-insensitive string of 1 to 63 characters.

acl ipv6: Specifies a basic or advanced IPv6 ACL for the community.

ipv6-acl-number: Specifies a basic or advanced IPv6 ACL by its number. The basic IPv6 ACL number is in the range of 2000 to 2999. The advanced IPv6 ACL number is in the range of 3000 to 3999.

name *ipv6-acl-name*: Specifies a basic or advanced IPv6 ACL by its name, a case-insensitive string of 1 to 63 characters.

Usage guidelines

Only users with the network-admin, context-admin, or level-15 user role can execute this command. Users with other user roles cannot execute this command even if these roles are granted access to commands of the SNMP feature or this command.

An SNMP community is identified by a community name. It contains a set of NMSs and SNMP agents. Devices in an SNMP community authenticate each other by using the community name. An NMS and an SNMP agent can communicate only when they use the same community name.

Typically, **public** is used as the read-only community name and **private** is used as the read and write community name. To enhance security, you can assign your SNMP communities a name other than **public** and **private**.

The **snmp-agent community** command allows you to use either of the following modes to control SNMP community access to MIB objects:

- **View-based access control model**—The VACM mode controls access to MIB objects by assigning MIB views to SNMP communities.
- **Role based access control**—The RBAC mode controls access to MIB objects by assigning user roles to SNMP communities.
  - The network-admin, context-admin, and level-15 user roles have the read and write access to all MIB objects.
  - The network-operator user role and context-operator user role have the read-only access to all MIB objects.

  For more information about user roles, see *Fundamentals Configuration Guide*.

RBAC mode controls access on a per MIB object basis, and VACM mode controls access on a MIB view basis. As a best practice to enhance MIB security, use RBAC mode.

You can create a maximum of 10 SNMP communities by using the **snmp-agent community** command.

If you execute the command multiple times to specify the same community name but different other settings each time, the most recent configuration takes effect.

To set and save a community name in plain text, do not specify the **simple** or **cipher** keyword.

The ACL is used to filter illegitimate NMSs.

- If the specified ACL does not exist, or the specified ACL does not contain any rule, all NMSs can access the device.
- If a VPN instance is specified in an ACL rule, the rule applies only to the packets of the VPN instance. If no VPN instance is specified in an ACL rule, the rule applies only to the packets on the public network.
- If you specify an ACL and the ACL has rules, only NMSs permitted by the ACL can access the device.

For more information about ACL, see *ACL and QoS Configuration Guide*.

You can also create an SNMP community by using the **snmp-agent usm-user** { **v1** | **v2c** } and **snmp-agent group** { **v1** | **v2c** } commands. These two commands create an SNMPv1 or

SNMPv2c user and the group to which the user is assigned. The system automatically creates an SNMP community by using the SNMPv1 or SNMPv2c username.

The **display snmp-agent community** command displays information only about communities created and saved in plaintext form.

Examples

Create the read-only community with the plaintext form name **readaccess** so an SNMPv1 or SNMPv2c NMS can use the community name **readaccess** to read the MIB objects in the default view **ViewDefault**.

```
<Sysname> system-view
[Sysname] snmp-agent sys-info version v1 v2c
[Sysname] snmp-agent community read simple readaccess
```

Create the read and write community with the plaintext form name **writeaccess** so only the SNMPv2c NMS at 1.1.1.1 can use the community name **writeaccess** to read or set the MIB objects in the default view **ViewDefault**.

```
<Sysname> system-view
[Sysname] acl basic 2001
[Sysname-acl-ipv4-basic-2001] rule permit source 1.1.1.1 0.0.0.0
[Sysname-acl-ipv4-basic-2001] rule deny source any
[Sysname-acl-ipv4-basic-2001] quit
[Sysname] snmp-agent sys-info version v2c
[Sysname] snmp-agent community write simple writeaccess acl 2001
```

Create the read and write community with the plaintext form name **writeaccess** so only the SNMPv2c NMS at 1.1.1.2 can use the community name **writeaccess** to read or set the MIB objects in the default view **ViewDefault**.

```
<Sysname> system-view
[Sysname] acl basic name testacl
[Sysname-acl-ipv4-basic-testacl] rule permit source 1.1.1.2 0.0.0.0
[Sysname-acl-ipv4-basic-testacl] rule deny source any
[Sysname-acl-ipv4-basic-testacl] quit
[Sysname] snmp-agent sys-info version v2c
[Sysname] snmp-agent community write simple writeaccess acl name testacl
```

Create the read and write community with the plaintext form name **wr-sys-acc** so an SNMPv1 or SNMPv2c NMS can use the community name **wr-sys-acc** to read or set the MIB objects in the system subtree (OID 1.3.6.1.2.1.1).

```
<Sysname> system-view
[Sysname] snmp-agent sys-info version v1 v2c
[Sysname] undo snmp-agent mib-view ViewDefault
[Sysname] snmp-agent mib-view included test system
[Sysname] snmp-agent community write simple wr-sys-acc mib-view test
```

Related commands

snmp-agent community-map

Use **snmp-agent community-map** to map an SNMP community to an SNMP context.

Use **undo snmp-agent community-map** to delete the mapping between an SNMP community and an SNMP context.

Syntax

snmp-agent community-map *community-name* **context** *context-name*

undo snmp-agent community-map *community-name* **context** *context-name*

Default

No mapping exists between an SNMP community and an SNMP context.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

community-name: Specifies an SNMP community, a case-sensitive string of 1 to 32 characters.

context-name: Specifies an SNMP context, a case-sensitive string of 1 to 32 characters.

Usage guidelines

This command enables a module on an agent to obtain the context mapped to a community name when an NMS accesses the agent by using SNMPv1 or SNMPv2c.

You can configure a maximum of 10 community-context mappings on the device.

Examples

Map SNMP community **private** to SNMP context **trillcontext**.

```
<Sysname> system-view
[Sysname] snmp-agent community-map private context testcontext
```

Related commands

display snmp-agent community

snmp-agent context

Use **snmp-agent context** to create an SNMP context.

Use **undo snmp-agent context** to delete an SNMP context.

Syntax

snmp-agent context *context-name*

undo snmp-agent context *context-name*

Default

No SNMP contexts exist.

Views

System view

Predefined use roles

network-admin

context-admin

Parameters

context-name: Specifies an SNMP context, a case-sensitive string of 1 to 32 characters.

Usage guidelines

For an NMS and an SNMP agent to communicate, configure the same SNMP context for them or do not configure a context for the NMS.

You can create a maximum of 20 SNMP contexts.

Examples

Create SNMP context **trillcontext**.

```
<Sysname> system-view
[Sysname] snmp-agent context testcontext
```

Related commands

display snmp-agent context

snmp-agent group

Use **snmp-agent group** to create an SNMP group.

Use **undo snmp-agent group** to delete an SNMP group.

Syntax

- SNMPv1 and SNMP v2c:

  snmp-agent group { **v1** | **v2c** } *group-name* [**notify-view** *view-name* | **read-view** *view-name* | **write-view** *view-name*] * [**acl** { *ipv4-acl-number* | **name** *ipv4-acl-name* } | **acl ipv6** { *ipv6-acl-number* | **name** *ipv6-acl-name* }] *

  undo snmp-agent group { **v1** | **v2c** } *group-name*

- SNMPv3:

  snmp-agent group v3 *group-name* [**authentication** | **privacy**] [**notify-view** *view-name* | **read-view** *view-name* | **write-view** *view-name*] * [**acl** { *ipv4-acl-number* | **name** *ipv4-acl-name* } | **acl ipv6** { *ipv6-acl-number* | **name** *ipv6-acl-name* }] *

  undo snmp-agent group v3 *group-name* [**authentication** | **privacy**]

Default

No SNMP groups exist.

Views

System view

Predefined use roles

network-admin

context-admin

Parameters

v1: Specifies SNMPv1.

v2c: Specifies SNMPv2c.

v3: Specifies SNMPv3.

group-name: Specifies an SNMP group name, a case-sensitive string of 1 to 32 characters.

authentication: Specifies the authentication without privacy security model for the SNMPv3 group.

privacy: Specifies the authentication with privacy security model for the SNMPv3 group.

notify-view *view-name*: Specifies a notify MIB view. The *view-name* represents a MIB view name, a case-sensitive string of 1 to 32 characters. The SNMP agent sends notifications to the users in the specified group only for the MIB objects included in the notify view. If you do not specify a notify view, the SNMP agent does not send any notification to the users in the specified group.

read-view *view-name*: Specifies a read-only MIB view. The *view-name* represents a MIB view name, a case-sensitive string of 1 to 32 characters. If you do not specify a read-only MIB view, the SNMP group has read access to the default view **ViewDefault**.

write-view *view-name:* Specifies a read and write MIB view. The *view-name* represents a MIB view name, a case-sensitive string of 1 to 32 characters. If you do not specify a read and write view, the SNMP group cannot set any MIB object on the SNMP agent.

acl: Specifies a basic or advanced IPv4 ACL for the group.

ipv4-acl-number: Specifies a basic or advanced IPv4 ACL by its number. The basic IPv4 ACL number is in the range of 2000 to 2999. The advanced IPv4 ACL number is in the range of 3000 to 3999.

name *ipv4-acl-name*: Specifies a basic or advanced IPv4 ACL by its name, a case-insensitive string of 1 to 63 characters.

acl ipv6: Specifies a basic or advanced IPv6 ACL for the group.

ipv6-acl-number: Specifies a basic or advanced IPv6 ACL by its number. The basic IPv6 ACL number is in the range of 2000 to 2999. The advanced IPv6 ACL number is in the range of 3000 to 3999.

name *ipv6-acl-name*: Specifies a basic or advanced IPv6 ACL by its name, a case-insensitive string of 1 to 63 characters.

Usage guidelines

Only users with the network-admin, context-admin, or level-15 user role can execute this command. Users with other user roles cannot execute this command even if these roles are granted access to commands of the SNMP feature or this command.

All users in an SNMP group share the security model and access rights of the group.

You can create a maximum of 20 SNMP groups, including SNMPv1, SNMPv2c, and SNMPv3 groups.

All SNMPv3 users in a group share the same security model, but can use different authentication and encryption key settings. To implement a security model for a user and avoid SNMP communication failures, make sure the security model configuration for the group and the security key settings for the user are compliant with Table 12 and match the settings on the NMS.

Table 12 Basic security setting requirements for different security models

Security model	Security model keyword for the group	Security key settings for the user	Remarks
Authentication with privacy	**privacy**	Authentication key, encryption key	If the authentication key or the encryption key is not configured, SNMP communication will fail.
Authentication without privacy	**authentication**	Authentication key	If no authentication key is configured, SNMP communication will fail. The encryption key (if any) for the user does not take effect.

Security model	Security model keyword for the group	Security key settings for the user	Remarks
No authentication, no privacy	Neither **authentication** nor **privacy**	None	The authentication and encryption keys, if configured, do not take effect.

You can specify an ACL for the user and group, respectively, to filter illegitimate NMSs. Only the NMSs permitted by the ACLs for both the user and group can access the SNMP agent. The following rules apply to the ACLs for the user and group:

- If the specified ACL does not exist, or the specified ACL does not contain any rule, all NMSs can access the device.
- If a VPN instance is specified in an ACL rule, the rule applies only to the packets of the VPN instance. If no VPN instance is specified in an ACL rule, the rule applies only to the packets on the public network.
- If you specify an ACL and the ACL has rules, only NMSs permitted by the ACL can access the device.

For more information about ACL, see *ACL and QoS Configuration Guide*.

Examples

Create the SNMPv3 group **group1**.

```
<Sysname> system-view
[Sysname] snmp-agent group v3 group1
```

Related commands

display snmp-agent group

snmp-agent mib-view

snmp-agent usm-user

snmp-agent local-engineid

Use **snmp-agent local-engineid** to set an SNMP engine ID.

Use **undo snmp-agent local-engineid** to restore the default.

Syntax

snmp-agent local-engineid *engineid*

undo snmp-agent local-engineid

Default

The SNMP engine ID of the device is the company ID plus the device ID.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

engineid: Specifies an SNMP engine ID, a case-insensitive hexadecimal string. Its length is an even number in the range of 10 to 64. All-zero and all-F strings are invalid.

Usage guidelines

An SNMP engine ID uniquely identifies a device in an SNMP managed network. Make sure the local SNMP engine ID is unique within your SNMP managed network to avoid communication problems.

If you have configured SNMPv3 users, change the local SNMP engine ID only when necessary. The change can void the SNMPv3 usernames and encrypted keys you have configured.

You can use the default engine ID or configure an easy-to-remember engine ID based on the network plan. For example, you can set the engine ID for device 1 on the first floor of building A to 000Af0010001 and device 2 to 000Af0010002.

Examples

Set the local SNMP engine ID to **123456789A**.

```
<Sysname> system-view
[Sysname] snmp-agent local-engineid 123456789A
```

Related commands

display snmp-agent local-engineid

snmp-agent usm-user

snmp-agent log

Use **snmp-agent log** to enable SNMP logging.

Use **undo snmp-agent log** to disable SNMP logging.

Syntax

snmp-agent log { **all** | **authfail** | **get-operation** | **set-operation** }

undo snmp-agent log { **all** | **authfail** | **get-operation** | **set-operation** }

Default

SNMP logging operations are disabled.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

all: Enables logging SNMP authentication failures, Get operations, and Set operations.

authfail: Enables logging SNMP authentication failures.

get-operation: Enables logging SNMP Get operations.

set-operation: Enables logging SNMP Set operations.

Usage guidelines

Use SNMP logging to record the SNMP operations performed on the SNMP agent or authentication failures from the NMS to the agent for auditing NMS behaviors. The SNMP agent sends log data to

the information center. You can configure the information center to output the data to a destination as needed.

Examples

Enable logging SNMP Get operations.

```
<Sysname> system-view
[Sysname] snmp-agent log get-operation
```

Enable logging SNMP Set operations.

```
<Sysname> system-view
[Sysname] snmp-agent log set-operation
```

Enable logging SNMP authentication failures.

```
<Sysname> system-view
[Sysname] snmp-agent log authfail
```

snmp-agent mib-view

Use **snmp-agent mib-view** to create or update a MIB view.

Use **undo snmp-agent mib-view** to delete a MIB view.

Syntax

snmp-agent mib-view { **excluded** | **included** } *view-name oid-tree* [**mask** *mask-value*]

undo snmp-agent mib-view *view-name*

Default

The system creates the **ViewDefault** view when the SNMP agent is enabled. In this default MIB view, all MIB objects in the **iso** subtree but the **snmpUsmMIB**, **snmpVacmMIB**, and **snmpModules.18** subtrees are accessible.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

excluded: Denies access to any node in the specified MIB subtree.

included: Permits access to all the nodes in the specified MIB subtree.

view-name: Specifies a view name, a case-sensitive string of 1 to 32 characters.

oid-tree: Specifies a MIB subtree by its root node's OID (for example, **1.3.6.1.2.1.1**) or object name (for example, **system**). The *oid-tree* argument is a case-sensitive string of 1 to 255 characters. An OID is a dotted numeric string that uniquely identifies an object in the MIB tree.

mask *mask-value*: Sets a MIB subtree mask, a case-insensitive hexadecimal string. Its length is an even number in the range of 1 to 32.

Usage guidelines

A MIB view represents a set of MIB objects (or MIB object hierarchies) with certain access privilege. The MIB objects included in the MIB view are accessible while those excluded from the MIB view are inaccessible.

Each *view-name oid-tree* pair represents a view record. If you specify the same record with different MIB subtree masks multiple times, the most recent configuration takes effect.

Be cautious with deleting the default MIB view. The operation blocks the access to any MIB object on the device from NMSs that use the default view.

Examples

Include the **mib-2** (OID 1.3.6.1.2.1) subtree in the **mibtest** view and exclude the **system** subtree from this view.

```
<Sysname> system-view
[Sysname] snmp-agent sys-info version v1
[Sysname] snmp-agent mib-view included mibtest 1.3.6.1.2.1
[Sysname] snmp-agent mib-view excluded mibtest system
[Sysname] snmp-agent community read public mib-view mibtest
```

An SNMPv1 NMS in the **public** community can query the objects in the **mib-2** subtree but not any object (for example, the **sysDescr or sysObjectID** node) in the **system** subtree.

Related commands

display snmp-agent mib-view

snmp-agent group

snmp-agent packet max-size

Use **snmp-agent packet max-size** to set the maximum size (in bytes) of SNMP packets that the SNMP agent can receive or send.

Use **undo snmp-agent packet max-size** to restore the default.

Syntax

snmp-agent packet max-size *byte-count*

undo snmp-agent packet max-size

Default

An SNMP agent can process SNMP packets with a maximum size of 1500 bytes.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

byte-count: Sets the maximum size (in bytes) of SNMP packets that the SNMP agent can receive or send. The value range is 484 to 17940.

Usage guidelines

If any device on the path to the NMS does not support packet fragmentation, limit the SNMP packet size to prevent large-sized packets from being discarded. For most networks, the default value is sufficient.

Examples

Set the maximum SNMP packet size to 1024 bytes.

```
<Sysname> system-view
```

```
[Sysname] snmp-agent packet max-size 1024
```

snmp-agent port

Use **snmp-agent port** to specify an SNMP listening port.

Use **undo snmp-agent port** to restore the default.

Syntax

snmp-agent port *port-number*

undo snmp-agent port

Default

The SNMP listening port is UDP port 161.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

port-number: Specifies an SNMP listening port by its number in the range of 1 to 65535.

Usage guidelines

The SNMP agent will fail to be enabled when the port that the agent will listen on is used by another service. You can use the **snmp-agent port** command to change the SNMP listening port. As a best practice, execute the **display udp verbose** command to view the UDP port use information before specifying a new SNMP listening port.

After changing the SNMP listening port, the NMS can perform SNMP set and get operations on the device only after reconnecting the device by using the new port number.

Examples

Specify **5555** as the SNMP listening port.

```
<Sysname> system-view
[Sysname] snmp-agent port 5555
```

Related commands

display udp verbose (see IP performance optimization commands in *Layer 3—IP Services Configuration Guide*)

snmp-agent remote

Use **snmp-agent remote** to set an SNMP engine ID for a remote SNMP entity.

Use **undo snmp-agent remote** to delete the SNMP engine ID of a remote SNMP entity.

Syntax

snmp-agent remote { *ipv4-address* | **ipv6** *ipv6-address* } [**vpn-instance** *vpn-instance-name*] **engineid** *engineid*

undo snmp-agent remote { *ipv4-address* | **ipv6** *ipv6-address* } [**vpn-instance** *vpn-instance-name*]

Default

No SNMP engine IDs are configured for remote SNMP entities.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

ipv4-address: Specifies a remote SNMP entity by its IPv4 address.

ipv6 *ipv6-address*: Specifies a remote SNMP entity by its IPv6 address.

vpn-instance *vpn-instance-name*: Specifies the MPLS L3VPN instance to which the remote SNMP entity belongs. The *vpn-instance-name* argument represents the VPN instance name. a case-sensitive string of 1 to 31 characters. If the SNMP entity belongs to the public network, do not specify this option.

engineid: Specifies the SNMP engine ID of the remote SNMP entity. This argument is a case-insensitive hexadecimal string. Its length is an even number in the range of 10 to 64. All-zero and all-F strings are invalid.

Usage guidelines

To send informs to an NMS, you must configure the SNMP engine ID of the NMS on the SNMP agent.

The NMS accepts the SNMPv3 informs from the SNMP agent only if the engine ID in the informs is the same as its local engine ID.

You can configure a maximum of 20 remote SNMP engine IDs.

Examples

Set the SNMP engine ID to **123456789A** for the remote entity **10.1.1.1**.

```
<Sysname> system-view
[Sysname] snmp-agent remote 10.1.1.1 engineid 123456789A
```

Related commands

display snmp-agent remote

snmp-agent sys-info contact

Use **snmp-agent sys-info contact** to configure the system contact.

Use **undo snmp-agent sys-info contact** to restore the default contact.

Syntax

snmp-agent sys-info contact *sys-contact*

undo snmp-agent sys-info contact

Default

The system contact is NSFOCUS.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

sys-contact: Specifies the system contact, a case-sensitive string of 1 to 255 characters.

Usage guidelines

Configure the system contact for system maintenance and management.

Examples

Configure the system contact as **Dial System Operator # 27345**.

```
<Sysname> system-view
[Sysname] snmp-agent sys-info contact Dial System Operator # 27345
```

Related commands

display snmp-agent sys-info

snmp-agent sys-info location

Use **snmp-agent sys-info location** to configure the system location.

Use **undo snmp-agent sys-info location** to restore the default location.

Syntax

snmp-agent sys-info location *sys-location*

undo snmp-agent sys-info location

Default

The system location is **Hangzhou, China**.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

sys-location: Specifies the system location, a case-sensitive string of 1 to 255 characters.

Usage guidelines

Configure the location of the device for system maintenance and management.

Examples

Configure the system location as **Room524-row1-3**.

```
<Sysname> system-view
[Sysname] snmp-agent sys-info location Room524-row1-3
```

Related commands

display snmp-agent sys-info

snmp-agent sys-info version

Use **snmp-agent sys-info version** to specify the SNMP version.

Use **undo snmp-agent sys-info version** to restore the default.

Syntax

snmp-agent sys-info contact version { **all** | { **v1** | **v2c** | **v3** } * }

undo snmp-agent sys-info version { **all** | { **v1** | **v2c** | **v3** } * }

Default

SNMPv3 is enabled.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

all: Specifies SNMPv1, SNMPv2c, and SNMPv3.

v1: Specifies SNMPv1.

v2c: Specifies SNMPv2c.

v3: Specifies SNMPv3.

Usage guidelines

Configure the SNMP agent with the same SNMP version as the NMS for successful communications between them.

The community name and data carried in SNMPv1 and SNMPv2c messages are in plaintext form, putting the SNMP communication at risks. As a best practice, use SNMPv3.

SNMP notifications over IPv6 is supported only when you specify SNMPv2c or SNMPv3.

Examples

Enable SNMPv3.

```
<Sysname> system-view
[Sysname] snmp-agent sys-info version v3
```

Related commands

display snmp-agent sys-info

snmp-agent target-host

Use **snmp-agent target-host** to configure an SNMP notification target host.

Use **undo snmp-agent target-host** to remove an SNMP notification target host.

Syntax

snmp-agent target-host inform address udp-domain { *ipv4-target-host* | **ipv6** *ipv6-target-host* } [**source-ip** *source-ip-address* | **udp-port** *port-number* | **vpn-instance** *vpn-instance-name*] * **params securityname** *security-string* { **v2c** | **v3** [**authentication** | **privacy**] }

snmp-agent target-host trap address udp-domain { *ipv4-target-host* | **ipv6** *ipv6-target-host* } [**source-ip** *source-ip-address* | **udp-port** *port-number* | **vpn-instance** *vpn-instance-name*] * [**params securityname** *security-string* [**v1** | **v2c** | **v3** [**authentication** | **privacy**]]]

undo snmp-agent target-host { **trap** | **inform** } **address udp-domain** { *ipv4-target-host* | **ipv6** *ipv6-target-host* } **params securityname** *security-string* [**vpn-instance** *vpn-instance-name*]

Default

No SNMP notification target hosts exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

inform: Specifies a host that receives informs.

trap: Specifies a host that receives traps.

address: Specifies the destination address of SNMP notifications.

udp-domain: Specifies UDP as the transport protocol.

ipv4-target-host: Specifies a target host by its IPv4 address or host name. The host name is a case-insensitive string of 1 to 253 characters. The string can only contain letters, numbers, hyphens (-), underscores (_), and dots (.). If you specify a host name, the IPv4 address of the target host can be obtained.

ipv6 *ipv6-target-host*: Specifies a target host by its IPv6 address or host name. The host name is a case-insensitive string of 1 to 253 characters, which only contains letters, numbers, hyphens (-), underscores (_), and dots (.). If you specify a host name, the IPv6 address of the target host can be obtained. If you specify an IPv6 address, the address cannot be a link local address.

source-ip *source-ip-address*: Specifies the source IP address for SNMP notifications. If you do not specify this option, SNMP notifications uses the source IP address configured by using the **snmp-agent** { **inform** | **trap** } **source** command.

udp-port *port-number*: Specifies the UDP port for SNMP notifications. The default port number is 162.

vpn-instance *vpn-instance-name*: Specifies the MPLS L3VPN instance to which the target host belongs. The *vpn-instance-name* argument represents the VPN instance name, a case-sensitive string of 1 to 31 characters. If the target host belongs to the public network, do not specify this option.

params securityname *security-string*: Specifies the authentication parameter. The *security-string* argument specifies an SNMPv1 or SNMPv2c community name or an SNMPv3 username, a case-sensitive string of 1 to 32 characters.

v1: Specifies SNMPv1.

v2c: Specifies SNMPv2c.

v3: Specifies SNMPv3.

- **authentication**: Specifies the security model to be authentication without privacy. You must specify the authentication key when you create the SNMPv3 user.

- **privacy**: Specifies the security model to be authentication with privacy. You must specify the authentication key and encryption key when you create the SNMPv3 user.

Usage guidelines

You can specify multiple SNMP notification target hosts.

Make sure the SNMP agent uses the same UDP port for SNMP notifications as the target host. Typically, NMSs, for example, IMC and MIB Browser, use port 162 for SNMP notifications as defined in the SNMP protocols.

If none of the keywords **v1**, **v2c**, or **v3** is specified, SNMPv1 is used. Make sure the SNMP agent uses the same SNMP version as the target host so the host can receive the notification.

If neither **authentication** nor **privacy** is specified, the security model is no authentication, no privacy.

Examples

Configure the SNMP agent to send SNMPv3 traps to 10.1.1.1 by using the username **public**.

```
<Sysname> system-view
[Sysname] snmp-agent trap enable standard
[Sysname] snmp-agent target-host trap address udp-domain 10.1.1.1 params securityname
public v3
```

Related commands

snmp-agent { **inform** | **trap** } **source**

snmp-agent trap enable

snmp-agent trap life

snmp-agent trap enable

Use **snmp-agent trap enable** to enable SNMP notifications.

Use **undo snmp-agent trap enable** to disable SNMP notifications.

Syntax

snmp-agent trap enable [**configuration** | *protocol* | **standard** [**authentication** | **coldstart** | **linkdown** | **linkup** | **warmstart**] * | **system**]

undo snmp-agent trap enable [**configuration** | *protocol* | **standard** [**authentication** | **coldstart** | **linkdown** | **linkup** | **warmstart**] * | **system**]

Default

SNMP configuration notifications, standard notifications, and system notifications are enabled. Whether other SNMP notifications are enabled varies by module.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

configuration: Specifies configuration notifications. If configuration notifications are enabled, the system checks the running configuration and the startup configuration every 10 minutes for any change and generates a notification for the most recent change.

protocol: Specifies protocol module notifications. You can use the **snmp-agent trap enable ?** command to obtain the value of this argument. For more information about this argument, see the command reference for each module.

standard: Specifies SNMP standard notifications.

Table 13 Standard SNMP notifications

Keyword	Definition
authentication	Authentication failure notification sent when an NMS fails to be authenticated by the SNMP agent.
coldstart	Notification sent when the device restarts.
linkdown	Notification sent when the link of a port goes down.
linkup	Notification sent when the link of a port comes up.
warmstart	Notification sent when the SNMP agent restarts.

system: Specifies system notifications sent when the system time is modified, the system reboots, or the main system software image is not available.

Usage guidelines

To enable the device to send SNMP notifications for a protocol, first enable the protocol and then enable SNMP notifications for the protocol. For SNMP notifications to be sent correctly, you must also configure the notification sending parameters as required.

If no optional parameters are specified, this command or its **undo** form enables or disables all SNMP notifications supported by the device.

SNMP notifications over IPv6 is supported only when you specify SNMPv2c or SNMPv3.

Examples

Enable the SNMP agent to send SNMP authentication failure notifications.

```
<Sysname> system-view
[Sysname] snmp-agent trap enable standard authentication
```

snmp-agent trap if-mib link extended

Use **snmp-agent trap if-mib link extended** to configure the SNMP agent to send extended linkUp/linkDown notifications.

Use **undo snmp-agent trap if-mib link extended** to restore the default.

Syntax

snmp-agent trap if-mib link extended

undo snmp-agent trap if-mib link extended

Default

The SNMP agent sends standard linkUp/linkDown notifications.

Views

System view

Predefined user roles

network-admin

context-admin

Usage guidelines

Extended linkUp and linkDown notifications add interface name, interface type, and interface description to the standard linkUp/linkDown notifications for fast failure identification.

When you use this command, make sure the NMS supports the extended linkup and linkDown notifications.

Examples

Enable extended linkUp/linkDown notifications.

```
<Sysname> system-view
[Sysname] snmp-agent trap if-mib link extended
```

snmp-agent trap life

Use **snmp-agent trap life** to set the lifetime of notifications in the SNMP notification queue.

