[Device-security-policy-ip-1-rule2] quit
```

# Activate rule matching acceleration.

```
[Device-security-policy-ip] accelerate enhanced enable
[Device-security-policy-ip] quit
```

e. Configure MAC address learning through the gateway.

Enable ARP entry synchronization through SNMP. Configure the device to synchronize ARP entries from the gateway.

```
[Device] snmp-server arp-sync enable
[Device] snmp-server arp-sync target-host address 2.2.2.1 community simple public
v2c
[Device] snmp-server arp-sync interval 10 timeout 4
```

f. Create a MAC object group named **groupmac**. Add Host A's MAC address **00e0-0000-0001** and Host B's MAC address **00e0-0000-0002** to the group.

```
[Device] object-group mac-address groupmac
[Device-obj-grp-mac-groupmac] mac 00e0-0000-0001
[Device-obj-grp-mac-groupmac] mac 00e0-0000-0002
[Device-obj-grp-mac-groupmac] quit
```

Verifying the configuration

1. Verify that ARP entries have been synchronized to the device.

```
[Device] display snmp-server arp-sync table
IP Address       MAC Address        Aging(M)
1.1.1.1          00e0-0000-0001     1
1.1.1.2          00e0-0000-0002     1
1.1.1.3          00e0-0000-0003     1
Total:3
```

2. Verify that Host A and Host B can access the external network but Host C cannot.

Contents

SMS

About SMS

Short message service (SMS) is a text messaging service implemented through an SMS gateway. When operating as an SMS gateway, the device uses HTTP to send SMS data to the associated third-party SMS platform. Then, the third-party SMS platform sends SMS messages to users.

Restrictions and guidelines: SMS configuration

The device supports only the Emay SMS platform in the current software version.

Procedure

1. Enter system view.

   system-view

2. Create an SMS gateway and enter its view.

   sms-gateway *gateway-name*

3. Specify the SMS platform for the SMS gateway.

   sms-platform emay

   By default, no SMS platform is specified for an SMS gateway.

4. Configure the app ID for the third-party SMS platform.

   app-id *app-id*

   By default, no app ID is configured for the third-party SMS platform.

5. Configure the secret key for SMS data encryption.

   secret-key { **cipher** | **simple** } *string*

   By default, no secret key is configured for SMS data encryption.

6. (Optional.) Send an SMS message to the test mobile number.

   sms-send test-mobile *number*

7. (Optional.) Specify the VPN instance for the SMS gateway.

   vpn-instance *vpn-instance-name*

   By default, an SMS gateway belongs to the public network.

Display and maintenance commands for SMS

Execute the **display** command in any view.

Task	Command
Display SMS gateway information.	**display sms-gateway** [**brief** | **name** *gateway-name*]

NSFOCUS Firewall Series

NF DPI Configuration Guide

NSFOCUS Technologies, Inc.

Document version: 6W600-20230221

Preface

- This configuration guide describes the fundamentals and configuration procedures for DPI features, including DPI overview, DPI engine, IPS, URL filtering, data filtering, file filtering, anti-virus, data analysis center, proxy policy.
- Security zones, security policies, object groups, object policies, APR, and session management.
- User access and authentication features (such as AAA, portal, user identification, password control, and PKI).
- Data security features (such as public key management, SSL, SSH, and crypto engine).
- Attack protection features (such as ASPF, connection limit, IP source guard, ARP attack protection, ND attack defense, uRPF, attack detection and prevention, and IP-MAC binding).

This preface includes the following topics about the documentation:

- Audience.
- Conventions.

Audience

This documentation is intended for:

- Network planners.
- Field technical support and servicing engineers.
- Network administrators.

Conventions

The following information describes the conventions used in the documentation.

Command conventions

Convention	Description
Boldface	**Bold** text represents commands and keywords that you enter literally as shown.
Italic	*Italic* text represents arguments that you replace with actual values.
[ ]	Square brackets enclose syntax choices (keywords or arguments) that are optional.
{ x | y | ... }	Braces enclose a set of required syntax choices separated by vertical bars, from which you select one.
[x | y | ...]	Square brackets enclose a set of optional syntax choices separated by vertical bars, from which you select one or none.
{ x | y | ... } *	Asterisk marked braces enclose a set of required syntax choices separated by vertical bars, from which you select a minimum of one.
[x | y | ...] *	Asterisk marked square brackets enclose optional syntax choices separated by vertical bars, from which you select one choice, multiple choices, or none.
&<1-n>	The argument or keyword and argument combination before the ampersand (&) sign can be entered 1 to n times.
#	A line that starts with a pound (#) sign is comments.

GUI conventions

Convention	Description
Boldface	Window names, button names, field names, and menu items are in Boldface. For example, the **New User** window opens; click **OK**.
>	Multi-level menus are separated by angle brackets. For example, **File** > **Create** > **Folder**.

Symbols

Convention	Description
⚠ **WARNING!**	An alert that calls attention to important information that if not understood or followed can result in personal injury.
△ **CAUTION:**	An alert that calls attention to important information that if not understood or followed can result in data loss, data corruption, or damage to hardware or software.
(!) **IMPORTANT:**	An alert that calls attention to essential information.
NOTE:	An alert that contains additional or supplementary information.
💡 **TIP:**	An alert that provides helpful information.

Network topology icons

Convention	Description
	Represents a generic network device, such as a router, switch, or firewall.
	Represents a routing-capable device, such as a router or Layer 3 switch.
	Represents a generic switch, such as a Layer 2 or Layer 3 switch, or a router that supports Layer 2 forwarding and other Layer 2 features.
	Represents an access controller, a unified wired-WLAN module, or the access controller engine on a unified wired-WLAN switch.
	Represents an access point.
	Represents a wireless terminator unit.
	Represents a wireless terminator.
	Represents a mesh access point.
	Represents omnidirectional signals.
	Represents directional signals.
	Represents a security product, such as a firewall, UTM, multiservice security gateway, or load balancing device.

Convention	Description
	Represents a security module, such as a firewall, load balancing, NetStream, SSL VPN, IPS, or ACG module.

Examples provided in this document

Examples in this document might use devices that differ from your device in hardware model, configuration, or software version. It is normal that the port numbers, sample output, screenshots, and other information in the examples differ from what you have on your device.

Contents

DPI overview

About DPI

Deep packet inspection (DPI) inspects application layer payloads to protect the network against application layer malicious activities, such as worms, viruses, spams, breaches, and information leakage.

Traditional security technology relies on the network layer and transport layer. DPI further enhances network security.

DPI functions

DPI provides the following functions:

- **Service identification**—The DPI engine identifies the service of a data flow by analyzing the application layer payload and matching the payload against signatures. DPI engine informs the DPI service modules of the identification results for service control.
- **Service control**—DPI service modules control services flexibly by using DPI service policies. Actions that DPI service policies use for data flows include permit, drop, block source, reset, capture, and log.
- **Service statistics**—DPI provides service statistics about service types, protocol parsing, signature inspection, and packet processing. Service statistics visually display the distribution of data flows and the use of different services. You can find factors that might promote service development or affect network operation.

DPI signature libraries

A DPI signature library is a collection of common signatures that DPI uses for service identification. NSFOCUS releases up-to-date signatures in the form of DPI signature library files. You can manually download the files or configure the device to automatically download the files to update the DPI signature libraries. You can also define signatures of your own as required.

The device supports the following DPI signature libraries:

- IPS signature library.
- URL filtering signature library.
- APR signature library.
- Virus signature library.

DPI services

Table 1 lists the supported DPI services.

Table 1 DPI services

DPI service	Function
IPS	Monitors network traffic for malicious activities and proactively takes actions to protect the network against attacks.
URL filtering	Controls access to the Web resources by filtering the URLs that the users visit.

DPI service	Function
Data filtering	Inspects the content in application protocol packets and filters out illegal packets. With content filtering, you can prevent internal users from accessing inappropriate websites or receiving packets that carry illegal content from the Internet.
File filtering	Filters files by filename extensions.
Anti-virus	Inspects and handles viruses in files to protect the internal network.
NBAR	Identifies the application layer protocols of packets by comparing packet content against signatures. For more information about NBAR, see *Security Configuration Guide*.

DPI mechanism

DPI can be implemented based on security policies.

Security policy-based DPI mechanism

Figure 1 illustrates how security policy-based DPI works.

After receiving a packet, the device matches the packet against the configured security policy rules.

A security policy rule includes various match criterion types. A packet matches a policy rule if the packet matches all the criterion types in the rule. Each criterion type includes one or more criteria, and a packet matches a criterion type if it matches any criterion of the type.

For information about security policy rules, see security policy configuration in *Security Configuration Guide*.

- If no matching rule is found, the device drops the packet.
- If a matching rule is found, the device processes the packet according to the rule action:
  - If the rule action is **drop**, the device drops the packet.
  - If the rule action is **pass** and a DPI application profile is specified for the rule, the device uses the DPI application profile to perform DPI on the packet. If the DPI application profile does not exist, the device permits the packet to pass.
  - If the rule action is **pass** and no DPI application profile is specified for the rule, the device permits the packet to pass.

Configuring DPI engine

About DPI engine

DPI engine is an inspection module shared by DPI service modules. DPI engine uses inspection rules to identify the application layer information, including the application layer protocol and behavior. DPI service modules process packets based on the inspection results.

DPI functions

DPI engine provides the following functions:

- **Protocol parsing**—Identifies the application layer protocols and analyzes the application layer information. Information analysis includes recognizing, normalizing, and uncompressing application layer fields.
- **AC pattern matching**—Matches packet payloads by the Aho-Corasick (AC) patterns in inspection rules. AC pattern matching is fast and it is the core function of the DPI engine.
- **Option matching**—Matches packet payloads by the options in the inspection rules whose AC patterns have been matched. Option matching is slower than AC pattern matching.

DPI engine inspection rules

DPI engine uses inspection rules to match packets. Inspection rules are transformed from the rules or signatures of the DPI service modules. The match criteria in an inspection rule can contain the following types:

- **AC pattern**—Criteria that identify packet signatures. An AC pattern is a character string that is three or more bytes long.
- **Option**—Criteria other than AC patterns. For example, an option can be the port number or protocol type.

An inspection rule can contain both AC patterns and options. A packet must match both the AC patterns and options to match the rule.

An inspection rule can also contain only options. A packet matches the rule if it matches the options in the rule.

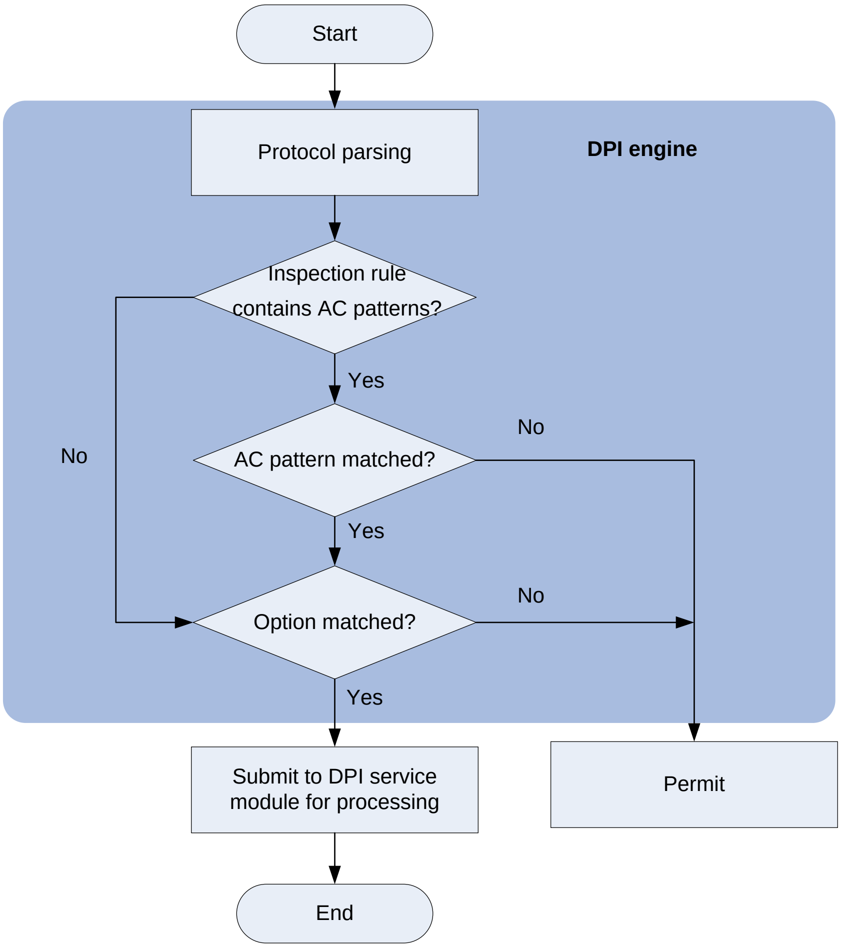
DPI engine mechanism

As shown in Figure 1, DPI engine works as follows:

1. The DPI engine performs protocol parsing for the packet and searches for applicable inspection rules according to the parsing results.
2. If an applicable inspection rule contains AC patterns, DPI engine performs AC pattern matching first. If an applicable inspection rule does not contain AC patterns, DPI engine directly performs option matching. The packet matches the rule if it matches the options.
3. If the packet matches an AC pattern in an applicable inspection rule, the DPI engine further compares the packet against the options associated with the AC pattern. The packet matches the rule if it matches the both the AC pattern and its associated options. If the packet matches an AC pattern but does not match its associated options, the DPI engine permits the packet to pass.

4. If the packet matches an inspection rule, the DPI engine submits the packet to the corresponding DPI service module for processing. If the packet does not match any rule, the DPI engine permits the packet to pass.

Figure 1 DPI engine mechanism



DPI engine tasks at a glance

To configure the DPI engine, perform the following tasks:

1. Configure a DPI application profile
2. Activating policy and rule settings for DPI service modules
3. Configuring action parameter profiles
4. (Optional.) Optimizing the DPI engine
5. (Optional.) Enabling inspection suspension upon excessive CPU usage
6. (Optional.) Configuring DPI engine inspection parameters
   - Configuring an inspection mode
   - Configuring stream fixed length inspection
   - Configuring file fixed length inspection
   - Configuring MD5 fixed-length file inspection
   - Configuring MD5 hash-based virus inspection for all files
   - Setting the maximum data size for file decompression

- Setting the maximum number of file decompression operations
- Setting the maximum number of NFS file names recorded

7. (Optional.) Configuring advanced features of the DPI engine
   - Enabling source port-based application identification
   - Specifying a proxy server for online DPI service signature update
   - Specifying the cloud query server for DPI services
   - Enabling support for HA dual-active mode
   - Configuring real source IP inspection
8. Disabling the DPI engine

Configure a DPI application profile

About this task

A DPI application profile includes a set of DPI service policies, such as a URL filtering policy. It can be applied to a security policy rule to specify the DPI service policy for packets that match the rule.

Procedure

1. Enter system view.

   system-view

2. Create a DPI application profile and enter its view.

   app-profile *profile-name*

3. Apply DPI service policies to the DPI application profile.
   - Specify an IPS policy.

     ips apply policy *policy-name* **mode** { **protect** | **alert** }

     For more information about this command, see IPS commands in *DPI Command Reference*.
   - Specify a URL filtering policy.

     url-filter apply policy *policy-name*

     For more information about this command, see URL filtering commands in *DPI Command Reference*.
   - Specify a data filtering policy.

     data-filter apply policy *policyname*

     For more information about this command, see data filtering commands in *DPI Command Reference*.
   - Specify a file filtering policy.

     file-filter apply policy *policyname*

     For more information about this command, see file filtering commands in *DPI Command Reference*.
   - Specify an anti-virus policy.

     anti-virus apply policy *policyname* **mode** { **alert** | **protect** }

     For more information about this command, see anti-virus commands in *DPI Command Reference*.

   By default, no DPI service policies are applied to a DPI application profile.

Activating policy and rule settings for DPI service modules

About this task

By default, the system will detect whether another configuration change (such as creation, modification, or deletion) occurs within a 20-second interval after a configuration change for DPI service modules such as URL filtering:

- If no configuration change occurs within the interval, the system performs an activation operation at the end of the next interval to make the configuration take effect.
- If a configuration change occurs within the interval, the system continues to periodically check whether a configuration change occurs within the interval.

To activate the policy and rule configurations for DPI service modules immediately, you can execute the **`inspect activate`** command.

Procedure

1. Enter system view.

   ```
   system-view
   ```

2. Activate policy and rule settings for DPI service modules.

   ```
   inspect activate
   ```

   By default, the creation, modification, and deletion of DPI service policies and rules will be activated automatically.

△ **CAUTION:**

This command causes transient DPI service interruption. DPI-based services might also be interrupted. For example, security policies cannot control access to applications.

Configuring action parameter profiles

Configuring a block source parameter profile

About this task

A block source parameter profile defines the block period for the block source action in DPI service modules.

Restrictions and guidelines

The block source action takes effect only after the blacklist feature is enabled.

With the blacklist feature is enabled, the device drops the matching packet and adds the packet's source IP address to the IP blacklist. Subsequent packets from the source IP address will be dropped directly during the block period.

For more information about the blacklist feature, see attack detection and prevention configuration in the *Security Configuration Guide*.

Procedure

1. Enter system view.

   ```
   system-view
   ```

2. Create a block source parameter profile and enter its view.

inspect block-source parameter-profile *parameter-name*

3. Set the block period during which a source IP address is blocked.

   block-period *period*

   The default setting is 1800 seconds.

Configuring a capture parameter profile

About this task

A capture parameter profile defines the following parameters for the capture action in DPI service modules:

- Maximum number of bytes that can be cached.
- Daily export time for cached packets.
- URL to which cached packets are exported (for example, tftp://192.168.100.100/upload).

The device caches captured packets locally and exports the cached packets to the designated URL at the daily export time or when the number of cached bytes reaches the limit. After the export, the device clears the local cache and starts to capture new packets.

Procedure

1. Enter system view.

   system-view

2. Create a capture parameter profile and enter its view.

   inspect capture parameter-profile *parameter-name*

3. Set the maximum volume of captured packets that can be cached.

   capture-limit *kilobytes*

   By default, the device can cache a maximum of 512 Kilobytes of captured packets.

4. Set the daily export time for cached captured packets.

   export repeating-at *time*

   By default, the cached captured packets are exported at 1:00 a.m. every day.

5. Specify the URL to which cached captured packets are exported

   export url *url-string*

   By default, no URL is specified for exporting the cached captured packets.

Configuring a logging parameter profile

About this task

A logging parameter profile defines the log output method and log output language for the logging action in DPI service modules.

Restrictions and guidelines

After setting the IPS log language to Chinese, only the attack name field of the IPS logs supports displaying in Chinese.

Procedure

1. Enter system view.

   system-view

2. Create a logging parameter profile and enter its view.

   inspect logging parameter-profile *parameter-name*

3. Specify the log export method.

   log { **email** | **syslog** }

   By default, logs are exported to the information center.

4. Set the language for IPS log output to Chinese.

   log language chinese

   By default, IPS logs are output in English.

Configuring a redirect parameter profile

About this task

A redirect parameter profile defines the URL to which packets are redirected for the redirect action in DPI service modules.

Restrictions and guidelines

The defined URL must start with http:// or https://. for example, http://www.example.com.

Procedure

1. Enter system view.

   system-view

2. Create a redirect parameter profile and enter its view.

   inspect redirect parameter-profile *parameter-name*

3. Specify the URL to which packets are redirected.

   redirect-url *url-string*

   By default, no URL is specified for packet redirecting.

Configuring an email parameter profile

About this task

An email parameter profile defines the following parameters for the email action in DPI service modules:

- Email server.
- Email sender and receiver.
- Username and password for logging in to the email server.

Procedure

1. Enter system view.

   system-view

2. Create an email parameter profile and enter its view.

   inspect email parameter-profile *parameter-name*

3. Specify the email server.

   email-server *addr-string*

   By default, no email server is specified.

4. Specify the email sender address.

   sender *addr-string*

   By default, no email sender address is specified.

5. Specify the email receiver address.

receiver *addr-string*

By default, no email receiver address is specified.

6. (Optional.) Configure email client authentication.
   a. Enable email client authentication.
      authentication enable
      By default, email client authentication is enabled.
   b. Specify the username for logging in to the email server.
      username *name-string*
      By default, no username is specified for logging in to the email server.
   c. Specify the password for logging in to the email server.
      password { **cipher** | **simple** } *string*
      By default, no password is specified for logging in to the email server.
   d. Enable the secure password transmission feature.
      secure-authentication enable
      By default, the secure password transmission feature is disabled.
7. Configure output limit for log entries sent to the email server.
   email-limit interval *interval* **max-number** *value*
   By default, the device allows sending a maximum of 10 log entries within five minutes.

Configuring a warning parameter profile

About this task

A warning parameter profile defines the parameters for the warning action in DPI service modules. After you create a warning parameter profile, you can import a user-defined alarm message from a file.

Procedure

1. Enter system view.
   system-view
2. Create a warning parameter profile and enter its view,.
   inspect warning parameter-profile *profile-name*
3. Import a user-defined alarm message from a warning file.
   import block warning-file *file-path*
   By default, the device uses the alarm message "**The site you are accessing has a security risk and thereby is blocked**."
4. (Optional.) Restore the default alarm message.
   reset block warning-file
   This command clears the user-defined alarm message and restores the default alarm message.

Optimizing the DPI engine

About this task

The DPI engine includes a series of optimization features. For example, you can enable the DPI engine to uncompress or decode the compressed or encoded packets to identify the application information of the packets. The optimization features improve inspection and accuracy of the DPI engine, but consume more system resources.

Procedure

1. Enter system view.

   system-view

2. Set the maximum number of payload-carrying packets to be inspected per data flow.

   inspect packet maximum *max-number*

   By default, the DPI engine can inspect a maximum of 32 payload-carrying packets per data flow.

3. Set the maximum number of options to be cached per TCP or UDP data flow.

   inspect cache-option maximum *max-number*

   By default, the DPI engine can cache a maximum of 32 options per TCP or UDP data flow.

4. Configure the TCP segment reassembly feature.

   - Enable TCP segment reassembly.

     inspect tcp-reassemble enable

     By default, the TCP segment reassembly feature is disabled.

   - Set the maximum number of TCP segments that can be cached for reassembly per TCP flow.

     inspect tcp-reassemble max-segment *max-number*

     By default, a maximum of 10 TCP segments can be cached for reassembly per TCP flow.

5. (Optional.) Disable a DPI engine optimization feature.

   inspect optimization [**chunk** | **no-acsignature** | **raw** | **uncompress** | **url-normalization**] **disable**

   By default, all DPI engine optimization features are enabled.

   You can disable DPI engine optimization features to improve the device performance as needed.

Enabling inspection suspension upon excessive CPU usage

About this task

Packet inspection of the DPI engine is a complex and resource-consuming process.

Inspection suspension upon excessive CPU usage works as follows:

- When the device's CPU usage rises to or above the CPU usage threshold, the DPI engine suspends packet inspection to guarantee the device performance.
- When the device's CPU usage drops to or below the CPU usage recovery threshold, the DPI engine resumes packet inspection.

For information about configuring the CPU usage thresholds, see device management in *Fundamentals Configuration Guide*.

Restrictions and guidelines

Do not disable inspection suspension upon excessive CPU usage if the device's CPU usage is high.

When the device's CPU usage is low, you can disable this feature to improve inspection accuracy.

Procedure

1. Enter system view.

```
system-view
```

2. Enable inspection suspension upon excessive CPU usage.

```
undo inspect cpu-threshold disable
```

By default, inspection suspension upon excessive CPU usage is enabled.

Configuring DPI engine inspection parameters

Configuring an inspection mode

About this task

Select an inspection mode as required:

- **Balanced mode**—Applicable to most scenarios. This mode makes a tradeoff between the device performance and inspection coverage. The maximum length is 32 Kilobytes for FTP, HTTP, SMB, NFS, and email streams, and the maximum file length for MD5 inspection is 2048 Kilobytes.
- **Large coverage mode**—Applicable to the scenarios that require large inspection coverage. This mode improves the inspection coverage at the cost of device performance. The maximum length is 128 Kilobytes for FTP, HTTP, SMB, NFS, and email streams, and the maximum file length for MD5 inspection is 5120 Kilobytes.
- **High performance mode**—Applicable to the scenarios that require high device performance. This mode improves the device performance while ensuring a certain inspection coverage. The maximum length is 32 Kilobytes for FTP, HTTP, SMB, NFS, and email streams, and the maximum file length for MD5 inspection is 32 Kilobytes.
- **User-defined mode**—Applicable to the scenarios that have specific requirements for inspection coverage and device performance. In this mode, you can execute the **inspect stream-fixed-length and inspect md5-fixed-length** commands **to** set the maximum stream length for inspection and maximum file length for MD5 value calculation, respectively.

The maximum lengths for stream inspection and MD5 inspection will not change after the user-defined inspection mode is switched, and you can adjust those lengths as required.

Procedure

1. Enter system view.

```
system-view
```

2. Configure a DPI engine inspection mode.

```
inspect coverage { balanced | large-coverage | high-performance |
user-defined }
```

By default, the DPI engine uses the balanced mode.

Configuring stream fixed length inspection

About this task

DPI engine inspects only the fixed-length data after the first packet for each stream. The remaining stream data is not inspected. Reducing the fixed length for stream inspection enhances the inspection efficiency.

Restrictions and guidelines

This feature can be configured only if the DPI engine inspection mode is user-defined mode.

Procedure

1. Enter system view.

   system-view

2. Enable the stream fixed length inspection.

   undo inspect stream-fixed-length disable

   By default, the stream fixed length inspection is enabled.

3. Set the fixed length for stream inspection.

   inspect stream-fixed-length { **email** | **ftp** | **http** | **nfs** | **smb** } * *length*

   The default length is 32 Kilobytes for FTP, HTTP, NFS, SMB, and email streams.

   The longer the inspection data length, the lower the device throughput, and the higher the packet inspection accuracy.

Configuring file fixed length inspection

About this task

DPI engine inspects only the fixed-length data of files in each data stream. The remaining data of the file is not inspected. This is because virus signatures are typically embedded in the first half of a file. Narrowing the inspection scope enhances the file inspection efficiency.

Restrictions and guidelines

This feature can be configured only if the DPI engine inspection mode is user-defined mode.

Because files are transmitted in a data stream, the fixed length of files must not be longer than that of the data stream.

Procedure

1. Enter system view.

   system-view

2. Enable the file fixed length inspection.

   inspect file-fixed-length enable

   By default, the file fixed length inspection is disabled.

3. Set the fixed length for file inspection.

   inspect file-fixed-length { **email** | **ftp** | **http** | **nfs** | **smb** } * *length-value*

   By default, the fixed length is 32 Kilobytes for FTP, HTTP, NFS, SMB, and email files.

   If a data stream contains multiple files, this feature inspects only the fixed length data of each file.

Configuring MD5 fixed-length file inspection

About this task

In the anti-virus services, the device matches the packet signatures, calculates MD5 values of the files, and compares the calculated MD5 values with the MD5 rules in the signature library. If the MD5 value for a file matches an MD5 rule in the signature library, the file is considered to contain viruses. For more information about virus inspection, see "Configuring anti-virus."

The DPI engine inspects the packet signatures and MD5 values at the same time. After the length of a file reaches the fixed stream inspection length, the DPI engine will stop the packet signature inspection. To continue the MD5 inspection for a file, enable MD5 fixed-length file inspection and configure a fixed file length for MD5 inspection longer than the fixed length for stream inspection. Then the DPI engine calculates MD5 value of the fixed-length file.

The increase of the file length for MD5 inspection will reduce the device performance but improve the success rate of the MD5 inspection. The decrease of the file length for MD5 inspection will improve the device performance but reduce the success rate of the MD5 inspection.

Restrictions and guidelines

This feature can be configured only if the DPI engine inspection mode is user-defined mode.

Procedure

1. Enter system view.

   `system-view`

2. Enable MD5 fixed-length file inspection.

   `inspect md5-fixed-length enable`

   By default, MD5 fixed-length file inspection is enabled.

3. Set the fixed file length for MD5 inspection.

   `inspect md5-fixed-length` { **`email`** | **`ftp`** | **`http`** | **`nfs`** | **`smb`** } * *`length`*

   By default, the fixed length of FTP, HTTP, SMB, NFS, and email files for MD5 inspection is 2048 Kilobytes.

Configuring MD5 hash-based virus inspection for all files

Restrictions and guidelines

This feature might degrade the processing performance of other services. Enable it only when necessary.

Procedure

1. Enter system view.

   `system-view`

2. Enable MD5 hash-based virus inspection for all files.

   `inspect md5-verify all-files`

   By default, the DPI engine performs MD5 hash-based virus inspection only for executable files, office files, and compressed files.

Setting the maximum data size for file decompression

About this task

The device can decompress .zip files for file data inspection. Perform this task to set the maximum data size that can be decompressed in a file. The remaining file data will be ignored.

Small limits might make DPI engine unable to identify the original file content correctly, reducing the impact on the device forwarding performance but affecting the accuracy of the file inspection results for DPI services (such as anti-virus and data filtering).

Restrictions and guidelines

The device can decompress only .zip files.

Procedure

1. Enter system view.

   `system-view`

2. Set the maximum data size that can be decompressed in a .zip file.

   inspect file-uncompr-len *max-size*

   By default, the device can decompress a maximum of 100 MB data in a .zip file.

Setting the maximum number of file decompression operations

About this task

The DPI engine consumes memory resources each time it performs a file decompression operation. A large number of file decompression operations might consume a large number of memory resources. Perform this task to limit the memory resources consumed by file decompression operations.

A small limit can reduce memory consumption but might reduce the detection success rate of the DPI engine. A great limit might improve the detection success rate of the DPI engine but degrade the device performance.

Restrictions and guidelines

This feature is supported only on the default context. For more information about contexts, see *Virtual Technologies Configuration Guide*.

Procedure

1. Enter system view.

   system-view

2. Set the maximum number of file decompression operations.

   inspect uncompress maximum *max-number*

   By default, the maximum number of file decompression operations is calculated according to the actual memory size of the device.

Setting the maximum number of NFS file names recorded

About this task

The DPI engine records file names during file detection for users to obtain file information in logs. The record process occupies memory resources. The more files detected, the more memory resources occupied. In an environment using NFS to transfer a large number of files, perform this task to limit the memory resources consumed by recording file names.

In scenarios requiring high performance, you can set a small limit to reduce memory consumption. In scenarios not requiring high performance, you can set a great limit to enable users to obtain more file information.

Procedure

1. Enter system view.

   system-view

2. Set the maximum number of NFS file names recorded.

   inspect record-filename nfs maximum *max-number*

   By default, the maximum number of NFS file names recorded is calculated according to the actual memory size of the device.

Configuring advanced features of the DPI engine

Enabling source port-based application identification

About this task

You can use this feature to identify traffic of applications that use fixed source ports when the following conditions are true:

- The types of traffic transmitted over networks are relatively unvaried and use fixed source ports.
- Destination port-based application identification or signature-based traffic content identification is not supported.

The application identification results produced by this feature might not be accurate. Configure this feature according to your live network as a best practice.

Procedure

1. Enter system view.

   `system-view`

2. Enable source port-based application identification.

   `inspect source-port-identify enable`

   By default, source port-based application identification is disabled.

Specifying a proxy server for online DPI service signature update

About this task

The device must access the company's website for online signature update of DPI services (such as URL filtering). If direct connectivity is not available, the device can access the company's website through the specified proxy server. For more information about online signature update, see "Configuring URL filtering" and "Configuring anti-virus."

Restrictions and guidelines

If you specify a proxy server by domain name instead of IP address, make sure the device can resolve the domain name into an IP address through DNS. For more information about DNS, see *Layer 3—IP Services Configuration Guide.*

Procedure

1. Enter system view.

   `system-view`

2. Specify a proxy server for online DPI service signature update

   inspect signature auto-update proxy { **domain** *domain-name* | **ip** *ip-address* } [**port** *port-number*] [**user** *user-name* **password** { **cipher** | **simple** } *string*]

   By default, the proxy server used by DPI services for online signature update is not specified.

Specifying the cloud query server for DPI services

About this task

You can specify the server used for cloud query by DPI services.

Currently, the cloud query server supports URL filtering cloud query and anti-virus MD5 value cloud query.

Restrictions and guidelines

For successful cloud query, make sure the device can resolve the host name of the cloud query server into an IP address through DNS. For more information about DNS, see DNS configuration in *Layer 3—IP Services Configuration Guide.*

Procedure

1. Enter system view.

   ```
   system-view
   ```

2. Specify the cloud query server for DPI services.

   ```
   inspect cloud-server host-name
   ```

Enabling support for HA dual-active mode

About this task

The feature ensures the device in HA dual-active mode can correctly process DPI services in a network with asymmetric forwarding of flows.

For more information about HA dual-active mode, see RBM-based hot backup configuration in *High Availability Configuration Guide*.

Restrictions and guidelines

This feature takes effect only when the device operates in HA dual-active mode.

This feature might degrade device performance.

Procedure

1. Enter system view.

   ```
   system-view
   ```

2. Enable support for HA dual-active mode.

   ```
   inspect dual-active enable
   ```

   By default, support for HA dual-active mode is disabled.

Configuring real source IP inspection

Enabling real source IP inspection

About this task

When a client connects to a Web server through HTTP proxies, the source IP address of the request will change. To identify the source IP attacks accurately, you can enable real source IP inspection to obtain the real source IP address from the corresponding fields in the request.

Procedure

1. Enter system view.

   ```
   system-view
   ```

2. Enable real source IP inspection.

   ```
   inspect real-ip enable
   ```

   By default, real source IP inspection is disabled.

Setting the priority of an inspected field for real source IP inspection

About this task

With real source IP inspection enabled, the device obtains the real source IP address of the client by inspecting multiple fields in the packets by default.

When multiple IP addresses are detected, the devices uses the IP address obtained from the field with the highest priority as the final real source IP address.

Procedure

1. Enter system view.

   `system-view`

2. Set the priority of an inspected field for real source IP inspection.

   `inspect real-ip detect-field` { **`cdn-src-ip`** | **`tcp-option`** | **`x-real-ip`** | **`xff`** } **`priority`** *`priority-value`*

   By default, no priority is specified for any inspected field in the real source IP inspection, and all inspected fields use priority value 0. The device inspects the fields in the order of the **`xff`**, **`cdn-src-ip`**, **`x-real-ip`**, and **`tcp-option`** fields.

Configuring real source IP address inspection for the X-Forwarded-For field

About this task

When a client connects to a Web server through an HTTP proxy, the HTTP header might contain the X-Forwarded-For field that carries multiple IP addresses. The standard syntax of the X-Forwarded-For field is <client>, <proxy1>, <proxy2>,…<proxyn>. If a request goes through multiple proxies, the IP addresses of each successive proxy are listed. The rightmost IP address is the IP address of the most recent proxy and the leftmost IP address is the IP address of the originating client.

Procedure

1. Enter system view.

   `system-view`

2. Configure real source IP address inspection for the X-Forwarded-For field.

   `inspect real-ip detect-field xff` { **`head`** | **`tail`** }

   By default, the rightmost IP address in the X-Forwarded-For field is the real source IP address.

Configuring real source IP inspection for the TCP Options field

About this task

To enable the device to locate the real source IP address in the TCP Option field, you must first define a hexadecimal string. If no hexadecimal string is found, the device will stop searching the TCP Options field for the real IP address.

Restrictions and guidelines

With real source IP inspection enabled, the device does not obtain the real source IP address from the TCP Options field by default. The device searches the real source IP from the TCP Options field only after the parameters are configured.

Procedure

1. Enter system view.

   `system-view`

2. Configure real source IP inspection for the TCP Options field.

   inspect real-ip detect-field tcp-option hex *hex-vector* [**offset** *offset-value*] [**depth** *depth-value*] [**ip-offset** *ip-offset-value*]

   By default, real source IP inspection is not configured for the TCP Options field, and the device does not obtain the real source IP address from the TCP Options field.

Disabling the DPI engine

Disabling the DPI engine for all protocols

About this task

Packet inspection in the DPI engine is a complex and resource-consuming process. When the CPU usage is too high, you can disable the DPI engine to guarantee the device performance.

Procedure

1. Enter system view.

   `system-view`

2. Disable the DPI engine.

   `inspect bypass`

   By default, the DPI engine is enabled.

⚠ **CAUTION:**

This command causes packets of any protocols not to be processed by DPI. DPI-based services might also be interrupted. For example, security policies cannot control access to applications.

Disabling the DPI engine for the specified protocols

About this task

Perform this task in the following scenarios:

- Scenario 1: Inspection on packets of the specified protocols is not required. You can disable the DPI engine for the specified protocols to reduce the consumption of device resources and improve the device performance.
- Scenario 2: Inspection on packets of the specified protocols causes device reboot. You can specify the protocols to bypass the DPI engine to avoid device reboot caused by inspection error and ensure the inspection on packets of other protocols.

To disable the DPI engine for the specified protocols, you can use either of the following methods:

- **Manual configuration**—If the administrator knows the protocols to bypass, you can use this method. This method applies to scenario 1.

- **Automatic configuration**—This method applies to scenario 2. If you use this method, the device automatically identifies the protocols to bypass the DPI engine after device reboot.

Procedure

1. Enter system view.

   system-view

2. Disable the DPI engine for the specified protocols.
   - Manually disable the DPI engine for the specified protocols.

     inspect bypass protocol { **dns** | **ftp** | **ftp-data** | **http** | **https** | **imap** | **nfs** | **pop3** | **rtmp** | **sip** | **smb** | **smtp** | **telnet** | **tftp** } *

     By default, the DPI engine inspects all supported protocols.
   - Automatically disable the DPI engine for the specified protocols.

     inspect auto-bypass enable

     By default, automatic bypass of the DPI engine is disabled.

Display and maintenance commands for DPI engine

Execute **display** commands in any view.

Task	Command
Display the status of the DPI engine.	**display inspect status**
Display information about the MD5 hash-based virus inspection for all files feature.	**display inspect md5-verify configuration**

Contents

Configuring IPS

About IPS

Intrusion prevention system (IPS) is a security feature that enables devices to monitor network traffic for malicious activity and to proactively take prevention actions.

IPS functions

IPS provides the following functions:

- **In-depth protection**—IPS inspects the application layer data of packets, performs protocol analysis and reassembly on network traffic flows, and takes actions according to the analysis results.
- **Real-time protection**—IPS monitors network traffic in real-time and can take actions on detected attacks.
- **All-around protection**—IPS can detect and prevent the following types of attacks:
  - Malicious software such as worms, viruses, Trojan, bots, spyware, adware, scanners, and backdoors.
  - Malicious attacks such as common gateway interface (CGI) attacks, cross-site scripting attacks, injection attacks, directory traversal attacks, information leakage attacks, remote file inclusion attacks, buffer overflow attacks, code execution attacks, and DoS attacks.
- **Bidirectional protection**—IPS monitors both incoming and outgoing traffic to prevent attacks arising from the internal and external networks.

IPS policies

IPS is implemented based on IPS policies. An IPS policy contains a set of IPS signatures for matching packets and the actions for the packets.

IPS signatures

The device compares packets with IPS signatures to detect, classify, and prevent network attacks.

Each IPS signature contains various attributes, including attack category, action, protected target, severity level, and direction. You can filter the IPS signatures that an IPS policy uses based on the IPS signature attributes.

The device supports the following types of IPS signatures:

- **Predefined IPS signatures**—Automatically generated by the device based on the local signature library. You cannot add, modify, or delete a predefined IPS signature.
- **User-defined IPS signatures**—For new attacks that cannot be detected by predefined signatures, you can customize IPS signatures. The user-defined IPS signatures include Snort signatures that are imported from a Snort file and user-configured signatures that are manually configured.

IPS actions

When the device detects a matching packet for an IPS signature, it takes the actions specified for the signature on the packet.

The device supports the following signature actions:

- **Reset**—Closes the TCP connections for matching packets by sending TCP reset messages.
- **Redirect**—Redirects matching packets to a webpage.

- **Block-source**—Drops matching packets and adds the sources of the packets to the IP blacklist. If the IP blacklist feature is enabled, packets from the blacklisted sources will be blocked for a duration set by the **`block-period`** command. If the IP blacklist feature is not enabled, packets from the blacklisted sources are not blocked.

  To enable the IP blacklist feature, use the **`blacklist global enable`** command. For more information about the IP blacklist feature, see *Security Configuration Guide*.

  For more information about the **`block-period`** command, see *DPI Command Reference*.
- **Drop**—Drops matching packets.
- **Permit**—Permits matching packets to pass.
- **Capture**—Captures matching packets.
- **Logging**—Logs matching packets.

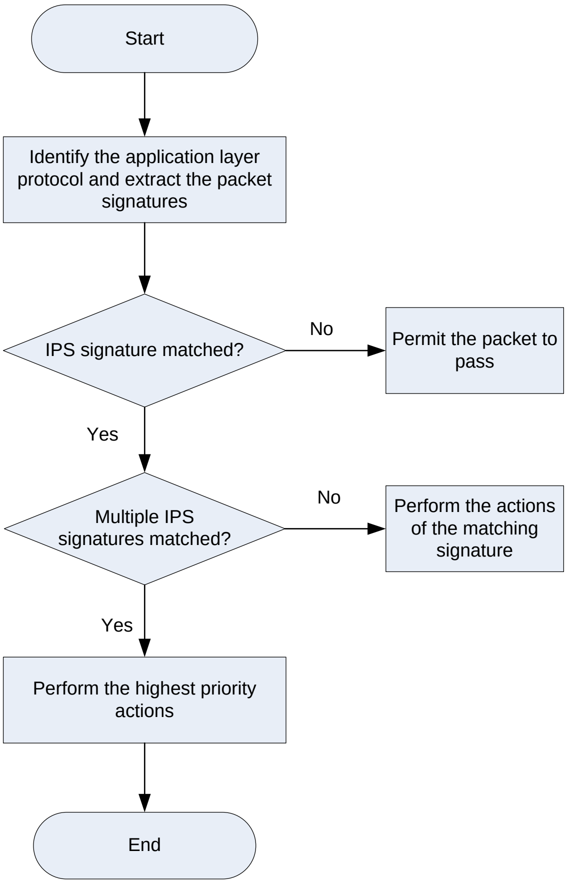
IPS mechanism

IPS takes effect after you apply an IPS policy to a DPI application profile and use the DPI application profile in a security policy rule.

As shown in Figure 1, upon receiving a packet, the device performs the following operations:

1. The device identifies the packet application layer protocol and extracts the packet signatures.
2. The device determines the actions for the packet by comparing the extracted packet signatures with the IPS signatures in the IPS policy:
   - If the packet does not match any IPS signatures, the device permits the packet to pass.
   - If the packet matches only one IPS signature, the device takes the signature actions.
   - If the packet matches multiple IPS signatures, the device uses the following rules to select the actions:
     - If the matching IPS signatures have two or more actions, including **redirect**, **drop, permit**, and **reset**, the device takes the action of the highest priority. The actions in descending order of priority are **reset**, **redirect**, **drop**, and **permit**.
     - The device will execute the **block-source**, **capture**, and **logging** actions if they are in the matching IPS signatures.

Figure 1 IPS mechanism



Start
Identify the application layer protocol and extract the packet signatures
IPS signature matched?
No
Permit the packet to pass
Yes
Multiple IPS signatures matched?
No
Perform the actions of the matching signature
Yes
Perform the highest priority actions
End

IPS signature library management

The device uses IPS signatures to inspect application layer traffic for malicious threats and attacks.

You can update the device IPS signature library to the latest version or roll back the library to the previous or the factory default version.

Updating the IPS signature library

The following methods are available for updating the IPS signature library on the device:

- Automatic update.

  The device automatically downloads the most up-to-date IPS signature file to update its local signature library periodically.
- Triggered update.

  The device downloads the most up-to-date IPS signature file to update its local signature library immediately after you trigger the operation.
- Manual update.

  Use this method when the device cannot obtain the IPS signature file automatically.

  You must manually download the most up-to-date IPS signature file, and then use the file to update the signature library on the device.

Rolling back the IPS signature library

If filtering false alarms or filtering exceptions occur frequently, you can roll back the IPS signature library to the previous version or to the factory default version.

Restrictions: Licensing requirements for IPS

The IPS module requires a license to run on the device. If the license expires, you can still use the IPS functions but you can no longer upgrade the IPS signature library on the device. For more information about licenses, see license management in *Fundamentals Configuration Guide*.

IPS tasks at a glance

To configure IPS, perform the following tasks:

1. Configuring an IPS policy
2. Applying an IPS policy to a DPI application profile
3. (Optional.) Activating IPS policy settings
4. Applying a DPI application profile to a security policy rule
5. Managing the IPS signature library
6. (Optional.) Importing and deleting Snort IPS signatures
7. (Optional.) Managing a user-configured IPS signature
8. (Optional.) Enabling IPS signature hit counting
9. (Optional.) Configuring IPS whitelist

Configuring an IPS policy

Creating an IPS policy

About this task

By default, a newly created IPS policy uses all enabled IPS signatures and applies to the packet matching a signature the default signature action. You can filter the IPS signatures used by the IPS policy and change the signature actions.

Procedure

1. Enter system view.

   ```
   system-view
   ```

2. Create an IPS policy and enter its view.

   ```
   ips policy policy-name
   ```

   A default IPS policy named **default** exists. The default IPS policy uses all enabled IPS signatures on the device and cannot be modified or deleted.

Configuring IPS signature filtering criteria for an IPS policy

About this task

By default, an IPS policy uses all enabled IPS signatures on the device. You can set criteria to filter IPS signatures that an IPS policy uses based on the signature attributes.

An IPS policy uses an IPS signature only if the signature matches all the configured criteria.

For certain attribute-based criterion (such as the action, object direction, or severity level criterion), you can specify multiple attribute values. An IPS signature matches the criterion if it matches any of the specified attribute values.

Procedure

1. Enter system view.

   system-view

2. Enter IPS policy view.

   ips policy *policy-name*

3. Configure the IPS signature filtering criteria.

   - Set a target criterion.

     protect-target { *target* [*subtarget* | **all**] }

     By default, the target attribute is not used for IPS signature filtering.

   - Set an attack category criterion.

     attack-category { *category* [*subcategory*] | **all** }

     By default, the attack category attribute is not used for IPS signature filtering.

   - Set an action criterion.

     action { **block-source** | **drop** | **permit** | **reset** } *

     By default, the action attribute is not used for IPS signature filtering.

   - Set an object direction criterion.

     object-dir { **client** | **server** } *

     By default, the object direction attribute is not used for IPS signature filtering.

   - Set a severity level criterion.

     severity-level { **critical** | **high** | **low** | **medium** } *

     By default, the severity level attribute is not used for IPS signature filtering.

   - Set a default status criterion.

     status { **disabled** | **enabled** } *

     By default, the default status attribute is not used for IPS signature filtering.

     In the IPS signature library, the default status of an IPS signature indicates whether or not the IPS signature is recommended. IPS signatures in **disabled** default status are not recommended, and IPS signatures in **enabled** default status are recommended.

Specifying an IPS signature library baseline version

About this task

This feature sets an IPS signature library version as the baseline version and enables the device to match packets only with the signatures in the baseline version. With this feature, the device compares the current IPS signature library with the baseline signature library. If a signature is included in the current signature library but does not included in the baseline signature library, the device sets the signature to ineffective state. Signatures in ineffective state cannot match packets.

This feature allows the device to match packets only with the signatures in the baseline version without rolling back the signature library to the baseline version.

To separately activate an ineffective signature after this feature is used, perform the following tasks:

1. On the Web interface of the device, obtain the IDs of all ineffective signatures.
2. Use this feature again to change the IPS signature library baseline version to the version that contains the signature.
3. Execute the **signature override** command to disable all signatures that were in ineffective state when the previous signature library baseline version was used, except the signature to be activated.

Procedure

1. Enter system view.

   system-view

2. Enter IPS policy view.

   ips policy *policy-name*

3. Specify an IPS signature library baseline version.

   signature version-baseline *version-number*

   By default, no IPS signature library version baseline is configured.

Configuring IPS actions for an IPS policy

About this task

By default, the system applies the default actions of an IPS signature to packets matching the signature.

You can also configure global actions for an IPS policy or change the actions for individual IPS signatures in the policy.

The system selects the actions for packets matching an IPS signature in the following order:

1. Actions configured for the IPS signature in the IPS policy.
2. Actions configured for the IPS policy.
3. Default actions of the IPS signature.

Restrictions and guidelines

The **logging** keyword enables the IPS module to log packet matching events and send log messages to the information center.

With the information center, you can set log message filtering and output rules, including output destinations.

The information center can output IPS logs to any destinations except the console and the monitor terminal. If you configure the console or monitor terminal as an output destination, the output destination setting will not take effect.

To view IPS logs stored on the device, use the **display logbuffer** command. Make sure you do not disable log output to the log buffer, which is enabled by default.

For more information about configuring the information center, see *Network Management and Monitoring Configuration Guide*.

In IPS logs, the values for the real source MAC address (RealSrcMacAddr) and real destination MAC address (RealDstMacAddr) are displayed only when MAC learning through a Layer 3 device is enabled. For more information about MAC learning through a Layer 3 device, see *Fundamentals Configuration Guide*.

Procedure

1. Enter system view.

   system-view

2. Enter the view of an IPS policy.

   ips policy *policy-name*

3. Specify the global packet processing actions for the IPS policy.

   signature override all { { **block-source** | **drop** | **permit** | **redirect** | **reset** } | **capture** | **logging** } *

By default, no actions are specified for an IPS policy and the default actions of IPS signatures are applied to matching packets.

4. (Optional.) Change the state or actions for an IPS signature.

   signature override { **pre-defined** | **user-defined** } *signature-id* { { **disable** | **enable** } [{ **block-source** | **drop** | **permit** | **redirect** | **reset** } | **capture** | **logging**] * }

   By default:

   - Predefined IPS signatures use the actions and states defined by the system.
   - User-defined IPS signatures use the actions and states defined in the IPS signature file from which the signatures are imported.

   You cannot change the state or actions for an IPS signature in the default IPS policy.

5. (Optional.) Specify the number of the captured packets to be cached for threat analysis.

   ips capture-cache *number*

   By default, the number of the captured packets to be cached for threat analysis is not specified, and the device does not cache any captured packets.

   This command enables the device to cache the IPS captured packets. After caching the specified number of the captured packets, the device writes all cached packets and the hit packet into the capture file for threat analysis.

Specifying a parameter profile for an IPS action

About this task

The **block source**, **capture**, and **logging** actions take effect only after a parameter profile is specified. You can specify a parameter profile for an IPS action as follows:

- Specify a global parameter profile in system view. The setting takes effect in all IPS policies.
- Specify a parameter profile in IPS policy view, which a policy-specific setting. Only the email action supports specifying a parameter profile in IPS policy view.

Restrictions and guidelines

- The global parameter profile for an IPS action takes precedence over a policy-specific parameter profile for the action.
- To have a parameter profile for an IPS action in an IPS policy take effect, make sure the global parameter profile is disabled.
- As a best practice, enable the global parameter profile after the global parameter profile configuration is completed.

Specifying a global parameter profile for an IPS action

1. Enter system view.

   system-view

2. Specify a global parameter profile for an IPS action.

   ips { **block-source** | **capture** | **email** | **logging** | **redirect** } **parameter-profile** *parameter-name*

   By default, no global parameter profile is specified for an IPS action.

   If you do not specify a parameter profile for an action, or if the specified profile does not exist, the default action parameter settings are used. For more information about configuring an action parameter profile, see DPI engine commands in *DPI Command Reference*.

Specifying an action parameter profile in an IPS policy

1. Enter system view.

system-view

2. Enter IPS policy view.

   ips policy *policy-name*

3. Specify the log output method.

   log { **email** | **syslog** }

   By default, the IPS log output method is **syslog**.

4. (Optional.) Specify the lowest severity level of the matching IPS signatures for log output via email.

   email severity-level { **critical** | **high** | **low** | **medium** }

   By default, the lowest severity level of the matching IPS signatures for log output via email is **low**.

   This command is available only when the log output method is **email**. The system sends emails for IPS logs only when the severity levels of the matching IPS signatures are not lower than specified severity level.

5. (Optional.) Specify a parameter profile for the email action.

   email parameter-profile *parameter-profile-name*

   By default, no parameter profile is specified for the email action.

   This command is available only when the log output method is **email**. For more information about configuring an email parameter profile, see DPI engine commands in *DPI Command Reference*.

6. (Optional.) Disable the global parameter profile.

   undo global-parameter enable

   By default, global parameter profiles are enabled.

Applying an IPS policy to a DPI application profile

About this task

An IPS policy must be applied to a DPI application profile to take effect.

Restrictions and guidelines

A DPI application profile can use only one IPS policy. If you apply different IPS policies to the same DPI application profile, only the most recent configuration takes effect.

Procedure

1. Enter system view.

   system-view

2. Enter DPI application profile view.

   app-profile *profile-name*

   For more information about this command, see DPI engine commands in *DPI Command Reference*.

3. Apply an IPS policy to the DPI application profile.

   ips apply policy *policy-name* **mode** { **protect** | **alert** }

   By default, no IPS policy is applied to the DPI application profile.

Activating IPS policy settings

About this task

By default, when a configuration change (such as creation, modification, or deletion) to an IPS policy or rule occurs, the system starts to detect configuration changes at 20-second intervals.

- If no configuration change occurs within 20 seconds after this change, the system will perform an activation operation after the next 20 seconds.
- If a new configuration change occurs within 20 seconds after this change, the system continues to detect configuration changes at 20-second intervals.

To immediately activate a configuration change, execute the **`inspect activate`** command.

For more information about activating DPI service module configuration, see "Configuring the DPI engine."

Procedure

1. Enter system view.
   `system-view`
2. Activate IPS policy settings.
   `inspect activate`
   By default, the system automatically activates changed IPS policy and rule settings for them to take effect.

△ **CAUTION:**

This command can cause temporary outage for DPI services. Services based on the DPI services might also be interrupted. For example, security policies cannot control application access.

Applying a DPI application profile to a security policy rule

1. Enter system view.
   `system-view`
2. Enter security policy view.
   `security-policy` { **`ip`** | **`ipv6`** }
3. Enter security policy rule view.
   `rule` { *`rule-id`* | [*`rule-id`*] **name** *`rule-name`* }
4. Set the rule action to pass.
   `action pass`
   The default rule action is **`drop`**.
5. Use a DPI application profile in the rule.
   `profile` *`app-profile-name`*
   By default, no DPI application profile is used in a security policy rule.

Managing the IPS signature library

You can update or roll back the version of the IPS signature library on the device.

Restrictions and guidelines

- Do not delete the **/dpi/** folder in the root directory of the storage medium.
- Do not perform IPS signature update or rollback when the device's free memory is below the normal state threshold. For more information about device memory thresholds, see device management in *Fundamentals Configuration Guide*.
- For successful automatic and immediate signature update, make sure the device can resolve the domain name of the company's website into an IP address through DNS. For more information about DNS, see DNS configuration in *Layer 3—IP Services Configuration Guide.*
- Update only one signature library at a time. Do not perform signature library update until the existing signature library update is completed.

Scheduling automatic IPS signature library update

About this task

You can schedule automatic IPS signature library update if the device can access the signature database services on the company's website. The device periodically obtains the latest signature file from the company's website to update its local signature library according to the update schedule.

Procedure

1. Enter system view.

   `system-view`

2. Enable automatic IPS signature library update and enter automatic IPS signature library update configuration view.

   `ips signature auto-update`

   By default, automatic IPS signature library update is disabled.

3. Schedule the update time.

   `update schedule` { **`daily`** | **`weekly`** { **`fri`** | **`mon`** | **`sat`** | **`sun`** | **`thu`** | **`tue`** | **`wed`** } } **`start-time`** *`time`* **`tingle`** *`minutes`*

   By default, the device updates the IPS signature library at a random time between 01:00:00 and 03:00:00 every day.

4. (Optional.) Configure the device to overwrite the current IPS signature library without backing up the library during an automatic signature library update.

   `override-current`

   By default, the device backs up the current IPS signature library as the previous version before performing an automatic IPS signature library update.

Triggering an immediate IPS signature update

About this task

Anytime you find a release of new signature version on the company's website, you can trigger the device to immediately update the local signature library.

Procedure

1. Enter system view.

```
system-view
```

2. Trigger an immediate IPS signature library update.

```
ips signature auto-update-now
```

Performing an IPS signature manual update

About this task

If the device cannot access the signature database services on the company's website, use one of the following methods to manually update the IPS signature library on the device:

- **Local update**—Updates the IPS signature library by using a locally stored update IPS signature file.

  Store the update file on the master device for successful signature library update.
- **FTP/TFTP update**—Updates the IPS signature library by using the file stored on the FTP or TFTP server.

Procedure

1. Enter system view.

```
system-view
```

2. Manually update the IPS signature library on the device.

```
ips signature update [ override-current ] file-path [ vpn-instance vpn-instance-name ]
```

Rolling back the IPS signature library

About this task

If an IPS signature library update causes exceptions or a high false alarm rate, you can roll back the IPS signature library.

Before rolling back the IPS signature library, the device backs up the current signature library as the previous version. For example, the previous library version is V1 and the current library version is V2. If you perform a rollback to the previous version, library version V1 becomes the current version and library version V2 becomes the previous version. If you perform a rollback to the previous version again, the library rolls back to library version V2.

Procedure

1. Enter system view.

```
system-view
```

2. Roll back the IPS signature library to the previous version or to the factory default version.

```
ips signature rollback { factory | last }
```

Enabling logging for IPS signature library update and rollback events

About this task

This feature enables logging for successful IPS signature library update and rollback events and outputs the logs at the specified daily time.

Restrictions and guidelines

The device supports outputting IPS signature library update and rollback logs only as fast logs to log hosts. For the IPS logs to be output correctly, make sure the following requirements are met:

- Fast log output of IPS logs in SGCC format are enabled by using the **`customlog format dpi ips sgcc`** command.
- The log hosts where the IPS logs should be sent are configured by using the **`customlog host`** command.

For more information about the preceding commands, see fast log output commands in *Network Management and Monitoring Command Reference*.

Procedure

1. Enter system view.

```
system-view
```

2. Enable IPS signature library update logging and set the daily log output time.

```
ips signature update-log send-time time
```

Importing and deleting Snort IPS signatures

Importing Snort IPS signatures

About this task

To add your own IPS signatures, create an IPS signature file in the Snort format and import the signatures from the file to the device.

Restrictions and guidelines

Make sure the IPS signature file contains all Snort signatures that you want to use. All existing Snort signatures on the device will be overwritten by the imported signatures.

For a signature defined by a Snort rule to be imported correctly from the IPS signature file, make sure Snort rule is valid.

Procedure

1. Enter system view.

```
system-view
```

2. Import Snort IPS signatures from a Snort file.

```
ips signature import snort file-path
```

Deleting Snort IPS signatures

1. Enter system view.

```
system-view
```

2. Delete all Snort IPS signatures.

```
ips signature remove snort
```

Managing a user-configured IPS signature

Creating a user-defined IPS signature

About this task

You can create signatures that do not exist in the current signature library.

Procedure

1. Enter system view.

   system-view
2. Create an IPS signature and enter its view.

   ips signature user-defined name *signature-name*

   By default, no user-configured IPS signatures exist.
3. (Optional.) Configure the description for the user-defined IPS signature.

   description *text*

Configuring attributes in a user-defined IPS signature

About this task

Each IPS signature contains various attributes, including action, direction, severity level, and the logical operator between the rules in the signature.

You can create multiple rules in a user-defined IPS signature. If the logical AND operator is specified, a packet matches the signature only when the packet matches all rules in the signature. If the logical OR operator is specified, a packet matches the signature when the packet matches any rule in the signature.

Procedure

1. Enter system view.

   system-view
2. Enter the view of a user-defined IPS signature.

   ips signature user-defined name *signature-name*

   By default, no user-defined IPS signatures exist.
3. Configure the attributes for the user-defined IPS signature.
   - Set the actions for packets matching the IPS signature.

     action { **block-source** | **drop** | **permit** | **reset** } [**capture** | **logging**] *

     By default, the action for a user-defined IPS signature is **permit**.
   - Set the traffic direction attribute.

     direction { **any** | **to-client** | **to-server** }

     By default, both client-to-server and server-to-client directions are defined for a user-defined IPS signature.
   - Set a severity level.

     severity-level { **critical** | **high** | **low** | **medium** } *

     By default, the low severity level attribute is specified for a user-defined IPS signature.
   - Set a logical operator between the rules in the signature.

     rule-logic { **and** | **or** }

By default, the logical OR operator is specified between the rules in a user-defined IPS signature.

Configuring rules for a user-defined IPS signature

About this task

A user-defined IPS signature rule can be one of the following types:

- **Keyword**.
- **Integer**.

A user-defined signature rule might contain filtering criteria, detection items, and a detection trigger condition. The device uses the rule for packet filtering as follows:

1. The device compares the packet with the filtering criteria.
   - If the packet matches all filtering criteria, the device goes to the next step.
   - If the packet does not match all filtering criteria, IPS does not process the packet.
2. The device compares the packet with the detection trigger condition.

   This step is available only for a rule of the keyword type.
   - If the packet matches the detection trigger condition, the device goes to the next step.
   - If the packet does not match the detection trigger condition, IPS does not process the packet.
3. The device compares the packet with the detection items.

   The detection items are used to match the specified contents in a packet. A packet matches a rule only when the packet matches all detection items in the rule. The match order of the detection items is their configuration order.

Restrictions and guidelines

A detection item compares its keyword with the contents in the specified protocol field.

To avoid detection errors, configure detection items based on the sequence of protocol fields in the HTTP protocol.

In a signature rule of the keyword match pattern type, a detection trigger condition must be configured before detection item configuration. If you delete the detection trigger condition, all detection items in the rule will also be deleted.

To define the start and end positions for the match operation, use either the offset and depth, or the relative offset and relative depth.

Procedure

1. Enter system view.

   `system-view`
2. Enter the view of a user-defined IPS signature.

   `ips signature user-defined name` *`signature-name`*
3. Create a user-defined IPS signature rule and enter its view.

   `rule` *`rule-id`* **`l4-protocol`** *`l4-protocol-name`* **`l5-protocol`** *`l5-protocol-name`* **`pattern-type`** { **`keyword`** | **`integer`** }

   By default, no user-defined IPS signature rules exist.
4. Configure the filtering criteria for the rule.
   - Set a source IP address filtering criterion.

     `source-address ip` *`ip-address`*

     By default, a user-defined IPS signature rule matches all source IP addresses.

- Set a destination IP address filtering criterion.

  destination-address ip *ip-address*

  By default, a user-defined IPS signature rule matches all destination IP addresses.
- Set source port filtering criteria.

  source-port *start-port* [**to** *end-port*]

  By default, a user-defined IPS signature rule matches all source ports.
- Set destination port filtering criteria.

  destination-port *start-port* [**to** *end-port*]

  By default, a user-defined IPS signature rule matches all destination ports.
- Set an HTTP request method filtering criterion.

  http-method *method-name*

  By default, a user-defined IPS signature rule matches all HTTP request methods.

5. Configure the detection trigger condition and detection items for a rule in a signature of the keyword type.

a. Create a detection trigger condition.

trigger field *field-name* **include** { **hex** *hex-string* | **text** *text-string* } [**offset** *offset-value*] [**depth** *depth-value*]

b. Create a detection item.

detection-keyword *detection-id* **field** *field-name* **match-type** { **exclude** | **include** } { **hex** *hex-string* | **regex** *regex-pattern* | **text** *text-string* } [**offset** *offset-value* [**depth** *depth-value*] | **relative-offset** *relative-offset-value* [**relative-depth** *relative-depth-value*]]

6. Configure detection items for a rule in a signature of the integer type.

detection-integer field *field-name* **match-type** { **eq** | **gt** | **gt-eq** | **lt** | **lt-eq** | **nequ** } *number*

Enabling IPS signature hit counting

About this task

This feature enables the device to collect hit statistics for each IPS signature. You can view IPS signature hit statistics on the Web interface of the device.

Procedure

1. Enter system view.

system-view

2. Enable the view of an IPS policy.

ips policy *policy-name*

3. Enable IPS signature hit counting.

statistics signature-hit enable

By default, IPS signature hit counting is disabled.

Configuring IPS whitelist

About this task

If false alarms exist in IPS logs, you can enable the IPS whitelist feature, and add the detected IPS signature IDs, URLs, or source IP addresses to the IPS whitelist. The IPS signature IDs, URLs, and source IP addresses are recorded in the IPS logs. The device permits packets matching the IPS signatures, URLs, or source IP addresses on the IPS whitelist to pass through, reducing false alarms.

If an IPS whitelist entry contains a signature ID, URL, and source IP address, or two of them, a packet matches this entry only when it matches all configured criteria.

Procedure

1. Enter system view.

   `system-view`

2. Enable the IPS whitelist feature.

   `ips whitelist enable`

   By default, the IPS whitelist feature is disabled.

3. Create an IPS whitelist entry and enter its view.

   `ips whitelist` *`entry-id`*

4. Configure the description for the IPS whitelist entry.

   `description` *`text`*

   By default, an IPS whitelist entry does not have any description.

5. Configure the IPS whitelist entry. Choose at least one of the following options to configure:
   - Add a signature ID to the IPS whitelist entry.

     `signature-id` *`sig-id`*

     By default, no signature ID exists in an IPS whitelist entry.
   - Add a URL to the IPS whitelist entry.

     `url match-type` { **`accurate`** | **`substring`** } *`url-text`*

     By default, no URL exists in an IPS whitelist entry.
   - Add a source IP address to the IPS whitelist entry.

     `source-address` { **`ip`** *`ipv4-address`* | **`ipv6`** *`ipv6-address`* }

     By default, no source IP address exists in an IPS whitelist entry.

6. Return to system view.

   `quit`

7. Activate the IPS whitelist configuration.

   `ips whitelist activate`

   After you create or edit an IPS whitelist entry that contains a URL, you must execute this command to have the configuration take effect.

Display and maintenance commands for IPS

Execute **`display`** commands in any view.

Task	Command
Display IPS policy information.	**`display ips policy`** *`policy-name`*

Display IPS signature library information.	**display ips signature library**
Display IPS signature information.	**display ips signature** [**pre-defined** | **user-defined** { **snort** | **user-config** }] [**direction** { **any** | **to-client** | **to-server** }] [**category** *category-name* | **fidelity** { **high** | **low** | **medium** } | **protocol** { **icmp** | **ip** | **tcp** | **udp** } | **severity** { **critical** | **high** | **low** | **medium** }] *
Display detailed information about an IPS signature.	**display ips signature** { **pre-defined** | **user-defined** } *signature-id*
Display information about IPS signatures that failed to be parsed during signature import.	**display ips signature user-defined parse-failed**

IPS configuration examples

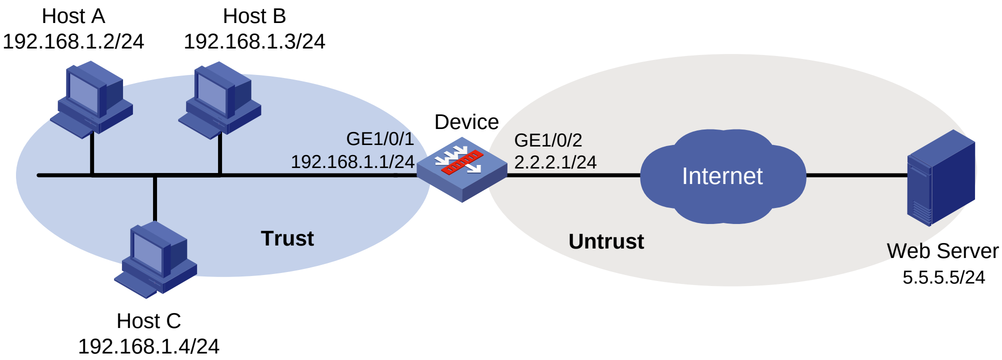
Example: Using the default IPS policy in a security policy

Network configuration

As shown in Figure 2, the device connects to the LAN and Internet through security zones **Trust** and **Untrust**, respectively.

Configure the device to use the default IPS policy for attack detection and prevention.

Figure 2 Network diagram



Procedure

1. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

   ```
   <Device> system-view
   [Device] interface gigabitethernet 1/0/1
   [Device-GigabitEthernet1/0/1] ip address 192.168.1.1 255.255.255.0
   [Device-GigabitEthernet1/0/1] quit
   ```

   # Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Configure settings for routing.

   This example configures a static route to reach the Web server, and the next hop in the route is 2.2.2.2.

```
[Device] ip route-static 5.5.5.0 24 2.2.2.2
```

3. Add interfaces to security zones.

```
[Device] security-zone name trust
[Device-security-zone-Trust] import interface gigabitethernet 1/0/1
[Device-security-zone-Trust] quit
[Device] security-zone name untrust
[Device-security-zone-Untrust] import interface gigabitethernet 1/0/2
[Device-security-zone-Untrust] quit
```

4. Apply the default IPS policy to a DPI application profile and activate the IPS policy settings:

# Create a DPI application profile named **sec** and enter its view. Apply the default IPS policy to the DPI application profile and set the policy mode to **protect**.

```
[Device] app-profile sec
[Device-app-profile-sec] ips apply policy default mode protect
[Device-app-profile-sec] quit
```

# Activate the IPS policy settings.

```
[Device] inspect activate
```

5. Configure a security policy:

# Enter IPv4 security policy view. Create a rule named **trust-untrust** to permit the traffic from internal users to the external network and apply the IPS policy to the traffic between the internal users and the Internet.

```
[Device] security-policy ip
[Device-security-policy-ip] rule name trust-untrust
[Device-security-policy-ip-10-trust-untrust] source-zone trust
[Device-security-policy-ip-10-trust-untrust] source-ip-subnet 192.168.1.0 24
[Device-security-policy-ip-10-trust-untrust] destination-zone untrust
[Device-security-policy-ip-10-trust-untrust] action pass
[Device-security-policy-ip-10-trust-untrust] profile sec
[Device-security-policy-ip-10-trust-untrust] quit
```

# Activate rule matching acceleration.

```
[Device-security-policy-ip] accelerate enhanced enable
[Device-security-policy-ip] quit
```

Verifying the configuration

# Verify that the device can use the default IPS policy to detect and prevent known network attacks. (Details not shown.)

For example, if an incoming attack packet matches predefined IPS signature GNU_Bash_Local_Memory_Corruption_Vulnerability(CVE-2014-7187), the device automatically applies the signature actions (**reset** and **logging**) to the packet.

Example: Using a user-defined IPS policy in a security policy

Network configuration

As shown in Figure 3, the device connects to the LAN and Internet through security zones **Trust** and **Untrust**, respectively.

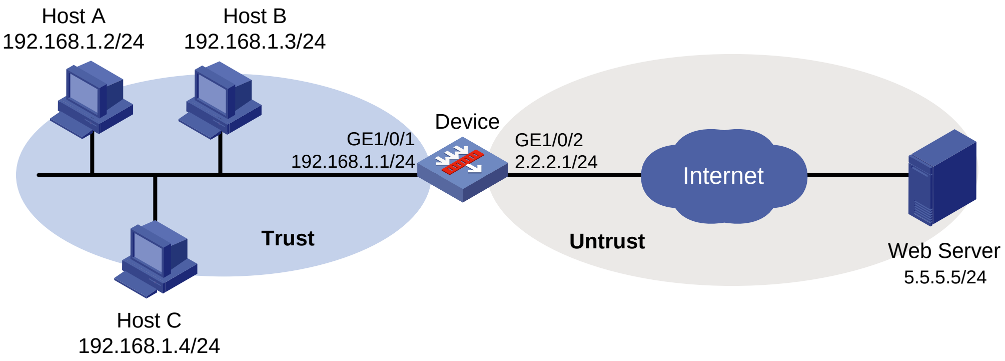
Perform the following tasks:

1. Create IPS policy **ips1** and modify its signature action and status settings as follows:
   - Enable predefined IPS signature 2 and specify actions **drop**, **capture**, and **logging** for the signature.

- Disable predefined IPS signature 4.
- Enable predefined IPS signature 6.

2. Apply IPS policy **ips1** to the zone pair between source security zone **Trust** and destination security zone **Untrust**.

Figure 3 Network diagram



Procedure

1. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

   ```
   <Device> system-view
   [Device] interface gigabitethernet 1/0/1
   [Device-GigabitEthernet1/0/1] ip address 192.168.1.1 255.255.255.0
   [Device-GigabitEthernet1/0/1] quit
   ```

   # Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Configure settings for routing.

   This example configures a static route to reach the Web server, and the next hop in the route is 2.2.2.2.

   ```
   [Device] ip route-static 5.5.5.0 24 2.2.2.2
   ```

3. Add interfaces to security zones.

   ```
   [Device] security-zone name trust
   [Device-security-zone-Trust] import interface gigabitethernet 1/0/1
   [Device-security-zone-Trust] quit
   [Device] security-zone name untrust
   [Device-security-zone-Untrust] import interface gigabitethernet 1/0/2
   [Device-security-zone-Untrust] quit
   ```

4. Configure an IPS policy:

   # Create an IPS policy named **ips1** and enter its view. Configure the IPS policy to use all IPS signatures without discrimination of the target attribute. Enable predefined IPS signature 2 and specify actions **drop**, **capture**, and **logging** for the signature, disable predefined IPS signature 4, and enable predefined IPS signature 6.

   ```
   [Device] ips policy ips1
   [Device-ips-policy-ips1] protect-target all
   [Device-ips-policy-ips1] signature override pre-defined 2 enable drop capture logging
   [Device-ips-policy-ips1] signature override pre-defined 4 disable
   [Device-ips-policy-ips1] signature override pre-defined 6 enable
   [Device-ips-policy-ips1] quit
   ```

5. Apply IPS policy **ips1** to a DPI application profile, and activate the IPS policy settings:

# Create a DPI application profile named **sec**. Apply IPS policy **ips1** to the DPI application profile and set the policy mode to **protect**.

```
[Device] app-profile sec
[Device-app-profile-sec] ips apply policy ips1 mode protect
[Device-app-profile-sec] quit
```

# Activate the IPS policy settings.

```
[Device] inspect activate
```

6. Configure a security policy:

# Enter IPv4 security policy view. Create a rule named **trust-untrust** to permit the traffic from internal users to the external network and apply the IPS policy to the traffic between the internal users and the Internet.

```
[Device] security-policy ip
[Device-security-policy-ip] rule name trust-untrust
[Device-security-policy-ip-10-trust-untrust] source-zone trust
[Device-security-policy-ip-10-trust-untrust] source-ip-subnet 192.168.1.0 24
[Device-security-policy-ip-10-trust-untrust] destination-zone untrust
[Device-security-policy-ip-10-trust-untrust] action pass
[Device-security-policy-ip-10-trust-untrust] profile sec
[Device-security-policy-ip-10-trust-untrust] quit
```

# Activate rule matching acceleration.

```
[Device-security-policy-ip] accelerate enhanced enable
[Device-security-policy-ip] quit
```

Verifying the configuration

# Verify that IPS policy **ips1** is configured correctly.

```
<Device> display ips policy ips1
```

Example: Manually updating the IPS signature library

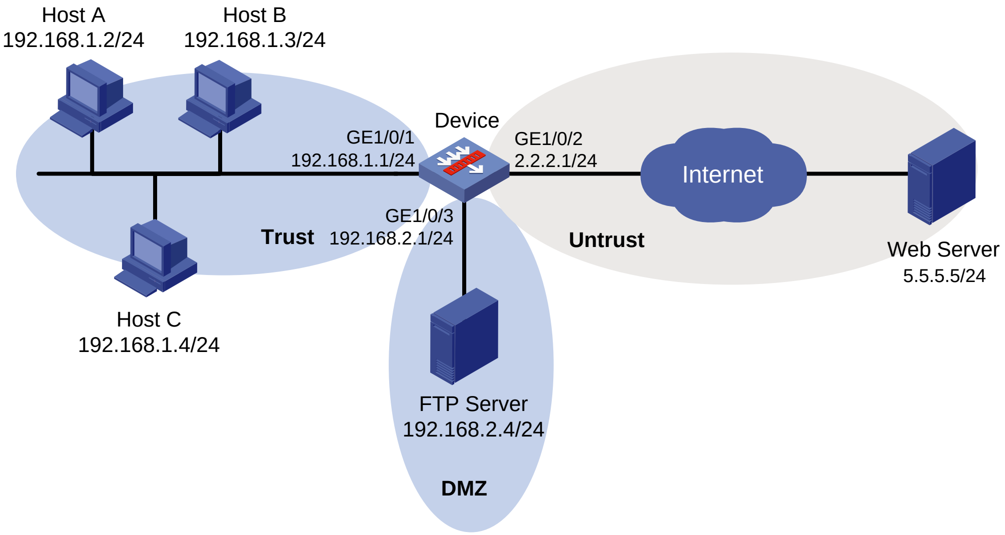
Network configuration

As shown in Figure 4, LAN users in security zone **Trust** can access the following resources:

- Internet resources in security zone **Untrust**.
- The FTP server at 192.168.2.4/24 in security zone **DMZ**. The FTP login username and password are **ips** and **123**, respectively.

Manually update the IPS signature library by using the latest IPS signature file stored on the FTP server.

Figure 4 Network diagram



Procedure

1. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

   ```
   <Device> system-view
   [Device] interface gigabitethernet 1/0/1
   [Device-GigabitEthernet1/0/1] ip address 192.168.1.1 255.255.255.0
   [Device-GigabitEthernet1/0/1] quit
   ```

   # Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Configure settings for routing.

   This example configures a static route to reach the Web server, and the next hop in the route is 2.2.2.2.

   ```
   [Device] ip route-static 5.5.5.0 24 2.2.2.2
   ```

3. Add interfaces to security zones.

   ```
   [Device] security-zone name trust
   [Device-security-zone-Trust] import interface gigabitethernet 1/0/1
   [Device-security-zone-Trust] quit
   [Device] security-zone name untrust
   [Device-security-zone-Untrust] import interface gigabitethernet 1/0/2
   [Device-security-zone-Untrust] quit
   [Device] security-zone name dmz
   [Device-security-zone-DMZ] import interface gigabitethernet 1/0/3
   [Device-security-zone-DMZ] quit
   ```

4. Configure a security policy:

   # Configure a security policy rule to permit the traffic from security zone **Trust** to security zone **Untrust** so internal users can access external resources.

   ```
   [Device] security-policy ip
   [Device-security-policy-ip] rule name trust-untrust
   [Device-security-policy-ip-10-trust-untrust] source-zone trust
   [Device-security-policy-ip-10-trust-untrust] source-ip-subnet 192.168.1.0 24
   [Device-security-policy-ip-10-trust-untrust] destination-zone untrust
   [Device-security-policy-ip-10-trust-untrust] action pass
   ```

```
[Device-security-policy-ip-10-trust-untrust] quit
```

# Configure a security policy rule to permit the traffic from security zone **Trust** to security zone **DMZ** so internal users can access the FTP server in the **DMZ** security zone.

```
[Device] security-policy ip
[Device-security-policy-ip] rule name trust-dmz
[Device-security-policy-ip-11-trust-dmz] source-zone trust
[Device-security-policy-ip-11-trust-dmz] source-ip-subnet 192.168.1.0 24
[Device-security-policy-ip-11-trust-dmz] destination-zone dmz
[Device-security-policy-ip-11-trust-dmz] action pass
[Device-security-policy-ip-11-trust-dmz] quit
```

# Configure a security policy rule to permit the traffic between the device and the FTP server so the device can access the FTP server to obtain the signature file.

```
[Device] security-policy ip
[Device-security-policy-ip] rule name ftplocalout
[Device-security-policy-ip-12-ftplocalout] source-zone local
[Device-security-policy-ip-12-ftplocalout] destination-zone dmz
[Device-security-policy-ip-12-ftplocalout] destination-ip-subnet 192.168.2.0 24
[Device-security-policy-ip-12-ftplocalout] application ftp
[Device-security-policy-ip-12-ftplocalout] application ftp-data
[Device-security-policy-ip-12-ftplocalout] action pass
[Device-security-policy-ip-12-ftplocalout] quit
```

# Activate rule matching acceleration.

```
[Device-security-policy-ip] accelerate enhanced enable
[Device-security-policy-ip] quit
```

5. Update the IPS signature library on the device by using IPS signature file **ips-1.0.8-encrypt.dat** on the FTP server.

```
[Device] ips signature update ftp://ips:123@192.168.2.4/ips-1.0.8-encrypt.dat
```

Verifying the configuration

# Verify that the device IPS signature library is updated.

```
<Device> display ips signature library
```

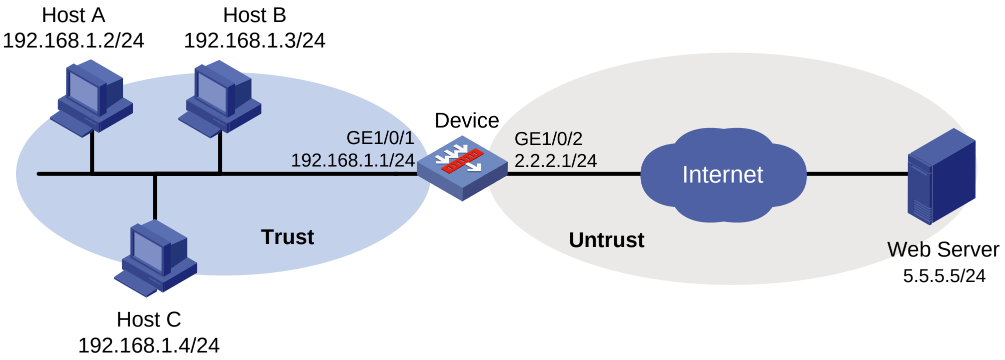
Example: Configuring automatic IPS signature library update

Network configuration

As shown in Figure 5, LAN users in security zone **Trust** can access Internet resources in security zone **Untrust**.

Configure the device to start automatically updating the local IPS signature library at a random time between 08:30 a.m. and 09:30 a.m. every Saturday.

Figure 5 Network diagram



Procedure

1. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

```
<Device> system-view
[Device] interface gigabitethernet 1/0/1
[Device-GigabitEthernet1/0/1] ip address 192.168.1.1 255.255.255.0
[Device-GigabitEthernet1/0/1] quit
```

   # Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Configure settings for routing.

   This example configures a static route to reach the Web server, and the next hop in the route is 2.2.2.2.

```
[Device] ip route-static 5.5.5.0 24 2.2.2.2
```

3. Add interfaces to security zones.

```
[Device] security-zone name trust
[Device-security-zone-Trust] import interface gigabitethernet 1/0/1
[Device-security-zone-Trust] quit
[Device] security-zone name untrust
[Device-security-zone-Untrust] import interface gigabitethernet 1/0/2
[Device-security-zone-Untrust] quit
```

4. Configure DNS for the device to resolve the domain name of the official website into the correct IP address.

```
[Device] dns server 10.72.66.36
```

5. Configure a security policy:

   # Configure a security policy rule to permit the traffic from security zone **Trust** to security zone **Untrust** so internal users can access external resources.

```
[Device] security-policy ip
[Device-security-policy-ip] rule name trust-untrust
[Device-security-policy-ip-10-trust-untrust] source-zone trust
[Device-security-policy-ip-10-trust-untrust] source-ip-subnet 192.168.1.0 24
[Device-security-policy-ip-10-trust-untrust] destination-zone untrust
[Device-security-policy-ip-10-trust-untrust] action pass
[Device-security-policy-ip-10-trust-untrust] quit
```

   # # Configure a security policy rule to permit the traffic from security zone **Local** to security zone **Untrust** so the device can access the official website to obtain the signature file.

```
[Device] security-policy ip
[Device-security-policy-ip] rule name downloadlocalout
```

```
[Device-security-policy-ip-11-downloadlocalout] source-zone local
[Device-security-policy-ip-11-downloadlocalout] destination-zone untrust
[Device-security-policy-ip-11-downloadlocalout] action pass
[Device-security-policy-ip-11-downloadlocalout] quit
```

# Activate rule matching acceleration.

```
[Device-security-policy-ip] accelerate enhanced enable
[Device-security-policy-ip] quit
```

6. Configure automatic IPS signature library update:

# Enable automatic IPS signature library update, and configure the device to perform automatic update at a random time between 08:30 a.m. and 09:30 a.m. every Saturday.

```
[Device] ips signature auto-update
[Device-ips-autoupdate] update schedule weekly sat start-time 9:00:00 tingle 60
[Device-ips-autoupdate] quit
```

Verifying the configuration

# Verify that the device IPS signature library is updated as scheduled.

```
<Device> display ips signature library
```

Contents

Configuring URL filtering

About URL filtering

URL filtering controls access to the Web resources by filtering the URLs that the users visit.

URL

A URL is a reference to a resource that specifies the location of the resource on a network and a mechanism for retrieving it. The syntax of a URL is protocol://host [:port]/path/[;parameters][?query]#fragment. Figure 1 shows an example URL.

Figure 1 URL syntax

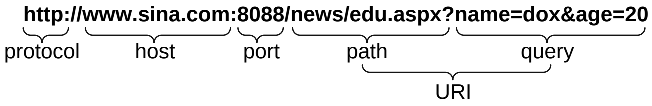


Table 1 describes the fields in a URL.

Table 1 URL field descriptions

Field	Description
protocol	Transmission protocol, such as HTTP.
host	Domain name or IP address of the server where the indicated resource is located.
[:port]	Optional field that identifies the port number of the transmission protocol. If this field is omitted, the default port number of the protocol is used.
/path/	String that identifies the directory or file where the indicated resource is stored. The path is a sequence of segments separated by zero or multiple forward slashes.
[parameters]	Optional field that contains special parameters.
[?query]	Optional field that contains parameters to be passed to the software for querying dynamic webpages. Each parameter is a <key>=<value> pair. Different parameters are separated by an ampersand (&).
URI	Uniform resource identifier that identifies a resource on a network.

URL filtering rule

A URL filtering rule matches URLs based on the content in the URI or hostname field.

URL filtering rule type

URL filtering provides the following types of URL filtering rules:

- **Predefined URL filtering rules**—Signature-based URL filtering rules. The device automatically generates them based on the local URL filtering signatures. In most cases, the predefined rules are sufficient for URL filtering.
- **User-defined URL filtering rules**—Regular expression- or text-based URL filtering rules that are manfully configured.

URL filtering rule matching method

A URL filtering rule supports the following URL matching methods:

- **Text-based matching**—Matches the hostname and URI fields of a URL against text patterns.

  When performing text-based matching for the hostname field of a URL, the device first determines if the text pattern contains the asterisk (*) wildcard character at the beginning or end.

  - If the text pattern does not contain the asterisk (*) wildcard character at the beginning or end, the hostname matching succeeds if the hostname of the URL matches the text pattern.
  - If the text pattern contains the asterisk (*) wildcard character at the beginning, the hostname matching succeeds if the hostname of the URL matches or ends with the text pattern without the wildcard character.
  - If the text pattern contains the asterisk (*) wildcard character at the end, the hostname matching succeeds if the hostname of the URL matches or starts with the text pattern without the wildcard character.
  - If the text pattern contains the asterisk (*) wildcard character at both the beginning and the end, the hostname matching succeeds if the hostname of the URL matches or includes the text pattern without the wildcard characters.

  Text-based matching for the URI field works in the same way that text-based matching for the hostname field works.

- **Regular expression-based matching**—Matches the hostname and URI fields of a URL against regular expressions. For example, if you set the regular expression for hostname matching to **sina.*cn**, URLs that carry the **news.sina.com.cn** hostname will be matched.

URL category

URL filtering provides the URL categorization feature to facilitate filtering rule management.

You can classify multiple URL filtering rules to a URL category and specify an action for the category. If a matching rule is in multiple URL categories, the system takes the action for the category with the highest severity level.

URL filtering supports the following types of URL categories:

- Predefined URL categories.

  The predefined URL categories contain the predefined URL filtering rules. Each predefined URL category has a unique severity level in the range of 1 to 999, and a category name that begins **Pre**-. Predefined URL categories cannot be modified.

  The device supports two levels of predefined URL categories: child URL category and parent URL category.

  A predefined parent URL category contains only predefined child URL categories.

- User-defined URL categories.

  You can manually create URL categories and configure filtering rules for them. The severity level of a user-defined URL category is in the range of 1000 to 65535. You can edit the filtering rules and change the severity level for a user-defined URL category.

URL filtering whitelist/blacklist rule

The device supports using URL-based whitelist and blacklist rules to filter packets. If the URL in a packet matches a blacklist rule, the packet is dropped. If the URL matches a whitelist rule, the packet is permitted to pass through.

URL filtering policy

A URL filtering policy can contain the following settings:

- URL categories and filtering actions. URL filtering actions include drop, permit, block source, reset, redirect, and logging.
- URL filtering whitelist and blacklist rules.
- URL filtering cloud query.

You can also specify the default action on packets that do not match any filtering rules (including URL categories, URL filtering whitelist and blacklist rules) in the policy.

URL filtering mechanism

URL filtering takes effect after you apply a URL filtering policy to a DPI application profile and use the DPI application profile in a security policy rule.

As shown in Figure 2, upon receiving a packet, the device performs the following operations:

1. The device compares the packet with the security policy rules.

   If the packet matches a rule that is associated with a URL filtering policy (through a DPI application profile), the device extracts the URL from the packet.

   For more information about security policies, see *Security Configuration Guide*.

2. The device compares the extracted URL with the whitelist and blacklist rules in the URL filtering policy.

   If both the whitelist and blacklist features are enabled, the device uses the following process to handle the packet:

   a. If the URL matches a whitelist rule, the packet is permitted to pass through.

   b. If the URL does not match a whitelist rule, the device identifies whether the URL matches a blacklist rule.

      – If the URL matches a blacklist rule, the packet is dropped.

      – If the URL does not match a blacklist rule, the device performs step 3.

   If only the whitelist feature is enabled, the device handles the packet as follows:

   ○ If the URL matches a whitelist rule, the packet is permitted to pass through.

   ○ If the URL does not match a whitelist rule, the device drops the packet.

   If both the whitelist and blacklist features are not enabled, the device performs step 3.

3. The device compares the extracted URL with the URL filtering rules in the URL filtering policy.

   a. If the URL matches a URL filtering rule that belongs to a user-defined URL category, the devices takes the action specified for the URL category. If the URL filtering rule belongs to multiple user-defined URL categories, the action specified for the URL category with the highest severity level apply.

      If no matching URL filtering rule belongs to a user-defined URL category, the device moves to step b.

   b. If the URL matches a URL filtering rule that belongs to a predefined URL category, the devices takes the action specified for the URL category.

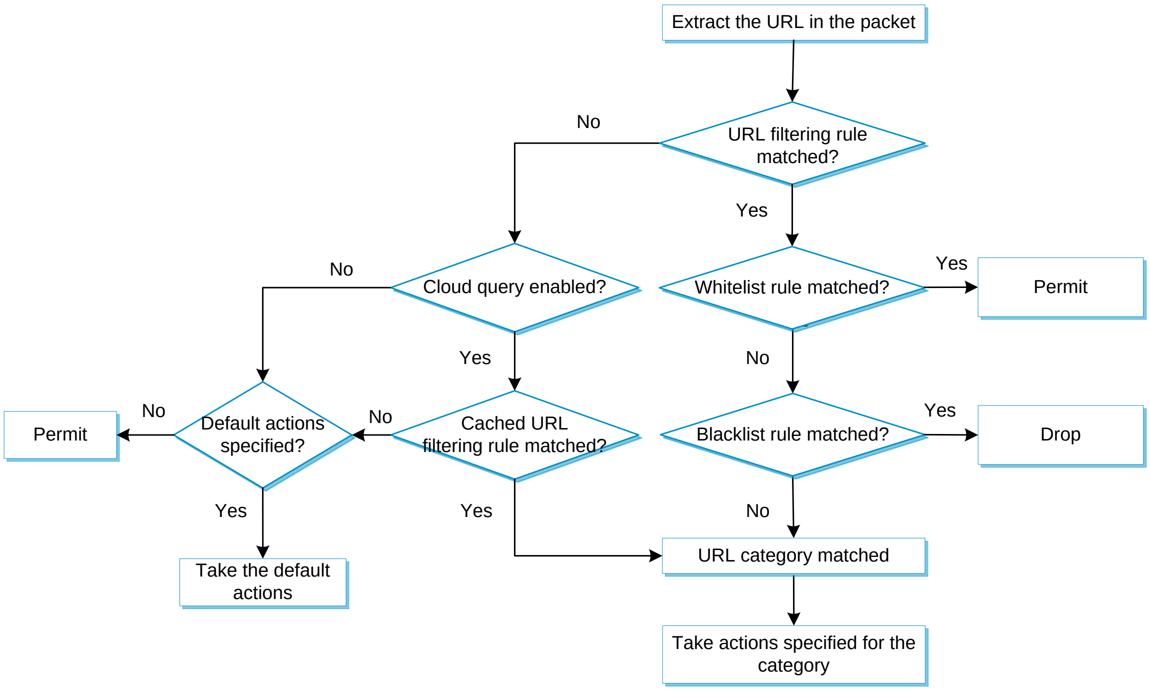
      If the URL filtering rule belongs to multiple predefined URL categories, the action specified for the URL category with the highest severity level apply.

4. If the URL does not match any rule in the policy, and cloud query is disabled in the URL filtering policy, the default action specified for the policy applies. If the default action is not configured, the device permits the packet to pass through.

   If the URL does not match any rule in the policy, and cloud query is enabled in the policy, the device handles the packet as follows:

- The device identifies whether the URL matches a cached URL filtering rule (history query result from the cloud server, including the URL and its category name).
  - If a matching cached rule is found for the URL, the device determines the action to take on the packet as described in step c of step 3.
  - If no matching cached rule is found for the URL, the default action specified for the policy applies. If the default action is not configured, the device permits the packet to pass through. In addition, the device sends the URL to the cloud server for further query and caches the query result.

Figure 2 URL filtering mechanism



URL filtering signature library management

The device uses the local URL filtering signature library to identify URLs in the HTTP packets.

You can update the device URL filtering signature library to the most up-to-date version or roll back the library to a version.

Updating the URL filtering signature library

The following methods are available for updating the URL filtering signature library on the device:

- Automatic update.

  The device periodically accesses the company's website and automatically downloads the most up-to-date URL filtering signature file to update its local signature library.

- Triggered update.

  The device downloads the most up-to-date URL filtering signature file from the company's website to update its local signature library immediately you trigger the operation.

- Manual update.

  Use this method when the device cannot connect to the company's website.

  You must manually download the most up-to-date URL filtering signature file from the company's website, and then use the file to update the signature library on the device.

Rolling back the URL filtering signature library

If filtering false alarms or filtering exceptions occur frequently, you can roll back the URL filtering signature library to the previous version or to the factory default version.

Restrictions: Licensing requirements for URL filtering

A license is required for URL filtering signature library update and URL filtering cloud query. If the license expires, the existing URL filtering signature library is still available but you cannot update the library on the device or perform a URL filtering cloud query task. For more information about licenses, see license management in *Fundamentals Configuration Guide*.

URL filtering tasks at a glance

To configure URL filtering:

1. (Optional.) Configuring a URL category
2. (Optional.) Configuring URL filtering cloud query
3. Configuring a URL filtering policy
4. (Optional.) Copying a URL filtering policy or category
5. Applying a URL filtering policy to a DPI application profile
6. (Optional.) Activating URL filtering policy and rule settings
7. Applying a DPI application profile to a security policy rule
8. Managing the URL filtering signature library
9. (Optional.) Managing the URL filtering signature library
10. (Optional.) Enabling DPI engine logging
11. (Optional.) Configuring URL filtering logging for resource access

Configuring a URL category

About this task

Perform this task to create a user-defined URL category and configure filtering rules for it to meet specific URL filtering requirements.

Restrictions and guidelines

When creating a URL category, you must assign a unique severity level in the range of 1000 to 65535 to the URL category. The larger the value, the higher the severity level.

Procedure

1. Enter system view.

   system-view

2. Create a URL category and enter its view.

   url-filter category *category-name* [**severity** *severity-level*]

   By default, the device provides predefined URL categories with names starting with **Pre-**.

   The name of a user-defined URL category cannot start with **Pre-**.

3. (Optional.) Configure a description for the URL category.

   description *text*

4. Configure URL filtering rules for the URL category. Choose the options to configure as needed:
   - Configure a URL filtering rule.

     rule *rule-id* **host** { **regex** *regex* | **text** *string* } [**uri** { **regex** *regex* | **text** *string* }]
   - (Optional.) Add the URL filtering rules of a predefined URL category to the URL category.

     include pre-defined *category-name*

     By default, a user-defined URL category does not contain the URL filtering rules of any predefined URL category.
5. (Optional.) Rename the URL category.

   rename *new-name*

Configuring URL filtering cloud query

About this task

The URL filtering cloud query feature enables the system to send URLs that do not match any local URL filtering rules to the cloud server for further query. This helps improves URL filtering accuracy for HTTP traffic.

The device caches the URL filtering rules returned from the cloud query server in the URL filtering cache. You can set the maximum number of rules that can be cached, and the minimum cache period for the cached rules. For more information about the cloud query server, see "Configuring the DPI engine."

Procedure

1. Enter system view.

   system-view
2. Specify the cloud query server.

   inspect cloud-server *host-name*
3. (Optional.) Set URL filtering cache size.

   url-filter cache size *cache-size*

   The URL filtering cache can cache a maximum of 16384 entries.
4. (Optional.) Set the minimum cache period for URL filtering rules.

   url-filter cache-time *value*

   By default, the minimum cache period is 10 seconds.
5. Enter the view of the URL filtering policy in which you want to enable cloud query.

   url-filter policy *policy-name*
6. Enable cloud query.

   cloud-query enable

   By default, cloud query is disabled in a URL filtering policy.

Configuring a URL filtering policy

About configuring a URL filtering policy

The URL filtering is implemented by URL filtering polices.

To configure a URL filtering policy, perform either of the following tasks:

- Configuring a category-based URL filtering policy

A category-based URL filtering policy contains the following settings:

- URL category-to-action mappings.
- Default action.
- (Optional.) Whitelist and blacklist rules.

- Configuring a whitelist-based URL filtering policy

Configuring a category-based URL filtering policy

Restrictions and guidelines

The **logging** keyword enables the URL filtering module to log URL filtering events and send log messages to the information center.

With the information center, you can set log message filtering and output rules, including output destinations.

The information center can output URL filtering logs to any destinations except the console and the monitor terminal. If you configure the console or monitor terminal as an output destination, the output destination setting will not take effect.

To view URL filtering logs stored on the device, use the **display logbuffer** command. Make sure you do not disable log output to the log buffer, which is enabled by default.

For more information about configuring the information center, see *Network Management and Monitoring Configuration Guide*.

Procedure

1. Enter system view.

   system-view

2. Create a URL filtering policy and enter its view.

   url-filter policy *policy-name*

3. Specify the actions for a URL category.

   category *category-name* **action** { **block-source** [**parameter-profile** *parameter-name*] | **drop** | **permit** | **redirect parameter-profile** *parameter-name* | **reset** } [**logging** [**parameter-profile** *parameter-name*]]

   By default, no actions are specified for a URL category.

   If a packet matches a rule that is in multiple URL categories, the system uses the actions for the category with the highest severity level.

4. (Optional.) Specify the default action on packets that do not match any rule in the policy.

   default-action { **block-source** [**parameter-profile** *parameter-name*] | **drop** | **permit** | **redirect parameter-profile** *parameter-name* | **reset** } [**logging** [**parameter-profile** *parameter-name*]]

5. (Optional.) Configure a whitelist or blacklist rule in the policy.

   add { **blacklist** | **whitelist** } [*id*] **host** { **regex** *host-regex* | **text** *host-name* } [**uri** { **regex** *uri-regex* | **text** *uri-name* }]

6. (Optional.) Enable the referer whitelist.

   referer-whitelist enable

   By default, the referer whitelist is enabled. It allows an HTTP or HTTPS request to pass through if its referer header matches a whitelist rule.

7. (Optional.) Rename the URL filtering policy.

   rename *new-name*

Configuring a whitelist-based URL filtering policy

About the task

This feature allows only the HTTP or HTTPS requests that match the whitelist rules to pass through. When you do not want to perform any other configurations, such as URL categories, URL filtering actions, and URL filtering policy default action, you can use this feature.

With this feature enabled, the device allows users to access only the Web resources added to the whitelist rules, and other Web resources are not allowed to access.

Procedure

1. Enter system view.

   `system-view`

2. Create a URL filtering policy and enter its view.

   `url-filter policy` *`policy-name`*

3. Configure a whitelist rule in the policy.

   `add whitelist` [*`id`*] **`host`** { **`regex`** *`host-regex`* | **`text`** *`host-name`* } [**`uri`** { **`regex`** *`uri-regex`* | **`text`** *`uri-name`* }]

4. (Optional.) Enable the referer whitelist.

   `referer-whitelist enable`

   By default, the referer whitelist is enabled. It allows an HTTP or HTTPS request to pass through if its referer header matches a whitelist rule.

5. Enable URL whitelist-only filtering.

   `whitelist-only enable`

   By default, URL whitelist-only filtering is disabled.

Copying a URL filtering policy or category

Copying a URL filtering policy

About this task

You can create a new URL filtering policy by copying an existing one.

Procedure

1. Enter system view.

   `system-view`

2. Create a URL filtering policy and enter its view.

   `url-filter copy policy` *`old-name new-name`*

Copying a URL filtering category

About this task

You can create a new URL category by copying an existing one.

Restrictions and guidelines

When you copy a URL category, be sure to assign a unique severity level to the new URL category.

Procedure

1. Enter system view.

   `system-view`

2. Copy a URL category.

   `url-filter copy category` *`old-name new-name`* **`severity`** *`severity-level`*

Applying a URL filtering policy to a DPI application profile

About this task

A URL filtering policy must be applied to a DPI application profile to take effect.

Restrictions and guidelines

A DPI application profile can use only one URL filtering policy. If you apply different URL filtering policies to the same DPI application profile, only the most recent configuration takes effect.

Procedure

1. Enter system view.

   `system-view`

2. Enter DPI application profile view.

   `app-profile` *`app-profile-name`*

   For more information about this command, see DPI engine commands in *DPI Command Reference*.

3. Assign a URL filtering policy to the DPI application profile.

   `url-filter apply policy` *`policy-name`*

   By default, no URL filtering policy is applied to the DPI application profile.

Activating URL filtering policy and rule settings

About this task

By default, the system will detect whether another configuration change (such as creation, modification, or deletion) occurs within a 20-second interval after a change to the URL filtering policy and rule settings:

- If no configuration change occurs within the interval, the system will perform an activation operation at the end of the next 20-second interval to make the configuration take effect.
- If a configuration change occurs within the interval, the system continues to detect configuration changes at 20-second intervals.

To immediately activate a configuration change, execute the **`inspect activate`** command.

For more information about activating DPI service module configuration, see "Configuring the DPI engine."

Procedure

1. Enter system view.

   `system-view`

2. Activate URL filtering policy and rule settings.

   `inspect activate`

By default, the system automatically activates changed URL filtering policy and rule settings for them to take effect.

△ **CAUTION:**

This command can cause temporary outage for DPI services. Services based on the DPI services might also be interrupted. For example, security policies cannot control application access.

Applying a DPI application profile to a security policy rule

1. Enter system view.
   system-view
2. Enter security policy view.
   security-policy { **ip** | **ipv6** }
3. Enter security policy rule view.
   rule { *rule-id* | [*rule-id*] **name** *rule-name* }
4. Set the rule action to pass.
   action pass

   The default rule action is **drop**.
5. Use a DPI application profile in the rule.
   profile *app-profile-name*

   By default, no DPI application profile is used in a security policy rule.

Managing the URL filtering signature library

You can update or roll back the version of the URL filtering signature library on the device.

Restrictions and guidelines

- Do not delete the **/dpi/** folder in the root directory of the storage medium.
- Do not perform URL filtering signature update and rollback when the device's free memory is below the normal state threshold. For more information about device memory thresholds, see device management in *Fundamentals Configuration Guide*.
- For successful automatic and immediate signature update, make sure the device can resolve the domain name of the company's website into an IP address through DNS. For more information about DNS, see DNS configuration in *Layer 3—IP Services Configuration Guide.*
- Update only one signature library at a time. Do not perform signature library update until the existing signature library update is completed.

Scheduling automatic URL filtering signature library update

About this task

You can schedule automatic URL filtering signature library update if the device can access the signature database services on the company's website. The device periodically obtains the latest signature file from the company's website to update its local signature library as scheduled.

Procedure

1. Enter system view.

   system-view

2. Enable automatic URL filtering signature library update and enter automatic URL filtering signature library update configuration view.

   url-filter signature auto-update

   By default, automatic URL filtering signature library update is disabled.

3. Schedule the update time.

   update schedule { **daily** | **weekly** { **fri** | **mon** | **sat** | **sun** | **thu** | **tue** | **wed** } } **start-time** *time* **tingle** *minutes*

   By default, the device starts to update the URL filtering signature at a random time between 01:00:00 and 03:00:00 every day.

Triggering an immediate URL filtering signature update

About this task

Anytime you find a release of new signature version on the company's website, you can trigger the device to immediately update the local signature library.

Procedure

1. Enter system view.

   system-view

2. Trigger an automatic URL filtering signature library update.

   url-filter signature auto-update-now

Performing a URL filtering signature manual update

About this task

If the device cannot access the signature database services on the company's website, use one of the following methods to manually update the URL filtering signature library on the device:

- **Local update**—Updates the URL filtering signature library on the device by using the locally stored update URL filtering signature file.

  Store the update file on the master device for successful signature library update.

- **FTP/TFTP update**—Updates the URL filtering signature library on the device by using the file stored on the FTP or TFTP server.

Procedure

1. Enter system view.

   system-view

2. Manually update the URL filtering signature library on the device.

   url-filter signature update *file-path*

△ **CAUTION:**

Select a signature file according to the memory size and software version of the device. NSFOCUS provides signature files separately for high-memory (equal to or higher than 8 GB) and low-memory (lower than 8 GB) devices and for different software versions. If you use a signature file applicable to high-memory devices to update the URL filtering signature library on a low-memory device, exceptions might occur on the low-memory device. As a best practice, use a signature file that is compatible with the software version and memory size of the device to update the URL filtering signature library on the device.

Rolling back the URL filtering signature library

About this task

If a URL filtering signature library update causes exceptions or a high false alarm rate, you can roll back the URL filtering signature library.

Before rolling back the URL filtering signature library, the device backs up the current signature library as the "previous version." For example, the previous library version is V1 and the current library version is V2. If you perform a rollback to the previous version, library version V1 becomes the current version and library version V2 becomes the previous version. If you perform a rollback to the previous version again, the library rolls back to library version V2.

Procedure

1. Enter system view.

   `system-view`

2. Roll back the URL filtering signature library to the previous version or to the factory default version.

   `url-filter signature rollback { factory | last }`

Enabling DPI engine logging

About this task

You can enable DPI engine logging for audit purposes. Log messages generated by DPI engine are output to the device information center. The information center then sends the messages to designated destinations based on log output rules. For more information about the information center, see *Network Management and Monitoring Configuration Guide*.

Procedure

1. Enter system view.

   `system-view`

2. Enable DPI engine logging.

   `url-filter log enable`

   By default, DPI engine logging is disabled.

Configuring URL filtering logging for resource access

About URL filtering logging for resource access

URL filtering logs user access to resources after you specify the logging action for a URL category or as a default action for a URL filtering policy.

You can use either of the following methods to configure URL filtering to log access to specific types of resources:

- Configure URL filtering to log access to only resources in the root directories of websites.
- Enable or disable URL filtering logging for access to resources of specific types.

Logging access to only resources in the root directories of websites

1. Enter system view.

   system-view

2. Configure URL filtering to log only access to resources in the root directories of websites.

   url-filter log directory root

   By default, URL filtering logs access to Web resources in all directories.

Disabling logging for access to resources of specific types

1. Enter system view.

   system-view

2. Disable URL filtering logging for access to resources of a specific resource type.

   - Disable logging for access to resources of a predefined resource type.

     url-filter log except pre-defined { **css** | **gif** | **ico** | **jpg** | **js** | **png** | **swf** | **xml** }

   - Disable logging for access to resources of a user-defined resource type.

     url-filter log except user-defined *text*

   By default, URL filtering logs access to all resources except for resources of the predefined resource types (including CSS, GIF, ICO, JPG, JS, PNG, SWF, and XML resources).

Enabling HTTPS URL filtering

About the task

By default, the device supports only the HTTP URL filtering. To enable filtering on HTTPS traffic, use either of the following methods:

- Use SSL decryption to decrypt the HTTPS traffic and then perform HTTP URL filtering on the decrypted traffic. For more information about SSL decryption, see proxy policy configuration in *DPI Configuration Guide*.

  SSL decryption involves a large number of encryption and decryption operations, which might downgrade device forwarding performance. As a best practice, use this method only when the device must perform URL filtering on HTTPS traffic.

- Enable HTTPS URL filtering. This feature performs URL filtering on undecrypted HTTPS traffic. The device directly detects the Client Hello message from the client, and extracts the server name from the Sever Name Indication (SNI) extension to match the URL filtering policy.

Restrictions and guidelines

If SSL decryption is configured, this feature does not take effect.

In HTTPS URL filtering, only the hostname match criterion in a URL filtering rule takes effect. The URI match criterion does not take effect.

This feature takes effect only when the hostname field in the URL is the server's domain name. This feature does not apply to the HTTPS traffic if the hostname field is an IP address.

This feature does not take effect in the following situations:

- The client browser enables TLS 1.3 downgrade enhancement mechanism, because the SNI extension will be encrypted.
- The HTTPS packets do not have the SNI extension.

Procedure

1. Enter system view.

   system-view

2. Create a URL filtering policy and enter its view.

   url-filter policy *policy-name*

3. Enable HTTPS URL filtering.

   https-filter enable

   By default, HTTPS URL filtering is disabled, and the device supports only the HTTP URL filtering.

Display and maintenance commands for URL filtering

Execute **display** commands except the **display url-reputation attack-category** command in any view and **reset** commands in user view.

Execute the **display url-reputation attack-category** command in URL filtering policy view.

Task	Command
Display URL filtering cache information.	**display url-filter cache**
Display URL category information.	**display url-filter** { **category** | **parent-category** } [**verbose**]
Display information about the URL filtering signature library.	**display url-filter signature library**
Display URL filtering statistics.	**display url-filter statistics**
Clear URL filtering statistics.	**reset url-filter statistics**

URL filtering configuration examples

Example: Using a URL filtering policy in a security policy

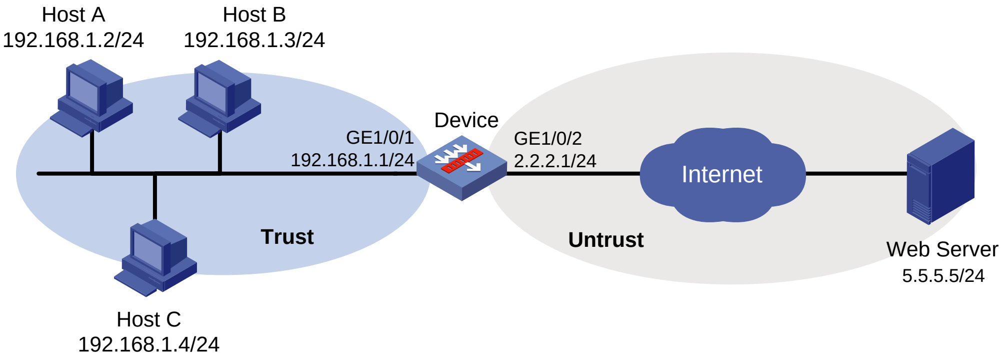
Network configuration

As shown in Figure 3, the device connects to the LAN and Internet through security zones **Trust** and **Untrust**, respectively.

Configure a URL filtering policy on the device so the device performs the following operations:

- Permits LAN users in security zone **Trust** to access website **http://www.sina.com** on the Web server.
- Drops and logs packets that match the Pre-Game URL category.
- Drops and logs packets that do not match any filtering rule in the URL filtering policy.

Figure 3 Network diagram



Procedure

1. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

   ```
   <Device> system-view
   [Device] interface gigabitethernet 1/0/1
   [Device-GigabitEthernet1/0/1] ip address 192.168.1.1 255.255.255.0
   [Device-GigabitEthernet1/0/1] quit
   ```

   # Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Configure settings for routing.

   This example configures a static route to reach the Web server, and the next hop in the route is 2.2.2.2.

   ```
   [Device] ip route-static 5.5.5.0 24 2.2.2.2
   ```

3. Add interfaces to security zones.

   ```
   [Device] security-zone name trust
   [Device-security-zone-Trust] import interface gigabitethernet 1/0/1
   [Device-security-zone-Trust] quit
   [Device] security-zone name untrust
   [Device-security-zone-Untrust] import interface gigabitethernet 1/0/2
   [Device-security-zone-Untrust] quit
   ```

4. Configure URL filtering:

   # Create user-defined URL category **news**, set its severity level to **2000**, and create URL filtering rule 1 to match HTTP packets that contain host name **www.sina.com** in the URL.

   ```
   [Device] url-filter category news severity 2000
   [Device-url-filter-category-news] rule 1 host text www.sina.com
   [Device-url-filter-category-news] quit
   ```

   # Create a URL filtering policy named **urlnews**. Specify action **permit** for URL category **news** and action **drop** for predefined URL category **Pre-Games**, enable logging for the matching packets, and set the default actions to **drop** and **logging**.

   ```
   [Device] url-filter policy urlnews
   [Device-url-filter-policy-urlnews] category news action permit
   [Device-url-filter-policy-urlnews] category Pre-Games action drop logging
   [Device-url-filter-policy-urlnews] default-action drop logging
   [Device-url-filter-policy-urlnews] quit
   ```

5. Apply URL filtering policy **urlnews** to a DPI application profile and activate the IPS policy settings:

# Create a DPI application profile named **sec**, and apply URL filtering policy **urlnews** to the DPI application profile.

```
[Device] app-profile sec
[Device-app-profile-sec] url-filter apply policy urlnews
[Device-app-profile-sec] quit
```

# Activate the URL filtering policy and rule settings.

```
[Device] inspect activate
```

6. Configure a security policy:

# Enter IPv4 security policy view. Create a rule named **trust-untrust** to permit the traffic from internal users to the external network and apply the URL filtering policy to the traffic between the internal users and the Internet.

```
[Device] security-policy ip
[Device-security-policy-ip] rule name trust-untrust
[Device-security-policy-ip-10-trust-untrust] source-zone trust
[Device-security-policy-ip-10-trust-untrust] source-ip-subnet 192.168.1.0 24
[Device-security-policy-ip-10-trust-untrust] destination-zone untrust
[Device-security-policy-ip-10-trust-untrust] action pass
[Device-security-policy-ip-10-trust-untrust] profile sec
[Device-security-policy-ip-10-trust-untrust] quit
```

# Activate rule matching acceleration.

```
[Device-security-policy-ip] accelerate enhanced enable
[Device-security-policy-ip] quit
```

Verifying the configuration

# Verify that LAN users in security zone **Trust** can access website **http://www.sina.com** on the Web server. (Details not shown.)

# Verify that the device drops and logs LAN users' HTTP requests to game resources. (Details not shown.)

Example: Manually updating the URL filtering signature library

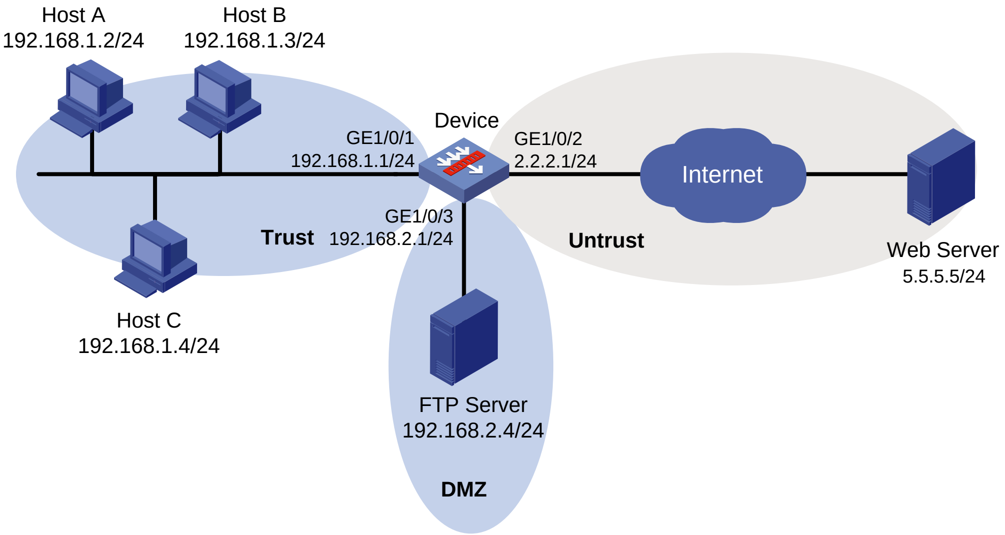
Network configuration

As shown in Figure 4, LAN users in security zone **Trust** can access the following resources:

- Internet resources in security zone **Untrust**.
- The FTP server at 192.168.2.4/24 in security zone **DMZ**. The FTP login username and password are **url** and **123**, respectively.

Manually update the URL filtering signature library on the device by using the latest URL filtering signature file (**url-1.0.2-encrypt.dat**) stored on the FTP server.

Figure 4 Network diagram



Procedure

1. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

   ```
   <Device> system-view
   [Device] interface gigabitethernet 1/0/1
   [Device-GigabitEthernet1/0/1] ip address 192.168.1.1 255.255.255.0
   [Device-GigabitEthernet1/0/1] quit
   ```

   # Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Configure settings for routing.

   This example configures a static route to reach the Web server, and the next hop in the route is 2.2.2.2.

   ```
   [Device] ip route-static 5.5.5.0 24 2.2.2.2
   ```

3. Add interfaces to security zones.

   ```
   [Device] security-zone name trust
   [Device-security-zone-Trust] import interface gigabitethernet 1/0/1
   [Device-security-zone-Trust] quit
   [Device] security-zone name untrust
   [Device-security-zone-Untrust] import interface gigabitethernet 1/0/2
   [Device-security-zone-Untrust] quit
   [Device] security-zone name dmz
   [Device-security-zone-DMZ] import interface gigabitethernet 1/0/3
   [Device-security-zone-DMZ] quit
   ```

4. Configure a security policy:

   # Configure a security policy rule to permit the traffic from security zone **Trust** to security zone **Untrust** for the internal users to access external resources.

   ```
   [Device] security-policy ip
   [Device-security-policy-ip] rule name trust-untrust
   [Device-security-policy-ip-10-trust-untrust] source-zone trust
   [Device-security-policy-ip-10-trust-untrust] source-ip-subnet 192.168.1.0 24
   [Device-security-policy-ip-10-trust-untrust] destination-zone untrust
   [Device-security-policy-ip-10-trust-untrust] action pass
   ```

```
[Device-security-policy-ip-10-trust-untrust] quit
```

# Configure a security policy rule to permit the traffic from security zone **Trust** to security zone **DMZ** for the internal users to access the FTP server in the **DMZ** security zone.

```
[Device] security-policy ip
[Device-security-policy-ip] rule name trust-dmz
[Device-security-policy-ip-11-trust-dmz] source-zone trust
[Device-security-policy-ip-11-trust-dmz] source-ip-subnet 192.168.1.0 24
[Device-security-policy-ip-11-trust-dmz] destination-zone dmz
[Device-security-policy-ip-11-trust-dmz] action pass
[Device-security-policy-ip-11-trust-dmz] quit
```

# Configure a security policy rule to permit the traffic between the FTP server and the device so the device can access the FTP server to obtain the signature file.

```
[Device] security-policy ip
[Device-security-policy-ip] rule name downloadlocalout
[Device-security-policy-ip-12-downloadlocalout] source-zone local
[Device-security-policy-ip-12-downloadlocalout] destination-zone dmz
[Device-security-policy-ip-12-downloadlocalout] destination-ip-subnet 192.168.2.0
24
[Device-security-policy-ip-12-downloadlocalout] application ftp
[Device-security-policy-ip-12-downloadlocalout] application ftp-data
[Device-security-policy-ip-12-downloadlocalout] action pass
[Device-security-policy-ip-12-downloadlocalout] quit
```

# Activate rule matching acceleration.

```
[Device-security-policy-ip] accelerate enhanced enable
[Device-security-policy-ip] quit
```

5. Update the URL filtering library on the device by using URL filtering signature file **url-1.0.2-encrypt.dat** on the FTP server.

```
[Device] url-filter signature update
ftp://url:123@192.168.2.4/url-1.0.2-encrypt.dat
```

Verifying the configuration

# Verify that the URL filtering signature library on the device is updated successfully.

```
<Device> display url-filter signature library
```

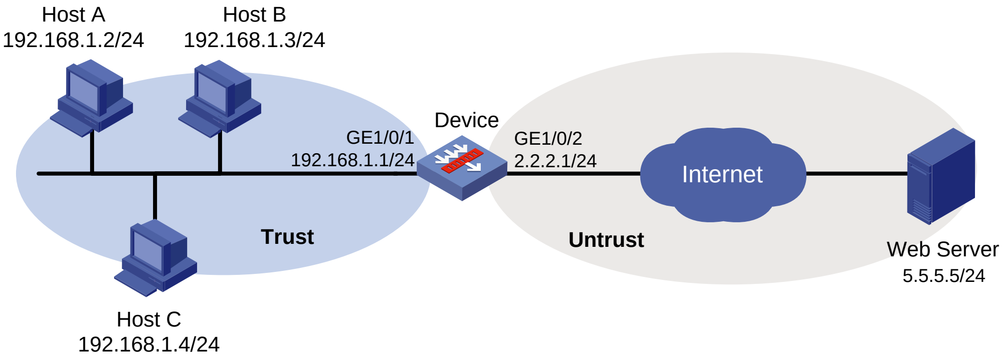
Example: Configuring automatic URL filtering signature library update

Network configuration

As shown in Figure 5, LAN users in security zone **Trust** can access Internet resources in security zone **Untrust**.

Configure the device to start automatically updating the local URL filtering signature library at a random time between 08:30 a.m. and 09:30 a.m. every Saturday.

Figure 5 Network diagram



Procedure

1. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

   ```
   <Device> system-view
   [Device] interface gigabitethernet 1/0/1
   [Device-GigabitEthernet1/0/1] ip address 192.168.1.1 255.255.255.0
   [Device-GigabitEthernet1/0/1] quit
   ```

   # Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Configure settings for routing.

   This example configures a static route to reach the Web server, and the next hop in the route is 2.2.2.2.

   ```
   [Device] ip route-static 5.5.5.0 24 2.2.2.2
   ```

3. Add interfaces to security zones.

   ```
   [Device] security-zone name trust
   [Device-security-zone-Trust] import interface gigabitethernet 1/0/1
   [Device-security-zone-Trust] quit
   [Device] security-zone name untrust
   [Device-security-zone-Untrust] import interface gigabitethernet 1/0/2
   [Device-security-zone-Untrust] quit
   ```

4. Configure DNS for the device to resolve the domain name of the official website into the correct IP address.

   ```
   [Device] dns server 10.72.66.36
   ```

5. Configure a security policy:

   # Configure a security policy rule to permit the traffic from security zone **Trust** to security zone **Untrust** for the internal users to access external resources.

   ```
   [Device] security-policy ip
   [Device-security-policy-ip] rule name trust-untrust
   [Device-security-policy-ip-10-trust-untrust] source-zone trust
   [Device-security-policy-ip-10-trust-untrust] source-ip-subnet 192.168.1.0 24
   [Device-security-policy-ip-10-trust-untrust] destination-zone untrust
   [Device-security-policy-ip-10-trust-untrust] action pass
   [Device-security-policy-ip-10-trust-untrust] quit
   ```

   # Configure a security policy rule to permit the traffic from security zone **Local** to security zone **Untrust** so the device can access the official website to obtain the signature file.

   ```
   [Device] security-policy ip
   [Device-security-policy-ip] rule name downloadlocalout
   ```

```
[Device-security-policy-ip-11-downloadlocalout] source-zone local
[Device-security-policy-ip-11-downloadlocalout] destination-zone untrust
[Device-security-policy-ip-11-downloadlocalout] action pass
[Device-security-policy-ip-11-downloadlocalout] quit
```

# Activate rule matching acceleration.

```
[Device-security-policy-ip] accelerate enhanced enable
[Device-security-policy-ip] quit
```

6. Configure automatic URL filtering signature library update:

# Enable automatic URL filtering signature library update. Configure the device to perform automatic update at a random time between 08:30 a.m. and 09:30 a.m. every Saturday.

```
[Device] url-filter signature auto-update
[Device-url-filter-autoupdate] update schedule weekly sat start-time 9:00:00 tingle 
60
[Device-url-filter-autoupdate] quit
```

Verifying the configuration

# Verify that the device URL filtering signature library is updated as scheduled.

```
<Device> display url-filter signature library
```

Contents

Configuring data filtering

About data filtering

Data filtering filters packets based on application layer information. You can use data filtering to effectively prevent leakage of internal information, distribution of illegal information, and unauthorized access to the Internet.

Data filtering supports filtering packets of the following protocols:

- HTTP.
- FTP.
- SMTP.
- IMAP.
- NFS.
- POP3.
- RTMP.
- SMB.

Basic concepts

Keyword match pattern

The device provides predefined keyword match patterns and allows you to create user-defined keyword match patterns in a keyword group.

- **Predefined pattern**—Includes the phone number, bank card number, credit card number, and ID card number patterns. These patterns can be used to identify packets that contain phone numbers, bank card numbers, credit card numbers, and ID card numbers.
- **User-defined pattern**—A text- or regular expression-based string to identify patterns in the application layer data of packets.

Keyword group

A keyword group is a group of keyword match patterns.

Data filtering rule

A data filtering rule contains a set of filtering criteria for matching packets, including keyword group, traffic direction, and application layer protocol. You can specify the actions to take on packets matching a data filtering rule. Supported actions include drop, permit, and logging. A packet must match all the filtering criteria for the actions specified for the rule to apply.

Data filtering mechanism

Data filtering takes effect after you apply a data filtering policy to a DPI application profile and use the DPI application profile in a security policy rule.

1. Compares the packet with the security policy rules.

If the packet matches a rule that is associated with a data filtering policy (through a DPI application profile), the device extracts the application layer information from the packet.

For more information about security policies, see *Security Configuration Guide*.

2. Determines the actions to take on the packet by comparing the extracted application layer information with the data filtering rules in the data filtering policy:

- If the packet does not match any data filtering rules in the policy, the device permits the packet to pass.
- If the packet matches only one rule, the device takes the actions specified for the rule.
- If the packet matches multiple rules, the device determines the actions as follows:
  - If the matching rules have both the permit and drop actions, the device takes the drop action.
  - If the logging action is specified for any of the matching rules, the device logs the packet.

Data filtering tasks at a glance

To configure data filtering, perform the following tasks:

3. Configuring a keyword group
4. Configuring a data filtering policy
5. Applying a data filtering policy to a DPI application profile
6. (Optional.) Activating data filtering policy and rule settings
7. Applying a DPI application profile to a security policy rule

Configuring a keyword group

About this task

A keyword group is a group of keyword match patterns. A keyword match pattern is a text or regular expression string that matches packets based on application layer data.

A packet matches a keyword group if it matches any keyword match pattern in the group.

Procedure

1. Enter system view.

   `system-view`

2. Create a keyword group and enter its view.

   `data-filter keyword-group` *`keywordgroup-name`*

3. (Optional.) Configure a description for the keyword group.

   `description` *`string`*

   By default, a keyword group does not have a description.

4. Configure keyword match patterns:
   - Create a user-defined keyword match pattern.

     `pattern` *`pattern-name`* { **`regex`** | **`text`** } *`pattern-string`*

     By default, a keyword group does not contain any user-defined keyword match patterns.
   - Enable a predefined keyword match pattern.

     `pre-defined-pattern name { bank-card-number | credit-card-number | id-card-number | phone-number }`

     By default, no predefined patterns are enabled in a keyword group.

Configuring a data filtering policy

About this task

A data filtering policy can contain a maximum of 32 data filtering rules. Each rule defines a set of filtering criteria and actions for matching packets. The filtering criteria include:

- One keyword group.
- One or more application layer protocols.
- Traffic direction.

Restrictions and guidelines

Data filtering rules applied to the NFS protocol take effect only on NFSv3 traffic.

Data filtering rules applied to the SMB protocol take effect only on SMBv1 and SMBv2 traffic.

The **logging** keyword enables the data filtering module to log packet matching events and send log messages to the information center.

With the information center, you can set log message filtering and output rules, including output destinations.

The information center can output data filtering logs to any destinations except the console and the monitor terminal. If you configure the console or monitor terminal as an output destination, the output destination setting will not take effect.

To view data filtering logs stored on the device, use the **display logbuffer** command. Make sure you do not disable log output to the log buffer, which is enabled by default.

For more information about configuring the information center, see *Network Management and Monitoring Configuration Guide*.

Procedure

1. Enter system view.

   system-view

2. Create a data filtering policy and enter its view.

   data-filter policy *policy-name*

3. (Optional.) Configure a description for the data filtering policy.

   description *string*

   By default, a data filtering policy does not have a description.

4. Create a data filtering rule and enter its view.

   rule *rule-name*

5. Specify a keyword group for the data filtering rule.

   keyword-group *keywordgroup-name*

   By default, a data filtering rule does not contain any keyword group.

6. Specify the application layer protocols to which the data filtering rule applies.

   application { **all** | **type** { **ftp** | **http** | **imap** | **nfs** | **pop3** | **rtmp** | **smb** | **smtp** } * }

   By default, no applicable application layer protocols are specified for a data filtering rule.

7. Specify the traffic directions to which the data filtering rule applies.

   direction { **both** | **download** | **upload** }

   By default, a data filtering rule applies to upload traffic.

8. Specify the actions to take on matching packets.

```
action { drop | permit } [ logging ]
```

The default action of a data filtering rule is **drop**.

Applying a data filtering policy to a DPI application profile

About this task

A data filtering policy must be applied to a DPI application profile to take effect.

A DPI application profile can use only one data filtering policy. If you apply different data filtering policies to the same DPI application profile, only the most recent configuration takes effect.

Procedure

1. Enter system view.

   ```
   system-view
   ```

2. Enter DPI application profile view.

   ```
   app-profile profile-name
   ```

   For more information about this command, see DPI engine commands in *DPI Command Reference*.

3. Apply a data filtering policy to the DPI application profile.

   ```
   data-filter apply policy policy-name
   ```

   By default, no data filtering policy is applied to the DPI application profile.

Activating data filtering policy and rule settings

About this task

By default, the system will detect whether another configuration change (such as creation, modification, or deletion) occurs within a 20-second interval after a change to the data filtering policy and rule settings:

- If no configuration change occurs within the interval, the system performs an activation operation at the end of the next 20-second interval to make the configuration take effect.
- If a configuration change occurs within the interval, the system continues to periodically detect whether configuration changes occur within next 20-second intervals.

To activate the policy and rule configurations immediately, you can execute the **inspect activate** command.

For more information about configuration activation for DPI service modules, see "Configuring DPI engine."

Procedure

1. Enter system view.

   ```
   system-view
   ```

2. Activate data filtering policy and rule settings.

   ```
   inspect activate
   ```

   By default, data filtering policy and rule settings will be activated automatically.

CAUTION:

This command can cause temporary outage for DPI services. Services based on the DPI services might also be interrupted. For example, security policies cannot control application access.

Applying a DPI application profile to a security policy rule

3. Enter system view.

   system-view

4. Enter security policy view.

   security-policy { **ip** | **ipv6** }

5. Enter security policy rule view.

   rule { *rule-id* | [*rule-id*] **name** *rule-name* }

6. Set the rule action to pass.

   action pass

   The default rule action is **drop**.

7. Use a DPI application profile in the rule.

   profile *app-profile-name*

   By default, no DPI application profile is used in a security policy rule.

Data filtering configuration examples

Example: Using a data filtering policy in a security policy

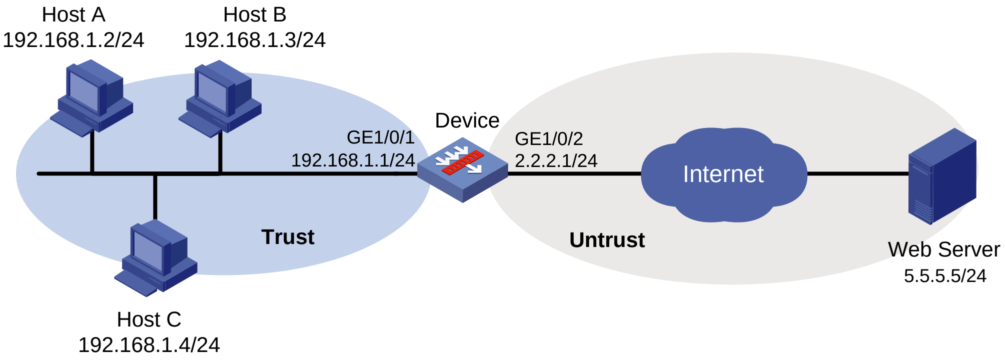
Network configuration

As shown in Figure 1, the device connects to the LAN and Internet through security zones **Trust** and **Untrust**, respectively.

Configure data filtering on the device so the device performs the following operations:

- Blocks HTTP packets that contain the **uri** or **abc.*abc** string in the URI field or message body.
- Blocks download FTP traffic that contains the **http://www.abcd.com/** string.
- Logs the blocked packets.

Figure 1 Network diagram



Procedure

1. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

   ```
   <Device> system-view
   [Device] interface gigabitethernet 1/0/1
   [Device-GigabitEthernet1/0/1] ip address 192.168.1.1 255.255.255.0
   [Device-GigabitEthernet1/0/1] quit
   ```

   # Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Configure settings for routing.

   This example configures a static route to reach the Web server, and the next hop in the route is 2.2.2.2.

   ```
   [Device] ip route-static 5.5.5.0 24 2.2.2.2
   ```

3. Add interfaces to security zones.

   ```
   [Device] security-zone name trust
   [Device-security-zone-Trust] import interface gigabitethernet 1/0/1
   [Device-security-zone-Trust] quit
   [Device] security-zone name untrust
   [Device-security-zone-Untrust] import interface gigabitethernet 1/0/2
   [Device-security-zone-Untrust] quit
   ```

4. Configure data filtering:

   a. Configure keyword groups:

      # Create a keyword group named **kg1** and create two keyword match patterns that match the **uri** text string and the **abc.*abc** regular expression string, respectively.

      ```
      [Device] data-filter keyword-group kg1
      [Device-data-filter-kgroup-kg1] pattern 1 text uri
      [Device-data-filter-kgroup-kg1] pattern 2 regex abc.*abc
      [Device-data-filter-kgroup-kg1] quit
      ```

      # Create a keyword group named **kg2** and create a keyword match pattern that matches the **http://www.abcd.com/** text string.

      ```
      [Device] data-filter keyword-group kg2
      [Device-data-filter-kgroup-kg2] pattern 1 text www.abcd.com
      [Device-data-filter-kgroup-kg2] quit
      ```

   b. Configure a data filtering policy:

      # Create a data filtering rule named **r1** and configure it to drop and log both upload and download HTTP traffic that matches keyword group **kg1**.

```
[Device] data-filter policy p1
[Device-data-filter-policy-p1] rule r1
[Device-data-filter-policy-p1-rule-r1] keyword-group kg1
[Device-data-filter-policy-p1-rule-r1] application type http
[Device-data-filter-policy-p1-rule-r1] direction both
[Device-data-filter-policy-p1-rule-r1] action drop logging
[Device-data-filter-policy-p1-rule-r1] quit
```

# Create a data filtering rule named **r2** and configure it to drop and log download FTP traffic that matches keyword group **kg2**.

```
[Device-data-filter-policy-p1] rule r2
[Device-data-filter-policy-p1-rule-r2] keyword-group kg2
[Device-data-filter-policy-p1-rule-r2] application type ftp
[Device-data-filter-policy-p1-rule-r2] direction download
[Device-data-filter-policy-p1-rule-r2] action drop logging
[Device-data-filter-policy-p1-rule-r2] quit
```

5. Configure a DPI application profile and activate the data filtering policy and rule settings:

   # Create a DPI application profile named **sec** and apply data filtering policy **p1** to the DPI application profile.

   ```
   [Device] app-profile sec
   [Device-app-profile-profile1] data-filter apply policy p1
   [Device-app-profile-profile1] quit
   ```

   # Activate the data filtering policy and rule settings.

   ```
   [Device] inspect activate
   ```

6. Configure a security policy:

   # Create a security policy rule named **trust-untrust.** Configure the rule to apply DPI application profile **sec** to packets from security zone **Trust** to security zone **Untrust** with source subnet address **192.168.1.0/24**.

   ```
   [Device] security-policy ip
   [Device-security-policy-ip] rule name trust-untrust
   [Device-security-policy-ip-10-trust-untrust] source-zone trust
   [Device-security-policy-ip-10-trust-untrust] source-ip-subnet 192.168.1.0 24
   [Device-security-policy-ip-10-trust-untrust] destination-zone untrust
   [Device-security-policy-ip-10-trust-untrust] action pass
   [Device-security-policy-ip-10-trust-untrust] profile sec
   [Device-security-policy-ip-10-trust-untrust] quit
   ```

   # Activate rule matching acceleration.

   ```
   [Device-security-policy-ip] accelerate enhanced enable
   [Device-security-policy-ip] quit
   ```

Verifying the configuration

# Verify that the device blocks and logs HTTP packets and FTP packets that meet the specified criteria. (Details not shown.)

Contents

Configuring file filtering

About file filtering

The file filtering feature filters files based on file extensions. You can configure file filtering to perform actions on files based on the file extensions.

File filtering supports filtering packets of the following protocols:

- HTTP.
- FTP.
- SMTP.
- IMAP.
- NFS.
- POP3.
- RTMP.
- SMB.

Basic concepts

File type match pattern

A file type match pattern identifies a type of files by file extension.

File type group

A file type group can contain a maximum of 32 file type match patterns. A file matches a file type group if it matches a pattern in the group.

File filtering rule

A file filtering rule contains a set of filtering criteria for matching files, including file type group, traffic direction, and application layer protocol. You can specify the actions to take on packets matching a file filtering rule. Supported actions include drop, permit, and logging. A file must match all the filtering criteria for the actions specified for the rule to apply.

File filtering mechanism

File filtering takes effect after you apply a file filtering policy to a DPI application profile and use the DPI application profile in a security policy rule.

Upon receiving a packet of a protocol that file filtering supports, the device performs the following operations:

1. Compares the packet with the security policy rules.

   If the packet matches a rule that is associated with a file filtering policy (through a DPI application profile), the device submits the packet to the DPI engine for file filtering processing.

   For more information about security policies, see *Security Configuration Guide*.
2. Extracts and records the file extension in the packet.
3. Identifies the real file extension and compares it with the recorded file extension:
   - If the two file extensions match or if the real file extension cannot be identified, the device proceeds to step 4.

- If the two file extensions do not match, the device checks the action specified for packets with files carrying false extensions.
  - If the **Drop** action is specified, the device drops the packet directly.
  - If the **Permit** action is specified, the device proceeds to step 4 to perform file filtering inspection based on the real file extension.

4. Determines the actions to take on the packet by comparing the packet attributes (file extension, application layer application, and traffic direction) with the file filtering rules in the file filtering policy:
   - If the packet does not match any file filtering rules in the policy, the device permits the packet to pass.
   - If the packet matches only one rule, the device takes the actions specified for the rule.
   - If the packet matches multiple rules, the device determines the actions as follows:
     - If the matching rules have both the **permit** and **drop** actions, the device takes the **drop** action.
     - The **logging** action is taken if it is specified for any of the matching rules.

File filtering tasks at a glance

To configure data filtering, perform the following tasks:

1. Configuring a file type group
2. Configuring a file filtering policy
3. Setting the action for packets with files carrying false extensions
4. Applying a file filtering policy to a DPI application profile
5. (Optional.) Activating file filtering policy and rule settings
6. Applying a DPI application profile to a security policy rule

Configuring a file type group

About this task

A file type group is a group of file type match patterns. A file type match pattern is a text or regular expression string that matches files by file extension.

A file matches a file type group if it matches a pattern in the group.

Procedure

1. Enter system view.
   system-view
2. Create a file type group and enter its view.
   file-filter policy *policy-name*
3. (Optional.) Configure a description for the file type group.
   description *string*
   By default, a file type group does not have a description.
4. Configure a file type match pattern.
   pattern *pattern-name* **text** *pattern-string*
   By default, a file type group does not contain any file type match patterns.

Configuring a file filtering policy

About this task

A file filtering policy can contain a maximum of 32 file filtering rules. Each rule defines a set of filtering criteria and the actions for matching packets. The filtering criteria include:

- One file type group.
- One or more application layer protocols.
- Traffic direction.

Restrictions and guidelines

File filtering rules applied to the NFS protocol take effect only on NFSv3 traffic.

File filtering rules applied to the SMB protocol take effect only on SMBv1 and SMBv2 traffic.

The **`logging`** keyword enables the file filtering module to log packet matching events and send log messages to the information center.

With the information center, you can set log message filtering and output rules, including output destinations.

The information center can output file filtering logs to any destinations except the console and the monitor terminal. If you configure the console or monitor terminal as an output destination, the output destination setting will not take effect.

To view file filtering logs stored on the device, use the **`display logbuffer`** command. Make sure you do not disable log output to the log buffer, which is enabled by default.

For more information about configuring the information center, see *Network Management and Monitoring Configuration Guide*.

Procedure

1. Enter system view.

   `system-view`

2. Create a file filtering policy and enter its view.

   `file-filter policy` *`policy-name`*

3. (Optional.) Configure a description for the file filtering policy.

   `description` *`string`*

   By default, a file filtering policy does not have a description.

4. Create a file filtering rule and enter its view.

   `rule` *`rule-name`*

5. Specify a file type group for the file filtering rule.

   `filetype-group` *`group-name`*

   By default, a file filtering rule does not contain any file type group.

6. Specify the application layer protocols to which the file filtering rule applies.

   `application` { **`all`** | **`type`** { **`ftp`** | **`http`** | **`imap`** | **`nfs`** | **`pop3`** | **`rtmp`** | **`smb`** | **`smtp`** } * }

   By default, no applicable application layer protocols are specified for a file filtering rule.

7. Specify the traffic directions to which the file filtering rule applies.

   `direction` { **`both`** | **`download`** | **`upload`** }

   By default, a file filtering rule applies to upload traffic.

8. Specify the actions to take on matching packets.

```
action { drop | permit } [ logging ]
```

The default action of a file filtering rule is **drop**.

Setting the action for packets with files carrying false extensions

About this task

A packet might contain files that carry false extensions. For example, a file that carries the .exe file extension might actually be a .txt file.

Use this command to specify the action for packets with files carrying false extensions. To perform file filtering inspection based on the real file extension, set the action to **permit**. To discard such packets directly, set the action to **drop**.

Procedure

1. Enter system view.

   ```
   system-view
   ```

2. Set the action for packets with files carrying false extensions.

   ```
   file-filter false-extension action { drop | permit }
   ```

   The default action is **permit**, which enables the device to determine the packet processing action based on the real file extension.

Applying a file filtering policy to a DPI application profile

About this task

A file filtering policy must be applied to a DPI application profile to take effect.

A DPI application profile can use only one file filtering policy. If you apply different file filtering policies to the same DPI application profile, only the most recent configuration takes effect.

Procedure

1. Enter system view.

   ```
   system-view
   ```

2. Enter DPI application profile view.

   ```
   app-profile profile-name
   ```

   For more information about this command, see DPI engine commands in *DPI Command Reference*.

3. Apply a file filtering policy to the DPI application profile.

   ```
   file-filter apply policy policy-name
   ```

   By default, no file filtering policy is applied to the DPI application profile.

Activating file filtering policy and rule settings

About this task

By default, the system will detect whether another configuration change (such as creation, modification, or deletion) occurs within a 20-second interval after a change to the file filtering policy and rule settings:

- If no configuration change occurs within the interval, the system performs an activation operation at the end of the next 20-second interval to make the configuration take effect.
- If a configuration change occurs within the interval, the system continues to periodically detect whether configuration changes occur within next 20-second intervals.

To activate the policy and rule configurations immediately, you can execute the **`inspect activate`** command.

For more information about configuration activation for DPI service modules, see "Configuring DPI engine."

Procedure

1. Enter system view.

   `system-view`

2. Activate file filtering policy and rule settings.

   `inspect activate`

   By default, file filtering policy and rule settings will be activated automatically.

△ **CAUTION:**

This command can cause temporary outage for DPI services. Services based on the DPI services might also be interrupted. For example, security policies cannot control application access.

Applying a DPI application profile to a security policy rule

1. Enter system view.

   `system-view`

2. Enter security policy view.

   security-policy { **ip** | **ipv6** }

3. Enter security policy rule view.

   rule { *rule-id* | [*rule-id*] **name** *rule-name* }

4. Set the rule action to pass.

   `action pass`

   The default rule action is **`drop`**.

5. Use a DPI application profile in the rule.

   profile *app-profile-name*

   By default, no DPI application profile is used in a security policy rule.

File filtering configuration examples

Example: Using a file filtering policy in a security policy

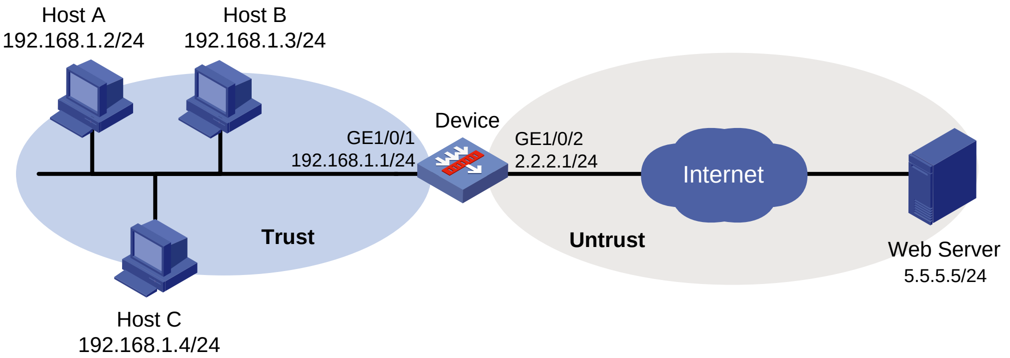
Network configuration

As shown in Figure 1, the device connects to the LAN and Internet through security zones **Trust** and **Untrust**, respectively.

Configure file filtering on the device so the device performs the following operations:

- Blocks files with the **pptx** or **dotx** extension.
- Logs the blocked files.

Figure 1 Network diagram



Procedure

1. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

```
<Device> system-view
[Device] interface gigabitethernet 1/0/1
[Device-GigabitEthernet1/0/1] ip address 192.168.1.1 255.255.255.0
[Device-GigabitEthernet1/0/1] quit
```

   # Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Configure settings for routing.

   This example configures a static route to reach the Web server, and the next hop in the route is 2.2.2.2.

```
[Device] ip route-static 5.5.5.0 24 2.2.2.2
```

3. Add interfaces to security zones.

```
[Device] security-zone name trust
[Device-security-zone-Trust] import interface gigabitethernet 1/0/1
[Device-security-zone-Trust] quit
[Device] security-zone name untrust
[Device-security-zone-Untrust] import interface gigabitethernet 1/0/2
[Device-security-zone-Untrust] quit
```

4. Configure file filtering:

   a. Create a file type group named **fg1** and create two file type match patterns to match files with the **pptx** and **dotx** extensions, respectively.

```
[Device] file-filter filetype-group fg1
```

```
[Device-file-filter-fgroup-fg1] pattern 1 text pptx
[Device-file-filter-fgroup-fg1] pattern 2 text dotx
[Device-file-filter-fgroup-fg1] quit
```

b. Create a file filtering rule named **r1** and configure it to drop and log both upload and download HTTP packets that match file type group **fg1**.

```
[Device] file-filter policy p1
[Device-file-filter-policy-p1] rule r1
[Device-file-filter-policy-p1-rule-r1] filetype-group fg1
[Device-file-filter-policy-p1-rule-r1] application type http
[Device-file-filter-policy-p1-rule-r1] direction both
[Device-file-filter-policy-p1-rule-r1] action drop logging
[Device-file-filter-policy-p1-rule-r1] quit
```

5. Configure a DPI application profile and activate the file filtering policy and rule settings:

# Create a DPI application profile named **sec** and apply file filtering policy **p1** to the DPI application profile.

```
[Device] app-profile sec
[Device-app-profile-sec] file-filter apply policy p1
[Device-app-profile-sec] quit
```

# Activate the file filtering policy and rule settings.

```
[Device] inspect activate
```

6. Configure a security policy:

# Create a security policy rule named **trust-untrust**. Configure the rule to apply DPI application profile **sec** to packets from security zone **Trust** to security zone **Untrust with** source subnet address **192.168.1.0/24**.

```
[Device] security-policy ip
[Device-security-policy-ip] rule name trust-untrust
[Device-security-policy-ip-10-trust-untrust] source-zone trust
[Device-security-policy-ip-10-trust-untrust] source-ip-subnet 192.168.1.0 24
[Device-security-policy-ip-10-trust-untrust] destination-zone untrust
[Device-security-policy-ip-10-trust-untrust] action pass
[Device-security-policy-ip-10-trust-untrust] profile sec
[Device-security-policy-ip-10-trust-untrust] quit
```

# Activate rule matching acceleration.

```
[Device-security-policy-ip] accelerate enhanced enable
[Device-security-policy-ip] quit
```

Verifying the configuration

# Verify that the device blocks and logs files that meet the specified criteria. (Details not shown.)

Contents

Configuring anti-virus

About anti-virus

Anti-virus identifies viruses in the application layer of packets based on an up-to-date virus signature library and takes actions to prevent a network from being infected. This feature is typically deployed on a gateway to insulate the internal network from viruses and protect the internal data.

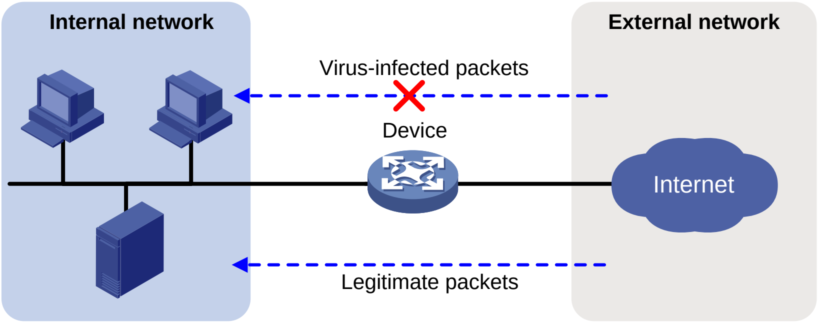
Anti-virus supports inspecting packets transported through FTP, HTTP, IMAP, NFS, POP3, SMB, and SMTP.

Application scenario

As shown in Figure 1, the device is the gateway of an internal network. Internal users access the external network and download data from the external network. The internal server accepts data uploaded by external users.

In this scenario, you can configure anti-virus on the gateway to protect the internal network. Anti-virus inspects incoming packets, permits legitimate packets to pass, and takes actions, such as alert, block, or redirect, on packets containing viruses.

Figure 1 Anti-virus application scenario



Terminology

Virus signature

A virus signature is a character string that uniquely identifies a specific virus. The virus signature library contains the predefined virus signatures.

MD5 rules

An MD5 rule is generated by the system based on the virus signatures in the virus signature library to identify virus-infected files.

Signature exception

Typically, anti-virus takes anti-virus actions on packets matching virus signatures. If a virus proves to be a false alarm, you can set the virus signature as a signature exception. Packets matching the signature exception are permitted to pass.

Application exception

Typically, anti-virus action is protocol specific and applies to all applications carried by the protocol. To take a different action on an application, you can set the application as an exception and specify a different anti-virus action for the application. Application exceptions use application-specific actions and the other applications use protocol-specific actions. For example, the anti-virus action for HTTP is alert. To block the games carried by HTTP, you can set the games as application exceptions and specify the block action for them.

MD5 exception

If false positives occur for a virus, you can set the MD5 value of the virus as an MD5 exception. The device will permit subsequent packets matching the MD5 exception to pass.

You can get the MD5 value of the virus through the threat log.

Anti-virus action

Anti-virus actions apply to the packets that match virus signatures. The actions include the following types:

- **alert**—Permits matching packets and generates logs.
- **block**—Blocks matching packets and generates logs.
- **redirect**—Redirects matching HTTP connections to a URL and generates logs. The redirection is applicable to only uploading connections.

The generated anti-virus logs can be sent to the device information center or to designated recipients by email.

Virus detection methods

The device supports the following virus detection methods:

- **Virus signature-based detection**—The device matches packets against virus signatures in the virus signature library, and determines that a packet contains viruses if a match is found.
- **MD5 rule-based detection**—The device generates an MD5 hash value for a file to be inspected and compares the value with the system-defined MD5 rules. If a match is found, the file is identified to be virus-infected.

Anti-virus mechanism

Anti-virus takes effect after you apply an anti-virus policy to a DPI application profile and use the DPI application profile in a security policy rule.

As shown in Figure 2, upon receiving a packet, the anti-virus device performs the following operations:

1. The device identifies whether the anti-virus supports the application layer protocol of the packet.
   - If not, the device permits the packet to pass without virus detection.
   - If yes, the device compares the packet with the virus signatures and MD5 rules.
2. If a matching signature or MD5 rule is found, the device determines if the matching signature is an exception.
   - If yes, the device permits the packet to pass.
   - If not, the device examines whether the application is an exception.
     - If the application is an exception, the device takes the application-specific action (alert, block, or permit).
     - If the application is not an exception, the device takes the protocol-specific action (alert, block, or redirect).
3. If no matching signature or MD5 rule is found, the device examines whether the MD5 value of the file in the packet matches an MD5 value exception.
   - If yes, the device permits the packet to pass.

- If not, the device examines whether the MD5 value of the file in the packet matches a buffered MD5 value in the anti-virus buffer.
  - If a buffered MD5 value labeled as virus is found, the device determines if the application is an exception. If yes, the device takes the application-specific action (alert, block, or permit). If not, the device takes the protocol-specific action (alert, block, or redirect).
  - If a buffered MD5 value labeled as non-virus is found, the device permits the packet to pass.
  - If no buffered MD5 value is found, the device sends the MD5 value of the file to the cloud server for future virus detection.

  After the virus detection, the device saves the detection results returned from the cloud server to the anti-virus buffer so the virus detection for subsequent packets can be performed locally.

Anti-virus processing

Virus signature library management

The device inspects packets for viruses based on the virus signature library. You can update the virus signature library to the latest version or roll it back to the previous version or the factory default version.

Updating the virus signature library

The following methods are available for updating the virus signature library:

- Automatic update.

  The device automatically and periodically downloads the most up-to-date virus signature file to update the signature library.
- Triggered update.

  The device downloads the most up-to-date virus signature file to update the signature library immediately after you trigger the operation.
- Manual update.

  Use this method when the device cannot obtain the virus signature file automatically.

  You must manually download the most up-to-date virus signature file and then use the downloaded file to update the signature library.

Rolling back the virus signature library

If the false alarm rate is high or abnormal situations frequently occur, you can roll back the virus signature library to the previous version or to the factory default version.

Licensing requirements

Before using the anti-virus feature, purchase and correctly install a license on the device. If the license expires, the anti-virus feature is still available but you can no longer update the virus signature library, perform MD5 value cloud query, or collaborate with sandbox to block packets. For more information about licenses, see *Fundamentals Configuration Guide*.

Restrictions and guidelines: Anti-virus

Anti-virus supports inspecting packets transported through FTP, HTTP, HTTPS, IMAP, IMAPS, NFS, POP3, POP3S, SMB, SMTP, and SMTPS. To inspect packets transported through HTTPS, IMAPS, POP3S, and SMTPS, you must use anti-virus together with SSL proxy. For information about SSL proxy, see "Configuring proxy policy."

Anti-virus tasks at a glance

To configure anti-virus, perform the following tasks:

1. Configuring an anti-virus policy
2. Configuring MD5 value-based anti-virus cloud query
3. Specifying a parameter profile for an anti-virus action
4. Applying an anti-virus policy to a DPI application profile
5. (Optional.) Activating anti-virus policy settings
6. Applying a DPI application profile to a security policy rule
7. Managing the virus signature library

Configuring an anti-virus policy

About this task

An anti-virus policy defines the virus detection criteria, anti-virus actions, virus signature exceptions, and application exceptions.

The virus signatures in the virus signature library are available to all anti-virus policies on the device.

The device supports sending the alarm message defined in the warning parameter profile applied to the policy. If an endpoint user visits a virus-infected website, the device will display the alarm message on the user's browser. For more information about configuring a warning parameter profile, see "Configuring DPI engine."

Restrictions and guidelines

Anti-virus supports only NFSv3 of the NFS protocol, and SMBv1 and SMBv2 of the SMB protocol.

The **logging** keyword enables the anti-virus module to log the packet matching events and send log messages to the information center.

With the information center, you can set log message filtering and output rules, including output destinations.

The information center can output anti-virus logs to any destinations except the console and the monitor terminal. If you configure the console or monitor terminal as an output destination, the output destination setting will not take effect.

To view anti-virus logs stored on the device, use the **display logbuffer** command. Make sure you do not disable log output to the log buffer, which is enabled by default.

For more information about configuring the information center, see *Network Management and Monitoring Configuration Guide*.

Procedure

1. Enter system view.

   system-view

2. Create an anti-virus policy and enter its view.

   anti-virus policy *policy-name*

   A default anti-virus policy named **default** exists. The default anti-virus policy cannot be modified or deleted.

3. (Optional.) Configure a description for the anti-virus policy.

   description *text*

4. Configure anti-virus for an application layer protocol.

   inspect { **ftp** | **http** | **imap** | **nfs** | **pop3** | **smb** | **smtp** } **direction** { **both** | **download** | **upload** } [**cache-file-size** *file-size*] **action** { **alert** | **block** | **redirect** }

   By default, the device performs virus detection on upload and download packets for FTP, HTTP, IMAP, NFS, and SMB, on download packets for POP3, and on upload packets for SMTP. The anti-virus action for FTP, HTTP, NFS, and SMB is **block** and for IMAP, SMTP, and POP3 is **alert**. The maximum size for the file that can be cached for virus detection is 1 MB. The **direction** keyword is not available for the POP3 and SMTP protocols because the POP3 protocol supports only the download direction and the SMTP protocol supports only the upload direction.

5. (Optional.) Apply a warning parameter profile to an anti-virus policy and enable sending the alarm message defined in the profile.

   warning parameter-profile *profile-name*

   By default, no warning parameter profile is applied and the device does not support the sending of alarm messages.

   The alarm message sending takes effect only when the HTTP protocol and the **block** action are configured for virus detection.

6. (Optional.) Set a signature as a signature exception.

   exception signature *signature-id*

7. (Optional.) Set an application as an application exception and specify an anti-virus action for the application exception.

   exception application *application-name* **action** { **alert** | **block** | **permit** }

8. (Optional.) Set an MD5 value as an MD5 exception.

   exception md5 *md5-value*

9. Enable the virus signatures at and above a severity level.

   signature severity { **critical** | **high** | **medium** } **enable**

   By default, virus signatures of all severity levels are enabled.

Configuring MD5 value-based anti-virus cloud query

About this task

You can enable MD5 value-based anti-virus cloud query in an anti-virus policy. If no virus is found in the file, the device will send the MD5 value of the file to the cloud server for cloud query. The cloud server determines whether the MD5 value is a virus and returns the result to the device so appropriate action can be taken. The anti-virus module will save the result returned from the cloud server to the anti-virus buffer so the virus detection for subsequent packets can be performed locally.

For more information about the cloud query server, see "Configuring DPI engine."

Restrictions and guidelines

MD5 value-based anti-virus cloud query is available only for the following protocols:

- HTTP.
- IMAP.
- NFS. Only the NFS read operation is supported.
- POP3.
- SMTP.

Procedure

1. Enter system view.

   system-view

2. Specify the cloud query server.

   inspect cloud-server *host-name*

3. (Optional.) Set the anti-virus cache size.

   anti-virus cache size *cache-size*

   By default, the anti-virus cache can cache a maximum of 100000 entries.

4. (Optional.) Set the minimum cache period for an anti-virus MD5 entry.

   anti-virus cache min-time *value*

   By default, the minimum cache period of an anti-virus MD5 entry is 10 minutes.

5. Enter anti-virus policy view.

   anti-virus policy *policy-name*

6. Enable MD5 value-based anti-virus cloud query.

   cloud-query enable

   By default, MD5 value-based anti-virus cloud query is disabled.

Specifying a parameter profile for an anti-virus action

About this task

Before you can specify a parameter profile for an anti-virus action, configure the parameter profile in the DPI engine. For more information, see "Configuring DPI engine."

A parameter profile defines the parameters for executing an action. For example, you can configure parameters such as the email server address and email recipients in the email parameter profile, and then apply the profile to the email action.

If no parameter profile is specified for an anti-virus action, or if the specified parameter profile does not exist, the default parameter settings of the action are used.

Procedure

1. Enter system view.

   system-view

2. Specify a parameter profile for an anti-virus action.

   anti-virus { **email** | **logging** | **redirect** } **parameter-profile** *profile-name*

   By default, no parameter profile is specified for an anti-virus action.

Applying an anti-virus policy to a DPI application profile

About this task

The DPI application profile is a template for configuring DPI security services. For an anti-virus policy to take effect, you must apply it to a DPI application profile.

A DPI application profile can use only one anti-virus policy. If you apply different anti-virus policies to the same DPI application profile, only the most recent configuration takes effect.

Procedure

1. Enter system view.

   system-view

2. Enter DPI application profile view.

   app-profile *profile-name*

   For more information about this command, see DPI engine commands in *DPI Command Reference*.

3. Apply an anti-virus policy to the DPI application profile.

   anti-virus apply policy *policy-name* **mode** { **alert** | **protect** }

   By default, no anti-virus policy is applied to a DPI application profile.

Activating anti-virus policy settings

About this task

By default, the system will detect whether another configuration change (such as creation, modification, or deletion) occurs within a 20-second interval after a change to the anti-virus policy and rule settings:

- If no configuration change occurs within the interval, the system performs an activation operation at the end of the next interval (40 seconds later) to make the configuration take effect.
- If a configuration change occurs within the interval, the system continues to periodically check whether a configuration change occurs within the interval.

To activate the policy and rule configurations immediately, you can execute the **`inspect activate`** command.

Procedure

1. Enter system view.
   `system-view`
2. Activate anti-virus policy settings.
   `inspect activate`
   By default, anti-virus policy settings will be activated automatically.

△ **CAUTION:**

This command can cause temporary outage for the DPI service and other services based on DPI. For example, security policies cannot perform application access control.

Applying a DPI application profile to a security policy rule

1. Enter system view.
   `system-view`
2. Enter security policy view.
   `security-policy` { **`ip`** | **`ipv6`** }
3. Enter security policy rule view.
   `rule` { *`rule-id`* | [*`rule-id`*] **name** *`rule-name`* }
4. Set the rule action to pass.
   `action pass`
   The default rule action is **`drop`**.
5. Use a DPI application profile in the rule.
   `profile` *`app-profile-name`*
   By default, no DPI application profile is used in a security policy rule.

Managing the virus signature library

As viruses constantly increase and change, you must update the virus signature library in time. You can also roll back the virus signature library.

Restrictions and guidelines

- Do not delete the **/dpi/** folder in the root directory of the storage medium.
- Do not perform virus signature update and rollback when the device's free memory is below the normal state threshold. For more information about device memory thresholds, see device management in *Fundamentals Configuration Guide*.
- For successful automatic and immediate signature update, make sure the device can resolve the domain name of the NSFOCUS website into an IP address through DNS. For more information about DNS, see DNS configuration in *Layer 3—IP Services Configuration Guide.*

Scheduling automatic virus signature library update

About this task

You can schedule automatic virus signature library update if the device can access the signature database services on the NSFOCUS website. The device periodically obtains the latest signature file from the NSFOCUS website to update its local signature library according to the update schedule.

Procedure

1. Enter system view.

   system-view

2. Enable automatic virus signature library update and enter automatic virus signature library update configuration view.

   anti-virus signature auto-update

   By default, automatic virus signature library update is disabled.

3. Schedule the update time.

   update schedule { **daily** | **weekly** { **fri** | **mon** | **sat** | **sun** | **thu** | **tue** | **wed** } } **start-time** *time* **tingle** *minutes*

   By default, the device updates the virus signature library at a random time between 02:01:00 and 04:01:00 every day.

Triggering an immediate automatic virus signature library update

About this task

Anytime you find a new release of virus signature file on the NSFOCUS website, you can trigger the device to immediately and automatically update the virus signature library.

Procedure

1. Enter system view.

   system-view

2. Trigger an immediate virus signature library update.

   anti-virus signature auto-update-now

Manually updating the virus signature library

About this task

If the device cannot access the signature database services on the NSFOCUS website, use one of the following methods to manually update the virus signature library:

- **Local update**—Updates the virus signature library by using the locally stored virus signature file.

  Store the update file on the master device for successful signature library update.
- **FTP/TFTP update**—Updates the virus signature library by using the virus signature file stored on an FTP or TFTP server.

Procedure

1. Enter system view.
   ```
   system-view
   ```
2. Manually update the virus signature library.
   ```
   anti-virus signature update file-path
   ```

△ **CAUTION:**

The NSFOCUS website provides different signature libraries for devices with different memory sizes and software versions. You must obtain the signature library that is suitable for your device. If your device has a small memory (8 GB or less) but you choose a signature library that is for a large memory (more than 8 GB), the signature update might result in device anomaly.

Rolling back the virus signature library

About this task

If a virus signature library update causes abnormal situations or a high false alarm rate, you can roll back the virus signature library.

Before rolling back the virus signature library, the device backs up the current signature library as the previous version. For example, the previous version is V1 and the current version is V2. If you perform a rollback to the previous version, version V1 becomes the current version and version V2 becomes the previous version. If you perform a rollback to the previous version again, version V2 becomes the current version and version V1 becomes the previous version.

Procedure

1. Enter system view.
   ```
   system-view
   ```
2. Roll back the virus signature library.
   ```
   anti-virus signature rollback { factory | last }
   ```

Display and maintenance commands for anti-virus

Execute the **display** commands in any view.

Task	Command
Display anti-virus cache information.	**display anti-virus cache** [**slot** *slot-number*]
Display virus signature information.	**display anti-virus signature** [[*signature-id*] | [**severity** { **critical** | **high** | **low** | **medium** }]]
Display virus signature family information.	**display anti-virus signature family-info**
Display virus signature library information.	**display anti-virus signature library**

Task	Command
Display anti-virus statistics.	**display anti-virus statistics** [**policy** *policy-name*] [**slot** *slot-number*]

Anti-virus configuration examples

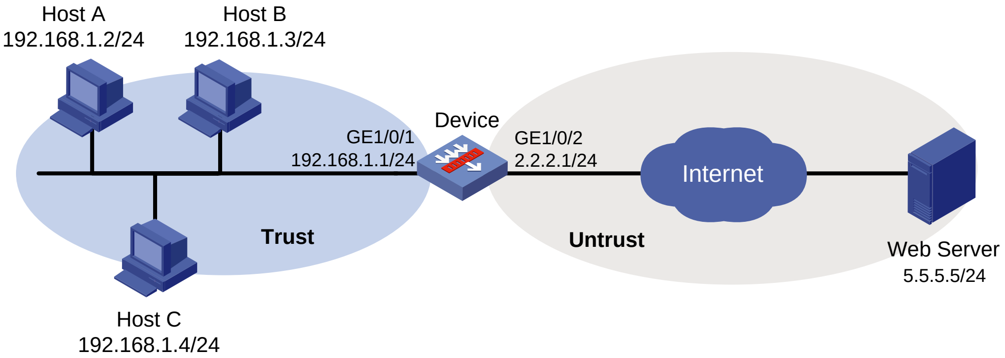
Example: Using the default anti-virus policy in a security policy

Network configuration

As shown in Figure 3, the device connects the LAN and the Internet. The LAN resides in security zone **Trust** and the Internet resides in security zone **Untrust**.

Configure the device to use the default anti-virus policy for virus detection and prevention.

Figure 3 Network diagram



Procedure

1. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

```
<Device> system-view
[Device] interface gigabitethernet 1/0/1
[Device-GigabitEthernet1/0/1] ip address 192.168.1.1 255.255.255.0
[Device-GigabitEthernet1/0/1] quit
```

   # Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Configure settings for routing.

   This example configures static routes, and the next hop in the routes is 2.2.2.2.

```
[Device] ip route-static 5.5.5.0 24 2.2.2.2
```

3. Add interfaces to security zones.

```
[Device] security-zone name trust
[Device-security-zone-Trust] import interface gigabitethernet 1/0/1
[Device-security-zone-Trust] quit
[Device] security-zone name untrust
[Device-security-zone-Untrust] import interface gigabitethernet 1/0/2
[Device-security-zone-Untrust] quit
```

4. Configure a DPI application profile and activate the anti-virus policy settings:

# Apply the default anti-virus policy to DPI application profile **sec** and set the policy mode to **protect**.

```
[Device] app-profile sec
[Device-app-profile-sec] anti-virus apply policy default mode protect
[Device-app-profile-sec] quit
```

# Activate the anti-virus policy settings.

```
[Device] inspect activate
```

5. Configure a security policy:

# Create a security policy rule named **trust-untrust**. Configure the rule to apply DPI application profile **sec** to packets from security zone **Trust** to security zone **Untrust** with source subnet address **192.168.1.0/24**.

```
[Device] security-policy ip
[Device-security-policy-ip] rule name trust-untrust
[Device-security-policy-ip-10-trust-untrust] source-zone trust
[Device-security-policy-ip-10-trust-untrust] source-ip-subnet 192.168.1.0 24
[Device-security-policy-ip-10-trust-untrust] destination-zone untrust
[Device-security-policy-ip-10-trust-untrust] action pass
[Device-security-policy-ip-10-trust-untrust] profile sec
[Device-security-policy-ip-10-trust-untrust] quit
```

# Activate rule matching acceleration.

```
[Device-security-policy-ip] accelerate enhanced enable
[Device-security-policy-ip] quit
```

Verifying the configuration

# Verify that the device can use the default anti-virus policy to detect and prevent known viruses. (Details not shown.)

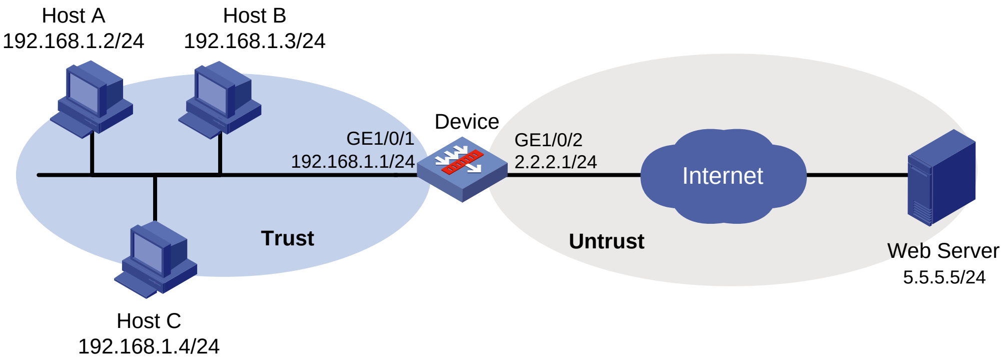
Example: Using a user-defined anti-virus policy in a security policy

Network configuration

As shown in Figure 4, the device connects the LAN and the Internet. The LAN resides in security zone **Trust** and the Internet resides in security zone **Untrust**.

Configure the device to use a user-defined anti-virus policy for virus detection and prevention. In the user-defined anti-virus policy, set virus signature 2 as a signature exception and set the **139Email** application as an application exception.

Figure 4 Network diagram



Procedure

1. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

   ```
   <Device> system-view
   [Device] interface gigabitethernet 1/0/1
   [Device-GigabitEthernet1/0/1] ip address 192.168.1.1 255.255.255.0
   [Device-GigabitEthernet1/0/1] quit
   ```

   # Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Configure settings for routing.

   This example configures static routes, and the next hop in the routes is 2.2.2.2.

   ```
   [Device] ip route-static 5.5.5.0 24 2.2.2.2
   ```

3. Add interfaces to security zones.

   ```
   [Device] security-zone name trust
   [Device-security-zone-Trust] import interface gigabitethernet 1/0/1
   [Device-security-zone-Trust] quit
   [Device] security-zone name untrust
   [Device-security-zone-Untrust] import interface gigabitethernet 1/0/2
   [Device-security-zone-Untrust] quit
   ```

4. Create anti-virus policy **antivirus1**, set virus signature 2 as a signature exception, set the **139Email** application as an application exception, and specify **alert** as the anti-virus action for the application exception.

   ```
   [Device] anti-virus policy antivirus1
   [Device-anti-virus-policy-antivirus1] exception signature 2
   [Device-anti-virus-policy-antivirus1] exception application 139Email action alert
   [Device-anti-virus-policy-antivirus1] quit
   ```

5. Configure a DPI application profile and activate the anti-virus policy settings:

   # Apply anti-virus policy **antivirus1** to DPI application profile **sec** and set the policy mode to **protect**.

   ```
   [Device] app-profile sec
   [Device-app-profile-sec] anti-virus apply policy antivirus1 mode protect
   [Device-app-profile-sec] quit
   ```

   # Activate the anti-virus policy settings.

   ```
   [Device] inspect activate
   ```

6. Configure a security policy:

   # Create a security policy rule named **trust-untrust**. Configure the rule to apply DPI application profile **sec** to packets from security zone **Trust** to security zone **Untrust** with source subnet address **192.168.1.0/24**.

   ```
   [Device] security-policy ip
   [Device-security-policy-ip] rule name trust-untrust
   [Device-security-policy-ip-10-trust-untrust] source-zone trust
   [Device-security-policy-ip-10-trust-untrust] source-ip-subnet 192.168.1.0 24
   [Device-security-policy-ip-10-trust-untrust] destination-zone untrust
   [Device-security-policy-ip-10-trust-untrust] action pass
   [Device-security-policy-ip-10-trust-untrust] profile sec
   [Device-security-policy-ip-10-trust-untrust] quit
   ```

   # Activate rule matching acceleration.

   ```
   [Device-security-policy-ip] accelerate enhanced enable
   [Device-security-policy-ip] quit
   ```

Verifying the configuration

# Verify that the anti-virus policy is correctly configured. (Details not shown.)

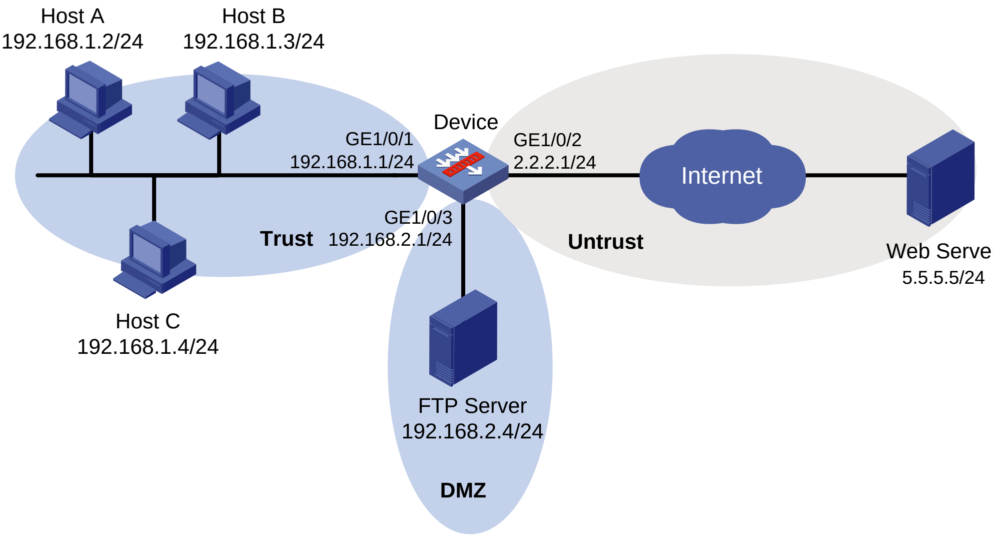
Example: Manually updating the virus signature library

Network configuration

As shown in Figure 5, LAN users in security zone **Trust** can access the Internet resources in security zone **Untrust** and the FTP server in security zone **DMZ**. The username and password for logging in to the FTP server are **anti-virus** and **123**, respectively. The latest virus signature file **anti-virus-1.0.8-encrypt.dat** is stored in the root directory on the FTP server.

Manually update the virus signature library on the device by using the latest virus signature file on the FTP server.

Figure 5 Network diagram



Procedure

1. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

```
<Device> system-view
[Device] interface gigabitethernet 1/0/1
[Device-GigabitEthernet1/0/1] ip address 192.168.1.1 255.255.255.0
[Device-GigabitEthernet1/0/1] quit
```

   # Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Configure settings for routing.

   This example configures static routes, and the next hop in the routes is 2.2.2.2.

```
[Device] ip route-static 5.5.5.0 24 2.2.2.2
```

3. Add interfaces to security zones.

```
[Device] security-zone name trust
[Device-security-zone-Trust] import interface gigabitethernet 1/0/1
[Device-security-zone-Trust] quit
[Device] security-zone name untrust
[Device-security-zone-Untrust] import interface gigabitethernet 1/0/2
[Device-security-zone-Untrust] quit
```

```
[Device] security-zone name dmz
[Device-security-zone-DMZ] import interface gigabitethernet 1/0/3
[Device-security-zone-DMZ] quit
```

4. Configure a security policy:

   # Create a security policy rule named **trust-untrust** to permit traffic sent from security zone **Trust** to security zone **Untrust**.

   ```
   [Device] security-policy ip
   [Device-security-policy-ip] rule name trust-untrust
   [Device-security-policy-ip-10-trust-untrust] source-zone trust
   [Device-security-policy-ip-10-trust-untrust] source-ip-subnet 192.168.1.0 24
   [Device-security-policy-ip-10-trust-untrust] destination-zone untrust
   [Device-security-policy-ip-10-trust-untrust] action pass
   [Device-security-policy-ip-10-trust-untrust] quit
   ```

   # Create a security policy rule named **trust-dmz** to permit traffic sent from security zone **Trust** to security zone **DMZ**.

   ```
   [Device] security-policy ip
   [Device-security-policy-ip] rule name trust-dmz
   [Device-security-policy-ip-11-trust-dmz] source-zone trust
   [Device-security-policy-ip-11-trust-dmz] source-ip-subnet 192.168.1.0 24
   [Device-security-policy-ip-11-trust-dmz] destination-zone dmz
   [Device-security-policy-ip-11-trust-dmz] action pass
   [Device-security-policy-ip-11-trust-dmz] quit
   ```

   # Create a security policy rule named **downloadlocalout** to permit traffic sent from security zone **Local** to security zone **DMZ**. Thus, the internal hosts can access the FTP server to obtain the virus signature files.

   ```
   [Device] security-policy ip
   [Device-security-policy-ip] rule name downloadlocalout
   [Device-security-policy-ip-12-downloadlocalout] source-zone local
   [Device-security-policy-ip-12-downloadlocalout] destination-zone dmz
   [Device-security-policy-ip-12-downloadlocalout] destination-ip-subnet 192.168.2.0
   24
   [Device-security-policy-ip-12-downloadlocalout] application ftp
   [Device-security-policy-ip-12-downloadlocalout] application ftp-data
   [Device-security-policy-ip-12-downloadlocalout] action pass
   [Device-security-policy-ip-12-downloadlocalout] quit
   ```

   # Activate rule matching acceleration.

   ```
   [Device-security-policy-ip] accelerate enhanced enable
   [Device-security-policy-ip] quit
   ```

5. Update the virus signature library by using the virus signature file **anti-virus-1.0.8-encrypt.dat** on the FTP server.

   ```
   [Device] anti-virus signature update
   ftp://anti-virus:123@192.168.2.4/anti-virus-1.0.8-encrypt.dat
   ```

Verifying the configuration

# Verify that the virus signature library is successfully updated.

```
<Device> display anti-virus signature library
```

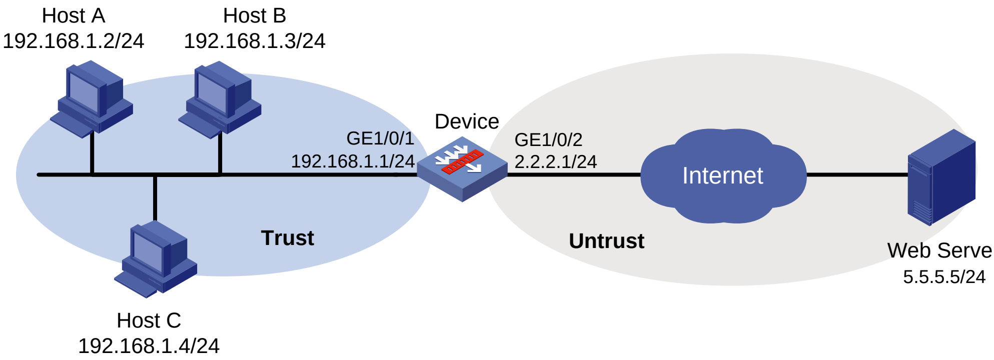
Example: Configuring automatic virus signature library update

Network configuration

As shown in Figure 6, LAN users in security zone **Trust** can access Internet resources in security zone **Untrust**.

Configure the device to automatically update the virus signature library at a random time between 08:30 a.m. and 09:30 a.m. every Saturday.

Figure 6 Network diagram



Procedure

1. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

   ```
   <Device> system-view
   [Device] interface gigabitethernet 1/0/1
   [Device-GigabitEthernet1/0/1] ip address 192.168.1.1 255.255.255.0
   [Device-GigabitEthernet1/0/1] quit
   ```

   # Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Configure settings for routing.

   This example configures static routes, and the next hop in the routes is 2.2.2.2.

   ```
   [Device] ip route-static 5.5.5.0 24 2.2.2.2
   ```

3. Add interfaces to security zones.

   ```
   [Device] security-zone name trust
   [Device-security-zone-Trust] import interface gigabitethernet 1/0/1
   [Device-security-zone-Trust] quit
   [Device] security-zone name untrust
   [Device-security-zone-Untrust] import interface gigabitethernet 1/0/2
   [Device-security-zone-Untrust] quit
   ```

4. Configure a DNS server to resolve the domain name of the official website into an IP address.

   ```
   [Device] dns server 10.72.66.36
   ```

5. Configure a security policy:

   # Create a security policy rule named **trust-untrust** to permit traffic sent from security zone Trust to security zone **Untrust**.

   ```
   [Device] security-policy ip
   [Device-security-policy-ip] rule name trust-untrust
   [Device-security-policy-ip-10-trust-untrust] source-zone trust
   ```

```
[Device-security-policy-ip-10-trust-untrust] source-ip-subnet 192.168.1.0 24
[Device-security-policy-ip-10-trust-untrust] destination-zone untrust
[Device-security-policy-ip-10-trust-untrust] action pass
[Device-security-policy-ip-10-trust-untrust] quit
```

# Create a security policy rule named **downloadlocalout** to permit traffic sent from security zone Local to security zone **Untrust**. Thus, the internal hosts can access official website to obtain the virus signature files.

```
[Device] security-policy ip
[Device-security-policy-ip] rule name downloadlocalout
[Device-security-policy-ip-11-downloadlocalout] source-zone local
[Device-security-policy-ip-11-downloadlocalout] destination-zone untrust
[Device-security-policy-ip-11-downloadlocalout] action pass
[Device-security-policy-ip-11-downloadlocalout] quit
```

# Activate rule matching acceleration.

```
[Device-security-policy-ip] accelerate enhanced enable
[Device-security-policy-ip] quit
```

6. Configure automatic virus signature library update:

# Enable automatic virus signature library update and configure the device to perform automatic update at a random time between 08:00 a.m. and 10:00 a.m. every Saturday.

```
[Device] anti-virus signature auto-update
[Device-anti-virus-autoupdate] update schedule weekly sat start-time 9:00:00 tingle
60
[Device-anti-virus-autoupdate] quit
```

Verifying the configuration

# Verify that the virus signature library is updated as scheduled.

```
<Device> display anti-virus signature library
```

Configuring the data analysis center

About the data analysis center

The data analysis center collects and analyzes log data for services and provides the analysis results in various forms of reports through the Web interface. It supports log data storage, traffic monitoring, and report analysis. This feature allows you to learn about the service traffic statistics and the network security status, helping you make decisions when customizing service policies.

Log data storage and analysis

The data analysis center collects log data from various service modules for central analysis and reporting. You can store the log data in a hard disk, a USB drive, or the memory according to the storage priority in descending order. If the storage media of a higher priority is not available or its space is full, the data are stored in the storage media of a lower priority.

Traffic monitoring

The data analysis center generates real-time traffic trend and statistics reports from various perspectives, such as user, application, and IP address. These reports help you monitor the network traffic, locate network vulnerabilities, and secure the network against potential attacks.

Reporting

The data analysis center can generate the multiple types of reports for you to understand the information such as service statistics, device running status, and network security status.

Restrictions and guidelines: Data analysis center configuration

You can configure the data analysis center at the CLI. The reports generated by the data analysis center are available only in the Web interface.

Data analysis center tasks at a glance

To configure the data analysis center, perform the following tasks:

- Enabling log collection
- Enabling real-time log display
- Enabling real-time traffic statistics collection
- Configuring the email server
- Configuring report subscription
- Configuring report export
    a. Configuring a report export template
    b. Configuring the report contents
       Choose one of the following tasks:

    - Configuring an LB link statistics report
    - Configuring an LB virtual server statistics report
  - **c.** Configuring report export parameters
- Configuring data storage limits for a service

Enabling log collection

About this task

The log collection feature enables the data analysis center to collect the log messages of specific services and extracts the data for summarization and analysis. You can see the relevant data analysis information in the dashboard and monitor pages of the Web interface.

Restrictions and guidelines

To collect the log messages for the traffic service, first enable the session statistics collection and then enable the log collection. For more information about the session statistics collection, see session management in *Security Configuration Guide*.

Procedure

1. Enter system view.

```
system-view
```

2. Enable the log collection for a service.

```
dac log-collect service service-type service-name enable
```

By default, the log collection status for each service varies by service setting when the service module is registered to the DAC.

Enabling real-time log display

About this task

With this feature enabled for a service, the data analysis center will send the service log messages to the Web interface in real time. You can see the real-time logs on the Web interface without refreshing the log lists manually.

Restrictions and guidelines

The real-time log display setting for a service takes effect only after the log collection for the service is enabled by the `dac log-collect enable` command.

Procedure

1. Enter system view.

```
system-view
```

2. Enable the real-time log display.

```
dac log-display service service-type service-name enable
```

The log collection status for each service varies by service setting when the service module is registered to the DAC.

Enabling real-time traffic statistics collection

About this task

The data analysis center can collect the user and application traffic statistics in real time and send the statistics result to the Web interface.

Restrictions and guidelines

Enable real-time traffic statistics collection with caution when large-volume service traffic exists. This feature is CPU intensive.

To collect the traffic statistics in real time, you must first enable the session statistics collection. For more information about the session statistics collection, see session management in *Security Configuration Guide*.

Procedure

1. Enter system view.

system-view

2. Enable real-time traffic statistics collection.

dac traffic-statistic { **application** | **user** } **enable** [**verbose**]

By default, the real-time collection of traffic statistics is disabled.

Configuring the email server

About this task

The report subscription and report export features require an email server to function correctly. The email server will send the reports to the subscribers or export the reports to the specified mail box.

Procedure

1. Enter system view.

system-view

2. Specify the email server address.

dac email-server server-address *address-string*

By default, no email server is specified for the data analysis center.

3. Specify the email sender address.

dac email-server sender *address-string*

By default, the email sender address is not specified.

4. (Optional.) Configure email client authentication.

a. Enable email client authentication.

dac email-server client-authentication enable

By default, email client authentication is disabled.

b. Specify the username for email client authentication.

dac email-server username *username*

By default, no username is specified for email client authentication.

c. Specify the password for email client authentication.

dac email-server password { **cipher** | **simple** } *string*

By default, no password is specified for email client authentication.

d. Enable secure transmission of client authentication credentials.

```
dac email-server secure-authentication enable
```

By default, secure transmission of client authentication credentials is disabled.

Configuring report subscription

About this task

The report subscription allows the device to generate and send periodic reports to the subscriber mail box.

By default, the daily report is sent during the least busy hours (1 am. to 5 am.) and the monthly report of the previous month is sent on the first day of each month. The report sending time cannot be changed.

The following types of reports are supported:

- **Summary report**—Displays summarized service traffic statistics collected over a time range.
- **Comparison report**—Provides comparison of service traffic statistics collected over two time ranges that contain the same number of days.
- **Intelligent report**—Provides intelligent analysis of users' work efficiency, data leakage, and turnover risks based on their network access behaviors.
- **Integrated report**—Illustrates the overall device operational and network security status based on analysis of critical service statistics.

Prerequisites

For the subscribers to receive the reports, you must configure the email server.

Procedure

1. Enter system view.

   ```
   system-view
   ```

2. Configure the subscription parameters for a report type.

   ```
   dac report type { comparison | integrated | intelligent | summary }
   subscriber mail-address [ language { chinese | english } ]
   ```

   By default, no report subscription parameters are configured.

Configuring report export

About report export

Report export periodically or immediately exports statistics reports for specified services. The following types of export methods are available:

- **Automatic export**—Exports periodic reports to the report destinations as scheduled. The report contents are defined in the report template.
- **Manual export**—Exports reports immediately after you define the statistics contents and time range of the data.

Restrictions and guidelines

Manual report export is supported only on the Web interface of the product.

Report export is available only for LB services. For more information about LB, see load balancing in *Load Balancing Configuration Guide*.

Prerequisites

For the subscribers to receive the reports, you must configure the email server.

Configuring a report export template

About this task

In a report export template, you can define the following items:

- Report language.
- Statistics contents in the report.

Procedure

1. Enter system view.
   system-view
2. Create a report export template and enter its view.
   dac report export template *template-name*
3. (Optional.) Specify the language used in exported reports.
   language { **chinese** | **english** }
   By default, Chinese is used.

Configuring an LB link statistics report

1. Enter system view.
   system-view
2. Enter the view of an existing report export template.
   dac report export template *template-name*
3. Create the LB link statistics report view and enter the veiw.
   export-service lb-link
4. Specify an LB link for the LB link statistics report.
   statistics link *name*
   By default, no LB link is specified for the LB link statistics report.
5. Specify the contents for the LB link statistics report.
   statistics content { **abnormal-flow** | **app** | **connection-count** | **connection-rate** | **delay** | **packet-loss** | **stability** }*
   By default, no content is specified for the LB link statistics report.

Configuring an LB virtual server statistics report

1. Enter system view.
   system-view
2. Enter the view of an existing report export template.
   dac report export template *template-name*
3. Create the LB virtual server statistics report view and enter the view.
   export-service lb-virtual-server
4. Specify an LB virtual server for the LB virtual server statistics report.

statistics virtual-server *name*

By default, no LB virtual server is specified for the LB virtual server statistics report.

5. Specify the content for the LB virtual server statistics report.

   statistics content class

   By default, no content is specified for the LB virtual server statistics report.

Configuring report export parameters

About this task

You can define the type of the periodic report, report template, and the destination to which the reports are exported.

Procedure

1. Enter system view.

   system-view

2. Configure report export parameters.

   dac report export period { **day** | **hour** | **month** | **quarter** | **week** | **year** } **template** *template-name* [**mail-address** *mail-address*]

   By default, no report export parameters are configured.

Configuring data storage limits for a service

About this task

Perform this task to set the storage time limit, storage space usage limit, and the storage limit-violated action for a service.

The data analysis center periodically checks the data of each service to determine if the storage time or storage space usage limit is exceed.

- If a storage limit is exceeded and the action is **delete**, the system deletes the expired or the oldest service data. A log will be generated to report the event.
- If a storage limit is exceeded and the action is **log-only**, the system generates a log message. New data will not be saved.

Procedure

1. Enter system view.

   system-view

2. Set the storage time limit, storage space usage limit, or the storage limit-triggered action for a service.

   dac storage service *service-type service-name* **limit** { **hold-time** *time-value* | **usage** *usage-value* | **action** { **delete** | **log-only** } }

   By default:

   - The service data can be saved for a maximum of 365 days.
   - The data of each service can occupy up to 20% of the total storage space.
   - If the storage time or storage space usage limit is exceeded, the system deletes the expired or the oldest data.

Display and maintenance commands for data analysis center

Execute the **display** commands in any view.

Task	Command
Display the email server configuration.	**display dac email-server**
Display the log collection configuration for a service.	**display dac log-collect { all | service** *service-type service-name* **}**
Display the configuration of the real-time log display.	**display dac log-display { all | service** *service-type service-name* **}**
Display the report subscription information.	**display dac report** [**comparison** | **integrated** | **intelligent** | **summary**]
Display report export configuration.	**display dac report export**
Display report export templates.	**display dac report export template**
Display the service storage limit settings.	**display dac storage** [*service-type service-name*]
Display the configuration of the real-time traffic statistics collection.	**display dac traffic-statistic** [**application** | **user**]

Contents

Configuring the proxy policy

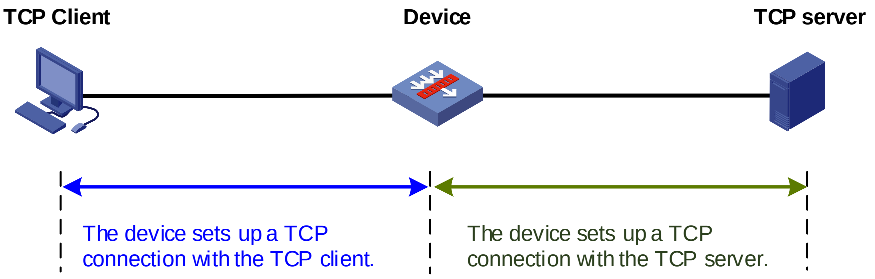
About the proxy policy

The proxy policy enables the device to proxy TCP or SSL connections between clients and servers and implement deep packet inspection and audit on the traffic for high security.

TCP proxy

As shown in Figure 1, the device implements TCP proxy for traffic between the TCP client and server. After receiving traffic from the TCP client to the server, the device becomes a TCP proxy. It proxies the server to establish a connection with the client and proxies the client to establish a connection with the server, respectively. The client and server exchange data through the two TCP connections. This mechanism provides TCP-layer isolation between the TCP client and server and helps effectively block unauthorized access attempts and malicious attacks.

Figure 1 TCP proxy



TCP Client
Device
TCP server
The device sets up a TCP connection with the TCP client.
The device sets up a TCP connection with the TCP server.

SSL proxy

About this task

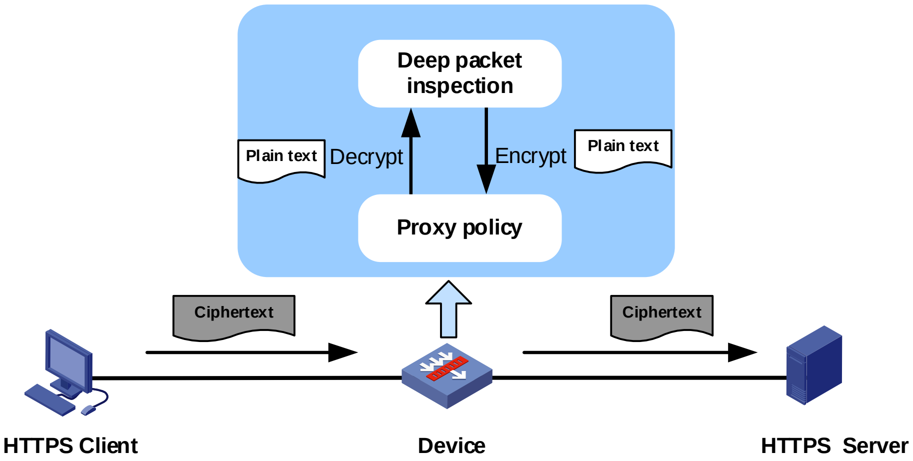
SSL proxy enables the device to decrypt SSL traffic and perform deep packet inspection on the traffic.

As shown in Figure 2, the device implements SSL decryption on HTTPS traffic from the HTTPS client to the HTTPS server. After receiving HTTP traffic from the HTTPS client to the server, the device becomes an SSL proxy. It proxies the server to complete the SSL handshake and establish an SSL connection with the client and proxies the client to establish an SSL connection with the server. When the HTTPS client and server exchange data, the device performs the following operations:

1. Decrypts the HTTPS traffic.
2. Performs deep packet inspection and audit on the traffic according to the DPI service configuration.

   For more information about DPI services, see *DPI Configuration Guide*.
3. Re-encrypts the traffic and send it to the server or client.

Figure 2 SSL proxy



Application scenarios

The SSL decryption can be used in the following scenarios:

- **Protecting internal clients**—The device is deployed at the exit of the network where the internal clients are. When the internal clients access an external server, the device acts as a proxy server to decrypt the packets and perform deep packet inspection on the decrypted packets. It protects the internal clients from being attacked by external malicious websites. In this scenario, the device requires imported SSL decryption certificates to establish SSL connections with the clients. For more information about the SSL decryption certificate, see "SSL decryption certificate."
- **Protecting internal servers**—The device is deployed at the entrance of the network where the internal servers are. When the external clients access an internal server, the device acts as a proxy server to decrypt the packets and perform deep packet inspection on the decrypted packets. It protects the internal servers from being attacked by external malicious traffic. In this scenario, the device requires imported internal server certificates to establish SSL connections with the clients. For more information about the internal server certificate, see "Internal server certificate."

For more information about DPI, see "DPI overview."

Basic concepts

SSL decryption certificate

The device supports a maximum of one trusted SSL decryption certificate and one untrusted SSL decryption certificate, both of which are CA certificates that must be manually imported to the device.

- **Trusted SSL decryption certificate**—SSL decryption certificate that is trusted by clients. The device uses the trusted SSL decryption certificate to sign proxy server certificates for servers whose certificates are verified as legitimate. The trusted SSL decryption certificate must be installed on the client browser so the client can trust the proxy server certificates signed by it.
- **Untrusted SSL decryption certificate**—SSL decryption certificate that clients do not trust. The device uses the untrusted SSL decryption certificate to sign proxy server certificates for servers whose certificates are verified as illegitimate.

Proxy server certificate

In the scenario of protecting internal clients, the device acts as an SSL proxy server to check whether an external server is trusted. After the identity verification, the device issues a new server certificate (that is a proxy server certificate) to the clients for SSL negotiation according to the received server certificate. Through the proxy server certificate, the internal clients can obtain the device identity and know whether the external server is trusted.

When the device proxies the SSL server to establish a connection with the client, it need to send a certificate to the client to identify itself. Instead of sending the certificate of the real server, the device uses the SSL decryption certificate to issue a new certificate (proxy server certificate) based on the real server certificate.

After receiving the certificate of the real server, the device verifies the legitimacy of the certificate on behalf of the SSL client.

- If the server certificate is legitimate, the device uses the trusted SSL decrypted certificate to issue the proxy server certificate. The client considers the proxy server certificate as legitimate because it trusts the SSL decryption certificate used to issue the certificate.
- If the server certificate is illegitimate, the device uses the untrusted SSL decryption certificate to issue the proxy server certificate. The client considers the proxy server certificate as illegitimate because it does not trust the SSL decryption certificate used to issue the certificate. A security alarm will be generated to indicate that the certificate is illegitimate and users must clear the alarm to continue the access.

Internal server certificate

The internal server certificates are required in the scenario of protecting internal servers. With an internal server certificate imported, the device will decrypt the certificate and generate a CER file and a key file.

- **CER file**—Used to identify the server. The device will calculate the MD5 value of the CER file and use the MD5 value as the unique identifier of the file. During the SSL proxy process, the device first calculates the MD5 value of the received server certificate and then compares the calculated MD5 value with the MD5 value of the imported internal server certificate. If they are the same, the certificate is trusted. If they are different, the certificate is untrusted.
- **Key file**—Used to encrypt and decrypt the packets in the subsequent SSL proxy process.

SSL proxy whitelist

The device does not proxy SSL connections destined for a server if the IP address or domain name of the server is on the SSL proxy whitelist.

The device supports the following types of SSL proxy whitelist lists:

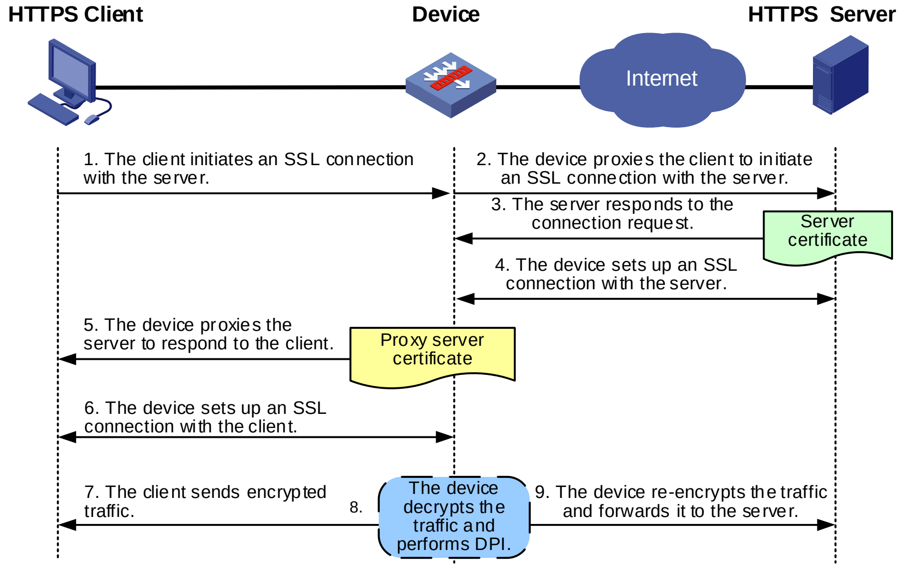
- **Predefined**—The device provides a predefined SSL hostname whitelist and a predefined SSL IP address whitelist.
- **User-defined**—The device supports a user-defined SSL hostname list. You can disable SSL proxy for SSL connections destined for a server by adding the server hostname to the whitelist.

Mechanism for protecting internal clients

The SSL proxy function is implemented based on the TCP proxy function. When the device detects SSL traffic that needs SSL proxy, it first acts as the TCP proxy to set up TCP connections, and then implements SSL proxy.

Figure 3 shows how the device acts as an SSL proxy to protect the internal client when it accesses the external server.

Figure 3 SSL proxy mechanism for protecting the internal client



HTTPS Client
Device
HTTPS Server
Internet
1. The client initiates an SSL connection with the server.
2. The device proxies the client to initiate an SSL connection with the server.
3. The server responds to the connection request.

4. The device sets up an SSL connection with the server.
5. The device proxies the server to respond to the client.
Proxy server certificate
6. The device sets up an SSL connection with the client.
7. The client sends encrypted traffic.
8.
The device decrypts the traffic and performs DPI.
9. The device re-encrypts the traffic and forwards it to the server.

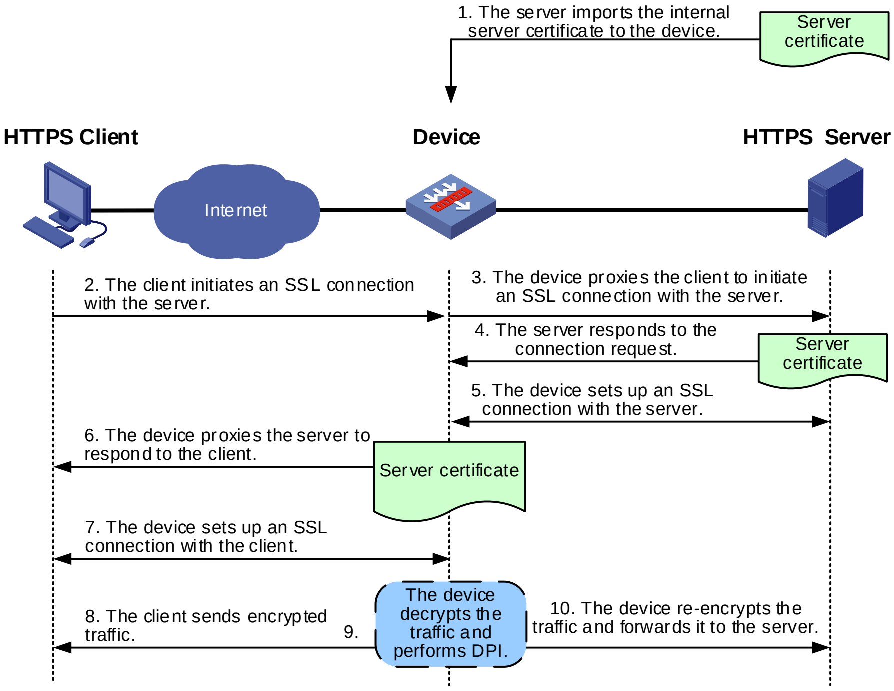
1. The client sends a request to initiate an SSL connection with the server.
2. The device receives the request from the client and proxies the client to send a new SSL connection request to the server.
3. The server responds to the request and sends the server certificate to the device.
4. The device verifies the legitimacy of the server certificate, completes the SSL handshake with the server on behalf of the SSL client, and sets up an SSL connection.
5. The device acts as the SSL proxy server to respond to the client connection request and send a proxy server certificate to the client. The proxy server certificate is issued by using the SSL decryption certificate based on the content of the real server certificate.
6. The client verifies the proxy server certificate, completes the SSL handshake with the device, and sets up an SSL connection.
7. The client and server transmit encrypted SSL traffic with the device, respectively.
8. The device decrypts the SSL traffic from the client or server and performs deep packet inspection and audit on the traffic.
9. The device re-encrypts the traffic and sends it to the server.

Mechanism for protecting internal servers

The SSL proxy function is implemented based on the TCP proxy function. When the device detects SSL traffic that needs SSL proxy, it first acts as the TCP proxy to set up TCP connections, and then implements SSL proxy.

Figure 3 shows how the device acts as an SSL proxy to protect the internal server when it is accessed by the external client.

Figure 4 SSL proxy mechanism for protecting the internal server



1. The server imports the internal server certificate to the device.
Server certificate
HTTPS Client
Device
HTTPS Server
Internet
2. The client initiates an SSL connection with the server.
3. The device proxies the client to initiate an SSL connection with the server.
4. The server responds to the connection request.
Server certificate
5. The device sets up an SSL connection with the server.
6. The device proxies the server to respond to the client.
Server certificate
7. The device sets up an SSL connection with the client.
8. The client sends encrypted traffic.
9.
The device decrypts the traffic and performs DPI.
10. The device re-encrypts the traffic and forwards it to the server.

1. The administrator obtains the certificate of the internal server to be protected and imports the internal server certificate to the device.
2. The device receives the SSL connection request from the client.
3. The device proxies the client to send a new SSL connection request to the server.
4. The server responds to the request and sends the server certificate to the device.
5. The device verifies the legitimacy of the server certificate, completes the SSL handshake with the server on behalf of the SSL client, and sets up an SSL connection.
6. The device acts as the SSL proxy server to respond to the client connection request and send the imported internal server certificate to the client.
7. The client verifies the internal server certificate, completes the SSL handshake with the device, and sets up an SSL connection.
8. The client and server transmit encrypted SSL traffic with the device, respectively.
9. The device decrypts the SSL traffic from the client or server and performs deep packet inspection and audit on the traffic.
10. The device re-encrypts the traffic and sends it to the server.

Proxy policy rules

The device supports only one proxy policy.

The proxy policy contains a set of user-defined proxy policy rules. Each rule defines a set of traffic filtering criteria and an action (TCP proxy, SSL decryption, or no-proxy) for traffic matching the rule.

Naming and numbering of proxy policy rules

Each proxy policy rule is identified by a unique rule name and ID. The rule name is required but the rule ID is optional when you create a rule. If you do not specify a rule ID, the system automatically assigns an ID to the rule.

Traffic filtering criteria in a proxy policy rule

You can configure the following types of criteria to filter the traffic to which a proxy policy rule applies:

- Source security zone.
- Destination security zone.
- Source IP address.
- Destinations IP address.
- User.
- User group.
- Service.

You can configure multiple criteria for each filtering criteria type. A packet matches a filtering criteria type if it matches a filtering criterion of the type. For example, you can configure multiple source security zone filtering criteria in a proxy policy rule. A packet passes the source security zone filtering if it matches any of the configured source security zone filtering criteria.

Proxy policy rule match order

By default, proxy policy rules are matched in the order they were created. A rule created earlier has a higher priority. You can change the rule match order by rearranging proxy policy rules. The match process stops once a matching rule is found.

The more refined the traffic filtering criteria are, the smaller the application range of the proxy policy rule. Configure the proxy policy rules in ascending order of their application ranges as a best practice.

Proxy policy rule actions

The device supports the following actions for traffic matching a proxy policy rule:

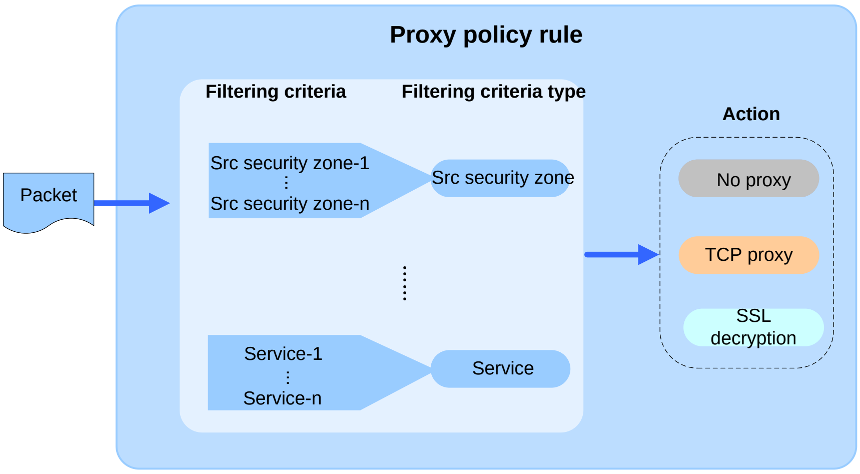
- **TCP-proxy**—The device acts as a TCP proxy and provides TCP-layer isolation between the TCP client and TCP server.
- **SSL-decryption**—The device acts as an SSL proxy to decrypt the SSL traffic between the SSL client and server and to implement deep packet inspection on the decrypted traffic.

  The SSL decryption supports the following protection services:

  - Internal client protection.
  - Internal server protection.
- **No-proxy**—The device directly transmits the traffic without TCP or SSL proxy.

Matching process

Figure 5 Matching process



As shown in Figure 5, a packet is compared against the proxy policy rules as follows:

1. The device compares the packet against the proxy policy rule with the highest priority.

The proxy policy rule can contain multiple filtering criteria types and each filtering criteria type can contain multiple filtering criteria. The packet matches a filtering criteria type if it matches any filtering criterion of the type.

2. The device determines that the packet matches the proxy policy rule if the packet matches each of following filtering criteria types in the rule:
   - Source security zone.
   - Destination security zone.
   - Source IP address.
   - Destinations IP address.
   - Service.
   - Either the user or user group filtering criteria type.
3. If the packet does not match the highest priority rule, the device continues the match process. The match process stops until a matching rule is found, and the action associated with the matching rule is applied.
4. If the packet does not match any rules in the proxy policy, the device applies the default action specified in the proxy policy to the packet.

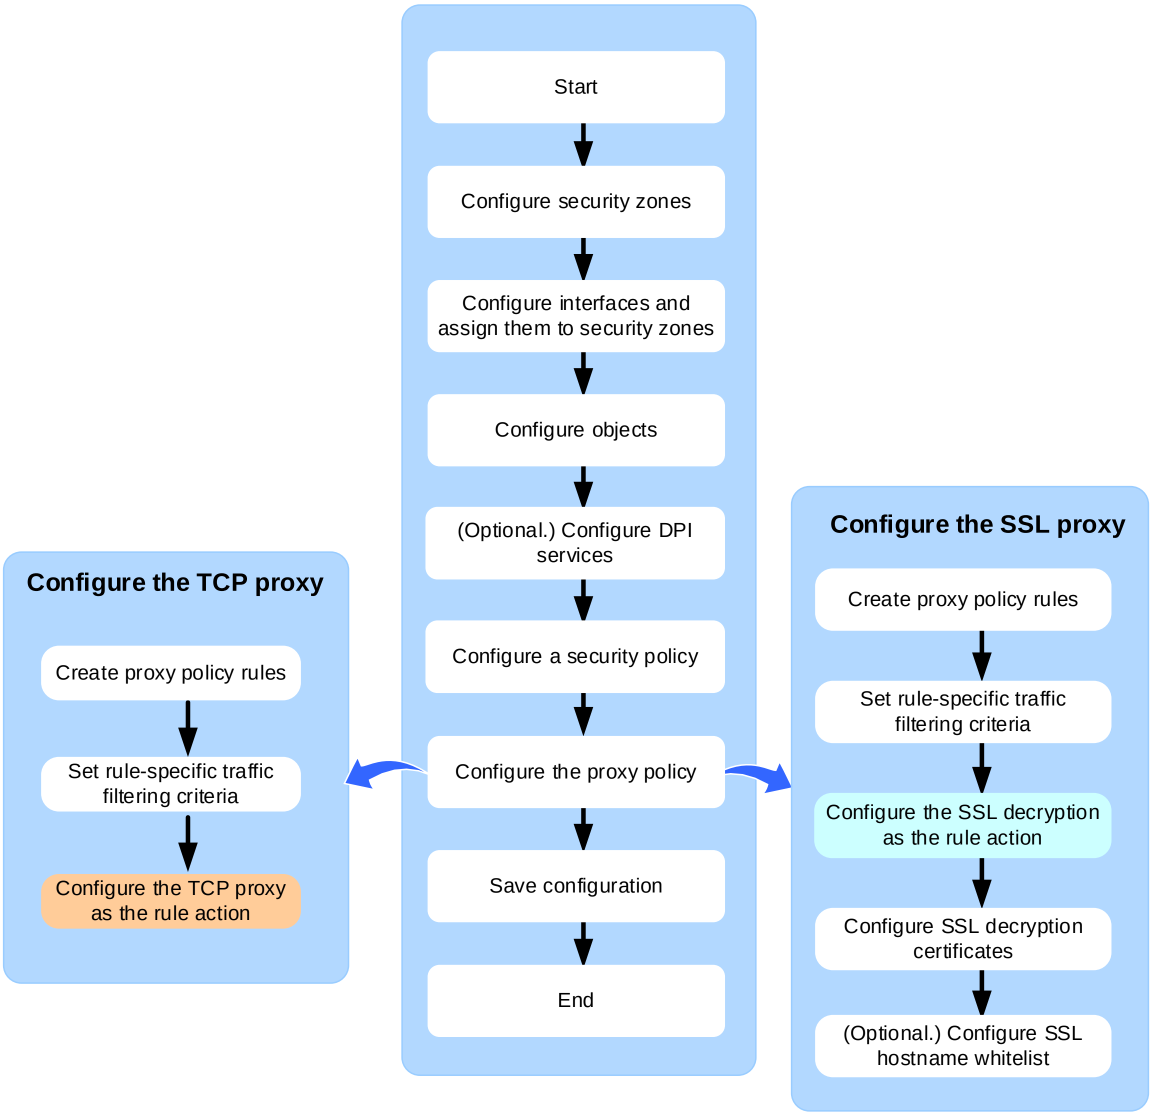
Restrictions and guidelines: Proxy policy configuration

- The TCP proxy and SSL proxy functions impact the device forwarding performance. When you configure proxy policy rules, refine the traffic filtering criteria to restrict application of the rules only to traffic that requires TCP or SSL proxy.
- Proxy policy rules are matched in descending order of their priorities. In the scenario that requires both TCP proxy and SSL decryption, make sure the proxy policy rule with the SSL decryption action has a higher priority than the rule with the TCP proxy action. This ensures that SSL traffic that requires SSL decryption can match the SSL decryption rule first.
- In the security policy to which the proxy policy is applied, make sure communications between the source security zones and the **Local** security zone are permitted. For more information about security zones, see security zone configuration in *Security Configuration Guide*.
- After the SSL proxy function is enabled, the packet capture action of the intrusion prevention system will be invalid. For more information about IPS, see "Configuring IPS."
- Select a protection service of the SSL decryption as required and import the corresponding certificates to the device for SSL connection establishment with the clients.
- In a hot backup system that performs asymmetric forwarding, TCP proxy and SSL proxy are not supported. If you configure TCP proxy or SSL proxy, the configuration does not take effect. For more information about hot backup, see RBM-based hot backup configuration in *High Availability Configuration Guide*.

Proxy policy configuration procedure summary

Figure 6 shows how to configure the proxy policy.

Figure 6 Proxy policy configuration procedure



Start
Configure security zones
Configure interfaces and assign them to security zones
Configure objects
(Optional.) Configure DPI services
Configure a security policy
Configure the proxy policy
Save configuration
End
Configure the TCP proxy
Create proxy policy rules
Set rule-specific traffic filtering criteria
Configure the TCP proxy as the rule action
Configure the SSL proxy
Create proxy policy rules
Set rule-specific traffic filtering criteria
Configure the SSL decryption as the rule action
Configure SSL decryption certificates
(Optional.) Configure SSL hostname whitelist

Proxy policy tasks at a glance

To configure the proxy policy:

1. Configuring attributes in the proxy policy
   a. Setting the default action for the proxy policy
   b. Creating a proxy policy rule
   c. Configuring the traffic filtering criteria for a proxy policy rule
   d. Setting the action for a proxy policy rule
2. (Optional.) Managing proxy policy rules
   a. Changing the rule match order
   b. Disabling a proxy policy rule
3. Configuring SSL decryption certificates

   The SSL decryption certifications are required in the scenario of protecting internal clients.

   a. Importing an SSL decryption certificate

   b. (Optional.) Channing the credibility of an SSL decryption certificate
   c. (Optional.) Deleting an SSL decryption certificate
4. Configuring internal server certificates

   The internal server certificates are required in the scenario of protecting internal servers.

   a. Importing an internal server certificate
   b. (Optional.) Deleting an internal server certificate
5. (Optional.) Configuring the SSL proxy whitelist
   a. Add a hostname to the user-defined SSL hostname whitelist
   b. Disabling hostnames on the predefined SSL hostname whitelist
   c. Activating SSL hostname whitelist settings

Prerequisites for proxy policy configuration

Before you configure the proxy policy, complete the following tasks:

- Configure IP address object groups and service object groups. For more information, see object group configuration in *Security Configuration Guide*.
- Configure user and user groups. For more information, see user identification configuration in *Security Configuration Guide*.
- Configure security zones. For more information, see security zone configuration in *Security Configuration Guide*.
- Configure security policies. For more information, see security policy configuration in *Security Configuration Guide*.
- Configure DPI services. For more information, see *DPI Configuration Guide.*

Configuring attributes in the proxy policy

Setting the default action for the proxy policy

About this task

If a packet does not match any rules in the proxy policy or if the proxy policy does not contain any rules, the device applies the default action to the packet.

Procedure

1. Enter system view.

   `system-view`

2. Enter proxy policy view.

   `app-proxy-policy`

3. Set the default action for the proxy policy.

   `default action` { **`no-proxy`** | **`ssl-decrypt`** | **`tcp-proxy`** }

   By default, the device transmits packets that do not match any proxy policy rules directly without TCP or SSL proxy.

4. Specify an SSL decryption protection mode for the proxy policy.

   `default ssl-decrypt protect-mode` { **`client`** | **`server`** }

   By default, the SSL decryption protection mode of the proxy policy is **`client`**.

Creating a proxy policy rule

1. Enter system view.

   system-view

2. Enter proxy policy view.

   app-proxy-policy

3. Create a proxy policy rule and enter its view.

   rule { *rule-id* | [*rule-id*] **name** *rule-name* }

Configuring the traffic filtering criteria for a proxy policy rule

Restrictions and guidelines

A proxy policy rule that does not contain any filtering criteria matches all packets.

A filtering criterion is ignored during packet matching if it is associated with a nonexistent or empty object group.

Procedure

1. Enter system view.

   system-view

2. Enter proxy policy view.

   app-proxy-policy

3. Enter the view of a proxy policy rule.

   rule { *rule-id* | [*rule-id*] **name** *rule-name* }

4. Configure the traffic filtering criteria as needed:
   - Configure a source security zone filtering criterion.

     source-zone *source-zone-name*

     By default, a proxy policy rule does not contain any source security zone filtering criterion.
   - Configure a destination security zone filtering criterion.

     destination-zone *destination-zone-name*

     By default, a proxy policy rule does not contain any destination security zone filtering criterion.
   - Configure a source IP address filtering criterion.

     source-ip object-group *object-group-name*

     By default, a proxy policy rule does not contain any source IP address filtering criterion.
   - Configure a destination IP address filtering criterion.

     destination-ip object-group *object-group-name*

     By default, a proxy policy rule does not contain any destination IP address filtering criterion.
   - Configure a service filtering criterion.

     service object-group { *object-group-name* | **any** }

     By default, a proxy policy rule does not contain any service filtering criterion.
   - Configure a user filtering criterion.

     user *username* [**domain** *domain-name*]

     By default, a proxy policy rule does not contain any user filtering criterion.
   - Configure a user group filtering criterion.

     user-group *user-group-name* [**domain** *domain-name*]

By default, a proxy policy rule does not contain any user group filtering criterion.

Setting the action for a proxy policy rule

1. Enter system view.

   `system-view`
2. Enter proxy policy view.

   `app-proxy-policy`
3. Enter the view of a proxy policy rule.

   rule { *rule-id* | [*rule-id*] **name** *rule-name* }
4. Set the action for traffic matching the proxy policy rule.

   action { **no-proxy** | **ssl-decrypt** | **tcp-proxy** }

   By default, the device transmits packets that match a proxy policy rule directly without TCP or SSL proxy.
5. Specify an SSL decryption protection mode for the proxy policy rule.

   ssl-decrypt protect-mode { **client** | **server** }

   By default, the SSL decryption protection mode of a proxy policy rule is **client**.

   Configure this command only when the SSL decryption action is used as the default action for the proxy policy.

Managing proxy policy rules

Changing the rule match order

About this task

By default, proxy policy rules are matched in the order they were created. A rule created earlier has a higher priority. You can change the rule match order by rearranging proxy policy rules. The match process stops once a matching rule is found.

Procedure

1. Enter system view.

   `system-view`
2. Enter proxy policy view.

   `app-proxy-policy`
3. Move a proxy policy rule.
   - Move a proxy policy rule through rule IDs.

     rule move id *rule-id* **before** *insert-rule-id*
   - Move a proxy policy rule through rule names.

     rule move name *rule-name1* { **before** [*rule-name2*] | **after** *rule-name2* }

Disabling a proxy policy rule

1. Enter system view.

   `system-view`
2. Enter proxy policy view.

app-proxy-policy

3. Enter the view of a proxy policy rule.

   rule { *rule-id* | [*rule-id*] **name** *rule-name* }

4. Disable the proxy policy rule.

   disable

   By default, a proxy policy rule is enabled.

Configuring SSL decryption certificates

Importing an SSL decryption certificate

About this task

The SSL decryption certifications are required in the scenario of protecting internal clients.

Restrictions and guidelines

The device supports a maximum of one trusted SSL decryption certificate and one untrusted SSL decryption certificate. Both of them must be manually imported to the device.

If you import multiple trusted or multiple untrusted SSL decryption certificates to the device, the most recent configuration takes effect.

You must install the trusted SSL decryption certificate on the client browser so the client can trust proxy server certificates issued by using the trusted SSL decryption certificate.

After an SSL decryption certificate is imported, its file extension will be changed to .cer.

Procedure

1. Enter system view.

   system-view

2. Import a CA certificate as a trusted or untrusted SSL decryption certificate to the device.

   app-proxy ssl-decrypt-certificate import { **trusted** | **untrusted** } { **pem** | **p12** } **filename** *filename*

Channing the credibility of an SSL decryption certificate

Restrictions and guidelines

The device supports only one trusted SSL decryption certificate and one untrusted SSL decryption certificate. A newly imported trusted or untrusted SSL decryption certificate will overwrite the existing one.

After an SSL decryption certificate is imported, its file extension will be changed to .cer. Append the .cer file extension when you specify the file containing the certificate whose credibility you want to change.

Procedure

1. Enter system view.

   system-view

2. Change the credibility of an SSL decryption certificate.

   app-proxy ssl-decrypt-certificate modify { **trusted** | **untrusted** } **filename** *filename*

Deleting an SSL decryption certificate

Restrictions and guidelines

The device, acting as an SSL proxy, requires the correct SSL decryption certificate to issue proxy server certificates to send to clients for server authentication. If the required SSL decryption certificate is not available, the device cannot set up a connection with the client and the SSL traffic will be transmitted directly without SSL decryption.

After an SSL decryption certificate is imported, its file extension will be changed to .cer, which must be appended to the file name when you delete the certificate.

Procedure

1. Enter system view.
   system-view
2. Delete an SSL decryption certificate.
   app-proxy ssl-decrypt-certificate delete filename *filename*

Configuring internal server certificates

Importing an internal server certificate

About this task

The internal server certifications are required in the scenario of protecting internal servers.

Restrictions and guidelines

Each internal server certificate stored in the device has a MD5 value. If the MD5 value of an internal server certificate to be imported is the same as that stored in the device, the new certificate will overwrite the old certificate.

Procedure

1. Enter system view.
   system-view
2. Import an internal server certificate.
   app-proxy internal-server-certificate import { **p12** | **pem** } **filename** *filename*

Deleting an internal server certificate

About this task

When an internal server certificate expires or an internal server does not need to be protected, you can execute this command to delete the imported internal server certificate.

You can execute the **display app-proxy imported internal-server-certificate** command to view the MD5 values of the internal server certificates.

Procedure

1. Enter system view.
   system-view
2. Delete an internal server certificate.
   app-proxy internal-server-certificate delete md5 *md5-value*

Configuring the SSL proxy whitelist

Add a hostname to the user-defined SSL hostname whitelist

About this task

In the scenario that requires SSL client authentication or in-depth server certificate inspection, SSL proxy will cause the device (as an SSL proxy) unable to pass SSL client or server verification. By adding the server's hostname to the SSL hostname whitelist, you can disable SSL proxy for connections destined for the server so the SSL traffic is transmitted directly without SSL decryption.

Procedure

1. Enter system view.

   system-view

2. Add the hostname of a server to the user-defined SSL hostname whitelist.

   app-proxy ssl whitelist user-defined-hostname *host-name*

   By default, the user-defined SSL hostname whitelist does not contain any hostnames.

Disabling hostnames on the predefined SSL hostname whitelist

1. Enter system view.

   system-view

2. Disable hostnames on the predefined SSL hostname whitelist.

   undo app-proxy ssl whitelist predefined-hostname { **chrome-hsts** [*hostname*] | *hostname* } **enable**

   By default, the entire predefined SSL hostname whitelist is enabled.

Activating SSL hostname whitelist settings

About this task

You must manually activate the SSL hostname whitelist settings for the following configurations to take effect:

- Adding or removing hostnames to or from the user-defined SSL hostname whitelist.
- Enabling or disabling hostnames on the predefined SSL hostname whitelist.

Procedure

1. Enter system view.

   system-view

2. Activate SSL hostname whitelist configuration.

   app-proxy ssl whitelist activate

Display and maintenance commands for the proxy policy

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display proxy policy information.	**display app-proxy-policy**
Display information about imported internal server certificates.	**display app-proxy imported internal-server-certificate**
Display SSL decryption certificate information.	**display app-proxy ssl-decrypt-certificate**
Display the SSL server certificates received by the device as the SSL proxy client.	**display app-proxy server-certificate** [**slot** *slot-number*]
Display the predefined or user-defined SSL hostname whitelist.	**display app-proxy ssl whitelist hostname** { **user-defined** | **predefined** }
Display IP addresses on the SSL IP address whitelist.	**display app-proxy ssl whitelist** { **ipv4** | **ipv6** } { **all** [slot *slot-number*] | *ip-address* }
Clear information about the SSL server certificates received by the device as the SSL proxy client.	**reset app-proxy server-certificate**
Clear the SSL IP address whitelist.	**reset app-proxy ssl whitelist ip**

Proxy policy configuration examples

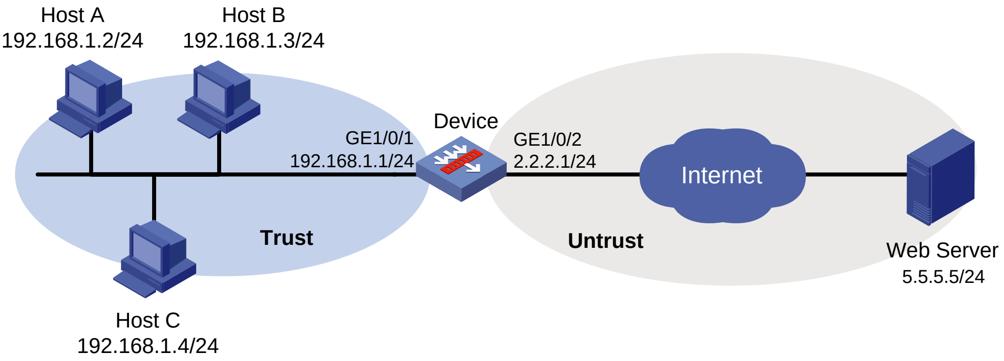
Example: Configuring the proxy policy

Network configuration

As shown in Figure 7, the device connects the LAN and the Internet. The LAN resides in security zone **Trust** and the Internet resides in security zone **Untrust**.

Configure the device to decrypt the HTTPS traffic and perform deep packet inspection on the traffic.

Figure 7 Network diagram



Procedure

1. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

```
<Device> system-view
[Device] interface gigabitethernet 1/0/1
```

```
[Device-GigabitEthernet1/0/1] ip address 192.168.1.1 255.255.255.0
[Device-GigabitEthernet1/0/1] quit
```

# Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Configure settings for routing.

   This example configures static routes, and the next hop in the routes is 2.2.2.2.

   ```
   [Device] ip route-static 5.5.5.0 24 2.2.2.2
   ```

3. Add interfaces to security zones.

   ```
   [Device] security-zone name trust
   [Device-security-zone-Trust] import interface gigabitethernet 1/0/1
   [Device-security-zone-Trust] quit
   [Device] security-zone name untrust
   [Device-security-zone-Untrust] import interface gigabitethernet 1/0/2
   [Device-security-zone-Untrust] quit
   ```

4. Create an IP address object group named **obj1** and configure an IP address object with subnet **192.168.1.0/24**.

   ```
   [Device] object-group ip address obj1
   [Device-obj-grp-ip-obj1] network subnet 192.168.1.0 24
   [Device-obj-grp-ip-obj1] quit
   ```

5. Import CA certificate **trust.pem** as a trusted SSL decryption certificate and CA certificate **untrust.pem** as an untrusted SSL decryption certificate to the device.

   ```
   [Device] app-proxy ssl-decrypt-certificate import trust pem filename trust.pem
   [Device] app-proxy ssl-decrypt-certificate import untrust pem filename untrust.pem
   ```

6. Install CA certificate **trust.pem** on all internal hosts and set the CA certificate **trust.pem** as a trusted SSL decryption certificate. (Details not shown.)

7. Create proxy policy rule **https** to match HTTPS traffic from internal hosts destined for the Web server and set the action for traffic matching rule **https** to SSL decryption.

   ```
   [Device] app-proxy-policy
   [Device-app-proxy-policy] rule 1 name https
   [Device-app-proxy-policy-rule-1-https] source-zone trust
   [Device-app-proxy-policy-rule-1-https] destination-zone untrust
   [Device-app-proxy-policy-rule-1-https] source-ip object-group obj1
   [Device-app-proxy-policy-rule-1-https] service object-group https
   [Device-app-proxy-policy-rule-1-https] action ssl-decrypt
   [Device-app-proxy-policy-rule-1-https] quit
   ```

8. Configure URL filtering:

   # Create user-defined URL category **https**, set its severity level to **1001**, and create URL filtering rule 1 to match HTTPS packets that contain host name **www. baidu.com** in the URL.

   ```
   [Device] url-filter category https severity 1001
   [Device-url-filter-category-https] rule host text www.baidu.com
   [Device-url-filter-category-https] quit
   ```

   # Create a URL filtering policy named **p1**. Specify action **drop** for URL category **https**, enable logging for the matching packets.

   ```
   [Device] url-filter policy p1
   [Device-url-filter-policy-p1] category https action reset logging
   [Device-url-filter-policy-p1] quit
   ```

9. Apply URL filtering policy **p1** to a DPI application profile and activate the URL filtering policy settings:

# Create a DPI application profile named **sec**, and apply URL filtering policy **p1** to the DPI application profile.