Use **undo snmp-agent trap life** to restore the default notification lifetime.

Syntax

snmp-agent trap life *seconds*

undo snmp-agent trap life

Default

The SNMP notification lifetime is 120 seconds.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

seconds: Sets a lifetime in the range of 1 to 2592000, in seconds.

Usage guidelines

When congestion occurs, the SNMP agent buffers notifications in a queue. The notification lifetime sets how long a notification can stay in the queue. A notification is deleted when its lifetime expires.

Examples

Set the SNMP notification lifetime to 60 seconds.

```
<Sysname> system-view
[Sysname] snmp-agent trap life 60
```

```

snmp-agent trap queue-size

Use **snmp-agent trap queue-size** to set the SNMP notification queue size.

Use **undo snmp-agent trap queue-size** to restore the default queue size.

Syntax

snmp-agent trap queue-size *size*

undo snmp-agent trap queue-size

Default

The SNMP notification queue can store a maximum of 100 notifications.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

size: Specifies the maximum number of notifications that the SNMP notification queue can hold. The value range is 1 to 1000.

Usage guidelines

When congestion occurs, the SNMP agent buffers notifications in a queue. SNMP notification queue size sets the maximum number of notifications that this queue can hold. When the queue size is reached, the oldest notifications are dropped for new notifications.

Examples

Set the SNMP notification queue size to 200.

```
<Sysname> system-view
[Sysname] snmp-agent trap queue-size 200
```

Parameters

v1: Specifies SNMPv1.

v2c: Specifies SNMPv2c.

user-name: Specifies an SNMP username, a case-sensitive string of 1 to 32 characters.

group-name: Specifies an SNMPv1 or SNMPv2c group name, a case-sensitive string of 1 to 32 characters. The group can be one that has been created or not. The user takes effect only after you create the group.

acl: Specifies a basic or advanced IPv4 ACL for the user.

ipv4-acl-number: Specifies a basic or advanced IPv4 ACL by its number. The basic IPv4 ACL number is in the range of 2000 to 2999. The advanced IPv4 ACL number is in the range of 3000 to 3999.

name *ipv4-acl-name*: Specifies a basic or advanced IPv4 ACL by its name, a case-insensitive string of 1 to 63 characters.

acl ipv6: Specifies a basic or advanced IPv6 ACL for the user.

ipv6-acl-number: Specifies a basic or advanced IPv6 ACL by its number. The basic IPv6 ACL number is in the range of 2000 to 2999. The advanced IPv6 ACL number is in the range of 3000 to 3999.

name *ipv6-acl-name*: Specifies a basic or advanced IPv6 ACL by its name, a case-insensitive string of 1 to 63 characters.

Usage guidelines

Only users with the network-admin, context-admin, or level-15 user role can execute this command. Users with other user roles cannot execute this command even if these roles are granted access to commands of the SNMP feature or this command.

On an SNMPv1 or SNMPv2c network, NMSs and agents authenticate each other by using the community name. On an SNMPv3 network, NMSs and agents authenticate each other by using the username.

You can create an SNMPv1 or SNMPv2c community by using either of the following ways:

- Execute the **snmp-agent community** command.
- Execute the **snmp-agent usm-user** { **v1** | **v2c** } and **snmp-agent group** { **v1** | **v2c** } commands to create an SNMPv1 or SNMPv2c user and the group that the user is assigned to. The system automatically creates an SNMP community by using the SNMPv1 or SNMPv2c username.

The **display snmp-agent community** command displays information only about communities created and saved in plaintext form.

You can specify an ACL for the user and group, respectively, to filter illegitimate NMSs. Only the NMSs permitted by the ACLs for both the user and group can access the SNMP agent. The following rules apply to the ACLs for the user and group:

- If the specified ACL does not exist, or the specified ACL does not contain any rule, all NMSs can access the device.
- If a VPN instance is specified in an ACL rule, the rule applies only to the packets of the VPN instance. If no VPN instance is specified in an ACL rule, the rule applies only to the packets on the public network.
- If you specify an ACL and the ACL has rules, only NMSs permitted by the ACL can access the device.

For more information about ACL, see *ACL and QoS Configuration Guide*.

Examples

Add the user **userv2c** to the SNMPv2c group **readCom** so an NMS can use the protocol SNMPv2c and the read-only community name **userv2c** to access the device.

```
<Sysname> system-view
[Sysname] snmp-agent sys-info version v2c
[Sysname] snmp-agent group v2c readCom
[Sysname] snmp-agent usm-user v2c userv2c readCom
```

Add the user **userv2c** in the SNMPv2c group **readCom** so only the NMS at 1.1.1.1 can use the protocol SNMPv2c and read-only community name **userv2c** to access the device.

```
<Sysname> system-view
[Sysname] acl basic 2001
[Sysname-acl-ipv4-basic-2001] rule permit source 1.1.1.1 0.0.0.0
[Sysname-acl-ipv4-basic-2001] rule deny source any
[Sysname-acl-ipv4-basic-2001] quit
[Sysname] snmp-agent sys-info version v2c
[Sysname] snmp-agent group v2c readCom
```

```
[Sysname] snmp-agent usm-user v2c userv2c readCom acl 2001
```

Add the user **userv2c** in the SNMPv2c group **readCom** so only the NMS at 1.1.1.2 can use the protocol SNMPv2c and read-only community name **userv2c** to access the device.

```
[Sysname] acl basic name testacl
[Sysname-acl-ipv4-basic-testacl] rule permit source 1.1.1.2 0.0.0.0
[Sysname-acl-ipv4-basic-testacl] rule deny source any
[Sysname-acl-ipv4-basic-testacl] quit
[Sysname] snmp-agent sys-info version v2c
[Sysname] snmp-agent group v2c readCom
[Sysname] snmp-agent usm-user v2c userv2c readCom acl name testacl
```

Related commands

snmp-agent usm-user v3

Use **snmp-agent usm-user v3** to create an SNMPv3 user.

Use **undo snmp-agent usm-user v3** to delete an SNMPv3 user.

Syntax

- In VACM mode:

  snmp-agent usm-user v3 *user-name group-name* [**remote** { *ipv4-address* | **ipv6** *ipv6-address* } [**vpn-instance** *vpn-instance-name*]] [{ **cipher** | **simple** } **authentication-mode** { **md5** | **sha** } *auth-password* [**privacy-mode** { **3des** | **aes128** | **des56** } *priv-password*]] [**acl** { *ipv4-acl-number* | **name** *ipv4-acl-name* } | **acl ipv6** { *ipv6-acl-number* | **name** *ipv6-acl-name* }] *

  undo snmp-agent usm-user v3 *user-name* { **local** | **engineid** *engineid-string* | **remote** { *ipv4-address* | **ipv6** *ipv6-address* } [**vpn-instance** *vpn-instance-name*] }

- In RBAC mode:

  snmp-agent usm-user v3 *user-name* **user-role** *role-name* [**remote** { *ipv4-address* | **ipv6** *ipv6-address* } [**vpn-instance** *vpn-instance-name*]] [{ **cipher** | **simple** } **authentication-mode** { **md5** | **sha** } *auth-password* [**privacy-mode** { **3des** | **aes128** | **des56** } *priv-password*]] [**acl** { *ipv4-acl-number* | **name** *ipv4-acl-name* } | **acl ipv6** { *ipv6-acl-number* | **name** *ipv6-acl-name* }] *

  undo snmp-agent usm-user v3 *user-name* { **local** | **engineid** *engineid-string* | **remote** { *ipv4-address* | **ipv6** *ipv6-address* } [**vpn-instance** *vpn-instance-name*] }

Default

No SNMPv3 users exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

user-name: Specifies an SNMPv3 username, a case-sensitive string of 1 to 32 characters.

group-name: Specifies an SNMPv3 group name, a case-sensitive string of 1 to 32 characters. The group can be one that has been created or not. The user takes effect only after you create the group.

user-role *role-name*: Specifies a user role name, a case-sensitive string of 1 to 63 characters.

remote { *ipv4-address* | **ipv6** *ipv6-address* }: Specifies a target host by its IPv4 or IPv6 address, typically the NMS, to receive the informs. To send SNMPv3 informs to a target host, you must specify this option and use the **snmp-agent remote** command to bind the IPv4 or IPv6 address to the remote engine ID.

vpn-instance *vpn-instance-name*: Specifies the MPLS L3VPN instance to which the target host belongs to. The *vpn-instance-name* argument represents the VPN instance name, a case-sensitive string of 1 to 31 characters. If the target host belongs to the public network, do not specify this option.

cipher: Specifies an authentication key and an encryption key in encrypted form. The keys will be converted to a digest in encrypted form and stored in the device.

simple: Specifies an authentication key and an encryption key in plaintext from. The keys will be converted to a digest in encrypted form and stored in the device.

authentication-mode: Specifies an authentication algorithm. If you do not specify the keyword, the system does not perform authentication.

- **md5**: Specifies the HMAC-MD5 authentication algorithm. For more information about this authentication algorithm, see IPSec configuration in *Security Configuration Guide*.
- **sha**: Specifies the HMAC-SHA1 authentication algorithm. For more information about this authentication algorithm, see IPSec configuration in *Security Configuration Guide*.

auth-password: Specifies an authentication key. This argument is case sensitive.

- The plaintext form of the key is a string of 1 to 64 characters.
- The encrypted form of the key can be calculated by using the **snmp-agent calculate-password** command.

privacy-mode: Specifies an encryption algorithm. If you do not specify this keyword, the system does not perform encryption.

- **3des**: Specifies the 3DES encryption algorithm that uses a 168-bit key.
- **aes128**: Specifies the AES encryption algorithm that uses a 128-bit key.
- **des56**: Specifies the DES encryption algorithm that uses a 56-bit key.

priv-password: Specifies an encryption key. This argument is case sensitive.

- The plaintext form of the key is a string of 1 to 64 characters.
- The encrypted form of the key can be calculated by using the **snmp-agent calculate-password** command.

acl: Specifies a basic or advanced IPv4 ACL for the user.

ipv4-acl-number: Specifies a basic or advanced IPv4 ACL by its number. The basic IPv4 ACL number is in the range of 2000 to 2999. The advanced IPv4 ACL number is in the range of 3000 to 3999.

name *ipv4-acl-name*: Specifies a basic or advanced IPv4 ACL by its name, a case-insensitive string of 1 to 63 characters.

acl ipv6: Specifies a basic or advanced IPv6 ACL for the user.

ipv6-acl-number: Specifies a basic or advanced IPv6 ACL by its number. The basic IPv6 ACL number is in the range of 2000 to 2999. The advanced IPv6 ACL number is in the range of 3000 to 3999.

name *ipv6-acl-name*: Specifies a basic or advanced IPv6 ACL by its name, a case-insensitive string of 1 to 63 characters.

local: Specifies the local SNMP engine. By default, an SNMPv3 user is associated with the local SNMP engine.

engineid *engineid-string*: Specifies an SNMP engine ID. The *engineid-string* argument is an even number of hexadecimal characters. All-zero and all-F strings are invalid. The even number is in the range of 10 to 64. If you change the local engine ID, the existing SNMPv3 users and keys become invalid. To delete an invalid username, specify the engine ID associated with the username in the **undo snmp-agent usm-user v3** command.

Usage guidelines

Only users with the network-admin, context-admin, or level-15 user role can execute this command. Users with other user roles cannot execute this command even if these roles are granted access to commands of the SNMP feature or this command.

You can use either of the following modes to control SNMPv3 user access to MIB objects.

- **VACM**—Controls user access to MIB objects by assigning the user to an SNMP group. To make sure the user takes effect, make sure the group has been created. An SNMP group contains one or multiple users and specifies the MIB views and security model for the users. The authentication and encryption algorithms for each user are specified when they are created.
- **RBAC**—Controls user access to MIB objects by assigning user roles to the user. A user role specifies the MIB objects accessible to the user and the operations that the user can perform on the objects. After you create a user in RBAC mode, you can use the **snmp-agent usm-user v3 user-role** command to assign more user roles to the user. You can assign a maximum of 64 user roles to a user.

RBAC mode controls access on a per MIB object basis, and VACM mode controls access on a MIB view basis. As a best practice to enhance MIB security, use RBAC mode.

You can execute the **snmp-agent usm-user v3** command multiple times to create different SNMPv3 users in VACM mode. If you do not change the username each time, the most recent configuration takes effect.

You can execute the **snmp-agent usm-user v3** command in RBAC mode multiple times to assign different user roles to an SNMPv3 user. The following restrictions and guidelines apply:

- If you specify only user roles but do not change any other settings each time, the **snmp-agent usm-user v3** command assigns different user roles to the user. Other settings remain unchanged.
- If you specify user roles and also change other settings each time, the **snmp-agent usm-user v3** command assigns different user roles to the user. The most recent configuration for other settings takes effect.

You can specify an ACL for the user and group, respectively, to filter illegitimate NMSs from accessing the agent. Only the NMSs permitted by the ACLs for both the user and group can access the SNMP agent. The following rules apply to the ACLs for the user and group:

- If the specified ACL does not exist, or the specified ACL does not contain any rule, all NMSs can access the device.
- If a VPN instance is specified in an ACL rule, the rule applies only to the packets of the VPN instance. If no VPN instance is specified in an ACL rule, the rule applies only to the packets on the public network.
- If you specify an ACL and the ACL has rules, only NMSs permitted by the ACL can access the device.

For more information about ACL, see *ACL and QoS Configuration Guide*.

Examples

In VACM mode:

Add user **testUser** to SNMPv3 group **testGroup**, and enable authentication for the group. Specify authentication algorithm **HMAC-SHA1** and plaintext-form authentication key **123456TESTplat&!** for the user.

```
<Sysname> system-view
[Sysname] snmp-agent group v3 testGroup authentication
[Sysname] snmp-agent usm-user v3 testUser testGroup simple authentication-mode sha
123456TESTplat&!
```

For an NMS to access the MIB objects in the default view **ViewDefault**, make sure the following configurations on the NMS are the same as the SNMP agent:

- SNMPv3 username.
- SNMP protocol version.
- Authentication algorithm and key.

Add user **testUser** to SNMPv3 group **testGroup**, and enable authentication and encryption for the group. Specify authentication algorithm **HMAC-SHA1**, encryption algorithm **AES**, plaintext-form authentication key **123456TESTauth&!**, and plaintext-form encryption key **123456TESTencr&!** for the user.

```
<Sysname> system-view
[Sysname] snmp-agent group v3 testGroup privacy
[Sysname] snmp-agent usm-user v3 testUser testGroup simple authentication-mode sha
123456TESTauth&! privacy-mode aes128 123456TESTencr&!
```

For an NMS to access the MIB objects in the default view **ViewDefault**, make sure the following configurations on the NMS are the same as the SNMP agent:

- SNMPv3 username.
- SNMP protocol version.
- Authentication algorithm.
- Privacy algorithm.
- Plaintext authentication and encryption keys.

Add user **remoteUser** for the SNMP remote engine at 10.1.1.1 to SNMPv3 group **testGroup**, and enable authentication and encryption for the group. Specify authentication algorithm **HMAC-SHA1**, encryption algorithm **AES**, plaintext-form authentication key **123456TESTauth&!**, and plaintext-form encryption key **123456TESTencr&!** for the user.

```
<Sysname> system-view
[Sysname] snmp-agent remote 10.1.1.1 engineid 123456789A
[Sysname] snmp-agent group v3 testGroup privacy
[Sysname] snmp-agent usm-user v3 remoteUser testGroup remote 10.1.1.1 simple
authentication-mode sha 123456TESTauth&! privacy-mode aes128 123456TESTencr&!
```

In RBAC mode:

Create SNMPv3 user **testUser** with user role **network-operator** and enable authentication for the user. Specify authentication algorithm **HMAC-SHA1** and plaintext-form authentication key **123456TESTplat&!** for the user.

```
<Sysname> system-view
[Sysname] snmp-agent usm-user v3 testUser user-role network-operator simple
authentication-mode sha 123456TESTplat&!
```

For an NMS to have read-only access to all MIB objects, make sure the following configurations on the NMS are the same as the SNMP agent:

- SNMPv3 username.
- SNMP protocol version.
- Authentication algorithm and key.

snmp-agent usm-user v3 user-role

snmp-agent usm-user v3 user-role

Use **snmp-agent usm-user v3 user-role** to assign a user role to an SNMPv3 user created in RBAC mode.

Use **undo snmp-agent usm-user user-role** to remove a user role.

Syntax

snmp-agent usm-user v3 *user-name* **user-role** *role-name*

undo snmp-agent usm-user v3 *user-name* **user-role** *role-name*

Default

An SNMPv3 user has the user role assigned to it at its creation.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

user-name: Specifies an SNMPv3 username, a case-sensitive string of 1 to 32 characters.

user-role *role-name*: Specifies a user role name, a case-sensitive string of 1 to 63 characters.

Usage guidelines

You can assign a maximum of 64 user roles to an SNMPv3 user.

An SNMPv3 user must have a minimum of one user role.

Examples

Assign the user role **network-admin** to the SNMPv3 user **testUser**.

```
<Sysname> system-view
[Sysname] snmp-agent usm-user v3 testUser user-role network-admin
```

RMON commands

display rmon alarm

Use **`display rmon alarm`** to display information about RMON alarm entries.

Syntax

`display rmon alarm` [*`entry-number`*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

`entry-number`: Specifies an alarm entry by its index in the range of 1 to 65535. If you do not specify an entry, the command displays all RMON alarm entries.

Examples

Display information about all RMON alarm entries.

```
<Sysname> display rmon alarm
AlarmEntry 1 owned by user1 is VALID.
  Sample type                    : absolute
  Sampled variable               : 1.3.6.1.2.1.16.1.1.1.4.1<etherStatsOctets.1>
  Sampling interval (in seconds) : 10
  Rising threshold               : 50(associated with event 1)
  Falling threshold              : 5(associated with event 2)
  Alarm sent upon entry startup  : risingOrFallingAlarm
  Latest value                   : 0
```

Table 1 Command output

Field	Description

AlarmEntry *entry-number* owned by *owner* is *status*.	Alarm entry owner and status:
	• *entry-number*—Alarm entry index.
	• *owner*—Entry owner.
	• *status*—Entry status:
	  ○ **VALID**—The entry is valid.
	  ○ **UNDERCREATION**—The entry is invalid.
	The *status* field is not configurable at the CLI. All alarm entries created from the CLI are valid by default.
	The **`display rmon alarm`** command can display invalid entries, but the **`display current-configuration`** and **`display this`** commands do not display their settings.

Field	Description
Sample type	Sample type: • absolute. • delta.
Sampled variable	Monitored variable.
Sampling interval	Interval (in seconds) at which data is sampled.
Rising threshold	Alarm rising threshold.
associated with event	Event index associated with the alarm..
Falling threshold	Alarm falling threshold.
Alarm sent upon entry startup	Alarm that can be generated at the first sampling: • **risingAlarm**. • **fallingAlarm**. • **risingOrFallingAlarm**. The default is **risingOrFallingAlarm**.
Latest value	Most recent sampled value.

Related commands

`rmon alarm`

display rmon event

Use **`display rmon event`** to display information about RMON event entries.

Syntax

`display rmon event` [*`entry-number`*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

`entry-number`: Specifies an event entry by its index in the range of 1 to 65535. If you do not specify an entry, the command displays all event entries.

Usage guidelines

An event entry includes the following information:

- Event index.
- Event owner.
- Event description.
- Action triggered by the event (such as logging the event or sending an SNMP notification).
- Last time when the event occurred (seconds that elapsed since the system startup).

Examples

Display information about all RMON event entries.

```
<Sysname> display rmon event
EventEntry 1 owned by user1 is VALID.
  Description: N/A
  Community: Security
  Take the action log-trap when triggered, last triggered at 0days 00h:02m:27s uptime.
```

Table 2 Command output

Field	Description

EventEntry *entry-number* owned by *owner* is *status*.	Event entry owner and status:
	• *entry-number*—Event entry index.
	• *owner*—Entry owner.
	• *status*—Entry status:
	  ○ **VALID**—The entry is valid.
	  ○ **UNDERCREATION**—The entry is invalid.
	The *status* field is not configurable at the CLI. All alarm entries created from the CLI are valid by default.
	The **display rmon event** command can display invalid entries, but the **display current-configuration** and **display this** commands do not display their settings.

Description	Event description.
Community	SNMP community name for the RMON event.
Take the action *action* when triggered	Actions that the system takes when the event is triggered: • **none**—Takes no action. • **log**—Logs the event. • **trap**—Sends an SNMP notification. • **log-trap**—Logs the event and sends an SNMP notification.
last triggered at *time* uptime	Last time when the event occurred, which is represented as the amount of time that elapsed since the system startup.

Related commands

rmon event

display rmon eventlog

Use **display rmon eventlog** to display information about event log entries.

Syntax

display rmon eventlog [*entry-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

entry-number: Specifies an event entry by its index in the range of 1 to 65535. If you do not specify an entry, the command displays log entries for all event entries.

Usage guidelines

If the log action is specified for an event, the system adds a record in the event log table each time the event occurs. Each record contains the log entry index, time when the event was logged (the amount of time that elapsed since system startup), and event description.

The system can maintain a maximum of 10 records for an event. The most recent record replaces the oldest record if the number of records reaches 10.

Examples

Display the RMON log for event entry **99**.

```
<Sysname> display rmon eventlog 99
EventEntry 99 owned by ww is VALID.
  LogEntry 99.1 created at 50days 08h:54m:44s uptime.
  Description: The 1.3.6.1.2.1.16.1.1.1.4.5 defined in alarmEntry 77,
     uprise 16760000 with alarm value 16776314. Alarm sample type is absolute.
  LogEntry 99.2 created at 50days 09h:11m:13s uptime.
  Description: The 1.3.6.1.2.1.16.1.1.1.4.5 defined in alarmEntry 77,
     less than(or =) 20000000 with alarm value 16951648. Alarm sample type is absolute.
  LogEntry 99.3 created at 50days 09h:18m:43s uptime.
  Description: The alarm formula defined in prialarmEntry 777,
     less than(or =) 15000000 with alarm value 14026493. Alarm sample type is absolute.
  LogEntry 99.4 created at 50days 09h:23m:28s uptime.
  Description: The alarm formula defined in prialarmEntry 777,
     uprise 17000000 with alarm value 17077846. Alarm sample type is absolute.
```

This example shows that the event log table has four records for event 99:

- Two records were created when event 99 was triggered by alarm entry 77.
- Two records were created when event 99 was triggered by private alarm entry 777.

Table 3 Command output

Field	Description

EventEntry *entry-number* owned by *owner* is *status*.	Event log entry owner and status:
	• *entry-number*—Event log entry index, which is the same as the event entry index for which this log entry is generated.
	• *owner*—Entry owner.
	• *status*—Entry status:
	  ○ **VALID**—The entry is valid (default value).
	  ○ **UNDERCREATION**—The entry is invalid.
	The *status* field is not configurable at the CLI. All event log entries are valid by default.
	The **display rmon eventlog** command can display invalid entries, but the **display current-configuration** and **display this** commands do not display their settings.

Field	Description
LogEntry *entry-number* created at *created-time* uptime.	Time when an event record was created: • *entry-number*—Event record index, represented as logEventIndex.logIndex, where logEventIndex and logIndex are MIB objects. A record index uniquely identifies a record among all records for the event. • *created-time*—Time when the event entry was created.
Description	Record description.

Related commands

rmon event

display rmon history

Use **display rmon history** to display RMON history control entries and history samples of Ethernet statistics for Ethernet interfaces.

Syntax

display rmon history [*interface-type interface-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

interface-type i*nterface-number*: Specifies an interface by its type and number. If you do not specify an interface, the command displays history samples for all interfaces that have an RMON history control entry.

Usage guidelines

RMON uses the etherHistoryTable object to store the history samples of Ethernet statistics for Ethernet interfaces.

To collect history samples for an Ethernet interface, you must first create a history control entry on the interface.

To configure the number of history samples that can be displayed and the history sampling interval, use the **rmon history** command.

Examples

Display the RMON history control entry and history samples for GigabitEthernet 1/0/1.

```
<Sysname> display rmon history gigabitethernet 1/0/1
HistoryControlEntry 6 owned by user1 is VALID.
  Sampled interface     : GigabitEthernet1/0/1<ifIndex.117>
  Sampling interval     : 8(sec) with 3 buckets max
  Sampling record 1 :
    dropevents        : 0         , octets              : 5869
    packets           : 54        , broadcast packets   : 9
```

```
multicast packets : 23        , CRC alignment errors : 0
undersize packets : 0         , oversize packets     : 0
fragments         : 0         , jabbers              : 0
collisions        : 0         , utilization          : 0
```

Table 4 Command output

Field	Description

HistoryControlEntry *entry-number* owned by *owner* is *status*.	Status and owner of the history control entry:
	• *entry-number*—History control entry index.
	• *owner*—Entry owner.
	• *status*—Entry status:
	  ○ **VALID**—The entry is valid.
	  ○ **UNDERCREATION**—The entry is invalid.
	The *status* field is not configurable at the CLI. All history control entries created from the CLI are valid by default.
	The **`display rmon history`** command can display invalid entries, but the **`display current-configuration`** and **`display this`** commands do not display their settings.

Sampled Interface	Sampled interface.
Sampling interval	Sampling interval in seconds.
buckets max	Maximum number of samples that can be saved for the history control entry. If the expected bucket size specified with the **`rmon history`** command exceeds the available history table size, RMON sets the bucket size as closely to the expected bucket size as possible. If the bucket has been full, RMON overwrites the oldest sample with the new sample.
Sampling record	History sample index.
dropevents	Total number of events in which packets were dropped during the sampling interval. **NOTE:** This statistic is the number of times that a drop condition occurred. It is not necessarily the total number of dropped packets.
octets	Total number of octets received during the sampling interval.
packets	Total number of packets (including bad packets) received during the sampling interval.
broadcast packets	Number of broadcast packets received during the sampling interval.
multicast packets	Number of multicast packets received during the sampling interval.
CRC alignment errors	Number of packets received with CRC alignment errors during the sampling interval.
undersize packets	Number of undersize packets received during the sampling interval. Undersize packets are shorter than 64 octets (excluding framing bits but including FCS octets).
oversize packets	Number of oversize packets received during the sampling interval. Oversize packets are longer than 1518 octets (excluding framing bits but including FCS octets).
fragments	Number of undersize packets with CRC errors received during the sampling interval.

Field	Description
jabbers	Number of oversize packets with CRC errors received during the sampling interval.
collisions	Number of colliding packets received during the sampling interval.
utilization	Bandwidth utilization (in hundreds of a percent) during the sampling period.

Related commands

rmon history

display rmon prialarm

Use **display rmon prialarm** to display information about RMON private alarm entries.

Syntax

display rmon prialarm [*entry-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

entry-number: Specifies an alarm entry index in the range of 1 to 65535. If you do not specify an entry, the command displays all private alarm entries.

Examples

Display information about all RMON private alarm entries.

```
<Sysname> display rmon prialarm
PrialarmEntry 1 owned by user1 is VALID.
  Sample type                    : absolute
  Variable formula          : (.1.3.6.1.2.1.16.1.1.1.6.1*100/.1.3.6.1.2.1.16.1.1.1.5.1)
  Description                    : ifUtilization.GigabitEthernet1/0/1
  Sampling interval (in seconds) : 10
  Rising threshold               : 80(associated with event 1)
  Falling threshold              : 5(associated with event 2)
  Alarm sent upon entry startup  : risingOrFallingAlarm
  Entry lifetime                 : forever
  Latest value                   : 85
```

Table 5 Command output

Field	Description

PrialarmEntry *entry-number* owned by *owner* is *status*.	Alarm entry owner and status:
	• *entry-number*—Alarm entry index.
	• *owner*—Entry owner.
	• *status*—Entry status:
	  ○ **VALID**—The entry is valid.
	  ○ **UNDERCREATION**—The entry is invalid.
	The *status* field is not configurable at the CLI. All alarm entries created from the CLI are valid by default.
	The **display rmon prialarm** command can display invalid entries, but the **display current-configuration** and **display this** commands do not display their settings.

Sample type	Sample type: • absolute. • delta.
Variable formula	Variable formula.
Description	Description of the alarm.
Sampling interval	Interval (in seconds) at which data is sampled.
Rising threshold	Alarm rising threshold.
Falling threshold	Alarm falling threshold.
associated with event	Event index associated with the alarm..
Alarm sent upon entry startup	Alarm that can be generated at the first sampling: • **risingAlarm**. • **fallingAlarm**. • **risingOrFallingAlarm**. The default is **risingOrFallingAlarm**.
Entry lifetime	Lifetime of the entry. • If the lifetime is set to **forever**, the entry never expires. • If the lifetime is set to an amount of time, the entry is removed when the timer expires.
Latest value	Most recent sampled value.

Related commands

rmon prialarm

display rmon statistics

Use **display rmon statistics** to display RMON statistics.

Syntax

display rmon statistics [*interface-type interface-number*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

interface-type interface-number: Specifies an interface by its type and number. If you do not specify an interface, the command displays RMON statistics for all interfaces.

Usage guidelines

This command displays the cumulative interface statistics for the period from the time the statistics entry was created to the time the command was executed. The statistics are cleared when the device reboots.

Examples

Display RMON statistics for GigabitEthernet 1/0/1.