```
[Device] app-profile sec
[Device-app-profile-sec] url-filter apply policy p1
[Device-app-profile-sec] quit
```

# Activate the URL filtering policy and rule settings.

```
[Device] inspect activate
```

10. Configure a security policy:

# Create a security policy rule named **trust-untrust** to permit the packets from security zone **Trust** to security zone **Untrust** and to perform URL filtering on the packets. Make you have configured IPS on the device.

```
[Device] security-policy ip
[Device-security-policy-ip] rule name trust-untrust
[Device-security-policy-ip-10-trust-untrust] source-zone trust
[Device-security-policy-ip-10-trust-untrust] source-ip-subnet 192.168.1.0 24
[Device-security-policy-ip-10-trust-untrust] destination-zone untrust
[Device-security-policy-ip-10-trust-untrust] action pass
[Device-security-policy-ip-10-trust-untrust] profile sec
[Device-security-policy-ip-10-trust-untrust] quit
```

# Create a security policy rule named **untrust-trust to permit the packets from** security zone **Untrust** to security zone **Trust.**

```
[Device] security-policy ip
[Device-security-policy-ip] rule name untrust-trust
[Device-security-policy-ip-11-untrust-trust] source-zone untrust
[Device-security-policy-ip-11-untrust-trust] destination-zone trust
[Device-security-policy-ip-11-untrust-trust] destination-ip-subnet 192.168.1.0 24
[Device-security-policy-ip-11-untrust-trust] action pass
[Device-security-policy-ip-11-untrust-trust] profile sec
[Device-security-policy-ip-11-untrust-trust] quit
```

# Create two security policy rules named **proxyserverlocalin and proxyserverlocalout to** permit the traffic between the **Trust** and **Local** security zones**. Thus, the device can proxy the traffic** from internal hosts destined for the Web server**.**

```
[Device-security-policy-ip] rule name proxyserverlocalin
[Device-security-policy-ip-12-proxyserverlocalin] source-zone trust
[Device-security-policy-ip-12-proxyserverlocalin] source-ip-subnet 192.168.1.0 24
[Device-security-policy-ip-12-proxyserverlocalin] destination-zone local
[Device-security-policy-ip-12-proxyserverlocalin] action pass
[Device-security-policy-ip-12-proxyserverlocalin] quit
[Device-security-policy-ip] rule name proxyserverlocalout
[Device-security-policy-ip-13-proxyserverlocalout] source-zone local
[Device-security-policy-ip-13-proxyserverlocalout] destination-zone trust
[Device-security-policy-ip-13-proxyserverlocalout] destination-ip-subnet
192.168.1.0 24
[Device-security-policy-ip-13-proxyserverlocalout] action pass
[Device-security-policy-ip-13-proxyserverlocalout] quit
```

# Create two security policy rules named **proxyclientlocalin and proxyclientlocalout to** permit the traffic between the **Untrust** and **Local** security zones**. Thus, the device can proxy the traffic** from the Web server destined for internal hosts**.**

```
[Device-security-policy-ip] rule name proxyclientlocalin
```

```
[Device-security-policy-ip-14-proxyclientlocalin] source-zone untrust
[Device-security-policy-ip-14-proxyclientlocalin] destination-zone local
[Device-security-policy-ip-14-proxyclientlocalin] destination-ip-subnet
192.168.1.0 24
[Device-security-policy-ip-14-proxyclientlocalin] action pass
[Device-security-policy-ip-14-proxyclientlocalin] quit
[Device-security-policy-ip] rule name proxyclientlocalout
[Device-security-policy-ip-15-proxyclientlocalout] source-zone local
[Device-security-policy-ip-15-proxyclientlocalout] source-ip-subnet 192.168.1.0 24
[Device-security-policy-ip-15-proxyclientlocalout] destination-zone untrust
[Device-security-policy-ip-15-proxyclientlocalout] action pass
[Device-security-policy-ip-15-proxyclientlocalout] quit
```

# Activate rule matching acceleration.

```
[Device-security-policy-ip] accelerate enhanced enable
[Device-security-policy-ip] quit
```

Verifying the configuration

Verify that the device can deny HTTPS requests to www.baidu.com and generate logs. You can also execute the **display app-proxy server-certificate** command to view the following information:

- SSL server certificates received by the device as the SSL proxy client.
- Number of times connections to the server had been proxied.
- Most recent time the device proxied a connection to the server.
- First time the device proxied a connection to the server.

NSFOCUS Firewall Series

NF NAT Configuration Guide

NSFOCUS Technologies, Inc.

Document version: 6W600-20230221

Preface

- This configuration guide describes the fundamentals and configuration procedures for NAT, NAT66, and AFT.
- Security zones, security policies, object groups, object policies, APR, and session management.
- User access and authentication features (such as AAA, portal, user identification, password control, and PKI).
- Data security features (such as public key management, SSL, SSH, and crypto engine).
- Attack protection features (such as ASPF, connection limit, IP source guard, ARP attack protection, ND attack defense, uRPF, attack detection and prevention, and IP-MAC binding).

This preface includes the following topics about the documentation:

- Audience.
- Conventions.

Audience

This documentation is intended for:

- Network planners.
- Field technical support and servicing engineers.
- Network administrators.

Conventions

The following information describes the conventions used in the documentation.

Command conventions

Convention	Description
Boldface	**Bold** text represents commands and keywords that you enter literally as shown.
Italic	*Italic* text represents arguments that you replace with actual values.
[ ]	Square brackets enclose syntax choices (keywords or arguments) that are optional.
{ x | y | ... }	Braces enclose a set of required syntax choices separated by vertical bars, from which you select one.
[x | y | ...]	Square brackets enclose a set of optional syntax choices separated by vertical bars, from which you select one or none.
{ x | y | ... } *	Asterisk marked braces enclose a set of required syntax choices separated by vertical bars, from which you select a minimum of one.
[x | y | ...] *	Asterisk marked square brackets enclose optional syntax choices separated by vertical bars, from which you select one choice, multiple choices, or none.
&<1-n>	The argument or keyword and argument combination before the ampersand (&) sign can be entered 1 to n times.
#	A line that starts with a pound (#) sign is comments.

GUI conventions

Convention	Description
Boldface	Window names, button names, field names, and menu items are in Boldface. For example, the **New User** window opens; click **OK**.
>	Multi-level menus are separated by angle brackets. For example, **File** > **Create** > **Folder**.

Symbols

Convention	Description
⚠ **WARNING!**	An alert that calls attention to important information that if not understood or followed can result in personal injury.
△ **CAUTION:**	An alert that calls attention to important information that if not understood or followed can result in data loss, data corruption, or damage to hardware or software.
❗ **IMPORTANT:**	An alert that calls attention to essential information.
NOTE:	An alert that contains additional or supplementary information.
💡 **TIP:**	An alert that provides helpful information.

Network topology icons

Convention	Description
	Represents a generic network device, such as a router, switch, or firewall.
	Represents a routing-capable device, such as a router or Layer 3 switch.
	Represents a generic switch, such as a Layer 2 or Layer 3 switch, or a router that supports Layer 2 forwarding and other Layer 2 features.
	Represents an access controller, a unified wired-WLAN module, or the access controller engine on a unified wired-WLAN switch.
	Represents an access point.
	Represents a wireless terminator unit.
	Represents a wireless terminator.
	Represents a mesh access point.
	Represents omnidirectional signals.
	Represents directional signals.
	Represents a security product, such as a firewall, UTM, multiservice security gateway, or load balancing device.

Convention	Description
	Represents a security module, such as a firewall, load balancing, NetStream, SSL VPN, IPS, or ACG module.

Examples provided in this document

Examples in this document might use devices that differ from your device in hardware model, configuration, or software version. It is normal that the port numbers, sample output, screenshots, and other information in the examples differ from what you have on your device.

Contents

NAT overview

Network Address Translation (NAT) translates an IP address in the IP packet header to another IP address. Typically, NAT is configured on gateways to enable private hosts to access external networks and external hosts to access private network resources such as a Web server.

Restrictions and guidelines: NAT configuration

The global NAT policy has priority over interface-based NAT. If both are configured, a packet is translated based on the global NAT policy when the packet matches an ACL rule in the global NAT policy. The interface-based source and destination address translation rules do not take effect. As a best practice, do not configure both the global NAT and interface-based NAT policies.

A device does not perform AFT translation on NATed packets.

Basic NAT concepts

The following describes basic NAT concepts:

- **NAT device**—A device configured with NAT. Typically, NAT is configured on the edge device that connects the internal and external networks.
- **NAT interface**—An interface configured with NAT.
- **NAT rule**—Rules that define how to perform address translation.
- **NAT address**—A public IP address used for address translation, and this address is reachable from the external network. The NAT address can be manually assigned or dynamically obtained.
- **NAT entry**—Stores the mapping between a private IP address and a public IP address. For more information, see "NAT entries."
- **Easy IP**—Uses the IP address of an interface as the NAT address. The IP address of the interface can be manually assigned or be obtained through DHCP.
- **Global NAT**—Uses NAT rules configured for the global NAT policy to translate packets.
- **Interface-based NAT**—Uses NAT rules configured on a per-interface basis to translate packets.

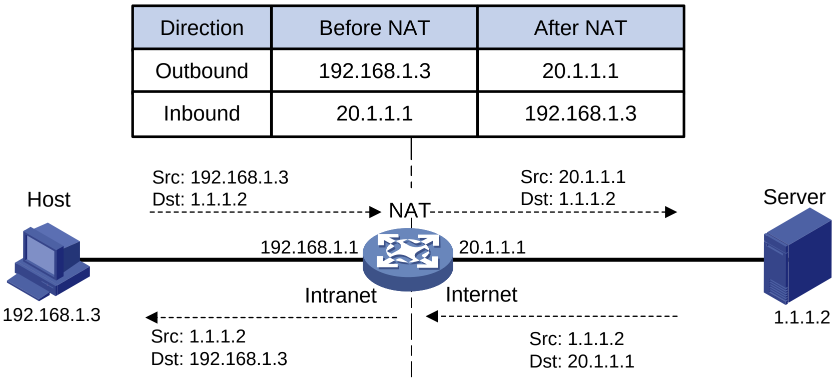
Basic NAT operating mechanism

Figure 1 shows the basic NAT operating mechanism.

1. Upon receiving a request from the host to the server, NAT translates the private source address 192.168.1.3 to the public address 20.1.1.1 and forwards the NATed packet. NAT adds a mapping for the two addresses to its NAT table.
2. Upon receiving a response from the server, NAT translates the destination public address to the private address, and forwards the packet to the host.

The NAT operation is transparent to the terminals (the host and the server). NAT hides the private network from the external users and shows that the IP address of the internal host is 20.1.1.1.

Figure 1 Basic NAT operation



Direction	Before NAT	After NAT
Outbound	192.168.1.3	20.1.1.1
Inbound	20.1.1.1	192.168.1.3

NAT control

You can use ACLs to implement NAT control. The match criteria in the ACLs include the source IP address, source port number, destination IP address, destination port number, transport layer protocol, and VPN instance. Only packets permitted by an ACL are processed by NAT.

NAT translation methods

Static NAT

Static NAT creates a fixed mapping between a private address and a public address. It supports connections initiated from internal users to external network and from external users to the internal network. Static NAT applies to regular communications.

Source address translation

Source address translation is dynamic NAT translation that uses an address pool to translate addresses. It applies to the scenario where a large number of internal users access the external network.

The NO-PAT, port-based PAT, and port block-based PAT modes are supported.

NO-PAT

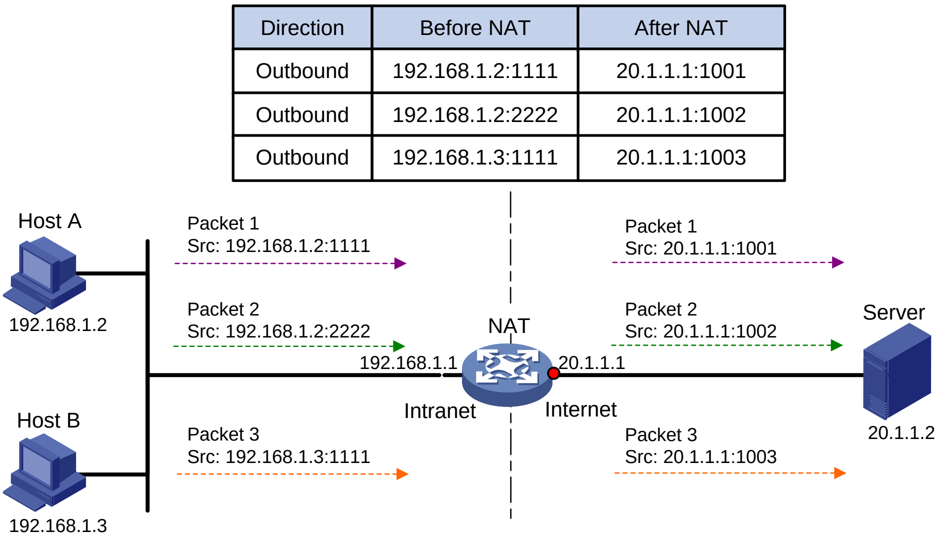
Not Port Address Translation (NO-PAT) translates a private IP address to an IP public address. The public IP address cannot be used by another internal host until it is released.

NO-PAT supports all IP packets.

Port-based PAT

Port Address Translation (PAT) translates multiple private IP addresses to a single public IP address by mapping the private IP address and source port to the public IP address and a unique port. PAT supports TCP and UDP packets, and ICMP request packets.

Figure 2 PAT operation



Direction	Before NAT	After NAT
Outbound	192.168.1.2:1111	20.1.1.1:1001
Outbound	192.168.1.2:2222	20.1.1.1:1002
Outbound	192.168.1.3:1111	20.1.1.1:1003

As shown in Figure 2, PAT translates the source IP addresses of the three packets to the same IP public address and translates their port numbers to different port numbers. Upon receiving a response, PAT translates the destination address and port number of the response, and forwards it to the target host.

PAT supports the following mappings:

- **Endpoint-Independent Mapping (EIM)**—Uses the same IP and port mapping (EIM entry) for packets from the same source IP and port to any destinations. EIM allows external hosts to initiate connections to the translated IP addresses and ports of internal hosts. It allows internal hosts behind different NAT gateways to access each other.
- **Address and Port-Dependent Mapping (APDM)**—Uses different IP and port mappings for packets from the same source IP and port to different destination IP addresses and ports. APDM allows an external host to initiate connections to an internal host only under the condition that the internal host has previously accessed the external host. It is secure, but it does not allow internal hosts behind different NAT gateways to access each other.

Port block-based NAT

Port block-based NAT is a PAT translation based on port ranges. It maps multiple private IP addresses to one public IP address and uses a different port block for each private IP address. For example, the private IP address 10.1.1.1 of an internal host is mapped to the public IP address 202.1.1.1 and port block 10001 to 10256. When the internal host accesses public hosts, the source IP address 10.1.1.1 is translated to 202.1.1.1, and the source ports are translated to ports in the port block 10001 to 10256.

Port block-based NAT includes static and dynamic mappings. It applies to NAT444 and DS-Lite networks.

Static port block mapping

The NAT gateway computes a static port block mapping before address translation. The mapping is between a private IP address and a public IP address with a port block.

When an internal user initiates a connection to the external network, the system performs the following operations:

- Locates a static mapping based on the private IP address of the user and obtains the public IP address and the port block in the mapping.
- Selects a public port number in the port block.

- Translates the private IP address to the public IP address and assigns the selected public port number.

The NAT gateway uses private IP addresses, public IP addresses, a port range, and a port block size to compute static mappings:

1. Divides the port range by the port block size to get the number of available port blocks for each public IP address.

   This value is the base number for mapping.
2. Sorts the port blocks in ascending order of the start port number in each block.
3. Sorts the private IP addresses and the public IP addresses separately in ascending order.
4. Maps the first base number of private IP addresses to the first public IP address and its port blocks in ascending order.

For example, the number of available port blocks of each public IP address is **m**. The first **m** private IP addresses are mapped to the first public IP address and the **m** port blocks in ascending order. The next **m** private IP addresses are mapped to the second IP address and the **m** port blocks in ascending order. The other static port block mappings are created by analogy.

Dynamic port block mapping

When an internal user initiates a connection to the external network, the dynamic port block-based NAT operates as follows:

1. Uses ACLs to implement translation control. It processes only packets that match an ACL permit rule.
2. Creates a mapping from the internal user's private IP address to a public IP address and a port block.
3. Translates the private IP address to the public IP address, and the source ports to ports in the selected port block for subsequent connections from the private IP address.
4. Withdraws the port block and deletes the dynamic port block mapping when all connections from the private IP address are disconnected.

Dynamic port block mapping supports port block extending. If the ports in the port block for a private address are all occupied, dynamic port block mapping translates the source port to a port in an extended port block.

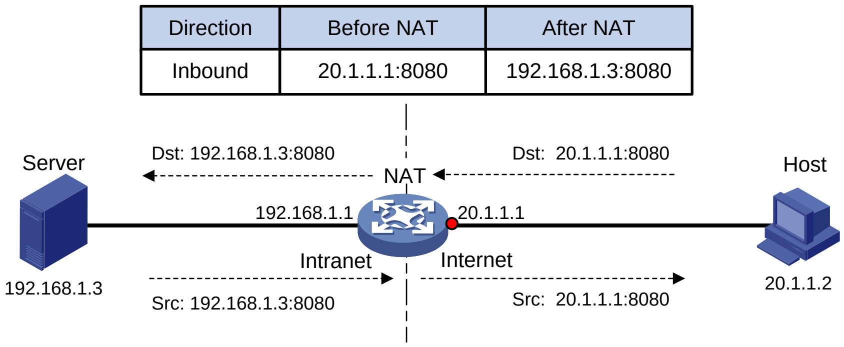
Destination address translation

Destination address translation maps a public address and port number to the private IP address and port number of an internal server. This feature allows servers in the private network to provide services for external users.

Figure 3 shows how destination address translation works:

1. Upon receiving a request from the host, NAT translates the public destination IP address and port number to the private IP address and port number of the internal server.
2. Upon receiving a response from the server, NAT translates the private source IP address and port number to the public IP address and port number.

Figure 3 Destination address translation operation



Direction	Before NAT	After NAT
Inbound	20.1.1.1:8080	192.168.1.3:8080

NAT entries

NAT session entry

NAT creates a NAT session entry for a session and creates an address mapping for the first packet in the session.

A NAT session entry contains extended NAT information, such as interface and translation method. Subsequent packets of the session are translated by using this entry.

- If the direction of the subsequent packets is the same as the direction of the first translated packet, NAT performs the source and destination address translation the same as the first packet.
- If the direction of the subsequent packets is opposite to the direction of the first translated packet, NAT perform reverse address translation. For example, if the source address of the first packet is translated, then the destination address of the subsequent packets is translated.

The session management module maintains the updating and aging of NAT session entries. For information about session management, see *Security Configuration Guide*.

EIM entry

If EIM is configured on the NAT device, the PAT mode will first create a NAT session entry, and then an EIM entry. The EIM entry is a 3-tuple entry, and it maps a private address/port to a public address/port. The EIM entry ensures:

- Subsequent new connections originating from the same source IP and port uses the same translation as the initial connection.
- Translates the address for new connections initiated from external hosts to the NAT address and port number based on the EIM entry.

An EIM entry ages out after all related NAT session entries age out.

NO-PAT entry

A NO-PAT entry maps a private address to a public address. The same mapping applies to subsequent connections originating from the same source IP.

A NO-PAT entry can also be created during the ALG process for NAT. For information about NAT ALG, see "NAT ALG."

A NO-PAT entry ages out after all related NAT session entries age out.

Port block-based entry

A port block-based entry maps a private IP address to a public IP address and a port block.

Port block-based entries include static and dynamic port block mappings. For information about these mappings, see "Static port block mapping" and "Dynamic port block mapping."

VRF-aware NAT

VRF-aware NAT allows users from different VRF (VPN instances) to access external networks and to access each other.

1. Upon receiving a request from a user in a VRF to an external network, NAT performs the following tasks:
   - Translates the private source IP address and port number to a public IP address and port number.
   - Records the VRF information, such as the VRF name.
2. When a response packet arrives, NAT performs the following tasks:
   - Translates the destination public IP address and port number to the private IP address and port number.
   - Forwards the packet to the target VRF.

The NAT Server feature supports VRF-aware NAT for external users to access the servers in a VPN instance. For example, to enable a host at 10.110.1.1 in VPN 1 to provide Web services for Internet users, configure NAT Server to use 202.110.10.20 as the public IP address of the Web server.

VRF-aware NAT is supported only in global NAT in the current software version.

NAT hairpin

NAT hairpin allows internal hosts to access each other through NAT. The source and destination IP address of the packets are translated on the interface connected to the internal network.

NAT hairpin includes P2P and C/S modes:

- **P2P**—Allows internal hosts to access each other through NAT. The internal hosts first register their public addresses to an external server. Then, the hosts communicate with each other by using the registered IP addresses.
- **C/S**—Allows internal hosts to access internal servers through NAT addresses. The destination IP address of the packet going to the internal server is translated by matching the NAT Server configuration. The source IP address is translated by matching the outbound dynamic or static NAT entries.

NAT ALG

NAT ALG (Application Level Gateway) translates address or port information in the application layer payloads to ensure connection establishment.

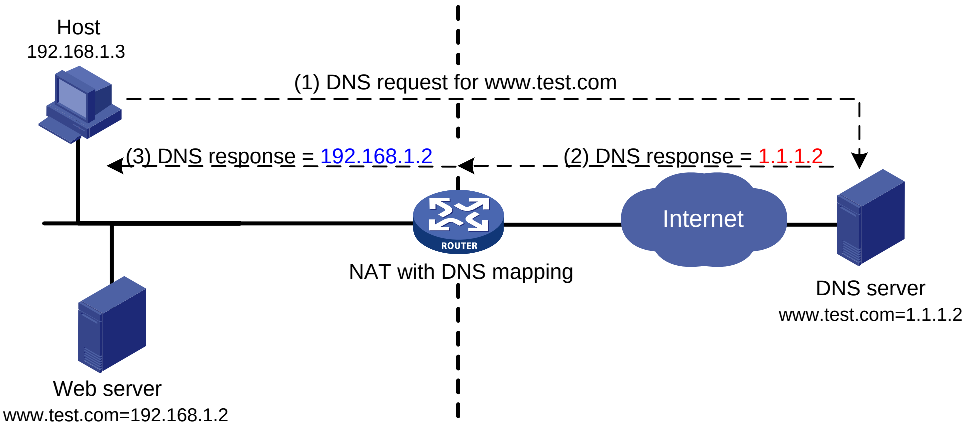
For example, an FTP application includes a data connection and a control connection. The IP address and port number for the data connection depend on the payload information of the control connection. This requires NAT ALG to translate the address and port information for data connection establishment.

NAT DNS mapping

The DNS server is typically on the public network. For the users on the public network to access an internal server, you can configure the NAT Server feature on the NAT device. The NAT Server maps the public IP address and port number to the private IP address and port number of the internal server. Then the public users can access the internal server through the server's domain name or public IP address.

When a user is in the private network, the user cannot access the internal server by using the domain name of the server. This is because the DNS response contains the public IP address of the server. In this case, you can configure NAT DNS mapping to solve the problem.

Figure 4 NAT DNS mapping



As shown in Figure 4, NAT DNS mapping works as follows:

1. The host sends a DNS request containing the domain name of the internal Web server.
2. Upon receiving the DNS response, the NAT device performs a DNS mapping lookup by using the domain name in the response. A NAT DNS mapping maps the domain name to the public IP address, public port number, and the protocol type for the internal server.
3. If a match is found, the NAT continues to compare the public address, public port number, and the protocol type with the NAT Server configuration. The NAT Server configuration maps the public IP address and port number to the private IP address and port number for the internal server.
4. If a match is found, NAT translates the public IP address in the response into the private IP address of the Web server.
5. The internal host receives the DNS response, and obtains the private IP address of the Web server.

NAT444

About NAT444

NAT444 provides carrier-grade NAT by unifying the NAT444 gateway, AAA server, and log server. NAT444 introduces a second layer of NAT on the carrier side, with few changes on the customer side and the application server side. With port block assignment, NAT444 supports user tracking. It has become a preferred solution for carriers in transition to IPv6.

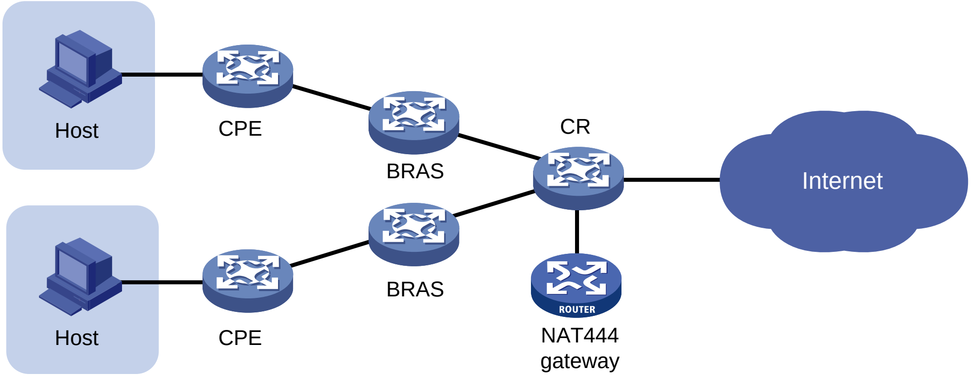
Centralized NAT444 deployment

Centralized NAT444 deployment is implemented by installing a NAT processing slot on the CR device or by connecting a NAT444 device to the CR.

As shown in Figure 5, when an internal user accesses the external network, NAT444 is implemented as follows:

1. The CPE device performs the first NAT.
2. After the user passes AAA authentication on the BRAS device, this user is assigned a private IP address.
3. When the packet destined to the external network, the NAT444 gateway performs the second NAT.

Figure 5 Centralized NAT444 deployment



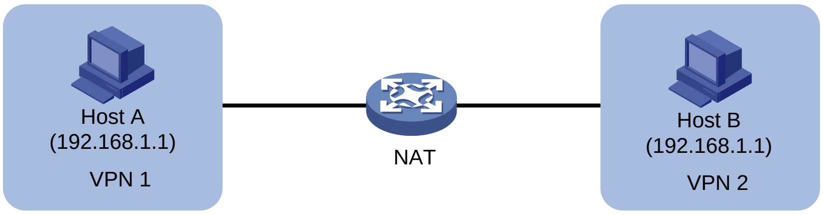
NAT for overlapping addresses

NAT for overlapping addresses in different VPNs

As shown in Figure 6, two hosts are in different VPN instances with overlapping addresses. For the hosts to access each other, both the source and destination addresses of packets between the two VPNs need to be translated. Configure static NAT on both interfaces connected to the VPNs on the NAT device.

1. Configure a static outbound NAT mapping between 192.168.1.1 in VPN 1 and 172.16.1.1 in VPN 2.
2. Configure a static outbound NAT mapping between 192.168.1.1 in VPN 2 and 172.16.2.1 in VPN 1.
3. When static NAT takes effect, the hosts can access each other.

Figure 6 VPN access with overlapping address

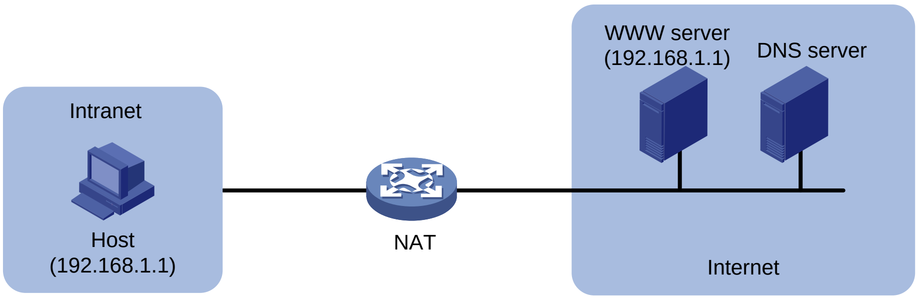


NAT for internal-to-external access through domain name

As shown in Figure 7, the IP address of the Web server overlaps with the private host at 192.168.1.0/24. Configure dynamic NAT ALG and outbound dynamic NAT to allow the internal host to access the external Web server by using the server's domain name.

1. The host sends a DNS request to the DNS server in the external network.
2. After receiving a DNS reply, the NAT device with NAT ALG configured translates the Web server's IP address in the DNS reply payload to a dynamically assigned public address 10.1.1.1.
3. Configure inbound dynamic NAT ALG to make sure the internal host reaches the Web server instead of another internal host. NAT ALG can translate the Web server's IP address in the DNS reply payload to a dynamically assigned public address 10.1.1.1.
4. After receiving the DNS reply from the NAT device, the host sends a packet with the source IP address 192.168.1.1 and destination IP address 10.1.1.1.
5. The NAT device with outbound dynamic NAT configured translates the source IP address of the packet to a dynamically assigned public address 20.1.1.1. NAT ALG translates the destination IP address of the packet to the IP address of the Web server.

Figure 7 Internal-to-external access through domain name



NAT in the DS-Lite network

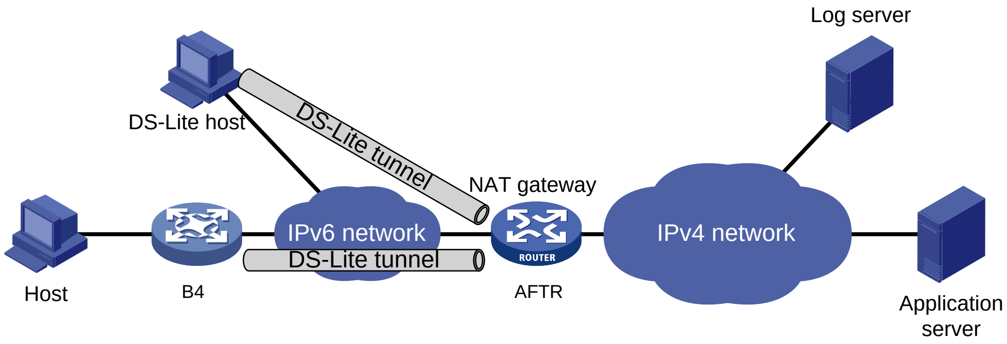
DS-Lite combines tunneling and NAT to allow an IPv4 private network to access the IPv4 public network over an IPv6 network. For more information about DS-Lite, see tunneling configuration in *VPN Configuration Guide*.

DS-Lite B4 address translation is configured on the AFTR and performs port block-based translation based on the IPv6 address of the B4 element. The B4 element refers to a B4 router or a DS-Lite host. DS-Lite B4 address translation dynamically maps a public IPv4 address and a port block to the IPv6 address of the B4 element. The DS-Lite host or hosts behind the B4 router use the mapped public IPv4 address and port block to access the public IPv4 network.

DS-Lite B4 address translation supports user tracing for DS-Lite hosts based on the port block.

Only dynamic port block mapping is supported for B4 address translation.

Figure 8 DS-Lite B4 address translation



Configuring global NAT

About the global NAT policy

The global NAT policy is applicable to scenarios where the external interface is not fixed. Compared with interface-based NAT policies, you do not need to change relevant configurations if the external interface changes, which reduces maintenance costs.

The global NAT policy contains NAT rules. A NAT rule contains the following elements:

- **Packet match criteria**—The packet match criteria can match packets by source IP address, destination IP address, service type, source security zone, or destination security zone. You can configure different packet match criteria for different NAT rules. The device translates the IP addresses of the matching packets. A matching packet refers to a packet that matches all match criteria in a NAT rule.
- **Action**—Action to take on matching packets, which can be source address translation (SNAT) or destination address translation (DNAT). SNAT can hide the IP addresses of internal hosts to external devices. DNAT is commonly used for internal servers to provide services for external users. A combination of SNAT and DNAT translates the source and destination IP addresses of packets.

NAT rules include the following types:

- **SNAT rule**—Used for source address translation.
- **DNAT rule**—Used for destination address translation.
- **SNAT+ DNAT rule**—Used for both source address translation and destination address translation.

Global NAT tasks at a glance

1. Configuring the global NAT policy
   a. Creating the global NAT policy
   b. Configuring NAT-type rules
   c. Configuring NAT64-type rules
   d. Configuring NAT66-type rules
   e. Rearranging NAT rules in the policy to adjust their priority
   f. Disabling NAT rules
2. (Optional.) Configuring NAT ALG
3. (Optional.) Configuring NAT DNS mapping
4. (Optional.) Configuring high availability for NAT
   - Enabling NAT port halving
   - Configuring hot backup for NAT
5. (Optional.) Configuring NAT in specific networks
   - Enabling NAT reply redirection
   - Enabling the deletion of timestamps in TCP SYN and SYN ACK packets
6. (Optional.) Configuring NAT maintenance
   - Configuring periodic NAT statistics collection
   - Enabling statistics collection for NAT session creation rate
   - Specifying a probe method for detecting reachability of NAT address group members

   - Enabling sending ICMP error messages for NAT failures
   - Enabling NAT configuration changes to take effect only on new connections
7. (Optional.) Configuring NAT logging
   - Configuring NAT session logging
   - Configuring NAT444 user logging
   - Configuring NAT alarm logging
   - Enabling logging for IP usage of a NAT address group in NO-PAT mode

Configuring the global NAT policy

About the global NAT policy

The global NAT policy contains a set of NAT rules to identify and translate matching packets. Compared with interface-based NAT policies, you do not need to apply the global NAT policy to any interface.

The global NAT policy contains NAT rules. A NAT rule contains the following elements:

- **Packet match criteria**—The packet match criteria can match packets by source IP address, destination IP address, service type, source security zone, or destination security zone. You can configure different packet match criteria for different NAT rules. The device translates the IP addresses of the matching packets. A matching packet refers to a packet that matches all match criteria in a NAT rule.
- **Action**—Action to take on matching packets, which can be source address translation or destination address translation.

NAT rules include the following types:

- **NAT type**—Used for translation between IPv4 addresses. For more information about NAT, see *NAT Configuration Guide*.
- **NAT64 type**—Used for translation between IPv4 addresses and IPv6 addresses. For more information about NAT64, see *NAT Configuration Guide*.
- **NAT66 type**—Used for translation between IPv6 addresses or translation between IPv6 address prefixes. For more information about NAT66, see *NAT Configuration Guide*.

Restrictions and guidelines for global NAT policy configuration

If no object group or security zone is specified for a NAT rule, this rule matches all packets.

NAT rules in the global NAT policy take effect only when the **Config status** of the policy is **Active**. You can use the **`display nat global-policy`** command to verify the status of the global policy.

- When the status is **Active**, the NAT rules in the global NAT policy are sorted in their configuration order. A rule configured earlier has a higher priority. The matching process stops when a packet matches a NAT rule. You can use the **`display this`** command to view the configuration order of the NAT rules.
- If the status is **Inactive**, the NAT rules are not used to match packets.

A maximum of 10000 NAT rules can be created for the global NAT policy.

Creating the global NAT policy

1. Enter system view

system-view

2. Create the global NAT policy and enter its view.

   nat global-policy

Configuring NAT-type rules

Restrictions and guidelines

When you configure a DNAT or SNAT+DNAT rule, follow these restrictions and guidelines:

- A destination security zone cannot be used as a match criterion.
- Only one destination address after NAT is supported:
  - You cannot execute the **action dnat ip-address** *local-address* [**local-port** *local-port*] command multiple times to configure multiple destination addresses after NAT.
  - Specify an object group that has only one IP address when you execute the **action dnat object-group** *ipv4-object-group-name* [**local-port** *local-port*] command.

For an object group-based static mapping to take effect, the object group cannot have excluded addresses.

Procedure

1. Enter system view.

   system-view

2. Enter the global NAT policy view.

   nat global-policy

3. Create a NAT-type rule and enter its view.

   rule name *rule-name* [**type nat**]

   By default, no NAT rule exists.

4. (Optional.) Configure a description for the NAT rule.

   description *text*

   By default, no description is configured for the NAT rule.

5. Specify packet match criteria for the rule.
   - Specify a source IP address match criterion.

     source-ip { *object-group-name* | **host** *ip-address* | **subnet** *subnet-ip-address mask-length* }

     By default, no source IP address match criterion is specified for the NAT rule.
   - Specify a destination IP address match criterion.

     destination-ip { *object-group-name* | **host** *ip-address* | **subnet** *subnet-ip-address mask-length* }

     By default, no destination IP address match criterion is specified for the NAT rule.
   - Specify a service object group.

     service *object-group-name*

     By default, no service type is specified for the NAT rule.
   - Specify a source security zone.

     source-zone *source-zone-name*

     By default, no source security zone is specified for the NAT rule.
   - Specify a destination security zone.

destination-zone *destination-zone-name*

By default, no destination security zone is specified for the NAT rule.

- Specify a VPN instance.

  vrf *vrf-name*

  By default, no VPN instance is specified for the NAT rule.

6. Specify an address translation method for the NAT rule.
   - Specify a source address translation method.

     NO-PAT:

     action snat { **address-group** { *group-id* | **name** *group-name* } | **object-group** *ipv4-object-group-name* } **no-pat** [**reversible**] [**vrrp** *virtual-router-id*] [**vrf** *vrf-name*]

     PAT:

     action snat { **address-group** { *group-id* | **name** *group-name* } | **object-group** *ipv4-object-group-name* } [**port-preserved**] [**vrrp** *virtual-router-id*] [**vrf** *vrf-name*]

     Easy IP:

     action snat easy-ip [**port-preserved**] [**vrf** *vrf-name*]

     Static translation:

     action snat static { **ip-address** *global-address* | **object-group** *object-group-name* | **subnet** *subnet-ip-address mask-length* } [**vrrp** *virtual-router-id*] [**vrf** *vrf-name*]

     NO-NAT:

     action snat no-nat

     By default, no source address translation method is specified for the NAT rule.
   - Specify a destination address translation method.

     Server mapping:

     action dnat { **ip-address** *local-address* | **object-group** *ipv4-object-group-name* } [**local-port** *local-port*] [**vrrp** *virtual-router-id*] [**vrf** *vrf-name*]

     NO-NAT:

     action dnat no-nat

     By default, no destination address translation method is specified for the NAT rule.
7. (Optional.) Enable hit counting for the NAT rule.

   counting enable

   By default, hit counting is disabled for the NAT rule.
8. Specify a translation mode for PAT.

   a. Return to global NAT policy view

   quit

   b. Return to system view.

   quit

   c. Apply the Endpoint-Independent Mapping mode for address translation.

   nat mapping-behavior endpoint-independent [**acl** { *ipv4-acl-number* | **name** *ipv4-acl-name* }]

   By default, the Address and Port-Dependent Mapping mode applies.

   This command takes effect only on outbound PAT.

Configuring NAT64-type rules

About this task

NAT64-type rules use the AFT function, and are applicable to the following scenarios:

- **Access initiated on the IPv6 side**—In the earlier stage of transition from IPv4 to IPv6, most services are in IPv4 networks. When an IPv6 network user accesses an IPv4 network service, both the source address and destination address of user packets are IPv6 addresses. In this case, the source address and destination address must be translated to IPv4 addresses.
- **Access initiated on the IPv4 side**—In the later stage of transition from IPv4 to IPv6, most services are in IPv6 networks. When an IPv4 network user accesses an IPv6 network service, both the source address and destination address of user packets are IPv4 addresses. In this case, the source address and destination address must be translated to IPv6 addresses.

In the scenarios above, both source address translation and destination address translation are required.

Restrictions and guidelines

If you configure multiple packet match criteria in a NAT64-type rule, the type of IP addresses in the later configured packet match criteria must be the same as that in the earlier configured packet match criteria. For example, if you first execute the **`source-ip host 192.168.1.1`** command, the **`source-ip host 100::1`** command later executed does not take effect. Select an IP type as needed.

When you use the prefix method for address translation, the IPv6 address prefix length in the match criteria must meet the general prefix, IVI prefix, or NAT64 prefix requirements in the NAT action.

Procedure

1. Enter system view.

   `system-view`

2. Enter global NAT policy view.

   `nat global-policy`

3. Create a NAT64-type rule and enter its view.

   `rule name` *`rule-name`* **`type nat64`**

   By default, no NAT rule exists.

4. (Optional.) Configure a description for the NAT rule.

   `description` *`text`*

   By default, no description is configured for the NAT rule.

5. Specify packet match criteria for the rule.

   - Specify a source IP address match criterion.

     `source-ip` { { *ipv4-object-group-name* | *ipv6-object-group-name* } | **host** { *ipv4-address* | *ipv6-address* } | **subnet** { *subnet-ipv4-address mask-length* | *subnet-ipv6-address prefix-length* } }

     By default, no source IP address match criterion is specified for the NAT rule.

   - Specify a destination IP address match criterion.

     `destination-ip` { { *ipv4-object-group-name* | *ipv6-object-group-name* } | **host** { *ipv4-address* | *ipv6-address* } | **subnet** { *subnet-ipv4-address mask-length* | *subnet-ipv6-address prefix-length* } }

   - Specify a service object group.

     `service` *`object-group-name`*

By default, no service object group is specified for the NAT rule.

- Specify a source security zone.

  source-zone *source-zone-name*

  By default, no source security zone is specified for the NAT rule.

- Specify a VPN instance.

  vrf *vrf-name*

  By default, no VPN instance is specified for the NAT rule.

6. Specify an address translation method for the NAT rule.

   - Specify a source address translation method.

     NO-PAT:

     action snat object-group *ipv4-object-group-name* **no-pat** [**ipv4-vrrp** *virtual-router-id*] [**vrf** *vrf-name*]

     action snat object-group *ipv6-object-group-name* **no-pat** [**vrf** *vrf-name*]

     PAT:

     action snat object-group *ipv4-object-group-name* [**ipv4-vrrp** *virtual-router-id*] [**vrf** *vrf-name*]

     action snat object-group *ipv6-object-group-name* [**vrf** *vrf-name*]

     Prefix translation:

     action snat prefix { **general** { **v4tov6** *prefix-general general-prefix-length* | **v6tov4** } | **ivi v6tov4** | **nat64 v4tov6** *prefix-nat64 nat64-prefix-length* } [**vrf** *vrf-name*]

     Static translation:

     action snat static ip-address *global-ipv4-addres* [**ipv4-vrrp** *virtual-router-id*] [**vrf** *vrf-name*]

     action snat static ip-address *global-ipv6-address* [**ipv6-vrrp** *virtual-router-id*] [**vrf** *vrf-name*]

   - Specify a destination address translation method.

     Static translation:

     action dnat static ip-address *local-ipv4-address* [**ipv6-vrrp** *virtual-router-id*] [**vrf** *vrf-name*]

     action dnat static ip-address *local-ipv6-address* [**ipv4-vrrp** *virtual-router-id*] [**vrf** *vrf-name*]

     Server mapping:

     action dnat server ip-address *local-ipv4-address* [**port** *local-port*] [**vrf** *vrf-name*]

     action dnat server ip-address *local-ipv6-address* [**local-port** *local-port*] [**ipv4-vrrp** *virtual-router-id*] [**vrf** *vrf-name*]

     Prefix method:

     action dnat prefix { **general v6tov4** | **nat64 v6tov4** } [**vrf** *vrf-name*]

     action dnat prefix { **general v4tov6** *prefix-general prefix-length* | **ivi v4tov6** *prefix-ivi* } [**ipv4-vrrp** *virtual-router-id*] [**vrf** *vrf-name*]

7. (Optional.) Enable hit counting for the NAT rule.

   counting enable

   By default, hit counting is disabled for the NAT rule.

Configuring NAT66-type rules

About this task

NAT66 is used for translation between IPv6 addresses. Available translation methods include dynamic, static, and NPTv6. An IPv6 address includes a network prefix and an interface identifier. The NPTv6 method translates the network prefix to a new network prefix, and the interface identifier of the IPv6 address will be adjusted according to RFC 6296. For more information about the algorithm, see RFC 6296. The other two methods translate an IPv6 address to a new IPv6 address. When a large number of IPv6 addresses exist and you are not sensitive to the addresses after translation, as a best practice, use the NPTv6 method.

Restrictions and guidelines

For a DNAT or SNAT+DNAT rule, a destination security zone cannot be used as a match criterion..

Procedure

1. Enter system view.

   `system-view`

2. Enter global NAT policy view.

   `nat global-policy`

3. Create a NAT66-type rule and enter its view.

   `rule name` *`rule-name`* **`type nat66`**

   By default, no NAT rule exists.

4. (Optional.) Configure a description for the NAT rule.

   `description` *`text`*

   By default, no description is configured for the NAT rule.

5. Specify packet match criteria for the rule.

   - Specify a source IP address match criterion.

     `source-ip` `{` *`ipv6-object-group-name`* `|` **`host`** *`ipv6-address`* `|` **`subnet`** *`subnet-ipv6-address prefix-length`* `}`

     By default, no source IP address match criterion is specified for the NAT rule.

   - Specify a destination IP address match criterion.

     `destination-ip` `{` *`ipv6-object-group-name`* `|` **`host`** *`ipv6-address`* `|` **`subnet`** *`subnet-ipv6-address prefix-length`* `}`

   - Specify a service object group.

     `service` *`object-group-name`*

     By default, no service object group is specified for the NAT rule.

   - Specify a source security zone.

     `source-zone` *`source-zone-name`*

     By default, no source security zone is specified for the NAT rule.

   - Specify a destination security zone.

     `destination-zone` *`destination-zone-name`*

     By default, no destination security zone is specified for the NAT rule.

   - Specify a VPN instance.

     `vrf` *`vrf-name`*

     By default, no VPN instance is specified for the NAT rule.

6. Specify an address translation method for the NAT rule.

   - Specify a source address translation method.

NO-PAT:

action snat object-group *ipv6-object-group-name* **no-pat** [**vrf** *vrf-name*]

PAT:

action snat object-group *ipv6-object-group-name* [**vrf** *vrf-name*]

Static translation:

action snat static ip-address *global-ipv6-address* [**ipv6-vrrp** *virtual-router-id*] [**vrf** *vrf-name*]

NPTv6:

action snat nptv6 *translated-ipv6-prefix nptv6-prefix-length* [**vrf** *vrf-name*]

NO-NAT:

action snat no-nat

- Specify a destination address translation method.

  Server mapping:

  action dnat ip-address *local-ipv6-address* [**local-port** *local-port*] [**vrf** *vrf-name*]

  NPTv6:

  action dnat nptv6 *translated-ipv6-prefix nptv6-prefix-length* [**vrf** *vrf-name*]

  NO-NAT:

  action dnat no-nat

7. (Optional.) Enable hit counting for the NAT rule.

   counting enable

   By default, hit counting is disabled for the NAT rule.

Rearranging NAT rules in the policy to adjust their priority

About this task

In the global NAT policy, the priority of NAT rules are determined by the configuration order. A rule configured earlier has a higher priority. You can use the **rule move** command to rearrange the NAT rules to adjust their priority.

Restrictions and guidelines

You can use this feature to rearrange only existing NAT rules to change their priority.

When you rearrange global NAT rules to change their priority, make sure all NAT rules containing destination address translation methods are before the NAT rules containing only source address translation methods.

- Do not place a NAT rule containing a destination address translation method after a NAT rule containing only a source address translation method.
- Do not place a NAT rule containing only a source address translation method before a NAT rule containing a destination address translation method.

Procedure

1. Enter system view.

   system-view

2. Enter the global NAT policy view.

nat global-policy

3. Rearrange NAT rules to change their priority.

   rule move *rule-name1* [**type** { **nat** | **nat64** | **nat66** }] { **after** | **before** } [*rule-name2* [**type** { **nat** | **nat64** | **nat66** }]]

Disabling NAT rules

Restrictions and guidelines

This feature does not delete a NAT rule, but makes the rule ineffective. To delete a NAT rule, use the **undo rule name** command.

Procedure

1. Enter system view.

   system-view

2. Enter the global NAT policy view.

   nat global-policy

3. Enter the view of a NAT rule.

   rule name *rule-name* [**type** { **nat** | **nat64** | **nat66** }]

4. Disable the NAT rule.

   disable

   By default, NAT rules are enabled.

Configuring NAT ALG

1. Enter system view.

   system-view

2. Configure NAT ALG for a protocol or all protocols.

   nat alg { **all** | **dns** | **ftp** | **h323** | **icmp-error** | **ils** | **mgcp** | **nbt** | **pptp** | **rsh** | **rtsp** | **sccp** | **sctp** | **sqlnet** | **tftp** | **xdmcp** }

   By default, NAT ALG is enabled for DNS, FTP, ICMP error messages, PPTP, and RTSP, and is disabled for the other supported protocols.

Configuring NAT DNS mapping

About this task

NAT DNS mapping is applicable to scenarios that internal users access an internal server by using the domain name of the server when the DNS server is located at the external network.

Enabled with this feature, NAT translates the public IP address in the DNS reply payload into the private IP address. So that the internal users access the internal server by using the private IP address.

NAT DNS mapping works in conjunction with address translation of the server mapping method:

1. A NAT DNS mapping maps the domain name to the public IP address, public port number, and the protocol type for the internal server.
2. To specify the mapped public IP address, configure the destination IP address match criterion. To specify the mapped protocol type and public port number, configure the service type match criterion. To specify the translated private IP address, perform the address translation.

3. Upon receiving the DNS response, the NAT device performs a DNS mapping lookup by using the domain name in the response. If a match is found, NAT translates the public IP address in the response into the private IP address.

Procedure

1. Enter system view.

   system-view

2. Enable NAT ALG for DNS.

   nat alg dns

   By default, NAT ALG is enabled for DNS.

3. Configure a NAT DNS mapping.

   nat dns-map domain *domain-name* **protocol** *pro-type* { **interface** *interface-type interface-number* | **ip** *global-ip* } **port** *global-port*

   You can configure multiple NAT DNS mappings.

Enabling NAT port halving

About this task

After you enable NAT port halving in VRRP load balancing on an IRF fabric, each port block will be equally divided between the two devices. The two devices will use different ports to translate packets from the same IP address, avoiding port assignment conflicts.

For more information about the IRF fabric, see *Virtual Technologies Configuration Guide*.

Restrictions and guidelines

Do not use this feature in VRRP standard mode on an IRF fabric.

Procedure

1. Enter system view.

   system-view

2. Enable NAT port halving.

   nat port-load-balance enable slot *slot-number*

   By default, NAT port halving is disabled.

Configuring hot backup for NAT

About hot backup for NAT

If only one NAT device is deployed in the internal network, internal users cannot access the external network when the NAT device fails. To avoid this situation, configure hot backup for NAT. In the hot backup plan, the two devices in a hot backup system are capable of processing NAT services. Session entries, session relation entries, NAT port block entries, and NAT configurations are synchronized through the hot backup channel. When one device fails, the other device takes over.

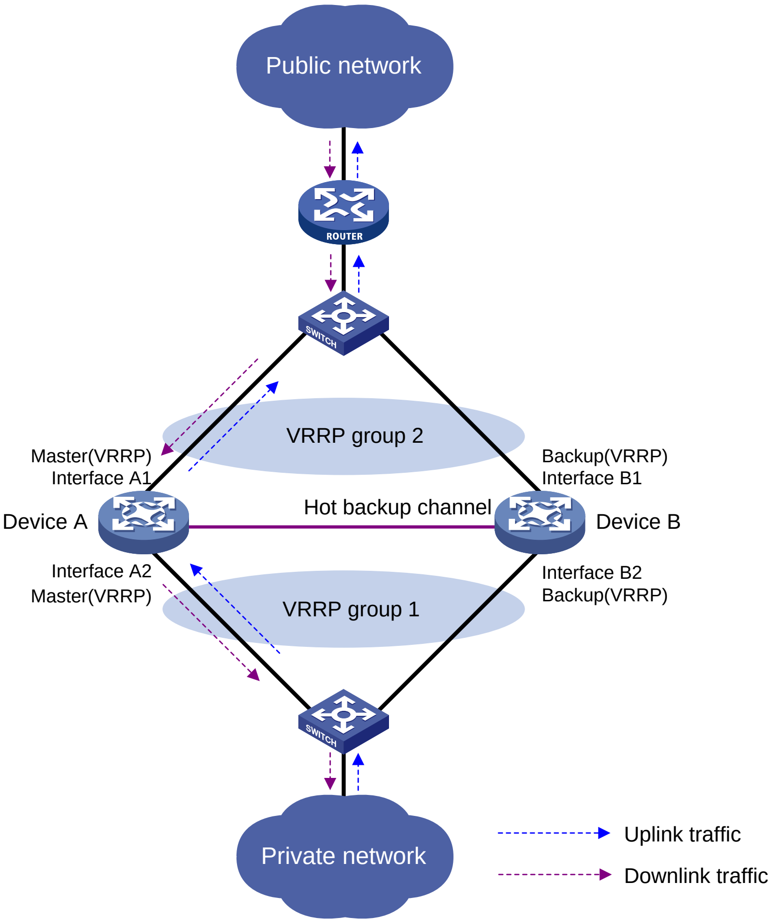
For more information about configuring hot backup, see *High Availability Configuration Guide*.

Operating mechanism

Typically, the master device in the VRRP group processes NAT services in the hot backup system. The following example illustrates how the hot backup system in active/standby mode ensures uninterrupted NAT services when the master device fails.

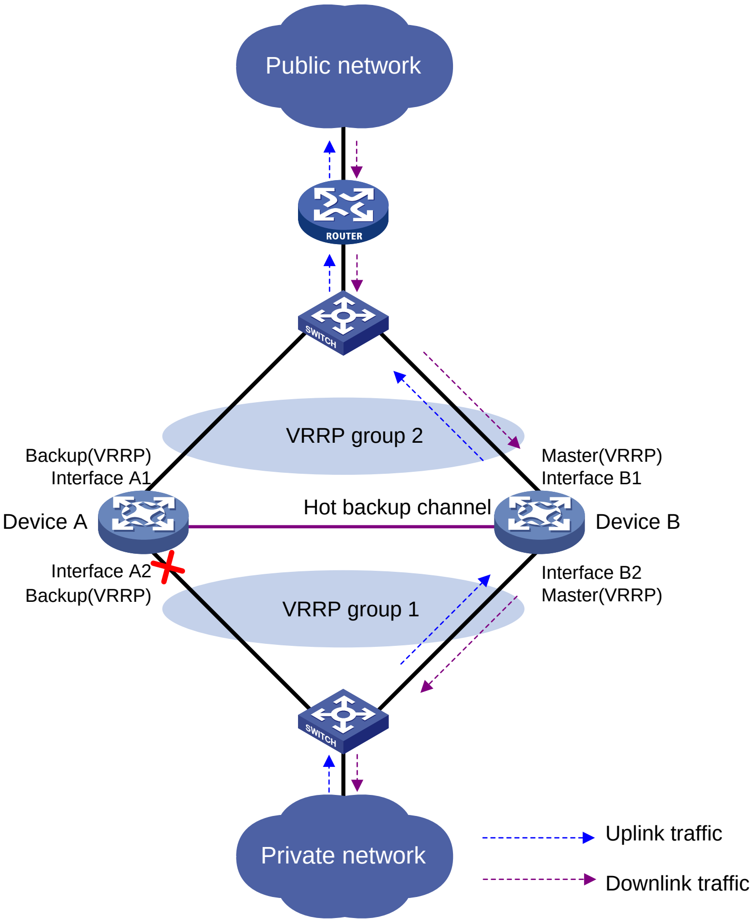
As shown in Figure 9, Device A acts as the primary device and Device B acts as the secondary device in a hot backup system. Device A synchronizes its session entries, session relation entries, and port block entries to Device B in real time through the hot backup channel. Downlinks of Device A and Device B are in VRRP group 1 and uplinks of Device A and Device B are in VRRP group 2. VRRP groups are associated with the hot backup system. RBM selects Device A as the master device for address translation based on the link status or forwarding capability of Device A.

Figure 9 Hot backup system in active/standby mode



As shown in Figure 10, when Interface A2 of Device A fails, Device B becomes the master device in the VRRP group. Because Device B has NAT configuration information and service entries, NAT services are not interrupted after link switchover.

Figure 10 Traffic switchover in active/standby mode



Configuring the hot backup system in active/standby mode

About this task

For active/standby hot backup, some translation rules for static address translation, source address translation, and destination address translation assign the public address after translation or public IP address of the internal server to the address management module. Then, both the active and standby devices advertise the mappings between the public IP address and MAC addresses of their own physical interfaces to all nodes in the same LAN or local link. As a result, the uplink Layer 3 device directly connected to the hot backup system might send downlink packets to the backup device, causing service anomalies.

To avoid such an issue, bind an address translation method to a VRRP group. Then, only the master device responds to ARP requests or NS messages with the virtual MAC address of the VRRP group. For more information about configuring the hot backup system, see *High Availability Configuration Guide*.

Restrictions and guidelines

Bind an address translation method to a VRRP group in NAT rule view on the primary device in the hot backup system. The virtual IP address of the VRRP group and the public IP address after translation or the public IP address of the internal server are on the same segment.

Procedure (NAT-type rule)

1. Enter system view.

system-view

2. Enter global NAT policy view.

   nat global-policy

3. Enter NAT rule view.

   rule name *rule-name* [**type nat**]

4. Bind a translation method to a VRRP group. Choose the options to configure as needed:
   - Bind the NO-PAT method to a VRRP group for source address translation.

     action snat address-group { *group-id* | **name** *group-name* } **no-pat** [**reversible**] **vrrp** *virtual-router-id*
   - Bind the PAT method to a VRRP group for source address translation.

     action snat address-group { *group-id* | **name** *group-name* } [**port-preserved**] **vrrp** *virtual-router-id*
   - Bind the static source address translation method to a VRRP group.

     action snat static { **ip-address** *global-address* | **object-group** *object-group-name* | **subnet** *subnet-ip-address mask-length* } **vrrp** *virtual-router-id*
   - Bind the server mapping method to a VRRP group for destination address translation.

     action dnat { **ip-address** *local-address* | **object-group** *ipv4-object-group-name* } [**local-port** *local-port*] **vrrp** *virtual-router-id*

   By default, a translation method is not bound to any VRRP group.

Procedure (NAT64-type rule)

1. Enter system view.

   system-view

2. Enter global NAT policy view.

   nat global-policy

3. Create a NAT64-type rule and enter its view.

   rule name *rule-name* **type nat64**

4. Bind a translation method to a VRRP group. Choose the options to configure as needed:
   - Bind the NO-PAT method to a VRRP group for source address translation.

     action snat object-group *ipv4-object-group-name* **no-pat** [**ipv4-vrrp** *virtual-router-id*] [**vrf** *vrf-name*]
   - Bind the PAT method to a VRRP group for source address translation.

     action snat object-group *ipv4-object-group-name* [**ipv4-vrrp** *virtual-router-id*] [**vrf** *vrf-name*]
   - Bind the IPv6-to-IPv4 static source address translation method to a VRRP group.

     action snat static ip-address *global-ipv4-address* [**ipv4-vrrp** *virtual-router-id*] [**vrf** *vrf-name*]
   - Bind the IPv4-to-IPv6 static source address translation method to a VRRP group.

     action snat static ip-address *global-ipv6-address* [**ipv6-vrrp** *virtual-router-id*] [**vrf** *vrf-name*]
   - Bind the IPv6-to-IPv4 static destination address translation method to a VRRP group.

     action dnat static ip-address *local-ipv4-address* [**ipv6-vrrp** *virtual-router-id*] [**vrf** *vrf-name*]
   - Bind the IPv4-to-IPv6 static destination address translation method to a VRRP group.

action dnat static ip-address *local-ipv6-address* [**ipv4-vrrp** *virtual-router-id*] [**vrf** *vrf-name*]

- Bind the server mapping method to a VRRP group for IPv4-to-IPv6 destination address translation.

  action dnat server ip-address *local-ipv6-address* [**local-port** *local-port*] [**ipv4-vrrp** *virtual-router-id*] [**vrf** *vrf-name*]
- Bind the prefix method to a VRRP group for IPv4-to-IPv6 destination address translation.

  action dnat prefix { **general v4tov6** *prefix-general prefix-length* | **ivi v4tov6** *prefix-ivi* } [**ipv4-vrrp** *virtual-router-id*] [**vrf** *vrf-name*]

By default, a translation method is not bound to any VRRP group.

Procedure (NAT66-type rule)

1. Enter system view.

   system-view
2. Enter global NAT policy view.

   nat global-policy
3. Create a NAT66-type rule and enter its view.

   rule name *rule-name* **type nat66**
4. Bind the static source address translation method to a VRRP group.

   action snat static ip-address *global-ipv6-address* [**ipv6-vrrp** *virtual-router-id*] [**vrf** *vrf-name*]

   By default, a static source address translation method is not bound to any VRRP group.

Configuring the hot backup system in dual-active mode

About this task

For dual-active hot backup, the uplink Layer 3 device directly connected to the hot backup system might send downlink packets to the backup device, causing service anomalies.

To avoid such an issue, bind an address translation method to a VRRP group. Then, only the master device responds to ARP requests or NS messages with the virtual MAC address of the VRRP group. For more information about configuring the hot backup system, see *High Availability Configuration Guide*.

Restrictions and guidelines

Select one of the following configuration methods:

- The two devices can share the same NAT address group. To prevent different master devices from using the same IP-port mapping for different hosts, specify the PAT translation mode for NAT rules and execute the **nat remote-backup port-alloc** command on the primary device.
- As a best practice to prevent different master devices from using the same IP-port mapping for different hosts, configure the two devices to use different public IP addresses for address translation. For example, if the two devices use addresses in different NAT address groups, user traffic with different source IP addresses is identified by source IP address match criteria in NAT rules. To enable different master devices to translate the forward user traffic, specify different gateway addresses for different internal users. To direct the reverse traffic to different master devices, bind the address translation method to different VRRP groups on the primary device for load sharing.

Bind an address translation method to a VRRP group in NAT rule view on the primary device in the hot backup system. The virtual IP address of the VRRP group and the public IP address after translation or public IP address of the internal server are on the same segment.

Procedure (NAT-type rule)

1. Enter system view.
   ```
   system-view
   ```
2. Enter global NAT policy view.
   ```
   nat global-policy
   ```
3. Enter NAT rule view.
   ```
   rule name rule-name [ type nat ]
   ```
4. Bind a translation method to a VRRP group. Choose the options to configure as needed:
   - Bind the NO-PAT method to a VRRP group for source address translation.
     ```
     action snat address-group { group-id | name group-name } no-pat
     [ reversible ] vrrp virtual-router-id
     ```
   - Bind the PAT method to a VRRP group for source address translation.
     ```
     action snat address-group { group-id | name group-name }
     [ port-preserved ] vrrp virtual-router-id
     ```
   - Bind the static source address translation method to a VRRP group.
     ```
     action snat static { ip-address global-address | object-group
     object-group-name | subnet subnet-ip-address mask-length } vrrp
     virtual-router-id
     ```
   - Bind the server mapping method to a VRRP group for destination address translation.
     ```
     action dnat { ip-address local-address | object-group
     ipv4-object-group-name } [ local-port local-port ] vrrp
     virtual-router-id
     ```

   By default, no translation method is bound to any VRRP group.
5. (Optional.) Specify NAT port block ranges for the two devices in the hot backup system.
   a. Return to global NAT policy view.
      ```
      quit
      ```
   b. Return to system view.
      ```
      quit
      ```
   c. Specify NAT port ranges for the two devices in the hot backup system.
      ```
      nat remote-backup port-alloc { primary | secondary }
      ```
      By default, the two devices in the hot backup system share NAT port resources.

      The following table describes port ranges indicated by the keywords:

Keyword	Port ranges
primary	The first half of the port range.
secondary	The second half of the port range.

Procedure (NAT64-type rule)

1. Enter system view.
   ```
   system-view
   ```
2. Enter global NAT policy view.
   ```
   nat global-policy
   ```

3. Create a NAT64-type rule and enter its view.

   rule name *rule-name* **type nat64**

4. Bind a translation method to a VRRP group. Choose the options to configure as needed:
   - Bind the NO-PAT method to a VRRP group for source address translation.

     action snat object-group *ipv4-object-group-name* **no-pat** [**ipv4-vrrp** *virtual-router-id*] [**vrf** *vrf-name*]
   - Bind the PAT method to a VRRP group for source address translation.

     action snat object-group *ipv4-object-group-name* [**ipv4-vrrp** *virtual-router-id*] [**vrf** *vrf-name*]
   - Bind the IPv6-to-IPv4 static source address translation method to a VRRP group.

     action snat static ip-address *global-ipv4-address* [**ipv4-vrrp** *virtual-router-id*] [**vrf** *vrf-name*]
   - Bind the IPv4-to-IPv6 static source address translation method to a VRRP group.

     action snat static ip-address *global-ipv6-address* [**ipv6-vrrp** *virtual-router-id*] [**vrf** *vrf-name*]
   - Bind the IPv6-to-IPv4 static destination address translation method to a VRRP group.

     action dnat static ip-address *local-ipv4-address* [**ipv6-vrrp** *virtual-router-id*] [**vrf** *vrf-name*]
   - Bind the IPv4-to-IPv6 static destination address translation method to a VRRP group.

     action dnat static ip-address *local-ipv6-address* [**ipv4-vrrp** *virtual-router-id*] [**vrf** *vrf-name*]
   - Bind the server mapping method to a VRRP group for IPv4-to-IPv6 destination address translation.

     action dnat server ip-address *local-ipv6-address* [**local-port** *local-port*] [**ipv4-vrrp** *virtual-router-id*] [**vrf** *vrf-name*]
   - Bind the prefix method to a VRRP group for IPv4-to-IPv6 destination address translation.

     action dnat prefix { **general v4tov6** *prefix-general prefix-length* | **ivi v4tov6** *prefix-ivi* } [**ipv4-vrrp** *virtual-router-id*] [**vrf** *vrf-name*]

   By default, a translation method is not bound to any VRRP group.

Procedure (NAT66-type rule)

1. Enter system view.

   system-view

2. Enter global NAT policy view.

   nat global-policy

3. Create a NAT66-type rule and enter its view.

   rule name *rule-name* **type nat66**

4. Bind the static source address translation method to a VRRP group.

   action snat static ip-address *global-ipv6-address* [**ipv6-vrrp** *virtual-router-id*] [**vrf** *vrf-name*]

   By default, a static source address translation method is not bound to any VRRP group.

Configuring NAT in specific networks

Enabling NAT reply redirection

About this task

In some network scenarios, the inbound dynamic NAT is configured with tunneling, and multiple tunnel interfaces use the same NAT address group. In this case, the device will translate the source IP addresses of packets from different tunnels into the same NAT address before forwarding them. When the forwarding interface receives the reply packets, the device, by default, will not look up the NAT session table. This will cause the incorrect forwarding of the reply packets. To solve the problem, you can enable the NAT reply redirection feature on the forwarding interface. NAT reply redirection allows the interface to use the NAT session table to translate the destination IP addresses for NAT reply packets and find the correct output interfaces for those NATed reply packets.

Procedure

1. Enter system view.

   `system-view`

2. Enter interface view.

   `interface` *`interface-type interface-number`*

3. Enable NAT reply redirection.

   `nat redirect reply-route enable`

   By default, NAT reply redirection is disabled.

Enabling the deletion of timestamps in TCP SYN and SYN ACK packets

About this task

With this feature configured, the system deletes the timestamps from the TCP SYN and SYN ACK packets after dynamic address translation.

If PAT mode is configured on an interface by using **`nat inbound`** or **`nat outbound`**, and the tcp_timestams and tcp_tw_recycle function is configured on the TCP server, TCP connections might not be established. To solve the problem, you can shut down the tcp_tw_recycle function or configure the **`nat timestamp delete`** command.

Procedure

1. Enter system view.

   `system-view`

2. Enable the deletion of timestamps in TCP SYN and SYN ACK packets

   `nat timestamp delete` `[` **`vpn-instance`** *`vpn-instance-name`* `]`

   By default, the deletion of timestamps in TCP SYN and SYN ACK packets is disabled.

   You can enable this feature for multiple VPN instances by repeating the command with different VPN parameters.

Configuring NAT maintenance

Configuring periodic NAT statistics collection

About this task

This feature periodically counts sessions and port block assignment failures for address groups.

Hardware and feature compatibility

Models	Feature compatibility
NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280	No
NFNX5-HD6480, NFNX3-HDB1780, NFNX3-HDB3080, NFNX3-HDB1180, NFNX3-HDB1480, NFNX3-HDB680, NFNX3-HDB1080	Yes

Restrictions and guidelines

This feature might cause intensive CPU usage. You can disable the feature when CPU resources are insufficient.

Procedure

1. Enter system view.

   `system-view`

2. Enable periodic NAT statistics collection.

   `nat periodic-statistics enable`

   By default, periodic NAT statistics collection is disabled.

3. Configure the interval for periodic NAT statistics collection.

   `nat periodic-statistics interval` *`interval`*

   By default, the interval for periodic NAT statistics collection is 300 seconds.

   A narrower interval indicates intensive CPU usage. As a best practice, use the default interval value.

Enabling statistics collection for NAT session creation rate

About this task

This feature collects information about NAT session creation rates. To view the statistics, use the **`display nat statistics`** command.

Procedure

1. Enter system view.

   `system-view`

2. Enable statistics collection for NAT session creation rate.

   `nat session create-rate enable`

   By default, statistics collection for NAT session creation rate is disabled.

Specifying a probe method for detecting reachability of NAT address group members

About this task

The NAT address group probing uses an NQA template to detect the reachability of the addresses in the group. For information about NQA, see *Network Management and Monitoring Configuration Guide*.

The device periodically sends probe packets to the specified destination address in the NQA template. The source IP addresses in the probe packets are the IP addresses in the NAT address group.

- If the device receives a response packet for a probe, the probed source IP address can be used for address translation.
- If the device does not receive a response packet for a probe, the probed source IP address will be excluded from address translation temporarily. However, in the next NQA operation period, this excluded IP address is also probed. If a response is received in this round, the IP address can be used for address translation.

Restrictions and guidelines

You can specify multiple NQA templates in one NAT address group view. An IP address in the address group is identified as reachable as long as one probe for this IP address succeeds.

This feature is applicable to NAT address groups used for outbound address translation. The manually configured excluded IP addresses are not probed.

Make sure the NQA template used for NAT address group probing does not have source IP address configured.

Procedure

1. Enter system view.

   system-view

2. Enter NAT address group view.

   nat address-group *group-id* [**name** *group-name*]

3. Specify a probe method for the NAT address group.

   probe *template-name*

   By default, no probe method is specified for a NAT address group.

   You can specify a nonexistent probe method. The probing takes effect only after you create and configure the NQA template.

Enabling sending ICMP error messages for NAT failures

About this task

By default, the device does not send ICMP error messages when NAT fails. Disabling sending ICMP error messages for NAT failures reduces useless packets, saves bandwidth, and avoids exposing the firewall IP address to the public network.

Procedure

1. Enter system view.

   system-view

2. Enable sending ICMP error messages for NAT failures.

   nat icmp-error reply

By default, no ICMP error messages are sent for ICMP packet translation failures.

Enabling NAT configuration changes to take effect only on new connections

About this task

By default, NAT configuration changes (such as adding, deleting, editing, or moving NAT rules) might cause traffic on an established connection to match a new NAT rule. As a result, you must create a new connection.

Execute the **`nat configuration-for-new-connection enable`** command if you do not want the NAT configuration change to affect existing connections. After you execute this command on the device, it still performs address translation according to the NAT rules before the configuration change for traffic on existing connections. For traffic on new connections, the device matches the traffic according to the priority of NAT rules after the configuration change and performs address translation based on the matching NAT rules.

Procedure

1. Enter system view.

   `system-view`

2. Enable NAT configuration change to take effect only on new connections.

   `nat configuration-for-new-connection enable`

   By default, NAT configuration change taking effect only on new connections is disabled.

Configuring NAT logging

Configuring NAT session logging

About this task

NAT session logging records NAT session information, including translation information and access information.

A NAT device generates NAT session logs for the following events:

- NAT session establishment.
- NAT session removal. This event occurs when you add a configuration with a higher priority, remove a configuration, change ACLs, when a NAT session ages out, or when you manually delete a NAT session.
- Active NAT session logging.

Procedure

1. Enter system view.

   `system-view`

2. Enable NAT logging.

   `nat log enable` [**`acl`** { *`ipv4-acl-number`* | **`name`** *`ipv4-acl-name`* }]

   By default, NAT logging is disabled.

3. Enable NAT session logging.
   - For NAT session establishment events:

     `nat log flow-begin`

   - For NAT session removal events:

```
nat log flow-end
```

- For active NAT flows:

```
nat log flow-active time-value
```

By default, NAT session logging is disabled.

Configuring NAT444 user logging

About this task

NAT444 user logs are used for user tracing. The NAT444 gateway generates a user log whenever it assigns or withdraws a port block. The log includes the private IP address, public IP address, and port block. You can use the public IP address and port numbers to locate the user's private IP address from the user logs.

A NAT444 gateway generates NAT user logs when one of the following events occurs:

- A port block is assigned.

  For the NAT444 static port block mapping, the NAT444 gateway generates a user log when it translates the first connection from a private IP address.

  For the NAT444 dynamic port block mapping, the NAT444 gateway generates a user log when it assigns or extends a port block for a private IP address.

- A port block is withdrawn.

  For the NAT444 static port block mapping, the NAT444 gateway generates a user log when all connections from a private IP address are disconnected.

  For the NAT444 dynamic port block mapping, the NAT444 gateway generates a user log when all the following conditions are met:

  - All connections from a private IP address are disconnected.
  - The port blocks (including the extended ones) assigned to the private IP address are withdrawn.
  - The corresponding mapping entry is deleted.

Prerequisites

Before configuring NAT444 user logging, you must configure the custom NAT444 log generation and outputting features. For more information, see the information center in *Network Management and Monitoring Configuration Guide*.

Procedure

1. Enter system view.

```
system-view
```

2. Enable NAT logging.

```
nat log enable [ acl { ipv4-acl-number | name ipv4-acl-name } ]
```

   By default, NAT logging is disabled.

   The **acl** keyword does not take effect on NAT444 user logging.

3. Enable NAT444 user logging. Choose the options to configure as needed:
   - For port block assignment:

```
nat log port-block-assign
```

   - For port block withdrawal:

```
nat log port-block-withdraw
```

   By default, NAT444 user logging is disabled.

Configuring NAT alarm logging

About this task

Packets that need to be translated are dropped if the NAT resources are not enough. In NO-PAT, the NAT resources refer to the public IP addresses. In EIM PAT, the NAT resources refer to public IP addresses and ports. In NAT444, the NAT resources refer to public IP addresses, port blocks, or ports in port blocks. NAT alarm logging monitors the usage of NAT resources and outputs logs if the NAT resources are not enough.

For NAT444 dynamic port block mappings, an alarm log is generated upon the port block assignment failure or the failure that port resources cannot meet the user address translation requirement.

Restrictions and guidelines

The **`nat log alarm`** command take effect only after you use the **`nat log enable`** command to enable NAT logging.

Prerequisites

Before configuring NAT alarm logging, you must configure the custom NAT log generation and outputting features. For more information, see the information center in *Network Management and Monitoring Configuration Guide*.

Procedure

1. Enter system view.

   `system-view`

2. Enable NAT logging.

   `nat log enable` [**`acl`** { *`ipv4-acl-number`* | **`name`** *`ipv4-acl-name`* }]

   By default, NAT logging is disabled.

   The **`acl`** keyword does not take effect on NAT alarm logging.

3. Enable NAT alarm logging.

   `nat log alarm`

   By default, NAT alarm logging is disabled.

   An NAT alarm log is output when NAT resources run out.

4. (Optional.) Set the NAT444 port block usage threshold.

   `nat log port-block usage threshold` *`threshold-value`*

   By default, the NAT444 port block usage threshold is 90%.

   The system generates alarm logs if the port block usage exceeds the threshold.

Enabling logging for IP usage of a NAT address group in NO-PAT mode

About this task

The system generates a log if the IP usage of a NAT address group exceeds the threshold.

Restrictions and guidelines

This feature takes effect only after you enable NAT logging by using the **`nat log enable`** command.

Procedure

1. Enter system view.

system-view

2. Enable NAT logging.

   nat log enable [**acl** { *ipv4-acl-number* | **name** *ipv4-acl-name* }]

   By default, NAT logging is disabled.

   The **acl** keyword does not take effect on the logging for IP usage of a NAT address group in NO-PAT mode.

3. Enable logging for the IP usage of a NAT address group in NO-PAT mode and set a threshold.

   nat log no-pat ip-usage [**threshold** *value*]

By default, logging is disabled for the IP usage of a NAT address group.

Display and maintenance commands for global NAT

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display the NAT ALG status for all supported protocols.	**display nat alg**
Display all NAT configuration information.	**display nat all**
Display NAT address group information.	**display nat address-group** [*group-id*]
Display NAT logging configuration.	**display nat log**
Display information about NAT NO-PAT entries.	**display nat no-pat** [**slot** *slot-number*]
Display IP usage of NAT address groups in NO-PAT mode.	**display nat no-pat ip-usage** [**address-group** { *group-id* | **name** *group-name* } | **object-group** *object-group-name*] [**slot** *slot-number*]
Display periodic NAT statistics.	**display nat periodic-statistics** { **address-group** [*group-id* | **name** *group-name*] | **ip** *global-ip* } [**slot** *slot-number*]
Display NAT sessions.	**display nat session** [[**responder**] { **source-ip** *source-ip* | **destination-ip** *destination-ip* } * [**vpn-instance** *vpn -instance-name*]] [**slot**

	slot-number] [**brief** | **verbose**]
Display NAT statistics.	**display nat statistics** [**summary**] [**slot** *slot-number*]
Display NAT port block mappings.	**display nat port-block dynamic** [**address-group** { *group-id* | **name** *group-name* }] [**slot** *slot-number*]
Display the port block usage for address groups.	**display nat port-block-usage** [**address-group** *group-id*] [**slot** *slot-number*]
Display NAT address group probe information.	**display nat probe address-group** [*group-id*]
Clear NAT counting statistics.	**reset nat count statistics** { **all** | **dynamic** | **global-policy** | **server** | **static** }
Clear periodic NAT statistics.	**reset nat periodic-statistics** [**slot** *slot-number*]
Clear NAT sessions.	**reset nat session** [**slot** *slot-number*]

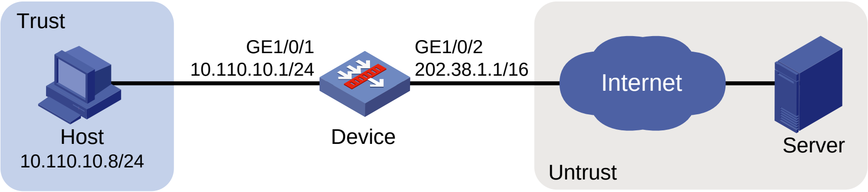
Global NAT configuration examples

Example: Configuring outbound one-to-one static NAT

Network configuration

Configure static NAT to allow the host at 10.110.10.8/24 to access the server at 201.20.1.1/24 on the Internet.

Figure 11 Network diagram



Procedure

1. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

   ```
   <Device> system-view
   [Device] interface gigabitethernet 1/0/1
   [Device-GigabitEthernet1/0/1] ip address 10.110.10.1 24
   [Device-GigabitEthernet1/0/1] quit
   ```

   # Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Add interfaces to security zones.

   ```
   ［Device］ security-zone name trust
   ［Device-security-zone-Trust］ import interface gigabitethernet 1/0/1
   ［Device-security-zone-Trust］ quit
   ［Device］ security-zone name untrust
   ［Device-security-zone-Untrust］ import interface gigabitethernet 1/0/2
   ［Device-security-zone-Untrust］ quit
   ```

3. Configure settings for routing.

   This example configures a static route, and the next hop in the routes is 202.38.1.2.

   ```
   [Device] ip route-static 201.20.1.0 24 202.38.1.2
   ```

4. Configure a security policy:

   # Configure a rule named **trust-untrust** to permit the packets from the host to the server.

   ```
   [Device] security-policy ip
   [Device-security-policy-ip] rule name trust-untrust
   [Device-security-policy-ip-1-trust-untrust] source-zone trust
   [Device-security-policy-ip-1-trust-untrust] destination-zone untrust
   [Device-security-policy-ip-1-trust-untrust] source-ip-host 10.110.10.8
   [Device-security-policy-ip-1-trust-untrust] destination-ip-host 201.20.1.1
   [Device-security-policy-ip-1-trust-untrust] action pass
   [Device-security-policy-ip-1-trust-untrust] quit
   [Device-security-policy-ip] quit
   ```

5. Configure NAT:

   # Configure a one-to-one static NAT mapping between the private address 10.110.10.8 and the public address 202.38.1.100.

   ```
   [Device] nat global-policy
   [Device-nat-global-policy] rule name rule1
   [Device-nat-global-policy-rule-rule1] source-ip host 10.110.10.8
   [Device-nat-global-policy-rule-rule1] source-zone trust
   [Device-nat-global-policy-rule-rule1] destination-zone untrust
   [Device-nat-global-policy-rule-rule1] action snat static ip-address 202.38.1.100
   ```

Verifying the configuration

# Verify that the host at 10.110.10.8/24 can access the server on the Internet. (Details not shown.)

# Display static NAT configuration.

```
[Device] display nat global-policy
NAT global-policy information:
  Totally 1 NAT global-policy rules.
  Rule name: rule1
    Type                  : nat
    SrcIP address         : 10.110.10.8
```

```
    Source-zone name      : Trust
    Destination-zone name : Untrust
    SNAT action:
      Ipv4 address: 202.38.1.100
    NAT counting : 0
    Config status: Active
```

# Display NAT sessions.

```
[Device] display nat session verbose
Slot 1:
Initiator:

Initiator->Responder:           8 packets        375 bytes
Responder->Initiator:          10 packets        851 bytes

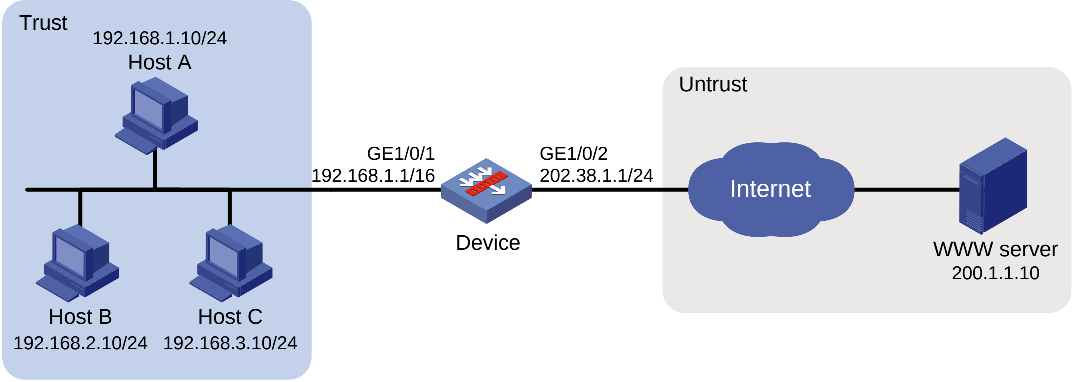
Total sessions found: 1
```

Example: Configuring outbound dynamic NAT (non-overlapping addresses)

Network configuration

As shown in Figure 12, a company has a private address 192.168.0.0/16 and two public IP addresses 202.38.1.2 and 202.38.1.3. Configure outbound dynamic NAT to allow only internal users on subnet 192.168.1.0/24 to access the Internet.

Figure 12 Network diagram



Procedure

1. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

```
<Device> system-view
[Device] interface gigabitethernet 1/0/1
[Device-GigabitEthernet1/0/1] ip address 192.168.1.1 16
[Device-GigabitEthernet1/0/1] quit
```

   # Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Add interfaces to security zones.

```
[Device] security-zone name trust
[Device-security-zone-Trust] import interface gigabitethernet 1/0/1
[Device-security-zone-Trust] quit
[Device] security-zone name untrust
[Device-security-zone-Untrust] import interface gigabitethernet 1/0/2
[Device-security-zone-Untrust] quit
```

3. Configure settings for routing.

   This example configures a static route, and the next hop in the routes is 202.38.1.20.

```
[Device] ip route-static 200.1.1.0 24 202.38.1.20
```

4. Configure a security policy:

   # Configure a rule named **trust-untrust** to permit the packets from the hosts to the server.

```
[Device] security-policy ip
[Device-security-policy-ip] rule name trust-untrust
[Device-security-policy-ip-1-trust-untrust] source-zone trust
[Device-security-policy-ip-1-trust-untrust] destination-zone untrust
[Device-security-policy-ip-1-trust-untrust] source-ip-subnet 192.168.1.0 24
[Device-security-policy-ip-1-trust-untrust] destination-ip-host 200.1.1.10
[Device-security-policy-ip-1-trust-untrust] action pass
[Device-security-policy-ip-1-trust-untrust] quit
[Device-security-policy-ip] quit
```

5. Configure NAT:

   # Configure address group 0, and add an address range from 202.38.1.2 to 202.38.1.3 to the group.

```
[Device] nat address-group 0
[Device-address-group-0] address 202.38.1.2 202.38.1.3
```

```
[Device-address-group-0] quit
```

# Configure address object group **obj1** to identify packets from subnet 192.168.1.0/24.

```
[Device] object-group ip address obj1
[Device-obj-grp-ip-obj1] network subnet 192.168.1.0 24
[Device-obj-grp-ip-obj1] quit
```

# Configure a NAT rule for the global policy, and specify address object group **obj1** as the packet match criterion and use NAT address group **0** for source address and port translation.

```
[Device] nat global-policy
[Device-nat-global-policy] rule name rule1
[Device-nat-global-policy-rule-rule1] source-ip obj1
[Device-nat-global-policy-rule-rule1] action snat address-group 0
```

Verifying the configuration

# Verify that Host A can access the WWW server, while Host B or Host C cannot. (Details not shown.)

# Display all NAT configuration and statistics.

```
[Device] display nat all
NAT address group information:
  Totally 1 NAT address groups.

```

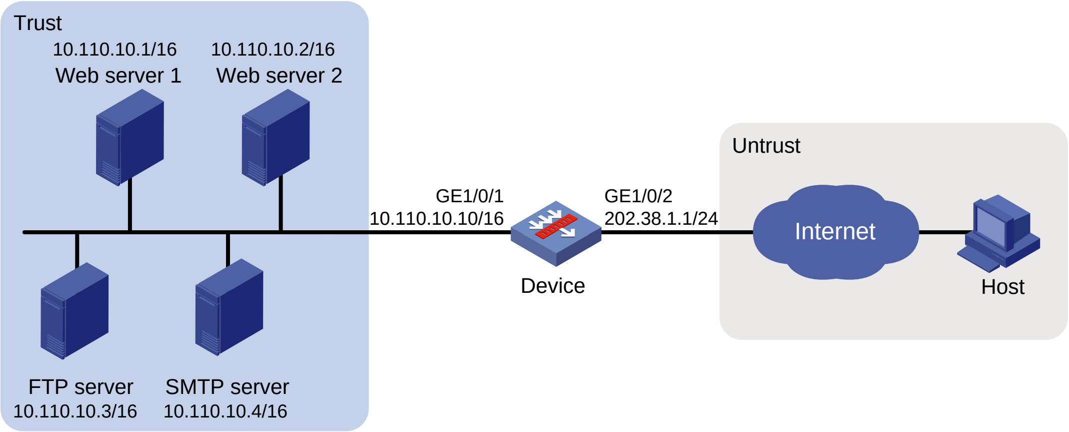
Example: Configuring NAT Server for external-to-internal access

Network configuration

As shown in Figure 13, two Web servers, one FTP server and one SMTP server, are in the internal network to provide services for external users. The internal network address is 10.110.0.0/16. The company has three public IP addresses from 202.38.1.1/24 to 202.38.1.3/24.

Configure the NAT Server feature to allow the external user to access the internal servers with public address 202.38.1.1/24.

Figure 13 Network diagram



Procedure

1. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

   ```
   <Device> system-view
   [Device] interface gigabitethernet 1/0/1
   [Device-GigabitEthernet1/0/1] ip address 10.110.10.10 16
   [Device-GigabitEthernet1/0/1] quit
   ```

   # Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Add interfaces to security zones.

   ```
   [Device] security-zone name trust
   [Device-security-zone-Trust] import interface gigabitethernet 1/0/1
   [Device-security-zone-Trust] quit
   [Device] security-zone name untrust
   [Device-security-zone-Untrust] import interface gigabitethernet 1/0/2
   ```

```
[Device-security-zone-Untrust] quit
```

3. Configure a security policy:

# Configure a rule named **untrust-trust** to permit the packets from the host to the servers.

```
[Device] security-policy ip
[Device-security-policy-ip] rule name untrust-trust
[Device-security-policy-ip-1-untrust-trust] source-zone untrust
[Device-security-policy-ip-1-untrust-trust] destination-zone trust
[Device-security-policy-ip-1-untrust-trust] destination-ip-host 10.110.10.1
[Device-security-policy-ip-1-untrust-trust] destination-ip-host 10.110.10.2
[Device-security-policy-ip-1-untrust-trust] destination-ip-host 10.110.10.3
[Device-security-policy-ip-1-untrust-trust] destination-ip-host 10.110.10.4
[Device-security-policy-ip-1-untrust-trust] action pass
[Device-security-policy-ip-1-untrust-trust] quit
[Device-security-policy-ip] quit
```

4. Configure NAT:

# Configure service object groups for FTP, Web, and SMTP services.

```
[Device] object-group service service1
[Device-obj-grp-service-service1] service tcp destination eq 21
[Device-obj-grp-service-service1] quit
[Device] object-group service service2
[Device-obj-grp-service-service2] service tcp destination eq 80
[Device-obj-grp-service-service2] quit
[Device] object-group service service3
[Device-obj-grp-service-service3] service tcp destination eq 8080
[Device-obj-grp-service-service3] quit
[Device] object-group service service4
[Device-obj-grp-service-service4] service tcp destination eq 25
[Device-obj-grp-service-service4] quit
```

# Configure global NAT rules to allow external users to access the internal servers.

```
[Device] nat global-policy
[Device-nat-global-policy] rule name rule1
[Device-nat-global-policy-rule-rule1] destination-ip host 202.38.1.1
[Device-nat-global-policy-rule-rule1] source-zone untrust
[Device-nat-global-policy-rule-rule1] service service1
[Device-nat-global-policy-rule-rule1] action dnat ip-address 10.110.10.3 local-port
21
[Device-nat-global-policy-rule-rule1] quit
[Device-nat-global-policy] rule name rule2
[Device-nat-global-policy-rule-rule2] destination-ip host 202.38.1.1
[Device-nat-global-policy-rule-rule2] source-zone untrust
[Device-nat-global-policy-rule-rule2] service service2
[Device-nat-global-policy-rule-rule2] action dnat ip-address 10.110.10.1 local-port
80
[Device-nat-global-policy-rule-rule2] quit
[Device-nat-global-policy] rule name rule3
[Device-nat-global-policy-rule-rule3] destination-ip host 202.38.1.1
[Device-nat-global-policy-rule-rule3] source-zone untrust
[Device-nat-global-policy-rule-rule3] service service3
```

```
[Device-nat-global-policy-rule-rule3] action dnat ip-address 10.110.10.2 local-port
80
[Device-nat-global-policy-rule-rule3] quit
[Device-nat-global-policy] rule name rule4
[Device-nat-global-policy-rule-rule4] destination-ip host 202.38.1.1
[Device-nat-global-policy-rule-rule4] source-zone untrust
[Device-nat-global-policy-rule-rule4] service service4
[Device-nat-global-policy-rule-rule4] action dnat ip-address 10.110.10.4 local-port
25
[Device-nat-global-policy-rule-rule4] quit
[Device-nat-global-policy] quit
```

Verifying the configuration

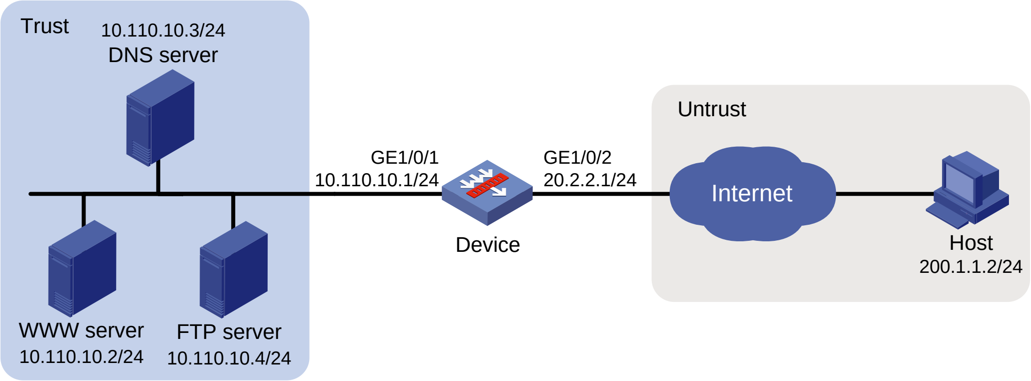
Example: Configuring NAT Server for external-to-internal access through domain name (non-overlapping addresses)

Network configuration

As shown in Figure 14, Web server at 10.110.10.2/24 in the internal network provides services for external users. A DNS server at 10.110.10.3/24 is used to resolve the domain name of the Web server. The company has two public IP addresses: 202.38.1.2 and 202.38.1.3.

Configure NAT Server to allow external users to access the internal Web server by using the domain name.

Figure 14 Network diagram



Requirements analysis

To meet the network requirements, you must perform the following tasks:

- Configure a NAT server mapping to map the private IP address and port of the DNS server to a public address and port. The mapping allows the external host to access the internal DNS server for domain name resolution.
- Enable ALG for DNS and configure outbound dynamic NAT to translate the private IP address of the Web server in the payload of the DNS response packet into a public IP address.

Procedure

1. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

   ```
   <Device> system-view
   [Device] interface gigabitethernet 1/0/1
   [Device-GigabitEthernet1/0/1] ip address 10.110.10.1 24
   [Device-GigabitEthernet1/0/1] quit
   ```

   # Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Add interfaces to security zones.

   ```
   [Device] security-zone name trust
   [Device-security-zone-Trust] import interface gigabitethernet 1/0/1
   [Device-security-zone-Trust] quit
   [Device] security-zone name untrust
   [Device-security-zone-Untrust] import interface gigabitethernet 1/0/2
   [Device-security-zone-Untrust] quit
   ```

3. Configure a security policy:

   # Configure a rule named **untrust-trust** to permit the packets from the host to the servers.

   ```
   [Device] security-policy ip
   [Device-security-policy-ip] rule name untrust-trust
   [Device-security-policy-ip-1-untrust-trust] source-zone untrust
   [Device-security-policy-ip-1-untrust-trust] destination-zone trust
   [Device-security-policy-ip-1-untrust-trust] destination-ip-host 10.110.10.2
   [Device-security-policy-ip-1-untrust-trust] destination-ip-host 10.110.10.3
   [Device-security-policy-ip-1-untrust-trust] destination-ip-host 10.110.10.4
   [Device-security-policy-ip-1-untrust-trust] action pass
   [Device-security-policy-ip-1-untrust-trust] quit
   [Device-security-policy-ip] quit
   ```

4. Configure NAT:

# Enable NAT with ALG for DNS.

```
[Device] nat alg dns
```

# Create an address group.

```
[Device] nat address-group 1
[Device-address-group-1] address 202.38.1.3 202.38.1.3
[Device-address-group-1] quit
```

# Create service object group service1 for DNS service.

```
[Device] object-group service service1
[Device-obj-grp-service-service1] service tcp destination eq 53
[Device-obj-grp-service-service1] service udp destination eq 53
[Device-obj-grp-service-service1] quit
```

# Configure a global NAT rule to map the address 202.38.1.1 to 10.110.10.3. External users can access the internal DNS server.

```
[Device] nat global-policy
[Device-nat-global-policy] rule name rule1
[Device-nat-global-policy-rule-rule1] source-zone untrust
[Device-nat-global-policy-rule-rule1] destination-ip host 202.38.1.2
[Device-nat-global-policy-rule-rule1] service service1
[Device-nat-global-policy-rule-rule1] action dnat ip-address 10.110.10.3 local-port
53
[Device-nat-global-policy-rule-rule1] quit
```

# Configure a global NAT rule. Use the address in address group 1 to translate the private address in DNS response payload, and allow reversible NAT.

```
[Device-nat-global-policy] rule name rule2
[Device-nat-global-policy-rule-rule2] source-ip host 10.110.10.2
[Device-nat-global-policy-rule-rule2] source-zone trust
[Device-nat-global-policy-rule-rule2] destination-zone untrust
[Device-nat-global-policy-rule-rule2] action snat address-group 1 no-pat reversible
[Device-nat-global-policy-rule-rule2] quit
[Device-nat-global-policy] quit
```

Verifying the configuration

# Verify that the host on the external network can access the internal Web server by using the server's domain name. (Details not shown.)

# Display all NAT configuration and statistics.

```

```

Example: Configuring NAT hairpin in P2P mode

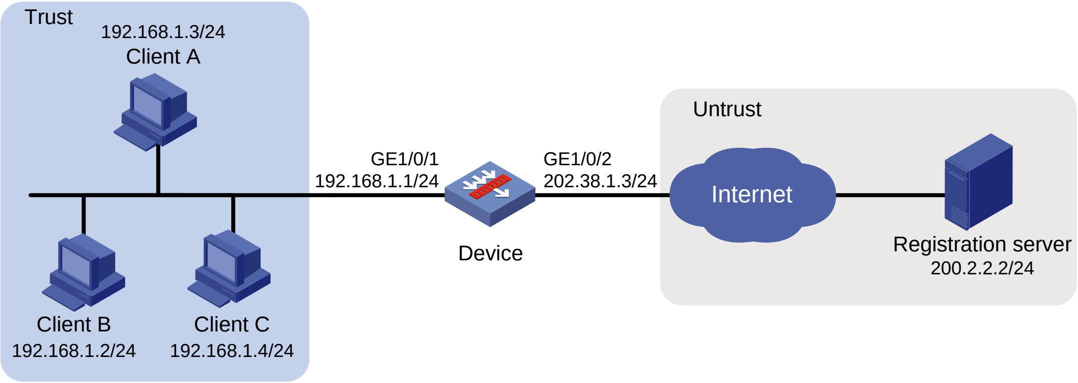
Network configuration

In the P2P application, internal clients must register their IP address to the external server and the server records the registered IP addresses and port numbers of the internal clients. An internal client must request the IP address and port number of another client from the external server before accessing the client.

Configure NAT hairpin so that:

- The internal clients can register the same public address to the external server.
- The internal clients can access each other through the IP address and port number obtained from the server.

Figure 15 Network diagram



Requirements analysis

To meet the network requirements, you must perform the following tasks:

- Configure outbound dynamic PAT on the NAT device, so the internal clients can access the external server for registration.
- Configure the mapping behavior for PAT as Endpoint-Independent Mapping because the registered IP address and port number should be accessible for any source address.

Procedure

1. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

   ```
   <Device> system-view
   [Device] interface gigabitethernet 1/0/1
   [Device-GigabitEthernet1/0/1] ip address 192.168.1.1 24
   [Device-GigabitEthernet1/0/1] quit
   ```

   # Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Add interfaces to security zones.

   ```
   [Device] security-zone name trust
   [Device-security-zone-Trust] import interface gigabitethernet 1/0/1
   [Device-security-zone-Trust] quit
   [Device] security-zone name untrust
   [Device-security-zone-Untrust] import interface gigabitethernet 1/0/2
   [Device-security-zone-Untrust] quit
   ```

3. Configure settings for routing.

   This example configures a static route, and the next hop in the routes is 202.38.1.1.

   ```
   [Device] ip route-static 200.2.2.0 24 202.38.1.1
   ```

4. Configure a security policy:

   # Configure a rule named **trust-untrust** to permit the packets from the clients to the server.

   ```
   [Device] security-policy ip
   [Device-security-policy-ip] rule name trust-untrust
   [Device-security-policy-ip-1-trust-untrust] source-zone trust
   [Device-security-policy-ip-1-trust-untrust] destination-zone untrust
   [Device-security-policy-ip-1-trust-untrust] source-ip-subnet 192.168.1.0 24
   ```

```
[Device-security-policy-ip-1-trust-untrust] destination-ip-host 200.2.2.2
[Device-security-policy-ip-1-trust-untrust] action pass
[Device-security-policy-ip-1-trust-untrust] quit
```

# Configure a rule named **trust-trust** to permit the packets between the clients in the **Trust** security zone.

```
[Device-security-policy-ip] rule name trust-trust
[Device-security-policy-ip-2-trust-trust] source-zone trust
[Device-security-policy-ip-2-trust-trust] destination-zone trust
[Device-security-policy-ip-2-trust-trust] source-ip-host 202.38.1.3
[Device-security-policy-ip-2-trust-trust] destination-ip-subnet 192.168.1.0 24
[Device-security-policy-ip-2-trust-trust] action pass
[Device-security-policy-ip-2-trust-trust] quit
[Device-security-policy-ip] quit
```

5. Configure NAT:

# Configure address object group **obj1** to identify packets from subnet 192.168.1.0/24.

```
[Device] object-group ip address obj1
[Device-obj-grp-ip-obj1] network subnet 192.168.1.0 24
[Device-obj-grp-ip-obj1] quit
```

# Configure a NAT rule for the global policy with Easy IP. IP address 202.38.1.1 is used as the public address for the source address translation of the packets from internal to external.

```
[Device] nat global-policy
[Device-nat-global-policy] rule name rule1
[Device-nat-global-policy-rule-rule1] source-zone trust
[Device-nat-global-policy-rule-rule1] destination-zone untrust
[Device-nat-global-policy-rule-rule1] source-ip obj1
[Device-nat-global-policy-rule-rule1] action snat easy-ip
[Device-nat-global-policy-rule-rule1] quit
[Device-nat-global-policy] quit
```

# Configure ACL 2000 to identify packets from subnet 192.168.1.0/24 to be translated.

```
[Device] acl basic 2000
[Device-acl-ipv4-basic-2000] rule permit source 192.168.1.0 0.0.0.255
[Device-acl-ipv4-basic-2000] quit
```

# Configure the Endpoint-Independent Mapping mode for PAT. For packets with the same source address and port number and permitted by ACL 2000, the source address and port number are translated to the same public address and port number.

```
[Device] nat mapping-behavior endpoint-independent acl 2000
```

Verifying the configuration

# Verify that Host A, Host B, and Host C can access each other after they register their IP addresses and port numbers to the external server. (Details not shown.)

# Display all NAT configuration and statistics.

```
[Device] display nat all

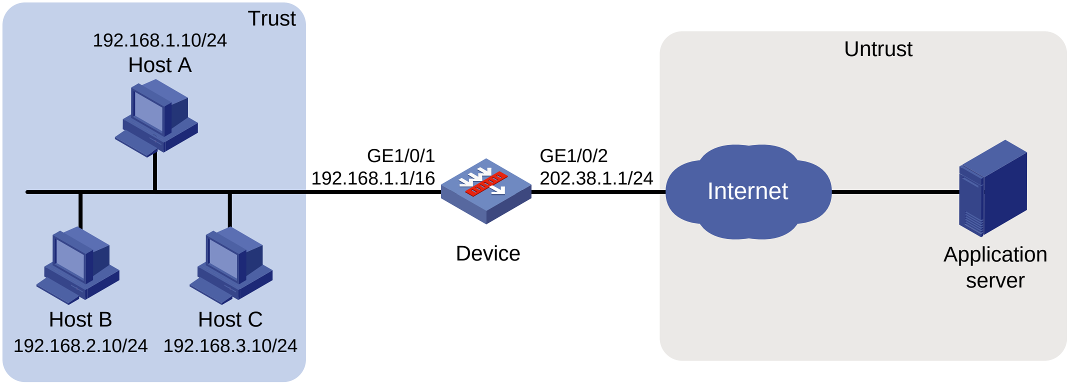
Example: Configuring the global NAT policy for NAT444 dynamic port mapping

Network configuration

As shown in Figure 16, a company uses private IP address on network 192.168.0.0/16 and public IP addresses 202.38.1.2 and 202.38.1.3. Configure the global NAT policy to meet the following requirements:

- Only users on subnet 192.168.1.0/24 can use public IP addresses 202.38.1.2 and 202.38.1.3 to access the server at 200.2.2.1 on the Internet.
- The port range for the public IP addresses is 1024 to 65535.
- The port block size is 300.
- If the ports in the assigned port block are all used, extend another port block for users.

Figure 16 Network diagram



Procedure

1. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

```
<Device> system-view
[Device] interface gigabitethernet 1/0/1
[Device-GigabitEthernet1/0/1] ip address 192.168.1.1 16
[Device-GigabitEthernet1/0/1] quit
```

   # Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Add interfaces to security zones.

```
[Device] security-zone name trust
[Device-security-zone-Trust] import interface gigabitethernet 1/0/1
[Device-security-zone-Trust] quit
[Device] security-zone name untrust
[Device-security-zone-Untrust] import interface gigabitethernet 1/0/2
[Device-security-zone-Untrust] quit
```

3. Configure settings for routing.

   This example configures a static route, and the next hop in the routes is 202.38.1.20.

```
[Device] ip route-static 200.2.2.1 32 202.38.1.20
```

4. Configure a security policy:

   # Configure a rule named **trust-untrust** to permit the packets from the hosts to the application server.

```
[Device] security-policy ip
[Device-security-policy-ip] rule name trust-untrust
[Device-security-policy-ip-1-trust-untrust] source-zone trust
[Device-security-policy-ip-1-trust-untrust] destination-zone untrust
[Device-security-policy-ip-1-trust-untrust] source-ip-subnet 192.168.1.0 24
[Device-security-policy-ip-1-trust-untrust] destination-ip-host 200.2.2.1
[Device-security-policy-ip-1-trust-untrust] action pass
[Device-security-policy-ip-1-trust-untrust] quit
[Device-security-policy-ip] quit
```

5. Configure NAT:

   # Create NAT address group **0**.

```
[Device] nat address-group 0
```

   # Add public IP addresses 202.38.1.2 and 202.38.1.3 to the NAT address group.

```
[Device-address-group-0] address 202.38.1.2 202.38.1.3
```

# Configure the port range as 1024 to 65535.

```
[Device-address-group-0] port-range 1024 65535
```

# Set the port block size to 300 and the extended port block number to 1.

```
[Device-address-group-0] port-block block-size 300 extended-block-number 1
[Device-address-group-0] quit
```

# Configure address object group **obj1** to identify packets from subnet 192.168.1.0/24.

```
[Device] object-group ip address obj1
[Device-obj-grp-ip-obj1] network subnet 192.168.1.0 24
[Device-obj-grp-ip-obj1] quit
```

# Configure a NAT rule for the global policy, and specify address object group **obj1** as the packet match criterion and use NAT address group **0** for source address and port translation.

```
[Device] nat global-policy
[Device-nat-global-policy] rule name rule1
[Device-nat-global-policy-rule-rule1] source-ip obj1
[Device-nat-global-policy-rule-rule1] action snat address-group 0
```

Verifying the configuration

# Verify that Host A can access external servers, but Host B and Host C cannot. (Details not shown.)

# Display all NAT configurations and statistics.

```
[Device]display nat all

Example: Configuring a hot backup system in active/standby mode in collaboration with VRRP for NAT

For more information, see *High Availability Configuration Guide*.

Example: Configuring a hot backup system in dual-active mode in collaboration with VRRP for NAT

For more information, see *High Availability Configuration Guide*.

Configuring interface-based NAT

Restrictions: Hardware compatibility with NAT configuration

Interface-based NAT is not supported on the NFNX3-HDB1180, NFNX3-HDB1480, NFNX3-HDB1780, NFNX3-HDB3080, NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280 devices.

Restrictions and guidelines: interface-based NAT configuration

The general restrictions and guidelines are as follows:

- You can use an ACL in a NAT rule to identify the IP addresses to be translated. The match criteria include the source IP address, source port number, destination IP address, destination port number, transport layer protocol, and VPN instance.
- If NAT is configured on only one output interface in a dual uplink network, do not add the two output interfaces to the same security zone. Doing so will cause communication interruption. For more information about security zone, see *Security Configuration Guide.*
- As a best practice, configure interface-based NAT on a logical interface of the device with multiple slots so that all packets to be NATed can be processed on the logical interface. If you fail to do so, the slots for input and output packets might be different and address translation will fail.
- If you perform all the translation methods on an interface, the NAT rules are sorted in the following descending order:
  a. NAT Server.
  b. Static NAT.
  c. NAT444 static port blocking mapping.
  d. Dynamic NAT, NAT444 dynamic port block mapping, and DS-Lite B4 address translation.
  Dynamic NAT, NAT444 dynamic port block mapping, and DS-Lite B4 address translation have the same priority. Dynamic NAT rules and NAT444 dynamic port block mapping rules are sorted in descending order of ACL numbers and are effective for IPv4 packets. DS-Lite B4 address translation rules are effective for IPv6 packets.

When you configure BRAS unification, follow these restrictions and guidelines:

- Supported user address types are private IPv4 address, private-DS address, and DS-Lite address.
- If the NAT444 configuration changes after users get online, the public IP addresses and port numbers used by the users also change. The change cannot be synchronized to the AAA server, affecting user tracing accuracy. As a best practice, log off the users immediately after you change the NAT444 configuration. When the users come online again, NAT444 creates new mappings for them.

Interface-based NAT tasks at a glance

To configure NAT, perform the following tasks:

1. Configuring an address translation method on an interface

    - Configuring static NAT on an interface
    - Configuring dynamic NAT on an interface
    - Configuring NAT server mappings on an interface
    - Configuring NAT444 on an interface
    - Configuring DS-Lite B4 address translation on an interface
    - Configuring the interface-based NAT policy

      The NAT policy allows flexible address translation rules for multiple interfaces.
2. (Optional.) Configuring NAT hairpin
3. (Optional.) Configuring NAT ALG
4. (Optional.) Configuring NAT DNS mapping
5. (Optional.) Configuring high availability for NAT
    - Enabling NAT port halving
    - Configuring hot backup for NAT
6. (Optional.) Configuring NAT maintenance
    - Configuring periodic NAT statistics collection
    - Enabling statistics collection for NAT session creation rate
    - Specifying a probe method for detecting reachability of NAT address group members
    - Enabling sending ICMP error messages for NAT failures
    - Enabling NAT configuration changes to take effect only on new connections
7. (Optional.) Configuring NAT logging
8. (Optional.) Configuring NAT in specific networks
    - Enabling NAT reply redirection
    - Enabling the deletion of timestamps in TCP SYN and SYN ACK packets
    - Enabling NAT session recreation after link switchover

Configuring static NAT on an interface

Restrictions and guidelines for static NAT configuration on an interface

Typically, configure inbound static NAT with outbound dynamic NAT, NAT Server, or outbound static NAT to implement source address translation and destination address translation.

Prerequisites

Before configuring static NAT, you must perform the following tasks:

- Configure an ACL to identify the IP addresses to be translated. For more information about ACLs, see *ACL and QoS Configuration Guide*.
- Manually add a route for inbound static NAT. Use *local-ip* or *local-network* as the destination address, and use *global-ip*, an address in *global-network*, or the next hop directly connected to the output interface as the next hop.

Configuring outbound one-to-one static NAT

About this task

For address translation from a private IP address to a public IP address, configure outbound one-to-one static NAT on the interface connected to the external network.

- When the source IP address of an outgoing packet matches the *local-ip*, the source IP address is translated into the *global-ip*.
- When the destination IP address of an incoming packet matches the *global-ip*, the destination IP address is translated into the *local-ip*.

Restrictions and guidelines

If multiple outbound one-to-one static mappings uses different ACL rules, you can map a private address to different public addresses.

If you do not specify the **acl** keyword for a one-to-one mapping NAT rule, the rule can process reversible traffic. If the **acl** keyword is specified for the NAT rule, you must specify the **reversible** keyword for the rule to process reversible traffic.

Procedure

1. Enter system view.

   system-view

2. Configure a one-to-one mapping for outbound static NAT.

   nat static outbound *local-ip* [**vpn-instance** *local-vpn-instance-name*] *global-ip* [**vpn-instance** *global-vpn-instance-name*] [**acl** { *ipv4-acl-number* | **name** *ipv4-acl-name* } [**reversible**]] [**vrrp** *virtual-router-id*] [**rule** *rule-name*] [**priority** *priority*] [**disable**] [**counting**] [**description** *text*]

3. (Optional.) Rearrange outbound one-to-one mapping NAT rules to adjust their priorities.

   nat static outbound rule move *nat-rule-name1* { **after** | **before** } *nat-rule-name2*

4. Enter interface view.

   interface *interface-type interface-number*

5. Enable static NAT on the interface.

   nat static enable

   By default, static NAT is disabled.

Configuring outbound net-to-net static NAT

About this task

For address translation from a private network to a public network, configure outbound net-to-net static NAT on the interface connected to the external network.

- When the source IP address of an outgoing packet matches the private address range, the source IP address is translated into a public address in the public address range.
- When the destination IP address of an incoming packet matches the public address range, the destination IP address is translated into a private address in the private address range.

Procedure

1. Enter system view.

   system-view

2. Configure a net-to-net mapping for outbound static NAT.

   ```
   nat static outbound net-to-net local-start-address local-end-address
   [ vpn-instance local-vpn-instance-name ] global global-network
   { mask-length | mask } [ vpn-instance global-vpn-instance-name ] [ acl
   { ipv4-acl-number | name ipv4-acl-name } [ reversible ] ] [ vrrp
   virtual-router-id ] [ rule rule-name ] [ priority priority ] [ disable ]
   [ counting ]
   ```

3. (Optional.) Change the priority of the outbound net-to-net static NAT rule.

   ```
   nat static outbound net-to-net rule move nat-rule-name1 { after |
   before } nat-rule-name2
   ```

   By default, an outbound net-to-net static NAT rule appearing earlier on the rule list has a higher priority for packet matching.

4. Enter interface view.

   ```
   interface interface-type interface-number
   ```

5. Enable static NAT on the interface.

   ```
   nat static enable
   ```

   By default, static NAT is disabled.

Configuring object group-based outbound static NAT

About this task

Configure object group-based outbound static NAT on the interface connected to the external network to translate private IP addresses into public IP addresses.

- When the source address of an outgoing packet matches the private address object group, the source address is translated into a public address in the public address object group.
- When the destination address of an incoming packet matches the public address object group, the destination address is translated into a private address in the private address object group.

Restrictions and guidelines

If you specify the **acl** keyword, NAT processes only packets permitted by the ACL.

For an object group-based outbound static NAT mapping to take effect, make sure the following requirements are met:

- One address object group contains only one host object or subnet object.
- A subnet object cannot have excluded addresses.

Procedure

1. Enter system view.

   ```
   system-view
   ```

2. Configure an object group-based outbound static NAT mapping.

   ```
   nat static outbound object-group local-object-group-name
   [ vpn-instance local-vpn-instance-name ] object-group
   global-object-group-name [ vpn-instance global-vpn-instance-name ]
   [ acl { ipv4-acl-number | name ipv4-acl-name } [ reversible ] ] [ vrrp
   virtual-router-id ] [ disable ] [ counting ]
   ```

   By default, no mappings exist.

3. Enter interface view.

   ```
   interface interface-type interface-number
   ```

4. Enable static NAT on the interface.

```
nat static enable
```

By default, static NAT is disabled.

Configuring inbound one-to-one static NAT

About this task

For address translation from a public IP address to a private IP address, configure inbound one-to-one static NAT.

- When the source IP address of an incoming packet matches the *global-ip*, the source IP address is translated into the *local-ip*.
- When the destination IP address of an outgoing packet matches the *local-ip*, the destination IP address is translated into the *global-ip*.

Procedure

1. Enter system view.

   ```
   system-view
   ```

2. Configure a one-to-one mapping for inbound static NAT.

   ```
   nat static inbound global-ip [ vpn-instance global-vpn-instance-name ]
   local-ip [ vpn-instance local-vpn-instance-name ] [ acl
   { ipv4-acl-number | name ipv4-acl-name } [ reversible ] ] [ rule
   rule-name ] [ priority priority ] [ disable ] [ counting ] [ description
   text ]
   ```

3. Enter interface view.

   ```
   interface interface-type interface-number
   ```

4. Enable static NAT on the interface.

   ```
   nat static enable
   ```

   By default, static NAT is disabled.

Configuring inbound net-to-net static NAT

About this task

For address translation from a public network to a private network, configure inbound net-to-net static NAT.

- When the source IP address of an incoming packet matches the public address range, the source IP address is translated into a private address in the private address range.
- When the destination IP address of an outgoing packet matches the private address range, the destination IP address is translated into a public address in the public address range.

Procedure

1. Enter system view.

   ```
   system-view
   ```

2. Configure a net-to-net mapping for inbound static NAT.

   ```
   nat static inbound net-to-net global-start-address
   global-end-address [ vpn-instance global-vpn-instance-name ] local
   local-network { mask-length | mask } [ vpn-instance
   local-vpn-instance-name ] [ acl { ipv4-acl-number | name ipv4-acl-name }
   [ reversible ] ] [ rule rule-name ] [ priority priority ] [ disable ]
   [ counting ]
   ```

3. (Optional.) Change the priority of the inbound net-to-net static NAT rule.

nat static inbound net-to-net rule move *nat-rule-name1* { **after** | **before** } *nat-rule-name2*

By default, an inbound net-to-net static NAT rule appearing earlier on the rule list has a higher priority for packet matching.

4. Enter interface view.

   interface *interface-type interface-number*

5. Enable static NAT on the interface.

   nat static enable

   By default, static NAT is disabled.

Configuring object group-based inbound static NAT

About this task

Configure object group-based inbound static NAT to translate public IP addresses into private IP addresses.

- When the destination address of an outgoing packet matches the private address object group, the destination address is translated into a public address in the public address object group.
- When the source address of an incoming packet matches the public address object group, the source address is translated into a private address in the private address object group.

Restrictions and guidelines

If you specify the **acl** keyword, NAT processes only packets permitted by the ACL.

For an object group-based inbound static NAT mapping to take effect, make sure the following requirements are met:

- One address object group contains only one host object or subnet object.
- A subnet object cannot have excluded addresses.

For an inbound static mapping, if its private IPv4 object group contains a host address, the host address cannot be on the same subnet as the interface configured with this mapping.

Procedure

1. Enter system view

   system-view

2. Configure an object group-based inbound static NAT mapping.

   nat static inbound object-group *global-object-group-name* [**vpn-instance** *global-vpn-instance-name*] **object-group** *local-object-group-name* [**vpn-instance** *local-vpn-instance-name*] [**acl** { *ipv4-acl-number* | **name** *ipv4-acl-name* } [**reversible**]] [**disable**] [**counting**]

   By default, no NAT mappings exist.

3. Enter interface view.

   interface *interface-type interface-number*

4. Enable static NAT on the interface.

   nat static enable

   By default, static NAT is disabled.

Configuring dynamic NAT on an interface

Restrictions and guidelines dynamic NAT configuration on an interface

You can configure multiple inbound or outbound dynamic NAT rules.

- A NAT rule with an ACL takes precedence over a rule without any ACL.
- If two ACL-based dynamic NAT rules are configured, the rule with the higher ACL number has higher priority.

When configuring NO-PAT and DNS ALG for internal server access through a domain name, make sure the NAT address group for NO-PAT has sufficient IP addresses. The minimum number of IP addresses must be equal to the number of security engines multiplied by the number of internal servers. For more information about security engines, see context configuration in *Virtual Technologies Configuration Guide*.

Prerequisites

Before configuring dynamic NAT, you must perform the following tasks:

- Configure an ACL to identify the IP addresses to be translated. For more information about ACLs, see *ACL and QoS Configuration Guide*.
- Determine whether to enable the Easy IP feature. If you use the IP address of an interface as the NAT address, you are configuring Easy IP.
- Determine a public IP address pool for address translation.
- Determine whether to translate port numbers. Use NO-PAT to translate only IP addresses and PAT to translate both IP addresses and port numbers.

Configuring outbound dynamic NAT

About this task

To translate private IP addresses into public IP addresses, configure outbound dynamic NAT on the interface connected to the external network.

Procedure

1. Enter system view.

   system-view

2. Create a NAT address group and enter its view.

   nat address-group *group-id*

3. Add an address range to the address group.

   address *start-address end-address* [**name** *group-name*]

   You can add multiple address ranges to an address group.

   The address ranges must not overlap.

4. (Optional.) Exclude IP addresses from being used in address translation.

   exclude-ip *start-address end-address*

   The *end-address* must not be lower than the *start-address*. If they are the same, you specify only one IP address.

5. Return to system view.

quit

6. Enter interface view.

   interface *interface-type interface-number*

7. Configure outbound dynamic NAT. Choose the options to configure as needed:

   - Configure NO-PAT.

     nat outbound [*ipv4-acl-number* | **name** *ipv4-acl-name*] **address-group** { *group-id* | **name** *group-name* } [**vpn-instance** *vpn-instance-name*] **no-pat** [**reversible**] [**rule** *rule-name*] [**priority** *priority*] [**disable**] [**counting**] [**description** *text*]

   - Configure PAT.

     nat outbound [*ipv4-acl-number* | **name** *ipv4-acl-name*][**address-group** { *group-id* | **name** *group-name* }] [**vpn-instance** *vpn-instance-name*] [**port-preserved**] [**rule** *rule-name*] [**priority** *priority*] [**disable**] [**counting**] [**description** *text*]

   You can configure multiple outbound dynamic NAT rules on an interface.

Parameter	Description
address-group	If you do not specify this keyword, the IP address of the interface is used as the NAT address. Easy IP is implemented.
no-pat reversible	If you specify these keywords, you enable reverse address translation. Reverse address translation uses existing NO-PAT entries to translate the destination address for connections actively initiated from the external network to the internal network. The destination address is translated into the private IP address in the matching NO-PAT entry.

8. (Optional.) Configure a PAT mapping mode.

   a. Return to system view.

      quit

   b. Configure a PAT mapping mode.

      nat mapping-behavior endpoint-independent [**acl** { *ipv4-acl-number* | **name** *ipv4-acl-name* }]

      The default mapping mode is **Address and Port-Dependent Mapping**.

      This command takes effect only on outbound dynamic NAT for PAT.

9. (Optional.) Rearrange outbound dynamic NAT rules to adjust their priorities.

   nat outbound rule move *nat-rule-name1* { **after** | **before** } *nat-rule-name2*

Configuring inbound dynamic NAT

Restrictions and guidelines

Do not configure inbound dynamic NAT alone. Typically, inbound dynamic NAT functions with outbound dynamic NAT, NAT Server, or outbound static NAT to implement source address translation and destination address translation.

As a best practice, manually create a route because it takes time to automatically add routes.

Procedure

1. Enter system view.

   system-view

2. Create a NAT address group and enter its view.

nat address-group *group-id*

3. Add an address range to the address group.

   address *start-address end-address* [**name** *group-name*]

   You can add multiple address ranges to an address group.

   The address ranges in address groups must not overlap.

4. (Optional.) Exclude IP addresses from being used in address translation.

   exclude-ip *start-address end-address*

   The *end-address* must not be lower than the *start-address*. If they are the same, you specify only one IP address.

5. Return to system view.

   quit

6. Enter interface view.

   interface *interface-type interface-number*

7. Configure inbound dynamic NAT.

   nat inbound { *ipv4-acl-number* | **name** *ipv4-acl-name* } **address-group** { *group-id* | **name** *group-name* } [**vpn-instance** *vpn-instance-name*] [**no-pat** [**reversible**] [**add-route**]] [**rule** *rule-name*] [**priority** *priority*] [**disable**] [**counting**] [**description** *text*]

   You can configure multiple inbound dynamic NAT rules on an interface.

Parameter	Description
no-pat reversible	If you specify these keywords, you enable reverse address translation. Reverse address translation uses existing NO-PAT entries to translate the destination address for connections actively initiated from the external network to the internal network. The destination address is translated into the private IP address in the matching NO-PAT entry.
add-route	This keyword enables the device to automatically add a route destined for the private address when an inbound dynamic NAT rule is matched. The output interface is the NAT interface, and the next hop is the source address before translation. If you do not specify this keyword, you must manually add the route.

8. (Optional.) Rearrange inbound dynamic NAT rules to adjust their priorities.

   nat inbound rule move *nat-rule-name1* { **after** | **before** } *nat-rule-name2*

Configuring NAT server mappings on an interface

About NAT server mappings

Typically, the NAT Server feature is configured on the interface connected to the external network to allow servers in the internal network or an MPLS VPN instance to provide services for external users. A NAT server mapping (also called NAT server rule) maps a public IP address and port number to the private IP address and port number of the internal server.

The NAT Server feature can be implemented by configuring the following server mappings:

- **Common NAT server mapping**—Maps the private IP address and the port number of the internal server to a public IP address and a port number. This method allows external hosts to access the internal server by using the specified public IP address.
- **Load sharing NAT server mapping**—You can add multiple internal servers to an internal server group so that these servers provide the same service for external hosts. The NAT device

chooses one internal server based on the weight and number of connections of the servers to respond to a request from an external host to the public address of the internal server group.

- **ACL-based NAT server mapping**—An extension of common NAT server mapping. A common NAT server mapping maps the private IP address of the internal server to a single public IP address. An ACL-based NAT server mapping maps the private IP address of the internal server to a set of public IP addresses defined by an ACL. If the destination address of a packet matches a permit rule in the ACL, the destination address is translated into the private IP address of the internal server.
- **Object group-based server mapping**—Uses the address object group and service object group as the packet match criteria. The destination IP addresses and port numbers of the matching packets are translated to the same address and port number. For more information about object groups, see *Security Configuration Guide*.

Restrictions and guidelines for NAT server mapping configuration on an interface

In a scenario where Real-Time Transport Protocol (RTP) is used to transmit audio and video flows, the server and client send Real-Time Control Protocol (RTCP) packets periodically during the course of a session. If the server is on the private network, you must specify the reversible keyword when executing the nat server command. If you do not specify the reversible keyword, the NAT device discards the RTCP packets sent to the client on the public network and audio and video transmission services fail.

When you configure a load shared NAT server mapping, you must make sure a user uses the same public address and public port to access the same service on an internal server. For this purpose, make sure value *N* in the following mappings is equal to or less than the number of servers in the internal server group:

- One public address and *N* consecutive public port numbers are mapped to one internal server group.
- *N* consecutive public addresses and one public port number are mapped to one internal server group.

When you roll back configuration in a version that supports the automatic NAT rule name assignment, a rollback failure message is displayed if the no automatically assigned names exist in the replacement configuration file.

For example, the system compares the configuration in the replacement configuration file and the configuration after the rollback and displays a rollback failure message in the following conditions:

- The replacement configuration file has the following configuration: **nat server global** 112.1.1.1 **inside** 192.168.20.1.
- The NAT rule configuration after the rollback is **nat server global** 112.1.1.1 **inside** 192.168.20.1 rule NAT server rule_10 (NAT server rule_10 indicating an NAT rule name automatically assigned by the system).

In this case, the NAT rule configuration in the replacement configuration file has been issued and you can ignore this failure message.

Configuring common NAT server mappings

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Configure common NAT server mappings. Choose the options to configure as needed:

- A single public address with a single or no public port:

  nat server [**protocol** *pro-type*] **global**{ *global-address* | **current-interface** | **interface** *interface-type interface-number* } [*global-port*] [**vpn-instance** *global-vpn-instance-name*] **inside** *local-address* [*local-port*] [**vpn-instance** *local-vpn-instance-name*] [**acl** { *ipv4-acl-number* | **name** *ipv4-acl-name* }] [**reversible**] [**vrrp** *virtual-router-id*] [**rule** *rule-name*] [**disable**] [**counting**] [**description** *text*]

- A single public address with consecutive public ports:

  nat server protocol *pro-type* **global**{ *global-address* | **current-interface** | **interface** *interface-type interface-number* } *global-port1 global-port2* [**vpn-instance** *global-vpn-instance-name*] **inside** { { *local-address* | *local-address1 local-address2* } *local-port* | *local-address local-port1 local-port2* } [**vpn-instance** *local-vpn-instance-name*] [**acl** { *ipv4-acl-number* | **name** *ipv4-acl-name* }] [**vrrp** *virtual-router-id*] [**rule** *rule-name*] [**disable**] [**counting**] [**description** *text*]

- Consecutive public addresses with no public port:

  nat server protocol *pro-type* **global** *global-address1 global-address2* [**vpn-instance** *global-vpn-instance-name*] **inside** { *local-address* | *local-address1 local-address2* } [*local-port*] [**vpn-instance** *local-vpn-instance-name*] [**acl** { *ipv4-acl-number* | **name** *ipv4-acl-name* }] [**vrrp** *virtual-router-id*] [**rule** *rule-name*] [**disable**] [**counting**] [**description** *text*]

- Consecutive public addresses with a single public port:

  nat server protocol *pro-type* **global** *global-address1 global-address2 global-port* [**vpn-instance** *global-vpn-instance-name*] **inside** { *local-address* [*local-port1 local-port2*] | [*local-address* | *local-address1 local-address2*] [*local-port*] } [**vpn-instance** *local-vpn-instance-name*] [**acl** { *ipv4-acl-number* | **name** *ipv4-acl-name* }] [**vrrp** *virtual-router-id*] [**rule** *rule-name*] [**disable**] [**counting**] [**description** *text*]

You can configure multiple NAT server mappings on an interface.

Configuring load sharing NAT server mappings

1. Enter system view.

   system-view

2. Create a NAT server group and enter its view.

   nat server-group *group-id*

   By default, no NAT server groups exist.

3. Add an internal server into the group.

   inside ip *inside-ip* **port** *port-number* [**weight** *weight-value*]

   You can add multiple internal servers to a group.

4. Return to system view.

   quit

5. Enter interface view.

   interface *interface-type interface-number*

6. Configure a load sharing NAT server mapping.

```
nat server protocol pro-type global { { global-address | nat server
protocol pro-type global { { global-address | current-interface |
interface interface-type interface-number } { global-port |
global-port1 global-port2 } | global-address1 global-address2
global-port } [ vpn-instance global-vpn-instance-name ] inside
server-group group-id[ vpn-instance local-vpn-instance-name ] [ acl
{ ipv4-acl-number | name ipv4-acl-name } ] [ vrrp virtual-router-id ]
[ rule rule-name ] [ disable ] [ counting ] [ description text ]
```

You can configure multiple load sharing NAT server mappings on an interface.

Configuring ACL-based NAT server mappings

1. Enter system view.

```
system-view
```

2. Enter interface view.

```
interface interface-type interface-number
```

3. Configure an ACL-based NAT server mapping.

```
nat server global { ipv4-acl-number | name ipv4-acl-name } inside
local-address [ local-port ] [ vpn-instance local-vpn-instance-name ]
[ vrrp virtual-router-id ] [ rule rule-name ] [ priority priority ]
[ disable ] [ counting ] [ description text ]
```

You can configure multiple NAT server mappings on an interface.

4. (Optional.) Rearrange ACL-based NAT server mappings to adjust their priorities.

```
nat server rule move nat-rule-name1 { after | before } nat-rule-name2
```

Configuring object group-based NAT server mappings

About this task

An object group-based NAT server mapping uses the address object group and service object group as the packet match criteria. The destination IP addresses and port numbers of the matching packets are translated to the same address and port number. For more information about object groups, see *Security Configuration Guide*.

When multiple object group-based NAT server mappings are configured, the mapping configured earlier has a higher priority. The match process of a packet stops when the packet matches a mapping.

Restrictions and guidelines

The private port number in the NAT server mapping takes effect only when the protocol type is TCP or UDP for the service object group used by the mapping.

One NAT server mapping supports a maximum of five address object groups and one service object group.

Prerequisites

Before you create a mapping, the IPv4 address object groups and service object group must already exist. An IPv4 address object group cannot have excluded IPv4 address configuration.

Procedure

1. Enter system view

```
system-view
```

2. Enter interface view.

interface *interface-type interface-number*

3. Create an object group-based NAT server mapping.

   nat server rule *rule-name* **global destination-ip** *object-group-name*&<1-5> [**service** *object-group-name*] **inside** *local-address* [*local-port*] [**vrrp** *virtual-router-id*] [**disable**] [**counting**] [**description** *text*]

   By default, no object group-based NAT server mapping exists.
4. Add object groups to the NAT server mapping.

   nat server rule *rule-name* **global** { **destination-ip** *object-group-name*&<1-5> | **service** *object-group-name* }

   You can add object groups only to existing object group-based NAT server mappings.

Configuring NAT444 on an interface

About NAT444

NAT444 provides outbound address translation, and it is configured on the interface connected to the public network. By configuring NAT444 address translation on the NAT444 gateway, multiple private IP addresses are mapped to one public IP address and a different port block is used for each private IP address

Restrictions and guidelines for NAT444 configuration on an interface

To configure dynamic port block mapping for NAT444, you must configure port block parameters in the NAT address group.

Configuring static port block mapping for NAT444

1. Enter system view.

   system-view
2. Create a NAT port block group, and enter its view.

   nat port-block-group *group-id*
3. Add a private IP address range to the port block group.

   local-ip-address *start-address end-address* [**vpn-instance** *vpn-instance-name*]

   You can add multiple private IP address ranges to one port block group, but they cannot overlap.
4. Add a public IP address range to the port block group.

   global-ip-pool *start-address end-address*

   You can add multiple public IP address ranges to one port block group, but they cannot overlap.
5. Configure the port range for the public IP addresses.

   port-range *start-port-number end-port-number*

   By default, the port range is 1 to 65535.
6. Set the port block size.

   block-size *block-size*

By default, the port block size is 256.

7. Return to system view.

   quit

8. Enter interface view.

   interface *interface-type interface-number*

9. Configure a static outbound port block mapping rule on the interface.

   nat outbound port-block-group *group-id* [**rule** *rule-name*] [**counting**]

   By default, no port block mapping rule is configured on an interface.

   You can configure multiple port block mapping rules on one interface.

10. (Optional.) Configure a PAT mapping mode.

    a. Return to system view.

       quit

    b. Configure a PAT mapping mode.

       nat mapping-behavior endpoint-independent [**acl** { *ipv4-acl-number* | **name** *ipv4-acl-name* }]

       The default mapping mode is **Address and Port-Dependent Mapping**.

Configuring dynamic port block mapping for NAT444

You can use one of the following methods to add IP addresses to a NAT address group:

- **Method 1**—Adding one or multiple address ranges.
- **Method 2**—Adding the IP address of the specified interface. This method supports the cooperation between dynamic NAT port block mappings and Easy IP and supports user tracing.

Only one method is supported for a NAT address group.

Use Method 2 if the IP address after translation is the IP address of the interface connected to the external network and the IP address is dynamically obtained through DHCP. This method avoids the inaccurate NAT IP address information caused by the IP address change of the interface.

Procedure

1. Enter system view.

   system-view

2. (Optional.) Configure a PAT mapping mode.

   nat mapping-behavior endpoint-independent [**acl** { *ipv4-acl-number* | **name** *ipv4-acl-name* }]

   The default mapping mode is **Address and Port-Dependent Mapping**.

3. Create a NAT address group, and enter its view.

   nat address-group *group-id* [**name** *group-name*]

4. Add addresses to the NAT address group. Choose one option as needed:

   ○ Add IP address ranges to the NAT address group.

   address *start-address end-address*

   You can add multiple public IP address ranges to an address group.

   The IP address ranges in address groups cannot overlap.

   Execute the following command to exclude IP addresses from being used in address translation.

   exclude-ip *start-address end-address*

The *end-address* must not be lower than the *start-address*. If they are the same, you specify only one IP address.

- Add the IP address of an interface to the NAT address group.

  address interface *interface-type interface-number*

  By default, no interface address exists in the NAT address group.

  You can specify only one interface for a NAT address group.

5. (Optional.) Configure the port range for the public IP addresses.

   port-range *start-port-number end-port-number*

   By default, the port range is 1 to 65535.

   The configuration takes effect only on PAT translation mode.

6. Configure port block parameters.

   port-block block-size *block-size* [**extended-block-number** *extended-block-number*]

   The configuration takes effect only on PAT translation mode.

7. Return to system view.

   quit

8. Enter interface view.

   interface *interface-type interface-number*

9. Configure PAT for outbound dynamic NAT.

   nat outbound [*ipv4-acl-number* | **name** *ipv4-acl-name*] [**address-group** { *group-id* | **name** *group-name* }] [**vpn-instance** *vpn-instance-name*] [**port-preserved**] [**rule** *rule-name*] [**priority** *priority*] [**disable**] [**counting**] [**description** *text*]

   By default, no outbound dynamic NAT rules exist.

   The **port-preserved** keyword does not take effect on dynamic NAT444.

10. (Optional.) Enable dynamic port block mapping synchronization.

    a. Return to system view.

       quit

    b. Enable dynamic port block mapping synchronization.

       nat port-block synchronization enable

       By default, dynamic port block mapping synchronization is disabled.

Enabling port block global sharing

About this task

When multiple interfaces have dynamic NAT port block mapping configured, the interfaces might create different port block mappings for packets from the same IP address. You can use this command to configure the interfaces to use the same port block mapping for translating packets from the same IP address.

Procedure

1. Enter system view

   system-view

2. Enable port block global sharing.

   nat port-block global-share enable

   By default, port block global sharing is disabled.

Configuring DS-Lite B4 address translation on an interface

About this task

DS-Lite B4 address translation is configured on the AFTR's interface connected to the external network. It uses an IPv6 ACL to identify packets to be NATed.

DS-Lite B4 address translation supports only the dynamic port block mapping method.

Prerequisites

Before configuring DS-Lite B4 address translation, make sure the B4 element and the AFTR can reach each other through IPv6.

Procedure

1. Enter system view.

   system-view

2. (Optional.) Configure a PAT mapping mode.

   nat mapping-behavior endpoint-independent [**acl** { *ipv4-acl-number* | **name** *ipv4-acl-name* }]

   The default mapping mode is **Address and Port-Dependent Mapping**.

3. Create a NAT address group, and enter its view.

   nat address-group *group-id* [**name** *group-name*]

4. Add a public IP address range to the NAT address group.

   address *start-address end-address*

   You can add multiple public IP address ranges to an address group.

   The IP address ranges in address groups cannot overlap.

5. (Optional.) Exclude IP addresses from being used in address translation.

   exclude-ip *start-address end-address*

   The *end-address* must not be lower than the *start-address*. If they are the same, you specify only one IP address.

6. Configure the port range for the public IP addresses.

   port-range *start-port-number end-port-number*

   By default, the port range is 1 to 65535.

   The configuration takes effect only on PAT translation mode.

7. Configure port block parameters.

   port-block block-size *block-size* [**extended-block-number** *extended-block-number*]

   By default, no port block parameters exist.

   The configuration takes effect only on PAT translation mode.

8. Return to system view.

   quit

9. Enter interface view.

   interface *interface-type interface-number*

10. Configure DS-Lite B4 address translation.

    nat outbound ds-lite-b4 { *ipv6-acl-number* | **name** *ipv6-acl-name* } **address-group** *group-id*

By default, DS-Lite B4 address translation is not configured.

11. (Optional.) Enable dynamic port block mapping synchronization.
    a. Return to system view.
       quit
    b. Enable dynamic port block mapping synchronization.
       nat port-block synchronization enable
       By default, dynamic port block mapping synchronization is disabled.

Configuring the interface-based NAT policy

About the interface-based NAT policy

The interface-based NAT policy performs address translation for outgoing packets on the interfaces that the rules are applied. The NAT policy can contain a set of NAT rules. The device identifies the packets based on the object groups in the NAT rules, and translates addresses according to the method in the matching rule.

Hardware compatibility with interface-based NAT policy

Models	Feature compatibility
NFNX5-HD6480, NFNX3-HDB680, NFNX3-HDB1080	Yes
NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB1780, NFNX3-HDB3080, NFNX3-HDB1180, NFNX3-HDB1480	No

Restrictions and guidelines for interface-based NAT policy configuration

If a NAT rule does not use any object group, this rule matches all packets.

The NAT policy supports only dynamic address translation, and the policy has a higher priority than the dynamic address translation configuration on interfaces.

Creating the interface-based NAT policy

1. Enter system view
   system-view
2. Create the interface-based NAT policy and enter its view.
   nat policy
   By default, the interface-based NAT policy does not exist.

Configuring NAT rules

Restrictions and guidelines

The NAT rules in the interface-based NAT policy are sorted in descending order of their configuration order. A rule configured earlier has a higher priority. The matching process stops when a packet matches a NAT rule. You can use the **display this** command to view the configuration order of the NAT rules.

Procedure

1. Enter system view.

   system-view

2. Enter the interface-based NAT policy view.

   nat policy

3. Create a NAT rule and enter its view.

   rule name *rule-name*

   By default, no NAT rule exists.

4. (Optional.) Configure a description for the rule.

   description *text*

   By default, a NAT rule does not have any description.

5. Apply the NAT rule to the outgoing traffic on an interface.

   outbound-interface *interface-type interface-name*

   By default, a NAT rule is not applied to the outgoing traffic on an interface.

6. Specify an object group for the NAT rule. Choose the options to configure as needed:
   - Specify a source IP address object group.

     source-ip *object-group-name*

     The source IP address object groups is used to match the source IP address in the packet.
   - Specify a destination IP address object group.

     destination-ip *object-group-name*

     The destination IP address object groups is used to match the destination IP address in the packet.
   - Specify a service object group.

     service *object-group-name*

     The service object groups is used to match the service type in the packet.

   By default, the NAT rule does not have any object groups.

   Make sure the specified object groups already exist.

7. Specify an address translation method for the NAT rule. Choose the options to configure as needed:
   - Specify the Easy IP method.

     action easy-ip
   - Specify the NO-NAT method.

     action no-nat
   - Specify the NO-PAT method.

     action address-group { *group-id* | **name** *group-name* } **no-pat** [**reversible**]
   - Specify the PAT method.

action address-group { *group-id* | **name** *group-name* } [**port-preserved**]

By default, no address translation method is specified in a NAT rule.

8. (Optional.) Enable hit counting for the NAT rule.

   counting enable

   By default, hit counting is disabled for the NAT rule.

9. Specify a translation mode for PAT.
   a. Return to interface-based NAT policy view

      quit
   b. Return to system view.

      quit
   c. Apply the Endpoint-Independent Mapping mode for address translation.

      nat mapping-behavior endpoint-independent [**acl** { *ipv4-acl-number* | **name** *ipv4-acl-name* }]

      By default, the Address and Port-Dependent Mapping mode applies.

      This command takes effect only on outbound PAT.

Rearranging NAT rules in the policy to adjust their priority

About this task

In the interface-based NAT policy, the priority of NAT rules are determined by the configuration order. A rule configured earlier has a higher priority. You can use the **rule move** command to rearrange the NAT rules to adjust their priority.

Restrictions and guidelines

You can use this feature to rearrange only existing NAT rules to change their priority.

Procedure

1. Enter system view.

   system-view
2. Enter the interface-based NAT policy view.

   nat policy
3. Rearrange NAT rules to change their priority.

   rule move *rule-name1* { **after** | **before** } [*rule-name2*]

Disabling NAT rules

Restrictions and guidelines

This feature does not delete a NAT rule, but makes the rule ineffective. You can use the **display nat policy** command to view the status of the NAT rules. If you want to delete a NAT rule, use the **undo rule name** command.

Procedure

1. Enter system view.

   system-view
2. Enter the interface-based NAT policy view.

   nat policy

3. Enter the view of a NAT rule.

   rule name *rule-name*

4. Disable the NAT rule.

   disable

   By default, NAT rules are enabled.

Configuring NAT hairpin

About this task

NAT hairpin allows internal hosts to access each other or allows internal hosts to access internal servers. The source and destination IP addresses of the packets are translated on the interface connected to the internal network.

Restrictions and guidelines

NAT hairpin works in conjunction with the following address translation methods:

- NAT Server and outbound dynamic NAT.
- NAT Server and outbound static NAT.

To provide service correctly, you must configure NAT hairpin on the same interface module as its collaborative NAT features.

When NAT hairpin works in conjunction with NAT Server, you must configure NAT server mappings in one of the following methods with a protocol type specified:

- Configuring common NAT server mappings
- Configuring load sharing NAT server mappings

To configure the P2P mode, you must configure outbound PAT on the interface connected to the external network and enable the EIM mapping mode.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Enable NAT hairpin.

   nat hairpin enable

   By default, NAT hairpin is disabled.

Configuring NAT ALG

About this task

NAT ALG translates address or port information in the application layer payload to ensure connection establishment.

For example, an FTP application includes a data connection and a control connection. The IP address and port number for the data connection depend on the payload information of the control connection. This requires NAT ALG to translate the address and port information to establish the data connection.

Procedure

1. Enter system view

system-view

2. Configure NAT ALG for a protocol or all protocols.

   nat alg { **all** | **dns** | **ftp** | **h323** | **icmp-error** | **ils** | **mgcp** | **nbt** | **pptp** | **rsh** | **rtsp** | **sccp** | **sip** | **sqlnet** | **tftp** | **xdmcp** }

   By default, NAT ALG is enabled for DNS, FTP, ICMP error messages, PPTP, and RTSP, and is disabled for the other supported protocols.

Configuring NAT DNS mapping

About this task

NAT DNS mapping is applicable to scenarios that internal users accesses an internal server by using the domain name of the server when the DNS server is located at the external network. In the scenario, NAT DNS mapping cooperates with DNS ALG and NAT server mappings.

1. The DNS reply from the external DNS server contains only the domain name and public IP address of the internal server in the payload.
2. The NAT device might have multiple NAT server mappings with the same public IP address but different private IP addresses. DNS ALG might find an incorrect internal server by using only the public IP address. With a NAT DNS mapping is configured, DNS ALG obtains the correct public IP address, public port number, and protocol type of the internal server by using the domain name.
3. A NAT server mapping maps the public IP and port to the private IP and port of the internal server.
4. The NAT device sends the DNS reply to the internal user.

Restrictions and guidelines

NAT DNS mapping works in conjunction with NAT Server. NAT DNS mapping maps the domain name of an internal server to the public IP address, public port number, and protocol type of the internal server. NAT Server maps the public IP and port to the private IP and port of the internal server.

Procedure

1. Enter system view.

   system-view

2. Enable NAT ALG for DNS.

   nat alg dns

   By default, NAT ALG is enabled for DNS.

3. Configure a NAT DNS mapping.

   nat dns-map domain *domain-name* **protocol** *pro-type* { **interface** *interface-type interface-number* | **ip** *global-ip* } **port** *global-port*

   You can configure multiple NAT DNS mappings.

Enabling NAT port halving

About this task

After you enable NAT port halving in VRRP load balancing on an IRF fabric, each port block will be equally divided between the two devices. The two devices will use different ports to translate packets from the same IP address, avoiding port assignment conflicts. For more information about IRF, see *Virtual Technologies Configuration Guide*.

Restrictions and guidelines

Do not use this feature in VRRP standard mode.

Procedure

1. Enter system view.
   `system-view`
2. Enable NAT port halving.
   `nat port-load-balance enable slot` *`slot-number`*
   By default, NAT port halving is disabled.

Configuring hot backup for NAT

About hot backup for NAT

If only one NAT device is deployed in the internal network, internal users cannot access the external network when the NAT device fails. To avoid this situation, configure hot backup for NAT. In the hot backup plan, the two devices in the hot backup system are capable of processing NAT services. Session entries, session relation entries, NAT port block entries, and NAT configurations are synchronized through the hot backup channel. When one device fails, the other device takes over.

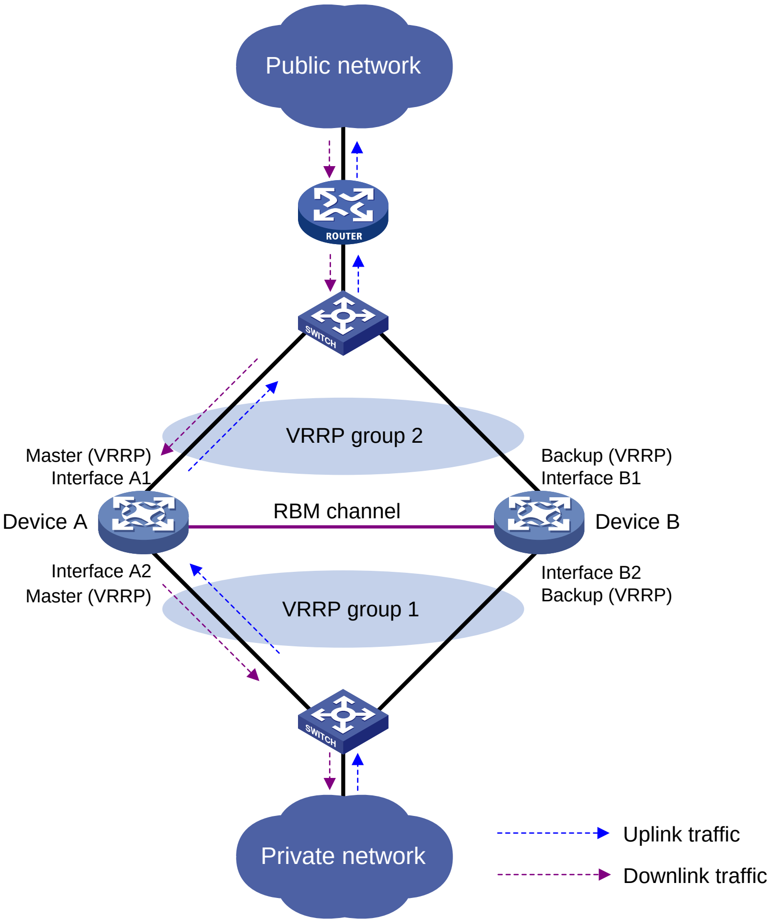
For more information about configuring hot backup, see *High Availability Configuration Guide*.

Operating mechanism

Typically, the master device in the VRRP group processes NAT services in the hot backup system. The following example illustrates how hot backup in active/standby mode ensures uninterrupted NAT services when the master device fails.

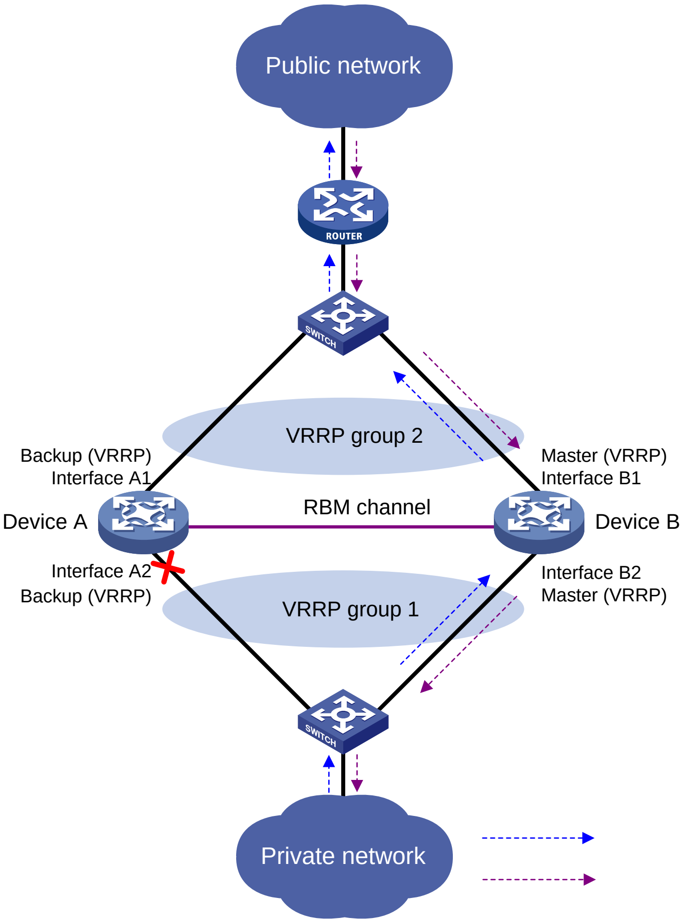
As shown in Figure 17, Device A acts as the primary device and Device B acts as the secondary device in a VRRP group. Device A synchronizes its session entries, session relation entries, and port block entries to Device B in real time through the hot backup channel. Downlinks of Device A and Device B are in VRRP group 1 and uplinks of Device A and Device B are in VRRP group 2. VRRP groups are associated with the hot backup system. Hot backup selects Device A as the master device for address translation based on the link status or forwarding capability of Device A.

Figure 17 Hot backup in active/standby mode



As shown in Figure 18, when Interface A2 of Device A fails, Device B becomes the master device in the VRRP group. Because Device B has NAT configuration information and service entries, NAT services are not interrupted after link switchover.

Figure 18 Traffic switchover in active/standby mode



Configuring active/standby hot backup

About this task

For active/standby hot backup, some translation rules for static address translation, source address translation, and destination address translation assign the public address after translation or public IP address of the internal server to the address management module. Then, both the active and standby devices advertise the mappings between the public IP address and MAC addresses of their own physical interfaces to all nodes in the same LAN. As a result, the uplink Layer 3 device directly connected to the hot backup system might send downlink packets to the backup device, causing service anomalies.

To avoid such an issue, bind an address translation method to a VRRP group. Then, only the master device responds to ARP requests or NS messages with the virtual MAC address of the VRRP group. The uplink Layer 3 device directly connected to the hot backup system sends downlink packets only to the master device.

For more information about configuring the hot backup system, see *High Availability Configuration Guide*.

Restrictions and guidelines

Bind an address translation method to a VRRP group on the primary device in the hot backup system.

Procedure

1. Enter system view.

   system-view

2. Bind a translation method to a VRRP group. Choose the following steps to configure as needed.

3. Bind a VRRP group to the NAT address group.

   a. Enter NAT address group view.

      nat address-group *group-id* [**name** *group-name*]

   b. Bind a VRRP group to the NAT address group.

      vrrp vrid *virtual-router-id*

      By default, a NAT address group is not bound to any VRRP group.

4. Bind a VRRP group to the NAT port block group.

   a. Enter NAT port block group view.

      nat port-block-group *group-id*

   b. Bind a VRRP group to the NAT port block group.

      vrrp vrid *virtual-router-id*

      By default, a NAT port block group is not bound to any VRRP group.

5. Bind a VRRP group to the one-to-one mapping for outbound static NAT.

   a. Enter interface view.

      interface *interface-type interface-number*

   b. Bind a VRRP group to the one-to-one mapping for outbound static NAT.

      For more information, see "Configuring outbound one-to-one static NAT."

6. Bind a VRRP group to the net-to-net mapping for outbound static NAT.

   a. Enter interface view.

      interface *interface-type interface-number*

   b. Bind a VRRP group to the net-to-net mapping for outbound static NAT.

      For more information, see "Configuring outbound net-to-net static NAT."

7. Bind a VRRP group to the object group-based outbound static NAT mapping.

   a. Enter interface view.

      interface *interface-type interface-number*

   b. Bind a VRRP group to the object group-based outbound static NAT mapping.

      For more information, see "Configuring object group-based outbound static NAT."

8. Bind a VRRP group to the internal server.

   a. Enter interface view.

      interface *interface-type interface-number*

   b. Bind a VRRP group to the internal server.

      For more information, see "Configuring common NAT server mappings", "Configuring load sharing NAT server mappings", "Configuring ACL-based NAT server mappings", and "Configuring object group-based NAT server mappings."

Configuring dual-active hot backup

About this task

For dual-active hot backup, the uplink Layer 3 device directly connected to the hot backup system might send downlink packets to the backup device, causing service anomalies.

To avoid such an issue, bind an address translation method to a VRRP group. Then, only the master device responses to ARP requests or NS messages with the virtual MAC address of the VRRP group. For more information about configuring the hot backup system, see *High Availability Configuration Guide*.

Restrictions and guidelines

Select one of the following configuration methods:

- The two devices can share the same NAT address group or port block group. To prevent different master devices from using the same IP-port mapping for different hosts, specify the PAT translation mode and execute the **nat remote-backup port-alloc** command on the primary device.
- As a best practice to prevent different master devices from using the same IP-port mapping for different hosts, configure the two devices to use different public IP addresses for address translation. For example, if the two devices use different NAT address groups or port block groups, user traffic with different source IP addresses is identified by ACLs in NAT rules. To enable different master devices to translate the forward user traffic, specify different gateway addresses for different internal users. To direct the reverse traffic to different master devices, bind NAT address groups or port block groups to different VRRP groups on the primary device.

Procedure

1. Enter system view.

   system-view

2. Bind a translation method to a VRRP group. Choose the following steps to configure as needed.

3. Bind a VRRP group to the NAT address group.

   a. Enter NAT address group view.

      nat address-group *group-id* [**name** *group-name*]

   b. Bind a VRRP group to the NAT address group.

      vrrp vrid *virtual-router-id*

      By default, a NAT address group is not bound to any VRRP group.

      If you execute this command multiple times, the most recent configuration takes effect.

4. Bind a VRRP group to the NAT port block group.

   a. Enter NAT port block group view.

      nat port-block-group *group-id*

   b. Bind a VRRP group to the NAT port block group.

      vrrp vrid *virtual-router-id*

      By default, a NAT port block group is not bound to any VRRP group.

      If you execute this command multiple times, the most recent configuration takes effect.

5. (Optional.) Specify NAT port block ranges for the two devices in the hot backup system.

   a. Return to system view.

      quit

   b. Specify NAT port ranges for the two devices in the hot backup system.

      nat remote-backup port-alloc { **primary** | **secondary** }

      By default, the two devices in the hot backup system share NAT port resources.

      The following table describes port ranges indicated by the keywords:

Keyword	Port ranges
primary	The first half of the port range.

Keyword	Port ranges
`secondary`	The second half of the port range.

6. Bind a VRRP group to the one-to-one mapping for outbound static NAT.
   a. Enter interface view.
      interface *interface-type interface-number*
   b. Bind a VRRP group to the one-to-one mapping for outbound static NAT.
      For more information, see "Configuring outbound one-to-one static NAT."
7. Bind a VRRP group to the net-to-net mapping for outbound static NAT.
   a. Enter interface view.
      interface *interface-type interface-number*
   b. Bind a VRRP group to the net-to-net mapping for outbound static NAT.
      For more information, see "Configuring outbound net-to-net static NAT."
8. Bind a VRRP group to the object group-based outbound static NAT mapping.
   a. Enter interface view.
      interface *interface-type interface-number*
   b. Bind a VRRP group to the object group-based outbound static NAT mapping.
      For more information, see "Configuring object group-based outbound static NAT."
9. Bind a VRRP group to the internal NAT server.
   a. Enter interface view.
      interface *interface-type interface-number*
   b. Bind a VRRP group to the internal NAT server.
      For more information, see "Configuring common NAT server mappings", "Configuring load sharing NAT server mappings", "Configuring ACL-based NAT server mappings", and "Configuring object group-based NAT server mappings."

Configuring NAT maintenance

Configuring periodic NAT statistics collection

About this task

This feature periodically counts sessions and port block assignment failures for address groups.

Hardware and feature compatibility

Models	Feature compatibility
NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280	No
NFNX5-HD6480, NFNX3-HDB1780, NFNX3-HDB3080, NFNX3-HDB1180, NFNX3-HDB1480, NFNX3-HDB680, NFNX3-HDB1080	Yes

Restrictions and guidelines

This feature might cause intensive CPU usage. You can disable the feature when CPU resources are insufficient.

Procedure

1. Enter system view.

   `system-view`

2. Enable periodic NAT statistics collection.

   `nat periodic-statistics enable`

   By default, periodic NAT statistics collection is disabled.

3. Configure the interval for periodic NAT statistics collection.

   `nat periodic-statistics interval` *`interval`*

   By default, the interval for periodic NAT statistics collection is 300 seconds.

   A narrower interval indicates intensive CPU usage. As a best practice, use the default interval value.

Enabling statistics collection for NAT session creation rate

About this task

This feature collects information about NAT session creation rates. To view the statistics, use the **`display nat statistics`** command.

Procedure

1. Enter system view.

   `system-view`

2. Enable statistics collection for NAT session creation rate.

   `nat session create-rate enable`

   By default, statistics collection for NAT session creation rate is disabled.

Specifying a probe method for detecting reachability of NAT address group members

About this task

The NAT address group probing uses an NQA template to detect the reachability of the addresses in the group. For information about NQA, see *Network Management and Monitoring Configuration Guide*.

The device periodically sends probe packets to the specified destination address in the NQA template. The source IP addresses in the probe packets are the IP addresses in the NAT address group.

- If the device receives a response packet for a probe, the probed source IP address can be used for address translation.
- If the device does not receive a response packet for a probe, the probed source IP address will be excluded from address translation temporarily. However, in the next NQA operation period, this excluded IP address is also probed. If a response is received in this round, the IP address can be used for address translation.

Restrictions and guidelines

You can specify multiple NQA templates in one NAT address group view. An IP address in the address group is identified as reachable as long as one probe for this IP address succeeds.

This feature is applicable to NAT address groups used for outbound address translation. The manually configured excluded IP addresses are not probed.

Make sure the NQA template used for NAT address group probing does not have source IP address configured.

Procedure

1. Enter system view.

   `system-view`

2. Enter NAT address group view.

   nat address-group *group-id* [**name** *group-name*]

3. Specify a probe method for the NAT address group.

   probe *template-name*

   By default, no probe method is specified for a NAT address group.

   You can specify a nonexistent probe method. The probing takes effect only after you create and configure the NQA template.

Enabling sending ICMP error messages for NAT failures

About this task

By default, sending ICMP error messages upon NAT failures is disabled on the NAT device. Applications using the ICMP protocol cannot be notified when an event occurs. With this feature enabled, the NAT device sends ICMP error messages upon NAT failures for the applications to locate and troubleshoot the failures.

Restrictions and guidelines

Enable this feature for traceroute because the traceroute function requires ICMP error packets.

Procedure

1. Enter system view.

   `system-view`

2. Enable sending ICMP error messages for NAT failures.

   `nat icmp-error reply`

   By default, no ICMP error messages are sent for NAT failures.

Enabling NAT configuration changes to take effect only on new connections

About this task

By default, NAT configuration changes (such as adding, deleting, editing, or moving NAT rules) might cause traffic on an established connection to match a new NAT rule. As a result, you must create a new connection.

Execute the **at configuration-for-new-connection enable** command if you do not want the NAT configuration change to affect existing connections. After you execute this command on the device, it still performs address translation according to the NAT rules before the configuration change for traffic on existing connections. For traffic on new connections, the device matches the traffic according to the priority of NAT rules after the configuration change and performs address translation based on the matching NAT rules.

Procedure

1. Enter system view.

   `system-view`

2. Enable NAT configuration change to take effect only on new connections.

   ```
   nat configuration-for-new-connection enable
   ```

   By default, NAT configuration change taking effect only on new connections is disabled.

Configuring NAT logging

Configuring NAT session logging

About this task

NAT session logging records NAT session information, including translation information and access information.

A NAT device generates NAT session logs for the following events:

- NAT session establishment.
- NAT session removal. This event occurs when you add a configuration with a higher priority, remove a configuration, change ACLs, when a NAT session ages out, or when you manually delete a NAT session.
- Active NAT session logging.

Procedure

1. Enter system view.

   ```
   system-view
   ```

2. Enable NAT logging.

   ```
   nat log enable [ acl { ipv4-acl-number | name ipv4-acl-name } ]
   ```

   By default, NAT logging is disabled.

3. Enable NAT session logging.

   - For NAT session establishment events:

     ```
     nat log flow-begin
     ```

   - For NAT session removal events:

     ```
     nat log flow-end
     ```

   - For active NAT flows:

     ```
     nat log flow-active minutes
     ```

   By default, NAT session logging is disabled.

Configuring NAT444 user logging

About this task

NAT444 user logs are used for user tracing. The NAT444 gateway generates a user log whenever it assigns or withdraws a port block. The log includes the private IP address, public IP address, and port block. You can use the public IP address and port numbers to locate the user's private IP address from the user logs.

A NAT444 gateway generates NAT user logs when one of the following events occurs:

- A port block is assigned.

  For the NAT444 static port block mapping, the NAT444 gateway generates a user log when it translates the first connection from a private IP address.

  For the NAT444 dynamic port block mapping, the NAT444 gateway generates a user log when it assigns or extends a port block for a private IP address.

- A port block is withdrawn.

  For the NAT444 static port block mapping, the NAT444 gateway generates a user log when all connections from a private IP address are disconnected.

  For the NAT444 dynamic port block mapping, the NAT444 gateway generates a user log when all the following conditions are met:

  - All connections from a private IP address are disconnected.
  - The port blocks (including the extended ones) assigned to the private IP address are withdrawn.
  - The corresponding mapping entry is deleted.

Prerequisites

Before configuring NAT444 user logging, you must configure the custom NAT444 log generation and outputting features. For more information, see the information center in *Network Management and Monitoring Configuration Guide*.

Procedure

1. Enter system view.

   `system-view`

2. Enable NAT logging.

   `nat log enable` [**`acl`** { *`ipv4-acl-number`* | **`name`** *`ipv4-acl-name`* }]

   By default, NAT logging is disabled.

   The **`acl`** keyword does not take effect on NAT444 user logging.

3. Enable NAT444 user logging. Choose the options to configure as needed:

   - For port block assignment:

     `nat log port-block-assign`

   - For port block withdrawal:

     `nat log port-block-withdraw`

   By default, NAT444 user logging is disabled.

Configuring NAT alarm logging

About this task

Packets that need to be translated are dropped if the NAT resources are not enough. In NO-PAT, the NAT resources refer to the public IP addresses. In EIM PAT, the NAT resources refer to public IP addresses and ports. In NAT444, the NAT resources refer to public IP addresses, port blocks, or ports in port blocks. NAT alarm logging monitors the usage of NAT resources and outputs logs if the NAT resources are not enough.

For NAT444 dynamic port block mappings, an alarm log is generated upon the port block assignment failure or the failure that port resources cannot meet the user address translation requirement.

Restrictions and guidelines

The **`nat log alarm`** command take effect only after you use the **`nat log enable`** command to enable NAT logging.

Prerequisites

Before configuring NAT alarm logging, you must configure the custom NAT log generation and outputting features. For more information, see the information center in *Network Management and Monitoring Configuration Guide*.

Procedure

1. Enter system view.

   system-view
2. Enable NAT logging.

   nat log enable [**acl** { *ipv4-acl-number* | **name** *ipv4-acl-name* }]

   By default, NAT logging is disabled.

   The **acl** keyword does not take effect on NAT alarm logging.
3. Enable NAT alarm logging.

   nat log alarm

   By default, NAT alarm logging is disabled.

   An NAT alarm log is output when NAT resources run out.
4. (Optional.) Set the NAT444 port block usage threshold.

   nat log port-block usage threshold *threshold-value*

   By default, the NAT444 port block usage threshold is 90%.

   The system generates alarm logs if the port block usage exceeds the threshold.

Enabling logging for IP usage of a NAT address group in NO-PAT mode

About this task

The system generates a log if the IP usage of a NAT address group exceeds the threshold.

Restrictions and guidelines

This feature takes effect only after you enable NAT logging by using the **nat log enable** command.

Procedure

1. Enter system view.

   system-view
2. Enable NAT logging.

   nat log enable [**acl** { *ipv4-acl-number* | **name** *ipv4-acl-name* }]

   By default, NAT logging is disabled.

   The **acl** keyword does not take effect on the logging for IP usage of a NAT address group in NO-PAT mode.
3. Enable logging for the IP usage of a NAT address group in NO-PAT mode and set a threshold.

   nat log no-pat ip-usage [**threshold** *value*]

   By default, logging is disabled for the IP usage of a NAT address group.

Configuring NAT in specific networks

Enabling NAT reply redirection

About this task

In some network scenarios, the inbound dynamic NAT is configured with tunneling, and multiple tunnel interfaces use the same NAT address group. In this case, the device will translate the source

IP addresses of packets from different tunnels into the same NAT address before forwarding them. When the forwarding interface receives the reply packets, the device, by default, will not look up the NAT session table. This will cause the incorrect forwarding of the reply packets. To solve the problem, you can enable the NAT reply redirection feature on the forwarding interface. NAT reply redirection allows the interface to use the NAT session table to translate the destination IP addresses for NAT reply packets and find the correct output interfaces for those NATed reply packets.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Enable NAT reply redirection.

   nat redirect reply-route enable

   By default, NAT reply redirection is disabled.

Enabling the deletion of timestamps in TCP SYN and SYN ACK packets

About this task

With this feature configured, the system deletes the timestamps from the TCP SYN and SYN ACK packets after dynamic address translation.

If PAT mode is configured on an interface by using **nat inbound** or **nat outbound**, and the tcp_timestams and tcp_tw_recycle function is configured on the TCP server, TCP connections might not be established. To solve the problem, you can shut down the tcp_tw_recycle function or configure the **nat timestamp delete** command.

Procedure

1. Enter system view.

   system-view

2. Enable the deletion of timestamps in TCP SYN and SYN ACK packets

   nat timestamp delete [**vpn-instance** *vpn-instance-name*]

   By default, the deletion of timestamps in TCP SYN and SYN ACK packets is disabled.

   You can enable this feature for multiple VPN instances by repeating the command with different VPN parameters.

Enabling NAT session recreation after link switchover

About this task

This feature is applicable to a WAN network where two interfaces of the NAT device are configured with outbound dynamic NAT rules using different address groups. When the link of one interface fails, traffic on this link is switched to the link of the other interface and the NAT device operates as follows:

- If the two interfaces are in different security zones, the NAT device deletes old session entries after link switchover. When user traffic later arrives, it triggers the NAT session recreation. This mechanism ensures that internal users can access the external network.
- If the two interfaces are in the same security zone, the NAT device retains old session entries after link switchover. Internal users cannot access the external network because the device

uses old session entries to match the user traffic. To avoid this issue, enable this feature to ensure availability of NAT services.

Procedure

1. Enter system view.

   system-view

2. Enable NAT session recreation after link switchover.

   nat link-switch recreate-session

   By default, NAT session recreation is disabled after link switchover.

Display and maintenance commands for interface-based NAT

IMPORTANT:

Support for the **display nat periodic-statistics** command depends on the device model. For more information, see the command reference.

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display the NAT ALG status for all supported protocols	**display nat alg**
Display all NAT configuration information.	**display nat all**
Display NAT address group information.	**display nat address-group** [*group-id*]
Display NAT DNS mapping configuration.	**display nat dns-map**
Display information about NAT EIM entries.	**display nat eim** [**slot** *slot-number*]
Display inbound dynamic NAT configuration.	**display nat inbound**
Display NAT logging configuration.	**display nat log**
Display information about NAT NO-PAT entries.	**display nat no-pat** [**slot** *slot-number*]
Display IP usage of NAT address groups in NO-PAT mode.	**display nat no-pat ip-usage** [**address-group** { *group-id* | **name** *group-name* } | **object-group** *object-group-name*] [**slot** *slot-number*]
Display outbound dynamic NAT configuration.	**display nat outbound**
Display the interface-based NAT policy configuration.	**display nat policy**
Display NAT server mappings.	**display nat server**
Display internal server group configuration.	**display nat server-group** [*group-id*]

Task	Command
Display NAT sessions.	**display nat session** [[**responder**] { **source-ip** *source-ip* | **destination-ip** *destination-ip* } * [**vpn-instance** *vpn-instance-name*]] [**slot** *slot-number*] [**verbose**]
Display static NAT mappings.	**display nat static**
Display NAT statistics.	**display nat statistics** [**summary**] [**slot** *slot-number*]
Display static outbound port block mapping rules for NAT444	**display nat outbound port-block-group**
Display NAT port block group configuration.	**display nat port-block-group** [*group-id*]
Display NAT port block mappings.	**display nat port-block** { **dynamic** [**address-group** { *group-id* | **name** *group-name* }] [**ds-lite-b4**] | **static** [**port-block-group** *group-id*] } [**slot** *slot-number*]
Display the port block usage for address groups	**display nat port-block-usage** [**address-group** *group-id*] [**slot** *slot-number*]
Display NAT address group probe information.	**display nat probe address-group** [*group-id*]
Clear NAT counting statistics.	**reset nat count statistics** { **all** | **global-policy**| **global-policy** | **server** | **static** | **static-port-block** }
Clear NAT sessions.	**reset nat session** [**slot** *slot-number*]

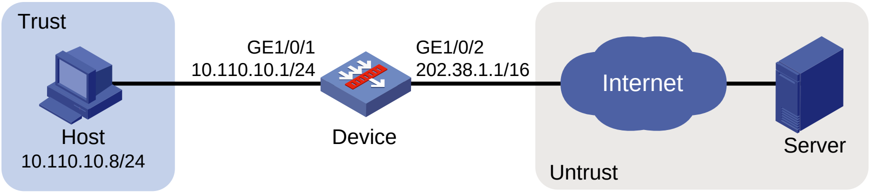
Interface-based NAT configuration examples

Example: Configuring outbound one-to-one static NAT

Network configuration

Configure static NAT to allow the host at 10.110.10.8/24 to access the server at 201.20.1.1/24 on the Internet.

Figure 19 Network diagram



Procedure

1. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

   ```
   <Device> system-view
   [Device] interface gigabitethernet 1/0/1
   [Device-GigabitEthernet1/0/1] ip address 10.110.10.1 24
   [Device-GigabitEthernet1/0/1] quit
   ```

   # Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Add interfaces to security zones.

   ```
   [Device] security-zone name trust
   [Device-security-zone-Trust] import interface gigabitethernet 1/0/1
   [Device-security-zone-Trust] quit
   [Device] security-zone name untrust
   [Device-security-zone-Untrust] import interface gigabitethernet 1/0/2
   [Device-security-zone-Untrust] quit
   ```

3. Configure settings for routing.

   This example configures a static route, and the next hop in the routes is 202.38.1.2.

   ```
   [Device] ip route-static 201.20.1.0 24 202.38.1.2
   ```

4. Configure a security policy:

   # Configure a rule named **trust-untrust** to permit the packets from the host to the server.

   ```
   [Device] security-policy ip
   [Device-security-policy-ip] rule name trust-untrust
   [Device-security-policy-ip-1-trust-untrust] source-zone trust
   [Device-security-policy-ip-1-trust-untrust] destination-zone untrust
   [Device-security-policy-ip-1-trust-untrust] source-ip-host 10.110.10.8
   [Device-security-policy-ip-1-trust-untrust] destination-ip-host 201.20.1.1
   [Device-security-policy-ip-1-trust-untrust] action pass
   [Device-security-policy-ip-1-trust-untrust] quit
   [Device-security-policy-ip] quit
   ```

5. Configure NAT:

   # Configure a one-to-one static NAT mapping between the private address 10.110.10.8 and the public address 202.38.1.100.

   ```
   [Device] nat static outbound 10.110.10.8 202.38.1.100
   [Device] interface gigabitethernet 1/0/2
   [Device-GigabitEthernet1/0/2] nat static enable
   [Device-GigabitEthernet1/0/2] quit
   ```

Verifying the configuration

# Verify that the host at 10.110.10.8/24 can access the server on the Internet. (Details not shown.)

# Display static NAT configuration.

```
[Device] display nat static
Static NAT mappings:
  Totally 1 outbound static NAT mappings.
  IP-to-IP:
    Local IP     : 10.110.10.8
    Global IP    : 202.38.1.100
    Config status: Active
```

```
Interfaces enabled with static NAT:
  Totally 1 interfaces enabled with static NAT.
  Interface: GigabitEthernet1/0/2
    NAT counting : 0
    Config status: Active
```

# Display NAT sessions.

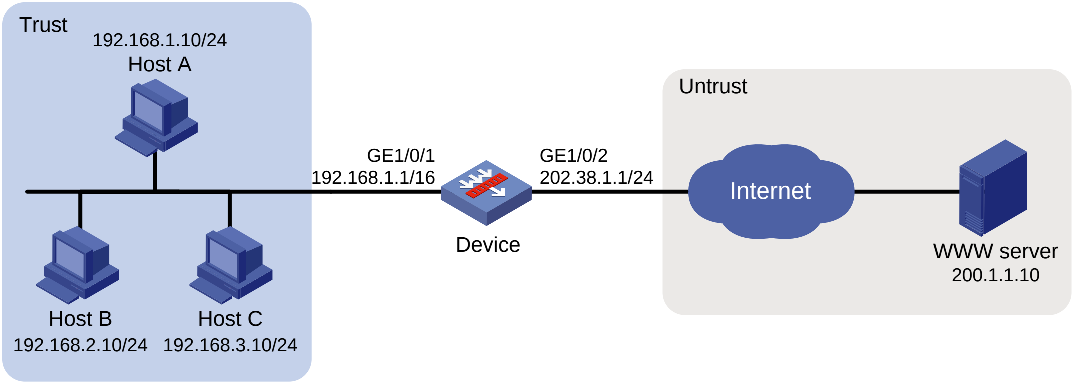
```
[Device] display nat session verbose
Slot 1:
Initiator:
  Source      IP/port: 10.110.10.8/54765
  Destination IP/port: 202.38.1.2/23
  DS-Lite tunnel peer: -
  VPN instance/VLAN ID/Inline ID: -/-/-
  Protocol: TCP(6)
  Inbound interface: GigabitEthernet1/0/1
  Source security zone: Trust
Responder:
  Source      IP/port: 202.38.1.2/23
  Destination IP/port: 202.38.1.100/54765
  DS-Lite tunnel peer: -
  VPN instance/VLAN ID/Inline ID: -/-/-
  Protocol: TCP(6)
  Inbound interface: GigabitEthernet1/0/2
  Source security zone: Untrust
State: TCP_ESTABLISHED
Application: TELNET
Rule ID: -/-/-
Rule name:
Start time: 2017-05-19 10:57:47  TTL: 1195s
Initiator->Responder:            8 packets        375 bytes
Responder->Initiator:           10 packets        851 bytes
Total sessions found: 1
```

Example: Configuring outbound dynamic NAT (non-overlapping addresses)

Network configuration

As shown in Figure 20, a company has a private address 192.168.0.0/16 and two public IP addresses 202.38.1.2 and 202.38.1.3. Configure outbound dynamic NAT to allow only internal users on subnet 192.168.1.0/24 to access the Internet.

Figure 20 Network diagram



Procedure

1. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

   ```
   <Device> system-view
   [Device] interface gigabitethernet 1/0/1
   [Device-GigabitEthernet1/0/1] ip address 192.168.1.1 16
   [Device-GigabitEthernet1/0/1] quit
   ```

   # Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Add interfaces to security zones.

   ```
   [Device] security-zone name trust
   [Device-security-zone-Trust] import interface gigabitethernet 1/0/1
   [Device-security-zone-Trust] quit
   [Device] security-zone name untrust
   [Device-security-zone-Untrust] import interface gigabitethernet 1/0/2
   [Device-security-zone-Untrust] quit
   ```

3. Configure settings for routing.

   This example configures a static route, and the next hop in the routes is 202.38.1.20.

   ```
   [Device] ip route-static 200.1.1.0 24 202.38.1.20
   ```

4. Configure a security policy:

   # Configure a rule named **trust-untrust** to permit the packets from the hosts to the server.

   ```
   [Device] security-policy ip
   [Device-security-policy-ip] rule name trust-untrust
   [Device-security-policy-ip-1-trust-untrust] source-zone trust
   [Device-security-policy-ip-1-trust-untrust] destination-zone untrust
   [Device-security-policy-ip-1-trust-untrust] source-ip-subnet 192.168.1.0 24
   [Device-security-policy-ip-1-trust-untrust] destination-ip-host 200.1.1.10
   [Device-security-policy-ip-1-trust-untrust] action pass
   [Device-security-policy-ip-1-trust-untrust] quit
   [Device-security-policy-ip] quit
   ```

5. Configure NAT:

   # Configure address group 0, and add an address range from 202.38.1.2 to 202.38.1.3 to the group.

   ```
   [Device] nat address-group 0
   [Device-address-group-0] address 202.38.1.2 202.38.1.3
   ```

```
[Device-address-group-0] quit
```

# Configure ACL 2000 to identify packets from subnet 192.168.1.0/24.

```
[Device] acl basic 2000
[Device-acl-ipv4-basic-2000] rule permit source 192.168.1.0 0.0.0.255
[Device-acl-ipv4-basic-2000] quit
```

# Enable outbound dynamic PAT on GigabitEthernet 1/0/2. The source IP addresses of the packets permitted by the ACL rule is translated into the addresses in address group 0.

```
[Device] interface gigabitethernet 1/0/2
[Device-GigabitEthernet1/0/2] nat outbound 2000 address-group 0
```

Verifying the configuration

# Verify that Host A can access the WWW server, while Host B cannot. (Details not shown.)

# Display all NAT configuration and statistics.

```
[Device] display nat all
NAT address group information:
  Totally 1 NAT address groups.
  Address group ID: 0
    Port range: 1-65535
    Address information:

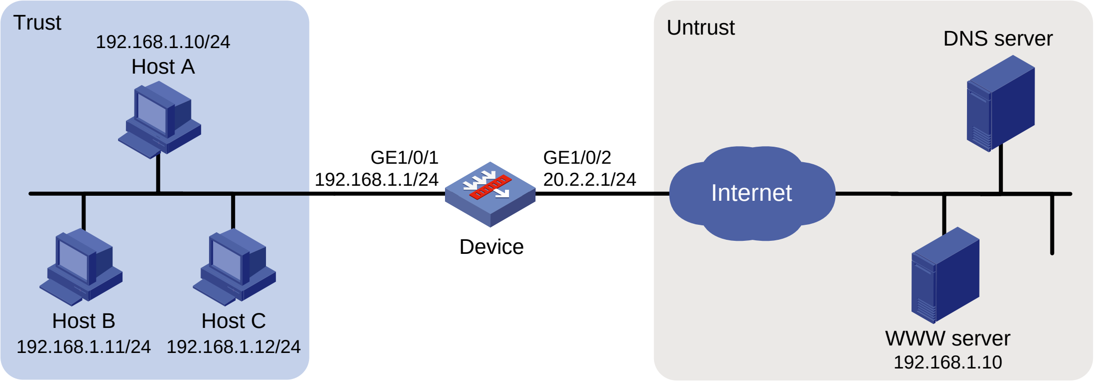
Total sessions found: 1
```

Example: Configuring outbound bidirectional NAT

Network configuration

As shown in Figure 21, the private network where the Web server resides overlaps with the company private network 192.168.1.0/24. The company has two public IP addresses 202.38.1.2 and 202.38.1.3. Configure NAT to allow internal users to access the external Web server by using the server's domain name.

Figure 21 Network diagram



Requirements analysis

To meet the network requirements, you must perform the following tasks:

- Configure inbound dynamic NAT ALG to make sure the internal host reaches the Web server instead of another internal host. NAT ALG can translate the Web server's IP address in the DNS reply payload to a dynamically assigned public address.
- Configure outbound dynamic NAT to translate the source IP address of packets from an internal host to a dynamically assigned public address.
- Add a static route to the public IP address of the external Web server.

Procedure

1. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

   ```
   <Device> system-view
   [Device] interface gigabitethernet 1/0/1
   [Device-GigabitEthernet1/0/1] ip address 192.168.1.1 24
   [Device-GigabitEthernet1/0/1] quit
   ```

   # Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Add interfaces to security zones.

   ```
   [Device] security-zone name trust
   [Device-security-zone-Trust] import interface gigabitethernet 1/0/1
   [Device-security-zone-Trust] quit
   [Device] security-zone name untrust
   [Device-security-zone-Untrust] import interface gigabitethernet 1/0/2
   [Device-security-zone-Untrust] quit
   ```

3. Configure settings for routing.

   This example configures a static route, and the next hop in the routes is 20.2.2.2.

   ```
   [Device] ip route-static 202.38.1.2 32 20.2.2.2
   ```

4. Configure a security policy:

# Configure a rule named **trust-untrust** to permit the packets from the hosts to the servers.

```
[Device] security-policy ip
[Device-security-policy-ip] rule name trust-untrust
[Device-security-policy-ip-1-trust-untrust] source-zone trust
[Device-security-policy-ip-1-trust-untrust] destination-zone untrust
[Device-security-policy-ip-1-trust-untrust] source-ip-subnet 192.168.1.0 24
[Device-security-policy-ip-1-trust-untrust] destination-ip-host 202.38.1.2
[Device-security-policy-ip-1-trust-untrust] action pass
[Device-security-policy-ip-1-trust-untrust] quit
[Device-security-policy-ip] quit
```

5. Configure NAT:

# Enable NAT ALG for DNS.

```
[Device] nat alg dns
```

# Configure ACL 2000 to identify packets from subnet 192.168.1.0/24.

```
[Device] acl basic 2000
[Device-acl-ipv4-basic-2000] rule permit source 192.168.1.0 0.0.0.255
[Device-acl-ipv4-basic-2000] quit
```

# Create address groups.

```
[Device] nat address-group 1
[Device-address-group-1] address 202.38.1.2 202.38.1.2
[Device-address-group-1] quit
[Device] nat address-group 2
[Device-address-group-2] address 202.38.1.3 202.38.1.3
[Device-address-group-2] quit
```

# Enable inbound NO-PAT on GigabitEthernet 1/0/2 to translate the source IP address in the DNS reply payload into the address in address group 1, and allow reversible NAT.

```
[Device] interface gigabitethernet 1/0/2
[Device-GigabitEthernet1/0/2] nat inbound 2000 address-group 1 no-pat reversible
```

# Enable outbound PAT on GigabitEthernet 1/0/2 to translate the source address of outgoing packets into the address in address group 2.

```
[Device-GigabitEthernet1/0/2] nat outbound 2000 address-group 2
[Device-GigabitEthernet1/0/2] quit
```

Verifying the configuration

# Verify that Host A can access the Web server by using its domain name. (Details not shown.)

# Display all NAT configuration and statistics.

```
[Device] display nat all

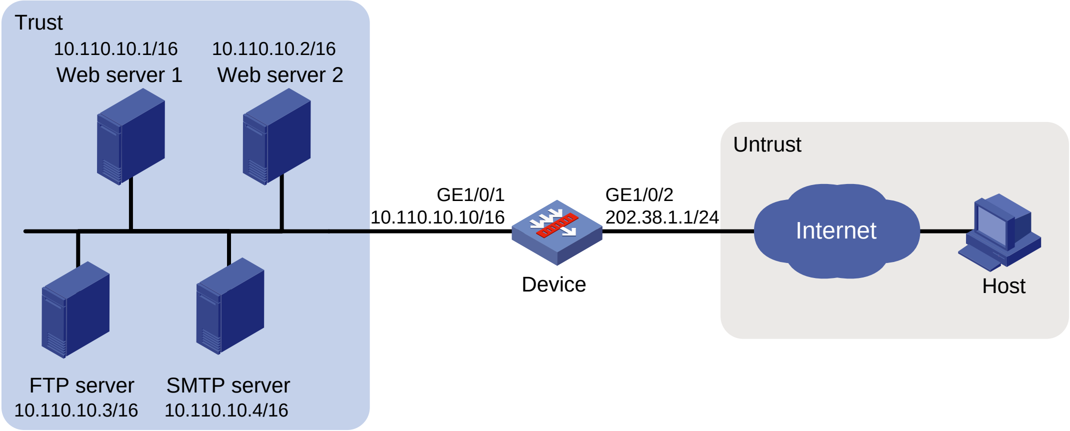
Example: Configuring NAT Server for external-to-internal access

Network configuration

As shown in Figure 22, two Web servers, one FTP server and one SMTP server, are in the internal network to provide services for external users. The internal network address is 10.110.0.0/16. The company has three public IP addresses from 202.38.1.1/24 to 202.38.1.3/24.

Configure the NAT Server feature to allow the external user to access the internal servers with public address 202.38.1.1/24.

Figure 22 Network diagram



Procedure

1. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

   ```
   <Device> system-view
   [Device] interface gigabitethernet 1/0/1
   [Device-GigabitEthernet1/0/1] ip address 10.110.10.10 16
   [Device-GigabitEthernet1/0/1] quit
   ```

   # Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Add interfaces to security zones.

   ```
   [Device] security-zone name trust
   [Device-security-zone-Trust] import interface gigabitethernet 1/0/1
   [Device-security-zone-Trust] quit
   [Device] security-zone name untrust
   [Device-security-zone-Untrust] import interface gigabitethernet 1/0/2
   [Device-security-zone-Untrust] quit
   ```

3. Configure a security policy:

   # Configure a rule named **untrust-trust** to permit the packets from the host to the servers.

   ```
   [Device] security-policy ip
   [Device-security-policy-ip] rule name untrust-trust
   [Device-security-policy-ip-1-untrust-trust] source-zone untrust
   [Device-security-policy-ip-1-untrust-trust] destination-zone trust
   [Device-security-policy-ip-1-untrust-trust] destination-ip-host 10.110.10.1
   [Device-security-policy-ip-1-untrust-trust] destination-ip-host 10.110.10.2
   [Device-security-policy-ip-1-untrust-trust] destination-ip-host 10.110.10.3
   [Device-security-policy-ip-1-untrust-trust] destination-ip-host 10.110.10.4
   [Device-security-policy-ip-1-untrust-trust] action pass
   [Device-security-policy-ip-1-untrust-trust] quit
   [Device-security-policy-ip] quit
   ```

4. Configure NAT:

   # Configure a NAT server mapping to allow external users to access the FTP server by using the address 202.38.1.1 and port 21.

   ```
   [Device] interface gigabitethernet 1/0/2
   ```

```
[Device-GigabitEthernet1/0/2] nat server protocol tcp global 202.38.1.1 21 inside
10.110.10.3 ftp
```

# Configure a NAT server mapping to allow external users to access the Web server 1 by using the address 202.38.1.1 and port 80.

```
[Device-GigabitEthernet1/0/2] nat server protocol tcp global 202.38.1.1 80 inside
10.110.10.1 http
```

# Configure a NAT server mapping to allow external users to access the Web server 2 by using the address 202.38.1.1 and port 8080.

```
[Device-GigabitEthernet1/0/2] nat server protocol tcp global 202.38.1.1 8080 inside
10.110.10.2 http
```

# Configure a NAT server mapping to allow external users to access the SMTP server by using the address 202.38.1.1 and port number defined by SMTP.

```
[Device-GigabitEthernet1/0/2] nat server protocol tcp global 202.38.1.1 smtp inside
10.110.10.4 smtp
[Device-GigabitEthernet1/0/2] quit
```

Verifying the configuration

# Verify that the host on the external network can access the internal servers by using the public addresses. (Details not shown.)

# Display all NAT configuration and statistics.

```
[Device] display nat all
NAT internal server information:

```

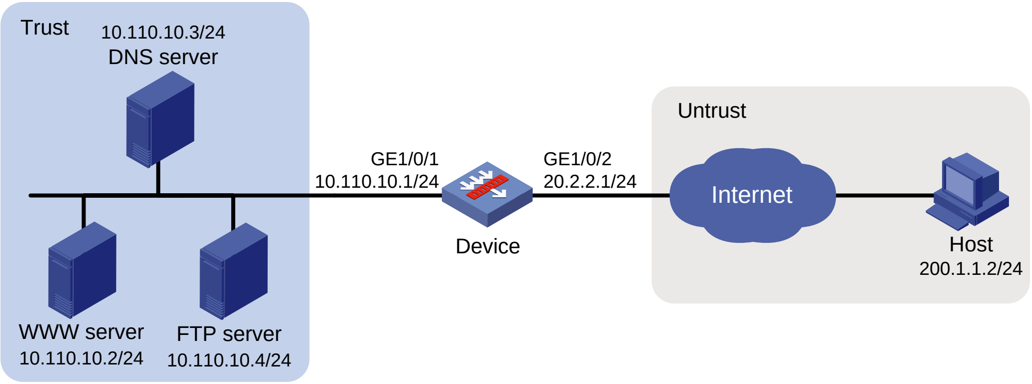
Example: Configuring NAT Server for external-to-internal access through domain name (non-overlapping addresses)

Network configuration

As shown in Figure 23, Web server at 10.110.10.2/24 in the internal network provides services for external users. A DNS server at 10.110.10.3/24 is used to resolve the domain name of the Web server. The company has two public IP addresses: 202.38.1.2 and 202.38.1.3.

Configure NAT Server to allow external users to access the internal Web server by using the domain name.

Figure 23 Network diagram



Requirements analysis

To meet the network requirements, you must perform the following tasks:

- Configure a NAT server mapping to map the private IP address and port of the DNS server to a public address and port. The mapping allows the external host to access the internal DNS server for domain name resolution.
- Enable ALG for DNS and configure outbound dynamic NAT to translate the private IP address of the Web server in the payload of the DNS response packet into a public IP address.

Procedure

1. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

   ```
   <Device> system-view
   [Device] interface gigabitethernet 1/0/1
   [Device-GigabitEthernet1/0/1] ip address 10.110.10.1 24
   [Device-GigabitEthernet1/0/1] quit
   ```

   # Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Add interfaces to security zones.

   ```
   [Device] security-zone name trust
   [Device-security-zone-Trust] import interface gigabitethernet 1/0/1
   [Device-security-zone-Trust] quit
   [Device] security-zone name untrust
   [Device-security-zone-Untrust] import interface gigabitethernet 1/0/2
   [Device-security-zone-Untrust] quit
   ```

3. Configure a security policy:

   # Configure a rule named **untrust-trust** to permit the packets from the host to the servers.

   ```
   [Device] security-policy ip
   [Device-security-policy-ip] rule name untrust-trust
   [Device-security-policy-ip-1-untrust-trust] source-zone untrust
   [Device-security-policy-ip-1-untrust-trust] destination-zone trust
   [Device-security-policy-ip-1-untrust-trust] destination-ip-host 10.110.10.2
   [Device-security-policy-ip-1-untrust-trust] destination-ip-host 10.110.10.3
   [Device-security-policy-ip-1-untrust-trust] destination-ip-host 10.110.10.4
   [Device-security-policy-ip-1-untrust-trust] action pass
   [Device-security-policy-ip-1-untrust-trust] quit
   [Device-security-policy-ip] quit
   ```

4. Configure NAT:

   # Enable NAT with ALG for DNS.

   ```
   [Device] nat alg dns
   ```

   # Configure ACL 2000, and create a rule to permit packets only from 10.110.10.2 to pass through.

   ```
   [Device] acl basic 2000
   [Device-acl-ipv4-basic-2000] rule permit source 10.110.10.2 0
   [Device-acl-ipv4-basic-2000] quit
   ```

   # Create an address group.

   ```
   [Device] nat address-group 1
   [Device-address-group-1] address 202.38.1.3 202.38.1.3
   [Device-address-group-1] quit
   ```

   # Configure a NAT server mapping on GigabitEthernet 1/0/2 to map the address 202.38.1.1 to 10.110.10.3. External users can access the internal DNS server.

   ```
   [Device] interface gigabitethernet 1/0/2
   ```

```
[Device-GigabitEthernet1/0/2] nat server protocol udp global 202.38.1.2 inside
10.110.10.3 dns
```

# Enable outbound NO-PAT on GigabitEthernet 1/0/2. Use the address in address group 1 to translate the private address in DNS response payload, and allow reversible NAT.

```
[Device-GigabitEthernet1/0/2] nat outbound 2000 address-group 1 no-pat reversible
[Device-GigabitEthernet1/0/2] quit
```

Verifying the configuration

# Verify that the host on the external network can access the internal Web server by using the server's domain name. (Details not shown.)

# Display all NAT configuration and statistics.

```
[Device] display nat all

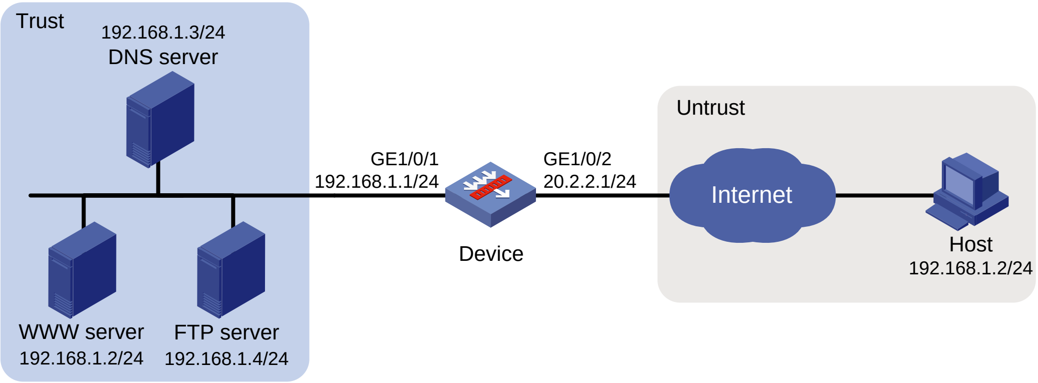
Example: Configuring NAT Server for external-to-internal access through domain name

Network configuration

As shown in Figure 24, an intranet uses the subnet 192.168.1.0/24. The Web server at 192.168.1.2/24 provides Web services for external users and the DNS server at 192.168.1.3/24 resolves the domain name of the Web server. The company has 3 public addresses 202.38.1.2, 202.38.1.3, and 202.38.1.4.

Configure NAT to allow external host at 192.168.1.2 in the external network to use the domain name to access the internal Web server.

Figure 24 Network diagram



Requirements analysis

To meet the network requirements, you must perform the following tasks:

- Configure a NAT server mapping to map the private IP address and port of the DNS server to a public IP address and port. NAT Server allows the external host to access the internal DNS server for domain name resolution.
- Configure outbound dynamic NAT and enable NAT ALG for DNS. The Web server's IP address is the same as the external host's IP address. NAT ALG can translate the Web server's private address in the payload of the DNS response packet to a dynamically assigned public address.
- Configure inbound dynamic NAT. The external host's IP address is the same as the Web server's IP address. Inbound dynamic NAT can translate the external host's IP address into a dynamically assigned public address.
- Add a static route to the public IP address of the external host with GigabitEthernet 1/0/2 as the output interface.

Procedure

1. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

   ```
   <Device> system-view
   [Device] interface gigabitethernet 1/0/1
   ```

```
[Device-GigabitEthernet1/0/1] ip address 192.168.1.1 24
[Device-GigabitEthernet1/0/1] quit
```

# Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Add interfaces to security zones.

```
[Device] security-zone name trust
[Device-security-zone-Trust] import interface gigabitethernet 1/0/1
[Device-security-zone-Trust] quit
[Device] security-zone name untrust
[Device-security-zone-Untrust] import interface gigabitethernet 1/0/2
[Device-security-zone-Untrust] quit
```

3. Configure settings for routing.

This example configures a static route, and the next hop in the routes is 20.2.2.2.

```
[Device] ip route-static 202.38.1.3 32 20.2.2.2
```

4. Configure a security policy:

# Configure a rule named **untrust-trust** to permit the packets from the host to the servers.

```
[Device] security-policy ip
[Device-security-policy-ip] rule name untrust-trust
[Device-security-policy-ip-1-untrust-trust] source-zone untrust
[Device-security-policy-ip-1-untrust-trust] destination-zone trust
[Device-security-policy-ip-1-untrust-trust] destination-ip-host 192.168.1.2
[Device-security-policy-ip-1-untrust-trust] destination-ip-host 192.168.1.3
[Device-security-policy-ip-1-untrust-trust] destination-ip-host 192.168.1.4
[Device-security-policy-ip-1-untrust-trust] action pass
[Device-security-policy-ip-1-untrust-trust] quit
[Device-security-policy-ip] quit
```

5. Configure NAT:

# Enable NAT ALG for DNS.

```
[Device] nat alg dns
```

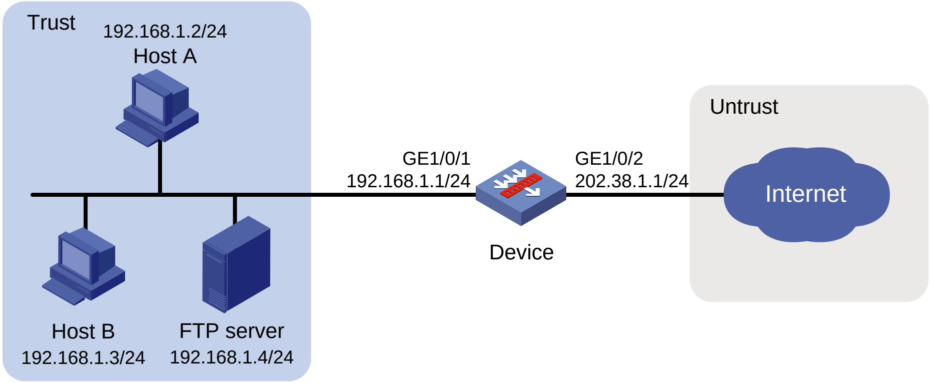
Example: Configuring NAT hairpin in C/S mode

Network configuration

As shown in Figure 25, the internal FTP server at 192.168.1.4/24 provides services for internal and external users. The private network uses two public IP addresses 202.38.1.1 and 202.38.1.2.

Configure NAT hairpin in C/S mode to allow external and internal users to access the internal FTP server by using public IP address 202.38.1.2.

Figure 25 Network diagram



Requirements analysis

To allow external hosts to access the internal FTP server by using a public IP address, configure NAT Server on the interface connected to the external network.

To allow internal hosts to access the internal FTP server by using a public IP address, perform the following tasks:

- Enable NAT hairpin on the interface connected to the internal network.
- Configure outbound NAT on the interface where NAT Server is configured. The destination address is translated by matching the NAT server mapping. The source address is translated by matching the outbound NAT.

Procedure

1. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

   ```
   <Device> system-view
   [Device] interface gigabitethernet 1/0/1
   [Device-GigabitEthernet1/0/1] ip address 10.110.10.1 24
   [Device-GigabitEthernet1/0/1] quit
   ```

   # Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Add interfaces to security zones.

   ```
   [Device] security-zone name trust
   [Device-security-zone-Trust] import interface gigabitethernet 1/0/1
   [Device-security-zone-Trust] quit
   [Device] security-zone name untrust
   [Device-security-zone-Untrust] import interface gigabitethernet 1/0/2
   [Device-security-zone-Untrust] quit
   ```

3. Configure a security policy:

   # Configure a rule named **trust-trust** to permit the packets from the hosts to the server in the **Trust** security zone.

   ```
   [Device] security-policy ip
   [Device-security-policy-ip] rule name trust-trust
   [Device-security-policy-ip-1-trust-trust] source-zone trust
   [Device-security-policy-ip-1-trust-trust] destination-zone trust
   [Device-security-policy-ip-1-trust-trust] source-ip-host 202.38.1.1
   [Device-security-policy-ip-1-trust-trust] destination-ip-host 192.168.1.4
   [Device-security-policy-ip-1-trust-trust] action pass
   [Device-security-policy-ip-1-trust-trust] quit
   ```

4. Configure a security policy:

   # Configure a rule named **untrust-trust** to permit the packets from the hosts in the **Untrust** security zone to the server.

   ```
   [Device-security-policy-ip] rule name untrust-trust
   [Device-security-policy-ip-2-untrust-trust] source-zone untrust
   [Device-security-policy-ip-2-untrust-trust] destination-zone trust
   [Device-security-policy-ip-2-untrust-trust] destination-ip-host 192.168.1.4
   [Device-security-policy-ip-2-untrust-trust] action pass
   [Device-security-policy-ip-2-untrust-trust] quit
   [Device-security-policy-ip] quit
   ```

5. Configure NAT:

   # Configure ACL 2000 to identify packets from subnet 192.168.1.0/24 to be translated.

   ```
   [Device] acl basic 2000
   [Device-acl-ipv4-basic-2000] rule permit source 192.168.1.0 0.0.0.255
   [Device-acl-ipv4-basic-2000] quit
   ```

   # Configure a NAT server mapping on GigabitEthernet 1/0/2 to map the IP address of the FTP server to a public address, allowing external users to access the internal FTP server.

   ```
   [Device] interface gigabitethernet 1/0/2
   [Device-GigabitEthernet1/0/2] nat server protocol tcp global 202.38.1.2 inside
   192.168.1.4 ftp
   ```

# Enable outbound NAT with Easy IP on GigabitEthernet 1/0/2 so that NAT translates the source addresses of the packets from internal hosts into the IP address of interface GigabitEthernet 1/0/2.

```
[Device-GigabitEthernet1/0/2] nat outbound 2000
```

# Enable NAT hairpin on GigabitEthernet 1/0/1.

```
[Device] interface gigabitethernet 1/0/1
[Device-GigabitEthernet1/0/1] nat hairpin enable
[Device-GigabitEthernet1/0/1] quit
```

Verifying the configuration

# Verify that both internal and external hosts can access the internal FTP server through the public address. (Details not shown.)

# Display all NAT configuration and statistics.

```
[Device] display nat all

Total sessions found: 1
```

Example: Configuring NAT hairpin in P2P mode

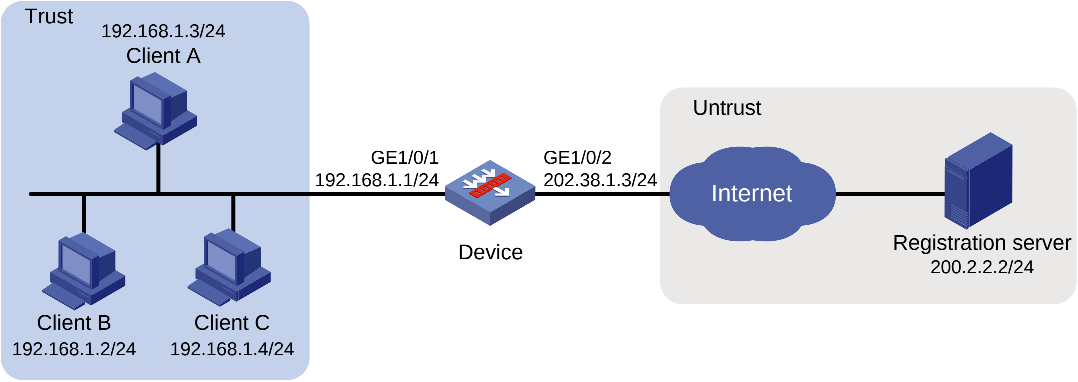
Network configuration

In the P2P application, internal clients must register their IP address to the external server and the server records the registered IP addresses and port numbers of the internal clients. An internal client must request the IP address and port number of another client from the external server before accessing the client.

Configure NAT hairpin so that:

- The internal clients can register the same public address to the external server.
- The internal clients can access each other through the IP address and port number obtained from the server.

Figure 26 Network diagram



Requirements analysis

To meet the network requirements, you must perform the following tasks:

- Configure outbound dynamic PAT on the interface connected to the external network, so the internal clients can access the external server for registration.
- Configure the mapping behavior for PAT as Endpoint-Independent Mapping because the registered IP address and port number should be accessible for any source address.
- Enable NAT hairpin on the interface connected to the internal network so that internal clients can access each other through the public address.

Procedure

1. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

   ```
   <Device> system-view
   [Device] interface gigabitethernet 1/0/1
   [Device-GigabitEthernet1/0/1] ip address 192.168.1.1 24
   [Device-GigabitEthernet1/0/1] quit
   ```

   # Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Add interfaces to security zones.

```
[Device] security-zone name trust
[Device-security-zone-Trust] import interface gigabitethernet 1/0/1
[Device-security-zone-Trust] quit
[Device] security-zone name untrust
[Device-security-zone-Untrust] import interface gigabitethernet 1/0/2
[Device-security-zone-Untrust] quit
```

3. Configure settings for routing.

   This example configures a static route, and the next hop in the routes is 202.38.1.1.

```
[Device] ip route-static 200.2.2.0 24 202.38.1.1
```

4. Configure a security policy:

   # Configure a rule named **trust-untrust** to permit the packets from the clients to the server.

```
[Device] security-policy ip
[Device-security-policy-ip] rule name trust-untrust
[Device-security-policy-ip-1-trust-untrust] source-zone trust
[Device-security-policy-ip-1-trust-untrust] destination-zone untrust
[Device-security-policy-ip-1-trust-untrust] source-ip-subnet 192.168.1.0 24
[Device-security-policy-ip-1-trust-untrust] destination-ip-host 200.2.2.2
[Device-security-policy-ip-1-trust-untrust] action pass
[Device-security-policy-ip-1-trust-untrust] quit
```

   # Configure a rule named **trust-trust** to permit the packets between the clients in the **Trust** security zone.

```
[Device-security-policy-ip] rule name trust-trust
[Device-security-policy-ip-2-trust-trust] source-zone trust
[Device-security-policy-ip-2-trust-trust] destination-zone trust
[Device-security-policy-ip-2-trust-trust] source-ip-host 202.38.1.3
[Device-security-policy-ip-2-trust-trust] destination-ip-subnet 192.168.1.0 24
[Device-security-policy-ip-2-trust-trust] action pass
[Device-security-policy-ip-2-trust-trust] quit
[Device-security-policy-ip] quit
```

5. Configure NAT:

   # Configure ACL 2000 to identify packets from subnet 192.168.1.0/24 to be translated.

```
[Device] acl basic 2000
[Device-acl-ipv4-basic-2000] rule permit source 192.168.1.0 0.0.0.255
[Device-acl-ipv4-basic-2000] quit
```

   # Configure outbound dynamic PAT with Easy IP on GigabitEthernet 1/0/2. The IP address of GigabitEthernet 1/0/2 is used as the public address for the source address translation of the packets from internal to external.

```
[Device] interface gigabitethernet 1/0/2
[Device-GigabitEthernet1/0/2] nat outbound 2000
```

   # Configure the Endpoint-Independent Mapping mode for PAT. For packets with the same source address and port number and permitted by ACL 2000, the source address and port number are translated to the same public address and port number.

```
[Device] nat mapping-behavior endpoint-independent acl 2000
```

   # Enable NAT hairpin on GigabitEthernet 1/0/1.

```
[Device] interface gigabitethernet 1/0/1
[Device-GigabitEthernet1/0/1] nat hairpin enable
[Device-GigabitEthernet1/0/1] quit
```

Verifying the configuration

# Verify that Host A, Host B, and Host C can access each other after they register their IP addresses and port numbers to the external server. (Details not shown.)

# Display all NAT configuration and statistics.

```
[Device] display nat all

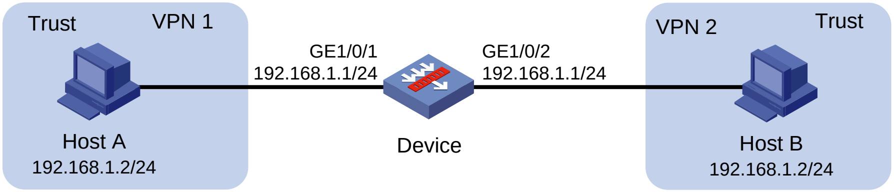
Example: Configuring twice NAT

Network configuration

As shown in Figure 27, two departments are in different VPN instances with overlapping addresses. Configure twice NAT so that Host A and Host B in different departments can access each other.

Figure 27 Network diagram



Requirements analysis

Both the source and destination addresses of packets between the two VPNs need to be translated. Configure static NAT on both interfaces connected to the VPNs on the NAT device.

To allow VPNs to access each other, configure the interzone policies to allow VPN packets to pass through.

Procedure

1. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

   ```
   <Device> system-view
   [Device] interface gigabitethernet 1/0/1
   [Device-GigabitEthernet1/0/1] ip binding vpn-instance vpn1
   [Device-GigabitEthernet1/0/1] ip address 192.168.1.1 24
   [Device-GigabitEthernet1/0/1] quit
   ```

   # Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Add interfaces to security zones.

   ```
   [Device] security-zone name trust
   [Device-security-zone-Trust] import interface gigabitethernet 1/0/1
   [Device-security-zone-Trust] import interface gigabitethernet 1/0/2
   [Device-security-zone-Trust] quit
   ```

3. Configure a security policy:

   # Configure a rule named **vpn1-vpn2** to permit the packets from Host A to Host B.

   ```
   [Device] security-policy ip
   [Device-security-policy-ip] rule name vpn1-vpn2
   [Device-security-policy-ip-1-vpn1-vpn2] source-zone trust
   [Device-security-policy-ip-1-vpn1-vpn2] destination-zone trust
   [Device-security-policy-ip-1-vpn1-vpn2] source-ip-host 192.168.1.2
   [Device-security-policy-ip-1-vpn1-vpn2] destination-ip-host 192.168.1.2
   [Device-security-policy-ip-1-vpn1-vpn2] vrf vpn1
   [Device-security-policy-ip-1-vpn1-vpn2] action pass
   [Device-security-policy-ip-1-vpn1-vpn2] quit
   ```

   # Configure a rule named **vpn2-vpn1** to permit the packets from Host B to Host A.

   ```
   [Device-security-policy-ip] rule name vpn2-vpn1
   [Device-security-policy-ip-1-vpn2-vpn1] source-zone trust
   [Device-security-policy-ip-1-vpn2-vpn1] destination-zone trust
   [Device-security-policy-ip-1-vpn2-vpn1] source-ip-host 192.168.1.2
   [Device-security-policy-ip-1-vpn2-vpn1] destination-ip-host 192.168.1.2
   [Device-security-policy-ip-1-vpn2-vpn1] vrf vpn2
   [Device-security-policy-ip-1-vpn2-vpn1] action pass
   [Device-security-policy-ip-1-vpn2-vpn1] quit
   ```

```
[Device-security-policy-ip] quit
```

4. Configure NAT:

   # Configure a static outbound NAT mapping between 192.168.1.2 in **vpn 1** and 172.16.1.2 in **vpn 2**.

   ```
   [Device] nat static outbound 192.168.1.2 vpn-instance vpn1 172.16.1.2 vpn-instance vpn2
   ```

   # Configure a static outbound NAT mapping between 192.168.1.2 in **vpn 2** and 172.16.2.2 in **vpn 1**.

   ```
   [Device] nat static outbound 192.168.1.2 vpn-instance vpn2 172.16.2.2 vpn-instance vpn1
   ```

   # Enable static NAT on the two sides of the device.

   ```
   [Device] interface gigabitethernet 1/0/2
   [Device-GigabitEthernet1/0/2] nat static enable
   [Device-GigabitEthernet1/0/2] quit
   [Device] interface gigabitethernet 1/0/1
   [Device-GigabitEthernet1/0/1] nat static enable
   [Device-GigabitEthernet1/0/1] quit
   ```

Verifying the configuration

# Verify that Host A and Host B can access each other. The public address for Host A is 172.16.1.2 and that for Host B is 172.16.2.2. (Details not shown.)

# Display all NAT configuration and statistics.

```
[Device] display nat all

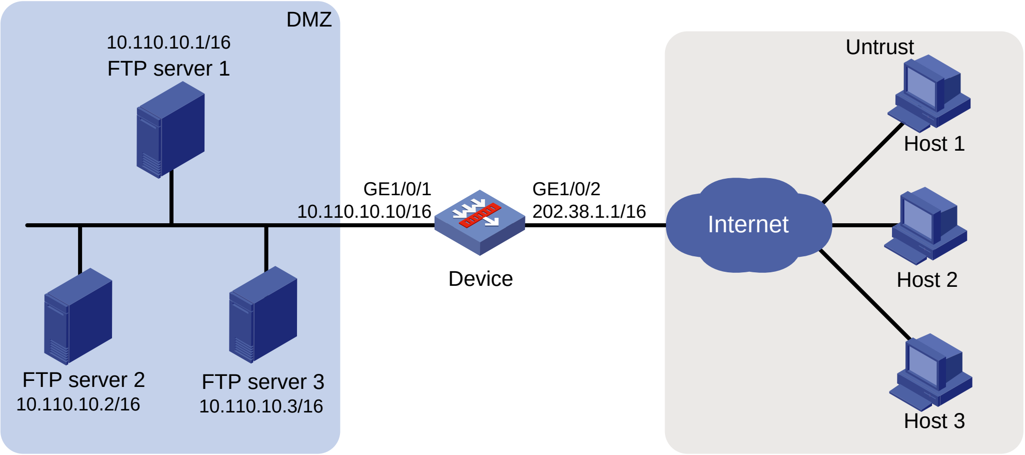
Example: Configuring load sharing NAT Server

Network configuration

As shown in Figure 28, three FTP servers are in the intranet to provide FTP services for external users. Configure NAT so that these external users use the address 202.38.1.1/16 to access the servers and the three FTP servers implement load sharing.

Figure 28 Network diagram



Procedure

1. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

   ```
   <Device> system-view
   [Device] interface gigabitethernet 1/0/1
   [Device-GigabitEthernet1/0/1] ip address 10.110.10.10 16
   [Device-GigabitEthernet1/0/1] quit
   ```

   # Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Add interfaces to security zones.

   ```
   [Device] security-zone name dmz
   [Device-security-zone-DMZ] import interface gigabitethernet 1/0/1
   ```

```
[Device-security-zone-DMZ] quit
[Device] security-zone name untrust
[Device-security-zone-Untrust] import interface gigabitethernet 1/0/2
[Device-security-zone-Untrust] quit
```

3. Configure a security policy:

   # Configure a rule named **untrust-dmz** to permit the packets from the hosts to the servers.

   ```
   [Device] security-policy ip
   [Device-security-policy-ip] rule name untrust-dmz
   [Device-security-policy-ip-1-untrust-dmz] source-zone untrust
   [Device-security-policy-ip-1-untrust-dmz] destination-zone dmz
   [Device-security-policy-ip-1-untrust-dmz] destination-ip-host 10.110.10.1
   [Device-security-policy-ip-1-untrust-dmz] destination-ip-host 10.110.10.2
   [Device-security-policy-ip-1-untrust-dmz] destination-ip-host 10.110.10.3
   [Device-security-policy-ip-1-untrust-dmz] action pass
   [Device-security-policy-ip-1-untrust-dmz] quit
   [Device-security-policy-ip] quit
   ```

4. Configure NAT:

   # Create NAT server group 0, and add members to the group.

   ```
   [Device] nat server-group 0
   [Device-nat-server-group-0] inside ip 10.110.10.1 port 21
   [Device-nat-server-group-0] inside ip 10.110.10.2 port 21
   [Device-nat-server-group-0] inside ip 10.110.10.3 port 21
   [Device-nat-server-group-0] quit
   ```

   # Associate NAT server group 0 with GigabitEthernet 1/0/2 so that servers in the server group can provide FTP services.

   ```
   [Device] interface gigabitethernet 1/0/2
   [Device-GigabitEthernet1/0/2] nat server protocol tcp global 202.38.1.1 ftp inside
   server-group 0
   [Device-GigabitEthernet1/0/2] quit
   ```

Verifying the configuration

# Verify that external hosts can access the internal FTP server group. (Details not shown.)

# Display all NAT configuration and statistics.

```
[Device] display nat all
NAT server group information:
  Totally 1 NAT server groups.

```

Example: Configuring NAT DNS mapping

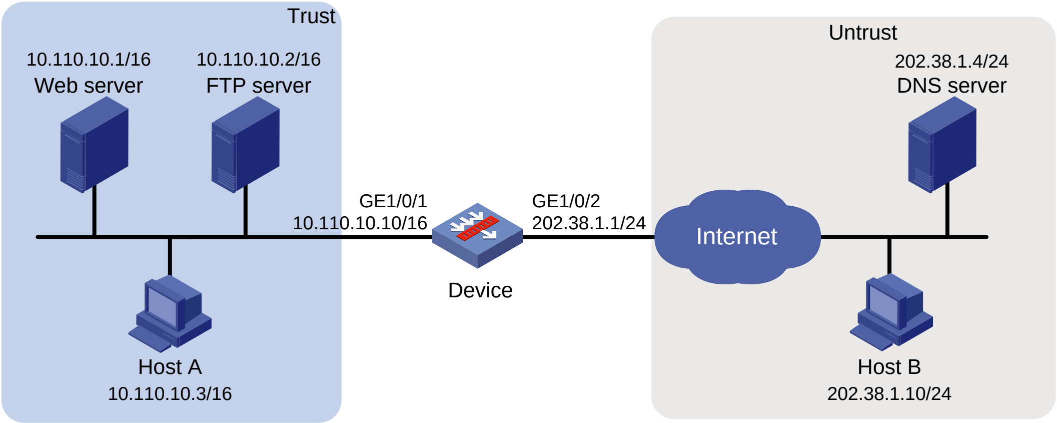
Network configuration

As shown in Figure 29, the internal Web server at 10.110.10.1/16 and FTP server at 10.110.10.2/16 provide services for external user. The company has three public addresses 202.38.1.1 through 202.38.1.3. The DNS server at 202.38.1.4 is on the external network.

Configure NAT so that:

- The public IP address 202.38.1.2 is used by external users to access the Web and FTP servers.
- External users can use the public address or domain name of internal servers to access them.
- Internal users can access the internal servers by using their domain names.

Figure 29 Network diagram



Requirements analysis

To meet the network requirements, perform the following tasks:

- Configure a NAT server mapping by mapping the public IP addresses and port numbers of the internal servers to a public address and port numbers so that external users can access the internal servers.

- Configure NAT DNS mapping and NAT ALG so that the public IP address of the internal server in the payload of the DNS response packet can be translated to the private IP address.

Procedure

1. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

```
<Device> system-view
[Device] interface gigabitethernet 1/0/1
[Device-GigabitEthernet1/0/1] ip address 10.110.10.10 16
[Device-GigabitEthernet1/0/1] quit
```

   # Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Add interfaces to security zones.

```
[Device] security-zone name trust
[Device-security-zone-Trust] import interface gigabitethernet 1/0/1
[Device-security-zone-Trust] quit
[Device] security-zone name untrust
[Device-security-zone-Untrust] import interface gigabitethernet 1/0/2
[Device-security-zone-Untrust] quit
```

3. Configure a security policy:

   # Configure a rule named **trust-untrust** to permit the packets from Host A to the DNS server.

```
[Device] security-policy ip
[Device-security-policy-ip] rule name trust-untrust
[Device-security-policy-ip-1-trust-untrust] source-zone trust
[Device-security-policy-ip-1-trust-untrust] destination-zone untrust
[Device-security-policy-ip-1-trust-untrust] source-ip-subnet 10.110.0.0 16
[Device-security-policy-ip-1-trust-untrust] destination-ip-host 202.38.1.4
[Device-security-policy-ip-1-trust-untrust] action pass
[Device-security-policy-ip-1-trust-untrust] quit
```

   # Configure a rule named **untrust-trust** to permit the packets from Host B to the servers in the **Trust** security zone.