```
<Sysname> display rmon statistics gigabitethernet 1/0/1
EtherStatsEntry 1 owned by user1 is VALID.
  Interface : GigabitEthernet1/0/1<ifIndex.3>
  etherStatsOctets         : 43393306  , etherStatsPkts          : 619825
  etherStatsBroadcastPkts  : 503581    , etherStatsMulticastPkts : 44013
  etherStatsUndersizePkts  : 0         , etherStatsOversizePkts  : 0
  etherStatsFragments      : 0         , etherStatsJabbers       : 0
  etherStatsCRCAlignErrors : 0         , etherStatsCollisions    : 0
  etherStatsDropEvents (insufficient resources): 0
  Incoming packets by size:
  64     : 0         ,  65-127  : 0         ,  128-255  : 0
  256-511: 0         ,  512-1023: 0         ,  1024-1518: 0
```

Table 6 Command output

Field	Description

EtherStatsEntry *entry-number* owned by *owner* is *status*.	Statistics entry owner and status:
	• *entry-number*—Statistics entry index.
	• *owner*—Entry owner.
	• *status*—Entry status:
	  ○ **VALID**—The entry is valid.
	  ○ **UNDERCREATION**—The entry is invalid.
	The *status* field is not configurable at the CLI. All alarm entries created from the CLI are valid by default.
	The **display rmon statistics** command can display invalid entries, but the **display current-configuration** and **display this** commands do not display their settings.

Interface	Interface on which statistics are gathered.
etherStatsOctets	Total number of octets received on the interface.
etherStatsPkts	Total number of packets received on the interface.
etherStatsBroadcastPkts	Total number of broadcast packets received on the interface.
etherStatsMulticastPkts	Total number of multicast packets received on the interface.

Field	Description
etherStatsUndersizePkts	Total number of undersize packets received on the interface.
etherStatsOversizePkts	Total number of oversize packets received on the interface.
etherStatsFragments	Total number of undersize packets received with CRC errors on the interface.
etherStatsJabbers	Total number of oversize packets received with CRC errors on the interface.
etherStatsCRCAlignErrors	Total number of packets received with CRC errors on the interface.
etherStatsCollisions	Total number of colliding packets received on the interface.
etherStatsDropEvents	Total number of events in which packets were dropped. **NOTE:** This statistic is the number of times that a drop condition occurred. It is not necessarily the total number of dropped packets.
Incoming packets by size:	Incoming-packet statistics by packet length: • **64**—Number of packets with a length less than or equal to 64 bytes. • **65-127**—Number of 65- to 127-byte packets. • **128-255**—Number of 128- to 255-byte packets. • **256-511**—Number of 256- to 511-byte packets. • **512-1023**—Number of 512- to 1023-byte packets. • **1024-1518**—Number of 1024- to 1518-byte packets.

Related commands

rmon statistics

rmon alarm

Use **rmon alarm** to create an RMON alarm entry.

Use **undo rmon alarm** to remove an RMON alarm entry.

Syntax

rmon alarm *entry-number alarm-variable sampling-interval* { **absolute** | **delta** } [**startup-alarm** { **falling** | **rising** | **rising-falling** }] **rising-threshold** *threshold-value1 event-entry1* **falling-threshold** *threshold-value2 event-entry2* [**owner** *text*]

undo rmon alarm *entry-number*

Default

No RMON alarm entries exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

entry-number: Specifies an alarm entry index in the range of 1 to 65535.

alarm-variable: Specifies an alarm variable, a string of 1 to 255 characters. You can only specify variables that can be parsed as an ASN.1 INTEGER value (INTEGER, INTEGER32, Unsigned32, Counter32, Counter64, Gauge, or TimeTicks) for the *alarm-variable* argument. The alarm variables must use one of the formats in Table 7.

Table 7 Alarm variable formats

Format	Examples
Dotted OID format: *entry.integer.instance*	1.3.6.1.2.1.2.1.10.1
Object name.instance	etherStatsOctets.1 etherStatsPkts.1 etherStatsBroadcastPkts.1 ifInOctets.1 ifInUcastPkts.1 ifInNUcastPkts.1

sampling-interval: Sets the sampling interval in the range of 5 to 65535 seconds.

absolute: Specifies absolute sampling. RMON compares the value of the variable with the rising and falling thresholds.

delta: Specifies delta sampling. RMON subtracts the value of the variable at the previous sample from the current sampled value, and then compares the difference with the rising and falling thresholds.

startup-alarm: Specifies alarms that can be generated at the first sampling when a rising or falling threshold is reached or exceeded. By default, a **rising-falling** alarm is generated.

rising: Generates a rising alarm.

falling: Generates a falling alarm.

rising-falling: Generates a rising or falling alarm.

rising-threshold *threshold-value1 event-entry1*: Sets the rising threshold. The *threshold-value1* argument represents the rising threshold in the range of –2147483648 to 2147483647. The *event-entry1* argument represents the index of the event that is triggered when the rising threshold is crossed. The value range for the *event-entry1* argument is 0 to 65535. If 0 is specified, the alarm does not trigger any event.

falling-threshold *threshold-value2 event-entry2*: Sets the falling threshold. The *threshold-value2* argument represents the falling threshold in the range of –2147483648 to 2147483647. The *event-entry2* argument represents the index of the event that is triggered when the falling threshold is crossed. The value range for the *event-entry2* argument is 0 to 65535. If 0 is specified, the alarm does not trigger any event.

owner *text*: Specifies the entry owner, a case-sensitive string of 1 to 127 characters.

Usage guidelines

You can create a maximum of 60 RMON alarm entries.

Each alarm entry must have a unique alarm variable, sampling interval, sample type, rising threshold, or falling threshold. You cannot create an alarm entry if all these parameters for the entry are the same as an existing entry.

To trigger the event associated with an alarm condition, you must create the event with the **rmon event** command.

RMON samples the monitored alarm variable at the specified sampling interval, compares the sampled value with the predefined thresholds, and performs one of the following operations:

- Triggers the event associated with the rising alarm if the sampled value is equal to or greater than the rising threshold.
- Triggers the event associated with the falling alarm if the sampled value is equal to or less than the falling threshold.

Examples

Create an alarm entry to perform absolute sampling on the number of octets received on GigabitEthernet 1/0/1 (object instance 1.3.6.1.2.1.16.1.1.1.4.1) at 10-seconds intervals. If the sampled value reaches or exceeds 5000, log the rising alarm event. If the sampled value is equal to or less than 5, take no actions.

```
<Sysname> system-view
[Sysname] rmon event 1 log
[Sysname] rmon event 2 none
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] rmon statistics 1
[Sysname-GigabitEthernet1/0/1] quit
[Sysname] rmon alarm 1 1.3.6.1.2.1.16.1.1.1.4.1 10 absolute rising-threshold 5000 1
falling-threshold 5 2 owner user1
```

In this example, you can replace 1.3.6.1.2.1.16.1.1.1.4.1 with etherStatsOctets.1, where 1 is the statistics entry index for the interface. If you execute the **rmon statistics 5** command, you can use etherStatsOctets.5 to replace 1.3.6.1.2.1.16.1.1.1.4.5.

Related commands

display rmon alarm

rmon event

rmon event

Use **rmon event** to create an RMON event entry.

Use **undo rmon event** to remove an RMON event entry.

Syntax

rmon event *entry-number* [**description** *string*] { **log** | **log-trap** *security-string* | **none** | **trap** *security-string* } [**owner** *text*]

undo rmon event *entry-number*

Default

No RMON event entries exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

entry-number: Specifies an event entry index in the range of 1 to 65535.

description *string*: Configures an event description, a case-sensitive string of 1 to 127 characters.

log: Logs the event .

log-trap: Logs the event and sends an SNMP notification.

security-string: Specifies the SNMP community name carried in the SNMP notifications. The *security-string* argument is a case-sensitive string of 1 to 127 characters and is determined by the SNMP configuration. This argument is supported but does not take effect in the current software version.

none: Performs no action.

trap: Sends an SNMP notification.

owner *text*: Specifies the entry owner, a case-sensitive string of 1 to 127 characters.

NOTE:

The SNMP community name setting for the *security-string* argument does not take effect even though you can configure it with the command. Instead, the system uses the settings you configure with SNMP when it sends RMON SNMP notifications. For more information about SNMP notifications, see *Network Management and Monitoring Configuration Guide*.

Usage guidelines

You can create a maximum of 60 event entries.

You can associate an event entry with a standard or private alarm entry to specify the action to take when an alarm condition occurs. Depending on your configuration, the system logs the event, sends an SNMP notification, does both, or does neither.

You can associate an event with multiple alarm entries.

Examples

Create an RMON log event entry. Specify its index as **10** and the entry owner as **user1**.

```
<Sysname> system-view
[Sysname] rmon event 10 log owner user1
```

Related commands

display rmon event

rmon alarm

rmon prialarm

rmon history

Use **rmon history** to create an RMON history control entry.

Use **undo rmon history** to remove an RMON history control entry.

Syntax

rmon history *entry-number* **buckets** *number* **interval** *interval* [**owner** *text*]

undo rmon history *entry-number*

Default

No RMON history control entries exist.

Views

Ethernet interface view

Predefined user roles

network-admin

context-admin

Parameters

entry-number: Specifies a history control entry index in the range of 1 to 65535.

buckets *number*: Specifies the expected maximum number of samples to be retained for the entry, in the range of 1 to 65535. RMON can retain a maximum of 50 samples for each history control entry. If the expected bucket size exceeds the available history table size, RMON sets the bucket size as closely to the expected bucket size as is possible. However, the granted bucket size will not exceed 50. For example, the bucket size for a history control entry will be 30 if the expected bucket size is set to 55, but the available bucket size is only 30.

interval *interval*: Specifies the sampling interval in the range of 5 to 3600 seconds.

owner *text*: Specifies the entry owner, a case-sensitive string of 1 to 127 characters.

Usage guidelines

The system supports a maximum of 100 history control entries.

If an Ethernet interface has a history control entry, RMON periodically samples packet statistics on the interface and stores the samples to the history table. When the bucket size for the history control entry is reached, RMON overwrites the oldest sample with the most recent sample.

You can create multiple RMON history control entries for an Ethernet interface.

Examples

Create RMON history control entry 1 for GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] rmon history 1 buckets 10 interval 5 owner user1
```

Related commands

display rmon history

rmon prialarm

Use **rmon prialarm** to create an RMON private alarm entry.

Use **undo rmon prialarm** to remove an RMON private alarm entry.

Syntax

rmon prialarm *entry-number prialarm-formula prialarm-des sampling-interval* { **absolute** | **delta** } [**startup-alarm** { **falling** | **rising** | **rising-falling** }] **rising-threshold** *threshold-value1 event-entry1* **falling-threshold** *threshold-value2 event-entry2* **entrytype** { **forever** | **cycle** *cycle-period* } [**owner** *text*]

undo rmon prialarm *entry-number*

Default

No RMON private alarm entries exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

entry-number: Specifies a private alarm entry index in the range of 1 to 65535.

prialarm-formula: Configures a private alarm variable formula, a string of 1 to 255 characters. The variables in the formula must be represented in OID format that starts with a dot (.), for example, (.1.3.6.1.2.1.2.1.10.1)*8. You can configure a formula to perform the basic math operations of addition, subtraction, multiplication, and division on these variables. To get a correct calculation result, make sure the following conditions are met:

- The values of the variables in the formula are positive integers.
- The result of each calculating step is in the value range for long integers.

prialarm-des: Configures an entry description, a case-sensitive string of 1 to 127 characters.

sampling-interval: Sets the sampling interval in the range of 10 to 65535 seconds.

absolute: Specifies absolute sampling. RMON compares the value of the variable with the rising and falling thresholds.

delta: Specifies delta sampling. RMON subtracts the value of the variable at the previous sample from the current sampled value, and then compares the difference with the rising and falling thresholds.

startup-alarm: Specifies alarms that can be generated at the first sampling when a rising or falling threshold is reached or exceeded. By default, a **rising-falling** alarm is generated.

rising: Generates a rising alarm.

falling: Generates a falling alarm.

rising-falling: Generates a rising or falling alarm.

rising-threshold *threshold-value1 event-entry1*: Sets the rising threshold. The *threshold-value1* argument represents the rising threshold in the range of –2147483648 to 2147483647. The *event-entry1* argument represents the index of the event that is triggered when the rising threshold is crossed. The value range for the *event-entry1* argument is 0 to 65535. If 0 is specified, the alarm does not trigger any event.

falling-threshold *threshold-value2 event-entry2*: Sets the falling threshold. The *threshold-value2* argument represents the falling threshold in the range of –2147483648 to 2147483647. The *event-entry2* argument represents the index of the event that is triggered when the falling threshold is crossed. The value range for the *event-entry2* argument is 0 to 65535. If 0 is specified, the alarm does not trigger any event.

forever: Configures the entry as a permanent entry. RMON retains a permanent private alarm entry until it is manually deleted.

cycle *cycle-period*: Sets the lifetime of the entry, in the range of 0 to 4294967 seconds. RMON deletes the entry when its lifetime expires.

owner *text*: Specifies the entry owner, a case-sensitive string of 1 to 127 characters.

Usage guidelines

You can create a maximum of 50 private alarm entries.

Each alarm entry must have a unique alarm variable, sampling interval, sample type, rising threshold, or falling threshold. You cannot create an alarm entry if all these parameters for the entry are the same as an existing entry.

To trigger the event associated with an alarm condition, you must create the event with the **rmon event** command.

The RMON agent samples variables and takes an alarm action based on a private alarm entry as follows:

1. Periodically samples the variables specified in the private alarm formula.
2. Processes the sampled values with the formula.
3. Compares the calculation result with the predefined thresholds, and then takes one of the following actions:
   - Triggers the event associated with the rising alarm event if the result is equal to or greater than the rising threshold.
   - Triggers the event associated with the falling alarm event if the result is equal to or less than the falling threshold.

Examples

Add a permanent private alarm entry to monitor the ratio of incoming broadcasts to the total number of incoming packets on GigabitEthernet 1/0/1. Log the rising alarm event when the ratio exceeds 80%, and take no actions when the ratio drops to 5%. The formula is (1.3.6.1.2.1.16.1.1.1.6.1*100/.1.3.6.1.2.1.16.1.1.1.5.1), where 1.3.6.1.2.1.16.1.1.1.6.1 is the OID of the object instance etherStatsBroadcastPkts.1, and 1.3.6.1.2.1.16.1.1.1.5.1 is the OID of the object instance etherStatsPkts.1.

```
<Sysname> system-view
[Sysname] rmon event 1 log
[Sysname] rmon event 2 none
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] rmon statistics 1
[Sysname-GigabitEthernet1/0/1] quit
[Sysname] rmon prialarm 1 (.1.3.6.1.2.1.16.1.1.1.6.1*100/.1.3.6.1.2.1.16.1.1.1.5.1)
BroadcastPktsRatioOfGE1/0/1 10 absolute rising-threshold 80 1 falling-threshold 5 2
entrytype forever owner user1
```

The last number in the OID forms of variables must be the same as the statistics entry index for the interface. For example, if you execute the **rmon statistics 5** command, you must replace 1.3.6.1.2.1.16.1.1.1.6.1 and 1.3.6.1.2.1.16.1.1.1.5.1 with 1.3.6.1.2.1.16.1.1.1.6.5 and 1.3.6.1.2.1.16.1.1.1.5.5, respectively.

Related commands

display rmon prialarm

rmon event

rmon statistics

Use **rmon statistics** to create an RMON statistics entry.

Use **undo rmon statistics** to remove an RMON statistics entry.

Syntax

rmon statistics *entry-number* [**owner** *text*]

undo rmon statistics *entry-number*

Default

No RMON statistics entries exist.

Views

Ethernet interface view

Predefined user roles

network-admin

context-admin

Parameters

entry-number: Specifies a statistics entry index in the range of 1 to 65535.

owner *text*: Specifies the entry owner, a case-sensitive string of 1 to 127 characters.

Usage guidelines

Each RMON statistics entry provides a set of cumulative traffic statistics collected up to the present time for an interface. Statistics include number of collisions, CRC alignment errors, number of undersize or oversize packets, number of broadcasts, number of multicasts, number of bytes received, and number of packets received. The statistics are cleared at a reboot.

The index of an RMON statistics entry must be globally unique. If the index has been used by another interface, the creation operation fails.

You can create only one RMON statistics entry for an Ethernet interface.

To display the RMON statistics table, use the **display rmon statistics** command.

Examples

Create an RMON statistics entry for GigabitEthernet 1/0/1. The index is 20 and the owner is **user1**.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] rmon statistics 20 owner user1
```

Related commands

Event MIB commands

action

Use **action** to set an action for an event.

Use **undo action** to remove an action.

Syntax

action { **notification** | **set** }

undo action { **notification** | **set** }

Default

An event does not have an action.

Views

Event view

Predefined user roles

network-admin

context-admin

Parameters

notification: Specifies the notification action. The system sends a notification to the NMS when the event is triggered.

set: Specifies the set action. The system sets a value for the specified MIB object when the event is triggered.

Usage guidelines

You can set both set and notification actions for an event.

- When you specify the set action, the system automatically creates a set entry and enters action-set view. You can configure the set action in this view. For more information, see the configuration in action-set view.
- When you specify the notification action, the system automatically creates a notification entry and enters action-notification view. You can configure the notification action in this view. For more information, see the configuration in action-notification view.

Examples

Set the notification action for an event and specify notification OID **mteEventSetFailure** for the action. Set the set action for the event and set the value for the **ipForwarding.0** object to 2.

```
<Sysname> system-view
[Sysname] snmp mib event owner owner1 name EventA
[Sysname-event-owner1-EventA] action notification
[Sysname-event-owner1-EventA-notification] oid mteEventSetFailure
[Sysname-event-owner1-EventA-notification] quit
[Sysname-event-owner1-EventA] action set
[Sysname-event-owner1-EventA-set] oid ipForwarding.0
[Sysname-event-owner1-EventA-set] value 2
```

Related commands

event enable

snmp mib event

comparison

Use **comparison** to specify a Boolean comparison type for the sampled value and the reference value.

Use **undo comparison** to restore the default.

Syntax

comparison { **equal** | **greater** | **greaterorequal** | **less** | **lessorequal** | **unequal** }

undo comparison

Default

The Boolean comparison type is unequal.

Views

Trigger-Boolean view

Predefined user roles

network-admin

context-admin

Parameters

equal: Specifies the Boolean comparison type as equal. When the sampled value equals the reference value, the trigger condition is met.

greater: Specifies the Boolean comparison type as greater than. When the sampled value is greater than the reference value, the trigger condition is met.

greaterorequal: Specifies the Boolean comparison type as greater than or equal to. When the sampled value is greater than or equal to the reference value, the trigger condition is met.

less: Specifies the Boolean comparison type as smaller than. When the sampled value is smaller than the reference value, the trigger condition is met.

lessorequal: Specifies the Boolean comparison type as smaller than or equal to. When the sampled value is smaller than or equal to the reference value, the trigger condition is met.

unequal: Specifies the Boolean comparison type as unequal. When the sampled value is unequal to the reference value, the trigger condition is met.

Usage guidelines

If the sampled value meets the trigger condition at two or more samplings in succession, an event is triggered only at the first sampling.

For an event to be triggered at the first sampling, execute the **startup enable** command.

Examples

Specify the Boolean comparison type as **unequal**.

```
<Sysname> system-view
[Sysname] snmp mib event trigger owner owner1 name triggerA
[Sysname-trigger-owner1-triggerA] test boolean
[Sysname-trigger-owner1-triggerA-boolean] comparison unequal
```

context (action-set view)

Use **context** to configure a context for the set-action object.

Use **undo context** to restore the default.

Syntax

context *context-name*

undo context

Default

A set-action object does not have a context.

Views

Action-set view

Predefined user roles

network-admin

context-admin

Parameters

context-name: Specifies a context, a case-sensitive string of 1 to 32 characters.

Usage guidelines

To uniquely identify a set-action object, configure a context for it.

Examples

Configure context **contextname1** for the set-action object.

```
<Sysname>system-view
[Sysname] snmp mib event owner owner1 name EventA
[Sysname-event-owner1-EventA] action set
[Sysname-event-owner1-EventA-set] context contextname1
```

delta falling

Use **delta falling** to set a delta falling threshold and specify a falling event.

Use **undo delta falling** to restore the default.

Syntax

delta falling { **event owner** *event-owner* **name** *event-name* | **value** *integer-value* }

undo delta falling { **event** | **value** }

Default

The delta falling threshold is 0, and no falling event is specified.

Views

Trigger-threshold view

Predefined user roles

network-admin

context-admin

Parameters

event owner *event-owner* **name** *event-name*: Specifies an event by its owner and its name. Use the trigger owner as the event owner. The *event-name* argument is a case-sensitive string of 1 to 32 characters.

value *integer-value*: Specifies a delta falling threshold in the range of –2147483648 to 2147483647. The value must be smaller than or equal to the delta rising threshold.

Usage guidelines

A falling event is triggered if the delta value (difference between the current sampled value and the previous sampled value) is smaller than or equal to the delta falling threshold.

If the delta value crosses the delta falling threshold multiple times in succession, a falling event is triggered only for the first crossing.

Examples

Set the delta falling threshold to 20.

```
<Sysname> system-view
[Sysname] snmp mib event trigger owner owner1 name triggerA
[Sysname-trigger-owner1-triggerA] test threshold
[Sysname-trigger-owner1-triggerA-threshold] delta falling value 20
```

sample

snmp mib event trigger

test

delta rising

Use **delta rising** to set a delta rising threshold and specify a rising event.

Use **undo delta rising** to restore the default.

Syntax

delta rising { **event owner** *event-owner* **name** *event-name* | **value** *integer-value* }

undo delta rising { **event** | **value** }

Default

The delta rising threshold is 0, and no rising event is specified.

Views

Trigger-threshold view

Predefined user roles

network-admin

context-admin

Parameters

event owner *event-owner* **name** *event-name*: Specifies an event by its owner and its name. Use the trigger owner as the event owner. The *event-name* argument is a case-sensitive string of 1 to 32 characters.

value *integer-value*: Specifies a delta rising threshold in the range of –2147483648 to 2147483647. The value must be greater than or equal to the delta falling threshold.

Usage guidelines

A rising event is triggered if the delta value is greater than or equal to the delta rising threshold.

If the delta value of the monitored object crosses the delta rising threshold multiple times in succession, a rising event is triggered only for the first crossing.

Examples

Set the delta rising threshold to 50, and specify the event identified by owner **owner1** and name **event1** as the rising event.

```
<Sysname> system-view
[Sysname] snmp mib event trigger owner owner1 name triggerA
[Sysname-trigger-owner1-triggerA] test threshold
[Sysname-trigger-owner1-triggerA-threshold] delta rising value 50
[Sysname-trigger-owner1-triggerA-threshold] delta rising event owner owner1 name event1
```

snmp mib event trigger

test

description (event view)

Use **description** to configure a description for an event.

Use **undo description** to restore the default.

Syntax

description *text*

undo description

Default

An event does not have a description.

Views

Event view

Predefined user roles

network-admin

context-admin

Parameters

text: Specifies a description, a case-sensitive string of 1 to 255 characters.

Examples

Configure a description of **EventA is an RMON event** for the event identified by owner **owner1** and name **eventA**.

```
<Sysname> system-view
[Sysname] snmp mib event owner owner1 name EventA
[Sysname-event-owner1-EventA] description EventA is an RMON event
```

Related commands

snmp mib event owner

description (trigger view)

Use **description** to configure a description for a trigger.

Use **undo description** to restore the default.

Syntax

description *text*

undo description

Default

A trigger does not have a description.

Views

Trigger view

Predefined user roles

   SetObjWildcard             : true
   SetValue                   : 2
   SetTargetTag               : N/A
   SetContextName             : context1
   SetContextNameWildcard     : false
```

Table 1 Command output

Field	Description
Event entry	
EvtComment	Description for the event.

Field	Description
EvtAction	Event actions: • Set action. • Notification action.
EvtEnabled	Event status: • Enabled. • Disabled.
Notification entry	
NotifyOID	Notification OID.
NotifyObjOwner	Owner of the notification-action object.
NotifyObjName	Name of the object list to be added to the notification.
Set entry	
SetObj	OID of the set-action object.
SetObjWildcard	Wildcarding option for the OID: • **false**—Specifies an object by its OID. • **true**—Enables a wildcard search for OIDs.
SetValue	Value of the set-action object.
SetTargetTag	Remote tag for the set-action object.
SetContextName	Context for the set-action object.
SetContextNameWildcard	Wildcarding option for the context • **false**—Specifies a context. • **true**—Enables wildcard search for contexts.

```

Table 4 Command output

Field	Description
Trigger entry	
TriggerComment	Description for the trigger.

Field	Description
TriggerTest	Trigger test type: • Existence. • Boolean. • Threshold.
TriggerSampleType	Trigger sampling method: • **absoluteValue**—Absolute sampling. • **deltaValue**—Delta sampling.
TriggerValueID	OID of the monitored object.
TriggerValueIDWildcard	Wildcarding option for the object OIDs: • **false**—Object OIDs are fully specified • **true**—Object OIDs are wildcarded.
TriggerTargetTag	Remote tag for the monitored object.
TriggerContextName	Context for an object.
TriggerContextNameWildcard	Wildcarding option for the contexts • **false**—Contexts are fully specified. • **true**—Contexts are wildcarded.
TriggerFrequency	Trigger sampling interval.
TriggerObjOwner	Owner of the trigger object.
TriggerObjName	Name of the trigger object.
TriggerEnabled	Trigger status: • **true**—The trigger is enabled. • **false**—The trigger is disabled..
Existence entry	
ExiTest	Type of the existence trigger test: • present. • absent. • changed.
ExiStartUp	Type of the existence trigger test for the first sampling: • present. • absent. • changed.
ExiObjOwner	Owner of the existence trigger test object.
ExiObjName	Name of the existence trigger test object.
ExiEvtOwner	Owner of the existence trigger test event.
ExiEvtName	Name of the existence trigger test event.
Boolean entry	
BoolCmp	Boolean trigger test type: • unequal. • equal. • less. • lessOrEqual. • greater. • greaterOrEqual.

Field	Description
BoolValue	Reference value for the Boolean trigger test.
BoolStartUp	Whether the event is enabled for the first sampling: • **true**—The event is enabled for the first sampling. • **false**—The event is disabled for the first sampling.
BoolObjOwner	Owner of the Boolean trigger test object.
BoolObjName	Name of the Boolean trigger test object.
BoolEvtOwner	Owner of the Boolean event.
BoolEvtName	Name of the Boolean event.
Threshold entry	
ThresStartUp	Threshold trigger test for the first sampling: • rising. • falling. • risingOrFalling.
ThresRising	Rising threshold.
ThresFalling	Falling threshold.
ThresDeltaRising	Delta rising threshold.
ThresDeltaFalling	Delta falling threshold.
ThresObjOwner	Owner of the threshold test object.
ThresObjName	Name of the threshold test object.
ThresRisEvtOwner	Owner of the rising event.
ThresRisEvtName	Name of the rising event.
ThresFalEvtOwner	Owner of the falling event.
ThresFalEvtName	Name of the falling event.
ThresDeltaRisEvtOwner	Owner of the Delta rising event.
ThresDeltaRisEvtName	Name of the Delta rising event.
ThresDeltaFalEvtOwner	Owner of the Delta falling event.
ThresDeltaFalEvtName	Name of the Delta falling event.

Related commands

`snmp mib event trigger`

event (trigger-Boolean view)

Use **`event`** to specify an event for a Boolean trigger test.

Use **`undo event`** to restore the default.

Syntax

`event owner` *`event-owner`* **`name`** *`event-name`*

`undo event`

Default

No event is specified for a Boolean trigger test.

Views

Trigger-Boolean view

Predefined user roles

network-admin

context-admin

Parameters

owner *event-owner*: Specifies the owner of an event. Use the trigger owner as the event owner.

name *event-name*: Specifies the name of an event, a case-sensitive string of 1 to 32 characters.

Examples

Specify an event for a Boolean trigger test.

```
<Sysname> system-view
[Sysname] snmp mib event trigger owner owner1 name triggerA
[Sysname-trigger-owner1-triggerA] test boolean
[Sysname-trigger-owner1-triggerA-boolean] event owner owner1 name event1
```

Related commands

snmp mib event trigger

test

event (trigger-existence view)

Use **event** to specify an event for an existence trigger test.

Use **undo event** to restore the default.

Syntax

event owner *event-owner* **name** *event-name*

undo event

Default

No event is specified for an existence trigger test.

Views

Trigger-existence view

Predefined user roles

network-admin

context-admin

Parameters

owner *event-owner*: Specifies the owner of an event. Use the trigger owner as the event owner.

name *event-name*: Specifies the name of an event, a case-sensitive string of 1 to 32 characters.

Examples

Specify an event for an existence trigger test.

```
<Sysname> system-view
```

```
[Sysname] snmp mib event trigger owner owner1 name triggerA
[Sysname-trigger-owner1-triggerA] test existence
[Sysname-trigger-owner1-triggerA-existence] event owner owner1 name event1
```

Related commands

snmp mib event trigger

test

event enable

Use **event enable** to enable an event.

Use **undo event enable** to disable an event.

Syntax

event enable

undo event enable

Default

An event is disabled.

Views

Event view

Predefined user roles

network-admin

context-admin

Usage guidelines

For an event to be triggered when the trigger condition is met, execute the **event enable** command.

Examples

Enable the event identified by owner **owner1** and name **EventA**.

```
<Sysname> system-view
[Sysname] snmp mib event owner owner1 name EventA
[Sysname-event-owner1-EventA] event enable
```

Related commands

action

snmp mib event

falling

Use **falling** to set a falling threshold and specify a falling event.

Use **undo falling** to restore the default.

Syntax

falling { **event owner** *event-owner* **name** *event-name* | **value** *integer-value* }

undo falling { **event** | **value** }

Default

The falling threshold is 0, and no falling event is specified.

Views

Trigger-threshold view

Predefined user roles

network-admin

context-admin

Parameters

event owner *event-owner*: Specifies the owner of an event. Use the trigger owner as the event owner.

name *event-name*: Specifies the name of an event, a case-sensitive string of 1 to 32 characters.

value *integer-value*: Specifies a falling threshold in the range of –2147483648 to 2147483647. The value must be smaller than or equal to the rising threshold.

Usage guidelines

A falling event is triggered if the value of the monitored object is smaller than or equal to the falling threshold.

If the value of the monitored object crosses the falling threshold at two or more samplings in succession, the event is triggered only at the first sampling.

Examples

Set the falling threshold to 20.

```
<Sysname> system-view
[Sysname] snmp mib event trigger owner owner1 name triggerA
[Sysname-trigger-owner1-triggerA] test threshold
[Sysname-trigger-owner1-triggerA-threshold] falling value 20
```

Related commands

sample

snmp mib event trigger

test

frequency

Use **frequency** to set a sampling interval.

Use **undo event** to restore the default.

Syntax

frequency *interval*

undo frequency

Default

The sampling interval is 600 seconds.

Views

Trigger view

Predefined user roles

network-admin

context-admin

Parameters

interval: Specifies a sampling interval in the range of 1 to 4294967295 seconds. The sampling interval must be greater than or equal to the minimum sampling interval.

Usage guidelines

To set the minimum sampling interval, execute the **snmp mib event sample minimum** command.

To avoid sampling failure, do not set the sampling interval too small when there are a large number of sampled objects.

Examples

Set the sampling interval for a trigger to 360 seconds.

```
<Sysname> system-view
[Sysname] snmp mib event trigger owner owner1 name triggerA
[Sysname-trigger-owner1-triggerA] frequency 360
```

Related commands

snmp mib event sample minimum

snmp mib event trigger

object list (action-notification view)

Use **object list** to specify an object list for a notification action. The objects in the list will be added to the notification when the notification action is triggered.

Use **undo object list** to restore the default.

Syntax

object list owner *group-owner* **name** *group-name*

undo object list

Default

No object list is specified for a notification action.

Views

Action-notification view

Predefined user roles

network-admin

context-admin

Parameters

owner *group-owner*: Specifies an object list owner. Use the event owner as the object list owner.

name *group-name*: Specifies an object list name, a case-sensitive string of 1 to 32 characters.

Usage guidelines

If you do not specify an object list for a notification action or the specified object list does not contain objects, no objects will be added to the triggered notification.

For more information, see "object list (trigger view)."

Examples

Specify the object list identified by owner **owner1** and name **listA** for the event identified by owner **owner1** and name **EventA**.

```
<Sysname> system-view
[Sysname] snmp mib event owner owner1 name EventA
[Sysname-event-owner1-EventA] action notification
[Sysname-event-owner1-EventA-notification] object list owner owner1 name listA
```

Related commands

action

snmp mib event owner

object list (trigger view)

Use **object list** to specify an object list for a trigger. The objects in the list will be added to the triggered notification.

Use **undo object list** to restore the default.

Syntax

object list owner *group-owner* **name** *group-name*

undo object list

Default

No object list is specified for a trigger.

Views

Trigger view

Predefined user roles

network-admin

context-admin

Parameters

owner *group-owner*: Specifies an object list owner. Use the trigger owner as the object list owner.

name *group-name*: Specifies an object list name, a case-sensitive string of 1 to 32 characters.

Usage guidelines

An object list is identified by its owner and name. After you specify a list of objects for a trigger, the objects in the list are added to the notification when the notification action is triggered.

You can configure the **object list** command in trigger view, trigger-test view (including trigger-Boolean view, trigger existence view, and trigger threshold view), and action-notification view. If the command is configured in any two of the views or all the three views, the object lists are added to the notification in the sequence: trigger view, trigger-test view, and action-notification view.

Examples

Specify the object list identified by owner **owner1** and name **objectA** for a trigger.

```
<Sysname> system-view
[Sysname] snmp mib event trigger owner owner1 name triggerA
[Sysname-trigger-owner1-triggerA] object list owner owner1 name objectA
```

Related commands

snmp mib event trigger

object list (trigger-Boolean view)

Use **object list** to specify an object list for a Boolean trigger test. The objects in the list will be added to the notification triggered by the test.

Use **undo object list** to restore the default.

Syntax

object list owner *group-owner* **name** *group-name*

undo object list

Default

No object list is specified for a Boolean trigger test.

Views

Trigger-Boolean view

Predefined user roles

network-admin

context-admin

Parameters

owner *group-owner*: Specifies an object list owner. Use the trigger owner as the object list owner.

name *group-name*: Specifies an object list name, a case-sensitive string of 1 to 32 characters.

Usage guidelines

For more information, see "object list (trigger view)."

Examples

Specify the object list identified by owner **owner1** and name **objectA** for the trigger-Boolean trigger test.

```
<Sysname> system-view
[Sysname] snmp mib event trigger owner owner1 name triggerA
[Sysname-trigger-owner1-triggerA] test boolean

object list (trigger-existence view)

Use **object list** to specify an object list for an existence trigger test. The objects in the list will be added to the notification triggered by the test.

Use **undo object list** to restore the default.

Syntax

object list owner *group-owner* **name** *group-name*

undo object list

Default

No object list is specified for an existence trigger test.

Views

Trigger- existence view

Predefined user roles

network-admin

context-admin

Parameters

owner *group-owner*: Specifies an object list owner. Use the trigger owner as the object list owner

name *group-name*: Specifies an object list name, a case-sensitive string of 1 to 32 characters.

Usage guidelines

For more information, see "object list (trigger view)."

Examples

Specify the object list identified by owner **owner1** and name **objectA** for the existence trigger test.

```
<Sysname> system-view
[Sysname] snmp mib event trigger owner owner1 name triggerA
[Sysname-trigger-owner1-triggerA] test existence
[Sysname-trigger-owner1-triggerA-existence] object list owner owner1 name objectA

Syntax

oid *object-identifier*

undo oid

Default

The OID is 0.0. No MIB object is specified for trigger sampling.

Views

Trigger view

Predefined user roles

network-admin

context-admin

Parameters

object-identifier: Specifies an object by its OID or name, a case-sensitive string of 1 to 255 characters. The object can be a table node, conceptual row node, table column node, leaf node, or parent leaf node.

Examples

Specify the object identified by OID **1.3.6.1.2.1.2.2.1.1.3** for trigger sampling.

```
<Sysname> system-view
[Sysname] snmp mib event trigger owner owner1 name triggerA
[Sysname-trigger-owner1-triggerA] oid 1.3.6.1.2.1.2.2.1.1.3
```

Related commands

snmp mib event trigger

rising

Use **rising** to specify a rising threshold.

Use **undo rising** to restore the default.

Syntax

rising { **event owner** *event-owner* **name** *event-name* | **value** *integer-value* }

undo rising { **event** | **value** }

Default

The rising threshold is 0, and no rising event is specified.

Views

Trigger-threshold view

Predefined user roles

network-admin

context-admin

Parameters

event owner *event-owner*: Specifies an event owner. Use the trigger owner as the event owner.

name *event-name*: Specifies an event name, a case-sensitive string of 1 to 32 characters.

value *integer-value*: Specifies a rising threshold in the range of –2147483648 to 2147483647. The value must be greater than or equal to the falling threshold.

Usage guidelines

If the value of the monitored object crosses the rising threshold at two or more samplings in succession, an event is triggered only at the first sampling.

Examples

Set the rising threshold to 50 and specify the rising event identified by owner **owner1** and name **event1** for the threshold test.

```
<Sysname> system-view
```

```
[Sysname] snmp mib event trigger owner owner1 name triggerA
[Sysname-trigger-owner1-triggerA] test threshold
[Sysname-trigger-owner1-triggerA-threshold] rising value 50
[Sysname-trigger-owner1-triggerA-threshold] rising event owner owner1 name event1
```

Related commands

sample

snmp mib event trigger

test

sample

Use **sample** to specify a sampling method.

Use **undo sample** to restore the default.

Syntax

sample { **absolute** | **delta** }

undo sample

Default

The sampling method is **absolute**.

Views

Trigger view

Predefined user roles

network-admin

context-admin

Parameters

absolute: Specifies the absolute sampling method. Use the current sampled value.

delta: Specifies the delta sampling method. Use the difference between the current sampled value and previous sampled value.

Usage guidelines

For delta sampling, obtain the difference between the current sampled value and previous sampled value as follows:

- If the object value is UINT type, use the larger value to subtract the smaller value.
- If the object value is INT type, use the present sampled value to subtract the previous sampled value.

Examples

Specify the absolute sampling method.

```
<Sysname>system-view
[Sysname] snmp mib event trigger owner owner1 name triggerA
[Sysname-trigger-owner1-triggerA] sample absolute
```

Related commands

snmp mib event trigger

snmp mib event

Use **snmp mib event** to create an event and enter its view, or enter the view of an existing event.

Use **undo snmp mib event** to remove an event.

Syntax

description

event enable

snmp mib event

snmp mib event object list

Use **snmp mib event object list** to configure an Event MIB object list.

Use **undo snmp mib event object list** to restore the default.

Syntax

snmp mib event object list owner *group-owner* **name** *group-name object-index* **oid** *object-identifier* [**wildcard**]

undo snmp mib event object list owner *group-owner* **name** *group-name object--index*

Default

No Event MIB object list is configured.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

owner *group-owner*: Specifies an object list owner. The object list owner must be an existing SNMPv3 user.

name *group-name*: Specifies an object list name, a case-sensitive string of 1 to 32 characters.

object-index argument: Specifies an object list index in the range of 1 to 4294967295.

oid *object-identifier*: Specifies an object by its OID or name, a case-sensitive string of 1 to 255 characters. The object can be a table node, a conceptual row node, a table column node, a leaf mode, or a parent leaf node.

wildcard: Enables wildcard search for objects. If you do not specify this keyword, the object is specified.

Usage guidelines

An object list is identified by its owner, name, and index. The specified objects in the object list will be carried in the triggered notification to the NMS.

Examples

Configure an object list identified by owner **owner1**, name **objectA**, and index **10**. Specify the object identified by OID **1.3.6.1.2.1.2.2.1.1.3** to be carried in the triggered notification.

```
<Sysname> system-view
[Sysname] snmp mib event object list owner owner1 name objectA 10 oid 1.3.6.1.2.1.2.2.1.1.3
```

Related commands

snmp mib event

snmp mib event trigger

snmp mib event sample instance maximum

Use **snmp mib event sample instance maximum** to specify the maximum number of object instances that can be concurrently sampled.

Use **undo snmp mib event sample instance maximum** to restore the default.

Syntax

snmp mib event sample instance maximum *max-number*

undo snmp mib event sample instance maximum

Default

The maximum number of object instances that can be concurrently sampled is limited by the available resources. The value is 0.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

max-number: Specifies the maximum number of object instances that can be concurrently sampled. The value is in the range of 0 to 4294967295.

Usage guidelines

If you use the wildcard option for an object, Event MIB also samples the wildcarded object instances. Include the wildcarded object instances when you calculate the number of the concurrently sampled instances.

Changing the maximum number of object instances that can be concurrently sampled does not affect the existing instances. If the maximum number of object instances that can be concurrently sampled is changed to a value smaller than the number of existing instances, the existing instances will continue to be sampled.

Examples

Set the maximum number to 10 for the object instances that can be concurrently sampled.

```
<Sysname> system-view
[Sysname] snmp mib event sample instance maximum 10
```

Related commands

snmp mib event sample minimum

snmp mib event sample minimum

Use **snmp mib event sample minimum** to specify the minimum sampling interval.

Use **undo snmp mib event sample minimum** to restore the default.

Syntax

snmp mib event sample minimum *min-number*

undo snmp mib event sample minimum

Default

The minimum sampling interval is 1 second.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

min-number: Specifies the minimum sampling interval in the range of 1 to 2147483647, in seconds.

Usage guidelines

After you configure the minimum sampling interval, make sure the trigger sampling interval is greater than or equal to the minimum sampling interval.

Changing the minimum sampling interval does not affect the existing instances. If the minimum sampling interval is changed to a value smaller than the sampling interval of a trigger, the existing instances of the trigger will continue to be sampled at its interval.

Examples

Set the minimum sampling interval to 50 seconds.

```
<Sysname> system-view
[Sysname] snmp mib event sample minimum 50
```

Related commands

frequency

snmp mib event trigger

snmp mib event trigger

Use **snmp mib event trigger** to create a trigger and enter its view, or enter the view of an existing trigger.

Use **undo snmp mib event trigger** to remove a trigger.

Syntax

snmp mib event trigger owner *trigger-owner* **name** *trigger-name*

undo snmp mib event trigger owner *trigger-owner* **name** *trigger-name*

Default

No trigger exists.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

trigger-owner: Specifies a trigger owner, which must be an existing SNMPv3 user.

trigger-name: Specifies a trigger name, a case-sensitive string of 1 to 32 characters.

Usage guidelines

A trigger is identified by its owner and name. In trigger view, you can specify a monitored object and set an interval for sampling the object. An event is triggered when the sampled object meets the trigger condition.

If the trigger owner has no read access to the monitored object configured in trigger view, sampling on the object cannot be performed. For more information about SNMPv3 user access rights, see *Network Management and Monitoring Configuration Guide*.

Examples

Create a trigger identified by owner **owner1** and name **triggerA**.

```
<Sysname> system-view
[Sysname] snmp mib event trigger owner owner1 name triggerA
[Sysname-trigger-owner1-triggerA]
```

snmp-agent trap enable event-mib

Use **snmp-agent trap enable event-mib** to enable the Event MIB trap feature.

Use **undo snmp-agent trap enable event-mib** to disable the Event MIB trap feature.

Syntax

snmp-agent trap enable event-mib

undo snmp-agent trap enable event-mib

Default

The Event MIB trap feature is enabled.

Views

System view

Predefined user roles

network-admin

context-admin

Usage guidelines

After you enable the Event MIB trap feature, traps are generated when object sampling fails or a trigger condition is met and sent to the SNMP module. Traps include trigger trap, rising threshold break trap, falling threshold break trap, trigger-condition detection failure trap, and set-action trigger failure trap.

For the traps to be sent correctly, you must also configure SNMP on the device. For more information about SNMP configuration, see *Network Management and Monitoring Configuration Guide*.

Examples

Enable the event MIB trap feature.

```
<Sysname> system-view
[Sysname] snmp-agent trap enable event-mib
```

startup (trigger-existence view)

Use **startup** to specify existence trigger test types for the first sampling.

Use **undo startup** to remove the existence trigger test types for the first sampling.

Syntax

startup { **absent** | **present** }

undo startup { **absent** | **present** }

Default

The existence trigger test types for the first sampling are **present** and **absent**.

Views

Trigger-existence view

Predefined user roles

network-admin

context-admin

Parameters

absent: Monitors the absence of a MIB object.

present: Monitors the presence of a MIB object.

Usage guidelines

For the first sampling, an event is triggered when the following conditions are met:

- Both the **startup** and **type** commands specify the existence test type as present and the state of the monitored object changes to present at the first sampling. If the monitored objects are wildcarded, the event is triggered independently for each wildcarded object.
- Both the **startup** command and **type** commands specify the existence trigger test type as absent and the state of the monitored object changes to absent at the first sampling. If the monitored objects are wildcarded, no event is triggered.

Examples

Remove the present test configuration for the first sampling.

```
<Sysname> system-view
[Sysname] snmp mib event trigger owner owner1 name triggerA
[Sysname-trigger-owner1-triggerA] test existence
[Sysname-trigger-owner1-triggerA-existence] undo startup present
```

Related commands

type

startup (trigger-threshold view)

Use **startup** to specify a threshold trap type for the first sampling.

Use **undo startup** to restore the default.

Syntax

startup { **falling** | **rising** | **rising-or-falling** }

undo startup

Default

The threshold trap type for the first sampling is **rising-or-falling**.

Views

Trigger-threshold view

Predefined user roles

network-admin

context-admin

Parameters

falling: Specifies the falling trap.

rising: Specifies the rising trap.

rising-or-falling: Specifies the rising or falling trap.

Usage guidelines

If the trap type for the first sampling is **rising** or **rising-or-falling**, a rising trap is triggered when the first sample value is greater than or equal to the rising threshold.

If the trap type for the first sampling is **rising** or **rising-or-falling**, a falling trap is triggered when the first sample value is smaller than or equal to the rising threshold.

If the first sampling fails or the monitored object does not exist at the first sampling, the second sampling is considered the first sampling.

Examples

Specify the rising trap for the first sampling.

```
<Sysname> system-view
[Sysname] snmp mib event trigger owner owner1 name triggerA
[Sysname-trigger-owner1-triggerA] test threshold
[Sysname-trigger-owner1-triggerA-threshold] startup rising
```

test

startup enable

Use **startup enable** to enable an event to be triggered for the first Boolean sampling.

Use **undo startup enable** to disable an event to be triggered for the first Boolean sampling.

Syntax

startup enable

undo startup enable

Default

An event is triggered for the first Boolean sampling.

Views

Trigger-Boolean view

Predefined user roles

network-admin

context-admin

Usage guidelines

For an event to be triggered when a trigger condition is met at the first Boolean sampling, execute the **startup enable** command.

If the first sampling fails or the monitored object does not exist at the first sampling, the second sampling is considered the first sampling.

Examples

Trigger an event for the first Boolean sampling.

```
<Sysname> system-view
[Sysname] snmp mib event trigger owner owner1 name triggerA
[Sysname-trigger-owner1-triggerA] test boolean
[Sysname-trigger-owner1-triggerA-boolean] startup enable
```

type

Use **type** to specify existence trigger test types.

Use **undo type** to remove the existence trigger test types.

Syntax

type { **absent** | **changed** | **present** }

undo type { **absent** | **changed** | **present** }

Default

The existence trigger test types are **present** and **absent**.

Views

Trigger-existence view

Predefined user roles

network-admin

context-admin

Parameters

absent: Monitors the absence of an object.

changed: Monitors the change of the value of an object. If the last sampling does not obtain a value, the event is not triggered.

present: Monitors the presence of an object.

Usage guidelines

For the first sampling, see "startup (trigger-existence view)".

The existence trigger tests also apply to the wildcarded instances of the monitor object.

Examples

Specify the existence trigger test type as **present**.

```
<Sysname> system-view
[Sysname] snmp mib event trigger owner owner1 name triggerA
[Sysname-trigger-owner1-triggerA] test existence
[Sysname-trigger-owner1-triggerA-existence] type present

cwmp enable

cwmp acs default password

Use **cwmp acs default password** to configure a password for authentication to the default ACS URL.

Use **undo cwmp acs default password** to restore the default.

Syntax

cwmp acs default password { **cipher** | **simple** } *string*

undo cwmp acs default password

Default

No password is configured for authentication to the default ACS URL.

Views

CWMP view

Predefined user roles

network-admin

context-admin

Parameters

cipher: Specifies a password in encrypted form.

simple: Specifies a password in plaintext form. For security purposes, the password specified in plaintext form will be stored in encrypted form.

string: Specifies the password. Its plaintext form is a case-sensitive string of 1 to 255 characters. Its encrypted form is a case-sensitive string of 33 to 373 characters.

Usage guidelines

You can configure only one password for authentication to the default ACS URL. If you execute this command multiple times, the most recent configuration takes effect.

For a successful connection, make sure the CPE has the same username and password settings as the ACS.

Examples

Configure the password used for authentication to the default ACS URL.

```
<Sysname> system-view
[Sysname] cwmp
[Sysname-cwmp] cwmp acs default password simple newpsw
```

Related commands

cwmp acs default url

Use **cwmp acs default url** to specify a default ACS URL.

Use **undo cwmp acs default url** to restore the default.

Syntax

cwmp acs default url *url*

undo cwmp acs default url

Default

No default ACS URL is specified.

Views

CWMP view

Predefined user roles

network-admin

context-admin

Parameters

url: Specifies the default ACS URL, a string of 8 to 255 characters. The URL must use the **http://***host[:port]/path* or **https://***host[:port]/path* format.

Usage guidelines

The CPE attempts to connect to the default ACS URL if no ACS URL has been assigned to it through the **cwmp acs url** command or DHCP.

You can configure only one default ACS URL. If you execute this command multiple times, the most recent configuration takes effect.

Examples

Specify the default ACS URL.

```
<Sysname> system-view
[Sysname] cwmp
[Sysname-cwmp] cwmp acs default url http://www.acs.com:9090
```

Use **undo cwmp acs default username** to restore the default.

Syntax

cwmp acs default username *username*

undo cwmp acs default username

Default

No username is configured for authentication to the default ACS URL.

Views

CWMP view

Predefined user roles

network-admin

context-admin

Parameters

username: Specifies a username, a case-sensitive string of 1 to 255 characters.

Usage guidelines

You can configure only one username for authentication to the default ACS URL. If you execute this command multiple times, the most recent configuration takes effect.

For a successful connection, make sure the CPE has the same username and password settings as the ACS.

Examples

Configure the username for authentication to the default ACS URL.

```
<Sysname> system-view
[Sysname] cwmp
[Sysname-cwmp] cwmp acs default username newname
```

Related commands

cwmp acs default password

cwmp acs default url

cwmp acs password

Use **cwmp acs password** to configure the password for authentication to the preferred ACS URL.

Use **undo cwmp acs password** to restore the default.

Syntax

cwmp acs password { **cipher** | **simple** } *string*

undo cwmp acs password

Default

No password is configured for authentication to the preferred ACS URL.

Views

CWMP view

Predefined user roles

network-admin

context-admin

Parameters

cipher: Specifies a password in encrypted form.

simple: Specifies a password in plaintext form. For security purposes, the password specified in plaintext form will be stored in encrypted form.

string: Specifies the password. Its plaintext form is a case-sensitive string of 1 to 255 characters. Its encrypted form is a case-sensitive string of 33 to 373 characters.

Usage guidelines

You can configure only one password for authentication to the preferred ACS URL. If you execute this command multiple times, the most recent configuration takes effect.

For a successful connection, make sure the CPE has the same username and password settings as the ACS.

Examples

Configure the password used for authentication to the preferred ACS URL.

```
<Sysname> system-view
[Sysname] cwmp
[Sysname-cwmp] cwmp acs password simple newpsw
```

Use **undo cwmp acs url** to restore the default.

Syntax

cwmp acs url *url*

undo cwmp acs url

Default

No preferred ACS URL is specified.

Views

CWMP view

Predefined user roles

network-admin

context-admin

Parameters

url: Specifies the preferred ACS URL, a string of 8 to 255 characters. The URL must use the **http://***host[:port]/path* or **https://***host[:port]/path* format.

Usage guidelines

The device supports only one preferred ACS URL. If you execute this command multiple times, the most recent configuration takes effect.

The preferred ACS URL is configurable from the CPE's CLI, the DHCP server, and the ACS. The CLI- and ACS-assigned URLs have higher priority than the DHCP-assigned URL. The CLI- and ACS-assigned URLs overwrite each other.

The CPE uses the default ACS attributes for connection establishment only when it is not assigned a preferred ACS URL from the CLI, ACS, or DHCP server.

Examples

Specify the ACS URL.

```
<Sysname> system-view
[Sysname] cwmp
[Sysname-cwmp] cwmp acs url http://www.acs.com:9090
```

cwmp acs username

Use **cwmp acs username** to configure the username for authentication to the preferred ACS URL.

Use **undo cwmp acs username** to restore the default.

Syntax

cwmp acs username *username*

undo cwmp acs username

Default

No username is configured for authentication to the preferred ACS URL.

cwmp cpe connect interface

Use **cwmp cpe connect interface** to specify the CWMP connection interface.

Use **undo cwmp cpe connect interface** to restore the default.

Syntax

cwmp cpe connect interface *interface-type interface-number*

undo cwmp cpe connect interface

Default

No CWMP connection interface is specified.

Views

CWMP view

Predefined user roles

network-admin

context-admin

Parameters

interface-type interface-number: Specifies the type and number of the CWMP connection interface.

Usage guidelines

A CWMP connection interface is the interface that the CPE uses to communicate with the ACS. To establish a CWMP connection, the CPE sends the IP address of this interface in the Inform message, and the ACS replies to this IP address.

Typically, the CPE selects the CWMP connection interface automatically. If the CWMP connection interface is not the interface that connects the CPE to the ACS, the CPE fails to establish a CWMP connection with the ACS. For example, an incorrect CWMP connection interface selection occurs when the following conditions exist:

- The CPE has multiple Layer 3 interfaces.
- The IP addresses of the CWMP connection interface and the ACS are not in the same subnet.

In this case, you need to use this command to manually specify the CWMP connection interface.

Examples

Specify GigabitEthernet 1/0/1 as the CWMP connection interface.

```
<Sysname> system-view
[Sysname] cwmp
[Sysname-cwmp] cwmp cpe connect interface gigabitethernet 1/0/1
```

cwmp cpe connect retry

Use **cwmp cpe connect retry** to set the maximum number of attempts the CPE can make to retry a failed CWMP connection.

Use **undo cwmp cpe connect retry** to restore the default.

Syntax

cwmp cpe connect retry *retries*

undo cwmp cpe connect retry

Default

The CPE retries a failed connection until the connection is established with the ACS.

Views

CWMP view

Predefined user roles

network-admin

context-admin

Parameters

retries: Specifies the maximum number of CWMP connection retries. The value range is 0 to 100. To disable the CPE to retry a CWMP connection, set this argument to 0.

Usage guidelines

The CPE retries connecting to the ACS when its initial connection attempt fails or the CWMP session is ended before the CPE receives a session closed message from the ACS. The CPE does not stop its connection retry attempts until the connection is established or the number of connection retries reaches the upper limit.

Examples

Set the maximum number of CWMP connection retries to 5.

```
<Sysname> system-view
[Sysname] cwmp
[Sysname-cwmp] cwmp cpe connect retry 5
```

cwmp cpe inform interval

Use **cwmp cpe inform interval** to set the periodic Inform interval.

Use **undo cwmp cpe inform interval** to restore the default.

Syntax

cwmp cpe inform interval *interval*

undo cwmp cpe inform interval

Default

The periodic Inform interval is 600 seconds.

Views

CWMP view

Predefined user roles

network-admin

context-admin

Parameters

interval: Sets the periodic Inform interval in the range of 10 to 86400 seconds.

Usage guidelines

This command sets the interval for the CPE to send Inform messages automatically to the ACS. For the command to take effect, you must configure the **cwmp cpe inform interval enable** command.

Examples

Set the periodic Inform interval to 3600 seconds.

```
<Sysname> system-view
[Sysname] cwmp
[Sysname-cwmp] cwmp cpe inform interval enable
[Sysname-cwmp] cwmp cpe inform interval 3600
```

Related commands

cwmp cpe inform interval enable

cwmp cpe inform interval enable

Use **cwmp cpe inform interval enable** to enable the periodic Inform feature.

Use **undo cwmp cpe inform interval enable** to disable the periodic Inform feature.