```
[Device-security-policy-ip] rule name untrust-trust
[Device-security-policy-ip-2-untrust-trust] source-zone untrust
[Device-security-policy-ip-2-untrust-trust] destination-zone trust
[Device-security-policy-ip-2-untrust-trust] destination-ip-host 10.110.10.1
[Device-security-policy-ip-2-untrust-trust] destination-ip-host 10.110.10.2
[Device-security-policy-ip-2-untrust-trust] action pass
[Device-security-policy-ip-2-untrust-trust] quit
```

   # Configure a rule named **trust-trust** to permit the packets from Host A to the servers in the **Trust** security zone.

```
[Device-security-policy-ip] rule name trust-trust
[Device-security-policy-ip-3-trust-trust] source-zone trust
[Device-security-policy-ip-3-trust-trust] destination-zone trust
[Device-security-policy-ip-3-trust-trust] source-ip-host 202.38.1.1
[Device-security-policy-ip-3-trust-trust] destination-ip-host 10.110.10.1
[Device-security-policy-ip-3-trust-trust] destination-ip-host 10.110.10.2
[Device-security-policy-ip-3-trust-trust] action pass
[Device-security-policy-ip-3-trust-trust] quit
[Device-security-policy-ip] quit
```

4. Configure NAT:

# Enable NAT ALG for DNS.

```
[Device] nat alg dns
```

# Configure a NAT server mapping to allow external hosts to access the internal Web server by using the address 202.38.1.2.

```
[Device] interface gigabitethernet 1/0/2
[Device-GigabitEthernet1/0/2] nat server protocol tcp global 202.38.1.2 inside
10.110.10.1 http
```

# Configure a NAT server mapping to allow external hosts to access the internal FTP server by using the address 202.38.1.2.

```
[Device-GigabitEthernet1/0/2] nat server protocol tcp global 202.38.1.2 inside
10.110.10.2 ftp
```

# Enable outbound NAT with Easy IP on GigabitEthernet 1/0/2.

```
[Device-GigabitEthernet1/0/2] nat outbound
```

# Configure two NAT DNS entries by mapping the domain name **www.server.com** of the Web server to 202.38.1.2, and **ftp.server.com** of the FTP server to 202.38.1.2.

```
[Device] nat dns-map domain www.server.com protocol tcp ip 202.38.1.2 port http
[Device] nat dns-map domain ftp.server.com protocol tcp ip 202.38.1.2 port ftp
[Device] quit
```

Verifying the configuration

# Verify that both internal and external hosts can access the internal servers by using domain names. (Details not shown.)

# Display all NAT configuration and statistics.

```
[Device] display nat all

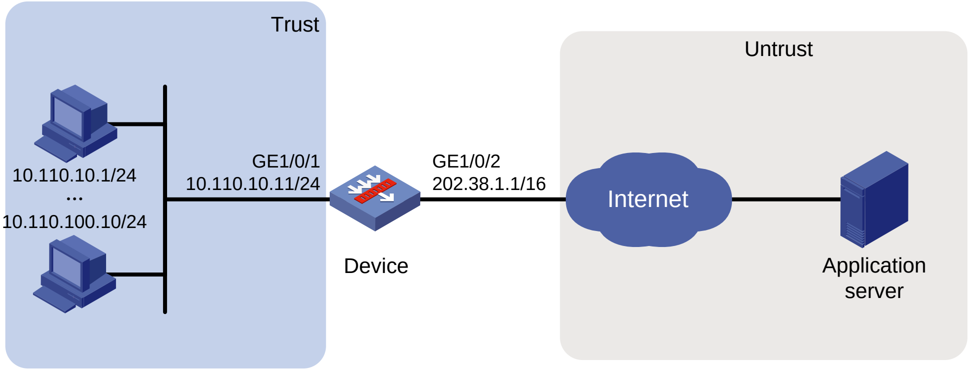
Example: Configuring static port block mapping NAT444

Network configuration

As shown in Figure 30, configure static NAT444 to allow users at private IP addresses 10.110.10.1 to 10.110.10.10 to use public IP address 202.38.1.100 for accessing Sever at 200.2.2.1 on the Internet. Configure the port range as 10001 to 15000, and set the port block size to 500.

Figure 30 Network diagram



Procedure

1. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

```
<Device> system-view
[Device] interface gigabitethernet 1/0/1
[Device-GigabitEthernet1/0/1] ip address 10.110.10.11 24
[Device-GigabitEthernet1/0/1] quit
```

   # Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Add interfaces to security zones.

```
[Device] security-zone name trust
[Device-security-zone-Trust] import interface gigabitethernet 1/0/1
[Device-security-zone-Trust] quit
[Device] security-zone name untrust
[Device-security-zone-Untrust] import interface gigabitethernet 1/0/2
[Device-security-zone-Untrust] quit
```

3. Configure settings for routing.

   This example configures a static route, and the next hop in the routes is 202.38.1.2.

```
[Device] ip route-static 200.2.2.1 32 202.38.1.2
```

4. Configure a security policy:

   # Configure a rule named **trust-untrust** to permit the packets from the hosts to the application server.

```
[Device] security-policy ip
[Device-security-policy-ip] rule name trust-untrust
[Device-security-policy-ip-1-trust-untrust] source-zone trust
[Device-security-policy-ip-1-trust-untrust] destination-zone untrust
[Device-security-policy-ip-1-trust-untrust] source-ip-range 10.110.10.1
10.110.10.10
[Device-security-policy-ip-1-trust-untrust] destination-ip-host 200.2.2.1
[Device-security-policy-ip-1-trust-untrust] action pass
[Device-security-policy-ip-1-trust-untrust] quit
[Device-security-policy-ip] quit
```

5. Configure NAT:

   # Create NAT port block group 1.

```
[Device] nat port-block-group 1
```

   # Add the private IP addresses from 10.110.10.1 to 10.110.10.10 to the port block group.

```
[Device-port-block-group-1] local-ip-address 10.110.10.1 10.110.10.10
```

# Add the public IP address 202.38.1.100 to the port block group.

```
[Device-port-block-group-1] global-ip-pool 202.38.1.100 202.38.1.100
```

# Set the port block size to 500.

```
[Device-port-block-group-1] block-size 500
```

# Configure the port range as 10001 to 15000.

```
[Device-port-block-group-1] port-range 10001 15000
[Device-port-block-group-1] quit
```

# Configure a static outbound port block mapping on GigabitEthernet 1/0/2.

```
[Device] interface gigabitethernet 1/0/2
[Device-GigabitEthernet1/0/2] nat outbound port-block-group 1
[Device-GigabitEthernet1/0/2] quit
```

Verifying the configuration

# Verify that users at the private IP addresses can access the Internet. (Details not shown.)

# Display all NAT configuration and statistics.

```
[Device] display nat all
NAT logging:

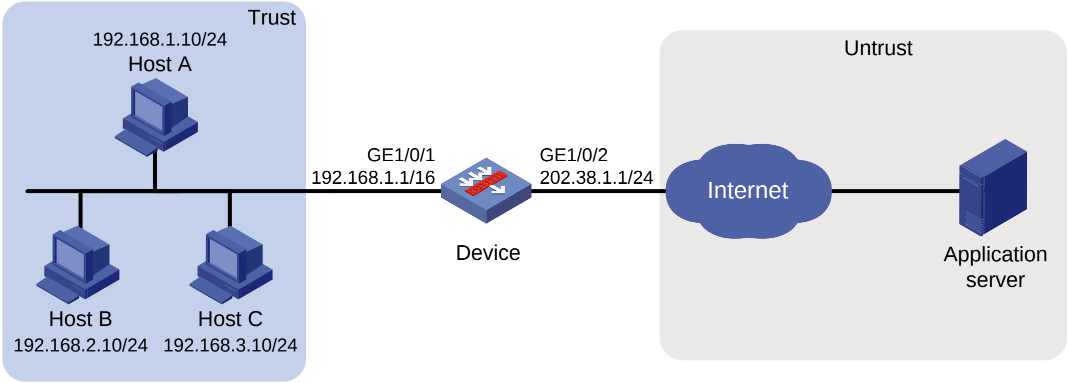
Example: Configuring dynamic port block mapping for NAT444

Network configuration

As shown in Figure 31, a company uses private IP address on network 192.168.0.0/16 and public IP addresses 202.38.1.2 and 202.38.1.3. Configure dynamic NAT444 to meet the following requirements:

- Only users on subnet 192.168.1.0/24 can use public IP addresses 202.38.1.2 and 202.38.1.3 to access the server at 200.2.2.1 on the Internet.
- The port range for the public IP addresses is 1024 to 65535.
- The port block size is 300.
- If the ports in the assigned port block are all used, extend another port block for users.

Figure 31 Network diagram



Procedure

1. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

```
<Device> system-view
[Device] interface gigabitethernet 1/0/1
[Device-GigabitEthernet1/0/1] ip address 192.168.1.1 16
[Device-GigabitEthernet1/0/1] quit
```

   # Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Add interfaces to security zones.

```
[Device] security-zone name trust
[Device-security-zone-Trust] import interface gigabitethernet 1/0/1
[Device-security-zone-Trust] quit
[Device] security-zone name untrust
[Device-security-zone-Untrust] import interface gigabitethernet 1/0/2
[Device-security-zone-Untrust] quit
```

3. Configure settings for routing.

   This example configures a static route, and the next hop in the routes is 202.38.1.20.

```
[Device] ip route-static 200.2.2.1 32 202.38.1.20
```

4. Configure a security policy:

   # Configure a rule named **trust-untrust** to permit the packets from the hosts to the application server.

```
[Device] security-policy ip
[Device-security-policy-ip] rule name trust-untrust
[Device-security-policy-ip-1-trust-untrust] source-zone trust
[Device-security-policy-ip-1-trust-untrust] destination-zone untrust
[Device-security-policy-ip-1-trust-untrust] source-ip-subnet 192.168.1.0 24
[Device-security-policy-ip-1-trust-untrust] destination-ip-host 200.2.2.1
[Device-security-policy-ip-1-trust-untrust] action pass
[Device-security-policy-ip-1-trust-untrust] quit
```

```
[Device-security-policy-ip] quit
```

5. Configure NAT:

   # Create NAT address group 0.

   ```
   [Device] nat address-group 0
   ```

   # Add public IP addresses 202.38.1.2 and 202.38.1.3 to the NAT address group.

   ```
   [Device-address-group-0] address 202.38.1.2 202.38.1.3
   ```

   # Configure the port range as 1024 to 65535.

   ```
   [Device-address-group-0] port-range 1024 65535
   ```

   # Set the port block size to 300 and the extended port block number to 1.

   ```
   [Device-address-group-0] port-block block-size 300 extended-block-number 1
   [Device-address-group-0] quit
   ```

   # Configure an ACL to identify packets from subnet 192.168.1.0/24.

   ```
   [Device] acl basic 2000
   [Device-acl-ipv4-basic-2000] rule permit source 192.168.1.0 0.0.0.255
   [Device-acl-ipv4-basic-2000] quit
   ```

   # Configure outbound NAT on GigabitEthernet 1/0/2.

   ```
   [Device] interface gigabitethernet 1/0/2
   [Device-GigabitEthernet1/0/2] nat outbound 2000 address-group 0
   [Device-GigabitEthernet1/0/2] quit
   ```

Verifying the configuration

# Verify that Host A can access external servers, but Host B and Host C cannot. (Details not shown.)

# Display all NAT configurations and statistics.

```

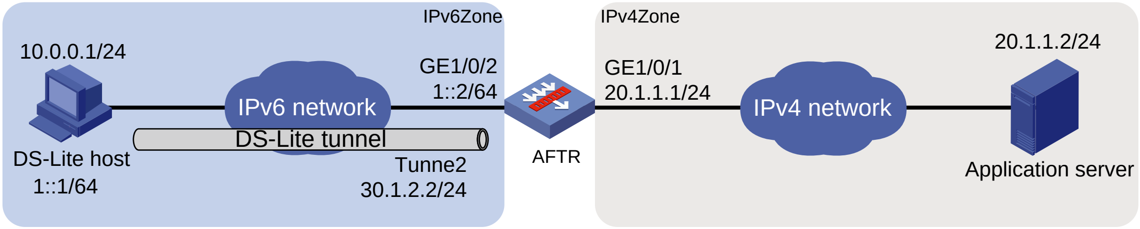
Example: Configuring DS-Lite B4 address translation

Network configuration

As shown in Figure 32, configure DS-Lite tunneling and NAT to allow the DS-Lite host to access the IPv4 network over the IPv6 network.

Figure 32 Network diagram



Restrictions and guidelines

Add DS-Lite tunnel interfaces to security zones, and allow traffic between zone pairs to pass through. In this example, Tunnel 2 is added to security zone **IPv6Zone**, and allow traffic between zones **IPv6Zone** and **IPv4Zone**.

Procedure

1. Configure the AFTR:

   a. Assign IP addresses to interfaces:

   # Assign IP addresses to interfaces GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2.

   ```
   <Device> system-view
   [Device] interface gigabitethernet 1/0/1
   [Device-GigabitEthernet1/0/1] ip address 20.1.1.1 24
   [Device-GigabitEthernet1/0/1] quit
   [Device] interface gigabitethernet 1/0/2
   [Device-GigabitEthernet1/0/2] ipv6 address 1::2 64
   [Device-GigabitEthernet1/0/2] quit
   ```

   # Create a tunnel interface on the AFTR.

   ```
   [Device] interface tunnel 2 mode ds-lite-aftr
   ```

   # Specify an IP address for the tunnel interface.

   ```
   [Device-Tunnel2] ip address 30.1.2.2 255.255.255.0
   ```

   # Specify GigabitEthernet 1/0/2 as the source interface for the tunnel.

   ```
   [Device-Tunnel2] source gigabitethernet 1/0/2
   [Device-Tunnel2] quit
   ```

   b. Add interfaces to security zones.

   ```
   [Device] security-zone name IPv4Zone
   [Device-security-zone-IPv4Zone] import interface gigabitethernet 1/0/1
   [Device-security-zone-IPv4Zone] quit
   [Device] security-zone name IPv6Zone
   [Device-security-zone-IPv6Zone] import interface gigabitethernet 1/0/2
   [Device-security-zone-IPv6Zone] import interface Tunnel 2
   [Device-security-zone-IPv6Zone] quit
   ```

   c. Configure a security policy:

# Configure a rule named **v6-v4** to permit the packets from the host to the application server.

```
[Device] security-policy ip
[Device-security-policy-ip] rule name v6-v4
[Device-security-policy-ip-1-v6-v4] source-zone IPv6Zone
[Device-security-policy-ip-1-v6-v4] destination-zone IPv4Zone
[Device-security-policy-ip-1-v6-v4] source-ip-host 10.0.0.1
[Device-security-policy-ip-1-v6-v4] destination-ip-host 20.1.1.2
[Device-security-policy-ip-1-v6-v4] action pass
[Device-security-policy-ip-1-v6-v4] quit
[Device-security-policy-ip] quit
```

# Configure a rule named **v6-local** to allow the device to encapsulate and decapsulate the packets transmitted through the DS-Lite tunnel.

```
[Device] security-policy ipv6
[Device-security-policy-ipv6] rule name v6-local
[Device-security-policy-ipv6-1-v6-local] source-zone IPv6Zone
[Device-security-policy-ipv6-1-v6-local] destination-zone local
[Device-security-policy-ipv6-1-v6-local] source-ip-host 1::1
[Device-security-policy-ipv6-1-v6-local] destination-ip-host 1::2
[Device-security-policy-ipv6-1-v6-local] action pass
[Device-security-policy-ipv6-1-v6-local] quit
[Device-security-policy-ipv6] quit
```

d. Enable DS-Lite tunneling:

# Enable DS-Lite tunneling on GigabitEthernet 1/0/1.

```
[Device] interface gigabitethernet 1/0/1
[Device-GigabitEthernet1/0/1] ds-lite enable
[Device-GigabitEthernet1/0/1] quit
```

e. Configure NAT:

# Create public address group 0.

```
[AFTR] nat address-group 0
```

# Add public IP addresses 20.1.1.11 and 20.1.1.12 to the NAT address group.

```
[AFTR-address-group-0] address 20.1.1.11 20.1.1.12
```

# Configure the port range as 1024 to 65535.

```
[AFTR-address-group-0] port-range 1024 65535
```

# Set the port block size to 300.

```
[AFTR-address-group-0] port-block block-size 300
[AFTR-address-group-0] quit
```

# Configure an IPv6 ACL to identify packets from subnet 1::/64.

```
[AFTR] acl ipv6 basic 2100
[AFTR-acl-ipv4-basic-2100] rule permit source 1::/64
[AFTR-acl-ipv4-basic-2100] quit
```

# Configure DS-Lite NAT444 on GigabitEthernet 1/0/1.

```
[AFTR] interface gigabitethernet 1/0/1
[AFTR-GigabitEthernet1/0/1] nat outbound ds-lite-b4 2100 address-group 0
[AFTR-GigabitEthernet1/0/1] quit
```

2. Configure the DS-Lite host:

# Configure the IPv4 and IPv6 addresses of the DS-Lite host as 10.0.0.1 and 1::1/64. (Details not shown.)

# Configure a static route to the destination IPv4 network. (Details not shown.)

Verifying the configuration

# Use the **display tunnel interface** command to verify that the tunnel interface is up on the AFTR. (Details not shown.)

# Verify that the DS-Lite host can ping the IPv4 application server.

```
C:\> ping 20.1.1.2
Pinging 20.1.1.2 with 32 bytes of data:
Reply from 20.1.1.2: bytes=32 time=51ms TTL=255
Reply from 20.1.1.2: bytes=32 time=44ms TTL=255
Reply from 20.1.1.2: bytes=32 time=1ms TTL=255
Reply from 20.1.1.2: bytes=32 time=1ms TTL=255
Ping statistics for 20.1.1.2:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
Approximate round trip times in milli-seconds:
    Minimum = 1ms, Maximum = 51ms, Average = 24ms
```

# Verify that the DS-Lite NAT444 configuration is correct.

```
[AFTR] display nat outbound
NAT outbound information:
  Totally 1 NAT outbound rules.
  Interface: GigabitEthernet1/0/1
    DS-Lite B4 ACL: 2100
    Address group ID: 0
    Port-preserved: N    NO-PAT: N         Reversible: N
    Config status: Active
```

# Verify that the DS-Lite NAT444 configuration takes effect by checking the port block assignment.

```
[AFTR] display nat statistics
Slot 1:

Configuring NAT66

Overview

IPv6-to-IPv6 Network Prefix Translation (NPTv6), also known as NAT66, translates the internal IPv6 prefix in the IPv6 packet header to an external IPv6 prefix and vice versa. A device that implements NAT66 translation is called a NAT66 device.

IPv6 source prefix translation

NAT66 source address translation is applicable to the following scenarios:

- **Single internal and external network**—The NAT66 device is connected to an internal network and an external network. Hosts in the internal network uses locally routed IPv6 prefixes. When an internal host sends packets to access the external network, the NAT66 device translates the source IPv6 address prefix in the packets to a global unicast address prefix.
- **Redundancy and load sharing**—Multiple NAT66 devices are deployed between two IPv6 networks and they use ECMPs for load sharing. To allow any NAT66 device to process IPv6 traffic among different sites, configure the same source prefix mappings on these NAT66 devices.
- **Multihoming**—In a multihomed network, NAT66 devices are connected to an internal network and multiple external networks. One internal prefix is mapped to different external prefixes on the NAT66 devices, so that one internal address can be translated to multiple external addresses.

IPv6 destination prefix translation

To allow external users to access internal servers, such as Wed server or FTP server, configure IPv6 destination prefix mappings on the interface connected to the external network.

NAT66 ALG

NAT66 ALG (Application Level Gateway) translates address or port information in the application layer payloads to ensure connection establishment.

For example, an FTP application includes a data connection and a control connection. The IP address and port number for the data connection depend on the payload information of the control connection. This requires NAT66 ALG to translate the address and port information for data connection establishment.

NAT66 ALG supports the following protocol packets: FTP packets and ICMP error messages.

Configuring IPv6 source prefix translation

Restrictions and guidelines

On one interface, the mapping between an internal prefix and an external prefix must be unique.

On different interfaces, different internal prefixes cannot be mapped to the same external prefix.

When you configure source address translation in NO-PAT mode, specify the same IPv6 prefix length before and after NAT66 in a mapping.

The source IPv6 prefix after translation cannot be the same as the external prefix of the NAT66 device or the prefix of the external destination address.

You can configure the global NAT policy to achieve IPv6 source prefix translation. For more information about global NAT policy, see "Configuring NAT."

This feature cannot perform translation on IPsec protected packets with encapsulated by ESP or AH.

Procedure

1. Enter system view.

   `system-view`

2. Enter interface view.

   `interface` *`interface-type interface-number`*

3. Configure an IPv6 prefix mapping for IPv6 source address translation.

   `nat66 prefix source` *`original-ipv6-prefix prefix-length translated-ipv6-prefix prefix-length`* [**`pat`**]

   By default, no IPv6 prefix mappings are configured for IPv6 source address translation.

Configuring IPv6 destination prefix translation

Restrictions and guidelines

On one interface, the mapping between an external prefix and an internal prefix must be unique.

On different interfaces, one external prefix cannot be mapped to different internal prefixes.

The external IPv6 prefix of the internal server cannot be the same as the external prefix of the NAT66 device or the prefix of external hosts that access the internal server.

You can configure the global NAT policy to achieve IPv6 destination prefix translation. For more information about global NAT policy, see "Configuring NAT."

This feature cannot perform translation on IPsec protected packets with encapsulated by ESP or AH.

Procedure

1. Enter system view.

   `system-view`

2. Enter interface view.

   `interface` *`interface-type interface-number`*

3. Configure an IPv6 prefix mapping for IPv6 destination address translation.

   `nat66 prefix destination` *`original-ipv6-prefix prefix-length`* [**`protocol`** *`pro-type`* [*`global-port`*]] *`translated-ipv6-prefix prefix-length`* [*`local-port`*]

   By default, no IPv6 prefix mappings are configured for IPv6 destination address translation.

Display and maintenance commands for NAT66

Execute **`display`** commands in any view and **`reset`** commands in user view.

Task	Command
Display all NAT66 configurations.	**`display nat66 all`**
Display NAT66 sessions.	**`display nat66 session`** [**`slot`** *`slot-number`*]

Task	Command
	[**verbose**]
Display NAT66 statistics.	**display nat66 statistics** [**summary**] [**slot** *slot-number*]
Delete NAT66 sessions.	**reset nat66 session** [**slot** *slot-number*]

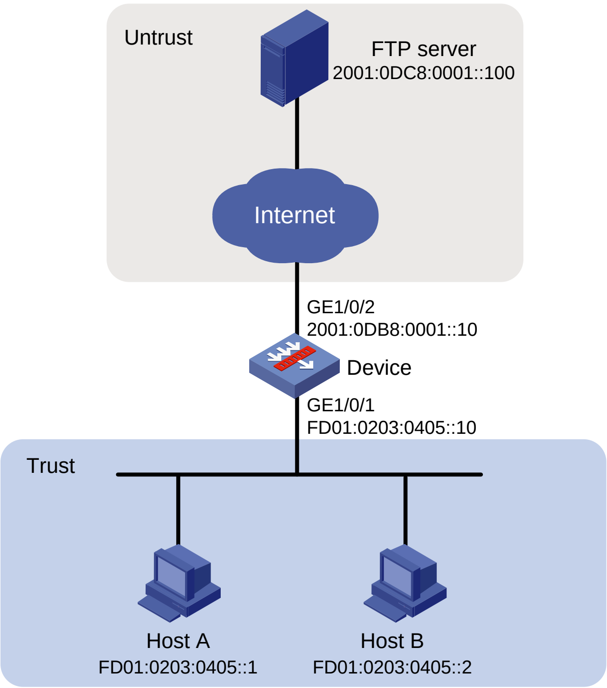
NAT configuration examples

Example: Configuring IPv6 source prefix translation (single internal and external network)

Network configuration

As shown in Figure 1, internal users use IPv6 prefix FD01:0203:0405::/48 and the internal IPv6 addresses are not routable on the Internet. For internal users to access the FTP server on the Internet, configure IPv6 source prefix translation to translate the internal IPv6 prefix FD01:0203:0405::/48 to external prefix 2001:0DF8:0001::/48.

Figure 1 Network diagram



Procedure

1. Assign IPv6 addresses to interfaces:

   # Assign an IPv6 address to interface GigabitEthernet 1/0/1.

   ```
   <Device> system-view
   [Device] interface gigabitethernet 1/0/1
   [Device-GigabitEthernet1/0/1] ipv6 address FD01:0203:0405::10 48
   [Device-GigabitEthernet1/0/1] quit
   ```

   # Assign IPv6 addresses to other interfaces in the same way. (Details not shown.)

2. Configure settings for routing.

   This example configures a static route, and the next hop in the route is 2001:0DB8:0001::11.

   ```
   [Device] ipv6 route-static 2001:0DC8:0001::100 48 2001:0DB8:0001::11
   ```

3. Add interfaces to security zones.

   ```
   [Device] security-zone name trust
   [Device-security-zone-Trust] import interface gigabitethernet 1/0/1
   [Device-security-zone-Trust] quit
   [Device] security-zone name untrust
   [Device-security-zone-Untrust] import interface gigabitethernet 1/0/2
   [Device-security-zone-Untrust] quit
   ```

4. Configure a security policy:

   # Configure a rule named **trust-untrust** to permit the packets from Host A and Host B to the FTP server.

   ```
   [Device] security-policy ipv6
   [Device-security-policy-ipv6] rule 1 name trust-untrust
   [Device-security-policy-ipv6-1-trust-untrust] source-zone trust
   [Device-security-policy-ipv6-1-trust-untrust] destination-zone untrust
   [Device-security-policy-ipv6-1-trust-untrust] source-ip-host FD01:0203:0405::1
   [Device-security-policy-ipv6-1-trust-untrust] source-ip-host FD01:0203:0405::2
   [Device-security-policy-ipv6-1-trust-untrust] destination-ip-host
   2001:0DC8:0001::100
   [Device-security-policy-ipv6-1-trust-untrust] action pass
   [Device-security-policy-ipv6-1-trust-untrust] quit
   [Device-security-policy-ipv6] quit
   ```

5. Configure IPv6 source prefix translation:

   # Configure an IPv6 source prefix mapping from FD01:0203:0405::/48 to 2001:0DF8:0001::/48.

   ```
   [Device] interface gigabitethernet 1/0/2
   [Device-GigabitEthernet1/0/2] nat66 prefix source fd01:0203:0405:: 48

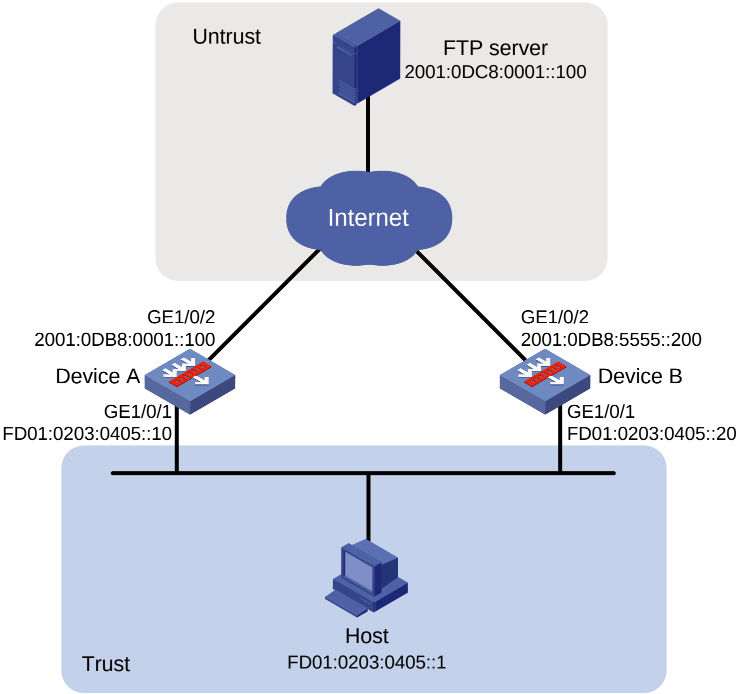
Example: Configuring IPv6 source prefix translation (multihomed network)

Network configuration

As shown in Figure 2, internal users use IPv6 prefix FD01:0203:0405::/48 and the internal IPv6 address is not routable on the Internet.

Device A and Device B are connected to the same internal network but different external networks. Configure IPv6 source prefix translation to translate the internal IPv6 prefix FD01:0203:0405::/48 to different external prefixes so that the internal address can be translated to two external addresses.

Figure 2 Network diagram



Procedure

1. Configure Device A.

a. Assign IPv6 addresses to interfaces:

# Assign an IPv6 address to interface GigabitEthernet 1/0/1.

```
<DeviceA> system-view
[DeviceA] interface gigabitethernet 1/0/1
[DeviceA-GigabitEthernet1/0/1] ipv6 address FD01:0203:0405::10 48
[DeviceA-GigabitEthernet1/0/1] quit
```

# Assign IPv6 addresses to other interfaces in the same way. (Details not shown.)

b. Configure settings for routing.

This example configures a static route, and the next hop in the route is 2001:0DB8:0001::11.

```
[DeviceA] ipv6 route-static 2001:0DC8:0001::100 48 2001:0DB8:0001::11
```

c. Add interfaces to security zones.

```
[DeviceA] security-zone name trust
[DeviceA-security-zone-Trust] import interface gigabitethernet 1/0/1
[DeviceA-security-zone-Trust] quit
[DeviceA] security-zone name untrust
[DeviceA-security-zone-Untrust] import interface gigabitethernet 1/0/2
[DeviceA-security-zone-Untrust] quit
```

d. Configure a security policy:

# Configure a rule named **trust-untrust** to permit the packets from the host to the FTP server.

```
[DeviceA] security-policy ipv6
[DeviceA-security-policy-ipv6] rule name trust-untrust
[DeviceA-security-policy-ipv6-1-trust-untrust] source-zone trust
[DeviceA-security-policy-ipv6-1-trust-untrust] destination-zone untrust
```

```
[DeviceA-security-policy-ipv6-1-trust-untrust] source-ip-host FD01:0203:0405::1
[DeviceA-security-policy-ipv6-1-trust-untrust] destination-ip-host 
2001:0DC8:0001::100
[DeviceA-security-policy-ipv6-1-trust-untrust] action pass
[DeviceA-security-policy-ipv6-1-trust-untrust] quit
[DeviceA-security-policy-ipv6] quit
```

e. Configure IPv6 source prefix translation:

# Configure an IPv6 source prefix mapping from FD01:0203:0405::/48 to 2001:0DF8:0001::/48.

```
[DeviceA] interface gigabitethernet 1/0/2
[DeviceA-GigabitEthernet1/0/2] nat66 prefix source fd01:0203:0405:: 48 
2001:0df8:0001:: 48
[DeviceA-GigabitEthernet1/0/2] quit
```

2. Configure Device B.

a. Assign IPv6 addresses to interfaces:

# Assign an IPv6 address to interface GigabitEthernet 1/0/1.

```
<DeviceB> system-view
[DeviceB] interface gigabitethernet 1/0/1
[DeviceB-GigabitEthernet1/0/1] ipv6 address FD01:0203:0405::20 48
[DeviceB-GigabitEthernet1/0/1] quit
```

# Assign IPv6 addresses to other interfaces in the same way. (Details not shown.)

b. Configure settings for routing.

This example configures a static route, and the next hop in the route is 2001:0DB8:5555::11.

```
[DeviceB] ipv6 route-static 2001:0DC8:0001::100 48 2001:0DB8:5555::11
```

c. Add interfaces to security zones.

```
[DeviceB] security-zone name trust
[DeviceB-security-zone-Trust] import interface gigabitethernet 1/0/1
[DeviceB-security-zone-Trust] quit
[DeviceB] security-zone name untrust
[DeviceB-security-zone-Untrust] import interface gigabitethernet 1/0/2
[DeviceB-security-zone-Untrust] quit
```

d. Configure a security policy:

# Configure a rule named **trust-untrust** to permit the packets from the host to the FTP server.

```
[DeviceB] security-policy ipv6
[DeviceB-security-policy-ipv6] rule name trust-untrust
[DeviceB-security-policy-ipv6-1-trust-untrust] source-zone trust
[DeviceB-security-policy-ipv6-1-trust-untrust] destination-zone untrust
[DeviceB-security-policy-ipv6-1-trust-untrust] source-ip-host FD01:0203:0405::1
[DeviceB-security-policy-ipv6-1-trust-untrust] destination-ip-host 
2001:0DC8:0001::100
[DeviceB-security-policy-ipv6-1-trust-untrust] action pass
[DeviceB-security-policy-ipv6-1-trust-untrust] quit
[DeviceB-security-policy-ipv6] quit
```

e. Configure IPv6 source prefix translation:

# Configure an IPv6 source prefix mapping from FD01:0203:0405::/48 to 2001:0DE8:0001::/48.

```
[DeviceB] interface gigabitethernet 1/0/2
[DeviceB-GigabitEthernet1/0/2] nat66 prefix source fd01:0203:0405:: 48
2001:0de8:0001:: 48
[DeviceB-GigabitEthernet1/0/2] quit
```

Verifying the configuration

# Verify that the internal host can access the FTP server through Device A or Device B. The internal prefix is mapped to different external prefixes and external prefixes are mapped to the same internal prefix on the two NAT66 devices.

# Verify NAT66 configurations on Device A.

```
[DeviceA] display nat66 all
NAT66 source information:
  Totally 1 source rules.
  Interface(outbound): GigabitEthernet1/0/2

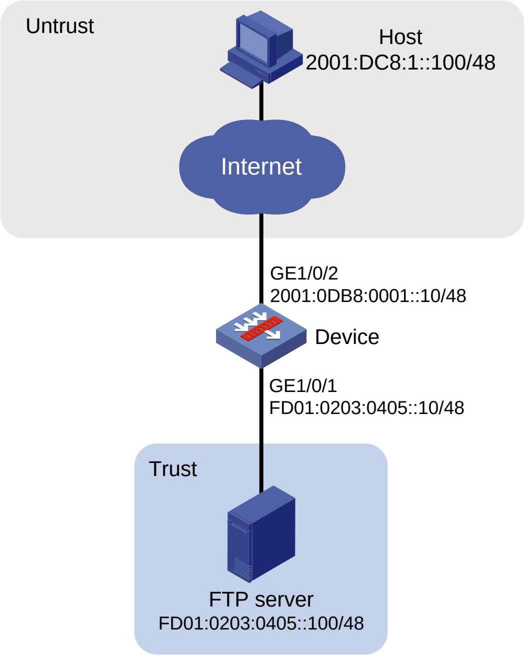
Example: Configuring IPv6 destination prefix translation

Network configuration

As shown in Figure 3, the internal IPv6 address of FTP server is FD01:0203:0405::100/48. The internal prefix is FD01:0203:0405::/48. Configure destination IPv6 prefix translation to allow the FTP server to use IPv6 address 2001:AB01:0001::1 to provide services for external users.

Figure 3 Network diagram



Procedure

1. Assign IPv6 addresses to interfaces:

   # Assign an IPv6 address to interface GigabitEthernet 1/0/1.

   ```
   <Device> system-view
   [Device] interface gigabitethernet 1/0/1
   [Device-GigabitEthernet1/0/1] ipv6 address FD01:0203:0405::10 48
   [Device-GigabitEthernet1/0/1] quit
   ```

   # Assign IPv6 addresses to other interfaces in the same way. (Details not shown.)

2. Add interfaces to security zones.

   ```
   [Device] security-zone name trust
   [Device-security-zone-Trust] import interface gigabitethernet 1/0/1
   [Device-security-zone-Trust] quit
   [Device] security-zone name untrust
   [Device-security-zone-Untrust] import interface gigabitethernet 1/0/2
   [Device-security-zone-Untrust] quit
   ```

3. Configure a security policy:

   # Configure a rule named **untrust-trust** to permit the packets from the hosts in the external network to the FTP server in the **Trust** security zone.

   ```
   [Device] security-policy ipv6
   [Device-security-policy-ipv6] rule 1 name untrust-trust
   [Device-security-policy-ipv6-1-untrust-trust] source-zone untrust
   [Device-security-policy-ipv6-1-untrust-trust] destination-zone trust
   [Device-security-policy-ipv6-1-untrust-trust] destination-ip-host
   FD01:0203:0405::100
   [Device-security-policy-ipv6-1-untrust-trust] action pass
   [Device-security-policy-ipv6-1-untrust-trust] quit
   [Device-security-policy-ipv6] quit
   ```

4. Configure IPv6 destination prefix translation:

# Configure an IPv6 destination prefix mapping from 2001:AB01:0001::1/128 to FD01:0203:0405::100/128.

```
[Device] interface gigabitethernet 1/0/2
[Device-GigabitEthernet1/0/2] nat66 prefix destination 2001:ab01:1::1 128
fd01:203:405::100 128
[Device-GigabitEthernet1/0/2] quit
```

Verifying the configuration

# Verify that external hosts can access the FTP server. (Details not shown.)

# Verify NAT66 configurations.

```
[Device] display nat66 all
NAT66 destination information:
  Totally 1 destination rules.
  Interface(inbound): GigabitEthernet1/0/2
    Original prefix/prefix-length: 2001:AB01:1::1/128
    Translated prefix/prefix-length: FD01:203:405::100/128
```

# Verify that NAT66 sessions are established.

```
[Device] display nat66 session verbose
Slot 1:
Initiator:
  Source      IP/port: 2001:DC8:1::100/9025

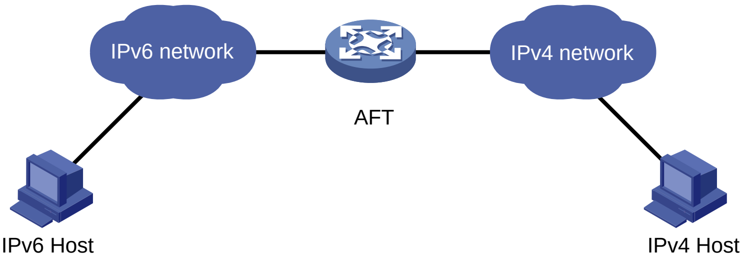
Configuring AFT

About AFT

Address Family Translation (AFT) translates an IP address of one address family into an IP address of the other address family. It enables an IPv4 network and an IPv6 network to communicate with each other, as shown in Figure 1. The IPv4 host and the IPv6 host can communicate with each other without changing the existing configuration.

Figure 1 AFT application scenario



AFT translation methods

Static AFT

Static AFT creates a fixed mapping between an IPv4 address and an IPv6 address.

To perform static AFT, you can configure IPv4-to-IPv6 source address static translation policies and IPv6-to-IPv4 source address static translation policies.

An IPv4-to-IPv6 source address static translation policy can be applied to the following scenarios:

- For an IPv4-initiated session packet, if the source IPv4 address in the packet matches the translation policy, AFT translates the source IPv4 address in the packet to the specified IPv6 address.
- For an IPv6-initiated session packet, if the destination IPv6 address in the packet matches the translation policy, AFT translates the destination IPv6 address in the packet to the specified IPv4 address.

An IPv6-to-IPv4 source address static translation policy can be applied to the following scenarios:

- For an IPv6-initiated session packet, if the source IPv6 address in the packet matches the translation policy, AFT translates the source IPv6 address in the packet to the specified IPv4 address.
- For an IPv4-initiated session packet, if the destination IPv4 address in the packet matches the translation policy, AFT translates the destination IPv4 address in the packet to the specified IPv6 address.

Dynamic AFT

Dynamic AFT creates a dynamic mapping between an IPv4 address and an IPv6 address.

When dynamic AFT performs IPv6-to-IPv4 source address translation, the Not Port Address Translation (NO-PAT) and Port Address Translation (PAT) modes are available.

NO-PAT

NO-PAT translates one IPv6 address to one IPv4 address. An IPv4 address assigned to one IPv6 host cannot be used by any other IPv6 host until it is released.

NO-PAT supports all IP packets.

PAT

PAT translates multiple IPv6 addresses to a single IPv4 address by mapping each IPv6 address and port to the IPv4 address and a unique port. PAT supports the following packet types:

- TCP packets.
- UDP packets.
- ICMPv6 echo request and echo reply messages.

PAT supports port blocks for connection limit and user tracing. Port blocks are generated by dividing the port range (1024 to 65535) by the port block size. Port block based PAT maps multiple IPv6 addresses to one IPv4 address and uses a port block for each IPv6 address.

Port block based PAT functions as follows:

1. When an IPv6 host first initiates a connection to the IPv4 network, it creates a mapping from the host's IPv6 address to an IPv4 address and a port block.
2. It translates the IPv6 address to the IPv4 address, and the source ports to ports in the port block for subsequent connections from the IPv6 host until the ports in the port block are exhausted.

NOTE:

If the port range cannot be divided by the port block size exactly, the remaining ports are not used for translation.

Prefix translation

NAT64 prefix translation

NAT64 prefix is an IPv6 address prefix used to construct an IPv6 address representing an IPv4 node in an IPv6 network. The IPv6 hosts do not use a constructed IPv6 address as their real IP address. The length of a NAT64 prefix can be 32, 40, 48, 56, 64, or 96.

As shown in Figure 2, the construction methods vary depending on the NAT64 prefix length. Bits 64 through 71 in the constructed IPv6 address are reserved bits.

- If the prefix length is 32, 64, or 96 bits, the IPv4 address contained in the IPv6 address will be intact.
- If the prefix length is 40, 48, or 56 bits, the IPv4 address contained in the IPv6 address will be divided into two parts by bits 64 through 71. Bits 64 through 71 are reserved bits and they must be set to 0.

Figure 2 IPv6 address construction with NAT 64 prefix and IPv4 address

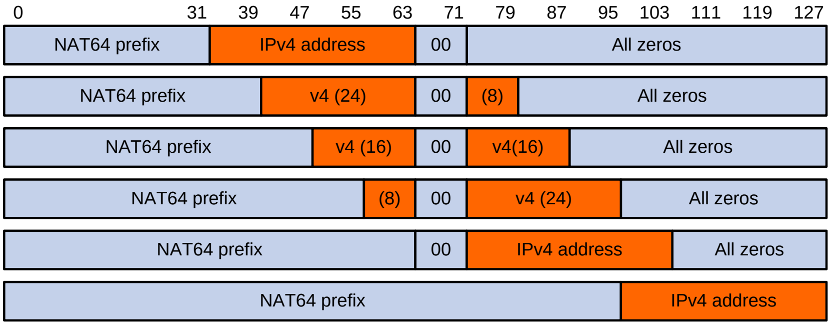


Table 1 shows the examples of addresses constructed by AFT for IPv4 nodes on an IPv6 network.

Table 1 Examples of IPv6 addresses created with an IPv4 address and a NAT64 prefix

IPv6 prefix	IPv4 address	IPv6 address embedded with the IPv4 address
2001:db8::/32	192.0.2.33	2001:db8:c000:221::
2001:db8:100::/40	192.0.2.33	2001:db8:1c0:2:21::
2001:db8:122::/48	192.0.2.33	2001:db8:122:c000:2:2100::
2001:db8:122:300::/56	192.0.2.33	2001:db8:122:3c0:0:221::
2001:db8:122:344::/64	192.0.2.33	2001:db8:122:344:c0:2:2100::
2001:db8:122:344::/96	192.0.2.33	2001:db8:122:344::192.0.2.33

AFT uses a NAT64 prefix to perform the following translation:

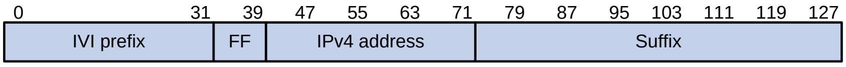
- IPv4-to-IPv6 source address translation. AFT translates a source IPv4 address to an IPv6 address that is created by using the NAT64 prefix and the IPv4 address.
- IPv6-to-IPv4 destination address translation. AFT uses the NAT64 prefix to match destination IPv6 addresses and extracts the embedded IPv4 address from the matching IPv6 addresses.

A NAT64 prefix cannot be on the same subnet as any interface on the device.

IVI prefix translation

An IVI prefix is a 32-bit IPv6 address prefix. An IVI address is the IPv6 address that an IPv6 node uses. As shown in Figure 3, the IVI address includes an IVI prefix and an IPv4 address.

Figure 3 IVI address format



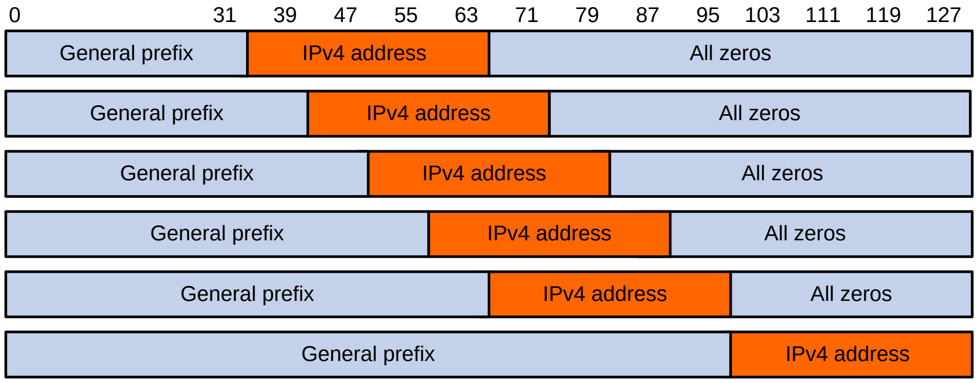
AFT uses an IVI prefix for IPv6-to-IPv4 source address translation. If a source IPv6 address matches the IVI prefix, AFT translates it to the embedded IPv4 address.

General prefix translation

A general prefix is an IPv6 address prefix used to construct an IPv6 address representing an IPv4 node in an IPv6 network. The length of a general prefix can be 32, 40, 48, 56, 64, or 96.

As shown in Figure 4, a general prefix based IPv6 address does not have bits 64 through 71 reserved as a NAT64 prefix based IPv6 address does. An IPv4 address is embedded as a whole into an IPv6 address.

Figure 4 General prefix based IPv6 address format



AFT uses a general prefix for IPv6-to-IPv4 source and destination address translation. If a source or destination IPv6 address matches the general prefix, AFT translates it to the embedded IPv4 address.

A general prefix cannot be on the same subnet as any interface on the device.

IPv6 internal server

IPv6 internal server maps the IPv6 address and port number of an IPv6 internal server to an IPv4 address and port number. It allows the IPv6 internal server to provide services to IPv4 hosts.

IPv4 internal server

IPv4 internal server maps the IPv4 address and port number of an IPv4 internal server to an IPv6 address and port number. It allows the IPv4 internal server to provide services to IPv6 hosts.

AFT translation process

The address translation differs for IPv6-initiated communication and IPv4-initiated communication.

IPv6-initiated communication

As shown in Figure 5, when the IPv6 host initiates access to the IPv4 host, AFT operates as follows:

1. Upon receiving a packet from the IPv6 host, AFT compares the packet with IPv6-to-IPv4 destination address translation policies.
    - If a matching policy is found, AFT translates the destination IPv6 address according to the policy.
    - If no matching policy is found, AFT does not process the packet.
2. AFT performs pre-lookup to determine the output interface for the translated packet. PBR is not used for the pre-lookup.
    - If a matching route is found, the process goes to step 3.
    - If no matching route is found, AFT discards the packet.
3. AFT compares the source IPv6 address of the packet with IPv6-to-IPv4 source address translation policies.
    - If a matching policy is found, AFT translates the source IPv6 address according to the policy.
    - If no matching policy is found, AFT discards the packet.

4. AFT forwards the translated packet and records the mappings between IPv6 addresses and IPv4 addresses.
5. AFT translates the IPv4 addresses in the response packet header to IPv6 addresses based on the address mappings before packet forwarding.

For more information about IPv6-to-IPv4 destination address translation policies, see "Configuring an IPv6-to-IPv4 destination address translation policy."

For more information about IPv6-to-IPv4 source address translation policies, see "Configuring an IPv6-to-IPv4 source address translation policy."

IPv4-initiated communication

As shown in Figure 6, when the IPv4 host initiates access to the IPv6 host, AFT operates as follows:

1. Upon receiving a packet from the IPv4 host, AFT compares the packet with IPv4-to-IPv6 destination address translation policies.
   - If a matching policy is found, AFT translates the destination IPv4 address according to the policy.
   - If no matching policy is found, AFT does not perform address translation.
2. AFT performs the pre-lookup to determine output interface for the translated packet. PBR is not used for the pre-lookup.
   - If a matching route is found, the process goes to step 3.
   - If no matching route is found, AFT discards the packet.
3. AFT compares the source IPv4 address with IPv4-to-IPv6 source address translation policies.
   - If a matching policy is found, AFT translates the source IPv4 address according to the policy.
   - If no matching policy is found, AFT discards the packet.
4. AFT forwards the translated packet and records the mappings between IPv4 addresses and IPv6 addresses.

5. AFT translates the IPv6 addresses in the response packet header to IPv4 addresses based on the address mappings before packet forwarding.

For more information about IPv4-to-IPv6 destination address translation policies, see "Configuring an IPv4-to-IPv6 destination address translation policy."

For more information about IPv4-to-IPv6 source address translation policies, see "Configuring an IPv4-to-IPv6 source address translation policy."

AFT ALG

AFT ALG translates address or port information in the application layer payloads.

For example, an FTP application includes a data connection and a control connection. The IP address and port number for the data connection depend on the payload information of the control connection. This requires AFT ALG to translate the address and port information.

Restrictions and guidelines: AFT configuration

Packets translated by AFT are not translated by NAT.

AFT tasks at a glance

To configure AFT, perform the following tasks:

1. Enabling AFT
2. Configuring address translation for IPv6-initiated communication
   - Configuring an IPv6-to-IPv4 destination address translation policy
   - Configuring an IPv6-to-IPv4 source address translation policy
   - (Optional.) Setting the ToS field to 0 for translated IPv4 packets
3. Configuring address translation for IPv4-initiated communication

    - Configuring an IPv4-to-IPv6 destination address translation policy
    - Configuring an IPv4-to-IPv6 source address translation policy
    - (Optional.) Setting the Traffic Class field to 0 for translated IPv6 packets
4. (Optional.) Configuring AFT ALG
5. (Optional.) Configuring AFT high availability
    - Enabling AFT port halving for IRF hot backup
    - Associating an AFT address group with a VRRP group
6. (Optional.) Configuring AFT logging

Enabling AFT

Restrictions and guidelines

To implement address translation between IPv4 and IPv6 networks, you must enable AFT on interfaces connected to the IPv4 network and interfaces connected to the IPv6 network.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable AFT.
   aft enable
   By default, AFT is disabled.

Configuring an IPv6-to-IPv4 destination address translation policy

About IPv6-to-IPv4 destination address translation policies

AFT compares an IPv6 packet with IPv6-to-IPv4 destination address translation policies in the following order:

1. AFT mappings for IPv4 internal servers.
2. IPv4-to-IPv6 source address static mappings.
3. General prefixes.
4. NAT64 prefixes.

Restrictions and guidelines

Make sure the security policy on the device permits packets that are sent from the IPv6 network-side security zone to security zone **Local**.

Configuring an AFT mapping for an IPv4 internal server

1. Enter system view.
   system-view
2. Configure an AFT mapping for an IPv4 internal server.

aft v4server protocol *protocol-type ipv6-destination-address ipv6-port-number* [**vpn-instance** *ipv6-vpn-instance-name*] *ipv4-destination-address ipv4-port-number* [**vpn-instance** *ipv4-vpn-instance-name*] [**vrrp** *virtual-router-id*]

By default, no AFT mapping for an IPv4 internal server is configured.

Configuring an IPv4-to-IPv6 source address static mapping

Restrictions and guidelines

An IPv4-to-IPv6 source address static translation policy creates a one-to-one mapping between an IPv4 address and an IPv6 address, and can be applied to the following scenarios:

- For an IPv4-initiated session packet, if the source IPv4 address in the packet matches the translation policy, AFT translates the source IPv4 address in the packet to the specified IPv6 address.
- For an IPv6-initiated session packet, if the destination IPv6 address in the packet matches the translation policy, AFT translates the destination IPv6 address in the packet to the specified IPv4 address.

Procedure

1. Enter system view.

   system-view

2. Configure an IPv4-to-IPv6 source address static mapping.

   aft v4tov6 source *ipv4-address* [**vpn-instance** *ipv4-vpn-instance-name*] *ipv6-address* [**vpn-instance** *ipv6-vpn-instance-name*] [**vrrp** *virtual-router-id*]

   By default, no IPv4-to-IPv6 source address static mapping is configured.

Configuring a general prefix

1. Enter system view.

   system-view

2. Configure a general prefix.

   aft prefix-general *prefix-general prefix-length*

   By default, no general prefix is configured.

Configuring a NAT64 prefix

1. Enter system view.

   system-view

2. Configure a NAT64 prefix.

   aft prefix-nat64 *prefix-nat64 prefix-length*

   By default, no NAT64 prefix is configured.

Configuring an IPv6-to-IPv4 source address translation policy

About IPv6-to-IPv4 source address translation policies

AFT compares an IPv6 packet with IPv6-to-IPv4 source address translation policies in the following order:

1. IPv6-to-IPv4 source address static mappings.
2. General prefixes.
3. IVI prefixes.
4. IPv6-to-IPv4 source address dynamic translation policies.

Restrictions and guidelines

Make sure the security policy on the device permits packets that are from security zone **Local** to the IPv4 network-side security zone.

Configuring an IPv6-to-IPv4 source address static mapping

Restrictions and guidelines

An IPv6-to-IPv4 source address static translation policy creates a one-to-one mapping between an IPv6 address and an IPv4 address, and can be applied to the following scenarios:

- For an IPv6-initiated session packet, if the source IPv6 address in the packet matches the translation policy, AFT translates the source IPv6 address in the packet to the specified IPv4 address.
- For an IPv4-initiated session packet, if the destination IPv4 address in the packet matches the translation policy, AFT translates the destination IPv4 address in the packet to the specified IPv6 address.

Procedure

1. Enter system view.

   `system-view`

2. Configure an IPv6-to-IPv4 source address static mapping.

   `aft v6tov4 source` *`ipv6-address`* `[` **`vpn-instance`** *`ipv6-vpn-instance-name`* `]` *`ipv4-address`* `[` **`vpn-instance`** *`ipv4-vpn-instance-name`* `] [` **`vrrp`** *`virtual-router-id`* `]`

Configuring a general prefix

1. Enter system view.

   `system-view`

2. Configure a general prefix.

   `aft prefix-general` *`prefix-general prefix-length`*

Configuring an IVI prefix

1. Enter system view.

   `system-view`

2. Configure an IVI prefix for IPv6-to-IPv4 source address translation.

   aft prefix-ivi *prefix-ivi*

Configuring an IPv6-to-IPv4 source address dynamic translation policy

About this task

An IPv6-to-IPv4 source address dynamic translation policy uses dynamic IPv6-to-IPv4 mappings for IPv6-to-IPv4 source address translation. In PAT mode, AFT translates multiple IPv6 addresses to a single IPv4 address by mapping each IPv6 address and port to the IPv4 address and a unique port. PAT supports the following packet types:

- TCP packets.
- UDP packets.
- ICMPv6 echo request and echo reply messages.

Procedure

1. Enter system view.

   system-view

2. (Optional.) Configure an AFT address group.

   a. Create an AFT address group and enter AFT address group view.

      aft address-group *group-id*

      This step is required if you decide to use an address group in an IPv6-to-IPv4 source address dynamic translation policy.

   b. Add an address range to the address group.

      address *start-address end-address*

      You can add multiple address ranges to an address group, but the address ranges must not overlap.

   c. Return to system view.

      quit

3. Configure an IPv6-to-IPv4 source address dynamic translation policy.

   aft v6tov4 source { **acl ipv6** { **name** *ipv6-acl-name* | **number** *ipv6-acl-number* } | **prefix-nat64** *prefix-nat64 prefix-length* [**vpn-instance** *ipv6-vpn-instance-name*] } { **address-group** *group-id* [**no-pat** | **port-block-size** *blocksize*] | **interface** *interface-type interface-number* } [**vpn-instance** *ipv4-vpn-instance-name*]

Configuring an IPv4-to-IPv6 destination address translation policy

About IPv4-to-IPv6 destination address translation policies

AFT compares an IPv4 packet with IPv4-to-IPv6 destination address translation policies in the following order:

1. AFT mappings for IPv6 internal servers.
2. IPv6-to-IPv4 source address static mappings.
3. IPv4-to-IPv6 destination address translation policies that use IVI prefixes or general prefixes.

Restrictions and guidelines for configuring an IPv4-to-IPv6 destination address translation policy

Make sure the security policy on the device permits packets that are sent from the IPv4 network-side security zone to security zone **Local**.

Configuring an AFT mapping for an IPv6 internal server

1. Enter system view.

   system-view

2. Configure an AFT mapping for an IPv6 internal server.

   aft v6server protocol *protocol-type ipv4-destination-address ipv4-port-number* [**vpn-instance** *ipv4-vpn-instance-name*] *ipv6-destination-address ipv6-port-number* [**vpn-instance** *ipv6-vpn-instance-name*] [**vrrp** *virtual-router-id*]

Configuring an IPv6-to-IPv4 source address static mapping

Restrictions and guidelines

An IPv6-to-IPv4 source address static translation policy creates a one-to-one mapping between an IPv6 address and an IPv4 address, and can be applied to the following scenarios:

- For an IPv6-initiated session packet, if the source IPv6 address in the packet matches the translation policy, AFT translates the source IPv6 address in the packet to the specified IPv4 address.
- For an IPv4-initiated session packet, if the destination IPv4 address in the packet matches the translation policy, AFT translates the destination IPv4 address in the packet to the specified IPv6 address.

Procedure

1. Enter system view.

   system-view

2. Configure an IPv6-to-IPv4 source address static mapping.

   aft v6tov4 source *ipv6-address* [**vpn-instance** *ipv6-vpn-instance-name*] *ipv4-address* [**vpn-instance** *ipv4-vpn-instance-name*] [**vrrp** *virtual-router-id*]

Configuring an IPv4-to-IPv6 destination address translation policy based on IVI or general prefix

1. Enter system view.

   system-view

2. Configure an IVI prefix or general prefix. Choose one option as needed:

   - Configure an IVI prefix.

     aft prefix-ivi *prefix-ivi*

   - Configure a general prefix.

     aft prefix-general *prefix-general prefix-length*

3. Configure an IPv4-to-IPv6 destination address translation policy that uses an IVI prefix or a general prefix.

   aft v4tov6 destination acl { **name** *ipv4-acl-name* **prefix-ivi** *prefix-ivi* [**vpn-instance** *ipv6-vpn-instance-name*] | **number** *ipv4-acl-number* { **prefix-general** *prefix-general prefix-length* | **prefix-ivi** *prefix-ivi* [**vpn-instance** *ipv6-vpn-instance-name*] } }

   You can use a nonexistent IVI prefix or general prefix in a policy, but the policy takes effect only after you configure the prefix.

Configuring an IPv4-to-IPv6 source address translation policy

About IPv4-to-IPv6 source address translation policies

AFT compares an IPv4 packet with IPv4-to-IPv6 source address translation policies in the following order:

1. IPv4-to-IPv6 source address static mappings.
2. IPv4-to-IPv6 source address translation policies that use NAT64 prefixes or general prefixes.
3. The first NAT64 prefix.

Restrictions and guidelines for configuring an IPv4-to-IPv6 source address translation policy

Make sure the security policy on the device permits packets that are sent from security zone **Local** to the IPv6 network-side security zone.

Configuring an IPv4-to-IPv6 source address static mapping

Restrictions and guidelines

An IPv4-to-IPv6 source address static translation policy creates a one-to-one mapping between an IPv4 address and an IPv6 address, and can be applied to the following scenarios:

- For an IPv4-initiated session packet, if the source IPv4 address in the packet matches the translation policy, AFT translates the source IPv4 address in the packet to the specified IPv6 address.
- For an IPv6-initiated session packet, if the destination IPv6 address in the packet matches the translation policy, AFT translates the destination IPv6 address in the packet to the specified IPv4 address.

Procedure

1. Enter system view.

   system-view

2. Configure an IPv4-to-IPv6 source address static mapping.

   aft v4tov6 source *ipv4-address* [**vpn-instance** *ipv4-vpn-instance-name*] *ipv6-address* [**vpn-instance** *ipv6-vpn-instance-name*] [**vrrp** *virtual-router-id*]

Configuring an IPv4-to-IPv6 source address translation policy based on NAT64 or general prefix

1. Enter system view.

   system-view

2. Configure a NAT64 prefix or general prefix. Choose one option as needed:
   - Configure a NAT64 prefix.

     aft prefix-nat64 *prefix-nat64 prefix-length*

   - Configure a general prefix.

     aft prefix-general *prefix-general prefix-length*

3. Configure an IPv4-to-IPv6 source address translation policy that uses a NAT64 prefix or general prefixes.

   aft v4tov6 source acl { **name** *ipv4-acl-name* **prefix-nat64** *prefix-nat64 prefix-length* [**vpn-instance** *ipv6-vpn-instance-name*] | **number** *ipv4-acl-number* { **prefix-general** *prefix-general prefix-length* | **prefix-nat64** *prefix-nat64 prefix-length* [**vpn-instance** *ipv6-vpn-instance-name*] } }

   You can use a nonexistent NAT64 prefix or general prefix in a policy, but the policy takes effect only after you configure the prefix.

Configuring a NAT64 prefix

1. Enter system view.

   system-view

2. Configure a NAT64 prefix.

   aft prefix-nat64 *prefix-nat64 prefix-length*

Setting the ToS field to 0 for translated IPv4 packets

About this task

You can set the ToS field value for IPv4 packets translated from IPv6 packets:

- If the value is set to 0, the priority of the IPv4 packets is set to the lowest.
- If the value is kept the same as the Traffic Class field value of original IPv6 packets, the priority is not changed.

Procedure

1. Enter system view.

   system-view

2. Set the ToS field to 0 for IPv4 packets translated from IPv6 packets.

   aft turn-off tos

   By default, the ToS field value of translated IPv4 packets is the same as the Traffic Class field value of original IPv6 packets.

Setting the Traffic Class field to 0 for translated IPv6 packets

About this task

You can set the Traffic Class field value for IPv6 packets translated from IPv4 packets:

- If the value is set to 0, the priority of the IPv6 packets is set to the lowest.
- If the value is kept the same as the ToS field value of original IPv4 packets, the priority is not changed.

Procedure

1. Enter system view.
   `system-view`
2. Set the Traffic Class field to 0 for IPv6 packets translated from IPv4 packets.
   `aft turn-off traffic-class`
   By default, the Traffic Class field value of translated IPv6 packets is the same as the ToS field value of original IPv4 packets.

Configuring AFT ALG

Restrictions and guidelines

In an IRF fabric, AFT configured on physical interfaces does not support ALG.

Procedure

1. Enter system view.
   `system-view`
2. Enable AFT ALG for a protocol or all protocols.
   `aft alg` { **`all`** | **`dns`** | **`ftp`** | **`http`** | **`icmp-error`** }
   By default, AFT ALG is enabled for DNS, FTP, ICMP error messages, and HTTP.

Configuring AFT high availability

About AFT high availability

If only one AFT device is deployed in the internal network, internal users cannot access the external network when the AFT device fails. To avoid this situation, configure dual-device hot backup for AFT. The dual-device hot backup supports the IRF hot backup and HA group schemes. In the two schemes, the two IRF/HA group member devices in dual-active or active/standby mode are capable of processing AFT services. Session entries, session relation entries, AFT port block entries, and AFT settings are synchronized through the backup channel. When one device fails, the other device takes over.

For more information about IRF, see *Virtual Technologies Configuration Guide*.

For more information about the HA group, see *High Availability Configuration Guide*.

Enabling AFT port halving for IRF hot backup

Restrictions and guidelines

AFT supports IRF hot backup in active/standby and dual-active mode. The AFT configuration for IRF hot backup depends on the deployment mode.

- In dual-active mode, if the two IRF member devices in an IRF fabric use the same AFT address group, the devices might map different IPv6 addresses and ports to the same IPv4 address and port. To avoid this situation, enable AFT port halving on the devices. After you enable AFT port halving, each port block will be equally divided between the two devices. The two devices will use different ports to translate packets from different IP addresses, avoiding port assignment conflicts.
- In active/standby mode, you do not need to enable AFT port halving on the IRF member devices.

Procedure

1. Enter system view.

   `system-view`

2. Enable AFT port halving.

   `aft port-load-balance enable slot` *`slot-number`*

   By default, AFT port halving is disabled.

Associating an AFT address group with a VRRP group

About this task

In an HA group network collaborated with VRRP, if the virtual IP address of the VRRP group and public addresses in an AFT address group are on the same subnet, bind the AFT address group with the VRRP group. When receiving ARP requests for the MAC addresses corresponding to these public IP addresses, the master device in the VRRP group returns ARP replies with its virtual MAC address.

For more information about configuring the HA group, see *High Availability Configuration Guide*.

Procedure (dual-active mode)

1. Enter system view.

   `system-view`

2. Enter AFT address group view.

   `aft address-group` *`group-id`*

3. Bind the AFT address group to a VRRP group.

   `vrrp vrid` *`virtual-router-id`*

   By default, an AFT address group is not bound to any VRRP group.

4. Return to system view.

   `quit`

5. Specify AFT port ranges for the two devices in the HA group.

   `aft remote-backup port-alloc` `{` **`primary`** `|` **`secondary`** `}`

   By default, the two devices in the HA group share AFT port resources.

   When the two devices in the HA group use the same AFT address group, execute this command on the primary device.

Procedure (active/standby mode)

1. Enter system view.

   `system-view`

2. Enter AFT address group view.

   `aft address-group` *`group-id`*

3. Bind the AFT address group to a VRRP group.

   `vrrp vrid` *`virtual-router-id`*

   By default, an AFT address group is not bound to any VRRP group.

   Execute this command on the primary device in the HA group.

Configuring AFT logging

About this task

For security auditing, you can configure AFT logging to record AFT session information. AFT sessions refer to sessions whose source and destination addresses have been translated by AFT.

AFT can log the following events:

- An AFT port block is created.
- An AFT port block is deleted.
- An AFT session is established.
- An AFT session is removed.

The logs are sent to the information center of the device. For the logs to be output correctly, you must also configure the information center on the device. For more information about information center configuration, see *Network Management and Monitoring Configuration Guide*.

Procedure

1. Enter system view.

   `system-view`

2. Enable AFT logging.

   `aft log enable`

   By default, AFT logging is disabled.

   After you configure this command, AFT logs the creation and deletion events of AFT port blocks.

3. (Optional.) Enabling AFT session establishment and removal logging.

   - Enable AFT session establishment logging.

     `aft log flow-begin`

     By default, AFT session establishment logging is disabled.

     AFT session establishment logging takes effect only after you execute the **`aft log enable`** command to enable AFT logging.

   - Enable AFT session removal logging.

     `aft log flow-end`

     By default, AFT session removal logging is disabled.

     AFT session removal logging takes effect only after you execute the **`aft log enable`** command to enable AFT logging.

Display and maintenance commands for AFT

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display AFT configuration.	**display aft configuration**
Display AFT address group information.	**display aft address-group** [*group-id*]
Display AFT mappings.	**display aft address-mapping** [**slot** *slot-number*]
Display information about AFT NO-PAT entries.	**display aft no-pat** [**slot** *slot-number*]
Display AFT port block mappings.	**display aft port-block** [**slot** *slot-number*]
Display information about AFT sessions.	**display aft session ipv4** [{ **source-ip** *source-ip-address* | **destination-ip** *destination-ip-address* } * [**vpn-instance** *ipv4-vpn-instance-name*]] [**slot** *slot-number*] [**verbose**] **display aft session ipv6** [{ **source-ip** *source-ipv6-address* | **destination-ip** *destination-ipv6-address* } * [**vpn-instance** *ipv6-vpn-instance-name*]] [**slot** *slot-number*] [**verbose**]
Display AFT statistics.	**display aft statistics** [**slot** *slot-number*]
Clear AFT sessions.	**reset aft session** [**slot** *slot-number*]
Clear AFT statistics.	**reset aft statistics** [**slot** *slot-number*]

AFT configuration examples

Example: Allowing IPv4 Internet access from an IPv6 network

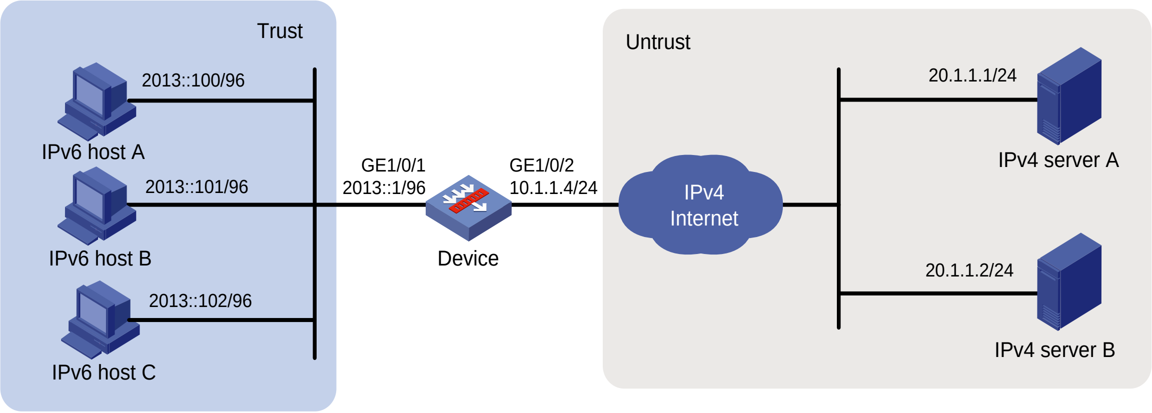
Network configuration

As shown in Figure 7, a company upgrades the network to IPv6 and has IPv4 addresses from 10.1.1.1 to 10.1.1.3.

To allow IPv6 hosts on subnet 2013::/96 to access the IPv4 Internet, configure the following AFT policies on the device:

- Configure a NAT64 prefix to translate IPv4 addresses of IPv4 servers to IPv6 addresses.
- Configure an IPv6-to-IPv4 source address dynamic translation policy to translate source IPv6 addresses of IPv6-initiated packets to IPv4 addresses in the range of 10.1.1.1 to 10.1.1.3.

Figure 7 Network diagram



Procedure

1. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

   ```
   <Device> system-view
   [Device] interface gigabitethernet 1/0/1
   [Device-GigabitEthernet1/0/1] ipv6 address 2013::1 96
   [Device-GigabitEthernet1/0/1] quit
   ```

   # Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Add interfaces to security zones.

   ```
   [Device] security-zone name trust
   [Device-security-zone-Trust] import interface gigabitethernet 1/0/1
   [Device-security-zone-Trust] quit
   [Device] security-zone name untrust
   [Device-security-zone-Untrust] import interface gigabitethernet 1/0/2
   [Device-security-zone-Untrust] quit
   ```

3. Configure settings for routing.

   This example configures a static route with next hop address 10.1.1.100.

   ```
   [Device] ip route-static 20.1.1.0 24 10.1.1.100
   ```

4. Configure security policies:

   # In the IPv6 security policy, configure a rule named **aftlocalin** to allow the device to perform AFT on the IPv6 host traffic destined for the IPv4 servers.

   ```
   [Device] security-policy ipv6
   [Device-security-policy-ipv6] rule name aftlocalin
   [Device-security-policy-ipv6-1-aftlocalin] source-zone trust
   [Device-security-policy-ipv6-1-aftlocalin] destination-zone local
   [Device-security-policy-ipv6-1-aftlocalin] source-ip-subnet 2013:: 96
   [Device-security-policy-ipv6-1-aftlocalin] destination-ip-host 2012::20.1.1.1
   [Device-security-policy-ipv6-1-aftlocalin] destination-ip-host 2012::20.1.1.2
   [Device-security-policy-ipv6-1-aftlocalin] action pass
   [Device-security-policy-ipv6-1-aftlocalin] quit
   [Device-security-policy-ipv6] quit
   ```

   # In the IPv6 security policy, configure a rule named **aftlocalout** to allow the device to forward the AFT-translated packets to the IPv4 servers.

   ```
   [Device] security-policy ip
   ```

```
[Device-security-policy-ip] rule name aftlocalout
[Device-security-policy-ip-1-aftlocalout] source-zone local
[Device-security-policy-ip-1-aftlocalout] destination-zone untrust
[Device-security-policy-ip-1-aftlocalout] source-ip-host 10.1.1.1
[Device-security-policy-ip-1-aftlocalout] source-ip-host 10.1.1.2
[Device-security-policy-ip-1-aftlocalout] source-ip-host 10.1.1.3
[Device-security-policy-ip-1-aftlocalout] destination-ip-host 20.1.1.1
[Device-security-policy-ip-1-aftlocalout] destination-ip-host 20.1.1.2
[Device-security-policy-ip-1-aftlocalout] action pass
[Device-security-policy-ip-1-aftlocalout] quit
[Device-security-policy-ip] quit
```

5. Configure AFT settings:

   # Create AFT address group 0, and add the address range from 10.1.1.1 to 10.1.1.3 to the group.

   ```
   [Device] aft address-group 0
   [Device-aft-address-group-0] address 10.1.1.1 10.1.1.3
   [Device-aft-address-group-0] quit
   ```

   # Configure IPv6 ACL 2000 to permit IPv6 packets only from subnet 2013::/96 to pass through.

   ```
   [Device] acl ipv6 basic 2000
   [Device-acl-ipv6-basic-2000] rule permit source 2013:: 96
   [Device-acl-ipv6-basic-2000] rule deny
   [Device-acl-ipv6-basic-2000] quit
   ```

   # Configure the device to translate source IPv6 addresses of packets permitted by IPv6 ACL 2000 to IPv4 addresses in address group 0.

   ```
   [Device] aft v6tov4 source acl ipv6 number 2000 address-group 0
   ```

   # Configure the device to use NAT64 prefix **2012::/96** to translate destination IPv6 addresses of IPv6 packets.

   ```
   [Device] aft prefix-nat64 2012:: 96
   ```

   # Enable AFT on the interfaces connected to the IPv6 network and IPv4 Internet, respectively.

   ```
   [Device] interface gigabitethernet 1/0/1
   [Device-GigabitEthernet1/0/1] aft enable
   [Device-GigabitEthernet1/0/1] quit
   [Device] interface gigabitethernet 1/0/2
   [Device-GigabitEthernet1/0/2] aft enable
   [Device-GigabitEthernet1/0/2] quit
   ```

   # Configure routes to make sure IPv6 hosts can reach IPv6 addresses that are translated by using the NAT64 prefix, and IPv4 servers can reach translated IPv4 addresses. (Details not shown.)

Verifying the configuration

# Verify the connectivity between IPv6 hosts and IPv4 servers. This example pings IPv4 server A from IPv6 host A.

```
D:\>ping 2012::20.1.1.1
Pinging 2012::20.1.1.1 with 32 bytes of data:
Reply from 2012::20.1.1.1: time=3ms
Reply from 2012::20.1.1.1: time=3ms
Reply from 2012::20.1.1.1: time=3ms
Reply from 2012::20.1.1.1: time=3ms
```

# Display detailed information about IPv6 AFT sessions on the device.

```
[Device] display aft session ipv6 verbose
Initiator:
  Source      IP/port: 2013::100/0

Example: Providing FTP service from an IPv6 network to the IPv4 Internet

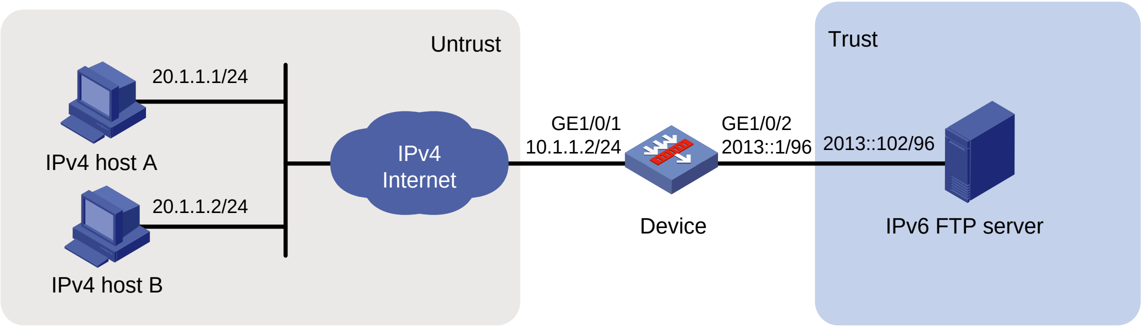
Network configuration

As shown in Figure 8, a company upgrades the network to IPv6, and it has an IPv4 address 10.1.1.1.

To allow the IPv6 FTP server to provide FTP services to IPv4 hosts, configure the following AFT policies on the device:

- Map the IPv6 FTP server's IPv6 address and TCP port number to the company's IPv4 address and TCP port number.
- Configure a NAT64 prefix to translate source IPv4 addresses of IPv4 packets to source IPv6 addresses.

Figure 8 Network diagram



Procedure

1. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

   ```
   <Device> system-view
   [Device] interface gigabitethernet 1/0/1
   [Device-GigabitEthernet1/0/1] ip address 10.1.1.2 24
   [Device-GigabitEthernet1/0/1] quit
   ```

   # Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Add interfaces to security zones.

   ```
   ［Device］ security-zone name trust
   ［Device-security-zone-Trust］ import interface gigabitethernet 1/0/2
   ［Device-security-zone-Trust］ quit
   ［Device］ security-zone name untrust
   ［Device-security-zone-Untrust］ import interface gigabitethernet 1/0/1
   ［Device-security-zone-Untrust］ quit
   ```

3. Configure security policies:

   # In the IPv4 security policy, configure a rule named **aftlocalin** to allow the device to perform AFT on the IPv4 traffic destined for the IPv6 FTP server.

   ```
   [Device] security-policy ip
   ```

```
[Device-security-policy-ip] rule name aftlocalin
[Device-security-policy-ip-1-aftlocalin] source-zone untrust
[Device-security-policy-ip-1-aftlocalin] destination-zone local
[Device-security-policy-ip-1-aftlocalin] destination-ip-host 10.1.1.1
[Device-security-policy-ip-1-aftlocalin] action pass
[Device-security-policy-ip-1-aftlocalin] quit
[Device-security-policy-ip] quit
```

# In the IPv6 security policy, configure a rule named **aftlocalout** to allow the device to forward the AFT-translated packets to the IPv6 server.

```
[Device] security-policy ipv6
[Device-security-policy-ipv6] rule name aftlocalout
[Device-security-policy-ipv6-1-aftlocalout] source-zone local
[Device-security-policy-ipv6-1-aftlocalout] destination-zone trust
[Device-security-policy-ipv6-1-aftlocalout] source-ip-subnet 2012:: 96
[Device-security-policy-ipv6-1-aftlocalout] destination-ip-host 2013::102
[Device-security-policy-ipv6-1-aftlocalout] action pass
[Device-security-policy-ipv6-1-aftlocalout] quit
[Device-security-policy-ipv6] quit
```

4. Configure AFT settings:

# Map IPv4 address **10.1.1.1** with TCP port **21** to IPv6 address **2013::102** with TCP port **21** for the IPv6 internal FTP server.

```
[Device] aft v6server protocol tcp 10.1.1.1 21 2013::102 21
```

# Configure the device to use NAT64 prefix **2012:: 96** to translate source addresses of IPv4 packets.

```
[Device] aft prefix-nat64 2012:: 96
```

# Enable AFT on the interfaces connected to the IPv4 Internet and IPv6 network, respectively.

```
[Device] interface gigabitethernet 1/0/1
[Device-GigabitEthernet1/0/1] aft enable
[Device-GigabitEthernet1/0/1] quit
[Device] interface gigabitethernet 1/0/2
[Device-GigabitEthernet1/0/2] aft enable
[Device-GigabitEthernet1/0/2] quit
```

Verifying the configuration

# Verify that IPv4 hosts can use FTP to access the IPv6 FTP server. (Details not shown.)

# Display detailed information about IPv6 AFT sessions on the device.

```
[Device] display aft session ipv4 verbose

Example: Allowing mutual access between IPv4 and IPv6 networks

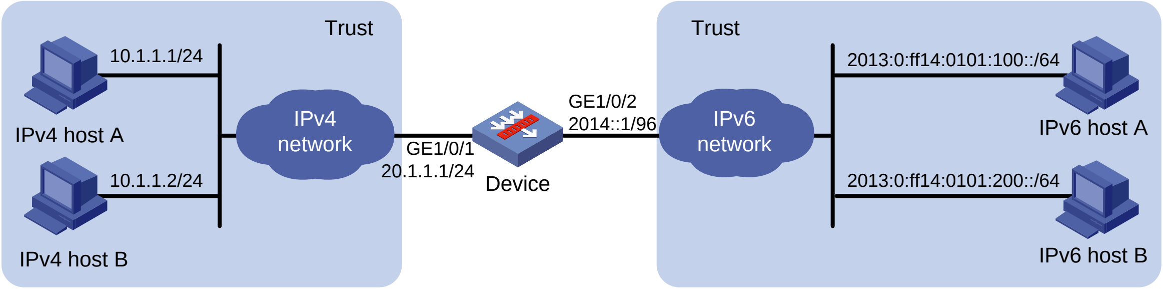
Network configuration

As shown in Figure 9, a company deploys both an IPv4 network and an IPv6 network.

To allow mutual access between the IPv4 network and the IPv6 network, configure the following AFT policies on the device:

- Assign an IVI prefix and an IPv4 subnet to the IPv6 network. Each IPv6 host uses the IPv6 addresses formed by the IVI prefix and an IPv4 address on the IPv4 subnet.
- Configure a NAT64 prefix to translate source IPv4 addresses of packets initiated by the IPv4 network to IPv6 addresses.

Figure 9 Network diagram



Procedure

1. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

```
<Device> system-view
[Device] interface gigabitethernet 1/0/1
[Device-GigabitEthernet1/0/1] ip address 20.1.1.1 24
[Device-GigabitEthernet1/0/1] quit
```

   # Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Add interfaces to security zones.

```
[Device] security-zone name trust
[Device-security-zone-Trust] import interface gigabitethernet 1/0/1
[Device-security-zone-Trust] import interface gigabitethernet 1/0/2
[Device-security-zone-Trust] quit
```

3. Configure settings for routing.

   This example configures an IPv6 static route (with next hop address 2014::100) and an IPv4 static route (with next hop address 20.1.1.2).

```
[Device] ipv6 route-static 2013:: 32 2014::100
[Device] ip route-static 10.1.1.0 24 20.1.1.2
```

4. Configure security policies to allow the device to permit IPv4-to-IPv6 traffic:

   # In the IPv4 security policy, configure a rule named **aftlocalin4** to allow the device to perform AFT on the IPv4 traffic destined for the IPv6 hosts.

```
[Device] security-policy ip
[Device-security-policy-ip] rule name aftlocalin4
[Device-security-policy-ip-1-aftlocalin4] source-zone trust
[Device-security-policy-ip-1-aftlocalin4] destination-zone local
[Device-security-policy-ip-1-aftlocalin4] source-ip-subnet 10.1.1.0 24
[Device-security-policy-ip-1-aftlocalin4] destination-ip-subnet 20.1.1.0 24
[Device-security-policy-ip-1-aftlocalin4] action pass
[Device-security-policy-ip-1-aftlocalin4] quit
[Device-security-policy-ip] quit
```

   # In the IPv6 security policy, configure a rule named **aftlocalout6** to allow the device to forward the AFT-translated packets to the IPv6 hosts.

```
[Device] security-policy ipv6
```

```
[Device-security-policy-ipv6] rule name aftlocalout6
[Device-security-policy-ipv6-1-aftlocalout6] source-zone local
[Device-security-policy-ipv6-1-aftlocalout6] destination-zone trust
[Device-security-policy-ipv6-1-aftlocalout6] source-ip-subnet 2012:: 96
[Device-security-policy-ipv6-1-aftlocalout6] destination-ip-subnet 2013:: 32
[Device-security-policy-ipv6-1-aftlocalout6] action pass
[Device-security-policy-ipv6-1-local-ipv6] quit
```

5. Configure security policies to allow the device to permit IPv6-to-IPv4 traffic:

   # In the IPv6 security policy, configure a rule named **aftlocalin6** to allow the device to perform AFT on the IPv6 traffic destined for the IPv4 hosts.

```
[Device-security-policy-ipv6] rule name aftlocalin6
[Device-security-policy-ipv6-2-aftlocalin6] source-zone trust
[Device-security-policy-ipv6-2-aftlocalin6] destination-zone local
[Device-security-policy-ipv6-2-aftlocalin6] source-ip-subnet 2013:: 32
[Device-security-policy-ipv6-2-aftlocalin6] destination-ip-subnet 2012:: 96
[Device-security-policy-ipv6-2-aftlocalin6] action pass
[Device-security-policy-ipv6-2-aftlocalin6] quit
[Device-security-policy-ipv6] quit
```

   # In the IPv4 security policy, configure a rule named **aftlocalout4** to allow the device to forward the AFT-translated packets to the IPv4 hosts.

```
[Device] security-policy ip
[Device-security-policy-ip] rule 2 name aftlocalout4
[Device-security-policy-ip-2-aftlocalout4] source-zone local
[Device-security-policy-ip-2-aftlocalout4] destination-zone trust
[Device-security-policy-ip-2-aftlocalout4] source-ip-subnet 20.1.1.0 24
[Device-security-policy-ip-2-aftlocalout4] destination-ip-subnet 10.1.1.0 24
[Device-security-policy-ip-2-aftlocalout4] action pass
[Device-security-policy-ip-2-aftlocalout4] quit
[Device-security-policy-ip] quit
```

6. Configure AFT settings:

   # Configure IPv4 ACL 2000 to permits all IPv4 packets to pass through.

```
[Device] acl basic 2000
[Device-acl-ipv4-basic-2000] rule permit
[Device-acl-ipv4-basic-2000] quit
```

   # Configure the device to use NAT64 prefix **2012:: 96** to translate source addresses of IPv4 packets. The device also uses the prefix to translate destination addresses of IPv6 packets.

```
[Device] aft prefix-nat64 2012:: 96
```

   # Configure the device to use IVI prefix **2013::** to translate source addresses of IPv6 packets.

```
[Device] aft prefix-ivi 2013::
```

   # Configure the device to use IVI prefix **2013::** to translate destination addresses of packets permitted by IPv4 ACL 2000.

```
[Device] aft v4tov6 destination acl number 2000 prefix-ivi 2013::
```

   # Enable AFT on the interfaces connected to the IPv4 and IPv6 networks, respectively.

```
[Device] interface gigabitethernet 1/0/1
[Device-GigabitEthernet1/0/1] aft enable
[Device-GigabitEthernet1/0/1] quit
[Device] interface gigabitethernet 1/0/2
[Device-GigabitEthernet1/0/2] aft enable
```

```
    [Device-GigabitEthernet1/0/2] quit
```

Verifying the configuration

# Verify the connectivity between IPv6 hosts and IPv4 hosts. This example pings IPv4 host A from IPv6 host A.

```
D:\>ping 2012::a01:0101

Example: Allowing IPv6 Internet access from an IPv4 network

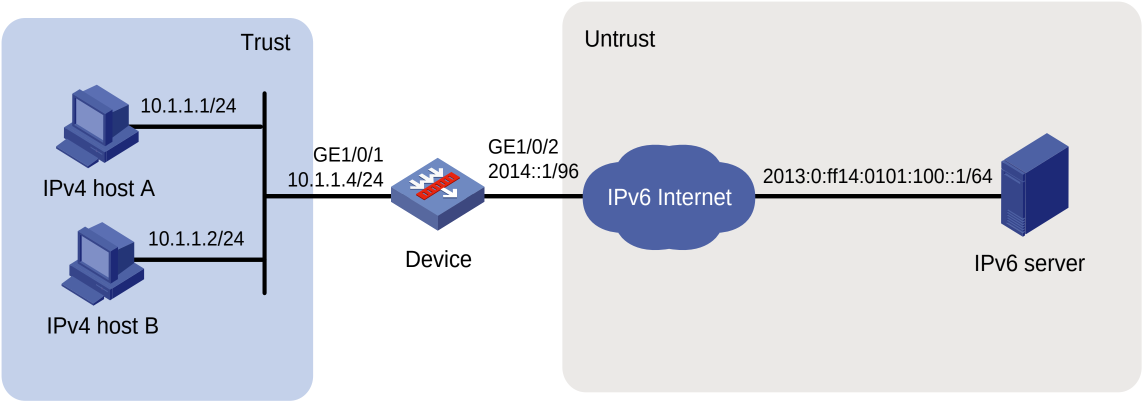
Network configuration

As shown in Figure 10, a company deploys an IPv4 network, and the Internet migrates to IPv6.

To allow IPv4 hosts to access the IPv6 server in the IPv6 Internet, configure the following AFT policies on the device:

- Configure an IPv4-to-IPv6 source address dynamic translation policy.
- Configure an IPv6-to-IPv4 source address static mapping for the IPv6 server.

Figure 10 Network diagram



Procedure

1. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

   ```
   <Device> system-view
   [Device] interface gigabitethernet 1/0/1
   [Device-GigabitEthernet1/0/1] ip address 10.1.1.4 24
   [Device-GigabitEthernet1/0/1] quit
   ```

   # Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Add interfaces to security zones.

```
[Device] security-zone name trust
[Device-security-zone-Trust] import interface gigabitethernet 1/0/1
[Device-security-zone-Trust] quit
[Device] security-zone name untrust
[Device-security-zone-Untrust] import interface gigabitethernet 1/0/2
[Device-security-zone-Untrust] quit
```

3. Configure settings for routing.

   This example configures a static route with next hop address 2014::100.

```
[Device] ipv6 route-static 2013:0:ff14:0101:100:: 64 2014::100
```

4. Configure security policies:

   # In the IPv4 security policy, configure a rule named **aftlocalin** to allow the device to perform AFT on the IPv4 host traffic destined for the IPv6 server.

```
[Device] security-policy ip
[Device-security-policy-ip] rule name aftlocalin
[Device-security-policy-ip-1-aftlocalin] source-zone trust
[Device-security-policy-ip-1-aftlocalin] destination-zone local
[Device-security-policy-ip-1-aftlocalin] source-ip-subnet 10.1.1.0 24
[Device-security-policy-ip-1-aftlocalin] destination-ip-host 20.1.1.1
[Device-security-policy-ip-1-aftlocalin] action pass
[Device-security-policy-ip-1-aftlocalin] quit
[Device-security-policy-ip] quit
```

   # In the IPv6 security policy, configure a rule named **aftlocalout** to allow the device to forward the AFT-translated packets to the IPv6 server.

```
[Device] security-policy ipv6
[Device-security-policy-ipv6] rule name aftlocalout
[Device-security-policy-ipv6-1-aftlocalout] source-zone local
[Device-security-policy-ipv6-1-aftlocalout] destination-zone untrust
[Device-security-policy-ipv6-1-aftlocalout] source-ip-subnet 2012:: 96
[Device-security-policy-ipv6-1-aftlocalout] destination-ip-host
2013:0:ff14:0101:100::1
[Device-security-policy-ipv6-1-aftlocalout] action pass
[Device-security-policy-ipv6-1-aftlocalout] quit
[Device-security-policy-ipv6] quit
```

5. Configure AFT settings:

   # Configure IPv4 ACL 2000 to permit IPv4 packets only from subnet 10.1.1.0/24 to pass through.

```
[Device] acl basic 2000
[Device-acl-ipv4-basic-2000] rule permit source 10.1.1.0 0.0.0.255
[Device-acl-ipv4-basic-2000] rule deny
[Device-acl-ipv4-basic-2000] quit
```

   # Configure NAT64 prefix **2012:: 96**.

```
[Device] aft prefix-nat64 2012:: 96
```

   # Configure the device to use NAT64 prefix **2012:: 96** to translate source addresses of packets permitted by IPv4 ACL 2000.

```
[Device] aft v4tov6 source acl number 2000 prefix-nat64 2012:: 96
```

   # Map source IPv6 address **2013:0:ff14:0101:100::** to source IPv4 address **20.1.1.1**.

```
[Device] aft v6tov4 source 2013:0:ff14:0101:100:: 20.1.1.1
```

   # Enable AFT on the interfaces connected to the IPv4 and IPv6 networks, respectively.

```
[Device] interface gigabitethernet 1/0/1
[Device-GigabitEthernet1/0/1] aft enable
[Device-GigabitEthernet1/0/1] quit
[Device] interface gigabitethernet 1/0/2
[Device-GigabitEthernet1/0/2] aft enable
[Device-GigabitEthernet1/0/2] quit
```

Verifying the configuration

# Verify the connectivity between the IPv4 hosts and the IPv6 server. This example uses the ping utility on an IPv4 host.

```
D:\>ping 20.1.1.1
Pinging 20.1.1.1 with 32 bytes of data:

Example: Providing FTP service from an IPv4 network to the IPv6 Internet

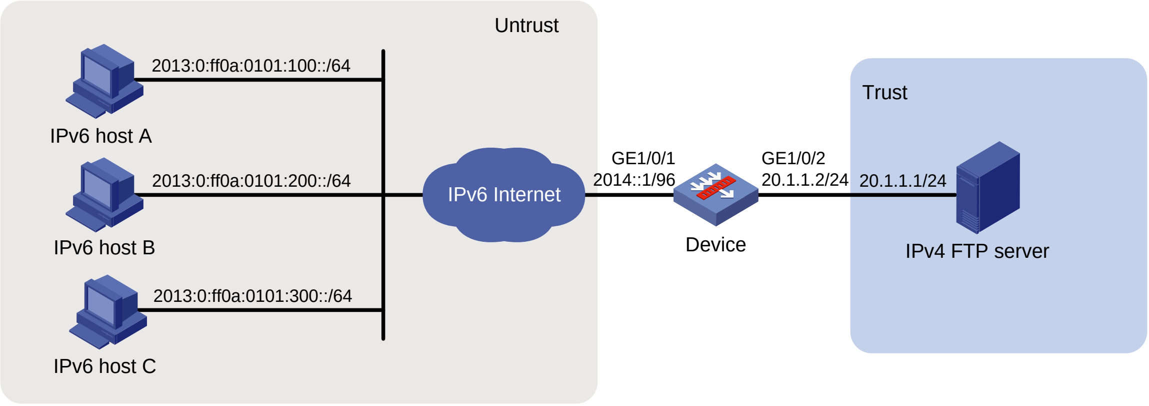
Network configuration

As shown in Figure 11, a company deploys an IPv4 network, and it has an IPv6 address 2012::1. The Internet migrates to IPv6.

To allow the IPv4 FTP server to provide FTP services to IPv6 hosts, configure the following AFT policies on the device:

- Configure an IPv4-to-IPv6 source address static mapping for the IPv4 FTP server. The device uses the mapping to translate the destination IPv6 address of IPv6-initiated addresses to the IPv4 address.
- Configure an IPv6-to-IPv4 source address dynamic translation policy. The device translates source IPv6 addresses of IPv6-initiated packets to source IPv4 addresses 30.1.1.1 and 30.1.1.2.

Figure 11 Network diagram



Procedure

1. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

   ```
   <Device> system-view
   [Device] interface gigabitethernet 1/0/1
   [Device-GigabitEthernet1/0/1] ip address 10.1.1.4 24
   [Device-GigabitEthernet1/0/1] quit
   ```

   # Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Add interfaces to security zones.

   ```
   [Device] security-zone name trust
   [Device-security-zone-Trust] import interface gigabitethernet 1/0/2
   [Device-security-zone-Trust] quit
   [Device] security-zone name untrust
   [Device-security-zone-Untrust] import interface gigabitethernet 1/0/1
   [Device-security-zone-Untrust] quit
   ```

3. Configure security policies:

   # In the IPv6 security policy, configure a rule named **aftlocalin** to allow the device to perform AFT on the IPv6 host traffic destined for the IPv4 server.

   ```
   [Device] security-policy ipv6
   [Device-security-policy-ipv6] rule name aftlocalin
   [Device-security-policy-ipv6-1-aftlocalin] source-zone untrust
   [Device-security-policy-ipv6-1-aftlocalin] destination-zone local
   [Device-security-policy-ipv6-1-aftlocalin] destination-ip-host 2012::1
   [Device-security-policy-ipv6-1-aftlocalin] action pass
   [Device-security-policy-ipv6-1-aftlocalin] quit
   [Device-security-policy-ipv6] quit
   ```

   # In the IPv4 security policy, configure a rule named **aftlocalout** to allow the device to forward the AFT-translated packets to the IPv4 server.

   ```
   [Device] security-policy ip
   [Device-security-policy-ip] rule name aftlocalout
   [Device-security-policy-ip-1-aftlocalout] source-zone local
   [Device-security-policy-ip-1-aftlocalout] destination-zone trust
   [Device-security-policy-ip-1-aftlocalout] source-ip-host 30.1.1.1
   [Device-security-policy-ip-1-aftlocalout] source-ip-host 30.1.1.2
   [Device-security-policy-ip-1-aftlocalout] destination-ip-host 20.1.1.1
   [Device-security-policy-ip-1-aftlocalout] action pass
   [Device-security-policy-ip-1-aftlocalout] quit
   ```

4. Configure AFT settings:

   # Map source IPv4 address **20.1.1.1** to source IPv6 address **2012::1**.

   ```
   [Device] aft v4tov6 source 20.1.1.1 2012::1
   ```

   # Configure address group 0, and add the address range from 30.1.1.1 to 30.1.1.2 to the group.

   ```
   [Device] aft address-group 0
   [Device-aft-address-group-0] address 30.1.1.1 30.1.1.2
   [Device-aft-address-group-0] quit
   ```

   # Configure IPv6 ACL 2000 to permit all IPv6 packets to pass through.

   ```
   [Device] acl ipv6 basic 2000
   [Device-acl-ipv6-basic-2000] rule permit
   ```

```
[Device-acl-ipv6-basic-2000] quit
```

# Configure the device to translate source addresses of IPv6 packets permitted by IPv6 ACL 2000 to IPv4 addresses in address group 0.

```
[Device] aft v6tov4 source acl ipv6 number 2000 address-group 0
```

# Enable AFT on the interfaces connected to the IPv6 Internet and IPv4 network, respectively.

```
[Device] interface gigabitethernet 1/0/1
[Device-GigabitEthernet1/0/1] aft enable
[Device-GigabitEthernet1/0/1] quit
[Device] interface gigabitethernet 1/0/2
[Device-GigabitEthernet1/0/2] aft enable
[Device-GigabitEthernet1/0/2] quit
```

Verifying the configuration

# Verify the connectivity between the IPv6 hosts and the IPv4 FTP server. For example, ping the IPv4 FTP server from IPv6 host A.

```
D:\>ping 2012::1
Pinging 2012::1 with 32 bytes of data:
Reply from 2012::1: time=3ms
Reply from 2012::1: time=3ms
Reply from 2012::1: time=3ms
Reply from 2012::1: time=3ms
```