Syntax

cwmp cpe inform interval enable

undo cwmp cpe inform interval enable

Default

The CPE does not send Inform messages periodically.

Views

CWMP view

Predefined user roles

network-admin

context-admin

Usage guidelines

If this command is configured, the CPE sends Inform messages regularly to establish a CWMP session with the ACS. To set the periodic Inform interval, use the **cwmp cpe inform interval** command.

Examples

Enable the periodic Inform feature.

```
<Sysname> system-view
[Sysname] cwmp
[Sysname-cwmp] cwmp cpe inform interval enable
```

Related commands

cwmp cpe inform interval

cwmp cpe inform time

Use **cwmp cpe inform time** to schedule a connection initiation for the CPE to connect to the ACS.

Use **undo cwmp cpe inform time** to restore the default.

Syntax

cwmp cpe inform time *time*

undo cwmp cpe inform time

Default

No connection initiation has been scheduled.

Views

CWMP view

Predefined user roles

network-admin

context-admin

Parameters

time: Specifies the time at which the CPE sends an Inform message. The time format is *yyyy-mm-dd*T*hh:mm:ss*, and the value range is 1970-01-01T00:00:00 to 2035-12-31T23:59:59. The specified time must be greater than the current system time.

Examples

Configure the CPE to send an Inform message at 2007-12-01T20:00:00.

```
<Sysname> system-view
[Sysname] cwmp
[Sysname-cwmp] cwmp cpe inform time 2012-12-01T20:00:00
```

cwmp cpe password

Use **cwmp cpe password** to configure the password for the CPE to authenticate the ACS.

Use **undo cwmp cpe password** to restore the default.

Syntax

cwmp cpe password { **cipher** | **simple** } *string*

undo cwmp cpe password

Default

No password is configured for authenticating the ACS.

Views

CWMP view

Predefined user roles

network-admin

context-admin

Parameters

cipher: Specifies a password in encrypted form.

simple: Specifies a password in plaintext form. For security purposes, the password specified in plaintext form will be stored in encrypted form.

string: Specifies the password. Its plaintext form is a case-sensitive string of 1 to 255 characters. Its encrypted form is a case-sensitive string of 33 to 373 characters.

Usage guidelines

You can configure only one password for the ACS to authenticate to the CPE when it initiates a connection. If you execute this command multiple times, the most recent configuration takes effect.

For a successful connection, make sure the ACS has the same username and password settings as the CPE.

If a password is configured, the ACS must provide the correct password when it initiates a connection to the CPE. If the password is incorrect, the CPE denies the connection request from the ACS.

You do not need to configure this command if you want to authenticate the ACS only based on its username.

Examples

Configure the password used for authenticating the ACS.

```
<Sysname> system-view
[Sysname] cwmp
[Sysname-cwmp] cwmp cpe password simple newpsw
```

Related commands

cwmp cpe username

cwmp cpe provision-code

Use **cwmp cpe provision-code** to configure the provision code of the CPE.

Use **undo cwmp cpe provision-code** to restore the default.

Syntax

cwmp cpe provision-code *provision-code*

undo cwmp cpe provision-code

Default

The provision code is **PROVISIONINGCODE**.

Views

CWMP view

Predefined user roles

network-admin

context-admin

Parameters

provision-code: Specifies a provision code, a string of 1 to 64 characters. The string can contain uppercase letters, digits, and the full stop (.).

Usage guidelines

The ACS can use the provision code to identify services assigned to each CPE. For correct configuration deployment, make sure the same provision code is configured on the CPE and the ACS. For information about the support of your ACS for provision codes, see the ACS documentation.

The CPE can have only one provision code. If you execute this command multiple times, the most recent configuration takes effect.

Examples

Set the provision code to **ABC20150714**.

```
<Sysname> system
[Sysname] cwmp
[Sysname-cwmp] cwmp cpe provision-code ABC20150714
```

cwmp cpe stun enable

Use **cwmp cpe stun enable** to enable NAT traversal for the connection requests from the ACS to reach the CPE through a NAT gateway.

Use **undo cwmp cpe stun enable** to disable NAT traversal for the connection requests from the ACS to reach the CPE through a NAT gateway.

Syntax

cwmp cpe stun enable

undo cwmp cpe stun enable

Default

NAT traversal is disabled for CWMP.

Views

CWMP view

Predefined user roles

network-admin

context-admin

Usage guidelines

Connection requests initiated from the CPE can reach the ACS through a NAT gateway without NAT traversal. However, for the connection request initiated from the ACS to reach the CPE, you must enable NAT traversal on the CPE when a NAT gateway resides between the CPE and the ACS.

The NAT traversal feature complies with *Simple Traversal of UDP Through NATs (STUN)*, RFC 3489. The feature enables the CPE to do the following:

- Discovers the NAT gateway.
- Obtains an open NAT binding (a public IP address and port binding) through which the ACS can send unsolicited packets.

The CPE sends the binding to the ACS when it initiates a connection to the ACS. For the connection requests sent by the ACS at any time to reach the CPE, the CPE maintains the open NAT binding.

For more information about NAT, see *NAT Configuration Guide*.

Examples

Enable NAT traversal for the CPE.

```
<Sysname> system-view
[Sysname] cwmp
[Sysname-cwmp] cwmp cpe stun enable
```

cwmp cpe username

Use **cwmp cpe username** to configure the username for the CPE to authenticate the ACS.

Use **undo cwmp cpe username** to restore the default.

Syntax

cwmp cpe username *username*

undo cwmp cpe username

Default

No username is configured for authenticating the ACS.

Views

CWMP view

Predefined user roles

network-admin

context-admin

Parameters

username: Specifies a username, a case-sensitive string of 1 to 255 characters.

Usage guidelines

You can configure only one username for the ACS to authenticate to the CPE when it initiates a connection. If you execute this command multiple times, the most recent configuration takes effect.

For a successful connection, make sure the ACS has the same username setting as the CPE. If a password is required, you must also make sure the ACS has the same password setting as the CPE.

The ACS must provide the correct username when it initiates a connection to the CPE. If the username is incorrect, the CPE denies the connection request from the ACS.

Examples

Configure the username used for authenticating the ACS.

```
<Sysname> system-view
[Sysname] cwmp
[Sysname-cwmp] cwmp cpe username newname
```

Related commands

cwmp cpe password

cwmp cpe wait timeout

Use **cwmp cpe wait timeout** to set the close-wait timer for the CPE to close an idle connection.

Use **undo cwmp cpe wait timeout** to restore the default.

Syntax

cwmp cpe wait timeout *seconds*

undo cwmp cpe wait timeout

Default

The close-wait timer is 30 seconds.

Views

CWMP view

Predefined user roles

network-admin

context-admin

Parameters

seconds: Sets the close-wait timer, in the range of 30 to 1800 seconds.

Usage guidelines

The close-wait timer has the following functions:

- It specifies the amount of time the connection to the ACS can be idle before it is terminated. The CPE terminates the connection to the ACS if no traffic is transmitted before the timer expires.
- It also specifies the amount of time the CPE waits for the response to a session request. The CPE determines that its session attempt has failed when the timer expires. By default, the CPE retries a failed session until the session is established with the ACS. To limit the number of retries, use the **cwmp cpe connect retry** command.

Examples

Set the close-wait time to 60 seconds.

```
<Sysname> system-view
[Sysname] cwmp
[Sysname-cwmp] cwmp cpe wait timeout 60
```

Related commands

cwmp cpe connect retry

```

Table 1 Command output

Field	Description
CWMP state	Status of CWMP: **Enabled** or **Disabled**.
ACS URL	Preferred ACS URL. This field displays **Null** if no preferred ACS URL has been specified.
ACS username	Username for the CPE to authenticate to the ACS. This field displays **Null** if no username has been configured for authentication to the preferred ACS URL.
ACS default URL	Default ACS URL. This field displays **Null** if no default ACS URL has been configured.

Field	Description
ACS default username	Username for the CPE to authenticate to the default ACS URL. This field displays **Null** if no username has been configured for authentication to the default ACS URL.
Periodic inform	Status of the periodic Inform feature: **Enabled** or **Disabled**.
Inform interval	Periodic Inform interval. The default interval is 600 seconds.
Inform time	Date and time at which an Inform message is scheduled to be sent. If you do not schedule an Inform sending, this field displays **None**.
Wait timeout	Close-wait timer. This timer is configurable with the **cwmp cpe wait timeout** command.
Connection retries	Number of attempts the CPE can make to retry a failed CWMP connection. This field displays **Unlimited** if the default setting is used. The CPE retries a failed session until the session is established with the ACS.
Source IP interface	IP address of the specified CWMP connection interface. This field displays **None** if you have not specified a CWMP connection interface.
STUN state	Status of NAT traversal for CWMP: **Enabled** or **Disabled**.
SSL policy name	SSL client policy specified for the CPE to authenticate the ACS for establishing an HTTPS connection. You must specify an SSL client policy when HTTPS is used. This field displays **Null** if you have not specified an SSL client policy.

ACS URL of most recent connection         : http://www.acs.com:9090
ACS information source                    : User
ACS username of most recent connection    : newname
Connection status                         : Disconnected
```

```
Data transfer status                          : None
Most recent successful connection attempt     : None
Length of time before next connection attempt : 1096832s
```

Table 2 Command output

Field	Description
CWMP state	Status of CWMP: **Enabled** or **Disabled**.
ACS URL of most recent connection	ACS URL used for the most recent connection attempt. This field displays **Null** if no ACS URL was available.
ACS information source	Source from which the CPE obtained the ACS URL: • **User**—ACS URL assigned by using the **cwmp acs url** command or by ACS. • **DHCP**—ACS URL assigned by the DHCP server. • **Default**—ACS URL assigned by using the **cwmp acs default url** command. This field displays **None** if no ACS URL was available.
ACS username of most recent connection	Username used for the most recent connection to the ACS. This field displays **Null** if no ACS username was available.
Connection status	Current CWMP session status: • **Connected**—A CWMP session has been established to the ACS. • **Disconnected**—No CWMP session has been established to the ACS. • **Waiting response**—The CPE is waiting for the connection response from the ACS.
Data transfer status	Data transfer status of the CPE: • **Uploading**—The CPE is uploading data. • **Downloading**—The CPE is downloading data. • **None**—No data is transferred.
Most recent successful connection attempt	Time of the most recent successful CWMP connection. This field displays **None** if no CWMP session was established.
Length of time before next connection attempt	Amount of time (in seconds) that the CPE must wait before it initiates the next connection. This field displays **None** if the CPE does not detect an event that will trigger a connection attempt.

Related commands

display cwmp configuration

ssl client-policy

Use **ssl client-policy** to specify an SSL client policy for CWMP.

Use **undo ssl client-policy** to restore the default.

Syntax

ssl client-policy *policy-name*

undo ssl client-policy

Default

No SSL client policy is specified for CWMP.

Views

CWMP view

Predefined user roles

network-admin

context-admin

Parameters

policy-name: Specifies the name of an SSL client policy, a string of 1 to 31 characters.

Usage guidelines

CWMP uses HTTP or HTTPS for data transmission. If the ACS uses HTTPS for secure access, its URL begins with **https://**. You must configure an SSL client policy for the CPE to authenticate the ACS for establishing an HTTPS connection. For more information about configuring SSL client policies, see *Security Configuration Guide*.

Examples

Specify the SSL client policy **test** for CWMP.

```
<Sysname> system
[Sysname] cwmp
[Sysname-cwmp] ssl client-policy test
```

Process placement commands

The following compatibility matrixes showsthe support of hardware platforms for process placement:

Models	Process placement compatibility
NFNX5-HD6480, NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB1780, NFNX3-HDB3080, NFNX3-HDB1180, NFNX3-HDB1480	Yes
NFNX3-HDB680, NFNX3-HDB1080	No

affinity location-set

Use **affinity location-set** to set the affinity of a process to a set of CPUs.

Use **undo affinity location-set** to remove the affinity setting for the specified CPUs for a process.

Syntax

affinity location-set { **slot** *slot-number* }&<1-5> { **attract** *strength* | **default** | **none** | **repulse** *strength* }

undo affinity location-set { **slot** *slot-number* }&<1-5>

Default

No location affinity is set for any process.

Views

Placement process view

Predefined user roles

network-admin

context-admin

Parameters

slot *slot-number*: Specifies an IRF member device by its member ID.

&<1-5>: Indicates that you can specify a maximum of five CPUs.

attract *strength*: Sets a positive affinity in the range of 1 to 100000. The higher the value, the stronger the preference for the process to run on the specified CPUs.

default: Sets the affinity to the default, a positive affinity of 200.

none: Sets the affinity to 0, which means the active process has no preference for any location and the system determines its location.

repulse *strength*: Sets a negative affinity in the range of 1 to 100000. The higher the value, the weaker the preference for the process to run on the specified CPUs.

Examples

Set a positive affinity of 500 to the specified slot for the **staticroute** process.

```
<Sysname> system-view
[Sysname] placement program staticroute
```

```
[Sysname-program-staticroute] affinity location-set slot 1 attract 500
```

affinity location-type

Use **affinity location-type** to set the affinity of a process to a location type.

Use **undo affinity location-type** to remove the affinity setting for the specified location type for a process.

Syntax

affinity location-type { **current** | **paired** | **primary** } { **attract** *strength* | **default** | **none** | **repulse** *strength* }

undo affinity location-type { **current** | **paired** | **primary** }

Default

No location type affinity is set for any process.

Views

Placement process view

Predefined user roles

network-admin

context-admin

Parameters

current: Specifies the affinity to the current location of the active process. You can use the **display placement program** command to view the current location of an active process.

paired: Specifies the affinity to the locations of all standby processes.

primary: Specifies the affinity to the master device.

attract *strength*: Sets a positive affinity in the range of 1 to 100000. The higher the value, the stronger the preference of the process to run on the specified location type.

default: Sets the affinity to the default, a positive affinity of 200.

none: Sets the affinity to 0, which means the active process does not have any preference for any location type and the system determines its location.

repulse *strength*: Sets a negative affinity in the range of 1 to 100000. The higher the value, the weaker the preference for the process to run on the specified location type.

Examples

Set a positive affinity of 500 to the current location for the **staticroute** process.

```
<Sysname> system-view
[Sysname] placement program staticroute
[Sysname-program-staticroute] affinity location-type current attract 500
```

Use **undo affinity self** to restore the default.

Syntax

affinity self { **attract** *strength* | **default** | **none** | **repulse** *strength* }

undo affinity self

Default

No self affinity is set for any process.

Views

Placement process view

Predefined user roles

network-admin

context-admin

Parameters

attract *strength*: Specifies a positive affinity in the range of 1 to 100000. The higher the value, the stronger the preference for all the instances of the current process to run on the same location.

default: Sets the affinity to the default, a positive affinity of 200.

none: Sets the affinity to 0, which means the instances of the process have no preference to run on the same location and the system determines their locations.

repulse *strength*: Sets a negative affinity in the range of 1 to 100000. The higher the value, the weaker the preference for all the instances of the current process to run on the same location.

Usage guidelines

This command sets the preference for a process to run all its instances on the same location or different locations. If the process has only one instance, the command does not take effect.

The self affinity set in the placement process view of a process or any of its instances takes effect on all the instances of the process. If you execute this command multiple times, the most recent configuration takes effect.

To view the instances of a process, use the **display placement program all** command.

Examples

Set a negative self affinity of 200 for the **staticroute** process.

```
<Sysname> system-view
[Sysname] placement program staticroute
[Sysname-program-staticroute] affinity self repulse 200
```

Related commands

affinity location-set

affinity location-type

display ha service-group

Use **display ha service-group** to display service group information.

Syntax

display ha service-group { *service-group-name* [**instance** *instance-name*] | **all** }

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

service-group-name: Specifies a service group running on the device. The service group name is a case-insensitive string of 1 to 15 characters.

instance *instance-name*: Specifies a service group instance by its name, a case-insensitive string of 1 to 31 characters.

all: Specifies all service groups running on the device.

Usage guidelines

A service group is a collection of processes. Typically, a service group contains only one process. If a process has instances, the corresponding service group also has instances.

Examples

Display information about all service groups.

```
<Sysname> display ha service-group all
Service Group                     Current Location      State
-------------------------------------------------------------------------------
syslog                            1/0                   Realtime Backup
...
```

Display information about the **staticroute** service group.

```
<Sysname> display ha service-group staticroute
Service Group                     Current Location      State
-------------------------------------------------------------------------------
staticroute                       1/0 (Active)          Realtime Backup
  Detailed information about services of the program:
  Service           PID    Type      Location   State
  ------------------------------------------------------------
  ifm               200    Active    1/0        Realtime Backup
  staticroute       200    Active    1/0        Realtime Backup
```

Table 1 Command output

Field	Description
Service Group	Service group name.
Current Location	Current location of the active processes for a service group.
State	Backup state of the active and standby processes for a service group.
Detailed information about services of the program	Detailed information about all active and standby processes in a service group.
Service	Service name.
PID	Process ID.
Type	Process type: **Active** or **Standby**.

Field	Description
Location	Location of the active process of a service.
State	Process status: • **Realtime Backup**. • **Batch Backup**. • **Stopping**. • **Degrading**. • **Upgrading**.

display placement location

Use **display placement location** to display the processes running on the specified location.

Syntax

display placement location { **all** | **slot** *slot-number* }

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

all: Displays all processes running on the device.

slot *slot-number*: Specifies an IRF member device by its member ID.

Examples

Display all processes running on the device.

```
<Sysname> display placement location all
Program(s) placed at location: 1/0
  syslog
...
```

display placement policy

Use **display placement policy** to display process placement policy information.

Syntax

display placement policy program { *program-name* | **all** | **default** }

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

program-name: Specifies a process by its name, a case-insensitive string of 1 to 15 characters.

all: Displays all process placement policies.

default: Displays the default process placement policy. If no default process placement policy is configured by using the **placement program default** command, the **display placement policy program default** command does not display any information.

Usage guidelines

The information about a placement policy is displayed only when the placement policy is configured for the specified process.

Examples

Display the default process placement policy.

```
<Sysname> display placement policy program default
Program: [default]                                  : source
-------------------------------------------------------------
  affinity location-set slot 1 attract 500          : system [default]
```

Table 2 Command output

Field	Description
Program	Process name and the placement policy for the process. If you execute the **display placement policy program default** command, the process name is displayed as **[default]**.
source	Source of the setting. If a default placement setting is configured in the view you enter with the **placement program default** command, this field displays **system [default]**. If a placement setting for the **staticroute** process is configured in the view you enter with the **placement program** *program-name* command, this field displays **system staticroute**.

display placement program

Use **display placement program** to display the location of an active process.

Syntax

display placement program { *program-name* | **all** }

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

program-name: Specifies a process by its name, a case-insensitive string of 1 to 15 characters.

all: Specifies all processes running on the device.

Examples

Display the location of the **staticroute** active process.

```
<Sysname> display placement program staticroute
Program                          Placed at location
--------------------------------------------------
staticroute                      1/0
```

Table 3 Command output

Field	Description
Program	Process name.
Placed at location	Location of the active process. If the active process is abnormal or is starting up, this field displays **NA**.

display placement reoptimize

Use **display placement reoptimize** to display the predicted location changes that will occur after you execute the **placement reoptimize** command.

Syntax

display placement reoptimize program { *program-name* [**instance** *instance-name*] | **all** }

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

program-name: Specifies a process (that supports process optimization) by its name, a case-insensitive string of 1 to 15 characters.

instance *instance-name*: Specifies an instance of the specified process. The instance name is a case-insensitive string of 1 to 31 characters. Whether a process has multiple instances depends on the system software.

all: Specifies all processes that are running on the device and that support process optimization.

Examples

Display the predicted location changes for all processes.

```
<Sysname> display placement reoptimize program all
Predicted changes to the placement
Program                          Current location       New location
```

```
----------------------------------------------------------------------
staticroute                     1/0                 1/0
...
```

The output shows the process name, current location of the active process, and new location of the active process after optimization.

placement program

Use **placement program** to enter placement process view.

Use **undo placement program** to delete the placement policy for a process.

Syntax

placement program { *program-name* [**instance** *instance-name*] | **default** }

undo placement program { *program-name* [**instance** *instance-name*] | **default** }

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

program-name: Specifies a process name, a case-insensitive string of 1 to 15 characters.

instance *instance-name*: Specifies the name of an instance of the specified process. The instance name is a case-insensitive string of 1 to 31 characters. If you do not specify this option, this command enters process placement policy view and the settings in process placement policy view take effect on all instances. Whether a process has multiple instances depends on the system software.

default: Configures the default placement policy for all processes.

Usage guidelines

You configure a process placement policy to optimize the distribution of processes in your system for optimal distribution of CPU and memory resources.

For an instance of a process, the priorities of the settings in placement policy view of an instance, placement policy view of a process, and the default placement policy view are in descending order. For a process, the settings in placement policy view of the process take precedence over the settings in the default placement policy view.

A process placement policy contains the **affinity location-type**, **affinity location-set**, **affinity program**, and **affinity self** commands. The commands describe the preferences of the process for a specific location.

You can configure all the **affinity** commands in the placement policy for a process. Based on the placement policy and hardware resources, the system automatically determines the location for running the active process. Before you apply the policy, you can use the **display placement reoptimize** command to view the predicted location for the process. When a process switchover occurs, the process on the predicted location is selected as the active process.

Examples

Enter the placement process view of the **staticroute** process.

```
<Sysname> system-view
[Sysname] placement program staticroute
```

```
[Sysname-program-staticroute]
```

Enter the default placement process view.

```
<Sysname> system-view
[Sysname] placement program default
[Sysname-program-default]
```

placement reoptimize

Use **placement reoptimize** to apply configured process placement policies for optimizing process placement.

Syntax

placement reoptimize

Views

System view

Predefined user roles

network-admin

context-admin

Usage guidelines

CAUTION:

To avoid neighbor flapping of related protocols, make sure HA features such as NSR or GR are configured for the processes and are stable before optimizing process placement.

After you execute this command, the system bases its placement decisions on the new process placement policies, hardware resources, and locations and states of active processes. The process on the new location is selected as the active process. If the new location for an active process is different from its current location, a process switchover is triggered. The system changes the state of the original active process to standby and the state of the standby process on the new location to active. You can use the **display placement program** command to view the new location of the active process.

To keep the system stable, do not perform any tasks that require process restart when you execute this command.

Examples

Reoptimize process placement.

```
<Sysname> system-view
[Sysname] placement reoptimize
Predicted changes to the placement
Program                          Current location       New location
-------------------------------------------------------------------
staticroute                      1/0                    1/0
Continue? [y/n]:y
Re-optimization of the placement start. You will be notified on completion
Re-optimization of the placement complete. Use 'display placement' to view the new
placement
```

This example uses only the **staticroute** process.

NSFOCUS Firewall Series

NF VPN Instance Command Reference

NSFOCUS Technologies, Inc.

Document version: 6W600-20230221

Preface

This command reference describes the commands for configuring VPN instance features.

This preface includes the following topics about the documentation:

- Audience.
- Conventions.

Audience

This documentation is intended for:

- Network planners.
- Field technical support and servicing engineers.
- Network administrators.

Conventions

The following information describes the conventions used in the documentation.

Command conventions

Convention	Description
Boldface	**Bold** text represents commands and keywords that you enter literally as shown.
Italic	*Italic* text represents arguments that you replace with actual values.
[ ]	Square brackets enclose syntax choices (keywords or arguments) that are optional.
{ x | y | ... }	Braces enclose a set of required syntax choices separated by vertical bars, from which you select one.
[x | y | ...]	Square brackets enclose a set of optional syntax choices separated by vertical bars, from which you select one or none.
{ x | y | ... } *	Asterisk marked braces enclose a set of required syntax choices separated by vertical bars, from which you select a minimum of one.
[x | y | ...] *	Asterisk marked square brackets enclose optional syntax choices separated by vertical bars, from which you select one choice, multiple choices, or none.
&<1-n>	The argument or keyword and argument combination before the ampersand (&) sign can be entered 1 to n times.
#	A line that starts with a pound (#) sign is comments.

GUI conventions

Convention	Description
Boldface	Window names, button names, field names, and menu items are in Boldface. For example, the **New User** window opens; click **OK**.
>	Multi-level menus are separated by angle brackets. For example, **File** > **Create** > **Folder**.

Symbols

Convention	Description
WARNING!	An alert that calls attention to important information that if not understood or followed can result in personal injury.
CAUTION:	An alert that calls attention to important information that if not understood or followed can result in data loss, data corruption, or damage to hardware or software.
IMPORTANT:	An alert that calls attention to essential information.
NOTE:	An alert that contains additional or supplementary information.
TIP:	An alert that provides helpful information.

Network topology icons

Convention	Description
	Represents a generic network device, such as a router, switch, or firewall.
	Represents a routing-capable device, such as a router or Layer 3 switch.
	Represents a generic switch, such as a Layer 2 or Layer 3 switch, or a router that supports Layer 2 forwarding and other Layer 2 features.
	Represents an access controller, a unified wired-WLAN module, or the access controller engine on a unified wired-WLAN switch.
	Represents an access point.
	Represents a wireless terminator unit.
	Represents a wireless terminator.
	Represents a mesh access point.
	Represents omnidirectional signals.
	Represents directional signals.
	Represents a security product, such as a firewall, UTM, multiservice security gateway, or load balancing device.
	Represents a security module, such as a firewall, load balancing, NetStream, SSL VPN, IPS, or ACG module.

Examples provided in this document

Examples in this document might use devices that differ from your device in hardware model, configuration, or software version. It is normal that the port numbers, sample output, screenshots, and other information in the examples differ from what you have on your device.

Contents

VPN instance commands

description (VPN instance view)

Use **description** to configure a description for a VPN instance.

Use **undo description** to restore the default.

Syntax

description *text*

undo description

Default

No description is configured for a VPN instance.

Views

VPN instance view

Predefined user roles

network-admin

context-admin

Parameters

text: Configures the description for the VPN instance, a case-sensitive string of 1 to 79 characters.

Usage guidelines

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Set the description for VPN instance **vpn1** to **This is vpn1**.

```
<Sysname> system-view
[Sysname] ip vpn-instance vpn1
[Sysname-vpn-instance-vpn1] description This is vpn1
```

display ip vpn-instance

Use **display ip vpn-instance** to display VPN instance information.

Syntax

display ip vpn-instance [**instance-name** *vpn-instance-name*]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

instance-name *vpn-instance-name*: Specifies a VPN instance by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VPN instance, this command displays brief information about all VPN instances.

Examples

Display brief information about all VPN instances.

```
<Sysname> display ip vpn-instance
  Total VPN-Instances configured : 1
  VPN-Instance Name               RD                    Create time
  management                      1000000000:1          2016/10/31
```

Table 1 Command output

Field	Description
VPN-Instance Name	Name of the VPN instance.
RD	Route distinguisher of the VPN instance.
Create time	Time when the VPN instance was created.

ip binding vpn-instance

Use **ip binding vpn-instance** to associate an interface with a VPN instance.

Use **undo ip binding vpn-instance** to restore the default.

Syntax

ip binding vpn-instance *vpn-instance-name*

undo ip binding vpn-instance

Default

An interface is not associated with a VPN instance and belongs to the public network.

Views

Interface view

Predefined user roles

network-admin

context-admin

Parameters

vpn-instance-name: Specifies a VPN instance by its name, a case-sensitive string of 1 to 31 characters.

Usage guidelines

This command or its **undo** form clears the IP address and routing protocol configuration on the interface. You must reconfigure the IP address and routing protocol for the interface after executing this command. To view the configuration of an interface, execute the **display this** command in interface view.

The specified VPN instance must have been created by using the **ip vpn-instance** command in system view.

To associate a new VPN instance with an interface, first execute the **undo ip binding vpn-instance** command to remove the existing association.

Examples

Associate interface GigabitEthernet 1/0/1 with VPN instance **vpn1**.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] ip binding vpn-instance vpn1
```

Related commands

ip vpn-instance (system view)

ip vpn-instance (system view)

Use **ip vpn-instance** to create a VPN instance and enter its view, or enter the view of an existing VPN instance.

Use **undo ip vpn-instance** to delete a VPN instance.

Syntax

ip vpn-instance *vpn-instance-name*

undo ip vpn-instance *vpn-instance-name*

Default

No VPN instances exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

vpn-instance-name: Specifies a name for the VPN instance, a case-sensitive string of 1 to 31 characters.

Examples

Create VPN instance **vpn1** and enter its view.