# Display detailed information about IPv6 AFT sessions on the device.

```
[Device] display aft session ipv6 verbose
Initiator:

NSFOCUS Firewall Series

NF VPN Configuration Guide

NSFOCUS Technologies, Inc.

Document version: 6W600-20230221

Preface

- This configuration guide describes the fundamentals and configuration procedures for VPN features, including:SSL VPN, IPsec, tunneling, GRE, L2TP, and ADVPN.
- Security zones, security policies, object groups, object policies, APR, and session management.
- User access and authentication features (such as AAA, portal, user identification, password control, and PKI).
- Data security features (such as public key management, SSL, SSH, and crypto engine).
- Attack protection features (such as ASPF, connection limit, IP source guard, ARP attack protection, ND attack defense, uRPF, attack detection and prevention, and IP-MAC binding).

This preface includes the following topics about the documentation:

- Audience.
- Conventions.

Audience

This documentation is intended for:

- Network planners.
- Field technical support and servicing engineers.
- Network administrators.

Conventions

The following information describes the conventions used in the documentation.

Command conventions

Convention	Description
Boldface	**Bold** text represents commands and keywords that you enter literally as shown.
Italic	*Italic* text represents arguments that you replace with actual values.
[ ]	Square brackets enclose syntax choices (keywords or arguments) that are optional.
{ x | y | ... }	Braces enclose a set of required syntax choices separated by vertical bars, from which you select one.
[x | y | ...]	Square brackets enclose a set of optional syntax choices separated by vertical bars, from which you select one or none.
{ x | y | ... } *	Asterisk marked braces enclose a set of required syntax choices separated by vertical bars, from which you select a minimum of one.
[x | y | ...] *	Asterisk marked square brackets enclose optional syntax choices separated by vertical bars, from which you select one choice, multiple choices, or none.
&<1-n>	The argument or keyword and argument combination before the ampersand (&) sign can be entered 1 to n times.
#	A line that starts with a pound (#) sign is comments.

GUI conventions

Convention	Description
Boldface	Window names, button names, field names, and menu items are in Boldface. For example, the **New User** window opens; click **OK**.
>	Multi-level menus are separated by angle brackets. For example, **File** > **Create** > **Folder**.

Symbols

Convention	Description
⚠ **WARNING!**	An alert that calls attention to important information that if not understood or followed can result in personal injury.
△ **CAUTION:**	An alert that calls attention to important information that if not understood or followed can result in data loss, data corruption, or damage to hardware or software.
ⓘ **IMPORTANT:**	An alert that calls attention to essential information.
NOTE:	An alert that contains additional or supplementary information.
💡 **TIP:**	An alert that provides helpful information.

Network topology icons

Convention	Description
	Represents a generic network device, such as a router, switch, or firewall.
	Represents a routing-capable device, such as a router or Layer 3 switch.
	Represents a generic switch, such as a Layer 2 or Layer 3 switch, or a router that supports Layer 2 forwarding and other Layer 2 features.
	Represents an access controller, a unified wired-WLAN module, or the access controller engine on a unified wired-WLAN switch.
	Represents an access point.
	Represents a wireless terminator unit.
	Represents a wireless terminator.
	Represents a mesh access point.
	Represents omnidirectional signals.
	Represents directional signals.
	Represents a security product, such as a firewall, UTM, multiservice security gateway, or load balancing device.

Convention	Description
	Represents a security module, such as a firewall, load balancing, NetStream, SSL VPN, IPS, or ACG module.

Examples provided in this document

Examples in this document might use devices that differ from your device in hardware model, configuration, or software version. It is normal that the port numbers, sample output, screenshots, and other information in the examples differ from what you have on your device.

Contents

Configuring SSL VPN

About SSL VPN

SSL VPN provides SSL-based secure remote access services through an SSL VPN gateway. Users from anywhere on the Internet can establish a secure connection to an SSL VPN gateway through an SSL-enabled browser to access protected resources behind the gateway.

SSL VPN operating mechanism

To allow remote user access to protected resources behind an SSL VPN gateway, you must configure these resources on the gateway. Remote users can access only the resources authorized to them after they establish an SSL-encrypted connection to the gateway and pass the identity authentication.

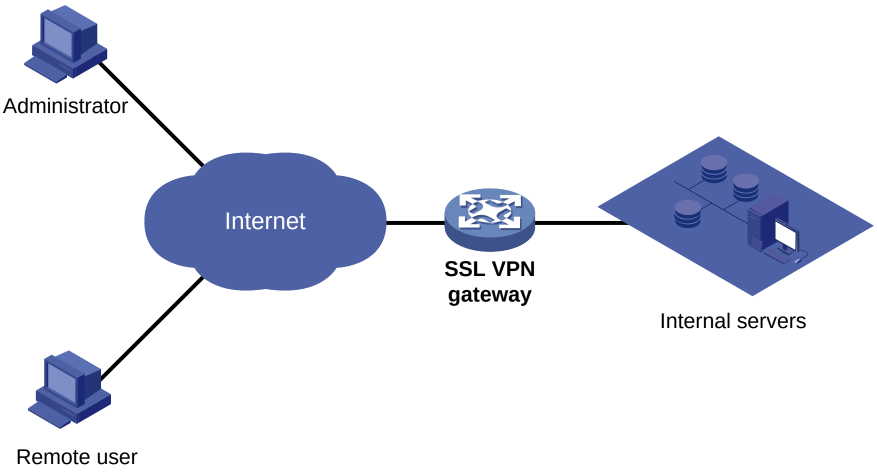
As shown in Figure 1, SSL VPN operates as follows:

1. The remote user establishes an HTTPS connection to the SSL VPN gateway.

   In this process, the remote user and the SSL VPN gateway perform SSL certificate authentication.
2. The remote user enters the username and password.
3. The SSL VPN gateway authenticates the credentials that the user entered, and authorizes the user to access a range of resources.
4. The user selects a resource to access.

   An access request for that resource is sent to the SSL VPN gateway through the SSL connection.
5. The SSL VPN gateway resolves the request and forwards the request to the corresponding internal server.
6. The SSL VPN gateway forwards the server's reply to the user through the SSL connection.

Figure 1 SSL VPN network diagram

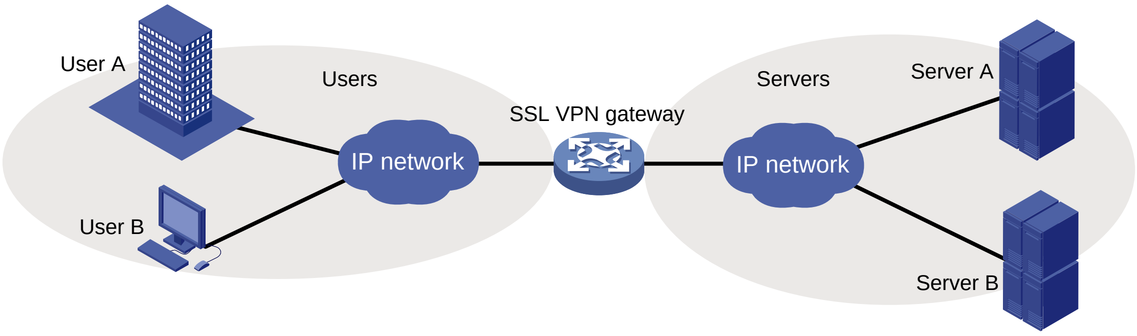


SSL VPN networking modes

Gateway mode

In gateway mode, the SSL VPN gateway acts as a gateway that connects remote users and the internal servers network, as shown in Figure 2. Because the SSL VPN gateway is deployed in line, it can provide full protection to the internal network but it affects data transmission performance.

Figure 2 Gateway mode

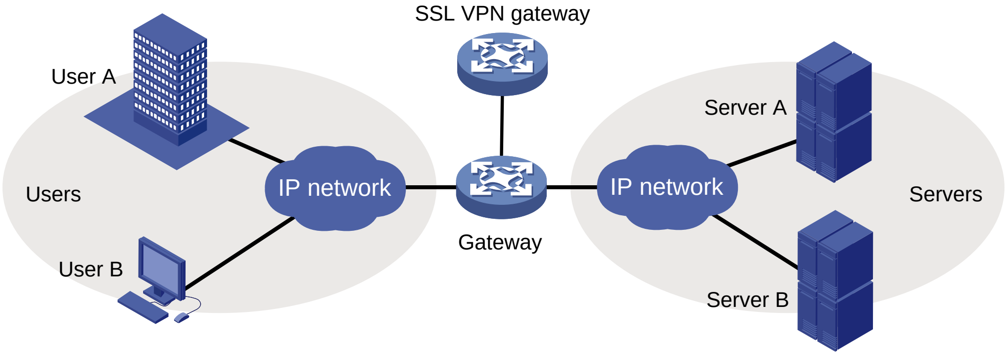


Single-arm mode

In single-arm mode, the SSL VPN gateway is attached to the network gateway, as shown in Figure 3.

The gateway forwards user-to-server traffic to the SSL VPN gateway. The SSL VPN gateway processes the traffic and sends the processed traffic back to the gateway. The gateway forwards the traffic to the internal servers. The SSL VPN gateway is not a performance bottleneck in the network because it is not deployed on the key path. However, the SSL VPN gateway cannot provide full protection to the internal network.

Figure 3 Single-arm mode



SSL VPN access modes

Web access

In Web access mode, remote users use browsers to access Web resources allowed by an SSL VPN gateway through HTTPS. After login, a user can access any resources listed on the webpage. In Web access mode, all operations are performed on webpages.

The resources available for SSL VPN Web access users are Web servers only.

To implement Web access, you must configure a list of URLs on the SSL VPN gateway. A URL is the IP address or domain name of an internal Web server.

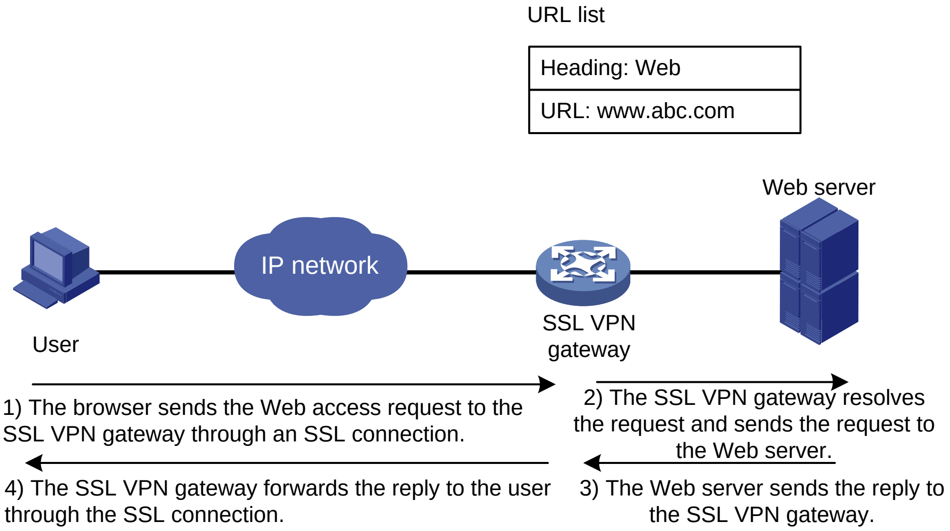
The Web access procedure is as follows:

1. A user uses a browser to log in to an SSL VPN gateway through HTTPS.
2. The SSL VPN gateway authenticates the user and authorizes the user to access the available URLs.

   The authorized URLs are displayed on the SSL VPN gateway webpage as URL links.
3. The user selects a URL to access on the SSL VPN gateway webpage. The browser sends the access request to the SSL VPN gateway through the SSL connection for HTTPS.
4. The SSL VPN gateway resolves the request and sends the request to the Web server through HTTP or HTTPS.
5. After receiving the reply from the Web server, the SSL VPN gateway forwards the reply to the user through the SSL connection for HTTPS.

Figure 4 illustrates the Web access process. The administrator configures a URL of www.nsfocus.com.cn on the SSL VPN gateway. Then, the SSL VPN user can access the internal Web server by accessing the URL on the SSL VPN gateway webpage.

Figure 4 Network diagram for Web access



URL list
Heading: Web
URL: www.abc.com
Web server
IP network
User
SSL VPN gateway
1) The browser sends the Web access request to the SSL VPN gateway through an SSL connection.
2) The SSL VPN gateway resolves the request and sends the request to the Web server.
4) The SSL VPN gateway forwards the reply to the user through the SSL connection.
3) The Web server sends the reply to the SSL VPN gateway.

TCP access

In TCP access mode, users access TCP applications on internal servers by accessing the applications' open ports. Supported applications include remote access services (such as Telnet), desktop sharing services, mail services, Notes services, and other TCP services that use fixed ports.

In TCP access mode, a user installs the TCP access client software on the SSL VPN client (the terminal device that the user uses). The client software uses an SSL connection to transmit the application layer data.

To implement TCP access, you must configure port forwarding instances on the SSL VPN gateway. A port forwarding instance maps a TCP service (identified by an IP address/domain name and port number) to an SSL VPN client's local IP address (or host name) and port number.

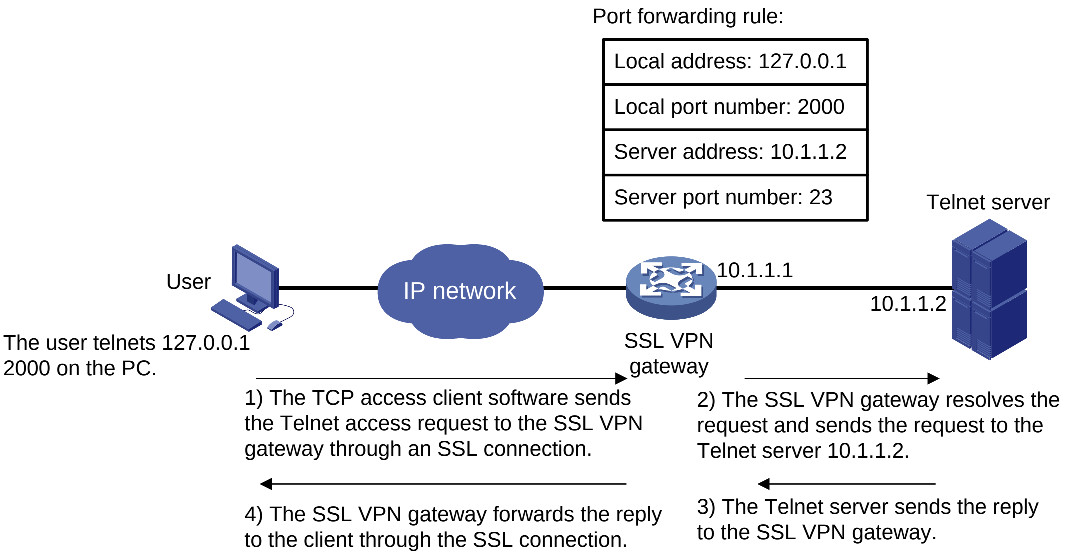
The TCP access procedure is as follows:

1. A user uses a browser to log in to an SSL VPN gateway through HTTPS.
2. The SSL VPN gateway authenticates the user and authorizes the user to access the Telnet service (port forwarding instance).
3. The user downloads the TCP access client software from the webpage of the SSL VPN gateway, and launches the software. The software opens the authorized local port in the port forwarding instance.
4. The user tries to access the local IP address and port number. The TCP access client software sends the access request to the SSL VPN gateway through an SSL connection.

5. The SSL VPN gateway resolves the request and sends the request to the Telnet server according to the port forwarding instance.
6. After receiving the reply from the Telnet server, the SSL VPN gateway forwards the reply to the user through the SSL connection.

As shown in Figure 5, the administrator creates a port forwarding instance for the Telnet service on the SSL VPN gateway. The rule maps the internal Telnet server address 10.1.1.2 and port number 23 to the SSL VPN client's local address 127.0.0.1 and local port number 2000. Then, the SSL VPN user can access the internal Telnet server by telneting the local address 127.0.0.1 and local port number 2000.

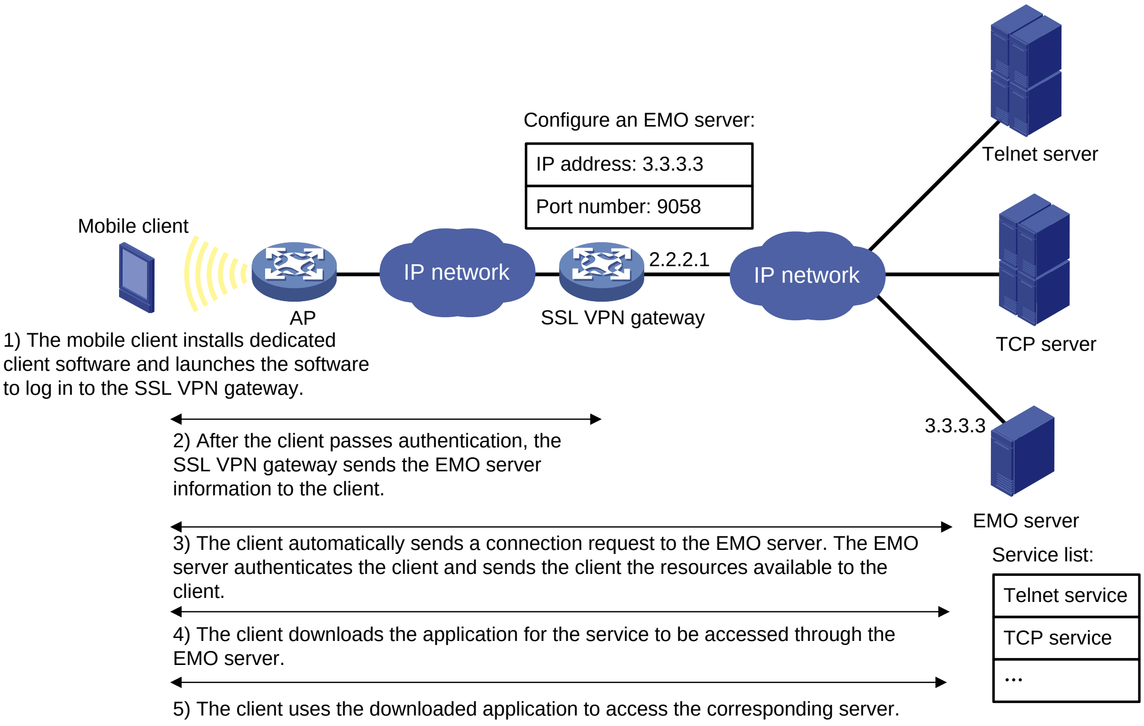
Figure 5 Network diagram for TCP access



Port forwarding rule:
Local address: 127.0.0.1
Local port number: 2000
Server address: 10.1.1.2
Server port number: 23
Telnet server
User
IP network
10.1.1.1
10.1.1.2
SSL VPN gateway
The user telnets 127.0.0.1 2000 on the PC.
1) The TCP access client software sends the Telnet access request to the SSL VPN gateway through an SSL connection.
2) The SSL VPN gateway resolves the request and sends the request to the Telnet server 10.1.1.2.
3) The Telnet server sends the reply to the SSL VPN gateway.
4) The SSL VPN gateway forwards the reply to the client through the SSL connection.

For mobile clients to use the TCP access mode, you do not need to configure port forwarding instances on the SSL VPN gateway. However, client software dedicated for mobile clients is required, and you must specify an Endpoint Mobile Office (EMO) server for mobile clients on the SSL VPN gateway. Mobile clients access internal resources through the EMO server. Figure 6 shows the access process.

Figure 6 Network diagram for mobile client access to internal servers



Configure an EMO server:
IP address: 3.3.3.3
Port number: 9058
Telnet server
Mobile client
2.2.2.1
IP network
IP network
AP
SSL VPN gateway
TCP server
1) The mobile client installs dedicated client software and launches the software to log in to the SSL VPN gateway.
3.3.3.3
2) After the client passes authentication, the SSL VPN gateway sends the EMO server information to the client.
EMO server
3) The client automatically sends a connection request to the EMO server. The EMO server authenticates the client and sends the client the resources available to the client.
Service list:
Telnet service
TCP service
...
4) The client downloads the application for the service to be accessed through the EMO server.
5) The client uses the downloaded application to access the corresponding server.

IP access

IP access implements secured IP communication between remote users and internal servers.

To access an internal server in IP access mode, a user must install dedicated IP access client software. The client software will install a virtual network interface card (VNIC) on the SSL VPN client.

To implement IP access, you must configure the following on the SSL VPN gateway:

- An SSL VPN AC interface.
- Routes to accessible IP resources. The routes will be issued to SSL VPN clients to instruct packet forwarding.

Figure 7 uses a ping operation to illustrate the IP access process. The administrator must first configure a route to the ping destination (server 10.1.1.2/24) on the SSL VPN gateway.

The access process is as follows:

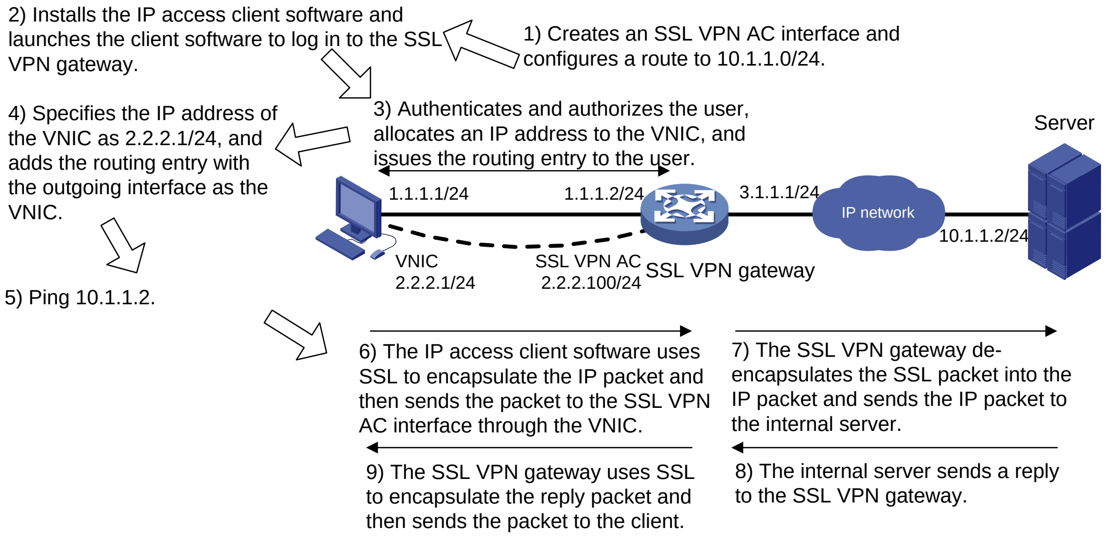
1. The user installs the IP access client software and launches the client software to log in to the SSL VPN gateway.
2. The SSL VPN gateway performs the following operations:
   a. Authenticates and authorizes the user.
   b. Allocates an IP address to the VNIC of the user.
   c. Issues the authorized IP access resources to the client.

      In this example, a route to server 10.1.1.2/24 is issued.
3. The client specifies the allocated IP address as the VNIC's address and adds the route to the local routing table, using the VNIC as output interface.
4. The user pings the server address.

   The ping request matches the route. Matching packets will be encapsulated by SSL.
5. The client uses SSL to encapsulate the ping request packet, and then sends the packet to the SSL VPN AC interface through the VNIC.

6. The SSL VPN gateway de-encapsulates the SSL packet into the IP packet and forwards the IP packet to the corresponding internal server.
7. The internal server sends a reply to the SSL VPN gateway.
8. The SSL VPN gateway uses SSL to encapsulate the reply packet and then sends the packet to the client through the SSL VPN AC interface.

Figure 7 Network diagram for IP access



2) Installs the IP access client software and launches the client software to log in to the SSL VPN gateway.
1) Creates an SSL VPN AC interface and configures a route to 10.1.1.0/24.
4) Specifies the IP address of the VNIC as 2.2.2.1/24, and adds the routing entry with the outgoing interface as the VNIC.
3) Authenticates and authorizes the user, allocates an IP address to the VNIC, and issues the routing entry to the user.

SSL VPN AC
2.2.2.100/24
SSL VPN gateway
5) Ping 10.1.1.2.
6) The IP access client software uses SSL to encapsulate the IP packet and then sends the packet to the SSL VPN AC interface through the VNIC.
7) The SSL VPN gateway de-encapsulates the SSL packet into the IP packet and sends the IP packet to the internal server.
9) The SSL VPN gateway uses SSL to encapsulate the reply packet and then sends the packet to the client.
8) The internal server sends a reply to the SSL VPN gateway.

SSL VPN user authentication

To access resources in an SSL VPN context, a user must first pass identity authentication to log in to the SSL VPN context. The authentication methods for an SSL VPN context include username/password authentication, certificate authentication, verification code authentication, SMS authentication, and custom authentication.

If custom authentication and SMS authentication are enabled at the same time, only custom authentication takes effect. You can enable username/password authentication, certificate authentication, or both in an SSL VPN context. Whether these authentication methods are required for logging in to the SSL VPN context depends on the configuration of the **authentication use** command. To use username/password authentication for users, you must also create accounts for the users in AAA. For more information, see "Configuring AAA."

You can also enable the verification code authentication, SMS authentication, and custom authentication in an SSL VPN context. These authentication methods are required for login authentication if they are configured.

Username/password authentication

The username/password authentication process is as follows:

1. The SSL VPN user enters the login username and password on the SSL VPN login page. The username and password are sent to the SSL VPN gateway.
2. The SSL VPN gateway sends the received username and password to AAA for authentication, authorization, and accounting, or to a custom authentication server for authentication and authorization.

Certification authentication

As shown in Figure 8, the certificate authentication process is as follows:

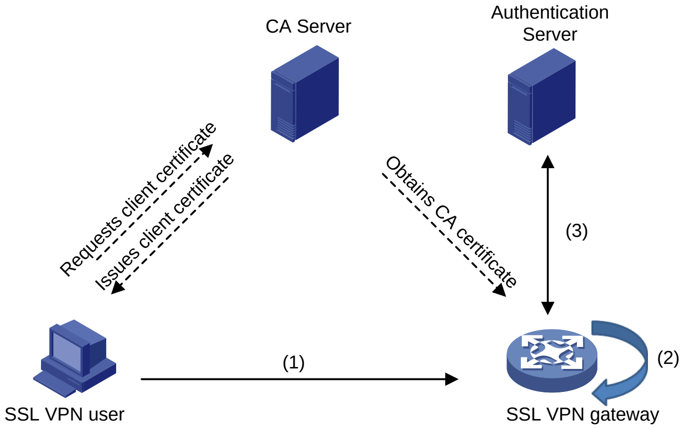
1. The SSL VPN user selects the certificate for login when prompted. The certificate is sent in an SSL connection request to the SSL VPN gateway.
2. The SSL VPN gateway verifies the validity of the user certificate.
   - If the certificate is verified as invalid, the gateway rejects the SSL connection request. The user cannot log in to the SSL VPN context.
   - If the certificate is verified as valid, the SSL connection is established and the gateway performs the next step.
3. The SSL VPN gateway checks for certificate revocation if CRL checking is enabled.
   - If the certificate is verified as not revoked, the SSL connection is established and the gateway performs the next step.
   - If the certificate is verified as revoked, the gateway rejects the SSL connection request. The user cannot log in to the SSL VPN context.

   For more inforamtion about CRL checking, see "Configuring PKI."
4. The SSL VPN gateway extracts the username from the certificate attribute (CN attribute by default). Then, the SSL VPN gateway sends the username to AAA for authorization and accounting, or to a custom authentication server for authorization.

NOTE:

To use certificate authentication, make sure the username extracted from the specified certificate attribute exists on the authentication server.

Figure 8 Certificate authentication process



Combined username/password authentication and certificate authentication

The authentication process of combined username/password authentication and certificate authentication is as follows:

1. The SSL VPN user selects the certificate for login when prompted. The certificate is sent in an SSL connection request to the SSL VPN gateway.
2. The SSL VPN gateway verifies the validity of the user certificate.
   - If the certificate is verified as invalid, the gateway rejects the SSL connection request. The user cannot log in to the SSL VPN context.
   - If the certificate is verified as valid, the SSL connection is established and the gateway performs the next step.
3. The SSL VPN gateway checks for certificate revocation if CRL checking is enabled.
   - If the certificate is verified as not revoked, the SSL connection is established and the gateway performs the next step.

    - If the certificate is verified as revoked, the gateway rejects the SSL connection request. The user cannot log in to the SSL VPN context.
4. The SSL VPN gateway extracts the username from the certificate and compares the extracted username with the username provided by the user:
    - The user passes identity authentication if the two usernames match. The SSL VPN gateway then sends the username and password to AAA for authentication, authorization and accounting, or to a custom authentication server for authentication and authorization.
    - The user fails the identity authentication if the two usernames do not match.

NOTE:

A user might enter the username and password when the user selects the certificate or after the SSL connection is established, depending on the access mode.

SMS authentication

After you enable SMS authentication, the device uses SMS verification codes to authenticate SSL VPN users. A user is allowed to log in to the SSL VPN gateway only when the user passes the SMS authentication.

The device supports the following types of SMS authentication:

- IMC SMS authentication.

  SMS authentication for SSL VPN users is performed by an IMC server. You must configure the IP address and port number for the IMC server in IMC SMS authentication view.
- SMS gateway authentication.

  SMS gateway authentication for SSL VPN users is performed by an SMS gateway. You must specify the SMS gateway, the verification code resend interval, and the verification code validity period in SMS gateway authentication view.

The two SMS authentication types cannot both be configured.

For SMS gateway authentication, one username can be bound to only one mobile number. When multiple users log in to the SSL VPN gateway by using the same username, the users must check the verification codes reception order. A user must submit the verification code received right for his own login attempt.

Custom authentication

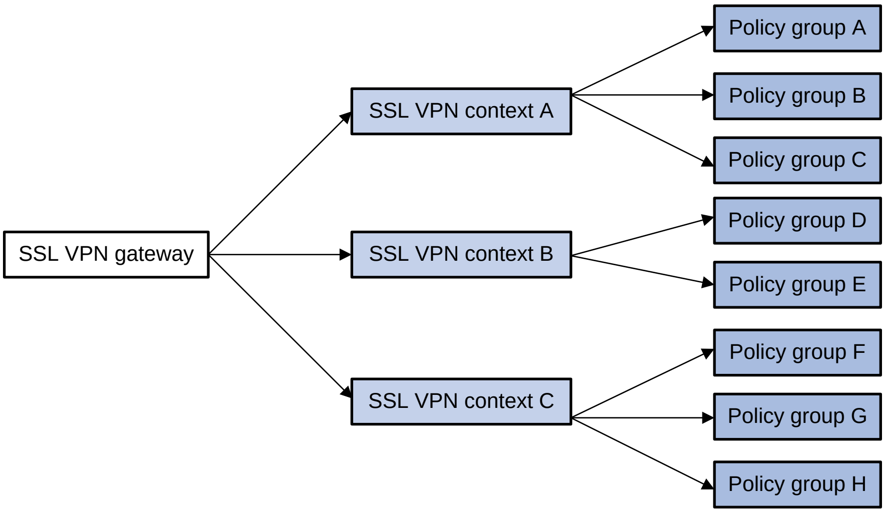
Custom authentication allows you to set up and configure a custom authentication server as needed. The device can use the custom authentication server for user authentication and authorization. The custom authentication server does not support accounting.

Resource access control

SSL VPN controls user access to resources on a per-user basis.

As shown in Figure 9, an SSL VPN gateway can be associated with multiple SSL VPN contexts. An SSL VPN context contains multiple policy groups. A policy group defines accessible Web resources, TCP resources, and IP resources.

Figure 9 SSL VPN resource access control



You can specify domain names or virtual host names for the SSL VPN contexts associated with an SSL VPN gateway. When a user logs in to the SSL VPN gateway, the SSL VPN gateway performs the following operations:

1. Uses the domain name or virtual host name that the user entered to determine the SSL VPN context to which the user belongs.
2. Uses the authentication and authorization methods of the ISP domain specified for the context to perform authentication and authorization for the user.
    - If the SSL VPN gateway authorizes the user to use a policy group, the user can access resources allowed by the policy group.
    - If the SSL VPN gateway does not authorize the user to use a policy group, the user can access resources allowed by the default policy group.

NOTE:

The SSL VPN gateway uses an AAA server or a custom authentication server to perform user authentication and authorization. SSL VPN supports AAA protocols RADIUS and LDAP. RADIUS is most often used.

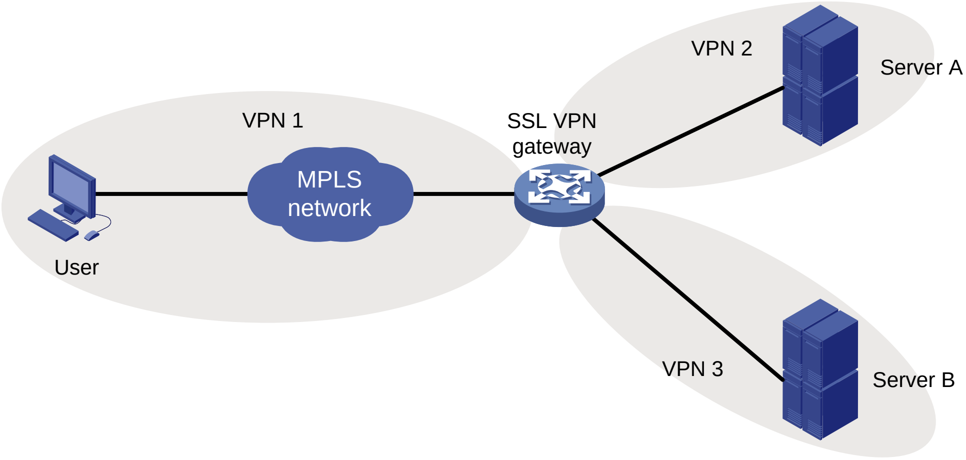
VRF-aware SSL VPN

VRF-aware SSL VPN provides the following functionalities:

- **VRF-aware SSL VPN context**—You associate different SSL VPN contexts with different VRF instances (VPN instances) on the SSL VPN gateway. Users in an SSL VPN context can access only the resources in the VPN instance associated with the SSL VPN context. VRF-aware SSL VPN contexts also allow server addresses to overlap.
- **VRF-aware SSL VPN gateway**—You specify the VPN instance to which the SSL VPN gateway belongs. Only users in the same VPN can access the SSL VPN gateway. The VRF-aware SSL VPN gateway prevents the internal server resources from leaking into the public network or other VPNs.

For more information about VPN instances, see VPN instance configuration in *VPN Instance Configuration Guide*.

Figure 10 VRF-aware SSL VPN



Restrictions: Licensing requirements for SSL VPN

The following compatibility matrixes show the maximum number of online user accounts supported by default:

Models	Default max online user accounts
NFNX5-HD6480, NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB1780, NFNX3-HDB3080, NFNX3-HDB1180, NFNX3-HDB1480, NFNX3-HDB680, NFNX3-HDB1080	125

You can purchase and install a license to increase the number of supported online users. For more information about licenses, see license management in *Fundamentals Configuration Guide*.

In an IRF network, the maximum number of online users supported by an IRF fabric is calculated as follows: Maximum online users supported by the IRF fabric = Sum of the maximum online users permitted by the license of each member device + maximum online users supported by default.

After a member device becomes faulty, its license can still take effect on the IRF fabric for 60 days. As a best practice, purchase and install a license for each IRF member device.

In other HA networks, a license for a member device takes effect only on the member device itself. For other member devices to use SSL VPN after the licensed member device becomes faulty, you must purchase and install a license for each member device.

Restrictions and guidelines: SSL VPN configuration

The SSL VPN gateway generates only one session for a user who accesses both Web and IP resources in the following method:

1. First, the user accesses the SSL VPN gateway through a Web browser.
2. Then, the user downloads the IP access client through the Web page and launches the IP access client.

Once the user exits the Web browser or IP access client, the session is terminated and the user can access neither Web nor IP access resources.

You can specify ACLs for user access filtering in an SSL VPN policy group. Rules in the specified ACLs do not take effect if they contain VPN settings.

In a browser-SSL VPN gateway-server network, the gateway cannot process the redirect URL carried with a reply from the internal server because the gateway cannot edit request or reply packets.

SSL VPN tasks at a glance

To configure SSL VPN, perform the following tasks on the SSL VPN gateway:

1. Configuring an SSL VPN gateway
2. Configuring an SSL VPN context
3. Configuring SSL VPN user authentication, authorization, and accounting
   a. Configuring user authentication in an SSL VPN context
   b. Configuring the SSL VPN user authentication server

      A custom authentication server must be configured for custom authentication.
4. Configuring SSL VPN resource access control as needed
   - Configuring a URI ACL
   - Configuring the Web access service
   - Configuring the TCP access service
   - Configuring the IP access service
   - Configuring SSL VPN access for mobile clients
   - (Optional.) Configuring shortcuts
   - (Optional.) Configuring redirect resources
   - (Optional.) Configuring HTTP redirection
   - (Optional.) Configuring the default policy group for an SSL VPN context
5. (Optional.) Configuring VRF-aware SSL VPN
   - Associating an SSL VPN context with a VPN instance
   - Specifying a VPN instance for an SSL VPN gateway
6. (Optional.) Configuring SSL VPN user control
   - Configuring online SSL VPN user control
   - Configuring SSL VPN session rate limit
   - Configuring SSL VPN cracking prevention
   - Configuring SSL VPN SSO login
   - Configuring WeChat Work authentication
7. (Optional.) Customizing SSL VPN webpages
   - Customizing SSL VPN webpage elements
   - Specifying an SSL VPN webpage template
8. (Optional.) Enabling SSL VPN logging

Prerequisites for SSL VPN

Before you configure the SSL VPN gateway, complete the following tasks:

- Configure PKI and obtain a digital certificate for the SSL VPN gateway (see "Configuring PKI").

- Configure an SSL server policy to be used by the SSL VPN gateway (see "Configuring SSL").

Configuring an SSL VPN gateway

Restrictions and guidelines

An SSL VPN gateway that uses the default IPv4 or IPv6 address must use a port number that is different from the HTTPS service port number.

If the settings of the SSL server policy applied to an SSL VPN gateway are changed, you must disable and then enable the SSL VPN gateway to use the modified policy.

The IP address and port number of an SSL VPN gateway cannot both be the same as those of the HTTPS server on the device. Otherwise, you can access only the SSL VPN Web interface but cannot access the device management Web interface by using those IP address and port number.

An SSL VPN gateway can use an IPv4 address, an IPv6 address, but not both. If you configure both IPv4 and IPv6 addresses, the most recent configuration takes effect.

When a remote user uses a browser to establish an HTTPS connection with the SSL VPN gateway, the gateway supports providing two types of local certificates to the peer. These local certificates include self-signed certificates signed by the device and local certificates signed by a CA for the SSL VPN gateway. This enables remote users to perform digital certificate-based authentication on the SSL VPN gateway. The remote user can choose a type of certificate according to security requirements and configuration complexity as follows:

- **Self-signed certificate**—Using this type of certificate is easy in configuration but has low insecure. You do not need to associate an SSL server policy with the SSL VPN gateway and the default SSL settings are used. A self-signed certificate is not assigned by a CA and therefore not trusted by the browser of the remote user, so the browser will prompt a security risk. If the remote user does not have high security requirements and can accept the security risk, the remote user can ignore the prompt and continue browsing the webpage.
- **Local certificate signed by a CA for the SSL VPN gateway**—Using this type of certificate is complex in configuration but has high security. To use this type of certificate, you must perform the following tasks:
  - Obtain a CA certificate and request a local certificate from the CA.
  - Specify an SSL server policy for the SSL VPN gateway.

For more information about digital certificates and SSL server policies, see "Configuring PKI" and "Configuring SSL", respectively.

To improve packet transmission security, a server policy supports only TLS 1.1 or higher for SSL negotiation by default. To log in to the iNode client, make sure the iNode client supports TLS 1.1 or higher. To resolve this issue, you can upgrade the iNode to the latest version.

Procedure

1. Enter system view.

   system-view

2. Create an SSL VPN gateway and enter its view.

   sslvpn gateway *gateway-name*

3. Configure an IPv4 address and a port number for the SSL VPN gateway.

   ip address *ip-address* [**port** *port-number*]

   By default, the SSL VPN gateway uses IPv4 address 0.0.0.0 and port number 443.

   If you configure the **ip address** command without specifying a port number, the default port number (443) is used.

4. Configure an IPv6 address and a port number for the SSL VPN gateway.

   ipv6 address *ipv6-address* [**port** *port-number*]

By default, no IPv6 address or port number is configured for the SSL VPN gateway.

If you configure the **ipv6 address** command without specifying a port number, the default port number (443) is used.

5. Apply an SSL server policy to the SSL VPN gateway.

   ssl server-policy *policy-name*

   By default, an SSL VPN gateway uses the SSL server policy of its self-signed certificate.

6. Enable the SSL VPN gateway.

   service enable

   By default, the SSL VPN gateway is disabled.

Configuring an SSL VPN context

About this task

An SSL VPN context manages user sessions and resources available to users.

Restrictions and guidelines

When you associate an SSL VPN context with an SSL VPN gateway, follow these guidelines:

- Make sure the context has a domain name or virtual host name different than any existing contexts associated with the SSL VPN gateway.
- If you do not specify a domain name or virtual host name for the context, you cannot associate other SSL VPN contexts with the SSL VPN gateway.
- If you specify a virtual host name, deploy a DNS server in the network to resolve the virtual host name to the SSL VPN gateway's IP address.
- Typically, a virtual host name for the context cannot contain underscores (_). For SSL VPN Web access, if a virtual host name contains underscores (_), the virtual host name will be added as part of domian names. When you specify an SSL VPN gateway and a virtual host for the context and the name of the virtual host contains underscores (_), the IE browser cannot save cookies and will not carry cookies in requests, which will cause an SSL VPN login failure.

You can associate an SSL VPN context with a maximum of 10 SSL VPN gateways.

Procedure

1. Enter system view.

   system-view

2. Create an SSL VPN context and enter its view.

   sslvpn context *context-name*

3. Associate the context with an SSL VPN gateway.

   gateway *gateway-name* [**domain** *domain-name* | **virtual-host** *virtual-host-name*]

   By default, the context is not associated with an SSL VPN gateway.

4. Specify an ISP domain for AAA of SSL VPN users in the context.

   aaa domain *domain-name*

   By default, the default ISP domain is used for AAA of SSL VPN users in an SSL VPN context.

   An SSL VPN username cannot carry ISP domain information. After this command is executed, the SSL VPN gateway uses the specified domain for AAA of SSL VPN users in the context.

5. Enable the context.

   service enable

   By default, the context is disabled.

6. (Optional.) Set the maximum number of sessions (online users) for the context.

   max-users *max-number*

   By default, an SSL VPN context supports a maximum of 1048575 sessions (online users).

7. (Optional.) Set the idle timeout timer for SSL VPN sessions.

   timeout idle *minutes*

   By default, the idle timeout timer for SSL VPN sessions is 30 minutes.

8. (Optional.) Set the idle-cut traffic threshold for SSL VPN sessions.

   idle-cut traffic-threshold

   By default, the SSL VPN session idle-cut traffic threshold is 0 bytes. An SSL VPN session will be disconnected if no traffic is transmitted within the session idle timeout time specified by the **timeout idle** command.

9. (Optional.) Apply an SSL client policy to the SSL VPN context.

   ssl client-policy *policy-name*

   The default SSL client policy for SSL VPN is used. This policy supports the **dhe_rsa_aes_128_cbc_sha**, **dhe_rsa_aes_256_cbc_sha**, **rsa_3des_ede_cbc_sha**, **rsa_aes_128_cbc_sha**, and **rsa_aes_256_cbc_sha** cipher suites.

   The SSL VPN gateway will use the settings in the specified SSL client policy to connect to HTTPS servers.

10. (Optional.) Enable URL masking globally.

    url-masking enable

    URL masking is disabled by default.

    After URL masking is enabled, the URLs of the Web access resources configured in the SSL VPN context are converted into coded strings.

Configuring user authentication in an SSL VPN context

Restrictions and guidelines for user authentication configuration in an SSL VPN context

How certificate authentication works depends on the configuration of the **client-verify** command in SSL server policy view. You can use the command to enable mandatory or optional SSL client authentication. Mandatory certificate authentication is supported only for Web users and IP access users. For TCP access users and mobile client users to access the SSL VPN gateway successfully, optional SSL client authentication must be used.

User authentication tasks at a glance

To configure user authentication in an SSL VPN context, perform the following tasks:

1. Specifying the authentication methods required for user login
2. Configuring basic authentication methods
   - Configuring username/password authentication
   - Configuring certificate authentication
3. (Optional.) Configuring verification code authentication
4. (Optional.) Configuring IMC SMS authentication
5. (Optional.) Configuring SMS gateway authentication

6. (Optional.) Configuring password modification for users

Specifying the authentication methods required for user login

About this task

You can enable username/password authentication, certificate authentication, or both in an SSL VPN context. Whether these authentication methods are required for logging in to the SSL VPN context depend on the configuration of the **authentication use all** command:

- If the **authentication use all** command is configured, a user must pass all the enabled authentication methods for login.
- If the **authentication use any-one** command is configured, a user can log in after passing any enabled authentication method.

Procedure

1. Enter system view.

   system-view

2. Enter SSL VPN context view.

   sslvpn context *context-name*

3. Specify the authentication methods required for user login.

   authentication use { **all** | **any-one** }

   By default, a user must pass all the enabled authentication methods to log in to an SSL VPN context.

Configuring username/password authentication

1. Enter system view.

   system-view

2. Enter SSL VPN context view.

   sslvpn context *context-name*

3. Enable username/password authentication.

   password-authentication enable

   Username/password authentication is enabled by default.

Configuring certificate authentication

1. Enter system view.

   system-view

2. Enter SSL VPN context view.

   sslvpn context *context-name*

3. Enable certificate authentication.

   certificate-authentication enable

   Certificate authentication is disabled by default.

4. Specify the certificate attribute as the SSL VPN username.

   certificate username-attribute { **cn** | **email-prefix** | **oid** *extern-id* }

   By default, the device uses the value of the CN attribute in the subject of the certificate as the SSL VPN username.

Configuring verification code authentication

1. Enter system view.

   system-view

2. Enter SSL VPN context view.

   sslvpn context *context-name*

3. Enable verification code authentication.

   verify-code enable

   By default, verification code authentication is enabled.

Configuring IMC SMS authentication

1. Enter system view.

   system-view

2. Enter SSL VPN context view.

   sslvpn context *context-name*

3. Enable IMC SMS authentication.

   sms-auth type imc

   By default, IMC SMS authentication is disabled.

4. Create and enter IMC SMS authentication view.

   sms-auth imc

5. Specify an IMC server.

   server-address *ip-address* **port** *port-number* [**vpn-instance** *vpn-instance-name*]

   By default, no IMC server is specified.

Configuring SMS gateway authentication

Prerequisites

Complete the SMS gateway configuration. For information about configuring an SMS gateway, see "Configuring SMS."

Procedure

1. Enter system view.

   system-view

2. Enter SSL VPN context view.

   sslvpn context *context-name*

3. Enter SSL VPN user view.

   user *username*

4. Specify the mobile number for the SSL VPN user to receive SMS messages.

   mobile-num *number*

   By default, no mobile number is specified for receiving SMS messages.

5. Return to SSL VPN context view.

   quit

6. Enable SMS gateway authentication.

sms-auth type sms-gw

By default, SMS gateway authentication is disabled.

7. Create and enter SMS gateway authentication view.

   sms-auth sms-gw

   By default, the SMS gateway authentication view does not exist.

8. Specify an SMS gateway.

   gateway *sms-gateway-name*

   By default, no SMS gateway is specified.

9. Enable mobile number binding.

   mobile-num-binding enable

   By default, mobile number binding is disabled.

10. Set the verification code resend interval.

    verification-code send-interval *seconds*

    By default, the verification code resend interval is 60 seconds.

11. Set the verification code validity period.

    verification-code validity *minutes*

    By default, the verification code validity period is one minute.

12. Specify the mobile country code.

    country-code *country-code*

    By default, the mobile country code is 86.

13. Configure the SMS content template.

    sms-content *string*

    By default, the SMS content template is **Hello, $$USER$$, the verification code is $$VERIFYCODE$$, and its validity period is $$VALIDTIME$$ in minutes.**.

Configuring password modification for users

About this task

Password modification allows SSL VPN users to modify login passwords on the personal settings page after logging in to the SSL VPN Web interface. This feature is available only for IMC authentication users.

If you disable this feature, the modify password function will be hidden on the SSL VPN Web interface, so users cannot modify their passwords.

Procedure

1. Enter system view.

   system-view

2. Enter SSL VPN context view.

   sslvpn context *context-name*

3. Enable SSL VPN users in the SSL VPN context to modify passwords.

   password-changing enable

   By default, SSL VPN users in the SSL VPN context are allowed to modify passwords.

4. Enter SSL VPN user view.

   user *username*

5. (Optional.) Enable password modification for the SSL VPN user.

```
password-changing enable
```

By default, an SSL VPN user is allowed to modify the password.

6. Specify an IMC server for password modification.

   ```
   self-service imc address ip-address port port-number [ vpn-instance vpn-instance-name ]
   ```

   By default, no IMC server is specified for password modification.

   Execute this command only when IMC authentication users need to modify the SSL VPN login passwords.

Configuring the SSL VPN user authentication server

Specifying the SSL VPN user authentication server type

About this task

The SSL VPN user authentication supports the following types of servers:

- **AAA authentication server**—The device uses an AAA server for user authentication, authorization, and accounting. For more information about AAA, see "Configuring AAA."
- **Custom authentication server**—You can set up and configure a custom authentication server as needed. The device can use the custom authentication server for user authentication and authorization. The custom authentication server does not support accounting. For more information about configuring the custom authentication server, see "Configuring the custom authentication server."

Procedure

1. Enter system view.

   ```
   system-view
   ```

2. Enter SSL VPN context view.

   ```
   sslvpn context context-name
   ```

3. Specify the authentication server type.

   ```
   authentication server-type { aaa | custom }
   ```

   By default, the SSL VPN authentication server is an AAA server.

Configuring the custom authentication server

About this task

To use a custom authentication server for user authentication and authorization, configure the following settings:

- URL of the custom authentication server.

  The SSL VPN gateway uses HTTP to send authentication requests to the specified URL.
- Custom authentication timeout.

  After sending an HTTP request to the custom authentication server, the SSL VPN gateway waits for reponses from the server. If the gateway receives no response within the authentication timeout, it returns an authentication failure message to the SSL VPN client.
- HTTP request settings for custom authentication.

The SSL VPN gateway constructs an HTTP request based on the authentication request settings, including HTTP request method, request header fields, and request template.

- HTTP response settings for custom authentication.

  The SSL VPN gateway parses an HTTP response based on the authentication response settings. The settings include HTTP response format, authentication success value in the response, field names in the response, and response templates for the custom-format HTTP response.

Procedure

1. Enter system view.

   system-view

2. Enter SSL VPN context view.

   sslvpn context *context-name*

3. Configure the URL of the custom authentication server.

   custom-authentication url *url*

   By default, no custom authentication server URL is configured.

4. Specify the custom authentication timeout.

   custom-authentication timeout *seconds*

   By default, the custom authentication timeout is 15 seconds.

5. Configure settings for a custom authentication request:

   a. Configure the HTTP request method.

      custom-authentication request-method { **get** | **post** }

      By default, the HTTP request method is GET.

   b. Configure HTTP request header fields.

      custom-authentication request-header-field *field-name* **value** *value*

      By default, a custom authentication request header includes the following fields:

      – **Content-type:application/x-www-form-urlencoded**.

      – **User-Agent:nodejs 4.1**.

      – **Accept:text/html,application/xhtml+xml,application/xml;q=0.9,image/webp,*/*;q**.

   c. Configure the HTTP request template.

      custom-authentication request-template *template*

      By default, no request template is configured.

6. Configure settings for a custom authentication response:

   a. Specify the HTTP response format.

      custom-authentication response-format { **custom** | **json** | **xml** }

      By default, the HTTP response format is JSON.

   b. Configure the authentication success value in the HTTP response.

      custom-authentication response-success-value *success-value*

      By default, no authentication success value is configured for the HTTP response.

   c. Configure field names in the HTTP response.

      custom-authentication response-field { **group** *group* | **message** *message* | **result** *result* }

      By default, no HTTP response field names are configured.

      You must configure HTTP response field names if the HTTP response format is JSON or XML.

   d. Configure response templates for the fields in the custom-format HTTP response.

custom-authentication response-custom-template { **group** | **message** | **result** } *template*

By default, no response templates are configured.

The response templates are required when the HTTP response format is custom.

Configuring a URI ACL

About this task

A URI ACL is a set of rules that permit or deny access to resources. You can use URI ACLs for fine-grained IP, TCP, and Web access filtering of SSL VPN users.

You can add multiple rules to a URI ACL. The device matches a packet against the rules in ascending order of rule ID. The match process stops once a matching rule is found.

You can create multiple URI ACLs in an SSL VPN context.

A URI ACL can filter SSL VPN users' HTTP, HTTPS, TCP, UDP, ICMP, and IP traffic based on the following fields:

- Protocol type.
- IP address.
- Host name.
- Port number.
- URL.

Procedure

1. Enter system view.

   system-view

2. Enter SSL VPN context view.

   sslvpn context *context-name*

3. Create a URI ACL and enter its view.

   uri-acl *uri-acl-name*

4. Configure a rule in the URI ACL.

   rule [*rule-id*] { **deny** | **permit** } **uri** *uri-pattern-string*

   By default, no rules are configured in a URI ACL.

Configuring the Web access service

To allow remote users to access internal resources in Web access mode, you must configure Web access resources and associate the resources with an SSL VPN policy group.

Restrictions and guidelines

A webpage compatibility error might occur for Web access. As a best practice, use IP access.

Web access service tasks at a glance

To configure the Web access service, perform the following tasks:

1. Configuring a URL list
2. Configuring an SSL VPN policy group for Web access

3. (Optional.) Configuring a file policy

Configuring a URL list

About this task

A URL list is a list of URL items that define the accessible Web resources behind the SSL VPN gateway. Each URL item corresponds to an internal Web resource.

The SSL VPN gateway rewrites the resource URL returned from the internal server before sending the URL to the requesting user. The URL mapping type determines how the gateway rewrites the URL.

The following example describes how URL mapping works when the user accesses internal resources at URL **http://www.server.com:8080**. The SSL VPN gateway name is **gw**, domain name is **https://www.gateway.com:4430**, and IP address is **1.1.1.1**.

- **Normal rewriting**—This is the default mapping method. The resource URL returned to the client will be rewritten to **https://www.gateway.com:4430/_proxy2/http/8080/www.server.com**.
- **Domain mapping**—The resource URL returned to the client will be rewritten to **https://***mapped domain name***:4430**, where *mapped domain name* is the user-defined domain name.
- **Port mapping**—You can specify a gateway name with or without a virtual host name for port mapping. For example:
    - If you specify **gw2** as the gateway name and do not specify a virtual host name, the resource URL will be rewritten to **https://2.2.2.2:4430**, where 2.2.2.2 and 4430 are the IP address and port number of SSL VPN gateway **gw2**.
    - If you specify **gw** as the gateway name and **vhosta** as the virtual host name, the resource URL will be rewritten to https://vhosta:4430.

Restrictions and guidelines

Resource URL rewriting is available only for resource access responses that contain HTML, XML, CSS, or JavaScript files.

Normal rewriting might cause problems such as missed URL rewriting and rewriting errors, resulting in SSL VPN clients not being able to access the internal resources. Use domain mapping or URL mapping as a best practice.

Procedure

1. Enter system view.

   system-view

2. Enter SSL VPN context view.

   sslvpn context *context-name*

3. Create a URL item and enter its view.

   url-item *name*

4. Specify the resource URL in the URL item.

   url *url*

   By default, no resource URL is specified in a URL item.

   If you do not specify a protocol type in the resource URL, the default protocol (HTTP) is used.

5. (Optional.) Enable URL masking.

   url-masking enable

   By default, URL masking is disabled.

   After URL masking is enabled, the Web resource URL for the URL item is converted into a coded string.

6. (Optional.) Specify a URI ACL in the URL item.

   resources uri-acl *uri-acl-name*

   By default, no URI ACL is specified.

7. (Optional.) Configure the URL mapping method.

   url-mapping { **domain-mapping** *domain-name* | **port-mapping gateway** *gateway-name* [**virtual-host** *virtual-host-name*] } [**rewrite-enable**]

   By default, the normal rewriting method is used.

8. Return to SSL VPN context view.

   quit

9. Create a URL list and enter its view.

   url-list *name*

10. (Optional.) Configure a heading for the URL list.

    heading *string*

    By default, the URL list heading is **Web**.

11. Add the URL item to the URL list.

    resources url-item *name*

    By default, a URL list does not contain any URL items.

Configuring an SSL VPN policy group for Web access

About this task

To configure an SSL VPN policy group for Web access, associate a URL list with the policy group. After the authentication server authorizes a user to use a policy group, the user can access the Web resources provided by the URL list associated with the policy group.

In a policy group, you can specify an advanced ACL and a URI ACL to filter users' Web access requests.

The advanced ACL supports filtering Web access requests by destination IP address and destination port number. The URI ACL supports filtering Web access requests by protocol type, destination address, domain name, port number, and URL.

The SSL VPN gateway uses the following procedure to determine whether to forward a Web access request:

1. Matches the request against the authorized URL list.
   - If the request matches a URL item in the list, the gateway forwards the request.
   - If the request does not match any URL items in the list, the gateway proceeds to the next step.
2. Matches the request against rules in the URI ACL:
   - If the request matches a permit rule, the gateway forwards the request.
   - If the request matches a deny rule, the gateway drops the request.
   - If the request does not match any rules in the URI ACL or if no URI ACL is available, the gateway proceeds to the next step.
3. Matches the request against rules in the advanced ACL:
   - If the request matches a permit rule, the gateway forwards the request.
   - If the request matches a deny rule, the gateway drops the request.
   - If the request does not match any rules in the advanced ACL or if no advanced ACL is available, the gateway drops the request.

Procedure

1. Enter system view.

   system-view

2. Enter SSL VPN context view.

   sslvpn context *context-name*

3. Create an SSL VPN policy group and enter SSL VPN policy group view.

   policy-group *group-name*

4. Associate a URL list with the policy group.

   resources url-list *url-list-name*

   By default, no URL list associated with a policy group.

5. (Optional.) Specify the ACLs for Web access filtering:
   - Specify an advanced ACL for Web access filtering.

     filter web-access [**ipv6**] **acl** *advanced-acl-number*
   - Specify a URI ACL for Web access filtering.

     filter web-access uri-acl *uri-acl-name*

   By default, users can access only the Web resources authorized to them through the URL list.

Configuring a file policy

About this task

A file policy enables the SSL VPN gateway to rewrite Web page files before forwarding them to requesting Web access users.

A file policy contains the following settings:

- A URL that identifies the path of the file to which the file policy is applied.
- One or more rewrite rules.

  A rewrite rule defines the old file content to be rewritten and the new content used to replace the old content.
- (Optional.) The file type that the file is changed to after being rewritten by the file policy.

Procedure

1. Enter system view.

   system-view

2. Enter SSL VPN context view.

   sslvpn context *context-name*

3. Create a file policy and enter its view.

   file-policy *policy-name*

   By default, no file policies exist.

4. Specify the URL of the file to be rewritten.

   url *url*

   By default, no file URL is specified in a file policy.

5. Specify the file type that a file is changed to after being rewritten by the file policy.

   content-type { **css** | **html** | **javascript** | **other** }

   By default, a file policy rewrites a file in an HTTP response to the file type indicated by the content-type field in the HTTP response.

6. Create a rewrite rule and enter its view.

rewrite-rule *rule-name*

7. Specify the old content to be rewritten.

   old-content *string*

   By default, the old content to be rewritten is not specified.

8. Specify the new content used to replace the old content.

   new-content *string*

   By default, the new content used to replace the old content is not specified.

Configuring the TCP access service

To allow remote users to access internal resources in TCP access mode, you must configure TCP access resources and associate the resources with an SSL VPN policy group.

TCP access service tasks at a glance

To configure the TCP access service, perform the following tasks:

1. Configuring a port forwarding list
2. Configuring an SSL VPN policy group for TCP access

Configuring a port forwarding list

About this task

A port forwarding list is a list of port forwarding items. Each port forwarding item contains a port forwarding instance.

A port forwarding instance maps a TCP service (such as Telnet, SSH, or POP3) hosted on an internal server to a local address and port number on the SSL VPN client. Remote users can access the TCP service though the local address and port number.

The port forwarding instance is displayed together with the port forwarding item name on the SSL VPN Web page. If you configure a resource link for the port forwarding item, the port forwarding item name will be displayed as a link on the SSL VPN Web page. You can click the link to access the resource directly.

Procedure

1. Enter system view.

   system-view

2. Enter SSL VPN context view.

   sslvpn context *context-name*

3. Create a port forwarding item and enter its view.

   port-forward-item *item-name*

4. Configure a port forwarding instance for the port forwarding item.

   local-port *local-port-number* **local-name** *local-name* **remote-server** *remote-server* **remote-port** *remote-port-number* [**description** *text*]

5. (Optional.) Configure a resource link for the port forwarding item.

   execution *script*

6. Return to SSL VPN context view.

   quit

7. Create a port forwarding list and enter its view.

```
port-forward port-forward-name
```

8. Assign the port forwarding item to the port forwarding list.

   ```
   resources port-forward-item item-name
   ```

   By default, a port forwarding list does not contain port forwarding items.

Configuring an SSL VPN policy group for TCP access

About this task

To configure an SSL VPN policy group for TCP access, associate a port forwarding list with the policy group. After the authentication server authorizes a user to use a policy group, the user can access the TCP services provided by the port forwarding list associated with the policy group.

In a policy group, you can specify an advanced ACL and a URI ACL to filter users' TCP access requests.

The advanced ACL supports filtering TCP access requests by destination IP address and destination port number. The URI ACL supports filtering TCP access requests by protocol type, destination address, domain name, port number, and URL.

For PC users, the ACLs configured for TCP access filtering do not take effect. They can access only the TCP resources authorized to them through the TCP port forwarding list.

For mobile client users, the SSL VPN gateway uses the following procedure to determine whether to forward a TCP access request:

1. Matches the request against the authorized port forwarding list.
   - If the request matches a port forwarding item in the list, the gateway forwards the request.
   - If the request does not match any port forwarding items in the list, the gateway proceeds to the next step.
2. Matches the request against the rules in the URI ACL:
   - If the request matches a permit rule, the gateway forwards the request.
   - If the request matches a deny rule, the gateway drops the request.
   - If the request does not match any rules in the URI ACL or if no URI ACL is available, the gateway proceeds to the next step.
3. Matches the request against the rules in the advanced ACL:
   - If the request matches a permit rule, the gateway forwards the request.
   - If the request matches a deny rule, the gateway drops the request.
   - If the request does not match any rules in the advanced ACL or if no advanced ACL is available, the gateway drops the request.

Procedure

1. Enter system view.

   ```
   system-view
   ```

2. Enter SSL VPN context view.

   ```
   sslvpn context context-name
   ```

3. Create an SSL VPN policy group and enter SSL VPN policy group view.

   ```
   policy-group group-name
   ```

4. Associate a port forwarding list with the policy group.

   ```
   resources port-forward port-forward-name
   ```

   By default, no port forwarding list is associated with a policy group.

5. (Optional.) Specify the ACLs for TCP access filtering:

- Specify an advanced ACL for TCP access filtering.

  filter tcp-access [**ipv6**] **acl** *advanced-acl-number*

- Specify a URI ACL for TCP access filtering.

  filter tcp-access uri-acl *uri-acl-name*

By default, users can access only the TCP resources authorized to them through the TCP port forwarding list.

Configuring the IP access service

To allow remote users to access internal resources in IP access mode, you must configure IP access resources and associate the resources with an SSL VPN policy group.

Restrictions and guidelines for IP access service configuration

To ensure correct forwarding of reply packets to an SSL VPN client, configure static routes from the internal servers to the network segment where the client's VNIC resides.

IP access service tasks at a glance

To configure the IP access service, perform the following tasks:

1. Configuring an SSL VPN AC interface for IP access
2. Creating an address pool for IP access users
3. Configuring IP access parameters in an SSL VPN context
4. Configuring an SSL VPN policy group for IP access
5. (Optional.) Binding IP addresses to an SSL VPN user

Configuring an SSL VPN AC interface for IP access

Configuring an SSL VPN AC interface

1. Enter system view.

   system-view

2. Create an SSL VPN AC interface and enter its view.

   interface sslvpn-ac *interface-number*

3. Configure an IP address for the interface.

   ip address *ip-address* { *mask* | *mask-length* }

   By default, no IP address is configured for an AC interface.

4. (Optional.) Set the expected bandwidth for the interface.

   bandwidth *bandwidth-value*

   The expected bandwidth is 64 kbps by default.

   The expected bandwidth is an informational parameter used only by higher-layer protocols for calculation. You cannot adjust the actual bandwidth of an interface by using this command.

5. (Optional.) Configure the description of the interface.

   description *text*

   The default interface description is *interface name* **Interface**. For example, **SSLVPN-AC1000 Interface**.

6. (Optional.) Set the MTU of the interface.

   mtu *size*

   The default MTU is 1500 bytes.

7. Bring up the interface.

   undo shutdown

   By default, an SSL VPN AC interface is up.

Restoring the default settings for the SSL VPN AC interface

> **IMPORTANT:**
>
> Restoring the default interface settings might interrupt ongoing network services. Make sure you are fully aware of the impact of this operation when you perform it on a live network.

To restore the default settings for the SSL VPN AC interface:

1. Enter system view.

   system-view

2. Enter SSL VPN AC interface view.

   interface sslvpn-ac *interface-number*

3. Restore the default settings for the SSL VPN AC interface.

   default

   This command might fail to restore the default settings for some commands for reasons such as command dependencies and system restrictions. You can use the **display this** command in interface view to check for these commands, and use their **undo** forms or follow the command reference to restore their respective default settings. If your restoration attempt still fails, follow the error message instructions to resolve the problem.

Creating an address pool for IP access users

About this task

Create an IP address pool for the SSL VPN gateway to assign IP addresses to the VNICs used by IP access users.

Restrictions and guidelines

To prevent IP address conflicts, make sure the IP addresses in the address pool meet the following requirements:

- Not in the same network segment as the physical NICs on the clients.
- Exclude IP addresses of the interfaces on the device that acts the SSL VPN gateway.
- Not in the same network segment as the internal addresses to be accessed.

Procedure

1. Enter system view.

   system-view

2. Create an address pool.

   sslvpn ip address-pool *pool-name start-ip-address end-ip-address*

Configuring IP access parameters in an SSL VPN context

About this task

To provide service to IP access users, you must configure IP access parameters in an SSL VPN context, including the SSL VPN AC interface, address pool, and route list. After a user passes identity authentication, the SSL VPN context allocates an IP address to the VNIC of the user from the specified address pool. The route list can be used by an SSL VPN policy group to issue route entries to users.

Restrictions and guidelines

Automatic pushing of accessible resources to IP access users through the Web page is available only for users that use the iNode client in Windows. You can install the iNode client by using one of the following methods:

- Log in to the SSL VPN gateway from a Web browser, and then download and install the iNode client that comes with the device.
- Install the iNode client downloaded from the official website. Select the iNode installation package for VPN gateway generation when customizing the iNode client. If you do not select this option, the user will be automatically logged out because the SSL VPN gateway cannot detect that the iNode client is logged in.

Procedure

1. Enter system view.

   `system-view`

2. Enter SSL VPN context view.

   `sslvpn context` *`context-name`*

3. Specify an SSL VPN AC interface for IP access.

   `ip-tunnel interface sslvpn-ac` *`interface-number`*

   By default, no SSL VPN AC interface is specified for IP access in the SSL VPN context.

4. Configure a route list:

   a. Create a route list and enter its view.

   `ip-route-list` *`list-name`*

   b. Add an included route to the route list.

   `include` *`ip-address`* { *`mask`* | *`mask-length`* }

   c. Add an excluded route to the route list.

   `exclude` *`ip-address`* { *`mask`* | *`mask-length`* }

   d. Return to SSL VPN context view.

   `quit`

5. Specify an address pool for IP access.

   `ip-tunnel address-pool` *`pool-name`* **`mask`** { *`mask-length`* | *`mask`* }

   By default, no address pool is specified for IP access.

6. (Optional.) Set the keepalive interval.

   `ip-tunnel keepalive` *`seconds`*

   By default, the keepalive interval is 30 seconds.

7. (Optional.) Specify a DNS server for IP access.

   `ip-tunnel dns-server` { **`primary`** | **`secondary`** } *`ip-address`*

   By default, no DNS servers are specified for IP access.

8. (Optional.) Specify a WINS server for IP access.

ip-tunnel wins-server { **primary** | **secondary** } *ip-address*

By default, no WINS servers are specified for IP access.

9. (Optional.) Enable automatic startup of the IP access client after Web login.

web-access ip-client auto-activate

By default, automatic startup of the IP access client after Web login is disabled.

10. (Optional.) Enable automatic pushing of accessible resources to IP access users through the Web page.

ip-tunnel web-resource auto-push

By default, automatic pushing of accessible resources to IP access users through the Web page is disabled.

11. (Optional.) Set a rate limit for IP access upstream or downstream traffic.

ip-tunnel rate-limit { **downstream** | **upstream** } { **kbps** | **pps** } *value*

By default, no rate limit is set for IP access upstream or downstream traffic.

Configuring an SSL VPN policy group for IP access

About this task

To configure an SSL VPN policy group for IP access, configure routes for the accessible IP resources in the policy group. After the AAA server or custom authentication server authorizes a user to use a policy group, the SSL VPN gateway issues the routes to the user so the user can access the IP resources.

You can configure the routes to be issued to users by using one of the following methods:

- Manually configure a route.
- Specify a route list.
- Force all traffic to be sent to the SSL VPN gateway.

  The SSL VPN gateway issues a default route to the SSL VPN client. The default route uses the VNIC as the output interface and has the highest priority among all default routes on the client. Packets for destinations not in the routing table are sent to the SSL VPN gateway through the VNIC. The SSL VPN gateway monitors the SSL VPN client in real time. It does not allow the client to delete the default route or add a default route with a higher priority.

In a policy group, you can specify an advanced ACL and a URI ACL to filter users' IP access requests.

The SSL VPN gateway uses the following procedure to determine whether to forward an IP access request:

1. Matches the request against the rules in the URI ACL:
   - If the request matches a permit rule, the gateway forwards the request.
   - If the request matches a deny rule, the gateway drops the request.
   - If the request does not match any rules in the URI ACL or if no URI ACL is available, the gateway proceeds to step 2.
2. Matches the request against the rules in the advanced ACL:
   - If the request matches a permit rule, the gateway forwards the request.
   - If the request matches a deny rule, the gateway drops the request.
   - If the request does not match any rules in the advanced ACL or if no advanced ACL is available, the gateway drops the request.

If no URI ACL or advanced ACL is specified for IP access filtering, the SSL VPN gateway permits all IP accesses by default.

The advanced ACL supports filtering IP access requests by using the following criteria:

- Destination IP address.
- Destination port number.
- Source IP address.
- Source port number.
- Protocol type.
- Packet priority.
- Fragment information.
- TCP flag.
- ICMP message type and message code.

The URI ACL supports filtering IP access requests by protocol type, destination address, domain name, port number, and URL.

Restrictions and guidelines

If a rule in the URI ACL specified for IP access filtering contains HTTP or HTTPS settings, the rule does not take effect.

Procedure

1. Enter system view.

   `system-view`

2. Enter SSL VPN context view.

   `sslvpn context` *`context-name`*

3. Create an SSL VPN policy group and enter SSL VPN policy group view.

   `policy-group` *`group-name`*

4. Specify the routes to be issued to clients.

   `ip-tunnel access-route` { *`ip-address`* { *`mask-length`* | *`mask`* } | **`force-all`** | **`ip-route-list`** *`list-name`* }

   By default, no routes are configured.

5. Specify the ACLs for IP access filtering:

   - Specify an advanced ACL for IP access filtering.

     `filter ip-tunnel` [**`ipv6`**] **`acl`** *`advanced-acl-number`*

   - Specify a URI ACL for IP access filtering.

     `filter ip-tunnel uri-acl` *`uri-acl-name`*

   By default, an SSL VPN gateway permits all IP access requests.

6. (Optional.) Specify an address pool for IP access.

   `ip-tunnel address-pool` *`pool-name`* **`mask`** { *`mask-length`* | *`mask`* }

   By default, no address pool is specified for IP access in an SSL VPN policy group.

   If no free address is available in the address pool or the address pool does not exist, address allocation to IP access users will fail and the users' access requests will be rejected.

   If no address pool is specified for the policy group, the SSL VPN gateway allocates IP addresses to users from the address pool specified for the SSL VPN context.

Binding IP addresses to an SSL VPN user

About this task

When an SSL VPN user accesses the SSL VPN gateway in IP access mode, the SSL VPN gateway must assign an IP address to the user. This feature allows you to specify the IP addresses that can be assigned to a user.

You can bind IP addresses to an SSL VPN user as follows:

- Bind a list of IP addresses to the user. When the user accesses the SSL VPN gateway in IP access mode, the SSL VPN gateway assigns a bound IP address to the user.
- Enable the SSL VPN gateway to automatically bind the specified number of free addresses in the IP access address pool to the user.

Restrictions and guidelines

The IP addresses to be bound to an SSL VPN user must meet the following requirements:

- If an IP access address pool is specified for the SSL VPN policy group authorized to the user, the IP addresses must exist in the address pool.
- If no address pool is specified for the SSL VPN policy group, the IP addresses must exist in the address pool specified for the SSL VPN context of the user.

You can bind the same IP address to different SSL VPN users only when the SSL VPN contexts of the users are associated with different networks (public network or VPN).

Procedure

1. Enter system view.
   `system-view`
2. Enter SSL VPN context view.
   `sslvpn context` *`context-name`*
3. Create an SSL VPN user and enter SSL VPN user view.
   `user` *`username`*
4. Bind IP addresses to the SSL VPN user.
   `ip-tunnel bind address` { *`ip-address-list`* | **`auto-allocate`** *`number`* }
   By default, an SSL VPN user does not have bound IP addresses.

Configuring SSL VPN access for mobile clients

SSL VPN access for mobile clients tasks at a glance

To configure SSL VPN access for mobile clients, perform the following tasks:

1. Specifying an EMO server for mobile clients
2. (Optional.) Specifying a message server for mobile clients

Specifying an EMO server for mobile clients

About this task

An EMO server provides services for mobile clients. After you specify an EMO server for mobile clients, the SSL VPN gateway issues the EMO server information to the clients. The clients can access available service resources through the EMO server.

Procedure

1. Enter system view.

   system-view

2. Enter SSL VPN context view.

   sslvpn context *context-name*

3. Specify an EMO server for mobile clients.

   emo-server address { *host-name* | *ipv4-address* } **port** *port-number*

   By default, no EMO server is specified for mobile clients.

Specifying a message server for mobile clients

About this task

A message server provides services for mobile clients. After you specify a message server for mobile clients, the SSL VPN gateway issues the message server information to the clients. The clients can access the message server.

Procedure

1. Enter system view.

   system-view

2. Enter SSL VPN context view.

   sslvpn context *context-name*

3. Specify a message server for mobile clients.

   message-server address { *host-name* | *ipv4-address* } **port** *port-number*

   By default, no message server is specified for mobile clients.

Configuring shortcuts

About this task

To provide quick access to resources on internal servers, configure shortcuts for these resources. A shortcut provides the access link to a protected resource on the SSL VPN Web page. Users can click a shortcut name on the SSL VPN Web page to access the associated resource.

Procedure

1. Enter system view.

   system-view

2. Enter SSL VPN context view.

   sslvpn context *context-name*

3. Create a shortcut and enter its view.

   shortcut *shortcut-name*

   By default, no shortcuts exist.

4. (Optional.) Configure a description for the shortcut.

   description *text*

   By default, no description is configured for a shortcut.

5. Configure a resource link for the shortcut.

   execution *script*

   By default, no resource link is configured for a shortcut.

6. Return to SSL VPN context view.

   quit

7. Create a shortcut list and enter its view.

   shortcut-list *list-name*

8. Assign the shortcut to the shortcut list.

   resources shortcut *shortcut-name*

   By default, a shortcut list does not contain shortcuts.

9. Return to SSL VPN context view.

   quit

10. Enter SSL VPN policy group view.

    policy-group *group-name*

11. Assign the shortcut list to the SSL VPN policy group.

    resources shortcut-list *list-name*

    By default, an SSL VPN policy group does not contain a shortcut list.

Configuring redirect resources

About this task

By default, a user enters the SSL VPN webpage after logging in to the SSL VPN gateway. To provide quick access to the specified Web resource on internal servers, configure the resource as a redirect resource. Users will directly enter the specified redirect resource after a short stay on the SSL VPN Web page.

Procedure

1. Enter system view.

   system-view

2. Enter SSL VPN context view.

   sslvpn context *context-name*

3. Enter SSL VPN policy group view.

   policy-group *group-name*

4. Configure the Web resource for SSL VPN users to access after login.

   redirect-resource { **shortcut** | **url-item** } *resource-name*

   By default, after logging in to the SSL VPN gateway, a user directly enters the SSL VPN webpage, and no redirection is performed.

Configuring HTTP redirection

About this task

An SSL VPN gateway communicates with users through HTTPS. To allow HTTP to access the SSL VPN gateway, you must configure HTTP redirection.

HTTP redirection enables an SSL VPN gateway to perform the following operations:

1. Listen to an HTTP port.
2. Redirect HTTP requests with the port number to the port used by HTTPS.
3. Send redirection packets to clients.

Procedure

1. Enter system view.

   system-view

2. Enter SSL VPN gateway view.

   sslvpn gateway *gateway-name*

3. Enable HTTP redirection.

   http-redirect [**port** *port-number*]

   By default, HTTP redirection is disabled. An SSL VPN gateway does not process HTTP traffic.

Configuring the default policy group for an SSL VPN context

About this task

If the AAA server or custom authentication server does not authorize a policy group to a user after the user logs in, the SSL VPN gateway authorizes the default policy group to the user. If no default policy group is configured, the SSL VPN gateway denies all access requests from the user.

Procedure

1. Enter system view.

   system-view

2. Enter SSL VPN context view.

   sslvpn context *context-name*

3. Create an SSL VPN policy group and enter SSL VPN policy group view.

   policy-group *group-name*

4. Configure accessible resources in the policy group:

   - Configure Web access resources.

     resources url-list *url-list-name*

     By default, no Web access resources are configured in a policy group.

   - Configure TCP access resources.

     resources port-forward *port-forward-name*

     By default, no TCP access resources are configured in a policy group.

   - Configure IP access resources.

     ip-tunnel access-route { *ip-address* { *mask-length* | *mask* } | **force-all** | **ip-route-list** *list-name* }

     By default, no IP access resources are configured in a policy group.

5. (Optional.) Specify the ACLs for Web access filtering:

   - Specify an advanced ACL for Web access filtering.

     filter web-access [**ipv6**] **acl** *advanced-acl-number*

   - Specify a URI ACL for Web access filtering.

     filter web-access uri-acl *uri-acl-name*

   By default, users can access only the Web resources authorized to them through the URL list.

6. (Optional.) Specify the ACLs for TCP access filtering:

   - Specify an advanced ACL for TCP access filtering.

     filter tcp-access [**ipv6**] **acl** *advanced-acl-number*

- Specify a URI ACL for TCP access filtering.

  filter tcp-access uri-acl *uri-acl-name*

  By default, users can access only the TCP resources authorized to them through the TCP port forwarding list.

7. (Optional.) Specify the ACLs for IP access filtering:
   - Specify an advanced ACL for IP access filtering.

     filter ip-tunnel [**ipv6**] **acl** *advanced-acl-number*
   - Specify a URI ACL for IP access filtering.

     filter ip-tunnel uri-acl *uri-acl-name*

   By default, an SSL VPN gateway permits all IP access requests.
8. Return to SSL VPN context view.

   quit
9. Specify the policy group as the default policy group for the SSL VPN context.

   default-policy-group *group-name*

   By default, no default policy group is specified for an SSL VPN context.

Configuring VRF-aware SSL VPN

Associating an SSL VPN context with a VPN instance

About this task

You can associate different SSL VPN contexts with different VPN instances on the SSL VPN gateway. Users in an SSL VPN context can access only the resources in the VPN instance associated with the SSL VPN context. VRF-aware SSL VPN contexts also allow server addresses to overlap.

Prerequisites

Before you configure this feature, complete the following tasks:

- Create the VPN instance.
- Associate the SSL VPN gateway's interface connected to the internal server with the VPN instance.
- (Required for IP access.) Associate the SSL VPN AC interface specified by the **ip-tunnel interface** command with the VPN instance.

For more information about VPN instances, see *VPN Instance Configuration Guide.*

Procedure

1. Enter system view.

   system-view
2. Enter SSL VPN context view.

   sslvpn context *context-name*
3. Associate the SSL VPN context with a VPN instance.

   vpn-instance *vpn-instance-name*

   By default, an SSL VPN context is associated with the public network.

Specifying a VPN instance for an SSL VPN gateway

About this task

After you specify a VPN instance for an SSL VPN gateway, only users in the specified VPN can access the SSL VPN gateway. The VRF-aware SSL VPN gateway prevents the internal server resources from leaking into the public network or other VPNs.

Prerequisites

Before you configure this feature, complete the following tasks:

- Create the VPN instance.
- Associate the VPN instance with the SSL VPN gateway's interface connected to the user.
- Bind the SSL VPN AC interface to

For more information

Procedure

1. Enter system view.
   system-view
2. Enter SSL VPN gateway view.
   sslvpn gateway *gateway-name*
3. Specify a VPN instance for the gateway.
   vpn-instance *vpn-instance-name*

   By default, an SSL VPN gateway belongs to the public network.

Configuring online SSL VPN user control

About this task

Perform this task to configure the SSL VPN user login control features, such as the force logout feature, the maximum number of concurrent logins for each account, and the maximum number of connections allowed per session.

Procedure

1. Enter system view.
   system-view
2. Enter SSL VPN context view.
   sslvpn context *context-name*
3. Force online users to log out.
   force-logout [**all** | **session** *session-id* | **user** *user-name*]
4. Set the maximum number of concurrent logins for each account.
   max-onlines *number*

   By default, the maximum number of concurrent logins for each account is 32.
5. Enable the force logout feature.
   force-logout max-onlines enable

   By default, the force logout feature is disabled. A user cannot log in if the number of logins using the account reaches the maximum.

   When a login is attempted but logins using the account reach the maximum, this feature logs out the user with the longest idle time to allow the new login.

6. Set the maximum number of connections allowed per session.

   session-connections *number*

   By default, a maximum of 64 connections are allowed per session.

   If the number of connections in a session has reached the maximum, new connection requests for the session will be rejected with a **503 Service Unavailable** message.

Configuring SSL VPN session rate limit

About this task

Perform this task to set a rate limit for SSL VPN session upstream and downstream traffic, respectively. If the SSL VPN session upstream or downstream traffic exceeds the rate limit, subsequent upstream or downstream traffic will be discarded.

Procedure

1. Enter system view.

   system-view

2. Enter SSL VPN context view.

   sslvpn context *context-name*

3. Set a rate limit for SSL VPN session upstream or downstream traffic.

   rate-limit { **downstream** | **upstream** } *value*

   By default, no rate limit is set for SSL VPN session upstream or downstream traffic.

Configuring SSL VPN cracking prevention

About this task

This feature reduces the risk of brute-force cracking of user login information by limiting the number of login attempts from the same IP address.

If the number of consecutive login failures of the same IP address reaches the specified number, the IP address will be frozen for the specified period of time. During the freeze period, the IP address is prohibited from logging in to the SSL VPN context. When the freeze period expires, the frozen IP address will be unfrozen automatically. To unfreeze the frozen IP address immediately, execute the **prevent-cracking unfreeze-ip** command.

Procedure

1. Enter system view.

   system-view

2. Enter SSL VPN context view.

   sslvpn context *context-name*

3. Enable IP address freezing for cracking prevention.

   prevent-cracking freeze-ip enable

   By default, IP address freezing for cracking prevention is disabled.

4. (Optional.) Specify the maximum number of consecutive login failures allowed for an IP address and the period of time to freeze an IP address for cracking prevention.

   prevent-cracking freeze-ip login-failures *login-failures* **freeze-time** *freeze-time*

   By default, the maximum number of consecutive login failures allowed for an IP address is 64, and the period of time to freeze an IP address is 30 seconds.

5. Enable code verification for cracking prevention.

   prevent-cracking verify-code enable

   By default, code verification for cracking prevention is disabled.

6. (Optional.) Specify the maximum number of consecutive login failures allowed for an IP address before performing code verification to prevent cracking.

   prevent-cracking verify-code login-failures *login-failures*

   By default, a maximum of five consecutive login failures are allowed for an IP address before performing code verification.

7. (Optional.) Unfreeze frozen IP addresses.

   prevent-cracking unfreeze-ip { **all** | { **ipv4** | **ipv6** } *ip-address* }

Configuring SSL VPN SSO login

About configuring SSL VPN SSO login

SSO allows a user to use one set of login credentials (such as username and password) to access multiple trusted systems. With SSO, SSL VPN Web access users can gain access to internal servers without entering the login credentials for the internal servers. The device supports the following methods for SSO login:

- **Auto-build method (automatically build login requests)**

  Use a packet capture tool to obtain internal server login requests, and then configure SSO login settings based on the login requests to automatically build login requests to the internal servers. SSO login settings include the HTTP request method, login request encoding method, login parameters, and login data encryption file.

- **Basic authentication method**

  Basic authentication is a simple HTTP authentication scheme, which requires a Web client to enter a username and password to access the server. The server authenticates the client based on the username and password.

  To implement SSO in the basic authentication method, the SSL VPN gateway acts as a Web client and automatically enters a username and password to perform HTTP basic authentication. The entered username and password can be SSL VPN username and password or custom username and password.

  The basic authentication SSO method is applicable only for logging in to the internal servers that support basic authentication.

Restrictions and guidelines

For the auto-build SSO method, the following requirements must be met:

- SSO login is available only for SSL VPN Web access users.
- If a user group name is specified as the SSO login parameter, only remote users are supported.
- SSO login is available only for accessing resources by clicking the URL links on the SSL VPN Web interface. SSO does not work if you access the resources by entering the URLs in a browser address bar or a URL input box.
- SSO login is not available for Web resources that require graphic verification codes.
- SSO login is not available for Web resources that require two-factor authentication or script invocation.

Configuring SSO login in auto-build method

1. Enter system view.

   system-view

2. Enter SSL VPN context view.

   sslvpn context *context-name*

3. Create a URL item and enter its view.

   url-item *name*

4. Specify the resource URL in the URL item.

   url *url*

   By default, no resource URL is specified in a URL item.

   If you do not specify a protocol type in the resource URL, the default protocol (HTTP) is used.

5. Enable Web access SOO and specify the auto-build method.

   sso method auto-build

   By default, Web access SSO login is disabled.

6. Specify the HTTP request method for sending SSO login requests.

   sso auto-build request-method { **get** | **post** }

   By default, the GET request method is used for sending SSO login requests.

7. Specify an encoding method for SSO login requests.

   sso auto-build code { **gb18030** | **utf-8** }

   By default, UTF-8 encoding is used for SSO login requests.

8. Configure a login parameter for automatic building of SSO login requests.

   sso auto-build login-parameter { **cert-fingerprint** | **cert-serial** | **cert-title** | **custom-password** | **custom-username** | **login-name** | **login-password** | **mobile-num** | **user-group** } **name** *parameter-name* [**encrypt**]

   By default, no login parameter is configured for automatic building of SSO login requests.

9. Configure a custom login parameter for automatic building of SSO login requests.

   sso auto-build custom-login-parameter name *parameter-name* **value** *value* [**encrypt**]

   By default, no custom parameter is configured for automatic building of SSO login requests.

10. Specify an encryption file to encrypt the values of parameters in SSO login requests.

    sso auto-build encrypt-file *filename*

    By default, no encryption file is specified.

Configuring SSO login through basic authentication

1. Enter system view.

   system-view

2. Enter SSL VPN context view.

   sslvpn context *context-name*

3. Create a URL item and enter its view.

   url-item *name*

4. Specify the resource URL in the URL item.

   url *url*

By default, no resource URL is specified in a URL item.

If you do not specify a protocol type in the resource URL, the default protocol (HTTP) is used.

5. Enable Web access SSO and specify the SSO method as basic authentication.

   ```
   sso method basic
   ```

   By default, Web access SSO login is disabled.

6. (Optional.) Enable using a custom username and password for SSO login through basic authentication.

   ```
   sso basic custom-username-password enable
   ```

   By default, SSL VPN login username and password are used for SSO login through basic authentication.

Configuring WeChat Work authentication

About WeChat Work authentication

WeChat Work (or WeCom) authentication allows the device to obtain user information in a company from WeChat Work and uses the user information for user authentication and authorization. This feature is transparent to users in the company.

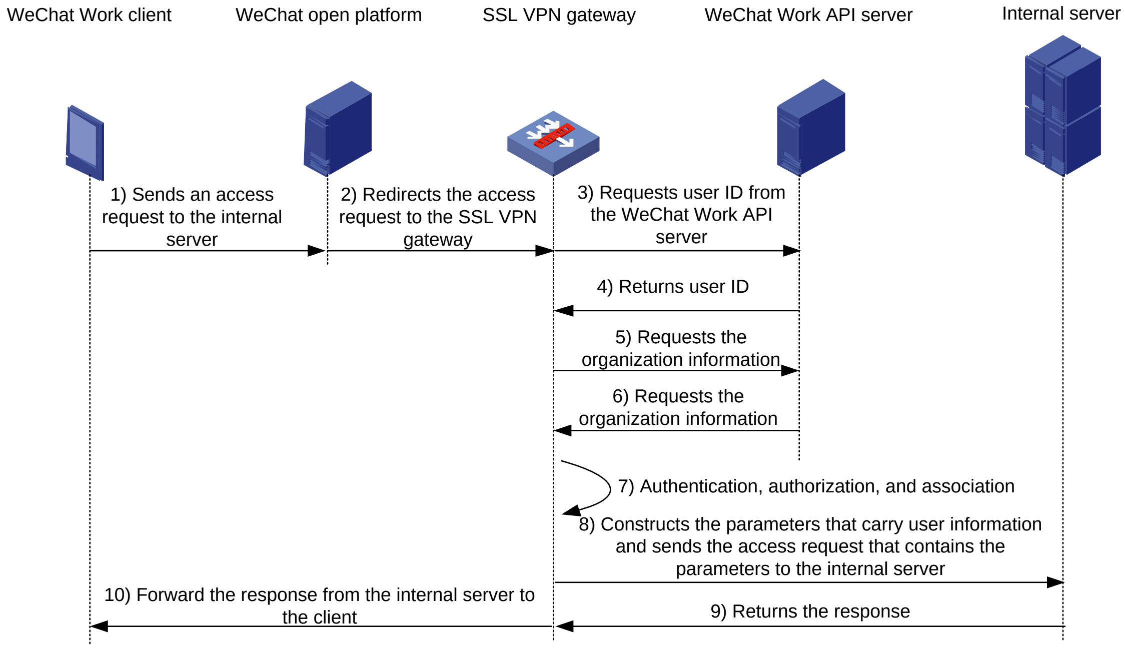
As shown in Figure 11, WeChat Work authentication operates as follows:

1. A user in a company uses the WeChat Work client to access an internal resource. The client sends the resource access request to the WeChat open platform.
2. The WeChat open platform redirects the request to the SSL VPN gateway for the gateway to protect the internal resource.

   Make sure the redirect link has been configured on the WeChat open platform.
3. On receiving the packet redirected from the WeChat Work server, the SSL VPN gateway sends a request to the WeChat Work API server to obtain the user ID.
4. The WeChat Work API server returns the user ID.
5. The SSL VPN gateway uses the user ID to further obtain the organization information of the user from the WeChat Work API server.

   The organization information corresponds to the authorization policy group name configured on the SSL VPN gateway.
6. The WeChat Work API server returns the organization information.
7. Based on the obtained user information, the SSL VPN gateway performs authentication for the user and authorizes the user to access the internal resource.
8. The SSL VPN gateway constructs a login request with parameters that carry the user information, and sends the request to the internal server.
9. The internal server returns the response to the SSL VPN gateway.
10. The SSL VPN gateway forwards the response to the WeChat Work client. The user then can access the internal resource through the client.

Figure 11 WeChat Work authentication mechanism



WeChat Work client
WeChat open platform
SSL VPN gateway
WeChat Work API server
Internal server
1) Sends an access request to the internal server
2) Redirects the access request to the SSL VPN gateway
3) Requests user ID from the WeChat Work API server
4) Returns user ID
5) Requests the organization information
6) Requests the organization information
7) Authentication, authorization, and association
8) Constructs the parameters that carry user information and sends the access request that contains the parameters to the internal server
9) Returns the response
10) Forward the response from the internal server to the client

Restrictions and guidelines

The self-signed certificate on the device does not support WeChat Work authentication. To use WeChat Work authentication, install a trusted SSL certificate first.

To enable WeChat Work authentication for an SSL VPN context, you must associate the SSL VPN context to an SSL VPN gateway exclusively.

Prerequisites

Before configuring WeChat Work authentication, you must configure the app homepage redirect link and the trusted domain name of the SSL VPN gateway for each app on the WeChat Work management platform.

Configuring the app homepage redirect link for an app

1. Enter **https://work.weixin.qq.com** in the browser.
2. Use the WeChat Work client to scan the QR code to log in to the WeChat Work management platform.
3. On the WeChat Work management platform, click **App Management** and select an app.
4. In the **Workplace App Management** area, click **Enabled** to configure the app homepage redirect link in the format of https://open.weixin.qq.com/connect/oauth2/authorize?appid=CORPID&redirect_uri=https://gateway.com:port/_proxywx/http/80/www.resources.com/?ctx=contextName&response_type=code&scope=snsapi_base&agentid=AGENTID&connect_redirect=1#wechat_redirect.
   - *CORPID*—Company ID. To view the company ID, go to **My Company** > **Company Information**.
   - *gateway.com:port*—Domain name and port number of the SSL VPN gateway.
   - www.resources.com—Domain name of the internal resource.
   - *contextName*—SSL VPN context name.

- *AGENTID*—App ID. To view the app ID of an app, select the app on the **App Management** page, and view the **Agentid** field.

You must encode https://*gateway.com:port*/_proxywx/http/80/*www.resources.com*/?ctx=*contextName* to the URL encoding format.

Configuring the trusted domain name of the SSL VPN gateway for an app

1. Enter **https://work.weixin.qq.com** in the browser.
2. Use the WeChat Work client to scan the QR code to log in to the WeChat Work management platform.
3. On the WeChat Work management platform, click **App Management** and select an app.
4. In the **Web Authorization and JS-SDK** area, click **Apply for domain name verification**. In the window that opens, enter the domain name and port number of the SSL VPN gateway in the format of *gateway.com:port* in the **Trustable Domain Names** field.
5. Click **Domain name to be verified** and download the verification file as instructed. Then, upload the verification file on the SSL VPN Web interface.
6. Select **The domain name ownership verification file has been uploaded.**, and then click **Confirm**.

Procedure

1. Enter system view.

   `system-view`
2. Enter SSL VPN context view.

   `sslvpn context` *`context-name`*
3. Enable WeChat Work authentication.

   `wechat-work-authentication enable`

   By default, WeChat Work authentication is disabled.
4. Specify the URL of the WeChat Work API server.

   `wechat-work-authentication url` *`url`*

   By default, no WeChat Work API server URL is configured.
5. Specify the WeChat Work authentication timeout.

   `wechat-work-authentication timeout` *`seconds`*

   By default, the WeChat Work authentication timeout is 15 seconds.
6. Specify the company ID for WeChat Work authentication.

   `wechat-work-authentication corp-id` *`corp-id`*

   By default, no company ID is specified for WeChat Work authentication.
7. Specify the app secret key for WeChat Work authentication.

   `wechat-work-authentication app-secret` *`app-secret`*

   By default, no app secret key is specified for WeChat Work authentication.
8. Specify the user ID field name for the SSL VPN gateway to access the internal server.

   `wechat-work-authentication userid-field` *`userid-field`*

   By default, no user ID field name is configured for the SSL VPN gateway to access the internal server.
9. Specify the name of the authorization policy group field.

   `wechat-work-authentication authorize-field` *`authorize-field`*

By default, no authorization policy group field name is specified for WeChat Work authentication.

10. Specify the WeChat open platform URL.

    wechat-work-authentication open-platform-url { **pre-defined** | **user-defined** *user-defined-url* }

    By default, no WeChat open platform URL is specified.

Customizing SSL VPN webpages

Restrictions and guidelines

If a user-defined webpage template is specified in an SSL VPN context, all other webpage customization settings are invalid for the SSL VPN context.

Customizing SSL VPN webpage elements

About this task

You can customize the following elements on the SSL VPN webpage:

- Login message.
- Password input box displaying.
- Title.
- Logo.
- Notification message on the SSL VPN gateway login page and resource page.
- Files for users to download on the SSL VPN resource page.
- Password complexity description.
- Server reply message rewriting.

Procedure

1. Enter system view.

   system-view

2. Enter SSL VPN context view.

   sslvpn context *context-name*

3. Configure a login message.

   login-message { **chinese** *chinese-message* | **english** *english-message* }

   By default, the login message is **Welcome to SSL VPN**.

4. Hide the password input box on the SSL VPN Web login page.

   password-box hide

   By default, the password input box is displayed on the SSL VPN Web login page.

5. Configure a title.

   title { **chinese** *chinese-title* | **english** *english-title* }

   By default, the title is **SSL VPN**.

6. Specify a logo.

   logo { **file** *file-name* | **none** }

7. Configure the notification message to be displayed on the SSL VPN gateway login page or resource page.

notify-message { **login-page** | **resource-page** } { **chinese** *chinese-message* | **english** *english-message* }

By default, no notification message is configured.

8. Specify a file for users to download on the SSL VPN gateway resource page.

   resources-file { **chinese** *chinese-filename* | **english** *english-filename* }

   By default, no file is provided for users to download.

9. Configure the password complexity message to be displayed on the SSL VPN password modification page.

   password-complexity-message { **chinese** *chinese-message* | **english** *english-message* }

   By default, no password complexity message is configured.

10. Rewrite a server reply message.

    rewrite server-response-message *server-response-message* { **chinese** *chinese-message* | **english** *english-message* }

    By default, no server reply message is rewritten.

Specifying an SSL VPN webpage template

About this task

This task allows you to customize SSL VPN webpages by specifying an SSL VPN webpage template. An SSL VPN webpage template defines the style of the SSL VPN gateway login page and resource page.

You can specify a webpage template in system view and in SSL VPN context view.

- The webpage template set in system view is the global SSL VPN webpage template, which is applicable to all SSL VPN contexts.
- The webpage template set in SSL VPN context view is applicable only to the current SSL VPN context.

Prerequisites

Upload the user-defined webpage templates to the file system of the device from the webpage.

Restrictions and guidelines for SSL VPN webpage customization

The SSL VPN webpage template specified in SSL VPN context view takes precedence over that in system view.

Specifying an SSL VPN webpage template in system view

1. Enter system view.

   system-view

2. Specify the global SSL VPN webpage template.

   sslvpn webpage-customize *template-name*

   By default, no global SSL VPN webpage template is specified. SSL VPN uses the system default SSL VPN webpages.

Specifying an SSL VPN webpage template in an SSL VPN context

1. Enter system view.

   system-view

2. Enter SSL VPN context view.

   sslvpn context *context-name*

3. Specify an SSL VPN webpage template.

   webpage-customize *template-name*

   By default, no SSL VPN webpage template is specified for an SSL VPN context. An SSL VPN context uses the global SSL VPN webpage template.

Enabling SSL VPN logging

About this task

Logs generated by SSL VPN logging are sent to the information center of the device. For the logs to be output correctly, you must also configure the information center on the device. For more information about the information center, see *Network Management and Monitoring Configuration Guide*.

Procedure

1. Enter system view.

   system-view

2. Enable the SSL VPN global logging feature.

   sslvpn log enable

   By default, the SSL VPN global logging feature is disabled.

3. Enter SSL VPN context view.

   sslvpn context *context-name*

4. Enable logging for user login and logoff events.

   log user-login enable

   By default, logging for user login and logoff events is disabled.

5. Enable logging for resource accesses of users.

   log resource-access enable [**brief** | **filtering**] *

   By default, resource access logging is disabled.

6. Enable logging for IP access connection close events.

   ip-tunnel log connection-close

   By default, logging for IP access connection close events is disabled.

7. Enable logging for IP access packet drop events.

   ip-tunnel log packet-drop

   By default, logging for IP access packet drop events is disabled.

8. Enable logging for IP address allocations and releases for the VNIC of the IP access client.

   ip-tunnel log address-alloc-release

   By default, logging is disabled for IP address allocations and releases for the VNIC of the IP access client.

Display and maintenance commands for SSL VPN

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display SSL VPN AC interface information.	**display interface sslvpn-ac**

	[*interface-number*] [**brief** [**description** | **down**]]
Display SSL VPN context information.	**display sslvpn context** [**brief** | **name** *context-name*]
Display SSL VPN gateway information.	**display sslvpn gateway** [**brief** | **name** *gateway-name*]
Display packet statistics for IP access users.	**display sslvpn ip-tunnel statistics** [**context** *context-name*] [**user** *user-name*]
Display SSL VPN policy group information.	**display sslvpn policy-group** *group-name* [**context** *context-name*]
Display TCP port forwarding connection information.	**display sslvpn port-forward connection** [**context** *context-name*] [**slot** *slot-number*]
Display information about IP addresses frozen for cracking prevention.	**display sslvpn prevent-cracking frozen-ip** { **statistics** | **table** } [**context** *context-name*]
Display SSL VPN session information.	**display sslvpn session** [**context** *context-name*] [**user** *user-name* | **verbose**]
Display SSL VPN webpage template information.	**display sslvpn webpage-customize template**
Clear SSL VPN AC interface statistics.	**reset counters interface** [**sslvpn-ac** [*interface-number*]]
Clear packet statistics for IP access users.	**reset sslvpn ip-tunnel statistics** [**context** *context-name* [**session** *session-id*]]

SSL VPN configuration examples

Example: Configuring Web access

Network configuration

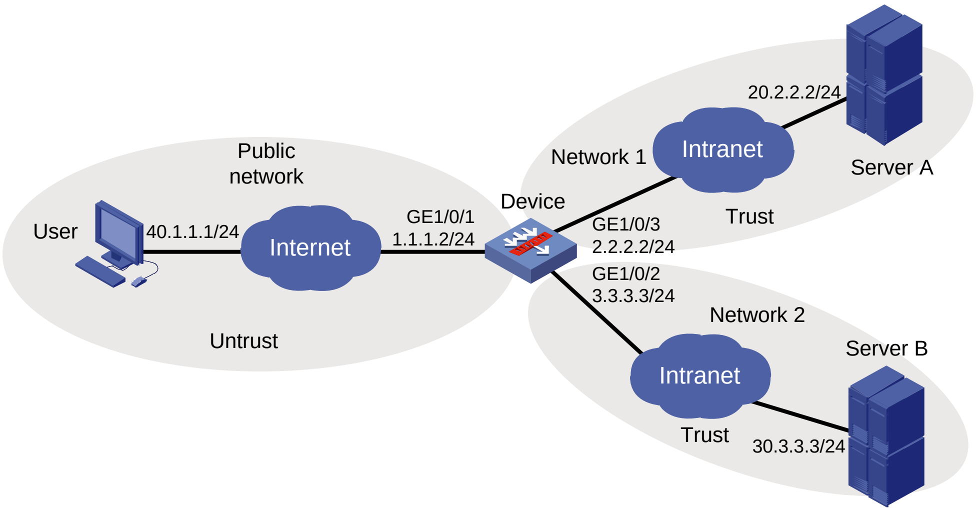
As shown in Figure 12, the device acts as the SSL VPN gateway that connects the public network and private networks Network 1 and Network 2. Server A and Server B are internal Web servers. Server A uses HTTP over port 80. Server B uses HTTPS over port 443.

The device uses a CA-signed SSL server certificate. If no SSL server policy is applied to the device, the device uses a self-signed SSL server certificate.

Configure SSL VPN Web access on the device to allow the user to access Server A in Network 1 and Server B in Network 2.

Configure the device to perform local authentication and authorization for the user.

Figure 12 Network diagram



Procedure

1. Obtain CA certificate file **ca.cer** and local certificate file **server.pfx** for the device. (Details not shown.)
2.
3. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

```
<Device> system-view
[Device] interface gigabitethernet 1/0/1
[Device-GigabitEthernet1/0/1] ip address 1.1.1.2 255.255.255.0
[Device-GigabitEthernet1/0/1] quit
```

   # Assign IP addresses to other interfaces in the same way. (Details not shown.)

4. Configure settings for routing.

   This example configures static routes, and the next hop in the routes is 2.2.2.3 to Server A, 3.3.3.4 to Server B, and 1.1.1.3 to the user.

```
[Device] ip route-static 20.2.2.2 24 2.2.2.3
[Device] ip route-static 30.3.3.3 24 3.3.3.4
[Device] ip route-static 40.1.1.1 24 1.1.1.3
```

5. Add interfaces to security zones.

```
[Device] security-zone name untrust
[Device-security-zone-Untrust] import interface gigabitethernet 1/0/1
[Device-security-zone-Untrust] quit
[Device] security-zone name trust
[Device-security-zone-Trust] import interface gigabitethernet 1/0/2
[Device-security-zone-Trust] import interface gigabitethernet 1/0/3
[Device-security-zone-Trust] quit
```

6. Configure rules in a security policy to permit the traffic between the **Untrust** and **Local** security zones for the user to access the SSL VPN gateway:

   # Configure a rule named **sslvpnlocalout1** to permit the packets from the device to the user.

```
[Device] security-policy ip
[Device-security-policy-ip] rule name sslvpnlocalout1
[Device-security-policy-ip-1-sslvpnlocalout1] source-zone local
[Device-security-policy-ip-1-sslvpnlocalout1] destination-zone untrust
```

```
[Device-security-policy-ip-1-sslvpnlocalout1] source-ip-host 1.1.1.2
[Device-security-policy-ip-1-sslvpnlocalout1] destination-ip-host 40.1.1.1
[Device-security-policy-ip-1-sslvpnlocalout1] action pass
[Device-security-policy-ip-1-sslvpnlocalout1] quit
```

# Configure a rule named **sslvpnlocalin1** to permit the packets from the user to the device.

```
[Device-security-policy-ip] rule name sslvpnlocalin1
[Device-security-policy-ip-2-sslvpnlocalin1] source-zone untrust
[Device-security-policy-ip-2-sslvpnlocalin1] destination-zone local
[Device-security-policy-ip-2-sslvpnlocalin1] source-ip-host 40.1.1.1
[Device-security-policy-ip-2-sslvpnlocalin1] destination-ip-host 1.1.1.2
[Device-security-policy-ip-2-sslvpnlocalin1] action pass
[Device-security-policy-ip-2-sslvpnlocalin1] quit
```

# Configure a rule named **sslvpnlocalout2** to permit the packets from the device to Server A or Server B.

```
[Device-security-policy-ip] rule name sslvpnlocalout2
[Device-security-policy-ip-3-sslvpnlocalout2] source-zone local
[Device-security-policy-ip-3-sslvpnlocalout2] destination-zone trust
[Device-security-policy-ip-3-sslvpnlocalout2] source-ip-host 2.2.2.2
[Device-security-policy-ip-3-sslvpnlocalout2] source-ip-host 3.3.3.3
[Device-security-policy-ip-3-sslvpnlocalout2] destination-ip-host 20.2.2.2
[Device-security-policy-ip-3-sslvpnlocalout2] destination-ip-host 30.3.3.3
[Device-security-policy-ip-3-sslvpnlocalout2] action pass
[Device-security-policy-ip-3-sslvpnlocalout2] quit
```

# Configure a rule named **sslvpnlocalin2** to permit the packets from Server A and Server B to the device.

```
[Device-security-policy-ip] rule name sslvpnlocalin2
[Device-security-policy-ip-4-sslvpnlocalin2] source-zone trust
[Device-security-policy-ip-4-sslvpnlocalin2] destination-zone local
[Device-security-policy-ip-4-sslvpnlocalin2] source-ip-host 20.2.2.2
[Device-security-policy-ip-4-sslvpnlocalin2] source-ip-host 30.3.3.3
[Device-security-policy-ip-4-sslvpnlocalin2] destination-ip-host 2.2.2.2
[Device-security-policy-ip-4-sslvpnlocalin2] destination-ip-host 3.3.3.3
[Device-security-policy-ip-4-sslvpnlocalin2] action pass
[Device-security-policy-ip-4-sslvpnlocalin2] quit
[Device-security-policy-ip] quit
```

7. Configure a PKI domain named **sslvpn** and certificate-related parameters.

```
[Device] pki domain sslvpn
[Device-pki-domain-sslvpn] public-key rsa general name sslvpn
[Device-pki-domain-sslvpn] undo crl check enable
[Device-pki-domain-sslvpn] quit
[Device] pki import domain sslvpn der ca filename ca.cer
[Device] pki import domain sslvpn p12 local filename server.pfx
```

8. Create an SSL server policy named **ssl** and specify PKI domain **sslvpn** for the policy.

```
[Device] ssl server-policy ssl
[Device-ssl-server-policy-ssl] pki-domain sslvpn
[Device-ssl-server-policy-ssl] quit
```

9. Configure the SSL VPN gateway for user access. Configure the IP address for SSL VPN gateway **gw** as 1.1.1.2 and port number as 2000, and then apply server policy **ssl** to the gateway.

```
[Device] sslvpn gateway gw
[Device-sslvpn-gateway-gw] ip address 1.1.1.2 port 2000
[Device-sslvpn-gateway-gw] ssl server-policy ssl
[Device-sslvpn-gateway-gw] service enable
[Device-sslvpn-gateway-gw] quit
```

10. Configure SSL VPN contexts to provide Web access service:

    # Create SSL VPN context **ctx1**, specify gateway **gw** and domain **domain1** for the context, and then associate the context with VPN instance **VPN1**.

    ```
    [Device] sslvpn context ctx1
    [Device-sslvpn-context-ctx1] gateway gw domain domain1
    [Device-sslvpn-context-ctx1] vpn-instance VPN1
    [Device-sslvpn-context-ctx1] url-item urlitem
    [Device-sslvpn-context-ctx1-url-item-urlitem] url http://20.2.2.2
    [Device-sslvpn-context-ctx1-url-item-urlitem] quit
    [Device-sslvpn-context-ctx1] url-list urllist
    [Device-sslvpn-context-ctx1-url-list-urllist] heading web
    [Device-sslvpn-context-ctx1-url-list-urllist] resources url-item urlitem
    [Device-sslvpn-context-ctx1-url-list-urllist] quit
    [Device-sslvpn-context-ctx1] policy-group pgroup
    [Device-sslvpn-context-ctx1-policy-group-pgroup] resources url-list urllist
    [Device-sslvpn-context-ctx1-policy-group-pgroup] quit
    [Device-sslvpn-context-ctx1] default-policy-group pgroup
    [Device-sslvpn-context-ctx1] service enable
    [Device-sslvpn-context-ctx1] quit
    ```

    # Create SSL VPN context **ctx2**, specify gateway **gw** and domain **domain2** for the context, and then associate the context with VPN instance **VPN2**.

    ```
    [Device] sslvpn context ctx2
    [Device-sslvpn-context-ctx2] gateway gw domain domain2
    [Device-sslvpn-context-ctx2] vpn-instance VPN2
    [Device-sslvpn-context-ctx2] url-item urlitem
    [Device-sslvpn-context-ctx2-url-item-urlitem] url https://30.3.3.3
    [Device-sslvpn-context-ctx2-url-item-urlitem] quit
    [Device-sslvpn-context-ctx2] url-list urllist
    [Device-sslvpn-context-ctx2-url-list-urllist] heading web
    [Device-sslvpn-context-ctx2-url-list-urllist] resources url-item urlitem
    [Device-sslvpn-context-ctx2-url-list-urllist] quit
    [Device-sslvpn-context-ctx2] policy-group pgroup
    [Device-sslvpn-context-ctx2-policy-group-pgroup] resources url-list urllist
    [Device-sslvpn-context-ctx2-policy-group-pgroup] quit
    [Device-sslvpn-context-ctx2] default-policy-group pgroup
    [Device-sslvpn-context-ctx2] service enable
    [Device-sslvpn-context-ctx2] quit
    ```

11. Create a local user named **sslvpn**, set the password to **123456**, service type to **sslvpn**, and user role to **network-operator**. Authorize the user to use policy group **pgroup**.

    ```
    [Device] local-user sslvpn class network
    [Device-luser-network-sslvpn] password simple 123456
    [Device-luser-network-sslvpn] service-type sslvpn
    [Device-luser-network-sslvpn] authorization-attribute user-role network-operator
    [Device-luser-network-sslvpn] authorization-attribute sslvpn-policy-group pgroup
    ```

```
    [Device-luser-network-sslvpn] quit
```

Verifying the configuration

# Verify that SSL VPN gateway **gw** is up on the device.

```
[Device] display sslvpn gateway

Example: Configuring TCP access

Network configuration

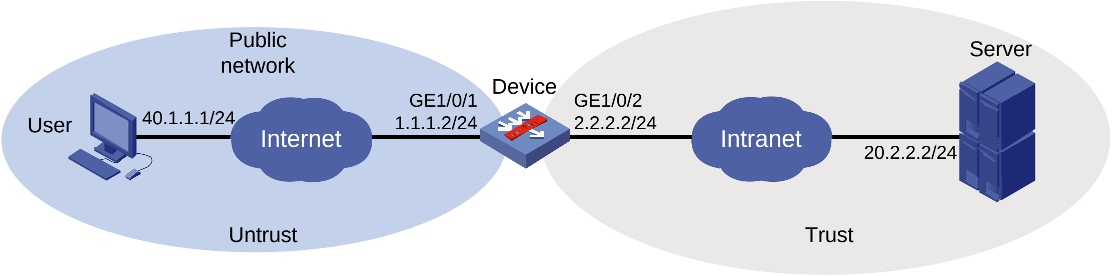
As shown in Figure 17, the device acts as an SSL VPN gateway that connects the public network and private network Network 1.

The device uses a CA-signed SSL server certificate. If no SSL server policy is applied to the device, the device uses a self-signed SSL server certificate.

Configure SSL VPN TCP access on the device to allow the user to access the internal Telnet server in Network 1.

Configure the device to perform local authentication and local authorization for the user.

Figure 17 Network diagram



Prerequisites

Before using the user's PC to access the SSL VPN gateway (the device), make sure a Java running environment is installed on the PC.

Procedure

1. Obtain CA certificate file **ca.cer** and local certificate file **server.pfx** for the device. (Details not shown.)
2. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

   ```
   <Device> system-view
   [Device] interface gigabitethernet 1/0/1
   [Device-GigabitEthernet1/0/1] ip address 1.1.1.2 255.255.255.0
   [Device-GigabitEthernet1/0/1] quit
   ```

   # Assign IP addresses to other interfaces in the same way. (Details not shown.)
3. Configure settings for routing.

   This example configures static routes, and the next hop in the routes is 2.2.2.3 to the server, and 1.1.1.3 to the user.

   ```
   [Device] ip route-static 20.2.2.2 24 2.2.2.3
   [Device] ip route-static 40.1.1.1 24 1.1.1.3
   ```
4. Add interfaces to security zones.

   ```
   [Device] security-zone name untrust
   [Device-security-zone-Untrust] import interface gigabitethernet 1/0/1
   [Device-security-zone-Untrust] quit
   [Device] security-zone name trust
   [Device-security-zone-Trust] import interface gigabitethernet 1/0/2
   [Device-security-zone-Trust] quit
   ```
5. Configure rules in a security policy to permit the traffic between the **Untrust** and **Local** security zones for the user to access the SSL VPN gateway:

   # Configure a rule named **sslvpnlocalout1** to permit the packets from the device to the user.

   ```
   [Device] security-policy ip
   [Device-security-policy-ip] rule name sslvpnlocalout1
   [Device-security-policy-ip-1-sslvpnlocalout1] source-zone local
   [Device-security-policy-ip-1-sslvpnlocalout1] destination-zone untrust
   [Device-security-policy-ip-1-sslvpnlocalout1] source-ip-host 1.1.1.2
   [Device-security-policy-ip-1-sslvpnlocalout1] destination-ip-host 40.1.1.1
   [Device-security-policy-ip-1-sslvpnlocalout1] action pass
   [Device-security-policy-ip-1-sslvpnlocalout1] quit
   ```

   # Configure a rule named **sslvpnlocalin1** to permit the packets from the user to the device.

   ```
   [Device-security-policy-ip] rule name sslvpnlocalin1
   [Device-security-policy-ip-2-sslvpnlocalin1] source-zone untrust
   [Device-security-policy-ip-2-sslvpnlocalin1] destination-zone local
   [Device-security-policy-ip-2-sslvpnlocalin1] source-ip-host 40.1.1.1
   [Device-security-policy-ip-2-sslvpnlocalin1] destination-ip-host 1.1.1.2
   [Device-security-policy-ip-2-sslvpnlocalin1] action pass
   [Device-security-policy-ip-2-sslvpnlocalin1] quit
   ```

   # Configure a rule named **sslvpnlocalout2** to permit the packets from the device to the server.

   ```
   [Device-security-policy-ip] rule name sslvpnlocalout2
   [Device-security-policy-ip-3-sslvpnlocalout2] source-zone local
   ```

```
[Device-security-policy-ip-3-sslvpnlocalout2] destination-zone trust
[Device-security-policy-ip-3-sslvpnlocalout2] source-ip-host 2.2.2.2
[Device-security-policy-ip-3-sslvpnlocalout2] destination-ip-host 20.2.2.2
[Device-security-policy-ip-3-sslvpnlocalout2] action pass
[Device-security-policy-ip-3-sslvpnlocalout2] quit
```

# Configure a rule named **sslvpnlocalin2** to permit the packets from the server to the device.

```
[Device-security-policy-ip] rule name sslvpnlocalin2
[Device-security-policy-ip-4-sslvpnlocalin2] source-zone trust
[Device-security-policy-ip-4-sslvpnlocalin2] destination-zone local
[Device-security-policy-ip-4-sslvpnlocalin2] source-ip-host 20.2.2.2
[Device-security-policy-ip-4-sslvpnlocalin2] destination-ip-host 2.2.2.2
[Device-security-policy-ip-4-sslvpnlocalin2] action pass
[Device-security-policy-ip-4-sslvpnlocalin2] quit
[Device-security-policy-ip] quit
```

6. Configure a PKI domain named **sslvpn** and certificate-related parameters.

```
<Device> system-view
[Device] pki domain sslvpn
[Device-pki-domain-sslvpn] public-key rsa general name sslvpn
[Device-pki-domain-sslvpn] undo crl check enable
[Device-pki-domain-sslvpn] quit
[Device] pki import domain sslvpn der ca filename ca.cer
[Device] pki import domain sslvpn p12 local filename server.pfx
```

7. Create an SSL server policy named **ssl** and specify PKI domain **sslvpn** for the policy.

```
[Device] ssl server-policy ssl
[Device-ssl-server-policy-ssl] pki-domain sslvpn
[Device-ssl-server-policy-ssl] quit
```

8. Configure the SSL VPN gateway for user access. Configure the IP address for SSL VPN gateway **gw** as 1.1.1.2 and port number as 2000, and then apply server policy **ssl** to the gateway.

```
[Device] sslvpn gateway gw
[Device-sslvpn-gateway-gw] ip address 1.1.1.2 port 2000
[Device-sslvpn-gateway-gw] ssl server-policy ssl
[Device-sslvpn-gateway-gw] service enable
[Device-sslvpn-gateway-gw] quit
```

9. Create an SSL VPN context named **ctx**, specify gateway **gw** for the context, and then associate the context with VPN instance **VPN1**.

```
[Device] sslvpn context ctx
[Device-sslvpn-context-ctx] gateway gw
[Device-sslvpn-context-ctx] vpn-instance VPN1
[Device-sslvpn-context-ctx] port-forward-item pfitem1
[Device-sslvpn-context-ctx-port-forward-item-pfitem1] local-port 2323 local-name
127.0.0.1 remote-server 20.2.2.2 remote-port 23 description telnet
[Device-sslvpn-context-ctx-port-forward-item-pfitem1] quit
[Device-sslvpn-context-ctx] port-forward plist
[Device-sslvpn-context-ctx-port-forward-plist] resources port-forward-item pfitem1
[Device-sslvpn-context-ctx-port-forward-plist] quit
[Device-sslvpn-context-ctx] policy-group pgroup
[Device-sslvpn-context-ctx-policy-group-pgroup] resources port-forward plist
[Device-sslvpn-context-ctx-policy-group-pgroup] quit
```

```
[Device-sslvpn-context-ctx] service enable
[Device-sslvpn-context-ctx] quit
```

10. Create a local user named **sslvpn**, set the password to **123456**, service type to **sslvpn**, and user role to **network-operator**. Authorize the user to use policy group **pgroup**.

```
[Device] local-user sslvpn class network
[Device-luser-network-sslvpn] password simple 123456
[Device-luser-network-sslvpn] service-type sslvpn
[Device-luser-network-sslvpn] authorization-attribute user-role network-operator
[Device-luser-network-sslvpn] authorization-attribute sslvpn-policy-group pgroup
[Device-luser-network-sslvpn] quit
```

Verifying the configuration

# Verify that SSL VPN gateway **gw** is up on the device.

```
[Device] display sslvpn gateway
Gateway name: gw
  Operation state: Up
  IP: 1.1.1.2  Port: 2000
  SSL server policy configured: ssl
  SSL server policy in use: ssl
  Front VPN instance: Not configured
```

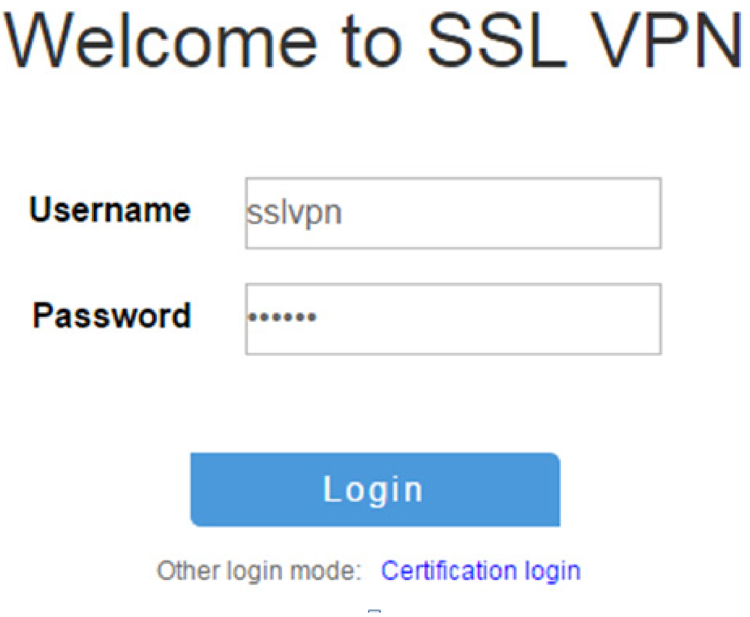
# Verify that SSL VPN context **ctx** is up on the device.

```
[Device] display sslvpn context
Context name: ctx
  Operation state: Up
  AAA domain: Not specified
  Certificate authentication: Disabled
  Password authentication: Enabled
  Authentication use: All
  SMS auth type: Not configured
  Urlmasking: Disabled
  Code verification: Disabled
  Default policy group: Not configured
  Associated SSL VPN gateway: gw
  SSL client policy configured: ssl
  SSL client policy in use: ssl
  Maximum users allowed: 1048575
  VPN instance: Not configured
  Idle timeout: 30 min
  Authentication server-type: aaa
  Password changing: Enabled
```

# On the user PC, enter **https://1.1.1.2:2000/** in the browser address bar to enter login page.

# On the login page, enter username **sslvpn** and password **123456**, and then click **Login**.

Figure 18 Login page



# On the SSL VPN home page that opens, click **Start** to download the TCP client application and start the application.

NOTE:

You cannot start the TCP client application by double-clicking it.

# Telnet to the local address (127.0.0.1) and local port (2323) on the PC. The user can remotely access the server. (Details not shown.)

# Display SSL VPN session information on the device.

```
[Device] display sslvpn session context ctx
SSL VPN context: ctx
Users: 1
Username        Connections  Idle time   Created       User IP
sslvpn          6            0/00:12:05  0/00:04:14    40.1.1.1
```

# Display SSL VPN port forwarding connection information on the device.

```
[Device] display sslvpn port-forward connection
SSL VPN context  : ctx
  Client address : 40.1.1.1
  Client port    : 50788
  Server address : 20.2.2.2
  Server port    : 23
  State          : Connected
```

Example: Configuring IP access

Network configuration

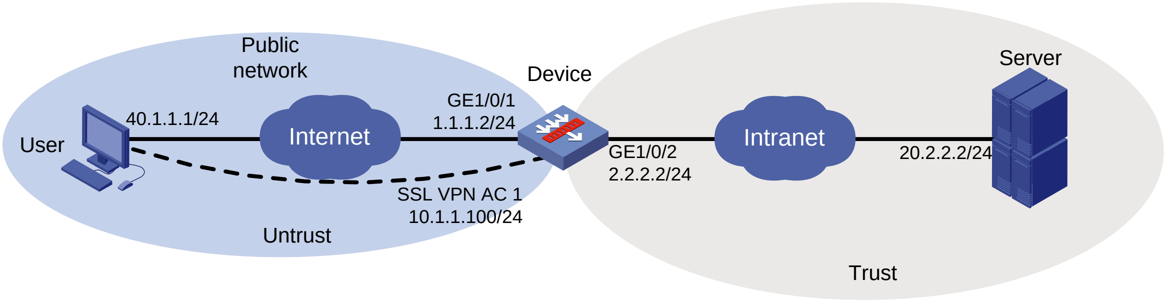
As shown in Figure 19, the device acts as an SSL VPN gateway that connects the public network and the private network.

The device uses a CA-signed SSL server certificate. If no SSL server policy is applied to the device, the device uses a self-signed SSL server certificate.

Configure SSL VPN IP access on the device to allow the user to access the internal server in the private network.

Configure the device to perform local authentication and authorization for the user.

Figure 19 Network diagram



Prerequisites

Before configuring IP access, make sure the server has a route to 10.1.1.0/24.

Procedure

1. Obtain CA certificate file **ca.cer** and local certificate file **server.pfx** for the device. (Details not shown.)
2. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

   ```
   <Device> system-view
   [Device] interface gigabitethernet 1/0/1
   [Device-GigabitEthernet1/0/1] ip address 1.1.1.2 255.255.255.0
   [Device-GigabitEthernet1/0/1] quit
   ```

   # Assign IP addresses to other interfaces in the same way. (Details not shown.)
3. Create SSL VPN AC interface AC 1 and configure the IP address as 10.1.1.100/24 for the interface.

   ```
   [Device] interface sslvpn-ac 1
   [Device-SSLVPN-AC1] ip address 10.1.1.100 24
   [Device-SSLVPN-AC1] quit
   ```
4. Configure settings for routing.

   This example configures static routes, and the next hop in the routes is 2.2.2.3 to the server, and 1.1.1.3 to the user.

   ```
   [Device] ip route-static 20.2.2.2 24 2.2.2.3
   [Device] ip route-static 40.1.1.1 24 1.1.1.3
   ```
5. Add interfaces to security zones.