```
<Sysname> system-view
[Sysname] ip vpn-instance vpn1
[Sysname-vpn-instance-vpn1]
```

NSFOCUS Firewall Series

Contents

VXLAN commands

Basic VXLAN commands

ac statistics enable

Use **ac statistics enable** to enable packet statistics for a Layer 3 interface that acts as an AC.

Use **undo ac statistics enable** to disable packet statistics for a Layer 3 interface that acts as an AC.

Syntax

ac statistics enable

undo ac statistics enable

The following compatibility matrix shows the support of hardware platforms for this command:

Models	Command compatibility
NFNX5-HD6480, NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB1780, NFNX3-HDB3080, NFNX3-HDB1180, NFNX3-HDB1480	Yes
NFNX3-HDB680, NFNX3-HDB1080	No

Default

The packet statistics feature is disabled for a Layer 3 interface that acts as an AC.

Views

Layer 3 aggregate interface view

Layer 3 Ethernet interface view

Predefined user roles

network-admin

context-admin

Usage guidelines

For this command to take effect, you must map the Layer 3 interface to a VSI. If you modify the VSI mapping, packet statistics of the interface are cleared.

Examples

Map GigabitEthernet 1/0/1 to VSI **vsia** and enable packet statistics on the interface.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] xconnect vsi vsia
[Sysname-GigabitEthernet1/0/1] ac statistics enable
```

Related commands

display l2vpn interface verbose

reset l2vpn statistics ac

arp suppression enable

Use **arp suppression enable** to enable ARP flood suppression.

Use **undo arp suppression enable** to disable ARP flood suppression.

Syntax

arp suppression enable

undo arp suppression enable

The following compatibility matrix shows the support of hardware platforms for this command:

Models	Command compatibility
NFNX5-HD6480, NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB1780, NFNX3-HDB3080, NFNX3-HDB1180, NFNX3-HDB1480	Yes
NFNX3-HDB680, NFNX3-HDB1080	Yes

Default

ARP flood suppression is disabled.

Views

VSI view

Predefined user roles

network-admin

context-admin

Usage guidelines

ARP flood suppression reduces ARP request broadcasts by enabling the VTEP to reply to ARP requests on behalf of VMs.

This feature snoops ARP packets to populate the ARP flood suppression table with local and remote MAC addresses. If an ARP request has a matching entry, the VTEP replies to the request on behalf of the VM. If no match is found, the VTEP floods the request to both local and remote sites.

Examples

Enable ARP flood suppression for VSI **vsi1**.

```
<Sysname> system-view
[Sysname] vsi vsi1
[Sysname-vsi-vsi1] arp suppression enable
```

Related commands

display arp suppression vsi

reset arp suppression vsi

description

Use **description** to configure a description for a VSI.

Use **undo description** to restore the default.

Syntax

description *text*

undo description

Default

A VSI does not have a description.

Views

VSI view

Predefined user roles

network-admin

context-admin

Parameters

text: Specifies a description, a case-sensitive string of 1 to 80 characters.

Examples

Configure a description for VSI **vpn1**.

```
<Sysname> system-view
[Sysname] vsi vpn1
[Sysname-vsi-vpn1] description vsi for vpn1
```

Related commands

display l2vpn vsi

display arp suppression vsi

Use **display arp suppression vsi** to display ARP flood suppression entries.

Syntax

display arp suppression vsi [**name** *vsi-name*] [**slot** *slot-number*] [**count**]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

name *vsi-name*: Specifies a VSI by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VSI, this command displays entries for all VSIs.

slot *slot-number*: Specifies an IRF member device by its member ID. If you do not specify a member device, this command displays entries on the master device.

count: Displays the number of ARP flood suppression entries that match the command.

Examples

Display ARP flood suppression entries.

```
<Sysname> display arp suppression vsi
IP address      MAC address    Vsi Name                        Link ID    Aging
1.1.1.2         000f-e201-0101 vsi1                            0x70000    14
```

```
1.1.1.3         000f-e201-0202 vsi1                              0x80000    18
1.1.1.4         000f-e201-0203 vsi2                              0x90000    10
```

Display the number of ARP flood suppression entries.

```
<Sysname> display arp suppression vsi count
Total entries: 3
```

Table 1 Command output

Field	Description
Link ID	Link ID that uniquely identifies an AC or a VXLAN tunnel on a VSI.
Aging	Remaining lifetime (in minutes) of the ARP flood suppression entry. When the timer expires, the entry is deleted.

Related commands

arp suppression enable

reset arp suppression vsi

display l2vpn interface

Use **display l2vpn interface** to display L2VPN information for Layer 3 interfaces that are mapped to VSIs.

Syntax

display l2vpn interface [**vsi** *vsi-name* | *interface-type interface-number*] [**verbose**]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

vsi *vsi-name*: Specifies a VSI name, a case-sensitive string of 1 to 31 characters.

interface-type interface-number: Specifies an interface by its type and number.

verbose: Displays detailed information about Layer 3 interfaces. If you do not specify this keyword, the command displays brief information about Layer 3 interfaces.

Usage guidelines

If you do not specify any parameters, this command displays brief L2VPN information for all Layer 3 interfaces that are mapped to VSIs.

Examples

Display brief L2VPN information for all Layer 3 interfaces that are mapped to VSIs.

```
<Sysname> display l2vpn interface
Total number of interfaces: 2, 1 up, 1 down
```

```
Interface                Owner                          Link ID   State    Type
GE1/0/1                  vxlan3                         1         Up       VSI
GE1/0/2                  vxlan4                         2         Down     VSI
```

Table 2 Command output

Field	Description
Interface	Layer 3 interface name.
Owner	VSI name.
Link ID	The interface's link ID on the VSI.
State	Physical state of the interface: • **Up**—The interface is physically up. • **Down**—The interface is physically down.
Type	L2VPN type of the interface. This field displays **VSI** for the VXLAN feature.

Display detailed L2VPN information for all Layer 3 interfaces that are mapped to VSIs.

```
<Sysname> display l2vpn interface verbose

Statistics	Packet statistics state: • **Enabled**—The packet statistics feature is enabled for the interface. • **Disabled**—The packet statistics feature is disabled for the interface.
Input Statistics	Incoming traffic statistics: • **Octets**—Number of incoming bytes. • **Packets**—Number of incoming packets.
Output Statistics	Outgoing traffic statistics: • **Octets**—Number of outgoing bytes. • **Packets**—Number of outgoing packets.

display l2vpn mac-address

Use **display l2vpn mac-address** to display MAC address entries for VSIs.

Syntax

display l2vpn mac-address [**vsi** *vsi-name*] [**dynamic**] [**count**]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

vsi *vsi-name*: Specifies a VSI name, a case-sensitive string of 1 to 31 characters. If you do not specify a VSI, this command displays MAC address entries for all VSIs.

dynamic: Specifies dynamic MAC address entries learned in the data plane. If you do not specify this keyword, the command displays all MAC address entries, including:

- Dynamic remote- and local-MAC entries.
- Manually added static remote-MAC entries.

VXLAN does not support static local-MAC entries.

count: Displays the number of MAC address entries. If you do not specify this keyword, the command displays detailed information about MAC address entries.

Examples

Display MAC address entries for all VSIs.

```
<Sysname> display l2vpn mac-address
MAC Address      State    VSI Name                       Link ID/Name  Aging
```

```
0000-0000-000b   Static   vpn1                            Tunnel10      NotAging
0000-0000-000c   Dynamic  vpn1                            Tunnel60      Aging
0000-0000-000d   Dynamic  vpn1                            Tunnel99      Aging
--- 3 mac address(es) found  ---
```

Display the total number of MAC address entries in all VSIs.

```
<Sysname> display l2vpn mac-address count
3 mac address(es) found
```

Table 4 Command output

Field	Description
State	Entry state: • **Dynamic**—Local- or remote-MAC entry dynamically learned in the data plane. • **Static**—Static remote-MAC entry.
Link ID/Name	For a local MAC address, this field displays the AC's link ID on the VSI. For a remote MAC address, this field displays the tunnel interface name.
Aging	Entry aging state: • **Aging**. • **NotAging**.

Related commands

reset l2vpn mac-address

display l2vpn service-instance

Use **display l2vpn service-instance** to display information about Ethernet service instances.

Syntax

display l2vpn service-instance [**interface** *interface-type interface-number* [**service-instance** *instance-id*]] [**verbose**]

The following compatibility matrix shows the support of hardware platforms for this command:

Models	Command compatibility
NFNX5-HD6480, NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB1780, NFNX3-HDB3080, NFNX3-HDB1180, NFNX3-HDB1480	Yes
NFNX3-HDB680, NFNX3-HDB1080	No

context-operator

Parameters

interface *interface-type interface-number*: Specifies a Layer 2 Ethernet interface or Layer 2 aggregate interface by its interface type and number. If you do not specify an interface, this command displays Ethernet service instance information for all Layer 2 Ethernet interfaces and Layer 2 aggregate interfaces.

service-instance *instance-id*: Specifies an Ethernet service instance by its ID in the range of 1 to 4096. If you do not specify an Ethernet service instance, this command displays information about all Ethernet service instances on the specified Layer 2 Ethernet interface or Layer 2 aggregate interface.

verbose: Displays detailed information about Ethernet service instances. If you do not specify this keyword, the command displays brief information about Ethernet service instances.

Examples

Display brief information about all Ethernet service instances.

```
<Sysname> display l2vpn service-instance
Total number of service-instances: 4, 4 up, 0 down
Total number of ACs: 2, 2 up, 0 down

Interface               SrvID Owner                          LinkID State Type

Table 8 Command output

Field	Description
VSI Description	Description of the VSI. If the VSI does not have a description, the command does not display this field.
VSI State	VSI state: • **Up**—The VSI is up. • **Down**—The VSI is down. • **Administratively down**—The VSI has been manually shut down by using the **shutdown** command.
MTU	MTU on the VSI.
Bandwidth	Maximum bandwidth (in kbps) for known unicast traffic on the VSI. This field displays a hyphen (**-**) if it is not available in the current software version.
Broadcast Restrain	Broadcast restraint bandwidth (in kbps). This field displays a hyphen (**-**) if it is not available in the current software version.
Multicast Restrain	Multicast restraint bandwidth (in kbps). This field displays a hyphen (**-**) if it is not available in the current software version.
Unknown Unicast Restrain	Unknown unicast restraint bandwidth (in kbps). This field displays a hyphen (**-**) if it is not available in the current software version.
MAC Learning	State of the MAC learning feature.
MAC Table Limit	Maximum number of MAC address entries on the VSI. This field displays a hyphen (**-**) if it is not available in the current software version.
MAC Learning Rate	MAC address entry learning rate of the VSI.
Drop Unknown	Action on source MAC-unknown frames received after the maximum number of MAC entries is reached.
Service Class	Service class value of outgoing VXLAN packets.
Gateway Interface	VSI interface name.
Tunnel Statistics	Packet statistics state: • **Enabled**—The packet statistics feature is enabled for the VXLAN tunnels of the VSI. • **Disabled**—The packet statistics feature is disabled for the VXLAN tunnels of the VSI.
State	Tunnel state: • **Up**—The tunnel is operating correctly. • **Blocked**—The tunnel is a backup proxy tunnel. Its tunnel interface is up, but the tunnel is blocked because the primary proxy tunnel is operating correctly. • **Defect**—The tunnel interface is up, but BFD cannot detect the remote VTEP. This state is not supported in the current software version. • **Down**—The tunnel interface is down.
Type	Tunnel assignment method. **Manual** indicates that the tunnel was manually assigned to the VXLAN.
Flood Proxy	Flood proxy state: • **Enabled**—Flood proxy is enabled. The VTEP sends broadcast, multicast, and unknown unicast traffic to a flood proxy server through the tunnel. The flood proxy server replicates and forwards flood traffic to remote VTEPs. • **Disabled**—Flood proxy is disabled.

Field	Description
Split horizon	State of split horizon: • **Enabled**—Split horizon is enabled on the VXLAN tunnel. The VXLAN tunnel does not forward the traffic that is received on other VXLAN tunnels. • **Disabled**—Split horizon is disabled on the VXLAN tunnel. The VXLAN tunnel forwards the traffic that is received on other VXLAN tunnels.
ACs	ACs that are bound to the VSI.
Link ID	AC's link ID on the VSI.
State	AC state: • **Up**. • **Down**.

display vxlan tunnel

Use **display vxlan tunnel** to display VXLAN tunnel information for VXLANs.

Syntax

display vxlan tunnel [**vxlan-id** *vxlan-id* [**tunnel** *tunnel-number*]]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

vxlan-id: Specifies a VXLAN ID in the range of 0 to 16777215. If you do not specify a VXLAN, this command displays VXLAN tunnel information for all VXLANs.

tunnel *tunnel-number*: Specifies a VXLAN tunnel. The *tunnel-number* argument represents the tunnel interface number. The value range for the *tunnel-number* argument is 0 to 1023. If you do not specify a VXLAN tunnel, this command displays information about all VXLAN tunnels associated with the specified VXLAN.

Examples

Display VXLAN tunnel information for all VXLANs.

```
<Sysname> display vxlan tunnel
Total number of VXLANs: 1

VXLAN ID: 10, VSI name: vpna, Total tunnels: 3 (3 up, 0 down, 0 defect, 0 blocked)
Tunnel name          Link ID    State  Type         Flood proxy  Split horizon
Tunnel1              0x5000001  Up     Manual       Disabled     Enabled
Tunnel2              0x5000002  Up     Manual       Disabled     Enabled
```

Display VXLAN tunnel information for VXLAN **10**.

```
<Sysname> display vxlan tunnel vxlan-id 10
VXLAN ID: 10, VSI name: vpna, Total tunnels: 3 (3 up, 0 down, 0 defect, 0 blocked)
Tunnel name          Link ID    State  Type         Flood proxy  Split horizon
```

```
Tunnel1              0x5000001  Up     Manual       Disabled     Enabled
Tunnel2              0x5000002  Up     Manual       Disabled     Enabled
```

Display information about VXLAN tunnel 0 for VXLAN **10**.

```
<Sysname> display vxlan tunnel vxlan-id 10 tunnel 0
Interface: Tunnel0
  Link ID    : 0x5000000
  State      : Up
  Type       : Auto
  Flood Proxy: Disabled
  Statistics : Enabled
    Input statistics:
      Octets : 994496
      Packets: 15539
    Output statistics:
      Octets : 0
      Packets: 0
```

Table 9 Command output

Field	Description
Link ID	Tunnel's link ID in the VXLAN.
State	Tunnel state: • **Up**—The tunnel is operating correctly. • **Blocked**—The tunnel is a backup proxy tunnel. Its tunnel interface is up, but the tunnel is blocked because the primary proxy tunnel is operating correctly. • **Defect**—The tunnel interface is up, but BFD cannot detect the remote VTEP. This state is not supported in the current software version. • **Down**—The tunnel interface is down.
Type	Tunnel assignment method. **Manual** indicates that tunnel was manually assigned to the VXLAN.
Flood proxy	Flood proxy state: • **Enabled**—Flood proxy is enabled. The VTEP sends broadcast, multicast, and unknown unicast traffic to a flood proxy server through the tunnel. The flood proxy server replicates and forwards flood traffic to remote VTEPs. • **Disabled**—Flood proxy is disabled.
Split horizon	State of split horizon: • **Enabled**—Split horizon is enabled on the VXLAN tunnel. The VXLAN tunnel does not forward the traffic that is received on other VXLAN tunnels. • **Disabled**—Split horizon is disabled on the VXLAN tunnel. The VXLAN tunnel forwards the traffic that is received on other VXLAN tunnels.
Statistics	Packet statistics state: • **Enabled**—The packet statistics feature is enabled for the VXLAN tunnel. • **Disabled**—The packet statistics feature is disabled for the VXLAN tunnel.
Input statistics	Incoming traffic statistics: • **Octets**—Number of incoming bytes. • **Packets**—Number of incoming packets.
Output statistics	Outgoing traffic statistics: • **Octets**—Number of outgoing bytes. • **Packets**—Number of outgoing packets.

encapsulation

Use **encapsulation** to configure a frame match criterion for an Ethernet service instance.

Use **undo encapsulation** to restore the default.

Syntax

encapsulation s-vid *vlan-id-list* [**only-tagged**]

encapsulation s-vid *vlan-id* **c-vid** { *vlan-id-list* | **all** }

encapsulation c-vid *vlan-id-list*

encapsulation { **default** | **tagged** | **untagged** }

undo encapsulation

The following compatibility matrix shows the support of hardware platforms for this command:

Models	Command compatibility
NFNX5-HD6480, NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB1780, NFNX3-HDB3080, NFNX3-HDB1180, NFNX3-HDB1480	Yes
NFNX3-HDB680, NFNX3-HDB1080	No

Default

An Ethernet service instance does not contain a frame match criterion.

Views

Ethernet service instance view

Predefined user roles

network-admin

context-admin

Parameters

s-vid: Matches frames that are tagged with the specified outer 802.1Q VLAN IDs.

c-vid: Matches frames that are tagged with the specified inner 802.1Q VLAN IDs.

vlan-id: Specifies an 802.1Q VLAN ID in the range of 1 to 4094.

vlan-id-list: Specifies a space-separated list of up to eight VLAN items. Each item specifies a VLAN ID or a range of VLAN IDs in the format of *vlan-id1* **to** *vlan-id2*. The value range for VLAN IDs is 1 to 4094.

only-tagged: Matches tagged frames. If the outer 802.1Q VLAN is not the PVID, the matching result does not differ, whether or not you specify the **only-tagged** keyword. If the outer 802.1Q VLAN is the PVID, the matching result depends on whether or not the **only-tagged** keyword is specified.

- To match only PVID-tagged frames, specify the **only-tagged** keyword.
- To match both untagged frames and PVID-tagged frames, do not specify the **only-tagged** keyword.

all: Specifies all 802.1Q VLAN IDs.

default: Matches frames that do not match any other Ethernet service instance on the interface. On an interface, you can configure this criterion only in one Ethernet service instance. The Ethernet service instance matches any frames if it is the only instance on the interface.

tagged: Matches any frames that have an 802.1Q VLAN tag.

untagged: Matches any frames that do not have an 802.1Q VLAN tag.

Usage guidelines

An Ethernet service instance can contain only one match criterion. To change the match criterion, first execute the **undo encapsulation** command to remove the original criterion. When you remove the match criterion in an Ethernet service instance, the mapping between the service instance and the VSI is removed automatically.

Examples

Configure Ethernet service instance 1 on GigabitEthernet 1/0/1 to match frames that have an outer 802.1Q VLAN ID of 111.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] service-instance 1
[Sysname-GigabitEthernet1/0/1-srv1] encapsulation s-vid 111
```

Related commands

display l2vpn service-instance

flooding disable

Use **flooding disable** to disable flooding for a VSI.

Use **undo flooding disable** to enable flooding for a VSI.

Syntax

flooding disable

undo flooding disable

Default

Flooding is enabled for a VSI.

Views

VSI view

Predefined user roles

network-admin

context-admin

Usage guidelines

By default, the device floods unknown unicast frames received from the local site to the following interfaces in the frame's VXLAN:

- All site-facing interfaces except for the incoming interface.
- All VXLAN tunnel interfaces.

To confine unknown unicast traffic to the site-facing interfaces, use this command to disable flooding for the VSI bound to the VXLAN. The VSI will not flood unknown unicast frames to VXLAN tunnel interfaces.

Examples

Disable flooding for VSI **vsi1**.

```
<Sysname> system-view
[Sysname] vsi vsi1
[Sysname-vsi-vsi1] flooding disable
```

l2vpn enable

Use **l2vpn enable** to enable L2VPN.

Use **undo l2vpn enable** to disable L2VPN.

Syntax

l2vpn enable

undo l2vpn enable

Default

L2VPN is disabled.

Views

System view

Predefined user roles

network-admin

context-admin

Usage guidelines

You must enable L2VPN before you can configure L2VPN settings.

Examples

Enable L2VPN.

```
<Sysname> system-view
[Sysname] l2vpn enable
```

l2vpn rewrite inbound tag

Use **l2vpn rewrite inbound tag** to configure the VLAN tag processing rule for incoming traffic.

Use **undo l2vpn rewrite inbound** to restore the default.

Syntax

l2vpn rewrite inbound tag { **nest** { **c-vid** *vlan-id* | **s-vid** *vlan-id* [**c-vid** *vlan-id*] } | **remark 1-to-2 s-vid** *vlan-id* **c-vid** *vlan-id* } [**symmetric**]

undo l2vpn rewrite inbound

The following compatibility matrix shows the support of hardware platforms for this command:

Models	Command compatibility
NFNX5-HD6480, NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB1780, NFNX3-HDB3080, NFNX3-HDB1180, NFNX3-HDB1480	Yes
NFNX3-HDB680, NFNX3-HDB1080	No

Default

VLAN tags of incoming traffic are not processed.

Views

Layer 3 aggregate interface view

Layer 3 Ethernet interface view

Predefined user roles

network-admin

context-admin

Parameters

nest: Adds VLAN tags.

c-vid: Specifies an inner VLAN tag.

s-vid: Specifies an outer VLAN tag.

vlan-id: Specifies a VLAN ID in the range of 1 to 4094.

remark: Maps VLAN tags.

1-to-2: Performs one-to-two mapping to replace the VLAN tag of single tagged packets with the specified outer and inner VLAN tags.

symmetric: Applies the reverse VLAN tag processing rule to outgoing traffic. If you do not specify this keyword, VLAN tags of outgoing traffic are not processed.

Usage guidelines

To modify the VLAN tag processing rule for incoming traffic, first execute the **undo l2vpn rewrite inbound** command to remove the existing rule, and then execute the **l2vpn rewrite inbound** command.

When you use this command, follow these restrictions:

- The **l2vpn rewrite inbound tag nest s-vid** *vlan-id* **c-vid** *vlan-id* command takes effect only on untagged packets.
- The **l2vpn rewrite inbound tag remark 1-to-2** command takes effect only on single tagged packets.

Examples

Configure Layer 3 Ethernet interface GigabitEthernet 1/0/1 to add outer VLAN tag 100 to incoming frames and remove outer VLAN tag 100 from outgoing frames.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] l2vpn rewrite inbound tag nest s-vid 100 symmetric
```

l2vpn statistics interval

Use **l2vpn statistics interval** to set the VXLAN statistics collection interval.

Use **undo l2vpn statistics interval** to restore the default.

Syntax

l2vpn statistics interval *interval*

undo l2vpn statistics interval

The following compatibility matrix shows the support of hardware platforms for this command:

Models	Command compatibility
NFNX5-HD6480, NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB1780, NFNX3-HDB3080, NFNX3-HDB1180, NFNX3-HDB1480	Yes
NFNX3-HDB680, NFNX3-HDB1080	No

Default

The VXLAN statistics collection interval is 15 minutes.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

interval: Specifies an interval value in the range of 30 to 65535 seconds.

Examples

Set the VXLAN statistics collection interval to 30 seconds.

```
<Sysname> system-view
[Sysname] l2vpn statistics interval 30
```

mac-address static vsi

Use **mac-address static vsi** to add a static remote-MAC address entry for a VXLAN VSI.

Use **undo mac-address static vsi** to remove static remote-MAC address entries for a VXLAN VSI.

Syntax

mac-address static *mac-address* **interface tunnel** *tunnel-number* **vsi** *vsi-name*

undo mac-address static [*mac-address*] [**interface tunnel** *tunnel-number*] **vsi** *vsi-name*

Default

VXLAN VSIs do not have static remote-MAC address entries.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

mac-address: Specifies a MAC address in H-H-H format. Do not specify a multicast MAC address or an all-zeros MAC address. You can omit the consecutive zeros at the beginning of each segment. For example, you can enter **f-e2-1** for **000f-00e2-0001**.

interface tunnel *tunnel-number*: Specifies a VXLAN tunnel interface by its tunnel interface number. The value range for the *tunnel-number* argument is 0 to 1023.

vsi *vsi-name*: Specifies a VSI name, a case-sensitive string of 1 to 31 characters.

Usage guidelines

A remote MAC address is the MAC address of a VM in a remote site. Remote MAC entries can be manually added or dynamically learned.

When you add a remote MAC address entry, make sure the specified VSI's VXLAN has been assigned the specified VXLAN tunnel.

The **undo mac-address static vsi** *vsi-name* command removes all static MAC address entries for a VSI.

Examples

Add MAC address **000f-e201-0101** to VSI **vsi1**. Specify Tunnel-interface 1 as the outgoing interface.

```
<Sysname> system-view
[Sysname] mac-address static 000f-e201-0101 interface tunnel 1 vsi vsi1
```

Related commands

vxlan tunnel mac-learning disable

mtu

Use **mtu** to set the MTU for a VSI.

Use **undo mtu** to restore the default.

Syntax

mtu *size*

undo mtu

Default

The default MTU of a VSI is 1500 bytes.

Views

VSI view

Predefined user roles

network-admin

context-admin

Parameters

size: Specifies an MTU value. The value range for this argument is 300 to 65535.

Usage guidelines

The MTU set by using this command limits the maximum length of the packets that a VSI receives from ACs and forwards through VXLAN tunnels. The MTU does not limit the maximum length of other packets in the VXLAN VSI.

Fragmentation is disabled for a VSI that uses the default MTU. If you set a MTU for a VSI, the packets longer than the MTU are fragmented.

Examples

Set the MTU to 1400 bytes for VSI **vxlan1**.

```
<Sysname> system-view
[Sysname] vsi vxlan1
[Sysname-vsi-vxlan1] mtu 1400
```

Related commands

display l2vpn vsi

reserved vxlan

Use **reserved vxlan** to specify a reserved VXLAN.

Use **undo reserved vxlan** to restore the default.

Syntax

reserved vxlan *vxlan-id*

undo reserved vxlan

Default

No VXLAN has been reserved.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

vxlan-id: Specifies a VXLAN ID in the range of 0 to 16777215.

Usage guidelines

You can specify only one reserved VXLAN on the VTEP. The reserved VXLAN cannot be the VXLAN created on any VSI.

Examples

Specify VXLAN 10000 as the reserved VXLAN.

```
<Sysname> system-view
[Sysname] reserved vxlan 10000
```

reset arp suppression vsi

Use **reset arp suppression vsi** to clear ARP flood suppression entries on VSIs.

Syntax

reset arp suppression vsi [**name** *vsi-name*]

Views

User view

Predefined user roles

network-admin

context-admin

Parameters

name *vsi-name*: Specifies a VSI by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VSI, this command clears ARP flood suppression entries on all VSIs.

Examples

Clear ARP flood suppression entries on all VSIs.

```
<Sysname> reset arp suppression vsi
This command will delete all entries. Continue? [Y/N]:y
```

Related commands

arp suppression enable

reset l2vpn mac-address

Use **reset l2vpn mac-address** to clear dynamic MAC address entries on VSIs.

Syntax

reset l2vpn mac-address [**vsi** *vsi-name*]

Views

User view

Predefined user roles

network-admin

context-admin

Parameters

vsi *vsi-name*: Specifies a VSI by its name, a case-sensitive string of 1 to 31 characters. If you do not specify a VSI, this command clears all dynamic MAC address entries on all VSIs.

Usage guidelines

Use this command when the number of dynamic MAC address entries reaches the limit or the device learns incorrect MAC addresses.

Examples

Clear the dynamic MAC address entries on VSI **vpn1**.

```
<Sysname> reset l2vpn mac-address vsi vpn1
```

Related commands

display l2vpn mac-address vsi

reset l2vpn statistics ac

Use **reset l2vpn statistics ac** to clear packet statistics on ACs.

Syntax

reset l2vpn statistics ac [**interface** *interface-type interface-number* [**service-instance** *instance-id*]]

The following compatibility matrixes show the support of hardware platforms for this command:

Models	Command compatibility
NFNX5-HD6480, NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB1780, NFNX3-HDB3080, NFNX3-HDB1180, NFNX3-HDB1480	Yes
NFNX3-HDB680, NFNX3-HDB1080	No

Views

Predefined user roles

network-admin

context-admin

Parameters

interface *interface-type interface-number*: Specifies an interface by its type and number.

service-instance *instance-id*: Specifies an Ethernet service instance ID in the range of 1 to 4096. You must specify this option if the **interface** *interface-type interface-number* option specifies a Layer 2 interface. You cannot specify this option if the **interface** *interface-type interface-number* option specifies a Layer 3 interface.

Usage guidelines

If you do not specify any parameters, this command clears packet statistics on all ACs.

Examples

Clear packet statistics for Layer 3 interface GigabitEthernet 1/0/1.

```
<Sysname> reset l2vpn statistics ac interface gigabitethernet 1/0/1
```

Related commands

selective-flooding mac-address

Use **selective-flooding mac-address** to enable selective flood for a MAC address.

Use **undo selective-flooding mac-address** to disable selective flood for a MAC address.

Syntax

selective-flooding mac-address *mac-address*

undo selective-flooding mac-address *mac-address*

Default

Selective flood is disabled for all MAC addresses.

Views

VSI view

Predefined user roles

network-admin

context-admin

Parameters

mac-address: Specifies a MAC address. The MAC address cannot be all Fs.

Usage guidelines

This command excludes a remote MAC address from the flood suppression done by using the **flooding disable** command. The VTEP will flood the frames destined for the specified MAC address to remote sites when unknown-unicast floods are confined to the local site.

Examples

Enable selective flood for **000f-e201-0101** on VSI **vsi1**.

```
<Sysname> system-view
[Sysname] vsi vsi1
[Sysname-vsi-vsi1] selective-flooding mac-address 000f-e201-0101
```

Related commands

service-class

Use **service-class** to set a service class value for outgoing VXLAN packets.

Use **undo service-class** to restore the default.

Syntax

service-class *service-class-value*

undo service-class

The following compatibility matrix shows the support of hardware platforms for this command:

Models	Command compatibility
NFNX5-HD6480, NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB1780, NFNX3-HDB3080, NFNX3-HDB1180, NFNX3-HDB1480	Yes

NFNX3-HDB680, NFNX3-HDB1080	No

Default

No service class value is set for outgoing VXLAN packets.

Views

VSI view

Predefined user roles

network-admin

context-admin

Parameters

service-class-value: Specifies a service class value. The value range for this argument is 0 to 15.

Usage guidelines

Class Based Tunnel Selection (CBTS) compares the service class value of VXLAN packets with the service class values of MPLS TE tunnels. CBTS uses the following rules to select a tunnel to forward the traffic:

- If the packets match only one MPLS TE tunnel, CBTS uses this tunnel.
- If the packets match multiple MPLS TE tunnels, CBTS randomly selects one tunnel from them.
- If the packets do not match any MPLS TE tunnel, CBTS selects the MPLS TE tunnel that meets the following requirements:
  - Its service class value is smaller than the service class value of the traffic.
  - Its service class value is the nearest to the service class value of the traffic.

  If multiple qualified tunnels exist, CBTS randomly selects one of them to forward the packets. If an MPLS TE tunnel is not configured with a service class value, this tunnel has the smallest service class value.

The service class value is used only when MPLS TE tunnels are used to forward the VXLAN packets. This value is meaningless if any other tunnel is used to forward the VXLAN packets.

To set the service class value for an MPLS TE tunnel, use the **mpls te service-class** command. For more information about this command, see MPLS TE commands in *MPLS Command Reference*.

If you execute the **service-class** command multiple times for a VSI, the most recent configuration takes effect.

Examples

Set the service class value to 2 for outgoing VXLAN packets.

```
<Sysname> system-view
[Sysname] vsi vpna
[Sysname-vsi-vpna] service-class 2
```

Related commands

display l2vpn vsi

service-instance

Use **service-instance** to create an Ethernet service instance and enter its view, or enter the view of an existing Ethernet service instance.

Use **undo service-instance** to delete an Ethernet service instance.

Syntax

service-instance *instance-id*

undo service-instance *instance-id*

The following compatibility matrix shows the support of hardware platforms for this command:

Models	Command compatibility
NFNX5-HD6480, NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB1780, NFNX3-HDB3080, NFNX3-HDB1180, NFNX3-HDB1480	Yes
NFNX3-HDB680, NFNX3-HDB1080	No

Default

No Ethernet service instances exist.

Views

Layer 2 aggregate interface view

Layer 2 Ethernet interface view

Predefined user roles

network-admin

context-admin

Parameters

instance-id: Specifies an Ethernet service instance ID in the range of 1 to 4096.

Examples

On Layer 2 Ethernet interface GigabitEthernet 1/0/1, create Ethernet service instance 1 and enter Ethernet service instance view.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] service-instance 1
[Sysname-GigabitEthernet1/0/1-srv1]
```

Related commands

display l2vpn service-instance

shutdown

Use **shutdown** to shut down a VSI.

Use **undo shutdown** to bring up a VSI.

Syntax

shutdown

undo shutdown

Default

VSIs are not manually shut down.

Views

VSI view

Predefined user roles

network-admin

context-admin

Usage guidelines

Use this command to temporarily disable a VSI to provide Layer 2 switching services. The shutdown action does not change settings on the VSI. You can continue to configure the VSI. After you bring up the VSI again, the VSI provides services based on the latest settings.

Examples

Shut down VSI **vpn1**.

```
<Sysname> system-view
[Sysname] vsi vpn1
[Sysname-vsi-vpn1] shutdown
```

Related commands

`display l2vpn vsi`

statistics enable (Ethernet service instance view)

Use **`statistics enable`** to enable packet statistics for an Ethernet service instance.

Use **`undo statistics enable`** to disable packet statistics for an Ethernet service instance.

Syntax

`statistics enable`

`undo statistics enable`

The following compatibility matrixes show the support of hardware platforms for this command:

Models	Command compatibility
NFNX5-HD6480, NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB1780, NFNX3-HDB3080, NFNX3-HDB1180, NFNX3-HDB1480	Yes
NFNX3-HDB680, NFNX3-HDB1080	No

Default

The packet statistics feature is disabled for an Ethernet service instance.

Views

Ethernet service instance view

Predefined user roles

network-admin

context-admin

Usage guidelines

For this command to take effect, you must configure a frame match criterion for the Ethernet service instance and map it to a VSI. If you modify the frame match criterion or VSI mapping, packet statistics of the instance is cleared.

Examples

Enable packet statistics for Ethernet service instance 200 on GigabitEthernet 1/0/1.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] service-instance 200
[Sysname-GigabitEthernet1/0/1-srv200] statistics enable
```

tunnel

Use **tunnel** to assign a VXLAN tunnel to a VXLAN.

Use **undo tunnel** to remove a VXLAN tunnel from a VXLAN.

Syntax

tunnel *tunnel-number*

undo tunnel *tunnel-number*

Default

A VXLAN does not contain VXLAN tunnels.

Views

VXLAN view

Predefined user roles

network-admin

context-admin

Parameters

*tunnel-numbe*r: Specifies a tunnel interface number. The value range for this argument is 0 to 1023. The tunnel must be a VXLAN tunnel.

remote-vni *vxlan-id*: Specifies a remote VXLAN ID. The value range for the *vxlan-id* argument varies by device model. You can specify this option only for a VXLAN-DCI tunnel.

Usage guidelines

This command assigns a VXLAN tunnel to a VXLAN to provide Layer 2 connectivity for the VXLAN between two sites. In unicast mode, the system floods unknown unicast, multicast, and broadcast traffic to each tunnel in the VXLAN.

You can assign multiple VXLAN tunnels to a VXLAN, and configure a VXLAN tunnel to trunk multiple VXLANs.

Examples

Assign VXLAN tunnels 1 and 2 to VXLAN 10000.

```
<Sysname> system-view
[Sysname] vsi vpna
[Sysname-vsi-vpna] vxlan 10000
[Sysname-vsi-vpna-vxlan-10000] tunnel 1
[Sysname-vsi-vpna-vxlan-10000] tunnel 2
```

Related commands

display vxlan tunnel

tunnel bfd enable

Use **tunnel bfd enable** to enable BFD on a VXLAN tunnel interface.

Use **undo tunnel bfd enable** to disable BFD on a VXLAN tunnel interface.

Syntax

tunnel bfd enable destination-mac *mac-address*

undo tunnel bfd enable

The following compatibility matrixes show the support of hardware platforms for this command:

Models	Command compatibility
NFNX5-HD6480, NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB1780, NFNX3-HDB3080, NFNX3-HDB1180, NFNX3-HDB1480	Yes
NFNX3-HDB680, NFNX3-HDB1080	No

Default

BFD is disabled on a VXLAN tunnel interface.

Views

VXLAN tunnel interface view

Predefined user roles

network-admin

context-admin

Parameters

destination-mac *mac-address*: Specifies a destination MAC address in H-H-H format for BFD control packets. The MAC address can be a remote VTEP address or a multicast address. You can omit the consecutive zeros at the beginning of each segment. For example, you can enter **f-e2-1** for **000f-00e2-0001**.

Usage guidelines

Enable BFD on both ends of a VXLAN tunnel for quick link connectivity detection. The VTEPs periodically send BFD single-hop control packets to each other through the VXLAN tunnel. A VTEP sets the tunnel state to Defect if it has not received control packets from the remote end for 5 seconds. In this situation, the tunnel interface state is still Up. The tunnel state will change from Defect to Up if the VTEP can receive BFD control packets again.

Examples

Enable BFD on VXLAN tunnel interface Tunnel 9, and specify 1-1-1 as the destination MAC address for BFD control packets.

```
<Sysname> system-view
[Sysname] interface tunnel 9 mode vxlan
[Sysname-Tunnel9] tunnel bfd enable destination-mac 1-1-1
```

tunnel statistics enable

Use **tunnel statistics enable** to enable packet statistics for all VXLAN tunnels associated with a VSI.

Use **undo tunnel statistics enable** to disable packet statistics for all VXLAN tunnels associated with a VSI.

Syntax

tunnel statistics enable

undo tunnel statistics enable

The following compatibility matrixes show the support of hardware platforms for this command:

Models	Command compatibility
NFNX5-HD6480, NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB1780, NFNX3-HDB3080, NFNX3-HDB1180, NFNX3-HDB1480	Yes
NFNX3-HDB680, NFNX3-HDB1080	No

Default

The packet statistics feature is disabled for the VXLAN tunnels associated with a VSI.

Views

VSI view

Predefined user roles

network-admin

context-admin

Usage guidelines

This command enables packet statistics only for VXLAN tunnels. It does not take effect on VXLAN-DCI tunnels.

Examples

Enable packet statistics for all VXLAN tunnels associated with VSI **vpna**.

```
<Sysname> system-view
[Sysname] vsi vpna
[Sysname-vsi-vpna] tunnel statistics enable
```

Related commands

display vxlan tunnel

VSİ

Use **vsi** to create a VSI and enter its view, or enter the view of an existing VSI.

Use **undo vsi** to delete a VSI.

Syntax

vsi *vsi-name*

undo vsi *vsi-name*

Default

No VSIs exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

vsi-name: Specifies a VSI name, a case-sensitive string of 1 to 31 characters.

Usage guidelines

A VSI acts as a virtual switch to provide Layer 2 switching services for a VXLAN on a VTEP. A VSI has all functions of a physical Ethernet switch, including source MAC address learning, MAC address aging, and flooding.

A VSI can provide services only for one VXLAN.

Examples

Create VSI **vxlan10** and enter VSI view.

```
<Sysname> system-view
[Sysname] vsi vxlan10
[Sysname-vsi-vxlan10]
```

Related commands

vxlan fast-forwarding enable

Use **vxlan fast-forwarding enable** to enable VXLAN fast forwarding.

Use **undo vxlan fast-forwarding enable** to disable VXLAN fast forwarding.

Syntax

vxlan fast-forwarding enable

undo vxlan fast-forwarding enable

Default

VXLAN fast forwarding is disabled.

Views

System view

Predefined user roles

network-admin

context-admin

Usage guidelines

VXLAN fast forwarding enables the device to bypass QoS and security services when the device forwards data traffic over VXLAN tunnels based on the software. As a best practice, enable this feature to improve forwarding speed only when QoS and security services are not configured on the following interfaces:

- VSI interfaces.
- Traffic outgoing interfaces for VXLAN tunnels.

When VXLAN fast forwarding is enabled, a VXLAN tunnel cannot use ECMP routes to load share traffic. Instead, it selects one route from the ECMP routes to forward VXLAN packets.

Examples

Enable VXLAN fast forwarding.

```
<Sysname> system
[Sysname] vxlan fast-forwarding enable
```

vxlan invalid-udp-checksum discard

Use **vxlan invalid-udp-checksum discard** to enable the device to drop the VXLAN packets that fail UDP checksum check.

Use **undo vxlan invalid-udp-checksum discard** to restore the default.

Syntax

vxlan invalid-udp-checksum discard

undo vxlan invalid-udp-checksum discard

Default

The device does not check the UDP checksum of VXLAN packets.

Views

System view

Predefined user roles

network-admin

context-admin

Usage guidelines

This command enables the device to check the UDP checksum of VXLAN packets.

The device always sets the UDP checksum of VXLAN packets to 0. For compatibility with third-party devices, a VXLAN packet can pass the check if its UDP checksum is 0 or correct. If its UDP checksum is incorrect, the VXLAN packet fails the check and is dropped.

Examples

Enable the device to drop the VXLAN packets that fail UDP checksum check.

```
<Sysname> system-view
[Sysname] vxlan invalid-udp-checksum discard
```

vxlan ip-forwarding

Use **vxlan ip-forwarding** to enable Layer 3 forwarding for all VXLANs.

Use **undo vxlan ip-forwarding** to enable Layer 2 forwarding for all VXLANs.

Syntax

vxlan ip-forwarding

undo vxlan ip-forwarding

The following compatibility matrixes show the support of hardware platforms for this command:

Models	Command compatibility
NFNX5-HD6480, NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB1780, NFNX3-HDB3080, NFNX3-HDB1180, NFNX3-HDB1480	Yes
NFNX3-HDB680, NFNX3-HDB1080	No

Default

Layer 3 forwarding is enabled for all VXLANs.

Views.

System view

Predefined user roles

network-admin

context-admin

Usage guidelines

If the device is a VTEP, enable Layer 2 forwarding for VXLANs. If the device is a VXLAN IP gateway, enable Layer 3 forwarding for VXLANs.

In Layer 3 forwarding mode, the VTEP uses the ARP table (IPv4 network) or ND table (IPv6 network) to forward traffic for VXLANs. In Layer 2 forwarding mode, the VTEP uses the MAC address table to forward traffic for VXLANs.

You must delete all VSIs, VSI interfaces, and VXLAN tunnel interfaces before you can change the forwarding mode.

Examples

Enable Layer 3 forwarding for all VXLANs.

```
<Sysname>system-view
[Sysname] vxlan ip-forwarding
```

vxlan local-mac report

Use **vxlan local-mac report** to enable local-MAC logging.

Use **undo vxlan local-mac report** to disable local-MAC logging.

Syntax

vxlan local-mac report

undo vxlan local-mac report

Default

Local-MAC logging is disabled.

Views

System view

Predefined user roles

network-admin

context-admin

Usage guidelines

When the local-MAC logging feature is enabled, the VXLAN module immediately sends a log message with its local MAC addresses to the information center. When a local MAC address is added or removed, a log message is also sent to the information center to notify the local-MAC change.

With the information center, you can set log message filtering and output rules, including output destinations. For more information about configuring the information center, see *Network Management and Monitoring Configuration Guide*.

Examples

Enable local-MAC logging.

```
<Sysname> system-view
[Sysname] vxlan local-mac report
```

vxlan source udp-port acl

Use **vxlan source udp-port acl** to configure an ACL match criterion and specify the source UDP port number in the VXLAN encapsulation for matching frames.

Use **undo vxlan source udp-port** to restore the default.

Syntax

vxlan source udp-port *port-number* **acl** *acl-number*

undo vxlan source udp-port

The following compatibility matrix shows the support of hardware platforms for this command:

Models	Command compatibility
NFNX5-HD6480, NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB1780, NFNX3-HDB3080, NFNX3-HDB1180, NFNX3-HDB1480	Yes
NFNX3-HDB680, NFNX3-HDB1080	No

Default

The source UDP port number in the VXLAN encapsulation is generated based on the source and destination MAC addresses of the inner Ethernet frame.

Views

VXLAN tunnel interface view

Predefined user roles

network-admin

context-admin

Parameters

port-number: Specifies a UDP port number in the range of 1024 to 65535. As a best practice, specify a port number in the range of 1024 to 49151.

acl-number: Specifies an ACL by its number in the range of 3000 to 3999. The ACL must be an advanced ACL.

Usage guidelines

This command takes effect only on IPv4-based VXLAN. Only manually created VXLAN tunnel interfaces support this command.

This command enables a VXLAN tunnel interface to filter frames by using an ACL and encapsulate a specific source UDP port number for matching frames. This allows IPsec to identify the VXLAN packets to encrypt by the source UDP port number in the VXLAN encapsulation.

If the ACL specified by using this command does not exist or does not contain an IP address-related rule, frames are encapsulated based on the default setting.

This command has a higher priority than the **vxlan source udp-port five-tuple** command.

If you execute this command multiple times, the most recent configuration takes effect.

Examples

Configure VXLAN tunnel interface **Tunnel 1** to encapsulate source UDP port number 50001 for the frames that match ACL 3001.

```
<Sysname> system-view
[Sysname] interface tunnel 1 mode vxlan
[Sysname-Tunnel1] vxlan source udp-port 50001 acl 3001
```

Related commands

acl (*ACL and QoS Command Reference*)

vxlan source udp-port five-tuple

vxlan source udp-port five-tuple

Use **vxlan source udp-port five-tuple** to configure a VXLAN tunnel interface to generate the source UDP port number in the VXLAN encapsulation based on the IP five-tuple of the inner Ethernet frame.

Use **undo vxlan source udp-port five-tuple** to restore the default.

Syntax

vxlan source udp-port five-tuple

undo vxlan source udp-port five-tuple

The following compatibility matrix shows the support of hardware platforms for this command:

Models	Command compatibility
NFNX5-HD6480, NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB1780, NFNX3-HDB3080, NFNX3-HDB1180, NFNX3-HDB1480	Yes
NFNX3-HDB680, NFNX3-HDB1080	No

Default

The source UDP port number in the VXLAN encapsulation is generated based on the source and destination MAC addresses of the inner Ethernet frame.

Views

VXLAN tunnel interface view

Predefined user roles

network-admin

context-admin

Usage guidelines

This command takes effect only on IPv4-based VXLAN. Only manually created VXLAN tunnel interfaces support this command.

This command has a lower priority than the **vxlan source udp-port acl** command. If you use both commands on a VXLAN tunnel interface, the **vxlan source udp-port five-tuple** command takes effect only on the frames that fail to match the ACL specified by using the **vxlan source udp-port acl** command.

Examples

Configure VXLAN tunnel interface **Tunnel 1** to generate the source UDP port number in the VXLAN encapsulation based on the IP five-tuple of the inner Ethernet frame.

```
<Sysname> system-view
[Sysname] interface tunnel 1 mode vxlan
[Sysname-Tunnel1] vxlan source udp-port five-tuple
```

Related commands

vxlan source udp-port acl

vxlan tunnel mac-learning disable

Use **vxlan tunnel mac-learning disable** to disable remote-MAC address learning.

Use **undo vxlan tunnel mac-learning disable** to enable remote-MAC address learning.

Syntax

vxlan tunnel mac-learning disable

undo vxlan tunnel mac-learning disable

Default

Remote-MAC address learning is enabled.

Views

System view

Predefined user roles

network-admin

context-admin

Usage guidelines

When network attacks occur, use this command to prevent the device from learning incorrect remote MAC addresses in the data plane.

Examples

Disable remote-MAC address learning.

```
<Sysname> system-view
[Sysname] vxlan tunnel mac-learning disable
```

vxlan udp-port

Use **vxlan udp-port** to set the destination UDP port number for VXLAN packets.

Use **undo vxlan udp-port** to restore the default.

Syntax

vxlan udp-port *port-number*

undo vxlan udp-port

Default

The destination UDP port number is 4789 for VXLAN packets.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

port-number: Specifies a UDP port number in the range of 1 to 65535. As a best practice, specify a port number in the range of 1024 to 65535 to avoid conflict with well-known ports.

Usage guidelines

You must configure the same destination UDP port number on all VTEPs in a VXLAN.

Examples

Set the destination UDP port number to 6666 for VXLAN packets.

```
<Sysname> system-view
[Sysname] vxlan udp-port 6666
```

xconnect vsi

Use **xconnect vsi** to map an AC to a VSI.

Use **undo xconnect vsi** to restore the default.

Syntax

xconnect vsi *vsi-name* [**track** *track-entry-number*&<1-3>]

undo xconnect vsi

Default

An AC is not mapped to any VSI.

Views

Interface view

Predefined user roles

network-admin

context-admin

Parameters

vsi-name: Specifies the VSI name, a case-sensitive string of 1 to 31 characters.

track *track-entry-number*&<1-3>: Specifies a space-separated list of up to three track entry numbers in the range of 1 to 1024. The AC is up only if a minimum of one associated track entry is in positive state.

Usage guidelines

For traffic that matches a Layer 3 interface, the system uses the VSI's MAC address table to make a forwarding decision.

Examples

Map GigabitEthernet 1/0/1 to VSI **vpn1**.

```
<Sysname> system-view
[Sysname] vsi vpn1
[Sysname-vsi-vpn1] quit
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] xconnect vsi vpn1
```

Related commands

VXLAN IP gateway commands

arp distributed-gateway dynamic-entry synchronize

Use **arp distributed-gateway dynamic-entry synchronize** to enable dynamic ARP entry synchronization for distributed VXLAN IP gateways.

Use **undo arp distributed-gateway dynamic-entry synchronize** to disable dynamic ARP entry synchronization for distributed VXLAN IP gateways.

Syntax

arp distributed-gateway dynamic-entry synchronize

undo arp distributed-gateway dynamic-entry synchronize

Default

Dynamic ARP entry synchronization is disabled for distributed VXLAN IP gateways.

Views

System view

Predefined user roles

network-admin

context-admin

Usage guidelines

When local proxy ARP is enabled on distributed VXLAN IP gateways, each gateway learns ARP information independently. A gateway does not forward ARP packets destined for its local VSI interfaces to other gateways. For distributed VXLAN IP gateways to have the same ARP entries, you must enable dynamic ARP entry synchronization.

A controller can also synchronize ARP entries among distributed VXLAN IP gateways. When you use a controller, do not enable dynamic ARP entry synchronization.

Examples

Enable dynamic ARP entry synchronization for distributed VXLAN IP gateways.

```
<Sysname> system-view
[Sysname] arp distributed-gateway dynamic-entry synchronize
```

Related commands

distributed-gateway local

local-proxy-arp enable (*Layer 3—IP Services Command Reference*)

bandwidth

Use **bandwidth** to set the expected bandwidth for a VSI interface.

Use **undo bandwidth** to restore the default.

Syntax

bandwidth *bandwidth-value*

undo bandwidth

Default

The expected bandwidth (in kbps) equals the interface baudrate divided by 1000.

Views

VSI interface view

Predefined user roles

network-admin

context-admin

Parameters

bandwidth-value: Specifies the expected bandwidth, in the range of 1 to 400000000 kbps.

Usage guidelines

The expected bandwidth is an informational parameter used only by higher-layer protocols for calculation. You cannot adjust the actual bandwidth of an interface by using this command.

Examples

Set the expected bandwidth to 10000 kbps for VSI-interface 100.

```
<Sysname> system-view
[Sysname] interface vsi-interface 100
[Sysname-Vsi-interface100] bandwidth 10000
```

default

Use **default** to restore the default settings for a VSI interface.

Syntax

default

Views

VSI interface view

Predefined user roles

network-admin

context-admin

Usage guidelines

CAUTION:

The **default** command might interrupt ongoing network services. Make sure you are fully aware of the impact of this command when you use it on a live network.

This command might fail to restore the default settings for some commands for reasons such as command dependencies and system restrictions.

To resolve this problem:

1. Use the **display this** command in interface view to identify these commands.
2. Use their **undo** forms or follow the command reference to restore their default settings.
3. If the restoration attempt still fails, follow the error message instructions to resolve the problem.

Examples

Restore the default settings for VSI-interface 100.

```
<Sysname> system-view
[Sysname] interface vsi-interface 100
[Sysname-Vsi-interface100] default
This command will restore the default settings. Continue? [Y/N]:y
```

description

Use **description** to configure the description of a VSI interface.

Use **undo description** to restore the default.

Syntax

description *text*

undo description

Default

The description of a VSI interface is *interface-name* plus **Interface** (for example, **Vsi-interface100 Interface**).

Views

VSI interface view

Predefined user roles

network-admin

context-admin

Parameters

text: Specifies a description, a case-sensitive string of 1 to 255 characters.

Examples

Configure the description as **gateway for VXLAN 10** for VSI-interface 100.

```
<Sysname> system-view
[Sysname] interface vsi-interface 100
[Sysname-Vsi-interface100] description gateway for VXLAN 10
```

display interface vsi-interface

Use **display interface vsi-interface** to display information about VSI interfaces.

Syntax

display interface [**vsi-interface** [*vsi-interface-id*]] [**brief** [**description** | **down**]]

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

vsi-interface [*vsi-interface-id*]: Specifies a VSI interface by its number. Make sure the specified VSI interface has been created on the device. If you do not specify the **vsi-interface** [*vsi-interface-id*] option, this command displays information about all interfaces. If you specify only the **vsi-interface** keyword, this command displays information about all VSI interfaces. If you specify a VSI interface, this command displays information about the specified interface.

brief: Display brief interface information. If you do not specify this keyword, the command displays detailed interface information.

description: Displays complete interface descriptions. If you do not specify this keyword, the command displays only the first 27 characters of interface descriptions.

down: Displays interfaces that are physically down as well as the down reason. If you do not specify this keyword, the command does not filter output by physical interface state.

Examples

Display information about VSI-interface 100.

```
<Sysname> display interface vsi-interface 100
Vsi-interface100
Current state: UP
Line protocol state: UP
Description: Vsi-interface100 Interface
Bandwidth: 1000000 kbps
Maximum transmission unit: 1500
Internet address: 10.1.1.1/24 (primary)
IP packet frame type: Ethernet II, hardware address: 0011-2200-0102
IPv6 packet frame type: Ethernet II, hardware address: 0011-2200-0102
Physical: Unknown, baudrate: 1000000 kbps
Last clearing of counters: Never
Last 300 seconds input rate: 0 bytes/sec, 0 bits/sec, 0 packets/sec
Last 300 seconds output rate: 0 bytes/sec, 0 bits/sec, 0 packets/sec
Input: 0 packets, 0 bytes, 0 drops
Output: 0 packets, 0 bytes, 0 drops
```

Table 10 Command output

Field	Description
Current state	Physical link state of the interface: • **Administratively DOWN**—The interface has been shut down by using the **shutdown** command. • **DOWN**—The interface is administratively up, but its physical state is down. • **UP**—The interface is both administratively and physically up.
Line protocol state	Data link layer state of the interface: • **UP**—The data link layer protocol is up. • **UP(spoofing)**—The data link layer protocol is up, but the link is an on-demand link or does not exist. • **DOWN**—The data link layer protocol is down.
Description	Description of the interface.
Bandwidth	Expected bandwidth of the interface.
Maximum transmission unit	MTU of the interface.
Internet protocol processing: Disabled	The interface is not assigned an IP address and cannot process IP packets.
Internet address: *ip-address*/*mask-length* (*Type*)	IP address of the interface and type of the address in parentheses. Possible IP address types include: • **Primary**—Manually configured primary IP address. • **Sub**—Manually configured secondary IP address. If the interface has both primary and secondary IP addresses, the primary IP address is displayed. If the interface has only secondary IP addresses, the lowest secondary IP address is displayed. • **DHCP-allocated**—DHCP allocated IP address. For more information, see DHCP client configuration in *Layer 3—IP Services Configuration Guide*. • **BOOTP-allocated**—BOOTP allocated IP address. For more information, see BOOTP client configuration in *Layer 3—IP*

Field	Description
	Services Configuration Guide. • **PPP-negotiated**—IP address assigned by a PPP server during PPP negotiation. For more information, see PPP configuration in *PPP and PPPoE Configuration Guide*. • **Unnumbered**—IP address borrowed from another interface. • **MAD**—IP address assigned to an IRF member device for MAD on the interface. For more information, see IRF configuration in *Virtual Technologies Configuration Guide*.
IP packet frame type	IPv4 packet framing format.
hardware address	MAC address.
IPv6 packet frame type	IPv6 packet framing format.
Physical	Physical type of the interface, which is fixed at **Unknown**.
baudrate	Interface baudrate in kbps.
Last clearing of counters	Last time when the **reset counters interface vsi-interface** command was used to clear interface statistics. This field displays **Never** if the **reset counters interface vsi-interface** command has never been used on the interface since the device startup.
Last 300 seconds input rate	Average input rate for the last 300 seconds.
Last 300 seconds output rate	Average output rate for the last 300 seconds.
Input: 0 packets, 0 bytes, 0 drops	Incoming traffic statistics on the interface: • Number of incoming packets. • Number of incoming bytes. • Number of dropped incoming packets.
Output: 0 packets, 0 bytes, 0 drops	Outgoing traffic statistics on the interface: • Number of outgoing packets. • Number of outgoing bytes. • Number of dropped outgoing packets.