   ```
   [Device] security-zone name untrust
   [Device-security-zone-Untrust] import interface gigabitethernet 1/0/1
   [Device-security-zone-Untrust] import interface sslvpn-ac 1
   [Device-security-zone-Untrust] quit
   [Device] security-zone name trust
   [Device-security-zone-Trust] import interface gigabitethernet 1/0/2
   [Device-security-zone-Trust] quit
   ```

6. Configure rules in a security policy to permit the traffic between security zones for the user to access the SSL VPN gateway and the server:

   # Configure a rule named **sslvpnlocalout1** to permit the packets from the device to the user.

```
[Device] security-policy ip
[Device-security-policy-ip] rule name sslvpnlocalout1
[Device-security-policy-ip-1-sslvpnlocalout1] source-zone local
[Device-security-policy-ip-1-sslvpnlocalout1] destination-zone untrust
[Device-security-policy-ip-1-sslvpnlocalout1] source-ip-host 1.1.1.2
[Device-security-policy-ip-1-sslvpnlocalout1] destination-ip-host 40.1.1.1
[Device-security-policy-ip-1-sslvpnlocalout1] action pass
[Device-security-policy-ip-1-sslvpnlocalout1] quit
```

   # Configure a rule named **sslvpnlocalin1** to permit the packets from the user to the device.

```
[Device-security-policy-ip] rule name sslvpnlocalin1
[Device-security-policy-ip-2-sslvpnlocalin1] source-zone untrust
[Device-security-policy-ip-2-sslvpnlocalin1] destination-zone local
[Device-security-policy-ip-2-sslvpnlocalin1] source-ip-host 40.1.1.1
[Device-security-policy-ip-2-sslvpnlocalin1] destination-ip-host 1.1.1.2
[Device-security-policy-ip-2-sslvpnlocalin1] action pass
[Device-security-policy-ip-2-sslvpnlocalin1] quit
```

   # Configure a rule named **sslvpnlocalout2** to permit the packets from the device to the server.

```
[Device-security-policy-ip] rule name sslvpnlocalout2
[Device-security-policy-ip-3-sslvpnlocalout2] source-zone local
[Device-security-policy-ip-3-sslvpnlocalout2] destination-zone trust
[Device-security-policy-ip-3-sslvpnlocalout2] source-ip-host 2.2.2.2
[Device-security-policy-ip-3-sslvpnlocalout2] destination-ip-host 20.2.2.2
[Device-security-policy-ip-3-sslvpnlocalout2] action pass
[Device-security-policy-ip-3-sslvpnlocalout2] quit
```

   # Configure a rule named **sslvpnlocalin2** to permit the packets from the server to the device.

```
[Device-security-policy-ip] rule name sslvpnlocalin2
[Device-security-policy-ip-4-sslvpnlocalin2] source-zone trust
[Device-security-policy-ip-4-sslvpnlocalin2] destination-zone local
[Device-security-policy-ip-4-sslvpnlocalin2] source-ip-host 20.2.2.2
[Device-security-policy-ip-4-sslvpnlocalin2] destination-ip-host 2.2.2.2
[Device-security-policy-ip-4-sslvpnlocalin2] action pass
[Device-security-policy-ip-4-sslvpnlocalin2] quit
```

   # Configure a rule named **untrust-trust** to allow the user to access the server through the SSL VPN AC interface.

```
[Device-security-policy-ip] rule name untrust-trust
[Device-security-policy-ip-5-untrust-trust] source-zone untrust
[Device-security-policy-ip-5-untrust-trust] destination-zone trust
[Device-security-policy-ip-5-untrust-trust] source-ip-subnet 10.1.1.0 24
[Device-security-policy-ip-5-untrust-trust] destination-ip-host 20.2.2.2
[Device-security-policy-ip-5-untrust-trust] action pass
[Device-security-policy-ip-5-untrust-trust] quit
```

   # Configure a rule named **trust-untrust** to permit the packets from the server to the user through the SSL VPN AC interface.

```
[Device-security-policy-ip] rule name trust-untrust
[Device-security-policy-ip-6-trust-untrust] source-zone trust
```

```
[Device-security-policy-ip-6-trust-untrust] destination-zone untrust
[Device-security-policy-ip-6-trust-untrust] source-ip-host 20.2.2.2
[Device-security-policy-ip-6-trust-untrust] destination-ip-subnet 10.1.1.0 24
[Device-security-policy-ip-6-trust-untrust] action pass
[Device-security-policy-ip-6-trust-untrust] quit
[Device-security-policy-ip] quit
```

7. Create ACL 3000. Add a rule to permit the packets sourced from subnet 10.1.1.0/24 and destined for 20.2.2.0/24.

```
[Device] acl advanced 3000
[Device-acl-ipv4-adv-3000] rule permit ip source 10.1.1.0 0.0.0.255 destination
20.2.2.0 0.0.0.255
[Device-acl-ipv4-adv-3000] quit
```

8. Configure a PKI domain named **sslvpn** and certificate-related parameters.

```
<Device> system-view
[Device] pki domain sslvpn
[Device-pki-domain-sslvpn] public-key rsa general name sslvpn
[Device-pki-domain-sslvpn] undo crl check  enable
[Device-pki-domain-sslvpn] quit
[Device] pki import domain sslvpn der ca filename ca.cer
[Device] pki import domain sslvpn p12 local filename server.pfx
```

9. Create an SSL server policy named **ssl** and specify PKI domain **sslvpn** for the policy.

```
[Device] ssl server-policy ssl
[Device-ssl-server-policy-ssl] pki-domain sslvpn
[Device-ssl-server-policy-ssl] quit
```

10. Configure the SSL VPN gateway for user access. Configure the IP address for SSL VPN gateway **gw** as 1.1.1.2 and port number as 4430, and then apply SSL server policy **ssl** to the gateway.

```
<Device> system-view
[Device] sslvpn gateway gw
[Device-sslvpn-gateway-gw] ip address 1.1.1.2 port 4430
[Device-sslvpn-gateway-gw] ssl server-policy ssl
[Device-sslvpn-gateway-gw] service enable
[Device-sslvpn-gateway-gw] quit
```

11. Create an IP access address pool named **sslvpnpool** and specify the address range as 10.1.1.1 to 10.1.1.10.

```
[Device] sslvpn ip address-pool sslvpnpool 10.1.1.1 10.1.1.10
```

12. Create SSL VPN context **ctxip**, and then specify gateway **gw** and domain **domainip** for the context.

```
[Device] sslvpn context ctxip
[Device-sslvpn-context-ctxip] gateway gw domain domainip
[Device-sslvpn-context-ctxip] ip-tunnel interface sslvpn-ac 1
[Device-sslvpn-context-ctxip] ip-route-list rtlist
[Device-sslvpn-context-ctxip-route-list-rtlist] include 20.2.2.0 24
[Device-sslvpn-context-ctxip-route-list-rtlist] quit
[Device-sslvpn-context-ctxip] ip-tunnel address-pool sslvpnpool mask 24
[Device-sslvpn-context-ctxip] policy-group resourcegrp
[Device-sslvpn-context-ctxip-policy-group-resourcegrp] ip-tunnel access-route
ip-route-list rtlist
[Device-sslvpn-context-ctxip-policy-group-resourcegrp] filter ip-tunnel acl 3000
```

```
[Device-sslvpn-context-ctxip-policy-group-resourcegrp] quit
[Device-sslvpn-context-ctxip] service enable
[Device-sslvpn-context-ctxip] quit
```

13. Create a local user named **sslvpnuser**, set the password to **123456**, service type to **sslvpn**, and user role to **network-operator**. Authorize the user to use policy group **resourcegrp**.

```
[Device] local-user sslvpnuser class network
[Device-luser-network-sslvpnuser] password simple 123456
[Device-luser-network-sslvpnuser] service-type sslvpn
[Device-luser-network-sslvpnuser] authorization-attribute sslvpn-policy-group
resourcegrp
[Device-luser-network-sslvpnuser] authorization-attribute user-role
network-operator
[Device-luser-network-sslvpnuser] quit
```

Verifying the configuration

# Verify that SSL VPN gateway **gw** is up on the device.

```
[Device] display sslvpn gateway
Gateway name: gw
  Operation state: Up
  IP: 1.1.1.2  Port: 4430
  Front VPN instance: Not configured
```

# Verify that SSL VPN context **ctxip** is up on the device.

```
[Device] display sslvpn context
Context name: ctxip
  Operation state: Up
  AAA domain: Not specified
  Certificate authentication: Disabled
  Password authentication: Enabled
  Authentication use: All
  SMS auth type: Not configured
  Urlmasking: Disabled
  Code verification: Disabled
  Default policy group: Not configured
  Associated SSL VPN gateway: gw
    Domain name: domainip
  Maximum users allowed: 1048575
  VPN instance: Not configured
  Idle timeout: 30 min
  Authentication server-type: aaa
  Password changing: Enabled
```

# On the user PC, enter **https://1.1.1.2:4430/** in the browser address bar to open the domain list page.

Example: Configuring RADIUS authentication and authorization

Network configuration

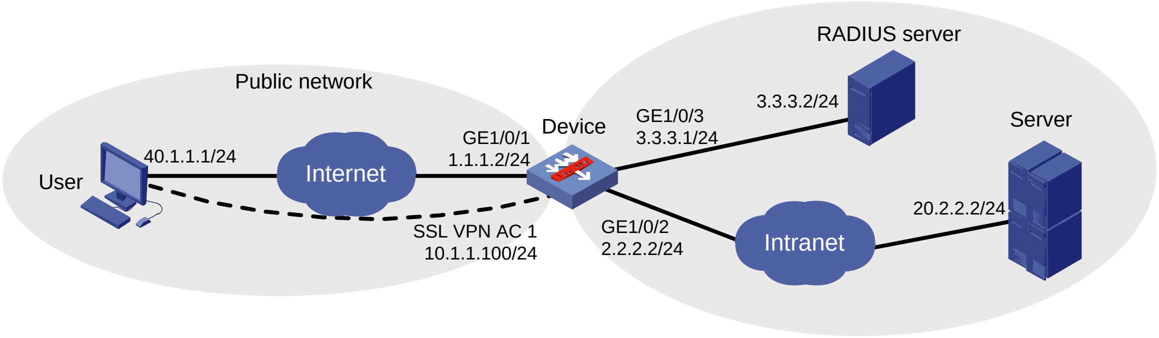
As shown in Figure 24, the device acts as an SSL VPN gateway that connects the public network and private network VPN 1.

The device uses a CA-signed SSL server certificate. If no SSL server policy is applied to the device, the device uses a self-signed SSL server certificate.

Configure SSL VPN IP access on the device to allow the user to access the internal server in the private network.

Configure the device to perform remote authentication and authorization (through the remote RADIUS server) for the user.

Figure 24 Network diagram



Prerequisites

Before configuring IP access, perform the following tasks:

- Make sure the server has a route to 10.1.1.0/24.
- Configure the RADIUS server to provide authentication and authorization for the user.

Procedure

1. Obtain CA certificate file **ca.cer** and local certificate file **server.pfx** for the device. (Details not shown.)
2. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

   ```
   <Device> system-view
   [Device] interface gigabitethernet 1/0/1
   [Device-GigabitEthernet1/0/1] ip address 1.1.1.2 255.255.255.0
   [Device-GigabitEthernet1/0/1] quit
   ```

   # Assign IP addresses to other interfaces in the same way. (Details not shown.)
3. Create SSL VPN AC interface AC 1 and configure the IP address as 10.1.1.100/24 for the interface.

   ```
   [Device] interface sslvpn-ac 1
   [Device-SSLVPN-AC1] ip address 10.1.1.100 24
   [Device-SSLVPN-AC1] quit
   ```
4. Configure settings for routing.

   This example configures static routes, and the next hop in the routes is 2.2.2.3 to the server, and 1.1.1.3 to the user.

```
[Device] ip route-static 20.2.2.2 24 2.2.2.3
[Device] ip route-static 40.1.1.1 24 1.1.1.3
```

5. Add interfaces to security zones.

```
[Device] security-zone name untrust
[Device-security-zone-Untrust] import interface gigabitethernet 1/0/1
[Device-security-zone-Untrust] import interface sslvpn-ac 1
[Device-security-zone-Untrust] quit
[Device] security-zone name trust
[Device-security-zone-Trust] import interface gigabitethernet 1/0/2
[Device-security-zone-Trust] import interface gigabitethernet 1/0/3
[Device-security-zone-Trust] quit
```

6. Configure rules in a security policy to permit the traffic between security zones for the user to access the SSL VPN gateway and the server:

# Configure a rule named **sslvpnlocalout1** to permit the packets from the device to the user.

```
[Device] security-policy ip
[Device-security-policy-ip] rule name sslvpnlocalout1
[Device-security-policy-ip-1-sslvpnlocalout1] source-zone local
[Device-security-policy-ip-1-sslvpnlocalout1] destination-zone untrust
[Device-security-policy-ip-1-sslvpnlocalout1] source-ip-host 1.1.1.2
[Device-security-policy-ip-1-sslvpnlocalout1] source-ip-host 10.1.1.100
[Device-security-policy-ip-1-sslvpnlocalout1] destination-ip-host 40.1.1.1
[Device-security-policy-ip-1-sslvpnlocalout1] destination-ip-subnet 10.1.1.0 24
[Device-security-policy-ip-1-sslvpnlocalout1] action pass
[Device-security-policy-ip-1-sslvpnlocalout1] quit
```

# Configure a rule named **sslvpnlocalin1** to permit the packets from the user to the device.

```
[Device-security-policy-ip] rule name sslvpnlocalin1
[Device-security-policy-ip-2-sslvpnlocalin1] source-zone untrust
[Device-security-policy-ip-2-sslvpnlocalin1] destination-zone local
[Device-security-policy-ip-2-sslvpnlocalin1] source-ip-host 40.1.1.1
[Device-security-policy-ip-2-sslvpnlocalin1] source-ip-host subnet 10.1.1.0 24
[Device-security-policy-ip-2-sslvpnlocalin1] destination-ip-host 1.1.1.2
[Device-security-policy-ip-2-sslvpnlocalin1] destination-ip-host 10.1.1.100
[Device-security-policy-ip-2-sslvpnlocalin1] action pass
[Device-security-policy-ip-2-sslvpnlocalin1] quit
```

# Configure a rule named **sslvpnlocalout2** to permit the packets from the device to the server.

```
[Device-security-policy-ip] rule name sslvpnlocalout2

[Device-security-policy-ip-4-sslvpnlocalin2] action pass
[Device-security-policy-ip-4-sslvpnlocalin2] quit
```

# Configure a rule named **untrust-trust** to allow the user to access the server through the SSL VPN AC interface.

```
[Device-security-policy-ip] rule name untrust-trust
[Device-security-policy-ip-5-untrust-trust] source-zone untrust
[Device-security-policy-ip-5-untrust-trust] destination-zone trust
[Device-security-policy-ip-5-untrust-trust] source-ip-subnet 10.1.1.0 24
[Device-security-policy-ip-5-untrust-trust] destination-ip-host 20.2.2.2
[Device-security-policy-ip-5-untrust-trust] action pass
[Device-security-policy-ip-5-untrust-trust] quit
```

# Configure a rule named **trust-untrust** to permit the packets from the server to the user through the SSL VPN AC interface.

```
[Device-security-policy-ip] rule name trust-untrust
[Device-security-policy-ip-6-trust-untrust] source-zone trust
[Device-security-policy-ip-6-trust-untrust] destination-zone untrust
[Device-security-policy-ip-6-trust-untrust] source-ip-host 20.2.2.2
[Device-security-policy-ip-6-trust-untrust] destination-ip-subnet 10.1.1.0 24
[Device-security-policy-ip-6-trust-untrust] action pass
[Device-security-policy-ip-6-trust-untrust] quit
[Device-security-policy-ip] quit
```

7. Configure a PKI domain named **sslvpn** and certificate-related parameters.

```
<Device> system-view
[Device] pki domain sslvpn
[Device-pki-domain-sslvpn] public-key rsa general name sslvpn
[Device-pki-domain-sslvpn] undo crl check  enable
[Device-pki-domain-sslvpn] quit
[Device] pki import domain sslvpn der ca filename ca.cer
[Device] pki import domain sslvpn p12 local filename server.pfx
```

8. Create an SSL server policy named **ssl** and specify PKI domain **sslvpn** for the policy.

```
[Device] ssl server-policy ssl
[Device-ssl-server-policy-ssl] pki-domain sslvpn
[Device-ssl-server-policy-ssl] quit
```

9. Configure the SSL VPN gateway for user access. Configure the IP address for SSL VPN gateway **gw** as 1.1.1.2 and port number as 2000, and then apply server policy **ssl** to the gateway.

```
[Device] sslvpn gateway gw
[Device-sslvpn-gateway-gw] ip address 1.1.1.2 port 2000
[Device-sslvpn-gateway-gw] ssl server-policy ssl
[Device-sslvpn-gateway-gw] service enable
[Device-sslvpn-gateway-gw] quit
```

10. Create an IP access address pool named **ippool** and specify the address range as 10.1.1.1 to 10.1.1.10.

```
[Device] sslvpn ip address-pool ippool 10.1.1.1 10.1.1.10
```

11. Configure RADIUS settings:

# Create a RADIUS scheme named **rscheme**. Specify the primary authentication server and primary accounting server as **3.3.3.2**. Set the keys for communication with the servers to **123456**.

```
[Device] radius scheme rscheme
[Device-radius-rscheme] primary authentication 3.3.3.2
[Device-radius-rscheme] primary accounting 3.3.3.2
[Device-radius-rscheme] accounting-on enable
[Device-radius-rscheme] key authentication simple 123456
[Device-radius-rscheme] key accounting simple 123456
```

# Exclude the domain name from the username sent to the RADIUS server.

```
[Device-radius-rscheme] user-name-format without-domain
[Device-radius-rscheme] quit
```

12. Create a user group named **group1** and authorize the user group to use SSL VPN policy group **pgroup**.

```
[Device] user-group group1
[Device-ugroup-group1] authorization-attribute sslvpn-policy-group pgroup
[Device-ugroup-group1] quit
```

13. Configure ISP domain **domain1**:

# Create an ISP domain named **domain1** and authorize the domain to use user group **group1**.

```
[Device] domain domain1
[Device-isp-domain1] authorization-attribute user-group group1
```

# Configure the ISP domain to use RADIUS scheme **rscheme** for AAA of users.

```
[Device-isp-domain1] authentication sslvpn radius-scheme rscheme
[Device-isp-domain1] authorization sslvpn radius-scheme rscheme
[Device-isp-domain1] accounting sslvpn radius-scheme rscheme
[Device-isp-domain1] quit
```

14. Create an SSL VPN context named **ctx**, specify gateway **gw** for the context, and then associate the context with VPN instance **VPN1**.

```
[Device] sslvpn context ctx
[Device-sslvpn-context-ctx] gateway gw
[Device-sslvpn-context-ctx] vpn-instance VPN1
[Device-sslvpn-context-ctx] aaa domain domain1
[Device-sslvpn-context-ctx] ip-route-list rtlist
[Device-sslvpn-context-ctx-route-list-rtlist] include 20.2.2.0 255.255.255.0
[Device-sslvpn-context-ctx-route-list-rtlist] quit
[Device-sslvpn-context-ctx] uri-acl uriacl
[Device-sslvpn-context-ctx-uri-acl-uriacl] rule 1 permit uri icmp://20.2.2.0
[Device-sslvpn-context-ctx-uri-acl-uriacl] quit
[Device-sslvpn-context-ctx] ip-tunnel interface sslvpn-ac 1
[Device-sslvpn-context-ctx] ip-tunnel address-pool ippool mask 255.255.255.0
[Device-sslvpn-context-ctx] policy-group pgroup
[Device-sslvpn-context-ctx-policy-group-pgroup] ip-tunnel access-route
ip-route-list rtlist
[Device-sslvpn-context-ctx-policy-group-pgroup] filter ip-tunnel uri-acl uriacl
[Device-sslvpn-context-ctx-policy-group-pgroup] quit
[Device-sslvpn-context-ctx] service enable
[Device-sslvpn-context-ctx] quit
```

Verifying the configuration

# Verify that SSL VPN gateway **gw** is up on the device.

```
[Device] display sslvpn gateway
Gateway name: gw
  Operation state: Up
  IP: 1.1.1.2  Port: 2000
  SSL server policy configured: ssl
  SSL server policy in use: ssl
  Front VPN instance: Not configured
```

# Verify that SSL VPN context **ctx** is up on the device.

```
[Device] display sslvpn context
Context name: ctx
  Operation state: Up
  AAA domain: domain1

Reply from 20.2.2.2: bytes=32 time=186ms TTL=254

Ping statistics for 20.2.2.2:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
Approximate round trip times in milli-seconds:
    Minimum = 1ms, Maximum = 197ms, Average = 96ms
```

Example: Configuring LDAP authentication and authorization

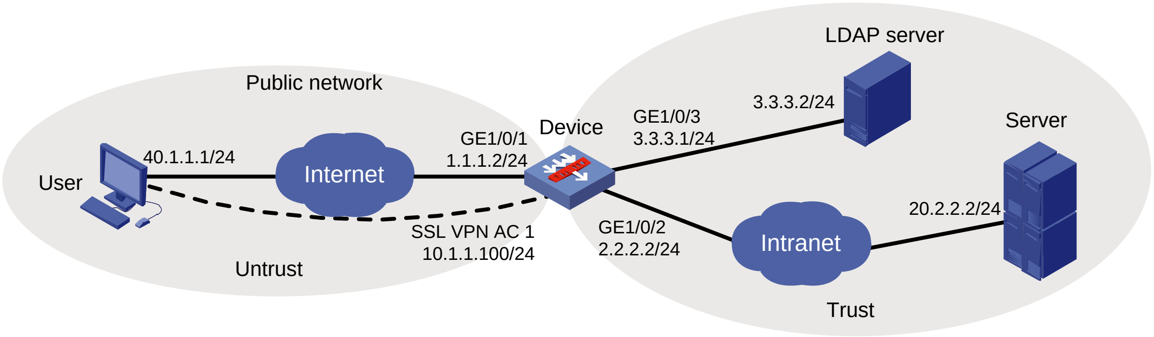
Network configuration

As shown in Figure 25, the device acts as an SSL VPN gateway. The SSL VPN gateway IP address is 1.1.1.2 and the service port number is 8080.

The device uses a CA-signed SSL server certificate. If no SSL server policy is applied to the device, the device uses a self-signed SSL server certificate.

Use an LDAP server to perform authentication and authorization for SSL VPN users. The LDAP server runs Microsoft Windows Server 2008 R2 Active Directory and uses domain **ldap.com**. The server assigns an SSL VPN policy group named **pgroup** to an SSL VPN user after the user passes authentication. The policy group specifies the Web resources that the user can access.

Figure 25 Network diagram



Configuring the LDAP server

1. Add an organizational unit named **sslvpn_usergroup**:

a. On the LDAP server, select **Start** > **Bandizip** > **Administrative Tools**.

b. Double-click **Active Directory Users and Computers**.

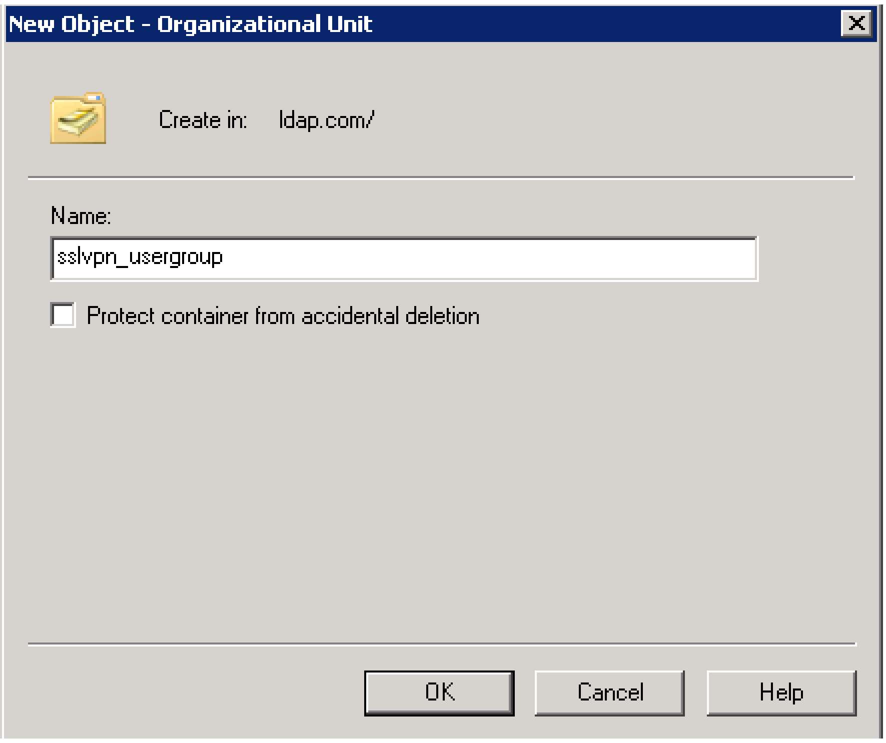
The **Active Directory Users and Computers** window opens.

c. From the navigation tree, right-click **ldap.com**.

d. Select **New** > **Organizational Unit** from the menu to display the dialog box for adding an organizational unit.

e. Enter organizational unit name **sslvpn_usergroup** and click **OK**.

Figure 26 Adding organizational unit sslvpn_usergroup



New Object - Organizational Unit

Create in: ldap.com/

Name: sslvpn_usergroup

☐ Protect container from accidental deletion

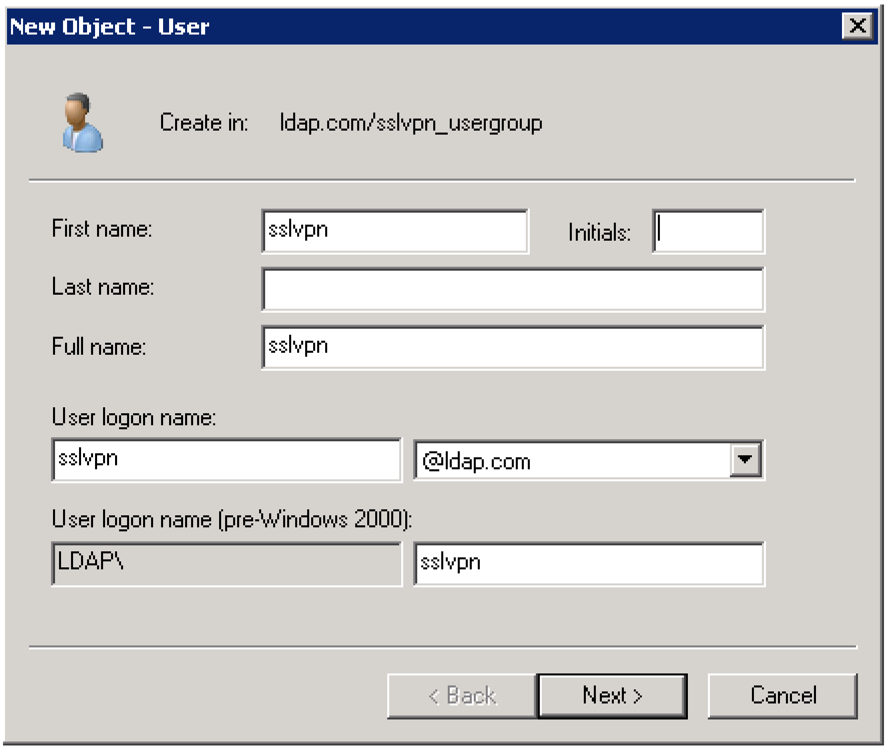
2. Add a user named **sslvpn** under organizational unit **sslvpn_usergroup** and set the password to **ldap!123456**:

a. From the navigation tree, right-click **sslvpn_usergroup**.

b. Select **New** > **User** from the menu to display the dialog box for adding a user.

c. Enter logon name **sslvpn** and click **Next**.

Figure 27 Adding user sslvpn



Create in: ldap.com/sslvpn_usergroup

First name: sslvpn

Initials:

Last name:

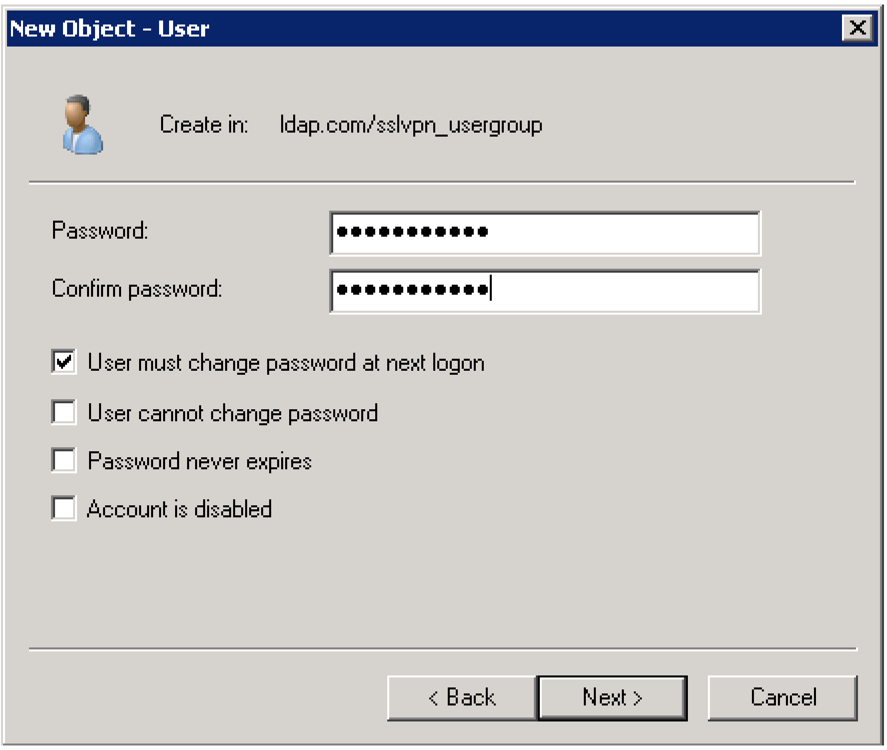
Full name: sslvpn

User logon name: sslvpn @ldap.com

User logon name (pre-Windows 2000): LDAP\ sslvpn

a. In the dialog box, enter password **ldap!123456**, select options as needed, and click **Next**.

Figure 28 Setting the user's password



Create in: ldap.com/sslvpn_usergroup

Password: ●●●●●●●●●●●

Confirm password: ●●●●●●●●●●●

☑ User must change password at next logon

□ User cannot change password

□ Password never expires

□ Account is disabled

a. Click **Next**.

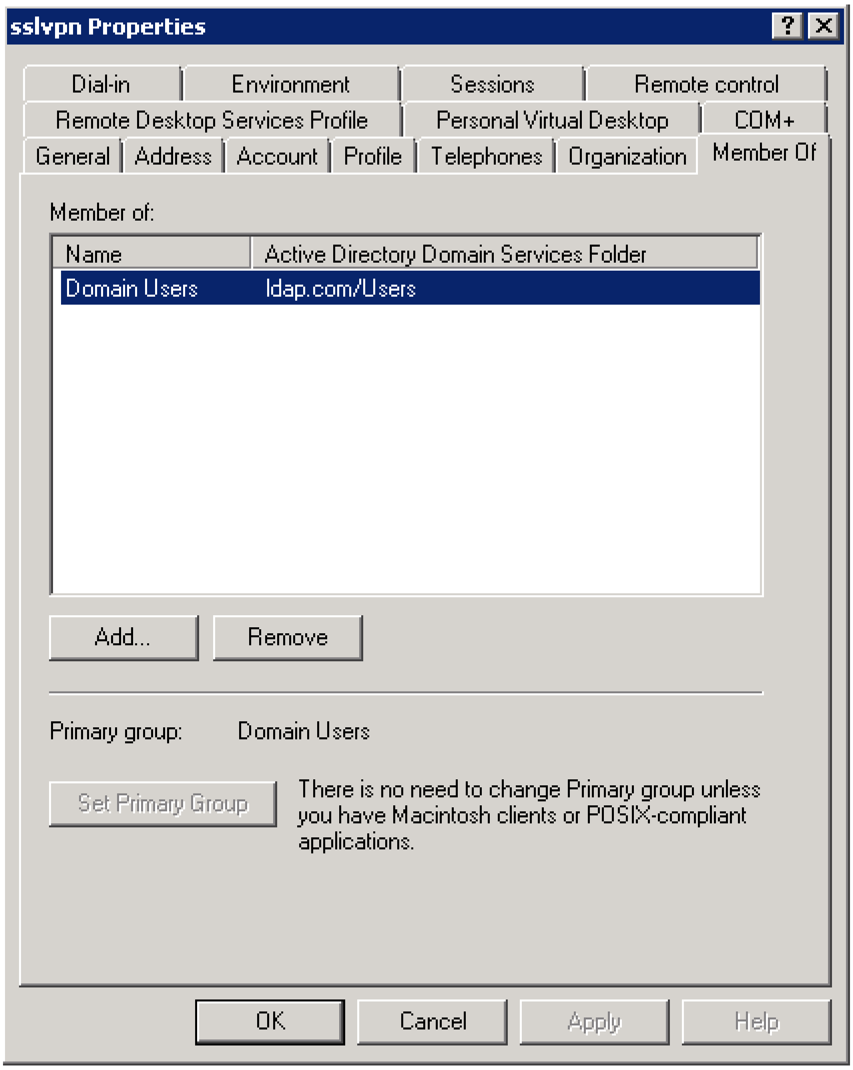
3. Add user **sslvpn** to group **Users**:

a. From the navigation tree, click **sslvpn_usergroup**.

b. In the right pane, right-click user **sslvpn** and select **Properties**.

c. In the dialog box, click the **Member Of** tab and click **Add**.

Figure 29 Modifying user properties



Member of:

Name	Active Directory Domain Services Folder
Domain Users	ldap.com/Users

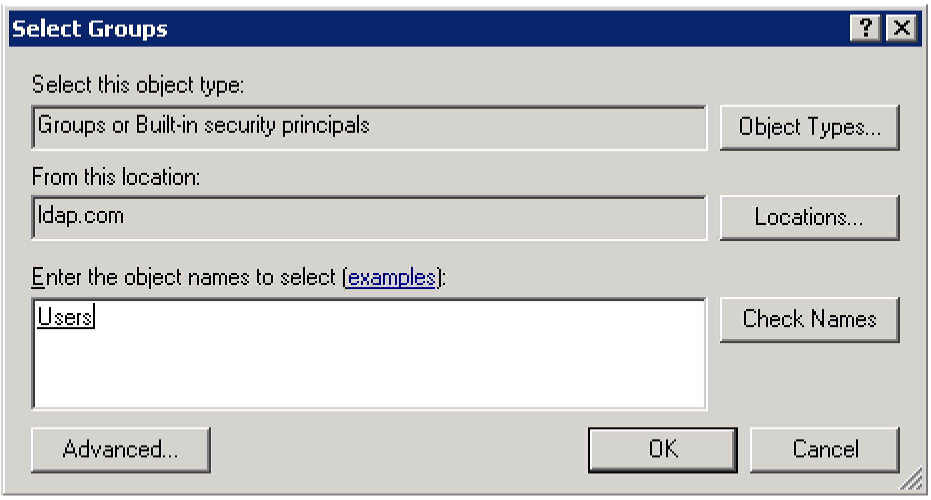
Primary group: Domain Users

There is no need to change Primary group unless you have Macintosh clients or POSIX-compliant applications.

a. In the **Select Groups** dialog box, enter **Users** in the **Enter the object names to select** field, and click **OK**.

User **sslvpn** is added to group **Users**.

Figure 30 Adding user sslvpn to group Users



Select Groups

Select this object type:

Groups or Built-in security principals

From this location:

ldap.com

Enter the object names to select (examples):

Users

Configuring the device

1. Obtain CA certificate file **ca.cer** and local certificate file **server.pfx** for the device. (Details not shown.)
2. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

   ```
   <Device> system-view
   [Device] interface gigabitethernet 1/0/1
   [Device-GigabitEthernet1/0/1] ip address 1.1.1.2 255.255.255.0
   [Device-GigabitEthernet1/0/1] quit
   ```

   # Assign IP addresses to other interfaces in the same way. (Details not shown.)
3. Create SSL VPN AC interface AC 1 and configure the IP address as 10.1.1.100/24 for the interface.

   ```
   [Device] interface sslvpn-ac 1
    [Device-SSLVPN-AC1] ip address 10.1.1.100 24
   [Device-SSLVPN-AC1] quit
   ```
4. Configure settings for routing.

   This example configures static routes, and the next hop in the routes is 2.2.2.3 to the server, and 1.1.1.3 to the user.

   ```
   [Device] ip route-static 20.2.2.2 24 2.2.2.3
   [Device] ip route-static 40.1.1.1 24 1.1.1.3
   ```
5. Add interfaces to security zones.

   ```
   [Device] security-zone name untrust
   [Device-security-zone-Untrust] import interface gigabitethernet 1/0/1
   [Device-security-zone-Untrust] import interface sslvpn-ac 1
   [Device-security-zone-Untrust] quit
   [Device] security-zone name trust
   [Device-security-zone-Trust] import interface gigabitethernet 1/0/2
   [Device-security-zone-Trust] import interface gigabitethernet 1/0/3
   [Device-security-zone-Trust] quit
   ```
6. Configure rules in a security policy to permit the traffic between security zones for the user to access the SSL VPN gateway and the server:

   # Configure a rule named **sslvpnlocalout1** to permit the packets from the device to the user.

```
[Device] security-policy ip
[Device-security-policy-ip] rule name sslvpnlocalout1
[Device-security-policy-ip-1-sslvpnlocalout1] source-zone local
[Device-security-policy-ip-1-sslvpnlocalout1] destination-zone untrust
[Device-security-policy-ip-1-sslvpnlocalout1] source-ip-host 1.1.1.2
[Device-security-policy-ip-1-sslvpnlocalout1] source-ip-host 10.1.1.100
[Device-security-policy-ip-1-sslvpnlocalout1] destination-ip-host 40.1.1.1
[Device-security-policy-ip-1-sslvpnlocalout1] destination-ip-subnet 10.1.1.0 24
[Device-security-policy-ip-1-sslvpnlocalout1] action pass
[Device-security-policy-ip-1-sslvpnlocalout1] quit
```

# Configure a rule named **sslvpnlocalin1** to permit the packets from the user to the device.

```
[Device-security-policy-ip] rule name sslvpnlocalin1
[Device-security-policy-ip-2-sslvpnlocalin1] source-zone untrust
[Device-security-policy-ip-2-sslvpnlocalin1] destination-zone local
[Device-security-policy-ip-2-sslvpnlocalin1] source-ip-host 40.1.1.1
[Device-security-policy-ip-2-sslvpnlocalin1] source-ip-host subnet 10.1.1.0 24
[Device-security-policy-ip-2-sslvpnlocalin1] destination-ip-host 1.1.1.2
[Device-security-policy-ip-2-sslvpnlocalin1] destination-ip-host 10.1.1.100
[Device-security-policy-ip-2-sslvpnlocalin1] action pass
[Device-security-policy-ip-2-sslvpnlocalin1] quit
```

# Configure a rule named **sslvpnlocalout2** to permit the packets from the device to the server.

```
[Device-security-policy-ip] rule name sslvpnlocalout2
[Device-security-policy-ip-3-sslvpnlocalout2] source-zone local
[Device-security-policy-ip-3-sslvpnlocalout2] destination-zone trust
[Device-security-policy-ip-3-sslvpnlocalout2] source-ip-host 2.2.2.2
[Device-security-policy-ip-3-sslvpnlocalout2] source-ip-host 3.3.3.1
[Device-security-policy-ip-3-sslvpnlocalout2] destination-ip-host 20.2.2.2
[Device-security-policy-ip-3-sslvpnlocalout2] destination-ip-host 3.3.3.2
[Device-security-policy-ip-3-sslvpnlocalout2] action pass
[Device-security-policy-ip-3-sslvpnlocalout2] quit
```

# Configure a rule named **sslvpnlocalin2** to permit the packets from the server to the device.

```
[Device-security-policy-ip] rule name sslvpnlocalin2
[Device-security-policy-ip-4-sslvpnlocalin2] source-zone trust
[Device-security-policy-ip-4-sslvpnlocalin2] destination-zone local
[Device-security-policy-ip-4-sslvpnlocalin2] source-ip-host 20.2.2.2
[Device-security-policy-ip-4-sslvpnlocalin2] source-ip-host 3.3.3.2
[Device-security-policy-ip-4-sslvpnlocalin2] destination-ip-host 2.2.2.2
[Device-security-policy-ip-4-sslvpnlocalin2] destination-ip-host 3.3.3.1
[Device-security-policy-ip-4-sslvpnlocalin2] action pass
[Device-security-policy-ip-4-sslvpnlocalin2] quit
```

# Configure a rule named **untrust-trust** to allow the user to access the server through the SSL VPN AC interface.

```
[Device-security-policy-ip] rule name untrust-trust
[Device-security-policy-ip-5-untrust-trust] source-zone untrust
[Device-security-policy-ip-5-untrust-trust] destination-zone trust
[Device-security-policy-ip-5-untrust-trust] source-ip-subnet 10.1.1.0 24
[Device-security-policy-ip-5-untrust-trust] destination-ip-host 20.2.2.2
[Device-security-policy-ip-5-untrust-trust] action pass
```

```
[Device-security-policy-ip-5-untrust-trust] quit
```

# Configure a rule named **trust-untrust** to permit the packets from the server to the user through the SSL VPN AC interface.

```
[Device-security-policy-ip] rule name trust-untrust
[Device-security-policy-ip-6-trust-untrust] source-zone trust
[Device-security-policy-ip-6-trust-untrust] destination-zone untrust
[Device-security-policy-ip-6-trust-untrust] source-ip-host 20.2.2.2
[Device-security-policy-ip-6-trust-untrust] destination-ip-subnet 10.1.1.0 24
[Device-security-policy-ip-6-trust-untrust] action pass
[Device-security-policy-ip-6-trust-untrust] quit
[Device-security-policy-ip] quit
```

7. Configure a PKI domain named **sslvpn** and certificate-related parameters.

```
[Device] pki domain sslvpn
[Device-pki-domain-sslvpn] public-key rsa general name sslvpn
[Device-pki-domain-sslvpn] undo crl check  enable
[Device-pki-domain-sslvpn] quit
[Device] pki import domain sslvpn der ca filename ca.cer
[Device] pki import domain sslvpn p12 local filename server.pfx
```

8. Create an SSL server policy named **ssl** and specify PKI domain **sslvpn** for the policy.

```
[Device] ssl server-policy ssl
[Device-ssl-server-policy-ssl] pki-domain sslvpn
[Device-ssl-server-policy-ssl] quit
```

9. Configure the SSL VPN gateway for user access. Configure the IP address for SSL VPN gateway **gw** as 1.1.1.2 and port number as 2000, and then apply server policy **ssl** to the gateway.

```
[Device] sslvpn gateway gw
[Device-sslvpn-gateway-gw] ip address 1.1.1.2 port 2000
[Device-sslvpn-gateway-gw] ssl server-policy ssl
[Device-sslvpn-gateway-gw] service enable
[Device-sslvpn-gateway-gw] quit
```

10. Create an IP access address pool named **ippool** and specify the address range as 10.1.1.1 to 10.1.1.10.

```
[Device] sslvpn ip address-pool ippool 10.1.1.1 10.1.1.10
```

11. Configure LDAP settings for SSL VPN user authentication.

```
[Device] ldap server ldap1
[Device-ldap-server-ldap1] ip 3.3.3.2
[Device-ldap-server-ldap1] login-dn cn=admin,cn=users,dc=ldap,dc=com
[Device-ldap-server-ldap1] login-password simple admin!123456
[Device-ldap-server-ldap1] search-base-dn dc=ldap,dc=com
[Device-ldap-server-ldap1] quit
[Device] ldap attribute-map test
[Device-ldap-attr-map-test] map ldap-attribute memberof prefix cn= delimiter , 
aaa-attribute user-group
[Device-ldap-attr-map-test] quit
[Device] ldap scheme shml
[Device-ldap-shml] authentication-server ldap1
[Device-ldap-shml] authorization-server ldap1
[Device-ldap-shml] attribute-map test
[Device-ldap-shml] quit
```

12. Create an ISP domain named **bbb** and configure the authentication, authorization, and accounting methods for SSL VPN users.

```
[Device] domain bbb
[Device-isp-bbb] authentication sslvpn ldap-scheme shml
[Device-isp-bbb] authorization sslvpn ldap-scheme shml
[Device-isp-bbb] accounting sslvpn none
[Device-isp-bbb] quit
```

13. Create an SSL VPN context named **ctx**, specify gateway **gw** for the context, and then associate the context with VPN instance **VPN1**.

```
[Device] sslvpn context ctx
[Device-sslvpn-context-ctx] gateway gw
[Device-sslvpn-context-ctx] vpn-instance VPN1
[Device-sslvpn-context-ctx] aaa domain bbb
[Device-sslvpn-context-ctx] ip-route-list rtlist
[Device-sslvpn-context-ctx-route-list-rtlist] include 20.2.2.0 255.255.255.0
[Device-sslvpn-context-ctx-route-list-rtlist] quit
[Device-sslvpn-context-ctx] uri-acl uriacl
[Device-sslvpn-context-ctx-uri-acl-uriacl] rule 1 permit uri icmp://20.2.2.0
[Device-sslvpn-context-ctx-uri-acl-uriacl] quit
[Device-sslvpn-context-ctx] ip-tunnel interface sslvpn-ac 1
[Device-sslvpn-context-ctx] ip-tunnel address-pool ippool mask 255.255.255.0
[Device-sslvpn-context-ctx] policy-group pgroup
[Device-sslvpn-context-ctx-policy-group-pgroup] ip-tunnel access-route
ip-route-list rtlist
[Device-sslvpn-context-ctx-policy-group-pgroup] filter ip-tunnel uri-acl uriacl
[Device-sslvpn-context-ctx-policy-group-pgroup] quit
[Device-sslvpn-context-ctx] service enable
[Device-sslvpn-context-ctx] quit
```

14. Create a user group named **users** and authorize the user group to use SSL VPN policy group **pgroup**.

```
[Device] user-group users
[Device-ugroup-users] authorization-attribute sslvpn-policy-group pgroup
[Device-ugroup-users] quit
```

Verifying the configuration

# Verify that SSL VPN gateway **gw** is up on the device.

```
[Device] display sslvpn gateway
Gateway name: gw
  Operation state: Up
  IP: 1.1.1.2  Port: 2000
  SSL server policy configured: ssl
  SSL server policy in use: ssl
  Front VPN instance: Not configured
```

# Verify that SSL VPN context **ctx** is up on the device.

```
[Device] display sslvpn context
Context name: ctx
  Operation state: Up
  AAA domain: domain1

    Minimum = 1ms, Maximum = 197ms, Average = 96ms
```

Example: Configuring IP access with USB key certificate authentication

Network configuration

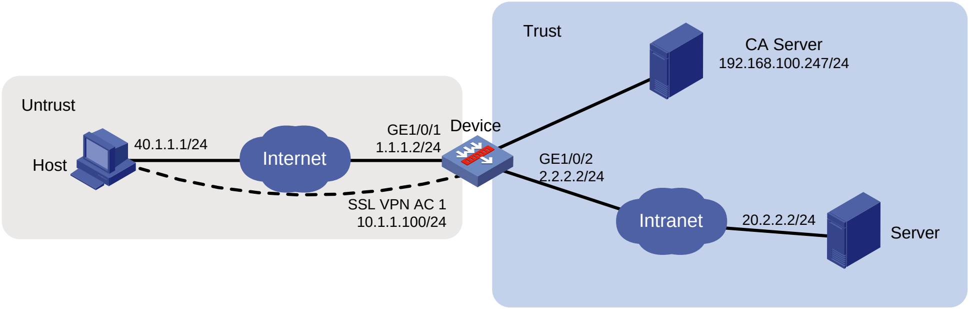
As shown in Figure 31, the device acts as an SSL VPN gateway that connects the public network and the private network.

Configure SSL VPN IP access on the device to allow a user on the public network to access the internal server on the private network securely.

Configure the device to perform certificate-based identity authentication for the user and authorize the user to access the internal server after the user passes the authentication.

The user uses a USB key to log in to the SSL VPN gateway.

Figure 31 Network diagram



Restrictions and guidelines

The device can use a self-signed SSL server certificate or a CA-signed SSL server certificate.

- **Self-signed SSL server certificate**—Factory default server certificate on the device. If the device uses a self-signed SSL server certificate, no SSL server policy is needed.
- **CA-signed SSL server certificate**—User requested server certificate. If the device uses a CA-signed SSL server certificate, you must specify an SSL server policy.

Because the self-signed SSL server certificate is not secure, use it only for a functional test. In practice, please use a CA-signed SSL server certificate.

Prerequisites

Before configuring SSL VPN, make sure of the following:

- The device has obtained CA certificate **ca.cer** and server certificate **server.pfx**. The USB key has installed certificates. The certificates in the USB key and those on the device are issued by the same CA.
- The specified attribute (CN attribute by default) in the client certificate of the USB key is the same as the username of the SSL VPN user.
- Install the driver for the USB key to ensure availability of the USB key.

Configuring the SSL VPN gateway device

1. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

   ```
   <Device> system-view
   [Device] interface gigabitethernet 1/0/1
   [Device-GigabitEthernet1/0/1] ip address 1.1.1.2 255.255.255.0
   [Device-GigabitEthernet1/0/1] quit
   ```

   # Create an SSL VPN AC interface and assign an IP address to it to forward the IP access traffic.

   ```
   [Device] interface sslvpn-ac 1
   [Device-SSLVPN-AC1] ip address 10.1.1.100 24
   [Device-SSLVPN-AC1] quit
   ```

   # Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Add interfaces to security zones.

   ```
   [Device] security-zone name untrust
   [Device-security-zone-Untrust] import interface gigabitethernet 1/0/1
   [Device-security-zone-Untrust] import interface sslvpn-ac 1
   [Device-security-zone-Untrust] quit
   [Device] security-zone name trust
   [Device-security-zone-Trust] import interface gigabitethernet 1/0/2
   [Device-security-zone-Trust] quit
   ```

3. Configure settings for routing.

   This example configures static routes, and the next hop in the route to the server is 2.2.2.3, and the next hop in the route to the host is 1.1.1.3.

   ```
   [Device] ip route-static 20.2.2.2 24 2.2.2.3
   [Device] ip route-static 40.1.1.1 24 1.1.1.3
   ```

4. Configure security policy rules to permit traffic between security zones for the user to access the SSL VPN gateway and the server.

   # Configure a rule named **sslvpnlocalout1** to allow the SSL VPN gateway to send packets to the user.

   ```
   [Device] security-policy ip
   [Device-security-policy-ip] rule name sslvpnlocalout1
   [Device-security-policy-ip-1-sslvpnlocalout1] source-zone local
   [Device-security-policy-ip-1-sslvpnlocalout1] destination-zone untrust
   [Device-security-policy-ip-1-sslvpnlocalout1] source-ip-host 1.1.1.2
   [Device-security-policy-ip-1-sslvpnlocalout1] destination-ip-host 40.1.1.1
   [Device-security-policy-ip-1-sslvpnlocalout1] action pass
   [Device-security-policy-ip-1-sslvpnlocalout1] quit
   ```

   # Configure a rule named **sslvpnlocalin1** to allow the user to send packets to the SSL VPN gateway.

   ```
   [Device-security-policy-ip] rule name sslvpnlocalin1
   [Device-security-policy-ip-2-sslvpnlocalin1] source-zone untrust
   [Device-security-policy-ip-2-sslvpnlocalin1] destination-zone local
   [Device-security-policy-ip-2-sslvpnlocalin1] source-ip-host 40.1.1.1
   [Device-security-policy-ip-2-sslvpnlocalin1] destination-ip-host 1.1.1.2
   [Device-security-policy-ip-2-sslvpnlocalin1] action pass
   [Device-security-policy-ip-2-sslvpnlocalin1] quit
   ```

# Configure a rule named **sslvpnlocalout2** to allow the SSL VPN gateway to send packets to the server.

```
[Device-security-policy-ip] rule name sslvpnlocalout2
[Device-security-policy-ip-3-sslvpnlocalout2] source-zone local
[Device-security-policy-ip-3-sslvpnlocalout2] destination-zone trust
[Device-security-policy-ip-3-sslvpnlocalout2] source-ip-host 2.2.2.2
[Device-security-policy-ip-3-sslvpnlocalout2] destination-ip-host 20.2.2.2
[Device-security-policy-ip-3-sslvpnlocalout2] action pass
[Device-security-policy-ip-3-sslvpnlocalout2] quit
```

# Configure a rule named **sslvpnlocalin2** to allow the server to send packets to the SSL VPN gateway.

```
[Device-security-policy-ip] rule name sslvpnlocalin2
[Device-security-policy-ip-4-sslvpnlocalin2] source-zone trust
[Device-security-policy-ip-4-sslvpnlocalin2] destination-zone local
[Device-security-policy-ip-4-sslvpnlocalin2] source-ip-host 20.2.2.2
[Device-security-policy-ip-4-sslvpnlocalin2] destination-ip-host 2.2.2.2
[Device-security-policy-ip-4-sslvpnlocalin2] action pass
[Device-security-policy-ip-4-sslvpnlocalin2] quit
```

# Configure a rule named **untrust-trust** to allow the user to access the server through the SSL VPN AC interface.

```
[Device-security-policy-ip] rule name untrust-trust
[Device-security-policy-ip-5-untrust-trust] source-zone untrust
[Device-security-policy-ip-5-untrust-trust] destination-zone trust
[Device-security-policy-ip-5-untrust-trust] source-ip-subnet 10.1.1.0 24
[Device-security-policy-ip-5-untrust-trust] destination-ip-host 20.2.2.2
[Device-security-policy-ip-5-untrust-trust] action pass
[Device-security-policy-ip-5-untrust-trust] quit
```

# Configure a rule named **trust-untrust** to allow the server to send packets to the user through the SSL VPN AC interface.

```
[Device-security-policy-ip] rule name trust-untrust
[Device-security-policy-ip-6-trust-untrust] source-zone trust
[Device-security-policy-ip-6-trust-untrust] destination-zone untrust
[Device-security-policy-ip-6-trust-untrust] source-ip-host 20.2.2.2
[Device-security-policy-ip-6-trust-untrust] destination-ip-subnet 10.1.1.0 24
[Device-security-policy-ip-6-trust-untrust] action pass
[Device-security-policy-ip-6-trust-untrust] quit
[Device-security-policy-ip] quit
```

5. Configure certificates for the device, which are used by the SSL VPN client to authenticate the SSL VPN gateway.

# Configure a PKI domain to import the certificates.

```
[Device] pki domain sslvpn
[Device-pki-domain-sslvpn] public-key rsa general name sslvpn
[Device-pki-domain-sslvpn] undo crl check  enable
[Device-pki-domain-sslvpn] quit
[Device] pki import domain sslvpn der ca filename ca.cer
[Device] pki import domain sslvpn p12 local filename server.pfx
```

# Configure an SSL VPN server policy, specify the PKI domain, and enable client authentication in the policy.

```
[Device] ssl server-policy ssl
```

```
[Device-ssl-server-policy-ssl] pki-domain sslvpn
[Device-ssl-server-policy-ssl] client-verify enable
[Device-ssl-server-policy-ssl] quit
```

6. Configure SSL VPN:

   # Configure the SSL VPN gateway.

```
[Device] sslvpn gateway gw
[Device-sslvpn-gateway-gw] ip address 1.1.1.2 port 4430
[Device-sslvpn-gateway-gw] ssl server-policy ssl
[Device-sslvpn-gateway-gw] service enable
[Device-sslvpn-gateway-gw] quit
```

   # Create an SSL VPN client pool, which is used to assign IP addresses to IP access users.

```
[Device] sslvpn ip address-pool sslvpnpool 10.1.1.1 10.1.1.10
```

   # Create an ACL to filter IP access traffic.

```
[Device] acl advanced 3000
[Device-acl-ipv4-adv-3000] rule permit ip source 10.1.1.0 0.0.0.255 destination
20.2.2.0 0.0.0.255
[Device-acl-ipv4-adv-3000] quit
```

   # Configure an SSL VPN context, enable certificate authentication for users, and provide SSL VPN IP access services to users.

```
[Device] sslvpn context ctxip
[Device-sslvpn-context-ctxip] gateway gw
[Device-sslvpn-context-ctxip] certificate-authentication enable
[Device-sslvpn-context-ctxip] ip-tunnel interface sslvpn-ac 1
[Device-sslvpn-context-ctxip] ip-route-list rtlist
[Device-sslvpn-context-ctxip-route-list-rtlist] include 20.2.2.0 24
[Device-sslvpn-context-ctxip-route-list-rtlist] quit
[Device-sslvpn-context-ctxip] ip-tunnel address-pool sslvpnpool mask 24
[Device-sslvpn-context-ctxip] policy-group resourcegrp
[Device-sslvpn-context-ctxip-policy-group-resourcegrp] ip-tunnel access-route
ip-route-list rtlist
[Device-sslvpn-context-ctxip-policy-group-resourcegrp] filter ip-tunnel acl 3000
[Device-sslvpn-context-ctxip-policy-group-resourcegrp] quit
[Device-sslvpn-context-ctxip] service enable
[Device-sslvpn-context-ctxip] quit
```

7. Configure an SSL VPN user, which is used to access the SSL VPN gateway.

   # Create a local SSL VPN user named **sslvpnuser**, specify the password as **123456TESTplat&!**, user role as **network-operator**, and the SSL VPN policy group authorized as **resourcegrp**.

```
[Device] local-user sslvpnuser class network
[Device-luser-network-sslvpnuser] password simple 123456TESTplat&!
[Device-luser-network-sslvpnuser] service-type sslvpn
[Device-luser-network-sslvpnuser] authorization-attribute sslvpn-policy-group
resourcegrp
[Device-luser-network-sslvpnuser] authorization-attribute user-role
network-operator
[Device-luser-network-sslvpnuser] quit
```

Configuring the server

Make sure the server has a route to subnet 10.1.1.0/24.

Verifying the configuration

1. Display SSL VPN information on the device:

   # Display SSL VPN gateway information. The output shows that the SSL VPN gateway is in UP state.

   ```
   [Device] display sslvpn gateway
   Gateway name: gw
     Operation state: Up
     IP: 1.1.1.2  Port: 4430
     Front VPN instance: Not configured
   ```

   # Display SSL VPN context information. The output shows that the SSL VPN context is in UP state.

   ```
   [Device] display sslvpn context
   Context name: ctxip
     Operation state: Up
     AAA domain: Not specified
     Certificate authentication: Enabled
     Password authentication: Enabled
     Authentication use: All
     SMS auth type: Not configured
     Urlmasking: Disabled
     Code verification: Disabled
     Default policy group: Not configured
     Associated SSL VPN gateway: gw
     Maximum users allowed: 1048575
     VPN instance: Not configured
     Idle timeout: 30 min
     Authentication server-type: aaa
     Password changing: Enabled
   ```

   # After the user logs in to the SSL VPN gateway, display SSL VPN session information on the device. The output shows the session information of SSL VPN user **sslvpnuser**.

   ```
   [Device] display sslvpn session user sslvpnuser
   User              : sslvpnuser
   Context           : ctxip
   Policy group      : resourcegrp
   Idle timeout      : 30 min
   Created at        : 16:38:48 UTC Wed 07/26/2017
   Lastest           : 16:47:41 UTC Wed 07/26/2017
   User IPv4 address : 172.16.1.16
   Allocated IP      : 10.1.1.1
   Session ID        : 14
   Web browser/OS    : Windows
   ```

2. Install a USB key on the host.

   Obtain the USB key from the administrator, and install the USB key on the host. For information about how to make a USB key, see the appendix in the following section.

3. Log in to the SSL VPN gateway from the host:

   # On the host, type the gateway address **https://1.1.1.2:4430/** in the address bar of a browser, and then press **Enter**. The following page opens:

Figure 32 Selecting a certificate

```

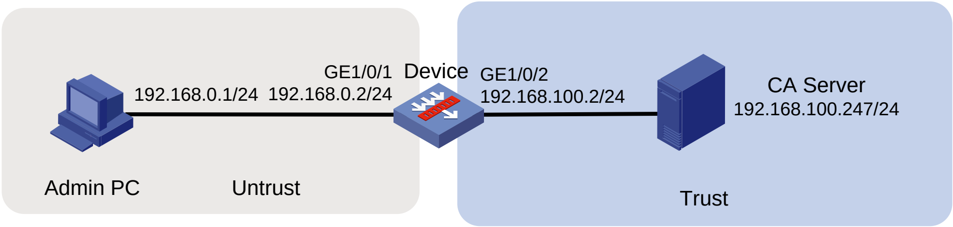
Appendix—Making a USB key

Make a USB key in the following procedure:

1. Configure an IP address and gateway on the administrator's PC to ensure the PC can reach the CA server. This example uses Windows 2008 server as the CA server.

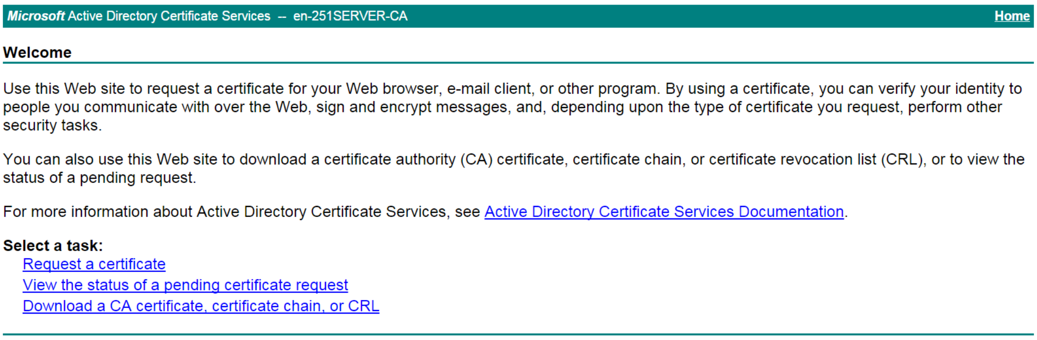
Figure 37 Network diagram



2. Request the USB key client certificate:

# Enter **http://192.168.100.247/certsrv** in the address bar of a browser to open the certificate service page.

Figure 38 Certificate services



Microsoft Active Directory Certificate Services -- en-251SERVER-CA

Welcome

Use this Web site to request a certificate for your Web browser, e-mail client, or other program. By using a certificate, you can verify your identity to people you communicate with over the Web, sign and encrypt messages, and, depending upon the type of certificate you request, perform other security tasks.

You can also use this Web site to download a certificate authority (CA) certificate, certificate chain, or certificate revocation list (CRL), or to view the status of a pending request.

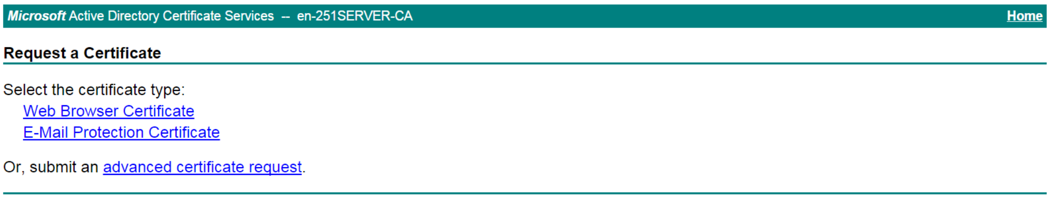
For more information about Active Directory Certificate Services, see Active Directory Certificate Services Documentation.

Select a task:

Request a certificate
View the status of a pending certificate request
Download a CA certificate, certificate chain, or CRL

# Click **Request a certificate**. The certificate request page opens.

Figure 39 Requesting a certificate



Microsoft Active Directory Certificate Services -- en-251SERVER-CA

Request a Certificate

Select the certificate type:
Web Browser Certificate
E-Mail Protection Certificate

Or, submit an advanced certificate request.

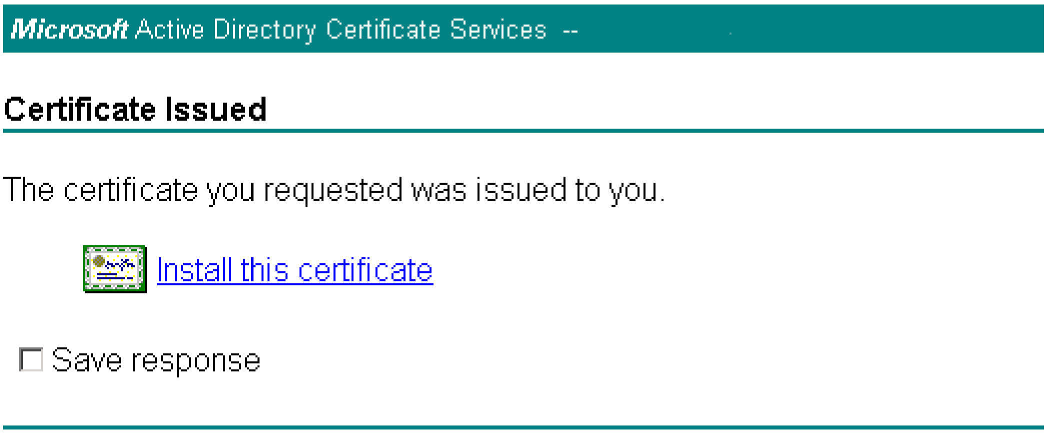
# Click **advanced certificate request**. On the page that opens, select **Create and submit a request to this CA** to request a client certificate.

# Configure the client certificate request parameters, and then click **Submit** at the bottom of the page.

# In the dialog box that opens, enter the USB key password, and then log in.

# Click **Install this certificate** to install the client certificate to the USB key.

Figure 40 Installing the client certificate to the USB key



Microsoft Active Directory Certificate Services --

Certificate Issued

The certificate you requested was issued to you.

Install this certificate

□ Save response

# After a possible conflict warning about installing a certificate, click **Yes** to install the client certificate into the USB key.

The USB key is made successfully.

Configuring IPsec

About IPsec

IP Security (IPsec) is defined by the IETF to provide interoperable, high-quality, cryptography-based security for IP communications. It is a Layer 3 VPN technology that transmits data in a secure channel established between two endpoints (such as two security gateways). Such a secure channel is usually called an IPsec tunnel.

IPsec framework

IPsec is a security framework that has the following protocols and algorithms:

- Authentication Header (AH).
- Encapsulating Security Payload (ESP).
- Internet Key Exchange (IKE).
- Algorithms for authentication and encryption.

AH and ESP are security protocols that provide security services. IKE performs automatic key exchange. For more information about IKE, see "Configuring IKE."

IPsec security services

IPsec provides the following security services for data packets in the IP layer:

- **Confidentiality**—The sender encrypts packets before transmitting them over the Internet, protecting the packets from being eavesdropped en route.
- **Data integrity**—The receiver verifies the packets received from the sender to make sure they are not tampered with during transmission.
- **Data origin authentication**—The receiver verifies the authenticity of the sender.
- **Anti-replay**—The receiver examines packets and drops outdated and duplicate packets.

Benefits of IPsec

IPsec delivers the following benefits:

- Reduced key negotiation overhead and simplified maintenance by supporting the IKE protocol. IKE provides automatic key negotiation and automatic IPsec security association (SA) setup and maintenance.
- Good compatibility. You can apply IPsec to all IP-based application systems and services without modifying them.
- Encryption on a per-packet rather than per-flow basis. Per-packet encryption allows for flexibility and greatly enhances IP security.

Security protocols

IPsec comes with two security protocols, AH and ESP. They define how to encapsulate IP packets and the security services that they can provide.

- AH (protocol 51) defines the encapsulation of the AH header in an IP packet, as shown in Figure 3. AH can provide data origin authentication, data integrity, and anti-replay services to prevent data tampering, but it cannot prevent eavesdropping. Therefore, it is suitable for transmitting non-confidential data. Authentication algorithms supported by AH include HMAC-MD5 and HMAC-SHA1. AH does not support NAT traversal.

- ESP (protocol 50) defines the encapsulation of the ESP header and trailer in an IP packet, as shown in Figure 3. ESP can provide data encryption, data origin authentication, data integrity, and anti-replay services. Unlike AH, ESP can guarantee data confidentiality because it can encrypt the data before encapsulating the data to IP packets. ESP-supported encryption algorithms include DES, 3DES, and AES, and authentication algorithms include HMAC-MD5 and HMAC-SHA1.

Both AH and ESP provide authentication services, but the authentication service provided by AH is stronger. In practice, you can choose either or both security protocols. When both AH and ESP are used, an IP packet is encapsulated first by ESP and then by AH.

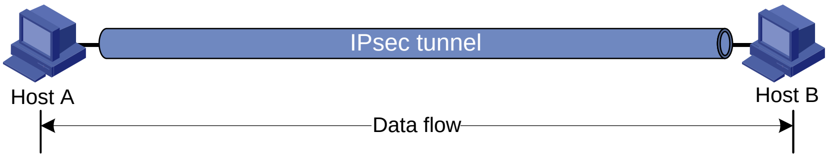
Encapsulation modes

IPsec supports the following encapsulation modes: transport mode and tunnel mode.

Transport mode

The security protocols protect the upper layer data of an IP packet. Only the transport layer data is used to calculate the security protocol headers. The calculated security protocol headers and the encrypted data (only for ESP encapsulation) are placed after the original IP header. You can use the transport mode when end-to-end security protection is required (the secured transmission start and end points are the actual start and end points of the data). The transport mode is typically used for protecting host-to-host communications, as shown in Figure 1.

Figure 1 IPsec protection in transport mode



Tunnel mode

The security protocols protect the entire IP packet. The entire IP packet is used to calculate the security protocol headers. The calculated security protocol headers and the encrypted data (only for ESP encapsulation) are encapsulated in a new IP packet. In this mode, the encapsulated packet has two IP headers. The inner IP header is the original IP header. The outer IP header is added by the network device that provides the IPsec service. You must use the tunnel mode when the secured transmission start and end points are not the actual start and end points of the data packets (for example, when two gateways provide IPsec but the data start and end points are two hosts behind the gateways). The tunnel mode is typically used for protecting gateway-to-gateway communications, as shown in Figure 2.

Figure 2 IPsec protection in tunnel mode

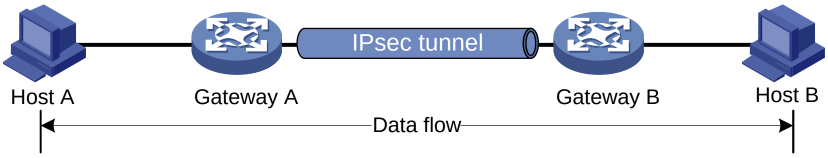


Figure 3 shows how the security protocols encapsulate an IP packet in different encapsulation modes.

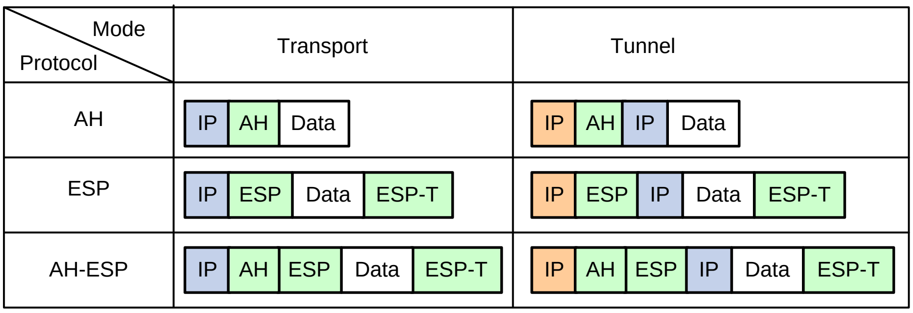
Figure 3 Security protocol encapsulations in different modes



Mode / Protocol	Transport	Tunnel
AH	IP | AH | Data	IP | AH | IP | Data
ESP	IP | ESP | Data | ESP-T	IP | ESP | IP | Data | ESP-T
AH-ESP	IP | AH | ESP | Data | ESP-T	IP | AH | ESP | IP | Data | ESP-T

Security association

About this task

A security association (SA) is an agreement negotiated between two communicating parties called IPsec peers. An SA includes the following parameters for data protection:

- Security protocols (AH, ESP, or both).
- Encapsulation mode (transport mode or tunnel mode).
- Authentication algorithm (HMAC-MD5, SM3, or HMAC-SHA1).
- Encryption algorithm (DES, 3DES, SM, or AES).
- Shared keys and their lifetimes.

An SA is unidirectional. At least two SAs are needed to protect data flows in a bidirectional communication. If two peers want to use both AH and ESP to protect data flows between them, they construct an independent SA for each protocol in each direction.

An SA is uniquely identified by a triplet, which consists of the security parameter index (SPI), destination IP address, and security protocol identifier. An SPI is a 32-bit number. It is transmitted in the AH/ESP header.

SA setup

An SA can be set up manually or through IKE.

- **Manual mode**—Configure all parameters for the SA through commands. This configuration mode is complex and does not support some advanced features (such as periodic key update), but it can implement IPsec without IKE. This mode is mainly used in small and static networks or when the number of IPsec peers in the network is small.
- **IKE negotiation mode**—The peers negotiate and maintain the SA through IKE. This configuration mode is simple and has good expansibility. As a best practice, set up SAs through IKE negotiations in medium- and large-scale dynamic networks.

SA aging

A manually configured SA never ages out.

An IKE-created SA has a lifetime and will be deleted when its lifetime timer expires.

Before the SA lifetime timer expires, IKE negotiates a new SA, which takes over immediately after its creation. The interval from the creation of an SA to the negotiation of a new SA is the SA's soft lifetime.

The SA soft lifetime is calculated as follows: SA soft lifetime = SA lifetime – SA soft lifetime buffer. If the SA soft lifetime buffer is not configured, the system calculates a default SA soft lifetime based on the SA lifetime.

The lifetime of an IKE-created SA comes in two types:

- **Time-based lifetime**—Defines how long the SA can exist after it is created.
- **Traffic-based lifetime**—Defines the maximum traffic that the SA can process.

If both lifetime timers are configured for an SA, the SA is deleted when either of the lifetime timers expires.

Authentication and encryption

Authentication algorithms

IPsec uses hash algorithms to perform authentication. A hash algorithm produces a fixed-length digest for an arbitrary-length message. IPsec peers respectively calculate message digests for each packet. The receiver compares the local digest with that received from the sender. If the digests are identical, the receiver considers the packet intact and the sender's identity valid. IPsec supports the following types of authentication algorithms:

- Hash-based Message Authentication Code (HMAC) based authentication algorithms, including HMAC-MD5 and HMAC-SHA.

  HMAC-MD5 is faster but less secure than HMAC-SHA.
- SM3 authentication algorithms.

Encryption algorithms

IPsec uses symmetric encryption algorithms, which encrypt and decrypt data by using the same keys. The following encryption algorithms are available for IPsec on the device:

- **DES**—Encrypts a 64-bit plaintext block with a 56-bit key. DES is the least secure but the fastest algorithm.
- **3DES**—Encrypts plaintext data with three 56-bit DES keys. The key length totals up to 168 bits. It provides moderate security strength and is slower than DES.
- **AES**—Encrypts plaintext data with a 128-bit, 192-bit, or 256-bit key. AES provides the highest security strength and is slower than 3DES.
- **SM**—Encrypts plaintext data with a 128-bit key. SM provides the same level of security strength as AES.

Crypto engine

The IPsec feature is resource intensive for its complex encryption/decryption and authentication algorithms. To improve processing performance, you can use crypto engine to offload IPsec tasks.

The crypto engine processes all IPsec protected packets and hands the processed packets back to the device for forwarding.

For more information about crypto engines, see "Configuring crypto engines."

The hardware key pairs stored on a GM crypto card become invalid after the GM crypto card is removed from a device and installed on a new device.

IPsec-protected traffic

IPsec tunnels can protect the following types of traffic:

- Packets that match specific ACLs.
- Packets routed to a tunnel interface.
- Packets of IPv6 routing protocols.

Two peers use security policies (IPsec policies or IPsec profiles) to protect packets between them. A security policy defines the range of packets to be protected by IPsec and the security parameters used for the protection. For more information about IPsec policies and IPsec profiles, see "IPsec policy and IPsec profile."

The following information describes how IPsec protects packets:

- When an IPsec peer identifies the packets to be protected according to the security policy, it sets up an IPsec tunnel and sends the packet to the remote peer through the tunnel. The IPsec tunnel can be manually configured beforehand, or it can be set up through IKE negotiation triggered by the packet. The IPsec tunnels are actually the IPsec SAs. The inbound packets are protected by the inbound SA, and the outbound packets are protected by the outbound SA.
- When the remote IPsec peer receives the packet, it drops, de-encapsulates, or directly forwards the packet according to the configured security policy.

ACL-based IPsec

To implement ACL-based IPsec, configure an ACL to define the data flows to be protected, specify the ACL in an IPsec policy, and then apply the IPsec policy to an interface. You can apply an IPsec policy to physical interfaces such as Ethernet interfaces, or virtual interfaces such as tunnel interfaces and virtual template interfaces.

ACL-based IPsec works as follows:

- When packets sent by the interface match a permit rule of the ACL, the packets are protected by the outbound IPsec SA and encapsulated with IPsec.
- When the interface receives an IPsec packet destined for the local device, it searches for the inbound IPsec SA according to the SPI in the IPsec packet header for de-encapsulation. If the de-encapsulated packet matches a permit rule of the ACL, the device processes the packet. If the de-encapsulated packet does not match any permit rule of the ACL, the device drops the packet.

The device supports the following data flow protection modes:

- **Standard mode**—One IPsec tunnel protects one data flow. The data flow permitted by an ACL rule is protected by one IPsec tunnel that is established solely for it.
- **Aggregation mode**—One IPsec tunnel protects all data flows permitted by all the rules of an ACL. This mode is only used to communicate with old-version devices.
- **Per-host mode**—One IPsec tunnel protects one host-to-host data flow. One host-to-host data flow is identified by one ACL rule and protected by one IPsec tunnel established solely for it. This mode consumes more system resources when multiple data flows exist between two subnets to be protected.

Tunnel interface-based IPsec

Tunnel interface-based IPsec is also known as virtual tunnel interface (VTI)-based IPsec.

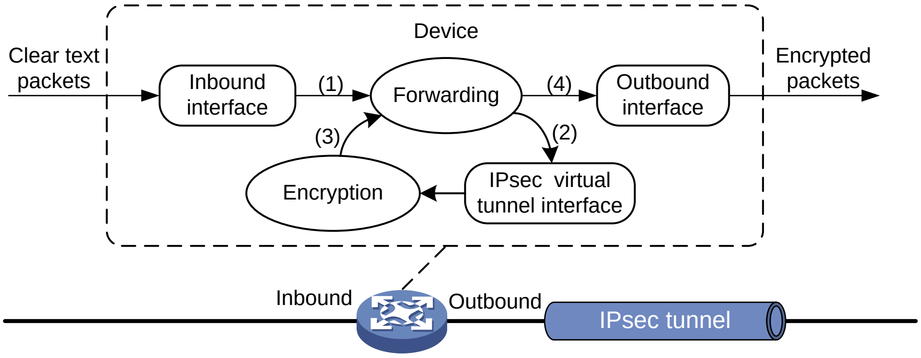
To implement tunnel interface-based IPsec, configure an IPsec profile and apply the IPsec profile to a tunnel interface. IPsec will protect all traffic routed to the tunnel interface, except the traffic that you specify not to protect. Tunnel interface-based IPsec supports only the tunnel encapsulation mode.

Compared with ACL-based IPsec, tunnel interface-based IPsec has the following advantages:

- Supports multicast traffic protection.
- Supports dynamic routing protocol advertisement between the IPsec tunnel peers.
- Simplifies configuration. Tunnel interface-based IPsec does not require using ACL rules to define the traffic to be protected. The routing table directs the traffic to the tunnel interface for protection.

For tunnel interface-based IPsec, packet encapsulation and decapsulation are performed on the tunnel interfaces.

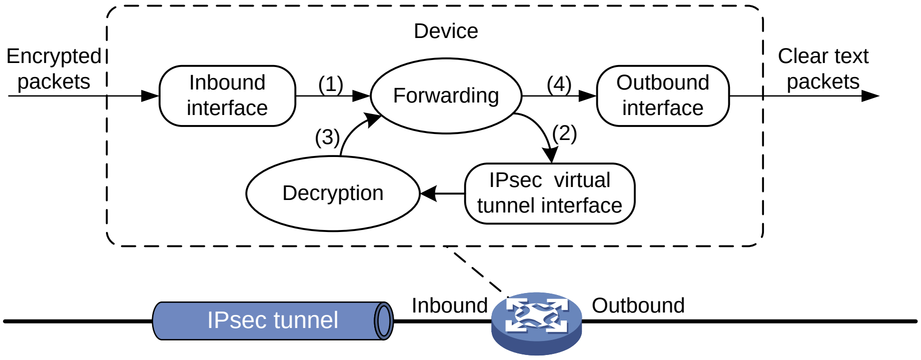
Figure 4 Tunnel interface encapsulation



As shown in Figure 4, a tunnel interface encapsulates an IP packet as follows:

1. Upon receiving a clear text packet, the input interface sends the packet to the forwarding module for routing.
2. If the packet requires IPsec protection, the forwarding module sends the packet to the tunnel interface.
3. The tunnel interface encapsulates the packet into a new IP packet. The source and destination IP addresses in the new IP header are the source and destination IP addresses of the tunnel interface. Then, the tunnel interface sends the packet back to the forwarding module.
4. The forwarding module looks up the routing table again and sends the packet out of the physical interface of the tunnel interface.

Figure 5 Tunnel interface de-encapsulation



As shown in Figure 5, a tunnel interface de-encapsulates an IP packet as follows:

1. Upon receiving an encrypted packet, the inbound interface sends the packet to the forwarding module for routing.
2. Because the packet is destined for the tunnel interface' source address and the payload protocol is AH or ESP, the forwarding module sends the packet to the tunnel interface.
3. The tunnel interface de-encapsulates the packet (removes the outer IP header) and sends the de-encapsulated packet back to the forwarding module.
4. The forwarding module looks up the routing table again and sends the packet out of the output interface.

IPv6 routing protocol-based IPsec

You can implement IPv6 routing protocol-based IPsec by binding an IPsec profile to an IPv6 routing protocol. All packets of the protocol are encapsulated with IPsec. Supported IPv6 routing protocols include OSPFv3, IPv6 BGP, and RIPng.

All packets of the applications that are not bound to IPsec and the IPsec packets that failed to be de-encapsulated are dropped.

In one-to-many communication scenarios, you must configure the IPsec SAs for an IPv6 routing protocol in manual mode because of the following reasons:

- The automatic key exchange mechanism protects communications between two points. In one-to-many communication scenarios, automatic key exchange cannot be implemented.
- One-to-many communication scenarios require that all the devices use the same SA parameters (SPI and key) to receive and send packets. IKE negotiated SAs cannot meet this requirement.

IPsec policy and IPsec profile

IPsec policies and IPsec profiles define the parameters used to establish IPsec tunnels between two peers and the range of packets to be protected.

IPsec policy

An IPsec policy is a set of IPsec policy entries that have the same name but different sequence numbers.

An IPsec policy contains the following settings:

- An ACL that defines the range of data flows to be protected.
- An IPsec transform set that defines the security parameters used for IPsec protection.
- IPsec SA establishment mode.

  Supported IPsec SA establishment modes are manual configuration and IKE negotiation.
- Local and remote IP addresses that define the start and end points of the IPsec tunnel.

In the same IPsec policy, an IPsec policy entry with a smaller sequence number has a higher priority. When sending a packet, the interface applied with an IPsec policy looks through the IPsec policy's entries in ascending order of sequence numbers. If the packet matches the ACL of an IPsec policy entry, the interface encapsulates the packet according to the IPsec policy entry. If no match is found, the interface sends the packet out without IPsec protection.

When the interface receives an IPsec packet destined for the local device, it searches for the inbound IPsec SA according to the SPI in the IPsec packet header for de-encapsulation. If the de-encapsulated packet matches a permit rule of the ACL, the device processes the packet. If the de-encapsulated packet does not match a permit rule of the ACL, the device drops the packet.

To protect traffic by using IPsec, you must apply an IPsec policy to an interface. The interface can be a physical interface, such as an Ethernet interface. It can also be a virtual interface, such as a tunnel and virtual template interface, to protect applications such as GRE and L2TP.

IPsec profile

An IPsec profile has similar settings as an IPsec policy. It is uniquely identified by a name and does not support ACL configuration.

IPsec profiles can be classified into the following types:

- **Manual IPsec profile**—A manual IPsec profile is used to protect IPv6 routing protocols. It specifies the IPsec transform set used for protecting data flows, and the SPIs and keys used by the SAs.
- **IKE-based IPsec profile**—An IKE-based IPsec profile is applied to tunnel interfaces to protect tunneled traffic. It specifies the IPsec transform sets used for protecting data flows, and the IKE profile used for IKE negotiation.

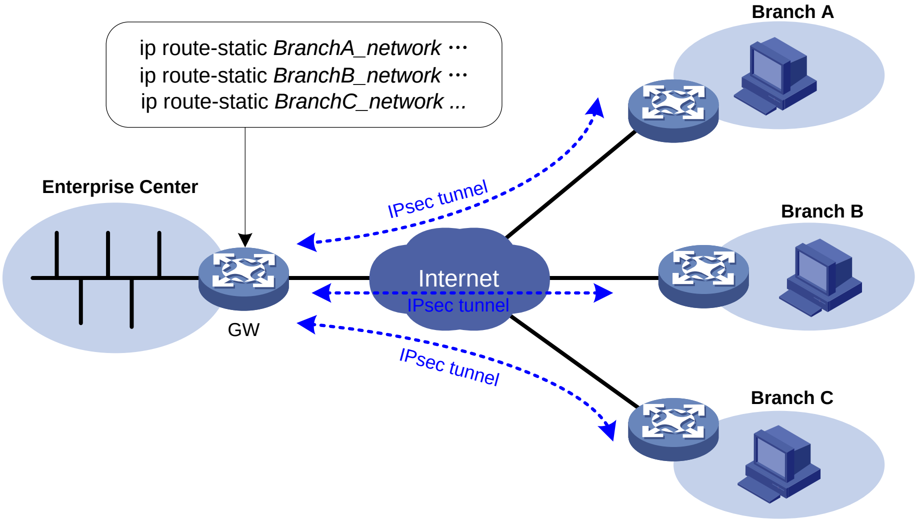
IPsec RRI

IPsec Reverse Route Injection (RRI) enables an IPsec tunnel gateway to automatically add and delete static routes destined for the protected private networks. It automatically adds the static routes when the IPsec SAs are established and deletes the static routes when the IPsec SAs are deleted. This greatly reduces the static route configuration work load on the gateway and increases the scalability of the IPsec VPN.

IPsec RRI is applicable to gateways that must provide many IPsec tunnels (for example, a headquarters gateway).

As shown in Figure 6, the traffic between the enterprise center and the branches are protected by IPsec. The gateway at the enterprise center is configured with static routes to route traffic to the IPsec-protected interfaces. It is difficult to add or modify static routes on the gateway at the enterprise center if the IPsec VPN has a large number of branches or if the network structure changes.

Figure 6 IPsec VPN



ip route-static *BranchA_network* ···
ip route-static *BranchB_network* ···
ip route-static *BranchC_network* ...
Branch A
Enterprise Center
IPsec tunnel
Branch B
Internet
IPsec tunnel
GW
IPsec tunnel
Branch C

After you can enable IPsec RRI on the gateway, the gateway automatically adds a static route to the routing table each time an IPsec tunnel is established. The destination IP address is the protected private network. The next hop IP address can be the remote IP address of the IPsec tunnel (default) or a user-defined next hop IP address. Traffic destined for the peer end is routed to the IPsec tunnel interface and thereby protected by IPsec.

You can advertise the static routes created by IPsec RRI in the internal network, and the internal network device can use them to forward traffic in the IPsec VPN.

You can set preferences for the static routes created by IPsec RRI to implement flexible route management. For example, you can set the same preference for multiple routes to the same destination to implement load sharing, or you can set different preferences to implement route backup.

You can also set tags for the static routes created by IPsec RRI to implement flexible route control through routing policies.

IPsec smart link selection

To improve network stability and availability, a branch's IPsec gateway typically deploys multiple links to connect to the corporate headquarters. The qualities of these links (in terms of packet loss ratio and delay) are not static but keep changing with time. It is important that the branch gateway can dynamically select a link with desired transmission quality to establish the IPsec tunnel to the headquarters. IPsec smart link selection can meet this requirement.

IPsec smart link selection enables the branch gateway to monitor the real-time packet loss ratio and delay of the active link over which the IPsec tunnel is established. If the packet loss ratio or delay of the link exceeds the specified threshold, IPsec smart link selection reselects a link for the IPsec tunnel. You can also manually activate a link to establish the IPsec tunnel over that link.

Protocols and standards

- RFC 2401, *Security Architecture for the Internet Protocol*
- RFC 2402, *IP Authentication Header*
- RFC 2406, *IP Encapsulating Security Payload*
- RFC 4552, *Authentication/Confidentiality for OSPFv3*

Restrictions: Hardware compatibility with IPsec

The SM1 algorithm is supported only on devices installed with a GM network data encryption module.

Restrictions and guidelines: IPsec configuration

Typically, IKE uses UDP port 500 for communication, and AH and ESP use the protocol numbers 51 and 50, respectively. Make sure traffic of these protocols is not denied on the interfaces with IKE or IPsec configured.

Implementing ACL-based IPsec

In transport mode, ACLs for IPsec take effect only on traffic that is generated by the device and traffic that is destined for the device. They do not take effect on traffic forwarded through the device. For example, an ACL-based IPsec tunnel can protect log messages the device sends to a log server, but it does not protect data flows and voice flows that are forwarded by the device.

ACL-based IPsec tasks at a glance

To configure ACL-based IPsec, perform the following tasks:

1. Configuring an ACL
2. Configuring an IPsec transform set
3. Configuring an IPsec policy

   Choose one of the following tasks:

   - Configuring a manual IPsec policy
   - Configuring an IKE-based IPsec policy
4. Applying an IPsec policy to an interface
5. (Optional.) Configuring accessibility features for ACL-based IPsec
   - Enabling ACL checking for de-encapsulated packets
   - Configuring IPsec anti-replay
   - Configuring IPsec anti-replay redundancy
   - Binding a source interface to an IPsec policy

   - Enabling QoS pre-classify
   - Configuring the DF bit of IPsec packets
   - Configuring IPsec RRI
   - Configuring IPsec smart link selection
   - Configuring IPsec netmask filtering
   - Enabling IPsec flow overlap check
   - Configuring the global IPsec SA lifetime and idle timeout
   - Configuring IPsec fragmentation
   - Setting the maximum number of IPsec tunnels
6. (Optional.) Configuring logging and SNMP notification for IPsec.
   - Enabling logging for IPsec packets
   - Enabling logging for IPsec negotiation
   - Configuring SNMP notifications for IPsec

Configuring an ACL

IPsec uses ACLs to identify the traffic to be protected.

Keywords in ACL rules

An ACL is a collection of ACL rules. Each ACL rule is a deny or permit statement. A permit statement identifies a data flow protected by IPsec, and a deny statement identifies a data flow that is not protected by IPsec. IPsec compares a packet against the ACL rules and processes the packet according to the first rule it matches.

- Each ACL rule matches both the outbound traffic and the returned inbound traffic. Suppose there is a rule **rule 0 permit ip source 1.1.1.0 0.0.0.255 destination 2.2.2.0 0.0.0.255**. This rule matches both traffic from 1.1.1.0 to 2.2.2.0 and traffic from 2.2.2.0 to 1.1.1.0.
- In the outbound direction, if a permit statement is matched, IPsec considers that the packet requires protection and continues to process it. If a deny statement is matched or no match is found, IPsec considers that the packet does not require protection and delivers it to the next module.
- In the inbound direction:
  - Non-IPsec packets that match a permit statement are dropped.
  - IPsec packets destined for the device itself are de-encapsulated. By default, the de-encapsulated packets are compared against the ACL rules. Only those that match a permit statement are processed. Other packets are dropped. If ACL checking for de-encapsulated IPsec packets is disabled, the de-encapsulated packets are not compared against the ACL rules and are directly processed by other modules.

When defining ACL rules for IPsec, follow these guidelines:

- Permit only data flows that need to be protected and use the **any** keyword with caution. With the **any** keyword specified in a permit statement, all outbound traffic matching the permit statement will be protected by IPsec. All inbound IPsec packets matching the permit statement will be received and processed, but all inbound non-IPsec packets will be dropped. This will cause all the inbound traffic that does not need IPsec protection to be dropped.
- Avoid statement conflicts in the scope of IPsec policy entries. When creating a deny statement, be careful with its match scope and match order relative to permit statements. The policy entries in an IPsec policy have different match priorities. ACL rule conflicts between them are prone to cause mistreatment of packets. For example, when configuring a permit statement for an IPsec policy entry to protect an outbound traffic flow, you must avoid the situation that the traffic flow matches a deny statement in a higher priority IPsec policy entry. Otherwise, the

packets will be sent out as normal packets. If they match a permit statement at the receiving end, they will be dropped by IPsec.

The following example shows how an improper statement causes unexpected packet dropping. Only the ACL-related configuration is presented.

Assume Device A is connected to subnet 1.1.2.0/24 and Device B is connected to subnet 3.3.3.0/24, and the IPsec policy configuration on Device A and Device B is as follows:

- IPsec configuration on Device A:

```
acl advanced 3000
 rule 0 permit ip source 1.1.1.0 0.0.0.255 destination 2.2.2.0 0.0.0.255
 rule 1 deny ip
acl advanced 3001
 rule 0 permit ip source 1.1.2.0 0.0.0.255 destination 3.3.3.0 0.0.0.255
 rule 1 deny ip
#
ipsec policy testa 1 isakmp <---IPsec policy entry with a higher priority
 security acl 3000
 ike-profile aa
 transform-set 1
#
ipsec policy testa 2 isakmp <---IPsec policy entry with a lower priority
 security acl 3001
 ike-profile bb
 transform-set 1
```

- IPsec configuration on Device B:

```
acl advanced 3001
 rule 0 permit ip source 3.3.3.0 0.0.0.255 destination 1.1.2.0 0.0.0.255
 rule 1 deny ip
#
ipsec policy testb 1 isakmp
 security acl 3001
 ike-profile aa
 transform-set 1
```

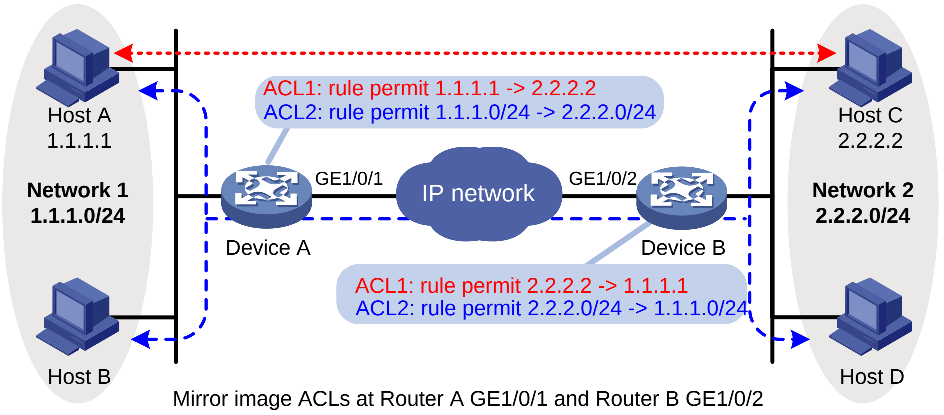
On Device A, apply the IPsec policy **testa** to the outbound interface of Device A. The IPsec policy contains two policy entries, **testa 1** and **testa 2**. The ACLs used by the two policy entries each contain a rule that matches traffic from 1.1.2.0/24 to 3.3.3.0/24. The one used in the policy entry **testa 1** is a deny statement and the one used in the policy entry **testa 2** is a permit statement. Because **testa 1** is matched prior to **testa 2**, traffic from 1.1.2.0/24 to 3.3.3.0/24 will match the deny statement and be sent as normal traffic. When the traffic arrives at Device B, the traffic matches rule 0 (a permit statement) in ACL 3001 used in the applied IPsec policy **testb**. Because non-IPsec traffic that matches a permit statement must be dropped on the inbound interface, Device B drops the traffic.

To make sure subnet 1.1.2.0/24 can access subnet 3.3.3.0/24, you can delete the deny rule in ACL 3000 on Device A.

Mirror image ACLs

To make sure SAs can be set up and the traffic protected by IPsec can be processed correctly between two IPsec peers, create mirror image ACLs on the IPsec peers. As shown in Figure 7, ACL rules on Device B are mirror images of the rules on Device A. In this way, SAs can be created successfully for the traffic between Host A and Host C and for the traffic between Network 1 and Network 2.

Figure 7 Mirror image ACLs

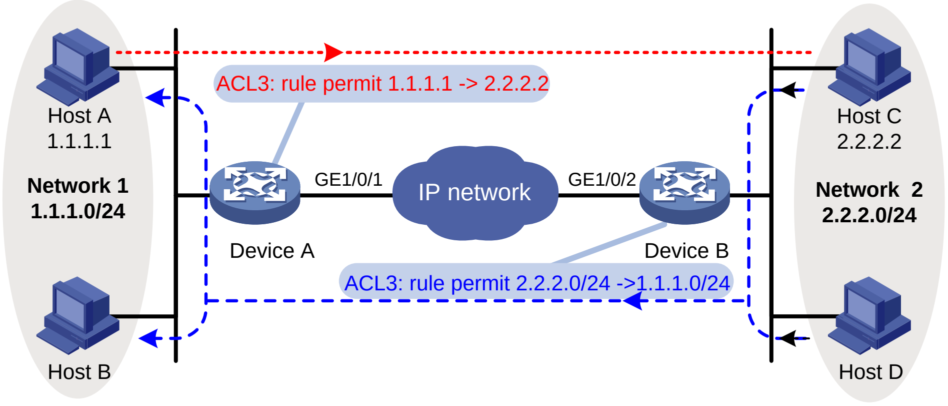


Host A
1.1.1.1
Network 1
1.1.1.0/24
Host B
ACL1: rule permit 1.1.1.1 -> 2.2.2.2
ACL2: rule permit 1.1.1.0/24 -> 2.2.2.0/24
GE1/0/1
IP network
GE1/0/2
Device A
Device B
ACL1: rule permit 2.2.2.2 -> 1.1.1.1
ACL2: rule permit 2.2.2.0/24 -> 1.1.1.0/24
Host C
2.2.2.2
Network 2
2.2.2.0/24
Host D
Mirror image ACLs at Router A GE1/0/1 and Router B GE1/0/2

If the ACL rules on IPsec peers do not form mirror images of each other, SAs can be set up only when both of the following requirements are met:

- The range specified by an ACL rule on one peer is covered by its counterpart ACL rule on the other peer. As shown in Figure 8, the range specified by the ACL rule configured on Device A is covered by its counterpart on Device B.
- The peer with the narrower rule initiates SA negotiation. If a wider ACL rule is used by the SA initiator, the negotiation request might be rejected because the matching traffic is beyond the scope of the responder. As shown in Figure 8, the SA negotiation initiated by Host A to Host C is accepted but the SA negotiations from Host C to Host A, from Host C to Host B, and from Host D to Host A are rejected.

Figure 8 Non-mirror image ACLs



ACL for IPsec protection in VPN instances

To use IPsec to protect the data of a VPN instance, you must specify the VPN instance for the protected data in the ACL.

As shown in Figure 9, to protect traffic of VPN1 by using IPsec, you must configure the ACL on Device A as follows:

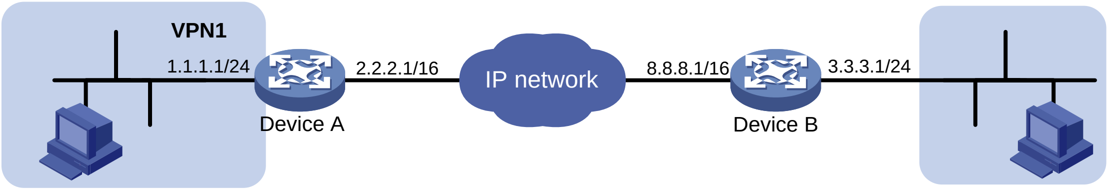
```
#
acl advanced 3400
 rule 0 permit ip vpn-instance vpn1 source 1.1.1.0 0.0.0.255 destination 3.3.3.0 0.0.0.255
#
```

In addition, you must specify VPN1 as the inside VPN instance in the IKE profile.