Display brief information about all VSI interfaces.

```
<Sysname> display interface vsi-interface brief
Brief information on interfaces in route mode:
Link: ADM - administratively down; Stby - standby
Protocol: (s) - spoofing
Interface            Link Protocol Primary IP      Description
Vsi100               DOWN DOWN     --
```

Display brief information and complete description for VSI-interface 100.

```
<Sysname> display interface vsi-interface 100 brief description
Brief information on interfaces in route mode:
Link: ADM - administratively down; Stby - standby
Protocol: (s) - spoofing
Interface            Link Protocol Primary IP      Description
Vsi100               UP   UP       1.1.1.1         VSI-interface100
```

Displays interfaces that are physically down and the down reason.

```
<Sysname> display interface brief down
```

```
Brief information on interfaces in route mode:
Link: ADM - administratively down; Stby - standby
Interface            Link   Cause
Vsi100               DOWN   Administratively
Vsi200               DOWN   Administratively
```

Table 11 Command output

Field	Description
Interface	Abbreviated interface name.
Link	Physical link state of the interface: • **UP**—The interface is physically up. • **DOWN**—The interface is physically down. • **ADM**—The interface has been shut down by using the **shutdown** command. To restore the physical state of the interface, use the **undo shutdown** command. • **Stby**—The interface is a backup interface in standby state. To see the primary interface, use the **display interface-backup state** command.
Protocol	Data link layer protocol state of the interface: • **UP**—The data link layer protocol of the interface is up. • **UP (s)**—The data link layer protocol of the interface is up, but the link is an on-demand link or does not exist. The **(s)** attribute represents the spoofing flag. • **DOWN**—The data link layer protocol of the interface is down.
Primary IP	Primary IP address of the interface. This field displays two hyphens (**--**) if the interface does not have an IP address.
Description	Description of the interface.
Cause	Cause for the physical link state of an interface to be **DOWN**: • **Administratively**—The interface has been manually shut down by using the **shutdown** command. To restore the physical state of the interface, use the **undo shutdown** command. • **Not connected**—The interface is not mapped to any VSI, or the mapped VSI does not have any AC or VXLAN tunnel.

Related commands

reset counters interface vsi-interface

distributed-gateway local

Use **distributed-gateway local** to specify a VSI interface as a distributed gateway to provide services for the local site.

Use **undo distributed-gateway local** to restore the default.

Syntax

distributed-gateway local

undo distributed-gateway local

Default

A VSI interface is not a distributed gateway.

Views

VSI interface view

Predefined user roles

network-admin

context-admin

Usage guidelines

If a VXLAN uses distributed gateway services, you must assign the same IP address to the VXLAN's VSI interfaces on different VTEPs. To avoid IP address conflicts, you must specify the VSI interface on each VTEP as a distributed gateway.

Examples

Specify VSI-interface 100 as a distributed gateway.

```
<Sysname> system-view
[Sysname] interface vsi-interface 100
[Sysname-Vsi-interface100] distributed-gateway local
```

gateway subnet

Use **gateway subnet** to assign a subnet to a VSI.

Use **undo gateway subnet** to remove a subnet from a VSI.

Syntax

gateway subnet { *ipv4-address wildcard-mask* | *ipv6-address prefix-length* }

undo gateway subnet { *ipv4-address wildcard-mask* | *ipv6-address prefix-length* }

Default

No subnet is assigned to a VSI.

Views

VSI view

Predefined user roles

network-admin

context-admin

Parameters

ipv4-address: Specifies an IPv4 subnet address in dotted-decimal notation.

wildcard-mask: Specifies a wildcard mask in dotted decimal notation. In contrast to a network mask, the 0 bits in a wildcard mask represent "do care" bits, and the 1 bits represent "don't care" bits. If the "do care" bits in a packet's IP address are identical to the "do care" bits in the specified subnet address, the packet is assigned to the VSI. All "don't care" bits are ignored. The 0s and 1s in a wildcard mask can be noncontiguous. For example, 0.255.0.255 is a valid wildcard mask.

ipv6-address prefix-length: Specifies an IPv6 subnet address and the address prefix length in the range of 1 to 128.

Usage guidelines

You must configure this command on VSIs that share a gateway interface. This command enables the VSI interface to identify the VSI of a packet.

You can assign a maximum of eight IPv4 and IPv6 subnets to a VSI.

You must specify a gateway interface for a VSI before you can assign subnets to the VSI. If you remove the gateway interface from the VSI, the VSI's subnet settings are automatically deleted.

For VSIs that share a gateway interface, the subnets must be unique.

Examples

Assign subnet 100.0.10.0/24 to VSI **vxlan**.

```
<Sysname> system-view
[Sysname] vsi vxlan
[Sysname-vsi-vxlan] gateway subnet 100.0.10.0 0.0.0.255
```

gateway vsi-interface

Use **gateway vsi-interface** to specify a gateway interface for a VSI.

Use **undo gateway vsi-interface** to restore the default.

Syntax

gateway vsi-interface *vsi-interface-id*

undo gateway vsi-interface

Default

No gateway interface is specified for a VSI.

Views

VSI view

Predefined user roles

network-admin

context-admin

Parameters

vsi-interface-id: Specifies a VSI interface by its number. The value range for this argument is 0 to 8191.

Usage guidelines

A VSI can have only one gateway interface. Multiple VSIs can share a gateway interface.

Examples

Specify VSI-interface 100 as the gateway interface for VSI **vpna**.

```
<Sysname> system-view
[Sysname] vsi vpna
[Sysname-vsi-vpna] gateway vsi-interface 100
```

Related commands

interface vsi-interface

interface vsi-interface

Use **interface vsi-interface** to create a VSI interface and enter its view, or enter the view of an existing VSI interface.

Use **undo interface vsi-interface** to delete a VSI interface.

Syntax

interface vsi-interface *vsi-interface-id*

undo interface vsi-interface *vsi-interface-id*

Default

No VSI interfaces exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

vsi-interface-id: Specifies a VSI interface number. The value range for this argument is 0 to 8191.

Examples

Create VSI-interface 100 and enter VSI interface view.

```
<Sysname> system-view
[Sysname] interface vsi-interface 100
[Sysname-Vsi-interface100]
```

mac-address

Use **mac-address** to assign a MAC address to a VSI interface.

Use **undo mac-address** to restore the default.

Syntax

mac-address *mac-address*

undo mac-address

Default

A VSI interface does not have a MAC address.

Views

VSI interface view

Predefined user roles

network-admin

context-admin

Parameters

mac-address: Specifies a MAC address in H-H-H format.

Examples

Assign MAC address 0001-0001-0001 to VSI-interface 100.

```
<Sysname> system-view
```

```
[Sysname] interface vsi-interface 100
[Sysname-Vsi-interface100] mac-address 1-1-1
```

mtu

Use **mtu** to set the MTU for a VSI interface.

Use **undo mtu** to restore the default.

Syntax

mtu *size*

undo mtu

Default

The MTU is 1500 bytes.

Views

VSI interface view

Predefined user roles

network-admin

context-admin

Parameters

size: Specifies an MTU value in the range of 46 to 1500 bytes.

Examples

Set the MTU to 1430 bytes for VSI-interface 100.

```
<Sysname> system-view
[Sysname] interface vsi-interface 100
[Sysname-Vsi-interface100] mtu 1430
```

reset counters interface vsi-interface

Use **reset counters interface vsi-interface** to clear packet statistics on VSI interfaces.

Syntax

reset counters interface [**vsi-interface** [*vsi-interface-id*]]

Views

User view

Predefined user roles

network-admin

context-admin

Parameters

vsi-interface [*vsi-interface-id*]: Specifies a VSI interface by its number. Make sure the specified VSI interface has been created on the device. If you do not specify the **vsi-interface** [*vsi-interface-id*] option, this command clears packet statistics on all interfaces. If you specify only the **vsi-interface** keyword, this command clears packet statistics on all VSI interfaces. If you specify a VSI interface, this command clears packet statistics on the specified interface.

Usage guidelines

Use this command to clear history statistics before you collect traffic statistics for a time period.

Examples

Clear packet statistics on VSI-interface 100.

```
<Sysname> reset counters interface vsi-interface 100
```

Related commands

display interface vsi-interface

shutdown

Use **shutdown** to shut down a VSI interface.

Use **undo shutdown** to bring up a VSI interface.

Syntax

shutdown

undo shutdown

Default

A VSI interface is not manually shut down.

Views

VSI interface view

Predefined user roles

network-admin

context-admin

Usage guidelines

CAUTION:

If you shut down a VSI interface, the VXLAN network using this VSI interface as the gateway will be unable to communicate with other networks at Layer 3. Make sure you are fully aware of the impact of this command when you use it on a live network.

Examples

Shut down VSI-interface 100.

```
<Sysname> system-view
[Sysname] interface vsi-interface 100
[Sysname-Vsi-interface100] shutdown
```

vtep group member local

Use **vtep group member local** to assign the local VTEP to a VTEP group.

Use **undo vtep group member local** to remove the local VTEP from a VTEP group.

Syntax

vtep group *group-ip* **member local** *member-ip*

undo vtep group *group-ip* **member local**

Default

A VTEP is not assigned to any VTEP group.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

group-ip: Specifies a VTEP group by its group IP address. The IP address must already exist on the local VTEP.

member-ip: Specifies the member VTEP IP address for the local VTEP. The IP address must already exist on the local VTEP.

Usage guidelines

Member VTEPs in a VTEP group cannot use the group IP address or share an IP address.

Examples

Assign the local VTEP to VTEP group 1.1.1.1, and specify 2.2.2.2 as the member VTEP IP address of the local VTEP.

```
<Sysname> system-view
[Sysname] vtep group 1.1.1.1 member local 2.2.2.2
```

Related commands

vtep group member remote

vtep group member remote

Use **vtep group member remote** to specify a VTEP group and its member VTEPs.

Use **undo vtep group member remote** to remove a VTEP group and its member VTEPs.

Syntax

vtep group *group-ip* **member remote** *member-ip*&<1-8>

undo vtep group *group-ip* **member remote**

Default

No VTEP group is specified.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

group-ip: Specifies a VTEP group by its group IP address.

member-ip&<1-8>: Specifies a space-separated list of up to eight member VTEP IP addresses.

Examples

Specify VTEP group 1.1.1.1 and its member VTEPs at 2.2.2.2, 3.3.3.3, and 4.4.4.4.

```
<Sysname> system-view
[Sysname] vtep group 1.1.1.1 member remote 2.2.2.2 3.3.3.3 4.4.4.4
```

Related commands

vtep group member local

vxlan tunnel arp-learning disable

Use **vxlan tunnel arp-learning disable** to disable remote ARP learning for VXLANs.

Use **undo vxlan tunnel arp-learning disable** to enable remote ARP learning for VXLANs.

Syntax

vxlan tunnel arp-learning disable

undo vxlan tunnel arp-learning disable

Default

Remote ARP learning is enabled for VXLANs.

Views

System view

Predefined user roles

network-admin

context-admin

Usage guidelines

By default, the device learns ARP information of remote VMs from packets received on VXLAN tunnel interfaces. To save resources on VTEPs in an SDN transport network, you can temporarily disable remote ARP learning when the controller and VTEPs are synchronizing entries. After the entry synchronization is completed, use the **undo vxlan tunnel arp-learning disable** command to enable remote ARP learning.

As a best practice, disable remote ARP learning for VXLANs only when the controller and VTEPs are synchronizing entries.

Examples

Disable remote ARP learning for VXLANs.

```
<Sysname> system
[Sysname] vxlan tunnel arp-learning disable
```

OVSDB commands

The following compatibility matrixes show the support of hardware platforms for OVSDB commands:

Models	OVSDB compatibility
NFNX5-HD6480, NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB1780, NFNX3-HDB3080, NFNX3-HDB1180, NFNX3-HDB1480	Yes

Models	OVSDB compatibility
NFNX3-HDB680, NFNX3-HDB1080	No

ovsdb server bootstrap ca-certificate

Use **ovsdb server bootstrap ca-certificate** to specify a CA certificate file for establishing OVSDB SSL connections.

Use **undo ovsdb server bootstrap ca-certificate** to restore the default.

Syntax

ovsdb server bootstrap ca-certificate *ca-filename*

undo ovsdb server bootstrap ca-certificate

Default

SSL uses the CA certificate file in the PKI domain.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

ca-filename: Specifies the CA certificate file name, a case-insensitive string. The file name cannot contain the **slot** string, and the file must be stored on the active MPU.

Usage guidelines

For the specified certificate to take effect, you must execute the **ovsdb server enable** command to enable the OVSDB server. You must disable and then re-enable the OVSDB server if it has been enabled.

If the specified CA certificate file does not exist, the device obtains a self-signed certificate from the controller. The obtained file uses the name specified for the *ca-filename* argument.

Examples

Specify CA certificate file **ca-new** for establishing OVSDB SSL connections.

```
<Sysname> system-view
[Sysname] ovsdb server bootstrap ca-certificate ca-new
```

Related commands

ovsdb server enable

ovsdb server pki domain

ovsdb server pssl

ovsdb server ssl

ovsdb server enable

Use **ovsdb server enable** to enable the OVSDB server.

Use **undo ovsdb server enable** to disable the OVSDB server.

Syntax

ovsdb server enable

undo ovsdb server enable

Default

The OVSDB server is disabled.

Views

System view

Predefined user roles

network-admin

context-admin

Usage guidelines

To obtain configuration data from controllers, you must enable the OVSDB server.

Before you enable the OVSDB server, you must establish an OVSDB SSL or TCP connection with a minimum of one controller.

Examples

Enable the OVSDB server.

```
<Sysname> system-view
[Sysname] ovsdb server enable
```

ovsdb server pki domain

Use **ovsdb server pki domain** to specify a PKI domain for establishing OVSDB SSL connections.

Use **undo ovsdb bootstrap server pki domain** to restore the default.

Syntax

ovsdb server pki domain *domain-name*

undo ovsdb server pki domain

Default

No PKI domain is specified for establishing OVSDB SSL connections.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

domain-name: Specifies a PKI domain name, a case-sensitive string of 1 to 31 characters. The PKI domain must already exist and contain a complete certificate and key.

Usage guidelines

To communicate with controllers through SSL, you must specify a PKI domain.

For the specified PKI domain to take effect, you must execute the **ovsdb server enable** command to enable the OVSDB server. You must disable and then re-enable the OVSDB server if it has been enabled.

For more information about PKI domains, see PKI in *Security Configuration Guide*.

Examples

Specify PKI domain **ovsdb_test** for establishing OVSDB SSL connections.

```
<Sysname> system-view
[Sysname] ovsdb server pki domain ovsdb_test
```

Related commands

ovsdb server bootstrap ca-certificate

ovsdb server enable

ovsdb server pssl

ovsdb server ssl

ovsdb server pssl

Use **ovsdb server pssl** to enable the device to listen for OVSDB SSL connection requests.

Use **undo ovsdb server pssl** to restore the default.

Syntax

ovsdb server pssl [**port** *port-number*]

undo ovsdb server pssl

Default

The device does not listen for OVSDB SSL connection requests.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

port *port-number*: Specifies a port to listen for OVSDB SSL connection requests. The value range for the *port-number* argument is 1 to 65535. If you do not specify a port, the device uses the port number 6640.

Usage guidelines

Before you use this command, you must specify a PKI domain for SSL.

You can specify only one port to listen for OVSDB SSL connection requests. If you execute this command multiple times, the most recent configuration takes effect.

For the specified port setting to take effect, you must execute the **ovsdb server enable** command to enable the OVSDB server. You must disable and then re-enable the OVSDB server if it has been enabled.

Examples

Enable the device to listen for OVSDB SSL connection requests on port 6640.

```
<Sysname> system-view
```

```
[Sysname] ovsdb server pssl
```

Related commands

ovsdb server bootstrap ca-certificate

ovsdb server enable

ovsdb server pki domain

ovsdb server ssl

ovsdb server ptcp

Use **ovsdb server ptcp** to enable the device to listen for OVSDB TCP connection requests.

Use **undo ovsdb server ptcp** to restore the default.

Syntax

ovsdb server ptcp [**port** *port-number*]

undo ovsdb server ptcp

Default

The device does not listen for OVSDB TCP connection requests.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

port-number: Specifies a port to listen for OVSDB TCP connection requests. The value range for the *port-number* argument is 1 to 65535. If you do not specify a port, the device uses the port number 6640.

Usage guidelines

You can specify only one port to listen for OVSDB TCP connection requests. If you execute this command multiple times, the most recent configuration takes effect.

For the specified port setting to take effect, you must execute the **ovsdb server enable** command to enable the OVSDB server. You must disable and then re-enable the OVSDB server if it has been enabled.

Examples

Enable the device to listen for OVSDB TCP connection requests on port 6640.

```
<Sysname> system-view
[Sysname] ovsdb server ptcp
```

Related commands

ovsdb server enable

ovsdb server tcp

ovsdb server ssl

Use **ovsdb server ssl** to set up an active OVSDB SSL connection to a controller.

Use **undo ovsdb server ssl** to remove an OVSDB SSL connection from a controller.

Syntax

ovsdb server ssl ip *ip-address* **port** *port-number*

undo ovsdb server ssl ip *ip-address* **port** *port-number*

Default

The device does not have active OVSDB SSL connections to a controller.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

ip *ip-address*: Specifies the destination IP address for the SSL connection.

port *port-number*: Specifies the destination port for the SSL connection. The value range for the *port-number* argument is 1 to 65535.

Usage guidelines

Before you use this command, you must specify a PKI domain for SSL.

The device can have a maximum of eight active SSL connections.

To establish the connection, you must execute the **ovsdb server enable** command. You must disable and then re-enable the OVSDB server if it has been enabled.

Examples

Set up an active SSL connection to port 6632 at 192.168.12.2.

```
<Sysname> system-view
[Sysname] ovsdb server ssl ip 192.168.12.2 port 6632
```

Related commands

ovsdb server bootstrap ca-certificate

ovsdb server enable

ovsdb server pki domain

ovsdb server pssl

ovsdb server tcp

Use **ovsdb server tcp** to set up an active OVSDB TCP connection to a controller.

Use **undo ovsdb server tcp** to remove an OVSDB TCP connection.

Syntax

ovsdb server tcp ip *ip-address* **port** *port-number*

undo ovsdb server tcp ip *ip-address* **port** *port-number*

Default

The device does not have active OVSDB TCP connections.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

ip *ip-address*: Specifies the destination IP address for the TCP connection.

port *port-number*: Specifies the destination port for the TCP connection. The value range for the *port-number* argument is 1 to 65535.

Usage guidelines

The device can have a maximum of eight active OVSDB TCP connections.

To establish the connection, you must execute the **ovsdb server enable** command. You must disable and then re-enable the OVSDB server if it has been enabled.

Examples

Set up an active OVSDB TCP connection to port 6632 at 192.168.12.2.

```
<Sysname> system-view
[Sysname] ovsdb server tcp ip 192.168.12.2 port 6632
```

Related commands

ovsdb server enable

ovsdb server ptcp

vtep access port

Use **vtep access port** to specify a site-facing interface as a VTEP access port.

Use **undo vtep access port** to restore the default.

Syntax

vtep access port

undo vtep access port

Default

An interface is not a VTEP access port.

Views

Layer 2 aggregate interface view

Layer 2 Ethernet interface view

Layer 3 interface view

Predefined user roles

network-admin

context-admin

Usage guidelines

For controllers to manage a site-facing interface, you must specify the interface as a VTEP access port.

Examples

Specify GigabitEthernet 1/0/1 as a VTEP access port.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] vtep access port
```

vtep enable

Use **vtep enable** to enable the OVSDB VTEP service.

Use **undo vtep enable** to disable the OVSDB VTEP service.

Syntax

vtep enable

undo vtep enable

Default

The OVSDB VTEP service is disabled.

Views

System view

Predefined user roles

network-admin

context-admin

Examples

Enable the OVSDB VTEP service.

```
<Sysname> system-view
[Sysname] vtep enable
```

vxlan tunnel flooding-proxy

Use **vxlan tunnel flooding-proxy** to enable flood proxy on multicast VXLAN tunnels.

Use **undo vxlan tunnel flooding-proxy** to disable flood proxy on multicast VXLAN tunnels.

Syntax

vxlan tunnel flooding-proxy

undo vxlan tunnel flooding-proxy

Default

Flood proxy is disabled on multicast VXLAN tunnels.

Views

System view

Predefined user roles

network-admin

context-admin

Usage guidelines

If you use a flood proxy server, you must enable flood proxy globally on multicast tunnels. Then the multicast tunnels are converted into flood proxy tunnels. The VTEP sends broadcast, multicast, and unknown unicast traffic for a VXLAN to the flood proxy server through the tunnels. The flood proxy server then replicates and forwards flood traffic to remote VTEPs.

The **vxlan tunnel flooding-proxy** command and its **undo** form affect only VXLAN tunnels that are issued after the **vxlan tunnel flooding-proxy** command.

Examples

Enable flood proxy on all multicast VXLAN tunnels.

```
<Sysname> system
[Sysname] vxlan tunnel flooding-proxy
```

NSFOCUS Firewall Series

NF Service Chain Instance

Command Reference

NSFOCUS Technologies, Inc.

Document version: 6W600-20230221

Preface

This command reference describes the commands for configuring Service Chain instance features.

This preface includes the following topics about the documentation:

- Audience.
- Conventions.

Audience

This documentation is intended for:

- Network planners.
- Field technical support and servicing engineers.
- Network administrators.

Conventions

The following information describes the conventions used in the documentation.

Command conventions

Convention	Description
Boldface	**Bold** text represents commands and keywords that you enter literally as shown.
Italic	*Italic* text represents arguments that you replace with actual values.
[ ]	Square brackets enclose syntax choices (keywords or arguments) that are optional.
{ x | y | ... }	Braces enclose a set of required syntax choices separated by vertical bars, from which you select one.
[x | y | ...]	Square brackets enclose a set of optional syntax choices separated by vertical bars, from which you select one or none.
{ x | y | ... } *	Asterisk marked braces enclose a set of required syntax choices separated by vertical bars, from which you select a minimum of one.
[x | y | ...] *	Asterisk marked square brackets enclose optional syntax choices separated by vertical bars, from which you select one choice, multiple choices, or none.
&<1-n>	The argument or keyword and argument combination before the ampersand (&) sign can be entered 1 to n times.
#	A line that starts with a pound (#) sign is comments.

GUI conventions

Convention	Description
Boldface	Window names, button names, field names, and menu items are in Boldface. For example, the **New User** window opens; click **OK**.
>	Multi-level menus are separated by angle brackets. For example, **File** > **Create** > **Folder**.

Symbols

Convention	Description
WARNING!	An alert that calls attention to important information that if not understood or followed can result in personal injury.
CAUTION:	An alert that calls attention to important information that if not understood or followed can result in data loss, data corruption, or damage to hardware or software.
IMPORTANT:	An alert that calls attention to essential information.
NOTE:	An alert that contains additional or supplementary information.
TIP:	An alert that provides helpful information.

Network topology icons

Convention	Description
	Represents a generic network device, such as a router, switch, or firewall.
	Represents a routing-capable device, such as a router or Layer 3 switch.
	Represents a generic switch, such as a Layer 2 or Layer 3 switch, or a router that supports Layer 2 forwarding and other Layer 2 features.
	Represents an access controller, a unified wired-WLAN module, or the access controller engine on a unified wired-WLAN switch.
	Represents an access point.
	Represents a wireless terminator unit.
	Represents a wireless terminator.
	Represents a mesh access point.
	Represents omnidirectional signals.
	Represents directional signals.
	Represents a security product, such as a firewall, UTM, multiservice security gateway, or load balancing device.
	Represents a security module, such as a firewall, load balancing, NetStream, SSL VPN, IPS, or ACG module.

Examples provided in this document

Examples in this document might use devices that differ from your device in hardware model, configuration, or software version. It is normal that the port numbers, sample output, screenshots, and other information in the examples differ from what you have on your device.

Contents

Service chain commands

display service-chain path

Use **display service-chain path** to display service chain information.

Syntax

display service-chain path { *path-id* | **all** }

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Parameters

path-id: Specifies a service chain by its path ID in the range of 1 to 8388606.

all: Displays information for all service chains.

Examples

Display information for all service chains.

```
<Sysname> display service-chain path all
PathID: 22
  Next service node: 4.4.4.4
  Previous service node: 5.5.5.5
  Function: 1
    Service-list: fw
```

Table 1 Command output

Field	Description
PathID	Path ID of the service chain.
Next service node	IP address of the next service node.
Previous service node	IP address of the previous service node.
Function	ID of the service node.
Service-list	Services in the service list.

display service-chain statistics

Use **display service-chain statistics** to display service chain statistics.

Syntax

display service-chain statistics

Views

Any view

Predefined user roles

network-admin

network-operator

context-admin

context-operator

Examples

Display all service chain statistics.

```
<Sysname> display service-chain statistics
 Service-chain statistics
 Board : all
  Total receive : 0          Total send : 0
  Service drop  : 0          Error drop : 0
```

Table 2 Command output

Field	Description
Board	ID of a card. This field displays **all** in the current software version.
Total receive	Number of received packets.
Total send	Number of sent packets.
Service drop	Number of dropped packets.
Error drop	Number of dropped error packets.

next-service-node

Use **next-service-node** to specify the IP address of the next service node in an inter-device service chain.

Use **undo next-service-node** to restore the default.

Syntax

next-service-node *ip-address*

undo next-service-node

Default

The IP address of the next service node in an inter-device service chain is not specified.

Views

Service chain view

Predefined user roles

network-admin

context-admin

Parameters

ip-address: Specifies the IP address of the next service node.

Usage guidelines

If the service node is the end node, you do not need to specify the IP address of the next service node.

Examples

Specify the IP address of the next service node as 2.2.2.2 for service chain 1.

```
<Sysname> system-view
[Sysname] service-chain path 1
[Sysname-spath1] next-service-node 2.2.2.2
```

Related commands

display service-chain path

previous-service-node

Use **previous-service-node** to specify the IP address of the previous service node in an inter-device service chain.

Use **undo previous-service-node** to restore the default.

Syntax

previous-service-node *ip-address*

undo previous-service-node

Default

The IP address of the previous service node in an inter-device service chain is not specified.

Views

Service chain view

Predefined user roles

network-admin

context-admin

Parameters

ip-address: Specifies the IP address of the previous service node.

Usage guidelines

If the service node is the head node, you do not need to specify the IP address of the previous service node.

Examples

Specify the IP address of the previous service node as 3.3.3.3 for service chain 1.

```
<Sysname> system-view
[Sysname] service-chain path 1
[Sysname-spath1] previous-service-node 3.3.3.3
```

Related commands

display service-chain path

service-chain path

Use **service-chain path** to create a service chain and enter its view, or enter the view of an existing service chain.

Use **undo service-chain path** to delete a service chain or all service chains on a device.

Syntax

service-chain path *path-id*

undo service-chain path { *path-id* | **all** }

Default

No service chains exist.

Views

System view

Predefined user roles

network-admin

context-admin

Parameters

path-id: Specifies the path ID of a service chain, in the range of 1 to 8388606. A path ID uniquely identifies a service chain.

all: Deletes all service chains on the device.

Examples

Create service chain 1 and enter its view.

```
<Sysname> system-view
[Sysname] service-chain path 1
[Sysname-spath1]
```

Related commands

display service-chain path

service function

Use **service function** to create a service node and enter its view, or enter the view of an existing service node.

Use **undo service function** to delete a service node or all service nodes on the service chain.

Syntax

service function *function-number*

undo service function { *function-number* | **all** }

Default

No service nodes exist.

Views

Service chain view

Predefined user roles

network-admin

context-admin

Parameters

function-number: Assigns an ID to the service node. The value for the *function-number* argument is fixed at 1.

all: Deletes all service nodes on the service chain.

Usage guidelines

You can configure only one service node for a service chain.

Examples

Create service node 1 and enter its view.

```
<Sysname> system-view
[Sysname] service-chain path 1
[Sysname-spath1] service function 1
[Sysname-spath1-func1]
```

Related commands

display service-chain path

service list

Use **service list** to create a service list.

Use **undo service list** to restore the default.

Syntax

service list { **acg** | **atk** | **connect-limit** | **dpi** | **fw** | **ips** | **ipsec** | **lb** | **nat** }*

undo service list

Default

No service list exists.

Views

Service node view

Predefined user roles

network-admin

context-admin

Parameters

acg: Specifies the application control gateway (ACG) service.

atk: Specifies the attack detection and prevention service.

connect-limit: Specifies the connection limit service.

dpi: Specifies the deep packet inspection (DPI) service.

fw: Specifies the firewall (FW) service.

ips: Specifies the intelligent protection switching (IPS) service.

ipsec: Specifies the IP security (IPsec) service.

lb: Specifies the load balancing (LB) service.

nat: Specifies the network address translation (NAT) service.

Usage guidelines

You can configure only one service list for each service node. All services in a service chain must be different from each other.

The services in a service list are applied to the traffic in the order they are specified in a service list.

Examples

Create a service list that contains the FW and LB services for service node 1.

```
<Sysname> system-view
[Sysname] service-chain path 1
[Sysname-spath1] service function 1
[Sysname-spath1-func1] service list fw lb
```

Related commands

display service-chain path