```
#
```

```
ike profile vpn1
 keychain vpn1
 match remote identity address 8.8.8.1 255.255.255.255
 inside-vpn vpn-instance vpn1
#
```

Figure 9 IPsec for VPN instances



Configuring an IPsec transform set

About this task

An IPsec transform set, part of an IPsec policy, defines the security parameters for IPsec SA negotiation, including the security protocol, encryption algorithms, and authentication algorithms.

Restrictions and guidelines

Changes to an IPsec transform set affect only SAs negotiated after the changes. To apply the changes to existing SAs, execute the **reset ipsec sa** command to clear the SAs so that they can be set up by using the updated parameters.

The transport mode applies only when the source and destination IP addresses of data flows match those of the IPsec tunnel. IPsec transform sets used in IPsec profiles for IPv6 routing protocols support only the transport mode.

The tunnel mode typically applies when the source and destination IP addresses of data flows are different from those of the IPsec tunnel. IPsec transform sets used in IPsec profiles for tunnels support only the tunnel mode.

When you configure the Perfect Forward Secrecy (PFS) feature in an IPsec transform set, follow these guidelines:

- In IKEv1, the security level of the DH group of the initiator must be higher than or equal to that of the responder. This restriction does not apply to IKEv2.
- The end without the PFS feature performs SA negotiation according to the PFS requirements of the peer end.

You can specify multiple authentication or encryption algorithms for the same security protocol. The algorithm specified earlier has a higher priority.

Some algorithms are available only for IKEv2. See Table 1.

Table 1 Algorithms available only for IKEv2

Type	Algorithms
Encryption algorithm	aes-ctr-128 aes-ctr-192 aes-ctr-256 camellia-cbc-128 camellia-cbc-192

	camellia-cbc-256 gmac-128 gmac-192 gmac-256 gcm-128 gcm-192 gcm-256
Authentication algorithm	aes-xcbc-mac
PFS algorithm	dh-group19 dh-group20

Procedure

1. Enter system view.

   system-view

2. Create an IPsec transform set and enter its view.

   ipsec transform-set *transform-set-name*

3. Specify the security protocol for the IPsec transform set.

   protocol { **ah** | **ah-esp** | **esp** }

   By default, the ESP security protocol is used.

4. Specify the encryption algorithms for ESP. Skip this step if the **protocol ah** command is configured.

   esp encryption-algorithm { **3des-cbc** | **aes-cbc-128** | **aes-cbc-192** | **aes-cbc-256** | **aes-ctr-128** | **aes-ctr-192** | **aes-ctr-256** | **camellia-cbc-128** | **camellia-cbc-192** | **camellia-cbc-256** | **des-cbc** | **gmac-128** | **gmac-192** | **gmac-256** | **gcm-128** | **gcm-192** | **gcm-256** | **null** | **sm1-cbc-128** | **sm4-cbc** } *

   By default, no encryption algorithm is specified for ESP.

5. Specify the authentication algorithms for ESP. Skip this step if the **protocol ah** command is configured.

   esp authentication-algorithm { **aes-xcbc-mac** | **md5** | **sha1** | **sha256** | **sha384** | **sha512** | **sm3** } *

   By default, no authentication algorithm is specified for ESP.

   The **aes-xcbc-mac** algorithm is available only for IKEv2.

6. Specify the authentication algorithms for AH. Skip this step if the **protocol esp** command is configured.

   ah authentication-algorithm { **aes-xcbc-mac** | **md5** | **sha1** | **sha256** | **sha384** | **sha512** | **sm3** } *

   By default, no authentication algorithm is specified for AH.

   The **aes-xcbc-mac** algorithm is available only for IKEv2.

7. Specify the packet encapsulation mode.

   encapsulation-mode { **transport** | **tunnel** }

   By default, the security protocol encapsulates IP packets in tunnel mode.

8. (Optional.) Enable the PFS feature.

   pfs { **dh-group1** | **dh-group2** | **dh-group5** | **dh-group14** | **dh-group24** | **dh-group19** | **dh-group20** }

   By default, the PFS feature is disabled.

For more information about PFS, see "Configuring IKE."

9. (Optional.) Enable the Extended Sequence Number (ESN) feature.

   esn enable [**both**]

   By default, the ESN feature is disabled.

   The ESN feature applies only to IPsec SAs negotiated by IKEv2.

Configuring a manual IPsec policy

In a manual IPsec policy, the parameters are configured manually, such as the keys, the SPIs, and the IP addresses of the two ends in tunnel mode.

Restrictions and guidelines

When you configure a manual IPsec policy, make sure the IPsec configuration at both ends of the IPsec tunnel meets the following requirements:

- The IPsec policies at the two ends must have IPsec transform sets that use the same security protocols, security algorithms, and encapsulation mode.
- The remote IPv4 address configured on the local end must be the same as the primary IPv4 address of the interface applied with the IPsec policy at the remote end. The remote IPv6 address configured on the local end must be the same as the first IPv6 address of the interface applied with the IPsec policy at the remote end.
- At each end, configure parameters for both the inbound SA and the outbound SA, and make sure the SAs in each direction are unique: For an outbound SA, make sure its triplet (remote IP address, security protocol, and SPI) is unique. For an inbound SA, make sure its SPI is unique.
- The local inbound SA must use the same SPI and keys as the remote outbound SA. The same is true of the local outbound SA and remote inbound SA.
- The keys for the IPsec SAs at the two tunnel ends must be configured in the same format. For example, if the local end uses a key in hexadecimal format, the remote end must also use a key in hexadecimal format. If you configure a key in both the character and the hexadecimal formats, only the most recent configuration takes effect.
- If you configure a key in character format for ESP, the device automatically generates an authentication key and an encryption key for ESP.

Procedure

1. Enter system view.

   system-view

2. Create a manual IPsec policy entry and enter its view.

   ipsec { **ipv6-policy** | **policy** } *policy-name seq-number* **manual**

3. (Optional.) Configure a description for the IPsec policy.

   description *text*

   By default, no description is configured.

4. Specify an ACL for the IPsec policy.

   security acl [**ipv6**] { *acl-number* | **name** *acl-name* }

   By default, no ACL is specified for an IPsec policy.

   You can specify only one ACL for an IPsec policy.

5. Specify an IPsec transform set for the IPsec policy.

   transform-set *transform-set-name*

   By default, no IPsec transform set is specified for an IPsec policy.

   You can specify only one IPsec transform set for a manual IPsec policy.

6. Specify the remote IP address of the IPsec tunnel.

   remote-address { *ipv4-address* | **ipv6** *ipv6-address* }

   By default, the remote IP address of the IPsec tunnel is not specified.

7. Configure an SPI for the inbound IPsec SA.

   sa spi inbound { **ah** | **esp** } *spi-number*

   By default, no SPI is configured for the inbound IPsec SA.

8. Configure an SPI for the outbound IPsec SA.

   sa spi outbound { **ah** | **esp** } *spi-number*

   By default, no SPI is configured for the outbound IPsec SA.

9. Configure keys for the IPsec SA.

   - Configure an authentication key in hexadecimal format for AH.

     sa hex-key authentication { **inbound** | **outbound** } **ah** { **cipher** | **simple** } *string*

   - Configure an authentication key in character format for AH.

     sa string-key { **inbound** | **outbound** } **ah** { **cipher** | **simple** } *string*

   - Configure a key in character format for ESP.

     sa string-key { **inbound** | **outbound** } **esp** { **cipher** | **simple** } *string*

   - Configure an authentication key in hexadecimal format for ESP.

     sa hex-key authentication { **inbound** | **outbound** } **esp** { **cipher** | **simple** }

   - Configure an encryption key in hexadecimal format for ESP.

     sa hex-key encryption { **inbound** | **outbound** } **esp** { **cipher** | **simple** } *string*

   By default, no keys are configured for the IPsec SA.

   Configure keys correctly for the security protocol (AH, ESP, or both) you have specified in the IPsec transform set used by the IPsec policy.

Configuring an IKE-based IPsec policy

About this task

In an IKE-based IPsec policy, the parameters are automatically negotiated through IKE.

To configure an IKE-based IPsec policy, use one of the following methods:

- Directly configure it by configuring the parameters in IPsec policy view.
- Configure it by using an existing IPsec policy template with the parameters to be negotiated configured.

  A device using an IPsec policy that is configured in this way cannot initiate an SA negotiation, but it can respond to a negotiation request. The parameters not defined in the template are determined by the initiator. For example, in an IPsec policy template, the ACL is optional. If you do not specify an ACL, the IPsec protection range has no limit. So the device accepts all ACL settings of the negotiation initiator.

  When the remote end's information (such as the IP address) is unknown, this method allows the remote end to initiate negotiations with the local end.

The configurable parameters for an IPsec policy template are the same as those when you directly configure an IKE-based IPsec policy. The difference is that more parameters are optional for an IPsec policy template. Except the IPsec transform sets and the IKE profile, all other parameters are optional.

Restrictions and guidelines for IKE-based IPsec policy configuration

The IPsec policies at the two tunnel ends must have IPsec transform sets that use the same security protocols, security algorithms, and encapsulation mode.

The IPsec policies at the two tunnel ends must have the same IKE profile parameters.

An IKE-based IPsec policy can use a maximum of six IPsec transform sets. During an IKE negotiation, IKE searches for a fully matched IPsec transform set at the two ends of the IPsec tunnel. If no match is found, no SA can be set up, and the packets expecting to be protected will be dropped.

The remote IP address of the IPsec tunnel is required on an IKE negotiation initiator and is optional on the responder. The remote IP address specified on the local end must be the same as the local IP address specified on the remote end.

The IPsec SA uses the local lifetime settings or those proposed by the peer, whichever are smaller.

The IPsec SA can have both a time-based lifetime and a traffic-based lifetime. The IPsec SA expires when either lifetime expires.

If you specify both an IKEv1 profile and an IKEv2 profile for an IPsec policy, the IKEv2 profile is used preferentially. For more information about IKEv1 and IKEv2 profiles, see "Configuring IKE" and "Configuring IKEv2."

Directly configuring an IKE-based IPsec policy

1. Enter system view.

   system-view

2. Create an IKE-based IPsec policy entry and enter its view.

   ipsec { **ipv6-policy** | **policy** } *policy-name seq-number* **isakmp**

3. (Optional.) Configure a description for the IPsec policy.

   description *text*

   By default, no description is configured.

4. (Optional.) Set the IPsec SA negotiation triggering mode.

   sa trigger-mode { **auto** | **traffic-based** }

   By default, IPsec SA negotiation is triggered when traffic requires IPsec protection.

   If the ACL for an IPsec policy or IPsec policy template uses the aggregation or the per-host mode, the IPsec policy or IPsec policy template cannot trigger IPsec SA negotiation in auto mode.

5. Specify an ACL for the IPsec policy.

   security acl [**ipv6**] { *acl-number* | **name** *acl-name* } [**aggregation** | **per-host**]

   By default, no ACL is specified for an IPsec policy.

   You can specify only one ACL for an IPsec policy.

6. Specify IPsec transform sets for the IPsec policy.

   transform-set *transform-set-name*&<1-6>

   By default, no IPsec transform sets are specified for an IPsec policy.

7. Specify an IKE profile or IKEv2 profile for the IPsec policy.
   - Specify an IKE profile.

     ike-profile *profile-name*

     By default, no IKE profile is specified for an IPsec policy.
   - Specify an IKEv2 profile.

     ikev2-profile *profile-name*

     By default, no IKEv2 profile is specified for an IPsec policy.

8. Specify the local IP address of the IPsec tunnel.

   local-address { *ipv4-address* | **ipv6** *ipv6-address* }

   By default, the local IPv4 address of the IPsec tunnel is the primary IPv4 address of the interface to which the IPsec policy is applied. The local IPv6 address of the IPsec tunnel is the first IPv6 address of the interface to which the IPsec policy is applied.

   The local IP address specified by this command must be the same as the IP address used as the local IKE identity.

   The local address cannot be a secondary IP address of the interface where the IPsec policy is applied.

9. Specify the remote IP address of the IPsec tunnel.

   remote-address { [**ipv6**] *host-name* | *ipv4-address* | **ipv6** *ipv6-address* } [**primary**]

   By default, the remote IP address of the IPsec tunnel is not specified.

10. (Optional.) Set the lifetime, soft lifetime buffer, or idle timeout for the IPsec SA.

    - Set the IPsec SA lifetime.

      sa duration { **time-based** *seconds* | **traffic-based** *kilobytes* }

      By default, the global SA lifetime is used.

    - Set the time-based or traffic-based IPsec SA soft lifetime buffer.

      sa soft-duration buffer { **time-based** *seconds* | **traffic-based** *kilobytes* }

      By default, no IPsec SA soft lifetime buffers are configured.

    - Set the IPsec SA idle timeout.

      sa idle-time *seconds*

      By default, the global IPsec SA idle timeout is used.

11. (Optional.) Enable the Traffic Flow Confidentiality (TFC) padding feature.

    tfc enable

    By default, the TFC padding feature is disabled.

    TFC padding applies only to IPsec SAs negotiated by IKEv2.

Configuring an IKE-based IPsec policy by using an IPsec policy template

1. Enter system view.

   system-view

2. Create an IPsec policy template and enter its view.

   ipsec { **ipv6-policy-template** | **policy-template** } *template-name* *seq-number*

3. (Optional.) Configure a description for the IPsec policy template.

   description *text*

   By default, no description is configured.

4. (Optional.) Specify an ACL for the IPsec policy template.

   security acl [**ipv6**] { *acl-number* | **name** *acl-name* } [**aggregation** | **per-host**]

   By default, no ACL is specified for an IPsec policy template.

   You can specify only one ACL for an IPsec policy template.

5. Specify IPsec transform sets for the IPsec policy template.

   transform-set *transform-set-name*&<1-6>

   By default, no IPsec transform sets are specified for an IPsec policy template.

6. Specify an IKE profile or IKEv2 profile for the IPsec policy template.
   - Specify an IKE profile.

     ike-profile *profile-name*

     By default, no IKE profile is specified for an IPsec policy template.

     Make sure the specified IKE profile is not used by another IPsec policy or IPsec policy template.
   - Specify an IKEv2 profile.

     ikev2-profile *profile-name*

     By default, no IKEv2 profile is specified for an IPsec policy template.
7. Specify the local IP address of the IPsec tunnel.

   local-address { *ipv4-address* | **ipv6** *ipv6-address* }

   The default local IPv4 address and IPv6 address is the primary IPv4 address and first IPv6 address of the interface where the IPsec policy is applied.

   The local IP address specified by this command must be the same as the IP address used as the local IKE identity.

   The local address cannot be a secondary IP address of the interface where the IPsec policy is applied.
8. Specify the remote IP address of the IPsec tunnel.

   remote-address { [**ipv6**] *host-name* | *ipv4-address* | **ipv6** *ipv6-address* }

   By default, the remote IP address of the IPsec tunnel is not specified.
9. (Optional.) Set the lifetime and idle timeout for the IPsec SA.
   - Set the IPsec SA lifetime.

     sa duration { **time-based** *seconds* | **traffic-based** *kilobytes* }

     By default, the global SA lifetime is used.
   - Set the IPsec SA idle timeout.

     sa idle-time *seconds*

     By default, the global IPsec SA idle timeout is used.
10. (Optional.) Enable the Traffic Flow Confidentiality (TFC) padding feature.

    tfc enable

    By default, the TFC padding feature is disabled.
11. Return to system view.

    quit
12. Create an IKE-based IPsec policy by using the IPsec policy template.

    ipsec { **ipv6-policy** | **policy** } *policy-name seq-number* **isakmp template** *template-name*

Applying an IPsec policy to an interface

Restrictions and guidelines

An IKE-based IPsec policy that is bound to a source interface can be applied to multiple interfaces.

A manual IPsec policy can be applied to only one interface.

To cancel the IPsec protection, remove the application of the IPsec policy.

Procedure

1. Enter system view.

system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Apply an IPsec policy to the interface.

   ipsec apply { **ipv6-policy** | **policy** } *policy-name*

   By default, no IPsec policy is applied to an interface.

   On one interface, you can apply a maximum of two IPsec policies: one IPv4 IPsec policy and one IPv6 IPsec policy.

Enabling ACL checking for de-encapsulated packets

About this task

This feature compares the de-encapsulated incoming IPsec packets against the ACL in the IPsec policy and discards those that do not match any permit rule of the ACL. This feature can protect networks against attacks using forged IPsec packets.

This feature applies only to tunnel-mode IPsec.

Procedure

1. Enter system view.

   system-view

2. Enable ACL checking for de-encapsulated packets.

   ipsec decrypt-check enable

   By default, ACL checking for de-encapsulated packets is enabled.

Configuring IPsec anti-replay

About this task

IPsec anti-replay protects networks against anti-replay attacks by using a sliding window mechanism called anti-replay window. This feature checks the sequence number of each received IPsec packet against the current IPsec packet sequence number range of the sliding window. If the sequence number is not in the current sequence number range, the packet is considered a replayed packet and is discarded.

IPsec packet de-encapsulation involves complicated calculation. De-encapsulation of replayed packets is not required, and the de-encapsulation process consumes large amounts of resources and degrades performance, resulting in DoS. IPsec anti-replay can check and discard replayed packets before de-encapsulation.

In some situations, service data packets are received in a different order than their original order. The IPsec anti-replay feature drops them as replayed packets, which impacts communications. If this happens, disable IPsec anti-replay checking or adjust the size of the anti-replay window as required.

Restrictions and guidelines

IPsec anti-replay does not affect manually created IPsec SAs. According to the IPsec protocol, only IKE-based IPsec SAs support anti-replay.

Set the anti-replay window size as small as possible to reduce the impact on system performance.

Failure to detect anti-replay attacks might result in denial of services. If you want to disable IPsec anti-replay, make sure you understand the impact of the operation on network security.

Procedure

1. Enter system view.

   system-view

2. Enable IPsec anti-replay.

   ipsec anti-replay check

   By default, IPsec anti-replay is enabled.

3. Set the size of the IPsec anti-replay window.

   ipsec anti-replay window *width*

   The default size is 64.

Binding a source interface to an IPsec policy

About this task

For high availability, a core device is usually connected to an ISP through two links, which operate in backup or load sharing mode. The two interfaces negotiate with their peers to establish IPsec SAs respectively. When one interface fails and a link failover occurs, the other interface needs to take some time to renegotiate SAs, resulting in service interruption.

To solve these problems, bind a source interface to an IPsec policy and apply the policy to both interfaces. This enables the two physical interfaces to use the same source interface to negotiate IPsec SAs. As long as the source interface is up, the negotiated IPsec SAs will not be removed and will keep working, regardless of link failover.

Restrictions and guidelines

Only the IKE-based IPsec policies can be bound to a source interface.

An IPsec policy can be bound to only one source interface.

A source interface can be bound to multiple IPsec policies.

If the source interface bound to an IPsec policy is removed, the IPsec policy becomes a common IPsec policy.

If no local address is specified for an IPsec policy that has been bound to a source interface, the IPsec policy uses the IP address of the bound source interface to perform IKE negotiation. If a local address is specified, the IPsec policy uses the local address to perform IKE negotiation.

Procedure

1. Enter system view.

   system-view

2. Bind a source interface to an IPsec policy.

   ipsec { **ipv6-policy** | **policy** } *policy-name* **local-address** *interface-type interface-number*

   By default, no source interface is bound to an IPsec policy.

Enabling QoS pre-classify

About this task

When both an IPsec policy and a QoS policy are applied to an interface, QoS classifies packets by using the new headers added by IPsec. If you want QoS to classify packets by using the headers of the original IP packets, enable the QoS pre-classify feature.

Restrictions and guidelines

If you configure both IPsec and QoS on an interface, make sure the IPsec traffic classification rules match the QoS traffic classification rules. If the rules do not match, QoS might classify the packets of one IPsec SA to different queues, causing packets to be sent out of order. When IPsec anti-replay is enabled, IPsec will drop the incoming packets that are out of the anti-replay window, resulting in packet loss.

IPsec traffic classification rules are determined by the rules of the specified ACL. For more information about QoS policy and classification, see *ACL and QoS Configuration Guide*.

Procedure

1. Enter system view.

   `system-view`

2. Enter IPsec policy view or IPsec policy template view.
   - Enter IPsec policy view.

     `ipsec` { **`ipv6-policy`** | **`policy`** } *`policy-name`* *`seq-number`* [**`isakmp`** | **`manual`**]
   - Enter IPsec policy template view.

     `ipsec` { **`ipv6-policy-template`** | **`policy-template`** } *`template-name`* *`seq-number`*

3. Enable QoS pre-classify.

   `qos pre-classify`

   By default, QoS pre-classify is disabled.

Configuring IPsec RRI

Restrictions and guidelines

Enabling IPsec RRI for an IPsec policy deletes all existing IPsec SAs created by this IPsec policy. IPsec RRI creates static routes according to new IPsec SAs.

Disabling IPsec RRI for an IPsec policy deletes all existing IPsec SAs created by this IPsec policy and the associated static routes.

IPsec RRI is supported in both tunnel mode and transport mode.

If you change the preference value or tag value for an IPsec policy, the device deletes all IPsec SAs created by this IPsec policy, and the associated static routes. The change takes effect for future IPsec RRI-created static routes.

IPsec RRI does not generate a static route to a destination address to be protected if the destination address is not defined in the ACL used by an IPsec policy or an IPsec policy template. You must manually configure a static route to the destination address.

Procedure

1. Enter system view.

   `system-view`

2. Enter IPsec policy view or IPsec policy template view.
   - Enter IPsec policy view.

     `ipsec` { **`policy`** | **`ipv6-policy`** } *`policy-name`* *`seq-number`* **`isakmp`**
   - Enter IPsec policy template view.

     `ipsec` { **`ipv6-policy-template`** | **`policy-template`** } *`template-name`* *`seq-number`*

3. Enable IPsec RRI.

reverse-route [**next-hop** [**ipv6**] *ip-address*] **dynamic**

By default, IPsec RRI is disabled.

4. (Optional.) Set the preference value for the static routes created by IPsec RRI.

   reverse-route preference *number*

   The default value is 60.
5. (Optional.) Set the tag value for the static routes created by IPsec RRI.

   reverse-route tag *tag-value*

   The default value is 0.

Configuring IPsec smart link selection

About this task

IPsec smart link selection enables a branch gateway to dynamically select a qualified link among the available links to establish the IPsec tunnel to the headquarters.

To configure IPsec smart link selection on a branch gateway, perform the following tasks:

1. Configure an IPsec smart link policy.

   An IPsec smart link policy defines the following settings:
   - Link quality probe settings, such as the number of probe packets sent in each probe cycle and the probe packet sending interval.
   - Links available for smart link selection. A link configured earlier has a higher priority in smart link selection.
   - Link switchover thresholds, including the packet loss ratio threshold and delay threshold.
2. Apply the IPsec smart link policy to an IKE-based IPsec policy.

The IPsec smart link selection process is as follows:

1. When the branch gateway identifies traffic that needs IPsec protection for the first time, it establishes an IPsec tunnel to the headquarters over the link with the highest priority.

   After a link is selected for IPsec tunnel establishment, the device applies the IPsec policy that uses the IPsec smart link policy to the local interface of the link.
2. The device periodically sends probe packets to test the packet loss ratio and delay over the active link.
3. If the packet loss ratio or delay over the link exceeds the configured threshold, the device starts a cyclic link switchover process, during which a qualified link is selected to transfer traffic.

   Cyclic link switchover probes the available links one by one in descending order of the link priority, and uses the first qualified link to transfer traffic. If no links are qualified when the maximum number of link switchover cycles is reached, the device selects a link for traffic as follows:
   - Selects the link with the lowest packet loss ratio.
   - Selects the link with the lowest delay if the links have the same packet loss ratio.
   - Selects the link with the lowest priority if the links have the same packet loss ratio and delay.

   After 10 minutes, the device starts link quality probing and cyclic link switchovers again.

Restrictions and guidelines

IPsec smart link selection is supported only on IPv4 networks.

An IPsec smart link policy takes effect after it is applied to an IKE-based IPsec policy. You cannot apply an IPsec smart link policy to a manual IPsec policy or an IPsec policy created by using an IPsec policy template.

When you configure IPsec smart link selection on the IPsec gateway at a branch, follow these restrictions and guidelines:

- An IPsec smart link policy can be applied to only one IPsec policy, and an IPsec policy can use only one IPsec smart link policy.
- In the IPsec policy that uses an IPsec smart link policy, do not use **`local-address`** and
- Make sure the device does not have static routes that use the same destination addresses as the routes automatically generated by smart link selection. If such static routes exist, delete them.

When you configure the IPsec gateway at the headquarters, follow these restrictions and guidelines:

- The IPsec policy applied to the gateway interface used for communication with the branch gateway must be created by using an IPsec policy template.
- When you specify the remote IP address in IKE configuration, use 0.0.0.0 0 or specify all the remote IP addresses configured at the branch gateway.

Procedure

1. Enter system view.

   `system-view`

2. Configure an IPsec smart link policy.

   a. Create an IPsec smart link policy and enter its view.

   `ipsec smart-link policy` *`policy-name`*

   b. Configure links for IPsec smart link selection.

   `link` *`link-id`* **`interface`** *`interface-type interface-number`* [**`local`** *`local-address`* **`nexthop`** *`nexthop-address`*] **`remote`** *`remote-address`*

   By default, an IPsec smart link policy does not contain any links.

   c. Enable IPsec smart link selection.

   `smart-link enable`

   By default, IPsec smart link selection is disabled in an IPsec smart link policy.

   The device performs link quality probing and cyclic link switchovers only when IPsec smart link selection is enabled in the IPsec smart link policy.

   d. (Optional.) Manually activate a link.

   `activate link` *`link-id`*

   To establish an IPsec tunnel over a specific link, use this command to activate the link.

   If the packet loss ratio or delay over the link exceeds the configured threshold, the first link switchover cycle starts from the manually activated link and ends with the link that has the lowest priority.

   e. (Optional.) Move links to adjust their priorities.

   `move link` *`link-id1`* **`before`** *`link-id2`*

   By default, a link configured earlier has a higher priority in smart link selection.

   During link switchover, traffic will be switched over the links in descending order of the link priority.

   f. (Optional.) Set the maximum number of link switchover cycles.

   `link-switch cycles` *`number`*

   By default, the maximum number of link switchover cycles is 3.

   If you set *`number`* to 0, the device never stops link quality probing and cyclic link switchovers.

   g. Set the number of link quality probe packets sent in each probe cycle and the probe packet sending interval.

link-probe { **interval** *interval* | **count** *number* }

By default, the device sends 10 probe packets at 1-second intervals in each probe cycle.

h. Specify the source and destination IP addresses for the link quality probe packets.

link-probe source *source-address* **destination** *destination-address*

By default, the link quality probe packets use the local and remote IP addresses of the probed link as the source and destination IP addresses.

i. Set the link switchover thresholds.

link-switch threshold { **loss** *loss-ratio* | **delay** *delay* }

By default, the packet loss ratio threshold is 30%, and the delay threshold is 500 milliseconds.

3. Configure the gateway address for the local interface of a link.

a. Return to system view.

quit

b. Enter interface view.

interface *interface-type* { *interface-number* | *interface-number.subnumber* }

c. Specify the gateway address for the interface.

gateway *gateway-address* [**no-route**]

By default, an interface with a manually configured IP address does not have a gateway address.

The local interface of a link is the interface specified when you configure the link by using the **link** command.

This task is required for the local interface of each link that meets the following conditions:

- The IP address of the interface is manually configured.
- The **nexthop** *nexthop-address* option is not specified in the **link** command.

The **gateway** command does not take effect if the interface acquires its IP address through DHCP or PPPoE. Such interfaces always use the gateway address assigned by the DHCP or PPPoE server.

4. Apply the IPsec smart link policy to an IKE-based IPsec policy

a. Return to system view.

quit

b. Enter the view of an IKE-based IPsec policy.

ipsec policy *policy-name seq-number* **isakmp**

c. Apply the IPsec smart link policy to the IPsec policy.

smart-link policy *policy-name*

By default, an IPsec smart link policy is not applied to an IPsec policy.

Configuring IPsec netmask filtering

About this task

On a hub-spoke network, if the IPsec data flow range configured on a spoke is too large, traffic of other spokes might be directed to that spoke incorrectly. To avoid incorrect packet forwarding, you can enable IPsec netmask filtering on the hub device. When negotiating an IPsec SA for a data flow, the device checks the mask lengths of the data flow. The IPsec SA negotiation proceeds only if the mask lengths of the source and destination IP addresses of the data flow are greater than or equal to those configured by IPsec netmask filtering. If the data flow fails to pass the netmask filtering, the IPsec SA negotiation fails and the device generates a corresponding SA negotiation failure notification. On receiving such notifications, you must reconfigure the ACL settings for IPsec on the spoke devices.

Restrictions and guidelines

This feature is supported only on IPv4 networks.

This feature takes effect only IPsec SAs negotiated by using IPsec policy templates.

As a best practice, configure this feature on the hub device of a hub-spoke network.

Procedure

1. Enter system view.

   `system-view`

2. Configure IPsec netmask filtering.

   `ipsec netmask-filter` { **`destination-mask`** *`mask-length`* | **`source-mask`** *`mask-length`* } *

   By default, IPsec netmask filtering is not configured.

Enabling IPsec flow overlap check

About this task

In a hub-spoke network, the hub typically uses an IPsec policy template to negotiate IPsec SAs with spokes. The data flows to be protected by the IPsec SAs might overlap with each other. To avoid IPsec flow overlapping, you can enable IPsec flow overlap check on the hub device. When negotiating an IPsec SA for a data flow, the device checks whether the data flow overlaps with an existing protected data flow. If yes, the new IPsec SA negotiation fails and the device generates an IPsec flow overlap notification. On receiving such notifications, you must reconfigure the ACL settings for IPsec on the spoke devices.

This feature checks the destination IP address of a data flow to be protected with the destination IP addresses of the existing protected data flows. If an overlap exists, the feature determines that the data flow overlaps.

Restrictions and guidelines

The following applies to the IPsec flow overlap check feature:

- As a best practice, enable this feature on the hub device of a hub-spoke network.
- This feature takes effect only on IPsec SAs negotiated by using IPsec policy templates.
- This feature takes effect only for new IPsec SA negotiations. It does not take effect on existing IPsec SAs.
- This feature takes effect only on IPsec SAs negotiated on the same interface and in the same VPN instance.
- This feature does not take effect on renegotiated IPsec SAs.
- This feature does not check overlaps for source IP addresses of data flows.
- This feature impacts device performance, enable this feature only when necessary (for example, for network upgrade or expansion) and disable it in time.

Procedure

1. Enter system view.

   `system-view`

2. Enable IPsec flow overlap check.

   `ipsec flow-overlap check enable`

   By default, IPsec flow overlap check is disabled.

Configuring IPsec for IPv6 routing protocols

IPsec protection for IPv6 routing protocols tasks at a glance

To configure IPsec protection for IPv6 routing protocols, perform the following tasks:

1. Configuring an IPsec transform set
2. Configuring a manual IPsec profile
3. Applying the IPsec profile to an IPv6 routing protocol
4. (Optional.) Configuring IPsec anti-replay redundancy
5. (Optional.) Configuring IPsec fragmentation
6. (Optional.) Setting the maximum number of IPsec tunnels
7. (Optional.) Enabling logging for IPsec packets
8. (Optional.) Enabling logging for IPsec negotiation
9. (Optional.) Configuring SNMP notifications for IPsec

Configuring a manual IPsec profile

About this task

A manual IPsec profile specifies the IPsec transform set used for protecting data flows, and the SPIs and keys used by the SAs.

Restrictions and guidelines

When you configure a manual IPsec profile, make sure the IPsec profile configuration at both tunnel ends meets the following requirements:

- The IPsec transform set specified in the IPsec profile at the two tunnel ends must have the same security protocol, encryption and authentication algorithms, and packet encapsulation mode.
- The local inbound and outbound IPsec SAs must have the same SPI and key.
- The IPsec SAs on the devices in the same scope must have the same key. The scope is defined by protocols. For OSPFv3, the scope consists of OSPFv3 neighbors or an OSPFv3 area. For RIPng, the scope consists of directly-connected neighbors or a RIPng process. For BGP, the scope consists of BGP peers or a BGP peer group.
- The keys for the IPsec SAs at the two tunnel ends must be configured in the same format. For example, if the local end uses a key in hexadecimal format, the remote end must also use a key in hexadecimal format. If you configure a key in both the character and the hexadecimal formats, only the most recent configuration takes effect.
- If you configure a key in character format for ESP, the device automatically generates an authentication key and an encryption key for ESP.

Procedure

1. Enter system view.

   system-view

2. Create a manual IPsec profile and enter its view.

   ipsec profile *profile-name* **manual**

   The **manual** keyword is not needed if you enter the view of an existing IPsec profile.

3. (Optional.) Configure a description for the IPsec profile.

   description *text*

By default, no description is configured.

4. Specify an IPsec transform set.

   `transform-set` *`transform-set-name`*

   By default, no IPsec transform set is specified in an IPsec profile.

   The specified IPsec transform set must use the transport mode.

5. Configure an SPI for an SA.

   `sa spi` { **`inbound`** | **`outbound`** } { **`ah`** | **`esp`** } *`spi-number`*

   By default, no SPI is configured for an SA.

6. Configure keys for the IPsec SA.

   - Configure an authentication key in hexadecimal format for AH.

     `sa hex-key authentication` { **`inbound`** | **`outbound`** } **`ah`** { **`cipher`** | **`simple`** } *`string`*

   - Configure an authentication key in character format for AH.

     `sa string-key` { **`inbound`** | **`outbound`** } **`ah`** { **`cipher`** | **`simple`** } *`string`*

   - Configure a key in character format for ESP.

     `sa string-key` { **`inbound`** | **`outbound`** } **`esp`** { **`cipher`** | **`simple`** } *`string`*

   - Configure an authentication key in hexadecimal format for ESP.

     `sa hex-key authentication` { **`inbound`** | **`outbound`** } **`esp`** { **`cipher`** | **`simple`** }

   - Configure an encryption key in hexadecimal format for ESP.

     `sa hex-key encryption` { **`inbound`** | **`outbound`** } **`esp`** { **`cipher`** | **`simple`** } *`string`*

   By default, no keys are configured for the IPsec SA.

   Configure a key for the security protocol (AH, ESP, or both) you have specified.

Applying the IPsec profile to an IPv6 routing protocol

For information about the configuration procedure, see IPv6 BGP, OSPFv3, and RIPng configuration in *Layer 3—IP Routing Configuration Guide*.

Configuring IPsec for tunnel interfaces

IPsec protection for tunnel interfaces tasks at a glance

To configure IPsec protection for tunnel interfaces, perform the following tasks:

1. Configuring an IPsec transform set
2. Configuring an IKE-based IPsec profile
3. Applying an IKE-based IPsec profile to a tunnel interface
4. (Optional.) Configuring IPsec anti-replay redundancy
5. (Optional.) Configuring the global IPsec SA lifetime and idle timeout
6. (Optional.) Configuring IPsec fragmentation
7. (Optional.) Setting the maximum number of IPsec tunnels
8. (Optional.) Enabling logging for IPsec packets
9. (Optional.) Enabling logging for IPsec negotiation
10. (Optional.) Configuring SNMP notifications for IPsec

Configuring an IKE-based IPsec profile

An IKE-based IPsec profile specifies the IPsec transform sets used for protecting data flows, and the IKE profile used for IKE negotiation.

Restrictions and guidelines

The IPsec profiles at the two tunnel ends must have IPsec transform sets that use the same security protocols, security algorithms, and encapsulation mode.

The IPsec profiles at the two tunnel ends must have the same IKE profile parameters.

An IKE-based IPsec profile can use a maximum of six IPsec transform sets. During an IKE negotiation, IKE searches for a fully matched IPsec transform set at the two ends of the IPsec tunnel. If no match is found, no SA can be set up, and the packets expecting to be protected will be dropped.

The IPsec SA uses the local lifetime settings or those proposed by the peer, whichever are smaller.

The IPsec SA can have both a time-based lifetime and a traffic-based lifetime. The IPsec SA expires when either lifetime expires.

Procedure

1. Enter system view.

   `system-view`

2. Create an IKE-based IPsec profile and enter its view.

   `ipsec profile` *`profile-name`* **`isakmp`**

   The **`isakmp`** keyword is not needed if you enter the view of an existing IPsec profile.

3. (Optional.) Configure a description for the IPsec profile.

   `description` *`text`*

   By default, no description is configured.

4. Specify IPsec transform sets.

   `transform-set` *`transform-set-name`*`&<1-6>`

   By default, no IPsec transform sets are specified in an IPsec profile.

   The specified IPsec transform sets must use the tunnel mode.

5. Specify an IKE profile.

   `ike-profile` *`profile-name`*

   By default, no IKE profile is specified for an IPsec profile, and the device selects an IKE profile configured in system view for negotiation. If no IKE profile is configured in system view, the globally configured IKE settings are used.

   You can specify only one IKE profile for an IPsec profile.

   For more information about IKE profiles, see "Configuring IKE."

6. (Optional.) Specify an IKEv2 profile.

   `ikev2-profile` *`profile-name`*

   By default, no IKEv2 profile is specified for an IPsec profile. If both an IKEv1 profile and an IKEv2 profile are specified for an IPsec profile, the IKEv2 profile is preferred.

   You can specify only one IKEv2 profile for an IPsec profile. For more information about IKEv2 profiles, see "Configuring IKEv2."

7. (Optional.) Set the IPsec SA lifetime.

   `sa duration` `{` **`time-based`** *`seconds`* `|` **`traffic-based`** *`kilobytes`* `}`

   By default, the global SA lifetime is used.

8. (Optional.) Set the time-based or traffic-based IPsec SA soft lifetime buffer.

sa soft-duration buffer { **time-based** *seconds* | **traffic-based** *kilobytes* }

By default, no IPsec SA soft lifetime buffers are configured.

9. (Optional.) Set the IPsec SA idle timeout.

   sa idle-time *seconds*

   By default, the global SA idle timeout is used.

Applying an IKE-based IPsec profile to a tunnel interface

About this task

After an IKE-based IPsec profile is applied to a tunnel interface, the peers negotiate an IPsec tunnel through IKE to protect data transmitted through the tunnel interface. The tunnel interface comes up after the IKE negotiation succeeds.

When you specify the IPsec profile to be applied to a tunnel interface, you can specify an ACL to filter the packets routed to the tunnel interface. Only the ACL-permitted packets can be protected by IPsec.

Procedure

1. Enter system view.

   system-view

2. Create a tunnel interface and enter its view.

   interface tunnel *number* **mode** { **advpn** { **gre** | **udp** } [**ipv6**] | **ipsec** [**ipv6**] }

3. Apply an IKE-based IPsec profile to the tunnel interface.

   tunnel protection ipsec profile *profile-name* [**acl** [**ipv6**] { *acl-number* | **name** *acl-name* }]

   By default, no IPsec profile is applied to a tunnel interface.

Configuring IPsec anti-replay redundancy

About this task

This feature synchronizes the following information from the active device to the standby device at configurable packet-based intervals:

- Lower bound values of the IPsec anti-replay window for inbound packets.
- IPsec anti-replay sequence numbers for outbound packets.

This feature, used together with IPsec redundancy, ensures uninterrupted IPsec traffic forwarding and anti-replay protection when the active device fails.

Procedure

1. Enter system view.

   system-view

2. Enable IPsec redundancy.

   ipsec redundancy enable

   By default, IPsec redundancy is disabled.

3. Enter IPsec profile view, IPsec policy view or IPsec policy template view.

   - Enter IPsec profile view.

     ipsec profile *profile-name* [**manual** | **isakmp**]

- Enter IPsec policy view.

  ipsec { **ipv6-policy** | **policy** } *policy-name seq-number* [**isakmp** | **manual**]

- Enter IPsec policy template view.

  ipsec { **ipv6-policy-template** | **policy-template** } *template-name seq-number*

4. Set the anti-replay window synchronization interval for inbound packets and the sequence number synchronization interval for outbound packets.

   redundancy replay-interval inbound *inbound-interval* **outbound** *outbound-interval*

   By default, the active device synchronizes the anti-replay window every time it receives 1000 packets and synchronizes the sequence number every time it sends 100000 packets.

Configuring the global IPsec SA lifetime and idle timeout

About this task

If the IPsec SA lifetime and idle timeout are not configured in an IPsec policy, IPsec policy template, or IPsec profile, the global settings are used.

When IKE negotiates IPsec SAs, it uses the local lifetime settings or those proposed by the peer, whichever are smaller.

An IPsec SA can have both a time-based lifetime and a traffic-based lifetime. The IPsec SA expires when either lifetime expires.

Procedure

1. Enter system view.

   system-view

2. Set the global IPsec SA lifetime, soft lifetime buffer, or idle timeout.

   - Set the global IPsec SA lifetime.

     ipsec sa global-duration { **time-based** *seconds* | **traffic-based** *kilobytes* }

     By default, the time-based SA lifetime is 3600 seconds, and the traffic-based SA lifetime is 1843200 kilobytes.

   - Set the global time-based or traffic-based IPsec SA soft lifetime buffer.

     ipsec sa global-soft-duration buffer { **time-based** *seconds* | **traffic-based** *kilobytes* }

     By default, no global IPsec SA soft lifetime buffers are configured.

   - Set the global SA idle timeout.

     ipsec sa idle-time *seconds*

     By default, the global IPsec SA idle timeout feature is disabled.

Configuring IPsec fragmentation

About this task

Perform this task to configure the device to fragment packets before or after IPsec encapsulation.

If you configure the device to fragment packets before IPsec encapsulation, the device predetermines the encapsulated packet size before the actual encapsulation. If the encapsulated packet size exceeds the MTU of the output interface, the device fragments the packets before encapsulation. If a packet's DF bit is set, the device drops the packet and sends an ICMP error message.

If you configure the device to fragment packets after IPsec encapsulation, the device directly encapsulates the packets and fragments the encapsulated packets in subsequent service modules.

Restrictions and guidelines

This feature takes effect on IPsec protected IPv4 packets.

Procedure

1. Enter system view.
   system-view
2. Configure IPsec fragmentation.
   ipsec fragmentation { **after-encryption** | **before-encryption** }
   By default, the device fragments packets before IPsec encapsulation.

Configuring the DF bit of IPsec packets

About this task

Perform this task to configure the Don't Fragment (DF) bit in the new IP header of IPsec packets in one of the following ways:

- **clear**—Clears the DF bit in the new header.
- **set**—Sets the DF bit in the new header.
- **copy**—Copies the DF bit in the original IP header to the new IP header.

You can configure the DF bit in IPsec policy view, IPsec policy template view, IPsec profile view, interface view, and system view. The DF bit setting in IPsec policy view, IPsec policy template view, or IPsec profile view has the highest priority. If the DF bit setting is not configured in the IPsec policy, IPsec profile, or IPsec policy template, the interface-view DF bit setting is used. If the DF bit setting is not configured in interface view, the global DF bit setting configured in system view is used.

Restrictions and guidelines for DF bit configuration for IPsec packets

The DF bit setting takes effect only in tunnel mode, and it changes the DF bit in the new IP header rather than the original IP header.

Only IKE-based IPsec supports configuring the DF bit.

Configure the same DF bit setting on the interfaces where the same IPsec policy bound to a source interface is applied.

If the DF bit is set, the devices on the path cannot fragment the IPsec packets. To prevent IPsec packets from being discarded, make sure the path MTU is larger than the IPsec packet size. As a best practice, clear the DF bit if you cannot make sure the path MTU is larger than the IPsec packet size.

Configuring the DF bit of IPsec packets in an IPsec profile, IPsec policy or IPsec policy template

1. Enter system view.
   system-view
2. Enter IPsec profile, IPsec policy or IPsec policy template view.
   - Enter IPsec profile view.
     ipsec profile *profile-name* **isakmp**

- Enter IPsec policy view.

  ipsec { **ipv6-policy** | **policy** } *policy-name seq-number* **isakmp**
- Enter IPsec policy template view.

  ipsec { **ipv6-policy-template** | **policy-template** }*template-name seq-number*

3. Configure the DF bit of IPsec packets.

   ipsec df-bit { **clear** | **copy** | **set** }

   By default, an IPsec profile, IPsec policy or IPsec policy template uses the interface-specific or global DF bit setting.

Configuring the DF bit of IPsec packets on an interface

1. Enter system view.

   system-view
2. Enter interface view.

   interface *interface-type interface-number*
3. Configure the DF bit of IPsec packets on the interface.

   ipsec df-bit { **clear** | **copy** | **set** }

   By default, the interface uses the global DF bit setting.

Configuring the DF bit of IPsec packets globally

1. Enter system view.

   system-view
2. Configure the DF bit of IPsec packets globally.

   ipsec global-df-bit { **clear** | **copy** | **set** }

   By default, IPsec copies the DF bit in the original IP header to the new IP header.

Setting the maximum number of IPsec tunnels

Restrictions and guidelines

To maximize concurrent performance of IPsec when memory is sufficient, increase the maximum number of IPsec tunnels. To ensure service availability when memory is insufficient, decrease the maximum number of IPsec tunnels.

Procedure

1. Enter system view.

   system-view
2. Set the maximum number of IPsec tunnels.

   ipsec limit max-tunnel *tunnel-limit*

   By default, the number of IPsec tunnels is not limited.

Enabling logging for IPsec packets

About this task

Perform this task to enable logging for IPsec packets that are discarded for reasons such as IPsec SA lookup failure, AH-ESP authentication failure, and ESP encryption failure. The log information includes the source and destination IP addresses, SPI value, and sequence number of a discarded IPsec packet, and the reason for the discard.

Procedure

1. Enter system view.

   system-view

2. Enable logging for IPsec packets.

   ipsec logging packet enable

   By default, logging for IPsec packets is disabled.

Enabling logging for IPsec negotiation

About this task

This feature enables the device to output logs for the IPsec negotiation process.

Procedure

1. Enter system view.

   system-view

2. Enable logging for IPsec negotiation.

   ipsec logging negotiation enable

   By default, logging for IPsec negotiation is enabled.

Configuring SNMP notifications for IPsec

About this task

After you enable SNMP notifications for IPsec, the IPsec module notifies the NMS of important module events. The notifications are sent to the device's SNMP module. For the notifications to be sent correctly, you must also configure SNMP on the device. For more information about SNMP notifications, see *Network Management and Monitoring Configuration Guide*.

To generate and output SNMP notifications for a specific IPsec failure or event type, perform the following tasks:

1. Enable SNMP notifications for IPsec globally.
2. Enable SNMP notifications for the failure or event type.

Procedure

1. Enter system view.

   system-view

2. Enable SNMP notifications for IPsec globally.

   snmp-agent trap enable ipsec global

   By default, SNMP notifications for IPsec are disabled.

3. Enable SNMP notifications for the specified failure or event types.

   snmp-agent trap enable ipsec [**auth-failure** | **connection-start** | **connection-stop** | **decrypt-failure** | **encrypt-failure** | **invalid-sa-failure** | **no-sa-failure** | **policy-add** | **policy-attach** | **policy-delete** | **policy-detach** | **tunnel-start** | **tunnel-stop**] *

   By default, SNMP notifications for all failure and event types are disabled.

Display and maintenance commands for IPsec

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display IPsec policy information.	**display ipsec** { **ipv6-policy** | **policy** } [*policy-name* [*seq-number*]]
Display IPsec policy template information.	**display ipsec** { **ipv6-policy-template** | **policy-template** } [*template-name* [*seq-number*]]
Display IPsec profile information.	**display ipsec profile** [*profile-name*]
Display IPsec SA information.	**display ipsec sa** [**brief** | **count** | **interface** *interface-type interface-number* | { **ipv6-policy** | **policy** } *policy-name* [*seq-number*] | **profile** *profile-name* | **remote** [**ipv6**] *ip-address*]
Display IPsec smart link policy information.	**display ipsec smart-link policy** [**brief** | **name** *policy-name*]
Display IPsec statistics.	**display ipsec statistics** [**tunnel-id** *tunnel-id*]
Display IPsec transform set information.	**display ipsec transform-set** [*transform-set-name*]
Display IPsec tunnel information.	**display ipsec tunnel** { **brief** | **count** | **tunnel-id** *tunnel-id* }
Clear IPsec SAs.	**reset ipsec sa** [{ **ipv6-policy** | **policy** } *policy-name* [*seq-number*] | **profile** *profile-name* | **remote** { *ipv4-address* | **ipv6** *ipv6-address* } | **spi** { *ipv4-address* | **ipv6** *ipv6-address* } { **ah** | **esp** } *spi-num*]
Clear IPsec statistics.	**reset ipsec statistics** [**tunnel-id** *tunnel-id*]

IPsec configuration examples

Example: Configuring a manual mode IPsec tunnel for IPv4 packets between gateways

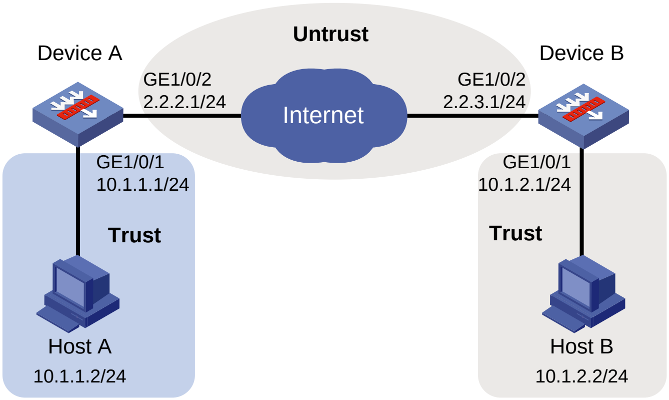
Network configuration

As shown in Figure 10, establish an IPsec tunnel between Device A and Device B to protect data flows between subnet 10.1.1.0/24 and subnet 10.1.2.0/24. Configure the tunnel as follows:

- Specify the encapsulation mode as tunnel, the security protocol as ESP, the encryption algorithm as 128-bit AES, and the authentication algorithm as HMAC-SHA1.

- Manually set up IPsec SAs.

Figure 10 Network diagram



Configuring Device A

1. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

   ```
   <DeviceA> system-view
   [DeviceA] interface gigabitethernet 1/0/1
   [DeviceA-GigabitEthernet1/0/1] ip address 10.1.1.1 255.255.255.0
   [DeviceA-GigabitEthernet1/0/1] quit
   ```

   # Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Configure settings for routing.

   This example configures static routes, and the next hop in the routes is 2.2.2.2.

   ```
   [DeviceA] ip route-static 10.1.2.0 24 2.2.2.2
   [DeviceA] ip route-static 2.2.3.1 24 2.2.2.2
   ```

3. Add interfaces to security zones.

   ```
   [DeviceA] security-zone name trust
   [DeviceA-security-zone-Trust] import interface gigabitethernet 1/0/1
   [DeviceA-security-zone-Trust] quit
   [DeviceA] security-zone name untrust
   [DeviceA-security-zone-Untrust] import interface gigabitethernet 1/0/2
   [DeviceA-security-zone-Untrust] quit
   ```

4. Configure a security policy:

   a. Configure rules to permit traffic between the **Untrust** and **Local** security zones, so the devices can set up an IPsec tunnel:

      # Configure a rule named **ipseclocalout** to allow Device A to send IPsec negotiation packets to Device B.

      ```
      [DeviceA] security-policy ip
      [DeviceA-security-policy-ip] rule name ipseclocalout
      [DeviceA-security-policy-ip-1-ipseclocalout] source-zone local
      [DeviceA-security-policy-ip-1-ipseclocalout] destination-zone untrust
      [DeviceA-security-policy-ip-1-ipseclocalout] source-ip-host 2.2.2.1
      [DeviceA-security-policy-ip-1-ipseclocalout] destination-ip-host 2.2.3.1
      [DeviceA-security-policy-ip-1-ipseclocalout] action pass
      [DeviceA-security-policy-ip-1-ipseclocalout] quit
      ```

# Configure a rule named **ipseclocalin** to allow Device A to receive the IPsec negotiation packets sent from Device B.

```
[DeviceA-security-policy-ip] rule name ipseclocalin
[DeviceA-security-policy-ip-2-ipseclocalin] source-zone untrust
[DeviceA-security-policy-ip-2-ipseclocalin] destination-zone local
[DeviceA-security-policy-ip-2-ipseclocalin] source-ip-host 2.2.3.1
[DeviceA-security-policy-ip-2-ipseclocalin] destination-ip-host 2.2.2.1
[DeviceA-security-policy-ip-2-ipseclocalin] action pass
[DeviceA-security-policy-ip-2-ipseclocalin] quit
```

b. Configure rules to permit the traffic between Host A and Host B:

# Configure a rule named **trust-untrust** to permit the packets from Host A to Host B.

```
[DeviceA-security-policy-ip] rule name trust-untrust
[DeviceA-security-policy-ip-3-trust-untrust] source-zone trust
[DeviceA-security-policy-ip-3-trust-untrust] destination-zone untrust
[DeviceA-security-policy-ip-3-trust-untrust] source-ip-subnet 10.1.1.0 24
[DeviceA-security-policy-ip-3-trust-untrust] destination-ip-subnet 10.1.2.0 24
[DeviceA-security-policy-ip-3-trust-untrust] action pass
[DeviceA-security-policy-ip-3-trust-untrust] quit
```

# Configure a rule named **untrust-trust** to permit the packets from Host B to Host A.

```
[DeviceA-security-policy-ip] rule name untrust-trust
[DeviceA-security-policy-ip-4-untrust-trust] source-zone untrust
[DeviceA-security-policy-ip-4-untrust-trust] destination-zone trust
[DeviceA-security-policy-ip-4-untrust-trust] source-ip-subnet 10.1.2.0 24
[DeviceA-security-policy-ip-4-untrust-trust] destination-ip-subnet 10.1.1.0 24
[DeviceA-security-policy-ip-4-untrust-trust] action pass
[DeviceA-security-policy-ip-4-untrust-trust] quit
[DeviceA-security-policy-ip] quit
```

5. Define the data flow to be protected:

# Configure an IPv4 advanced ACL to identify the data flow from subnet 10.1.1.0/24 to subnet 10.1.2.0/24.

```
[DeviceA] acl advanced 3101
[DeviceA-acl-ipv4-adv-3101] rule permit ip source 10.1.1.0 0.0.0.255 destination
10.1.2.0 0.0.0.255
[DeviceA-acl-ipv4-adv-3101] quit
```

6. Configure an IPsec transform set to specify the packet encapsulation mode, security protocols, and algorithms.

The IPsec transform set settings at both sides of the IPsec tunnel must be the same.

```
[DeviceA] ipsec transform-set tran1
[DeviceA-ipsec-transform-set-tran1] encapsulation-mode tunnel
[DeviceA-ipsec-transform-set-tran1] protocol esp
[DeviceA-ipsec-transform-set-tran1] esp encryption-algorithm aes-cbc-128
[DeviceA-ipsec-transform-set-tran1] esp authentication-algorithm sha1
[DeviceA-ipsec-transform-set-tran1] quit
```

7. Configure an IPsec policy, so as to establish the IPsec tunnel to protect data:

# Create a manual IPsec policy entry, which specifies the ACL for IPsec, the IPsec transform set, and the remote IP address of the IPsec tunnel.

```
[DeviceA] ipsec policy map1 10 manual
[DeviceA-ipsec-policy-manual-map1-10] security acl 3101
```

```
[DeviceA-ipsec-policy-manual-map1-10] transform-set tran1
[DeviceA-ipsec-policy-manual-map1-10] remote-address 2.2.3.1
[DeviceA-ipsec-policy-manual-map1-10] sa spi outbound esp 12345
[DeviceA-ipsec-policy-manual-map1-10] sa spi inbound esp 54321
[DeviceA-ipsec-policy-manual-map1-10] sa string-key outbound esp simple abcdefg
[DeviceA-ipsec-policy-manual-map1-10] sa string-key inbound esp simple gfedcba
[DeviceA-ipsec-policy-manual-map1-10] quit
```

8. Apply the IPsec policy to GigabitEthernet 1/0/2 to protect traffic on the interface.

```
[DeviceA] interface gigabitethernet 1/0/2
[DeviceA-GigabitEthernet1/0/2] ipsec apply policy map1
[DeviceA-GigabitEthernet1/0/2] quit
```

Configuring Device B

1. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

```
<DeviceB> system-view
[DeviceB] interface gigabitethernet 1/0/1
[DeviceB-GigabitEthernet1/0/1] ip address 10.1.2.1 255.255.255.0
[DeviceB-GigabitEthernet1/0/1] quit
```

   # Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Configure settings for routing.

   This example configures static routes, and the next hop in the routes is 2.2.3.2.

```
[DeviceB] ip route-static 10.1.1.0 24 2.2.3.2
[DeviceB] ip route-static 2.2.2.1 24 2.2.3.2
```

3. Add interfaces to security zones.

```
[DeviceB] security-zone name trust
[DeviceB-security-zone-Trust] import interface gigabitethernet 1/0/1
[DeviceB-security-zone-Trust] quit
[DeviceB] security-zone name untrust
[DeviceB-security-zone-Untrust] import interface gigabitethernet 1/0/2
[DeviceB-security-zone-Untrust] quit
```

4. Configure a security policy:

   a. Configure rules to permit traffic between the **Untrust** and **Local** security zones, so the devices can set up an IPsec tunnel:

   # Configure a rule named **ipseclocalout** to allow Device B to send IPsec negotiation packets to Device A.

```
[DeviceB] security-policy ip
[DeviceB-security-policy-ip] rule name ipseclocalout
[DeviceB-security-policy-ip-1-ipseclocalout] source-zone local
[DeviceB-security-policy-ip-1-ipseclocalout] destination-zone untrust
[DeviceB-security-policy-ip-1-ipseclocalout] source-ip-host 2.2.3.1
[DeviceB-security-policy-ip-1-ipseclocalout] destination-ip-host 2.2.2.1
[DeviceB-security-policy-ip-1-ipseclocalout] action pass
[DeviceB-security-policy-ip-1-ipseclocalout] quit
```

   # Configure a rule named **ipseclocalin** to allow Device B to receive the IPsec negotiation packets sent from Device A.

```
[DeviceB-security-policy-ip] rule name ipseclocalin
[DeviceB-security-policy-ip-2-ipseclocalin] source-zone untrust
```

```
[DeviceB-security-policy-ip-2-ipseclocalin] destination-zone local
[DeviceB-security-policy-ip-2-ipseclocalin] source-ip-host 2.2.2.1
[DeviceB-security-policy-ip-2-ipseclocalin] destination-ip-host 2.2.3.1
[DeviceB-security-policy-ip-2-ipseclocalin] action pass
[DeviceB-security-policy-ip-2-ipseclocalin] quit
```

b. Configure rules to permit traffic between Host B and Host A:

# Configure a rule named **trust-untrust** to permit the packets from Host B to Host A.

```
[DeviceB-security-policy-ip] rule name trust-untrust
[DeviceB-security-policy-ip-3-trust-untrust] source-zone trust
[DeviceB-security-policy-ip-3-trust-untrust] destination-zone untrust
[DeviceB-security-policy-ip-3-trust-untrust] source-ip-subnet 10.1.2.0 24
[DeviceB-security-policy-ip-3-trust-untrust] destination-ip-subnet 10.1.1.0 24
[DeviceB-security-policy-ip-3-trust-untrust] action pass
[DeviceB-security-policy-ip-3-trust-untrust] quit
```

# Configure a rule named **untrust-trust** to permit the packets from Host A to Host B.

```
[DeviceB-security-policy-ip] rule name untrust-trust
[DeviceB-security-policy-ip-4-untrust-trust] source-zone untrust
[DeviceB-security-policy-ip-4-untrust-trust] destination-zone trust
[DeviceB-security-policy-ip-4-untrust-trust] source-ip-subnet 10.1.1.0 24
[DeviceB-security-policy-ip-4-untrust-trust] destination-ip-subnet 10.1.2.0 24
[DeviceB-security-policy-ip-4-untrust-trust] action pass
[DeviceB-security-policy-ip-4-untrust-trust] quit
[DeviceB-security-policy-ip] quit
```

5. Define the data flows to be protected:

# Configure an IPv4 advanced ACL to identify data flows from subnet 10.1.2.0/24 to subnet 10.1.1.0/24.

```
[DeviceB] acl advanced 3101
[DeviceB-acl-ipv4-adv-3101] rule permit ip source 10.1.2.0 0.0.0.255 destination
10.1.1.0 0.0.0.255
[DeviceB-acl-ipv4-adv-3101] quit
```

6. Configure an IPsec transform set to specify the packet encapsulation mode, security protocols, and algorithms.

The IPsec transform set settings at both sides of the IPsec tunnel must be the same.

```
[DeviceB] ipsec transform-set tran1
[DeviceB-ipsec-transform-set-tran1] encapsulation-mode tunnel
[DeviceB-ipsec-transform-set-tran1] protocol esp
[DeviceB-ipsec-transform-set-tran1] esp encryption-algorithm aes-cbc-128
[DeviceB-ipsec-transform-set-tran1] esp authentication-algorithm sha1
[DeviceB-ipsec-transform-set-tran1] quit
```

7. Configure an IPsec policy, so as to establish the IPsec tunnel to protect data:

# Create a manual IPsec policy entry, which specifies the ACL for IPsec, the IPsec transform set, and the remote IP address of the IPsec tunnel.

```
[DeviceB] ipsec policy use1 10 manual
[DeviceB-ipsec-policy-manual-use1-10] security acl 3101
[DeviceB-ipsec-policy-manual-use1-10] transform-set tran1
[DeviceB-ipsec-policy-manual-use1-10] remote-address 2.2.2.1
[DeviceB-ipsec-policy-manual-use1-10] sa spi outbound esp 54321
[DeviceB-ipsec-policy-manual-use1-10] sa spi inbound esp 12345
```

```
[DeviceB-ipsec-policy-manual-use1-10] sa string-key outbound esp simple gfedcba
[DeviceB-ipsec-policy-manual-use1-10] sa string-key inbound esp simple abcdefg
[DeviceB-ipsec-policy-manual-use1-10] quit
```

8. Apply the IPsec policy to GigabitEthernet 1/0/2 to protect traffic on the interface.

```
[DeviceB] interface gigabitethernet 1/0/2
[DeviceB-GigabitEthernet1/0/2] ipsec policy use1
[DeviceB-GigabitEthernet1/0/2] quit
```

Verifying the configuration

After the configuration is completed, an IPsec tunnel between Device A and Device B is established, and the traffic between subnet 10.1.1.0/24 and subnet 10.1.2.0/24 is IPsec-protected. This example uses Device A to verify the configuration.

# Display IPsec SAs on Device A.

```
[DeviceA] display ipsec sa
-------------------------------
Interface: GigabitEthernet 1/0/2
-------------------------------

  -----------------------------
  IPsec policy: map1
  Sequence number: 10
  Mode: Manual
  -----------------------------
    Tunnel id: 549
    Encapsulation mode: tunnel
    Transmitting entity: Initiator
    Path MTU: 1443
    Tunnel:
        local  address: 2.2.2.1
        remote address: 2.2.3.1
    Flow:
        as defined in ACL 3101
    [Inbound ESP SA]
      SPI: 54321 (0x0000d431)
      Connection ID: 1
      Transform set: ESP-ENCRYPT-AES-CBC-128 ESP-AUTH-SHA1
      No duration limit for this SA
    [Outbound ESP SA]
      SPI: 12345 (0x00003039)
      Connection ID: 2
      Transform set: ESP-ENCRYPT-AES-CBC-128 ESP-AUTH-SHA1
      No duration limit for this SA
```

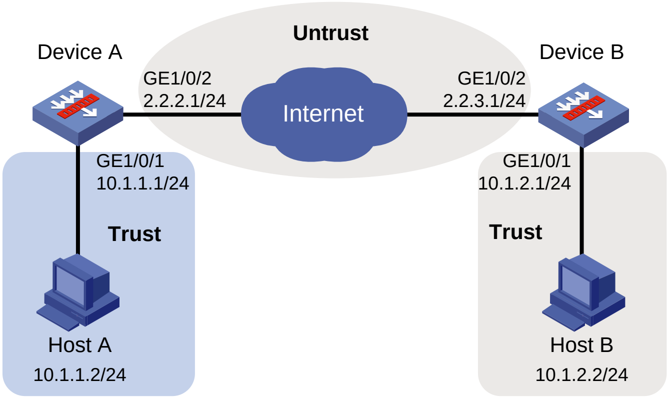
Example: Configuring an IKE-based IPsec tunnel for IPv4 packets between gateways (preshared key authentication)

Network configuration

As shown in Figure 11, establish an IPsec tunnel between Device A and Device B to protect data flows between subnet 10.1.1.0/24 and subnet 10.1.2.0/24. Configure the IPsec tunnel as follows:

- Specify the encapsulation mode as tunnel, the security protocol as ESP, the encryption algorithm as 128-bit AES, and the authentication algorithm as HMAC-SHA1.
- Set up SAs through IKE negotiation.

Figure 11 Network diagram



Configuring Device A

1. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

   ```
   <DeviceA> system-view
   [DeviceA] interface gigabitethernet 1/0/1
   [DeviceA-GigabitEthernet1/0/1] ip address 10.1.1.1 255.255.255.0
   [DeviceA-GigabitEthernet1/0/1] quit
   ```

   # Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Configure settings for routing.

   This example configures static routes, and the next hop in the routes is 2.2.2.2.

   ```
   [DeviceA] ip route-static 10.1.2.0 24 2.2.2.2
   [DeviceA] ip route-static 2.2.3.1 24 2.2.2.2
   ```

3. Add interfaces to security zones.

   ```
   [DeviceA] security-zone name trust
   [DeviceA-security-zone-Trust] import interface gigabitethernet 1/0/1
   [DeviceA-security-zone-Trust] quit
   [DeviceA] security-zone name untrust
   [DeviceA-security-zone-Untrust] import interface gigabitethernet 1/0/2
   [DeviceA-security-zone-Untrust] quit
   ```

4. Configure a security policy:

   a. Configure rules to permit traffic between the **Untrust** and **Local** security zones, so the devices can set up an IPsec tunnel:

      # Configure a rule named **ipseclocalout** to allow Device A to send IPsec negotiation packets to Device B.

```
[DeviceA] security-policy ip
[DeviceA-security-policy-ip] rule name ipseclocalout
[DeviceA-security-policy-ip-1-ipseclocalout] source-zone local
[DeviceA-security-policy-ip-1-ipseclocalout] destination-zone untrust
[DeviceA-security-policy-ip-1-ipseclocalout] source-ip-host 2.2.2.1
[DeviceA-security-policy-ip-1-ipseclocalout] destination-ip-host 2.2.3.1
[DeviceA-security-policy-ip-1-ipseclocalout] action pass
[DeviceA-security-policy-ip-1-ipseclocalout] quit
```

# Configure a rule named **ipseclocalin** to allow Device A to receive the IPsec negotiation packets sent from Device B.

```
[DeviceA-security-policy-ip] rule name ipseclocalin
[DeviceA-security-policy-ip-2-ipseclocalin] source-zone untrust
[DeviceA-security-policy-ip-2-ipseclocalin] destination-zone local
[DeviceA-security-policy-ip-2-ipseclocalin] source-ip-host 2.2.3.1
[DeviceA-security-policy-ip-2-ipseclocalin] destination-ip-host 2.2.2.1
[DeviceA-security-policy-ip-2-ipseclocalin] action pass
[DeviceA-security-policy-ip-2-ipseclocalin] quit
```

b. Configure rules to permit the traffic between Host A and Host B:

# Configure a rule named **trust-untrust** to permit the packets from Host A to Host B.

```
[DeviceA-security-policy-ip] rule name trust-untrust
[DeviceA-security-policy-ip-3-trust-untrust] source-zone trust
[DeviceA-security-policy-ip-3-trust-untrust] destination-zone untrust
[DeviceA-security-policy-ip-3-trust-untrust] source-ip-subnet 10.1.1.0 24
[DeviceA-security-policy-ip-3-trust-untrust] destination-ip-subnet 10.1.2.0 24
[DeviceA-security-policy-ip-3-trust-untrust] action pass
[DeviceA-security-policy-ip-3-trust-untrust] quit
```

# Configure a rule named **untrust-trust** to permit the packets from Host B to Host A.

```
[DeviceA-security-policy-ip] rule name untrust-trust
[DeviceA-security-policy-ip-4-untrust-trust] source-zone untrust
[DeviceA-security-policy-ip-4-untrust-trust] destination-zone trust
[DeviceA-security-policy-ip-4-untrust-trust] source-ip-subnet 10.1.2.0 24
[DeviceA-security-policy-ip-4-untrust-trust] destination-ip-subnet 10.1.1.0 24
[DeviceA-security-policy-ip-4-untrust-trust] action pass
[DeviceA-security-policy-ip-4-untrust-trust] quit
[DeviceA-security-policy-ip] quit
```

5. Define the data flows to be protected:

# Configure an IPv4 advanced ACL to identify data flows from subnet 10.1.1.0/24 to subnet 10.1.2.0/24.

```
[DeviceA] acl advanced 3101
[DeviceA-acl-ipv4-adv-3101] rule permit ip source 10.1.1.0 0.0.0.255 destination
10.1.2.0 0.0.0.255
[DeviceA-acl-ipv4-adv-3101] quit
```

6. Configure an IPsec transform set to specify the packet encapsulation mode, security protocols, and algorithms.

```
[DeviceA] ipsec transform-set tran1
[DeviceA-ipsec-transform-set-tran1] encapsulation-mode tunnel
[DeviceA-ipsec-transform-set-tran1] protocol esp
[DeviceA-ipsec-transform-set-tran1] esp encryption-algorithm aes-cbc-128
```

```
[DeviceA-ipsec-transform-set-tran1] esp authentication-algorithm sha1
[DeviceA-ipsec-transform-set-tran1] quit
```

7. Configure an IKE keychain to specify the key information used for IKE communication.

   The preshared key used by both sides of the communication must be the same.

   ```
   [DeviceA] ike keychain keychain1
   [DeviceA-ike-keychain-keychain1] pre-shared-key address 2.2.3.1 255.255.255.0 key
   simple 123456TESTplat&!
   [DeviceA-ike-keychain-keychain1] quit
   ```

8. Configure an IKE profile to specify the security parameters used for setting up IKE SAs.

   ```
   [DeviceA] ike profile profile1
   [DeviceA-ike-profile-profile1] keychain keychain1
   [DeviceA-ike-profile-profile1] match remote identity address 2.2.3.1 255.255.255.0
   [DeviceA-ike-profile-profile1] quit
   ```

9. Configure an IPsec policy, so as to establish the IPsec tunnel to protect data:

   # Create an IKE-based IPsec policy entry, which specifies the ACL for IPsec, IPsec transform set, local and remote IP addresses, and IKE profile.

   ```
   [DeviceA] ipsec policy map1 10 isakmp
   [DeviceA-ipsec-policy-isakmp-map1-10] security acl 3101
   [DeviceA-ipsec-policy-isakmp-map1-10] transform-set tran1
   [DeviceA-ipsec-policy-isakmp-map1-10] local-address 2.2.2.1
   [DeviceA-ipsec-policy-isakmp-map1-10] remote-address 2.2.3.1
   [DeviceA-ipsec-policy-isakmp-map1-10] ike-profile profile1
   [DeviceA-ipsec-policy-isakmp-map1-10] quit
   ```

10. Apply the IPsec policy to GigabitEthernet 1/0/2 to protect traffic on the interface.

    ```
    [DeviceA] interface gigabitethernet 1/0/2
    [DeviceA-GigabitEthernet1/0/2] ipsec apply policy map1
    [DeviceA-GigabitEthernet1/0/2] quit
    ```

Configuring Device B

1. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

   ```
   <DeviceB> system-view
   [DeviceB] interface gigabitethernet 1/0/1
   [DeviceB-GigabitEthernet1/0/1] ip address 10.1.2.1 255.255.255.0
   [DeviceB-GigabitEthernet1/0/1] quit
   ```

   # Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Configure settings for routing.

   This example configures static routes, and the next hop in the routes is 2.2.3.2.

   ```
   [DeviceB] ip route-static 10.1.1.0 24 2.2.3.2
   [DeviceB] ip route-static 2.2.2.1 24 2.2.3.2
   ```

3. Add interfaces to security zones.

   ```
   [DeviceB] security-zone name trust
   [DeviceB-security-zone-Trust] import interface gigabitethernet 1/0/1
   [DeviceB-security-zone-Trust] quit
   [DeviceB] security-zone name untrust
   [DeviceB-security-zone-Untrust] import interface gigabitethernet 1/0/2
   [DeviceB-security-zone-Untrust] quit
   ```

4. Configure a security policy:

a. Configure rules to permit traffic between the **Untrust** and **Local** security zones, so the devices can set up an IPsec tunnel:

# Configure a rule named **ipseclocalout** to allow Device B to send IPsec negotiation packets to Device A.

```
[DeviceB] security-policy ip
[DeviceB-security-policy-ip] rule name ipseclocalout
[DeviceB-security-policy-ip-1-ipseclocalout] source-zone local
[DeviceB-security-policy-ip-1-ipseclocalout] destination-zone untrust
[DeviceB-security-policy-ip-1-ipseclocalout] source-ip-host 2.2.3.1
[DeviceB-security-policy-ip-1-ipseclocalout] destination-ip-host 2.2.2.1
[DeviceB-security-policy-ip-1-ipseclocalout] action pass
[DeviceB-security-policy-ip-1-ipseclocalout] quit
```

# Configure a rule named **ipseclocalin** to allow Device B to receive the IPsec negotiation packets sent from Device A.

```
[DeviceB-security-policy-ip] rule name ipseclocalin
[DeviceB-security-policy-ip-2-ipseclocalin] source-zone untrust
[DeviceB-security-policy-ip-2-ipseclocalin] destination-zone local
[DeviceB-security-policy-ip-2-ipseclocalin] source-ip-host 2.2.2.1
[DeviceB-security-policy-ip-2-ipseclocalin] destination-ip-host 2.2.3.1
[DeviceB-security-policy-ip-2-ipseclocalin] action pass
[DeviceB-security-policy-ip-2-ipseclocalin] quit
```

b. Configure rules to permit traffic between Host B and Host A:

# Configure a rule named **trust-untrust** to permit the packets from Host B to Host A.

```
[DeviceB-security-policy-ip] rule name trust-untrust
[DeviceB-security-policy-ip-3-trust-untrust] source-zone trust
[DeviceB-security-policy-ip-3-trust-untrust] destination-zone untrust
[DeviceB-security-policy-ip-3-trust-untrust] source-ip-subnet 10.1.2.0 24
[DeviceB-security-policy-ip-3-trust-untrust] destination-ip-subnet 10.1.1.0 24
[DeviceB-security-policy-ip-3-trust-untrust] action pass
[DeviceB-security-policy-ip-3-trust-untrust] quit
```

# Configure a rule named **untrust-trust** to permit the packets from Host A to Host B.

```
[DeviceB-security-policy-ip] rule name untrust-trust
[DeviceB-security-policy-ip-4-untrust-trust] source-zone untrust
[DeviceB-security-policy-ip-4-untrust-trust] destination-zone trust
[DeviceB-security-policy-ip-4-untrust-trust] source-ip-subnet 10.1.1.0 24
[DeviceB-security-policy-ip-4-untrust-trust] destination-ip-subnet 10.1.2.0 24
[DeviceB-security-policy-ip-4-untrust-trust] action pass
[DeviceB-security-policy-ip-4-untrust-trust] quit
[DeviceB-security-policy-ip] quit
```

5. Define the data flows to be protected:

# Configure an IPv4 advanced ACL to identify data flows from subnet 10.1.2.0/24 to subnet 10.1.1.0/24.

```
[DeviceB] acl advanced 3101
[DeviceB-acl-ipv4-adv-3101] rule permit ip source 10.1.2.0 0.0.0.255 destination
10.1.1.0 0.0.0.255
[DeviceB-acl-ipv4-adv-3101] quit
```

6. Configure an IPsec transform set to specify the packet encapsulation mode, security protocols, and algorithms.

The IPsec transform set settings at both sides of the IPsec tunnel must be the same.

```
[DeviceB] ipsec transform-set tran1
[DeviceB-ipsec-transform-set-tran1] encapsulation-mode tunnel
[DeviceB-ipsec-transform-set-tran1] protocol esp
[DeviceB-ipsec-transform-set-tran1] esp encryption-algorithm aes-cbc-128
[DeviceB-ipsec-transform-set-tran1] esp authentication-algorithm sha1
[DeviceB-ipsec-transform-set-tran1] quit
```

7. Configure an IKE keychain to specify the key information used for IKE communication.

   The preshared key used by both sides of the communication must be the same.

   ```
   [DeviceB] ike keychain keychain1
   [DeviceB-ike-keychain-keychain1] pre-shared-key address 2.2.2.1 255.255.255.0 key
   simple 123456TESTplat&!
   [DeviceB-ike-keychain-keychain1] quit
   ```

8. Configure an IKE profile to specify the security parameters used for setting up IKE SAs.

   ```
   [DeviceB] ike profile profile1
   [DeviceB-ike-profile-profile1] keychain keychain1
   [DeviceB-ike-profile-profile1] match remote identity address 2.2.2.1 255.255.255.0
   [DeviceB-ike-profile-profile1] quit
   ```

9. Configure an IPsec policy, so as to establish the IPsec tunnel to protect data:

   # Create an IKE-based IPsec policy entry, which specifies the ACL for IPsec, IPsec transform set, local and remote IP addresses, and IKE profile.

   ```
   [DeviceB] ipsec policy use1 10 isakmp
   [DeviceB-ipsec-policy-isakmp-use1-10] security acl 3101
   [DeviceB-ipsec-policy-isakmp-use1-10] transform-set tran1
   [DeviceB-ipsec-policy-isakmp-use1-10] local-address 2.2.3.1
   [DeviceB-ipsec-policy-isakmp-use1-10] remote-address 2.2.2.1
   [DeviceB-ipsec-policy-isakmp-use1-10] ike-profile profile1
   [DeviceB-ipsec-policy-isakmp-use1-10] quit
   ```

10. Apply the IPsec policy to GigabitEthernet 1/0/2 to protect traffic on the interface.

   ```
   [DeviceB] interface gigabitethernet 1/0/2
   [DeviceB-GigabitEthernet1/0/2] ipsec apply policy use1
   [DeviceB-GigabitEthernet1/0/2] quit
   ```

Verifying the configuration

# Initiate a connection from subnet 10.1.1.0/24 to subnet 10.1.2.0/24 to trigger IKE negotiation. After IPsec SAs are successfully negotiated by IKE, the traffic between the two subnets is IPsec-protected.

# Display IPsec SAs on Device A and Device B. This example uses Device A to verify the configuration.

```
[DeviceA] display ipsec sa
-------------------------------
Interface: GigabitEthernet 1/0/2
-------------------------------

  -----------------------------
  IPsec policy: map1
  Sequence number: 10
  Mode: ISAKMP
  -----------------------------
    Tunnel id: 0
```

```
    Encapsulation mode: tunnel
    Perfect Forward Secrecy:
    Inside VPN:
    Extended Sequence Numbers enable: N
    Traffic Flow Confidentiality enable: N
    Transmitting entity: Initiator
    Path MTU: 1443
    Tunnel:
        local  address: 2.2.3.1
        remote address: 2.2.2.1
    Flow:
        sour addr: 10.1.1.0/255.255.255.0  port: 0  protocol: ip
        dest addr: 10.1.2.0/255.255.255.0  port: 0  protocol: ip

      Anti-replay check enable: N
      Anti-replay window size:
      UDP encapsulation used for NAT traversal: N
      Status: Active

    [Outbound ESP SAs]
      SPI: 3840956402 (0xe4f057f2)
      Connection ID: 64424509441
      Transform set: ESP-ENCRYPT-AES-CBC-128 ESP-AUTH-SHA1
      SA duration (kilobytes/sec): 3000/28800
      SA remaining duration (kilobytes/sec): 2312/797
      Max sent sequence-number: 1
      UDP encapsulation used for NAT traversal: N
      Status: Active
```

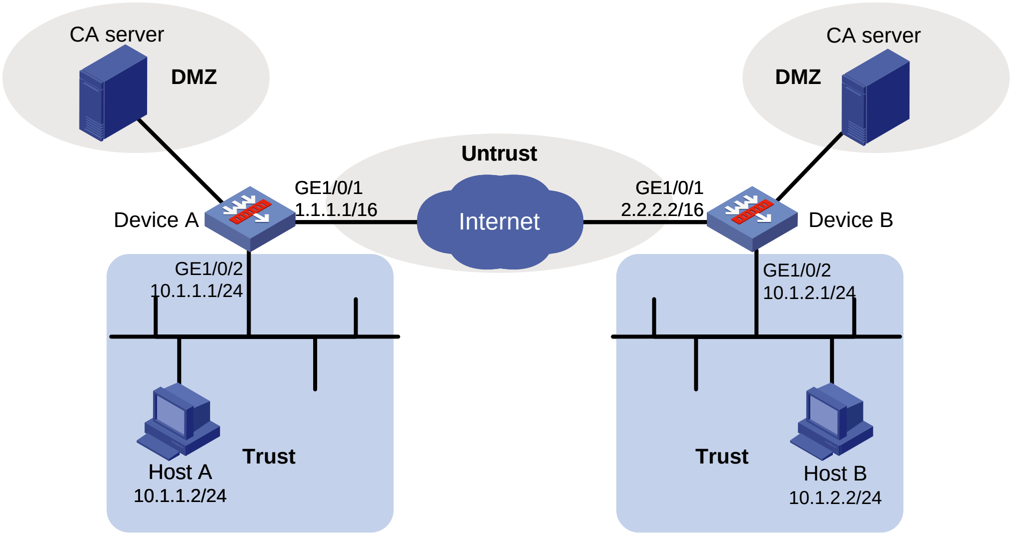
Example: Configuring an IKE-based IPsec tunnel for IPv4 packets between gateways (RSA signature authentication)

Network configuration

As shown in Figure 12, configure an IKE-based IPsec tunnel between Device A and Device B to secure the communication between subnet 10.1.1.0/24 and subnet 10.1.2.0/24.

Configure Device A and Device B to use aggressive mode for IKE negotiation phase 1 and to use RSA signature authentication. Device A acts as the initiator, and the subnet where Device A resides uses IP addresses dynamically allocated.

Figure 12 Network diagram



Prerequisites

Device A has obtained CA certificate **ca.cer** and local certificate **server.pfx**.

Device B has obtained CA certificate **ca.cer** and local certificate **server.pfx**.

Configuring Device A

1. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

   ```
   <DeviceA> system-view
   [DeviceA] interface gigabitethernet 1/0/1
   [DeviceA-GigabitEthernet1/0/1] ip address 1.1.1.1 255.255.0.0
   [DeviceA-GigabitEthernet1/0/1] quit
   ```

   # Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Configure settings for routing.

   This example configures static routes, and the next hop in the routes is 1.1.1.2.

   ```
   [DeviceA] ip route-static 10.1.2.0 24 1.1.1.2
   [DeviceA] ip route-static 2.2.2.2 16 1.1.1.2
   ```

3. Add interfaces to security zones.

   ```
   [DeviceA] security-zone name trust
   [DeviceA-security-zone-Trust] import interface gigabitethernet 1/0/2
   [DeviceA-security-zone-Trust] quit
   [DeviceA] security-zone name untrust
   [DeviceA-security-zone-Untrust] import interface gigabitethernet 1/0/1
   [DeviceA-security-zone-Untrust] quit
   ```

4. Configure a security policy:

   a. Configure rules to permit traffic between the **Untrust** and **Local** security zones, so the devices can set up an IPsec tunnel:

   # Configure a rule named **ipseclocalout** to allow Device A to send IPsec negotiation packets to Device B.

   ```
   [DeviceA] security-policy ip
   [DeviceA-security-policy-ip] rule name ipseclocalout
   [DeviceA-security-policy-ip-1-ipseclocalout] source-zone local
   ```

```
[DeviceA-security-policy-ip-1-ipseclocalout] destination-zone untrust
[DeviceA-security-policy-ip-1-ipseclocalout] source-ip-host 1.1.1.1
[DeviceA-security-policy-ip-1-ipseclocalout] destination-ip-host 2.2.2.2
[DeviceA-security-policy-ip-1-ipseclocalout] action pass
[DeviceA-security-policy-ip-1-ipseclocalout] quit
```

# Configure a rule named **ipseclocalin** to allow Device A to receive the IPsec negotiation packets sent from Device B.

```
[DeviceA-security-policy-ip] rule name ipseclocalin
[DeviceA-security-policy-ip-2-ipseclocalin] source-zone untrust
[DeviceA-security-policy-ip-2-ipseclocalin] destination-zone local
[DeviceA-security-policy-ip-2-ipseclocalin] source-ip-host 2.2.2.2
[DeviceA-security-policy-ip-2-ipseclocalin] destination-ip-host 1.1.1.1
[DeviceA-security-policy-ip-2-ipseclocalin] action pass
[DeviceA-security-policy-ip-2-ipseclocalin] quit
```

b. Configure rules to permit the traffic between Host A and Host B:

# Configure a rule named **trust-untrust** to permit the packets from Host A to Host B.

```
[DeviceA-security-policy-ip] rule name trust-untrust
[DeviceA-security-policy-ip-3-trust-untrust] source-zone trust
[DeviceA-security-policy-ip-3-trust-untrust] destination-zone untrust
[DeviceA-security-policy-ip-3-trust-untrust] source-ip-subnet 10.1.1.0 24
[DeviceA-security-policy-ip-3-trust-untrust] destination-ip-subnet 10.1.2.0 24
[DeviceA-security-policy-ip-3-trust-untrust] action pass
[DeviceA-security-policy-ip-3-trust-untrust] quit
```

# Configure a rule named **untrust-trust** to permit the packets from Host B to Host A.

```
[DeviceA-security-policy-ip] rule name untrust-trust
[DeviceA-security-policy-ip-4-untrust-trust] source-zone untrust
[DeviceA-security-policy-ip-4-untrust-trust] destination-zone trust
[DeviceA-security-policy-ip-4-untrust-trust] source-ip-subnet 10.1.2.0 24
[DeviceA-security-policy-ip-4-untrust-trust] destination-ip-subnet 10.1.1.0 24
[DeviceA-security-policy-ip-4-untrust-trust] action pass
[DeviceA-security-policy-ip-4-untrust-trust] quit
[DeviceA-security-policy-ip] quit
```

5. Define the data flows to be protected:

# Configure IPv4 advanced ACL 3101 to identify traffic from subnet 10.1.1.0/24 to subnet 10.1.2.0/24.

```
[DeviceA] acl advanced 3101
[DeviceA-acl-ipv4-adv-3101] rule permit ip source 10.1.1.0 0.0.0.255 destination
10.1.2.0 0.0.0.255
[DeviceA-acl-ipv4-adv-3101] quit
```

6. Configure an IPsec transform set to specify the packet encapsulation mode, security protocols, and algorithms.

The IPsec transform set settings at both sides of the IPsec tunnel must be the same.

```
[DeviceA] ipsec transform-set tran1
[DeviceA-ipsec-transform-set-tran1] encapsulation-mode tunnel
[DeviceA-ipsec-transform-set-tran1] protocol esp
[DeviceA-ipsec-transform-set-tran1] esp encryption-algorithm des-cbc
[DeviceA-ipsec-transform-set-tran1] esp authentication-algorithm sha1
[DeviceA-ipsec-transform-set-tran1] quit
```

7. Configure a PKI entity.

```
[DeviceA] pki entity entity1
[DeviceA-pki-entity-entity1] common-name devicea
[DeviceA-pki-entity-entity1] quit
```

8. Configure a PKI domain for certificate requests.

```
[DeviceA] pki domain domain1
[DeviceA-pki-domain-domain1] public-key rsa general name rsa1
[DeviceA-pki-domain-domain1] undo crl check enable
[DeviceA-pki-domain-domain1] quit
[DeviceA] pki import domain domain1 der ca filename ca.cer
[DeviceA] pki import domain domain1 p12 local filename server.pfx
```

9. Configure a certificate-based access control policy to control user access rights.

   A peer certificate is regarded valid only if it contains the specified string (**1** in this example) in the DN attribute of the subject name field.

```
[DeviceA] pki certificate access-control-policy policy1
[DeviceA-pki-cert-acp-policy1] rule 1 permit group1
[DeviceA] pki certificate attribute-group group1
[DeviceA-pki-cert-attribute-group-group1] attribute 1 subject-name dn ctn 1
```

10. Configure an IKE profile to specify the security parameters used for setting up IKE SAs.

```
[DeviceA] ike profile profile1
[DeviceA-ike-profile-profile1] certificate domain domain1
[DeviceA-ike-profile-profile1] exchange-mode aggressive
[DeviceA-ike-profile-profile1] local-identity dn
[DeviceA-ike-profile-profile1] match remote certificate policy1
[DeviceA-ike-profile-profile1] quit
```

11. Configure an IKE proposal to specify the parameters used for IKE negotiation.

```
[DeviceA] ike proposal 10
[DeviceA-ike-proposal-10] authentication-algorithm md5
[DeviceA-ike-proposal-10] authentication-method rsa-signature
[DeviceA-ike-proposal-10] quit
```

12. Configure an IPsec policy to establish an IPsec tunnel to protect the specified data:

```
[DeviceA] ipsec policy map1 10 isakmp
[DeviceA-ipsec-policy-isakmp-map1-10] remote-address 2.2.2.2
[DeviceA-ipsec-policy-isakmp-map1-10] transform-set tran1
[DeviceA-ipsec-policy-isakmp-map1-10] security acl 3101
[DeviceA-ipsec-policy-isakmp-map1-10] ike-profile profile1
[DeviceA-ipsec-policy-isakmp-map1-10] quit
```

13. Apply the IPsec policy to GigabitEthernet 1/0/1 to protect the traffic on the interface.

```
[DeviceA] interface gigabitethernet 1/0/1
[DeviceA-GigabitEthernet1/0/1] ipsec apply policy map1
[DeviceA-GigabitEthernet1/0/1] quit
```

Configuring Device B

1. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

```
<DeviceB> system-view
[DeviceB] interface gigabitethernet 1/0/1
[DeviceB-GigabitEthernet1/0/1] ip address 2.2.2.2 255.255.0.0
```

```
[DeviceB-GigabitEthernet1/0/1] quit
```

# Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Configure settings for routing.

This example configures static routes, and the next hop in the routes is 2.2.2.1.

```
[DeviceB] ip route-static 10.1.1.0 24 2.2.2.1
[DeviceB] ip route-static 1.1.1.1 16 2.2.2.1
```

3. Add interfaces to security zones.

```
[DeviceB] security-zone name trust
[DeviceB-security-zone-Trust] import interface gigabitethernet 1/0/2
[DeviceB-security-zone-Trust] quit
[DeviceB] security-zone name untrust
[DeviceB-security-zone-Untrust] import interface gigabitethernet 1/0/1
[DeviceB-security-zone-Untrust] quit
```

4. Configure a security policy:

a. Configure rules to permit traffic between the **Untrust** and **Local** security zones, so the devices can set up an IPsec tunnel:

# Configure a rule named **ipseclocalout** to allow Device B to send IPsec negotiation packets to Device A.

```
[DeviceB] security-policy ip
[DeviceB-security-policy-ip] rule name ipseclocalout
[DeviceB-security-policy-ip-1-ipseclocalout] source-zone local
[DeviceB-security-policy-ip-1-ipseclocalout] destination-zone untrust
[DeviceB-security-policy-ip-1-ipseclocalout] source-ip-host 2.2.2.2
[DeviceB-security-policy-ip-1-ipseclocalout] destination-ip-host 1.1.1.1
[DeviceB-security-policy-ip-1-ipseclocalout] action pass
[DeviceB-security-policy-ip-1-ipseclocalout] quit
```

# Configure a rule named **ipseclocalin** to allow Device B to receive the IPsec negotiation packets sent from Device A.

```
[DeviceB-security-policy-ip] rule name ipseclocalin
[DeviceB-security-policy-ip-2-ipseclocalin] source-zone untrust
[DeviceB-security-policy-ip-2-ipseclocalin] destination-zone local
[DeviceB-security-policy-ip-2-ipseclocalin] source-ip-host 1.1.1.1
[DeviceB-security-policy-ip-2-ipseclocalin] destination-ip-host 2.2.2.2
[DeviceB-security-policy-ip-2-ipseclocalin] action pass
[DeviceB-security-policy-ip-2-ipseclocalin] quit
```

b. Configure rules to permit traffic between Host B and Host A:

# Configure a rule named **trust-untrust** to permit the packets from Host B to Host A.

```
[DeviceB-security-policy-ip] rule name trust-untrust
[DeviceB-security-policy-ip-3-trust-untrust] source-zone trust
[DeviceB-security-policy-ip-3-trust-untrust] destination-zone untrust
[DeviceB-security-policy-ip-3-trust-untrust] source-ip-subnet 10.1.2.0 24
[DeviceB-security-policy-ip-3-trust-untrust] destination-ip-subnet 10.1.1.0 24
[DeviceB-security-policy-ip-3-trust-untrust] action pass
[DeviceB-security-policy-ip-3-trust-untrust] quit
```

# Configure a rule named **untrust-trust** to permit the packets from Host A to Host B.

```
[DeviceB-security-policy-ip] rule name untrust-trust
[DeviceB-security-policy-ip-4-untrust-trust] source-zone untrust
[DeviceB-security-policy-ip-4-untrust-trust] destination-zone trust
```

```
   [DeviceB-security-policy-ip-4-untrust-trust] source-ip-subnet 10.1.1.0 24
   [DeviceB-security-policy-ip-4-untrust-trust] destination-ip-subnet 10.1.2.0 24
   [DeviceB-security-policy-ip-4-untrust-trust] action pass
   [DeviceB-security-policy-ip-4-untrust-trust] quit
   [DeviceB-security-policy-ip] quit
```

5. Define the data flows to be protected:

   # Configure IPv4 advanced ACL 3101 to identify traffic from subnet 10.1.2.0/24 to subnet 10.1.1.0/24.

   ```
   [DeviceB] acl advanced 3101
   [DeviceB-acl-ipv4-adv-3101] rule permit ip source 10.1.2.0 0.0.0.255 destination
   10.1.1.0 0.0.0.255
   [DeviceB-acl-ipv4-adv-3101] quit
   ```

6. Configure an IPsec transform set to specify the packet encapsulation mode, security protocols, and algorithms.

   The IPsec transform set settings at both sides of the IPsec tunnel must be the same.

   ```
   [DeviceB] ipsec transform-set tran1
   [DeviceB-ipsec-transform-set-tran1] encapsulation-mode tunnel
   [DeviceB-ipsec-transform-set-tran1] protocol esp
   [DeviceB-ipsec-transform-set-tran1] esp encryption-algorithm des-cbc
   [DeviceB-ipsec-transform-set-tran1] esp authentication-algorithm sha1
   [DeviceB-ipsec-transform-set-tran1] quit
   ```

7. Configure a PKI entity.

   ```
   [DeviceB] pki entity entity2
   [DeviceB-pki-entity-entity2] common-name deviceb
   [DeviceB-pki-entity-entity2] quit
   ```

8. Configure a PKI domain for certificate request.

   ```
   [DeviceB] pki domain domain2
   [DeviceB-pki-domain-domain2] public-key rsa general name rsa1
   [DeviceB-pki-domain-domain2] undo crl check enable
   [DeviceB-pki-domain-domain2] quit
   [DeviceB] pki import domain domain2 der ca filename ca.cer
   [DeviceB] pki import domain domain2 p12 local filename server.pfx
   ```

9. Configure a certificate-based access control policy to control user access rights.

   A peer certificate is regarded valid only if it contains the specified string (**1** in this example) in the DN attribute of the subject name field.

   ```
   [DeviceB] pki certificate access-control-policy policy1
   [DeviceB-pki-cert-acp-policy1] rule 1 permit group1
   [DeviceB] pki certificate attribute-group group1
   [DeviceB-pki-cert-attribute-group-group1] attribute 1 subject-name dn ctn 1
   ```

10. Configure an IKE profile to specify the security parameters used for setting up IKE SAs.

    ```
    [DeviceB] ike profile profile2
    [DeviceB-ike-profile-profile2] certificate domain domain2
    [DeviceB-ike-profile-profile2] exchange-mode aggressive
    [DeviceB-ike-profile-profile2] local-identity dn
    [DeviceB-ike-profile-profile2] match remote certificate policy1
    [DeviceB-ike-profile-profile2] quit
    ```

11. Configure an IKE proposal to specify the security parameters for IKE negotiation.

    ```
    [DeviceB] ike proposal 10
    ```

```
[DeviceB-ike-proposal-10] authentication-algorithm md5
[DeviceB-ike-proposal-10] authentication-method rsa-signature
[DeviceB-ike-proposal-10] quit
```

12. Configure an IPsec policy template, which is used to create an IPsec policy:

    # Create an IPsec policy template entry. Specify **template1** as the template name and set the sequence number to 1.

    ```
    [DeviceB] ipsec policy-template template1 1
    [DeviceB-ipsec-policy-template-template1-1] transform-set tran1
    [DeviceB-ipsec-policy-template-template1-1] ike-profile profile2
    [DeviceB-ipsec-policy-template-template1-1] quit
    ```

13. Create an IKE-based IPsec policy entry by using IPsec policy template **template1**, so as to establish the IPsec tunnel to protect data.

    ```
    [DeviceB] ipsec policy use1 1 isakmp template template1
    ```

14. Apply the IPsec policy to GigabitEthernet 1/0/1 to protect the traffic on the interface.

    ```
    [DeviceB] interface gigabitethernet 1/0/1
    [DeviceB-GigabitEthernet1/0/1] ipsec apply policy use1
    [DeviceB-GigabitEthernet1/0/1] quit
    ```

Verifying the configuration

# Initiate a connection from subnet 10.1.1.0/24 to subnet 10.1.2.0/24 to trigger IKE negotiation. After IPsec SAs are successfully negotiated by IKE, traffic between the two subnets is IPsec-protected.

# Display the IKE SA on Device A.

```
[DeviceA] display ike sa

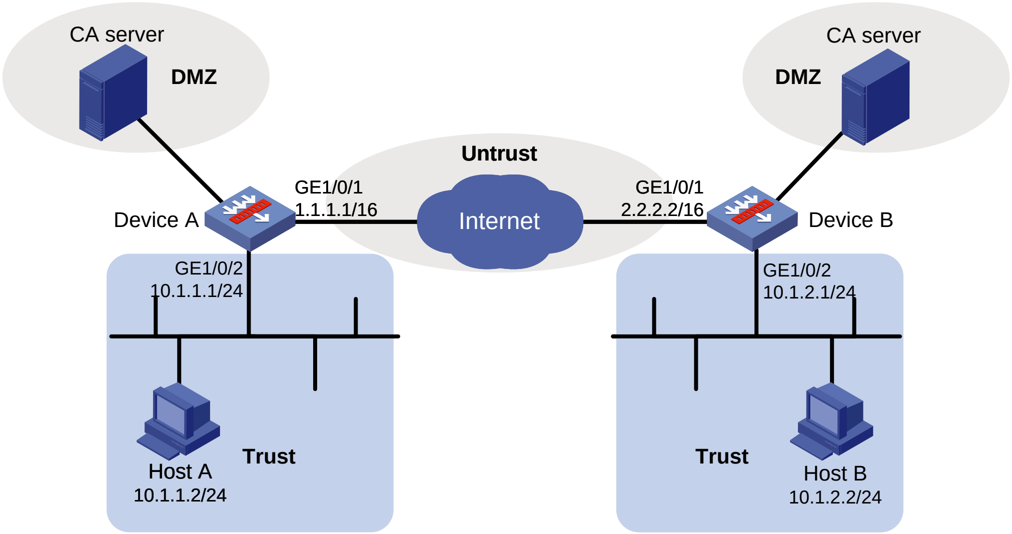
Example: Configuring an IKE-based IPsec tunnel for IPv4 packets between gateways (SM2-DE digital envelop authentication)

Network configuration

As shown in Figure 13, configure an IKE-based IPsec tunnel between Device A and Device B to secure the communication between subnet 10.1.1.0/24 and subnet 10.1.2.0/24.

Configure Device A and Device B to use GM main mode and SM2-DE digital envelop authentication for the IKE negotiation phase 1.

Figure 13 Network diagram



Prerequisites

Device A has obtained CA certificate **ca.cer** and local certificate **server.pfx**.

Device B has obtained CA certificate **ca.cer** and local certificate **server.pfx**.

Configuring Device A

1. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

   ```
   <DeviceA> system-view
   [DeviceA] interface gigabitethernet 1/0/1
   [DeviceA-GigabitEthernet1/0/1] ip address 1.1.1.1 255.255.0.0
   [DeviceA-GigabitEthernet1/0/1] quit
   ```

# Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. **Configure settings for routing.**

   This example configures static routes, and the next hop in the routes is 1.1.1.2.

```
[DeviceA] ip route-static 10.1.2.0 24 1.1.1.2
[DeviceA] ip route-static 2.2.2.2 16 1.1.1.2
```

3. Add interfaces to security zones.

```
[DeviceA] security-zone name trust
[DeviceA-security-zone-Trust] import interface gigabitethernet 1/0/2
[DeviceA-security-zone-Trust] quit
[DeviceA] security-zone name untrust
[DeviceA-security-zone-Untrust] import interface gigabitethernet 1/0/1
[DeviceA-security-zone-Untrust] quit
```

4. Configure a security policy:

   a. Configure rules to permit traffic between the **Untrust** and **Local** security zones, so the devices can set up an IPsec tunnel:

   # Configure a rule named **ipseclocalout** to allow Device A to send IPsec negotiation packets to Device B.

```
[DeviceA] security-policy ip
[DeviceA-security-policy-ip] rule name ipseclocalout
[DeviceA-security-policy-ip-1-ipseclocalout] source-zone local
[DeviceA-security-policy-ip-1-ipseclocalout] destination-zone untrust
[DeviceA-security-policy-ip-1-ipseclocalout] source-ip-host 1.1.1.1
[DeviceA-security-policy-ip-1-ipseclocalout] destination-ip-host 2.2.2.2
[DeviceA-security-policy-ip-1-ipseclocalout] action pass
[DeviceA-security-policy-ip-1-ipseclocalout] quit
```

   # Configure a rule named **ipseclocalin** to allow Device A to receive the IPsec negotiation packets sent from Device B.

```
[DeviceA-security-policy-ip] rule name ipseclocalin
[DeviceA-security-policy-ip-2-ipseclocalin] source-zone untrust
[DeviceA-security-policy-ip-2-ipseclocalin] destination-zone local
[DeviceA-security-policy-ip-2-ipseclocalin] source-ip-host 2.2.2.2
[DeviceA-security-policy-ip-2-ipseclocalin] destination-ip-host 1.1.1.1
[DeviceA-security-policy-ip-2-ipseclocalin] action pass
[DeviceA-security-policy-ip-2-ipseclocalin] quit
```

   b. Configure rules to permit the traffic between Host A and Host B:

   # Configure a rule named **trust-untrust** to permit the packets from Host A to Host B.

```
[DeviceA-security-policy-ip] rule name trust-untrust
[DeviceA-security-policy-ip-3-trust-untrust] source-zone trust
[DeviceA-security-policy-ip-3-trust-untrust] destination-zone untrust
[DeviceA-security-policy-ip-3-trust-untrust] source-ip-subnet 10.1.1.0 24
[DeviceA-security-policy-ip-3-trust-untrust] destination-ip-subnet 10.1.2.0 24
[DeviceA-security-policy-ip-3-trust-untrust] action pass
[DeviceA-security-policy-ip-3-trust-untrust] quit
```

   # Configure a rule named **untrust-trust** to permit the packets from Host B to Host A.

```
[DeviceA-security-policy-ip] rule name untrust-trust
[DeviceA-security-policy-ip-4-untrust-trust] source-zone untrust
[DeviceA-security-policy-ip-4-untrust-trust] destination-zone trust
[DeviceA-security-policy-ip-4-untrust-trust] source-ip-subnet 10.1.2.0 24
```

```
[DeviceA-security-policy-ip-4-untrust-trust] destination-ip-subnet 10.1.1.0 24
[DeviceA-security-policy-ip-4-untrust-trust] action pass
[DeviceA-security-policy-ip-4-untrust-trust] quit
[DeviceA-security-policy-ip] quit
```

5. **5.** Define the data flows to be protected:

   # Configure IPv4 advanced ACL 3101 to identify traffic from subnet 10.1.1.0/24 to subnet 10.1.2.0/24.

   ```
   [DeviceA] acl advanced 3101
   [DeviceA-acl-ipv4-adv-3101] rule permit ip source 10.1.1.0 0.0.0.255 destination
   10.1.2.0 0.0.0.255
   [DeviceA-acl-ipv4-adv-3101] quit
   ```

6. **6.** Configure an IPsec transform set to specify the packet encapsulation mode, security protocols, and algorithms.

   The IPsec transform set settings at both sides of the IPsec tunnel must be the same.

   ```
   [DeviceA] ipsec transform-set tran1
   [DeviceA-ipsec-transform-set-tran1] encapsulation-mode tunnel
   [DeviceA-ipsec-transform-set-tran1] protocol esp
   [DeviceA-ipsec-transform-set-tran1] esp encryption-algorithm sm1-cbc-128
   [DeviceA-ipsec-transform-set-tran1] esp authentication-algorithm sm3
   [DeviceA-ipsec-transform-set-tran1] quit
   ```

7. **7.** Configure a PKI entity.

   ```
   [DeviceA] pki entity entity1
   [DeviceA-pki-entity-entity1] common-name devicea
   [DeviceA-pki-entity-entity1] quit
   ```

8. **8.** Configure a PKI domain for certificate request.

   ```
   [DeviceA] pki domain domain1
   [DeviceA-pki-domain-domain1] public-key sm2 general name sm2-1
   [DeviceA-pki-domain-domain1] undo crl check enable
   [DeviceA-pki-domain-domain1] quit
   [DeviceA] pki import domain domain1 der ca filename ca.cer
   [DeviceA] pki import domain domain1 p12 local filename server.pfx
   ```

9. **9.** Configure an IKE proposal to specify the parameters for IKE neogitiation.

   ```
   [DeviceA] ike proposal 10
   [DeviceA-ike-proposal-10] authentication-method sm2-de
   [DeviceA-ike-proposal-10] authentication-algorithm sm3
   [DeviceA-ike-proposal-10] encryption-algorithm sm1-cbc-128
   [DeviceA-ike-proposal-10] quit
   ```

10. **10.** Configure an IKE profile to specify the security parameters used to establish IKE SAs.

    ```
    [DeviceA] ike profile profile1
    [DeviceA-ike-profile-profile1] exchange-mode gm-main
    [DeviceA-ike-profile-profile1] certificate domain domain1
    [DeviceA-ike-profile-profile1] proposal 10
    [DeviceA-ike-profile-profile1] local-identity address 1.1.1.1
    [DeviceA-ike-profile-profile1] match remote identity address 2.2.2.2 255.255.0.0
    [DeviceA-ike-profile-profile1] quit
    ```

11. **11.** Configure an IPsec policy to establish an IPsec tunnel to protect the specified data.

    ```
    [DeviceA] ipsec policy map1 10 isakmp
    [DeviceA-ipsec-policy-isakmp-map1-10] remote-address 2.2.2.2
    ```

```
[DeviceA-ipsec-policy-isakmp-map1-10] security acl 3101
[DeviceA-ipsec-policy-isakmp-map1-10] transform-set tran1
[DeviceA-ipsec-policy-isakmp-map1-10] ike-profile profile1
[DeviceA-ipsec-policy-isakmp-map1-10] quit
```

12. Apply the IPsec policy to GigabitEthernet 1/0/1 to protect the traffic on the interface.

```
[DeviceA] interface gigabitethernet 1/0/1
[DeviceA-GigabitEthernet1/0/1] ipsec apply policy map1
[DeviceA-GigabitEthernet1/0/1] quit
```

Configuring Device B

1. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

```
<DeviceB> system-view
[DeviceB] interface gigabitethernet 1/0/1
[DeviceB-GigabitEthernet1/0/1] ip address 2.2.2.2 255.255.0.0
[DeviceB-GigabitEthernet1/0/1] quit
```

   # Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Configure settings for routing.

   This example configures static routes, and the next hop in the routes is 2.2.2.1.

```
[DeviceB] ip route-static 10.1.1.0 24 2.2.2.1
[DeviceB] ip route-static 1.1.1.1 16 2.2.2.1
```

3. Add interfaces to security zones.

```
[DeviceB] security-zone name trust
[DeviceB-security-zone-Trust] import interface gigabitethernet 1/0/2
[DeviceB-security-zone-Trust] quit
[DeviceB] security-zone name untrust
[DeviceB-security-zone-Untrust] import interface gigabitethernet 1/0/1
[DeviceB-security-zone-Untrust] quit
```

4. Configure a security policy:

   a. Configure rules to permit traffic between the **Untrust** and **Local** security zones, so the devices can set up an IPsec tunnel:

   # Configure a rule named **ipseclocalout** to allow Device B to send IPsec negotiation packets to Device A.

```
[DeviceB] security-policy ip
[DeviceB-security-policy-ip] rule name ipseclocalout
[DeviceB-security-policy-ip-1-ipseclocalout] source-zone local
[DeviceB-security-policy-ip-1-ipseclocalout] destination-zone untrust
[DeviceB-security-policy-ip-1-ipseclocalout] source-ip-host 2.2.2.2
[DeviceB-security-policy-ip-1-ipseclocalout] destination-ip-host 1.1.1.1
[DeviceB-security-policy-ip-1-ipseclocalout] action pass
[DeviceB-security-policy-ip-1-ipseclocalout] quit
```

   # Configure a rule named **ipseclocalin** to allow Device B to receive the IPsec negotiation packets sent from Device A.

```
[DeviceB-security-policy-ip] rule name ipseclocalin
[DeviceB-security-policy-ip-2-ipseclocalin] source-zone untrust
[DeviceB-security-policy-ip-2-ipseclocalin] destination-zone local
[DeviceB-security-policy-ip-2-ipseclocalin] source-ip-host 1.1.1.1
[DeviceB-security-policy-ip-2-ipseclocalin] destination-ip-host 2.2.2.2
```

```
[DeviceB-security-policy-ip-2-ipseclocalin] action pass
[DeviceB-security-policy-ip-2-ipseclocalin] quit
```

b. Configure rules to permit traffic between Host B and Host A:

# Configure a rule named **trust-untrust** to permit the packets from Host B to Host A.

```
[DeviceB-security-policy-ip] rule name trust-untrust
[DeviceB-security-policy-ip-3-trust-untrust] source-zone trust
[DeviceB-security-policy-ip-3-trust-untrust] destination-zone untrust
[DeviceB-security-policy-ip-3-trust-untrust] source-ip-subnet 10.1.2.0 24
[DeviceB-security-policy-ip-3-trust-untrust] destination-ip-subnet 10.1.1.0 24
[DeviceB-security-policy-ip-3-trust-untrust] action pass
[DeviceB-security-policy-ip-3-trust-untrust] quit
```

# Configure a rule named **untrust-trust** to permit the packets from Host A to Host B.

```
[DeviceB-security-policy-ip] rule name untrust-trust
[DeviceB-security-policy-ip-4-untrust-trust] source-zone untrust
[DeviceB-security-policy-ip-4-untrust-trust] destination-zone trust
[DeviceB-security-policy-ip-4-untrust-trust] source-ip-subnet 10.1.1.0 24
[DeviceB-security-policy-ip-4-untrust-trust] destination-ip-subnet 10.1.2.0 24
[DeviceB-security-policy-ip-4-untrust-trust] action pass
[DeviceB-security-policy-ip-4-untrust-trust] quit
[DeviceB-security-policy-ip] quit
```

5. Define the data flows to be protected:

# Configure IPv4 advanced ACL 3101 to identify traffic from subnet 10.1.2.0/24 to subnet 10.1.1.0/24.

```
[DeviceB] acl advanced 3101
[DeviceB-acl-ipv4-adv-3101] rule permit ip source 10.1.2.0 0.0.0.255 destination
10.1.1.0 0.0.0.255
[DeviceB-acl-ipv4-adv-3101] quit
```

6. Configure an IPsec transform set to specify the packet encapsulation mode, security protocols, and algorithms.

The IPsec transform set settings at both sides of the IPsec tunnel must be the same.

```
[DeviceB] ipsec transform-set tran1
[DeviceB-ipsec-transform-set-tran1] encapsulation-mode tunnel
[DeviceB-ipsec-transform-set-tran1] protocol esp
[DeviceB-ipsec-transform-set-tran1] esp encryption-algorithm sm1-cbc-128
[DeviceB-ipsec-transform-set-tran1] esp authentication-algorithm sm3
[DeviceB-ipsec-transform-set-tran1] quit
```

7. Configure a PKI entity.

```
[DeviceB] pki entity entity2
[DeviceB-pki-entity-entity2] common-name deviceb
[DeviceB-pki-entity-entity2] quit
```

8. Configure a PKI domain for certificate request.

```
[DeviceB] pki domain domain2
[DeviceB-pki-domain-domain2] public-key sm2 general name sm2-1
[DeviceB-pki-domain-domain2] undo crl check enable
[DeviceB-pki-domain-domain2] quit
[DeviceB] pki import domain domain2 der ca filename ca.cer
[DeviceB] pki import domain domain2 p12 local filename server.pfx
```

9. Configure an IKE proposal to specify the parameters for IKE neogitiation.

```
[DeviceB] ike proposal 10
[DeviceB-ike-proposal-10] authentication-method sm2-de
[DeviceB-ike-proposal-10] authentication-algorithm sm3
[DeviceB-ike-proposal-10] encryption-algorithm sm1-cbc-128
[DeviceB-ike-proposal-10] quit
```

10. Configure an IKE profile to specify the security parameters used to establish IKE SAs.

```
[DeviceB] ike profile profile1
[DeviceB-ike-profile-profile1] exchange-mode gm-main
[DeviceB-ike-profile-profile1] certificate domain domain2
[DeviceB-ike-profile-profile1] proposal 10
[DeviceB-ike-profile-profile1] local-identity address 2.2.2.2
[DeviceB-ike-profile-profile1] match remote identity address 1.1.1.1 255.255.0.0
[DeviceB-ike-profile-profile1] quit
```

11. Configure an IPsec policy to establish an IPsec tunnel to protect the specified data.

```
[DeviceB] ipsec policy use1 10 isakmp
[DeviceB-ipsec-policy-isakmp-use1-10] remote-address 1.1.1.1
[DeviceB-ipsec-policy-isakmp-use1-10] security acl 3101
[DeviceB-ipsec-policy-isakmp-use1-10] transform-set tran1
[DeviceB-ipsec-policy-isakmp-use1-10] ike-profile profile1
[DeviceB-ipsec-policy-isakmp-use1-10] quit
```

12. Apply the IPsec policy to GigabitEthernet 1/0/1 to protect the traffic on the interface.

```
[DeviceB] interface gigabitethernet 1/0/1
[DeviceB-GigabitEthernet1/0/1] ipsec apply policy use1
[DeviceB-GigabitEthernet1/0/1] quit
```

Verifying the configuration

# Initiate a connection from subnet 10.1.1.0/24 to subnet 10.1.2.0/24 to trigger IKE negotiation. After IPsec SAs are successfully negotiated by IKE, traffic between the two subnets is IPsec-protected.

# Display the IKE proposal configuration on Device A and Device B.

```
[DeviceA] display ike proposal
 Priority Authentication Authentication Encryption  Diffie-Hellman Duration
              method       algorithm    algorithm       group      (seconds)
----------------------------------------------------------------------------

```
[DeviceB] display ike sa
[DeviceB] display ipsec sa
```

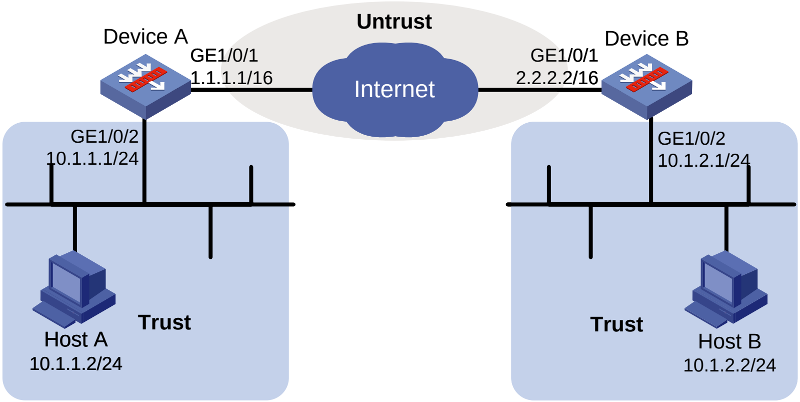
Example: Configuring an IKEv2-based IPsec tunnel for IPv4 packets between gateways (preshared key authentication)

Network configuration

As shown in Figure 14, configure an IKE-based IPsec tunnel between Device A and Device B to secure the communication between subnet 10.1.1.0/24 and subnet 10.1.2.0/24.

- Configure Device A and Device B to use the default IKEv2 proposal and the default IKEv2 policy in IKEv2 negotiation to set up IPsec SAs.
- Configure the two devices to use the preshared key authentication method in IKEv2 negotiation.

Figure 14 Network diagram



Configuring Device A

1. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

   ```
   <DeviceA> system-view
   [DeviceA] interface gigabitethernet 1/0/1
   [DeviceA-GigabitEthernet1/0/1] ip address 1.1.1.1 255.255.0.0
   [DeviceA-GigabitEthernet1/0/1] quit
   ```

   # Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Configure settings for routing.

   This example configures static routes, and the next hop in the routes is 1.1.1.2.

   ```
   [DeviceA] ip route-static 10.1.2.0 24 1.1.1.2
   [DeviceA] ip route-static 2.2.2.2 16 1.1.1.2
   ```

3. Add interfaces to security zones.

   ```
   [DeviceA] security-zone name trust
   [DeviceA-security-zone-Trust] import interface gigabitethernet 1/0/2
   [DeviceA-security-zone-Trust] quit
   [DeviceA] security-zone name untrust
   [DeviceA-security-zone-Untrust] import interface gigabitethernet 1/0/1
   [DeviceA-security-zone-Untrust] quit
   ```

4. Configure a security policy:
   a. Configure rules to permit traffic between the **Untrust** and **Local** security zones, so the devices can set up an IPsec tunnel:

      # Configure a rule named **ipseclocalout** to allow Device A to send IPsec negotiation packets to Device B.

```
[DeviceA] security-policy ip
[DeviceA-security-policy-ip] rule name ipseclocalout
[DeviceA-security-policy-ip-1-ipseclocalout] source-zone local
[DeviceA-security-policy-ip-1-ipseclocalout] destination-zone untrust
[DeviceA-security-policy-ip-1-ipseclocalout] source-ip-host 1.1.1.1
[DeviceA-security-policy-ip-1-ipseclocalout] destination-ip-host 2.2.2.2
[DeviceA-security-policy-ip-1-ipseclocalout] action pass
[DeviceA-security-policy-ip-1-ipseclocalout] quit
```

      # Configure a rule named **ipseclocalin** to allow Device A to receive the IPsec negotiation packets sent from Device B.

```
[DeviceA-security-policy-ip] rule name ipseclocalin
[DeviceA-security-policy-ip-2-ipseclocalin] source-zone untrust
[DeviceA-security-policy-ip-2-ipseclocalin] destination-zone local
[DeviceA-security-policy-ip-2-ipseclocalin] source-ip-host 2.2.2.2
[DeviceA-security-policy-ip-2-ipseclocalin] destination-ip-host 1.1.1.1
[DeviceA-security-policy-ip-2-ipseclocalin] action pass
[DeviceA-security-policy-ip-2-ipseclocalin] quit
```

   b. Configure rules to permit the traffic between Host A and Host B:

      # Configure a rule named **trust-untrust** to permit the packets from Host A to Host B.

```
[DeviceA-security-policy-ip] rule name trust-untrust
[DeviceA-security-policy-ip-3-trust-untrust] source-zone trust
[DeviceA-security-policy-ip-3-trust-untrust] destination-zone untrust
[DeviceA-security-policy-ip-3-trust-untrust] source-ip-subnet 10.1.1.0 24
[DeviceA-security-policy-ip-3-trust-untrust] destination-ip-subnet 10.1.2.0 24
[DeviceA-security-policy-ip-3-trust-untrust] action pass
[DeviceA-security-policy-ip-3-trust-untrust] quit
```

      # Configure a rule named **untrust-trust** to permit the packets from Host B to Host A.

```
[DeviceA-security-policy-ip] rule name untrust-trust
[DeviceA-security-policy-ip-4-untrust-trust] source-zone untrust
[DeviceA-security-policy-ip-4-untrust-trust] destination-zone trust
[DeviceA-security-policy-ip-4-untrust-trust] source-ip-subnet 10.1.2.0 24
[DeviceA-security-policy-ip-4-untrust-trust] destination-ip-subnet 10.1.1.0 24
[DeviceA-security-policy-ip-4-untrust-trust] action pass
[DeviceA-security-policy-ip-4-untrust-trust] quit
[DeviceA-security-policy-ip] quit
```

5. Define the data flows to be protected:

   # Configure IPv4 advanced ACL 3101 to identify traffic from subnet 10.1.1.0/24 to subnet 10.1.2.0/24.

```
[DeviceA] acl advanced 3101
[DeviceA-acl-ipv4-adv-3101] rule permit ip source 10.1.1.0 0.0.0.255 destination
10.1.2.0 0.0.0.255
[DeviceA-acl-ipv4-adv-3101] quit
```

6. Configure an IPsec transform set to specify the packet encapsulation mode, security protocols, and algorithms.

The IPsec transform set settings at both sides of the IPsec tunnel must be the same.

```
[DeviceA] ipsec transform-set tran1
[DeviceA-ipsec-transform-set-tran1] encapsulation-mode tunnel
[DeviceA-ipsec-transform-set-tran1] protocol esp
[DeviceA-ipsec-transform-set-tran1] esp encryption-algorithm des-cbc
[DeviceA-ipsec-transform-set-tran1] esp authentication-algorithm sha1
[DeviceA-ipsec-transform-set-tran1] quit
```

7. Configure an IKE keychain to specify the key information used for IKE communication.

   The preshared key used by both sides of the communication must be the same.

```
[DeviceA] ikev2 keychain keychain1
[DeviceA-ikev2-keychain-keychain1] peer peer1
[DeviceA-ikev2-keychain-keychain1-peer-peer1] address 2.2.2.2 16
[DeviceA-ikev2-keychain-keychain1-peer-peer1] identity address 2.2.2.2
[DeviceA-ikev2-keychain-keychain1-peer-peer1] pre-shared-key plaintext abcde
[DeviceA-ikev2-keychain-keychain1-peer-peer1] quit
[DeviceA-ikev2-keychain-keychain1] quit
```

8. Configure an IKEv2 profile to specify the security parameters used for setting up IKE SAs.

```
[DeviceA] ikev2 profile profile1
[DeviceA-ikev2-profile-profile1] authentication-method local pre-share
[DeviceA-ikev2-profile-profile1] authentication-method remote pre-share
[DeviceA-ikev2-profile-profile1] keychain keychain1
[DeviceA-ikev2-profile-profile1] match remote identity address 2.2.2.2 255.255.0.0
[DeviceA-ikev2-profile-profile1] quit
```

9. Configure an IPsec policy to establish an IPsec tunnel to protect the specified data.

```
[DeviceA] ipsec policy map1 10 isakmp
[DeviceA-ipsec-policy-isakmp-map1-10] remote-address 2.2.2.2
[DeviceA-ipsec-policy-isakmp-map1-10] security acl 3101
[DeviceA-ipsec-policy-isakmp-map1-10] transform-set tran1
[DeviceA-ipsec-policy-isakmp-map1-10] ikev2-profile profile1
[DeviceA-ipsec-policy-isakmp-map1-10] quit
```

10. Apply the IPsec policy to GigabitEthernet 1/0/1 to protect the traffic on the interface.

```
[DeviceA] interface gigabitethernet 1/0/1
[DeviceA-GigabitEthernet1/0/1] ipsec apply policy map1
[DeviceA-GigabitEthernet1/0/1] quit
```

Configuring Device B

1. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

```
<DeviceB> system-view
[DeviceB] interface gigabitethernet 1/0/1
[DeviceB-GigabitEthernet1/0/1] ip address 2.2.2.2 255.255.0.0
[DeviceB-GigabitEthernet1/0/1] quit
```

   # Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Configure settings for routing.

   This example configures static routes, and the next hop in the routes is 2.2.2.1.

```
[DeviceB] ip route-static 10.1.1.0 24 2.2.2.1
[DeviceB] ip route-static 1.1.1.1 16 2.2.2.1
```

3. Add interfaces to security zones.

```
[DeviceB] security-zone name trust
[DeviceB-security-zone-Trust] import interface gigabitethernet 1/0/2
[DeviceB-security-zone-Trust] quit
[DeviceB] security-zone name untrust
[DeviceB-security-zone-Untrust] import interface gigabitethernet 1/0/1
[DeviceB-security-zone-Untrust] quit
```

4. Configure a security policy:
   a. Configure rules to permit traffic between the **Untrust** and **Local** security zones, so the devices can set up an IPsec tunnel:

      # Configure a rule named **ipseclocalout** to allow Device B to send IPsec negotiation packets to Device A.

```
[DeviceB] security-policy ip
[DeviceB-security-policy-ip] rule name ipseclocalout
[DeviceB-security-policy-ip-1-ipseclocalout] source-zone local
[DeviceB-security-policy-ip-1-ipseclocalout] destination-zone untrust
[DeviceB-security-policy-ip-1-ipseclocalout] source-ip-host 2.2.2.2
[DeviceB-security-policy-ip-1-ipseclocalout] destination-ip-host 1.1.1.1
[DeviceB-security-policy-ip-1-ipseclocalout] action pass
[DeviceB-security-policy-ip-1-ipseclocalout] quit
```

      # Configure a rule named **ipseclocalin** to allow Device B to receive the IPsec negotiation packets sent from Device A.

```
[DeviceB-security-policy-ip] rule name ipseclocalin
[DeviceB-security-policy-ip-2-ipseclocalin] source-zone untrust
[DeviceB-security-policy-ip-2-ipseclocalin] destination-zone local
[DeviceB-security-policy-ip-2-ipseclocalin] source-ip-host 1.1.1.1
[DeviceB-security-policy-ip-2-ipseclocalin] destination-ip-host 2.2.2.2
[DeviceB-security-policy-ip-2-ipseclocalin] action pass
[DeviceB-security-policy-ip-2-ipseclocalin] quit
```

   b. Configure rules to permit the traffic between Host B and Host A:

      # Configure a rule named **trust-untrust** to permit the packets from Host B to Host A.

```
[DeviceB-security-policy-ip] rule name trust-untrust
[DeviceB-security-policy-ip-3-trust-untrust] source-zone trust
[DeviceB-security-policy-ip-3-trust-untrust] destination-zone untrust
[DeviceB-security-policy-ip-3-trust-untrust] source-ip-subnet 10.1.2.0 24
[DeviceB-security-policy-ip-3-trust-untrust] destination-ip-subnet 10.1.1.0 24
[DeviceB-security-policy-ip-3-trust-untrust] action pass
[DeviceB-security-policy-ip-3-trust-untrust] quit
```

      # Configure a rule named **untrust-trust** to permit the packets from Host A to Host B.

```
[DeviceB-security-policy-ip] rule name untrust-trust
[DeviceB-security-policy-ip-4-untrust-trust] source-zone untrust
[DeviceB-security-policy-ip-4-untrust-trust] destination-zone trust
[DeviceB-security-policy-ip-4-untrust-trust] source-ip-subnet 10.1.1.0 24
[DeviceB-security-policy-ip-4-untrust-trust] destination-ip-subnet 10.1.2.0 24
[DeviceB-security-policy-ip-4-untrust-trust] action pass
[DeviceB-security-policy-ip-4-untrust-trust] quit
[DeviceB-security-policy-ip] quit
```

5. Define the data flows to be protected:

# Configure IPv4 advanced ACL 3101 to identify traffic from subnet 10.1.2.0/24 to subnet 10.1.1.0/24.

```
[DeviceB] acl advanced 3101
[DeviceB-acl-ipv4-adv-3101] rule permit ip source 10.1.2.0 0.0.0.255 destination
10.1.1.0 0.0.0.255
[DeviceB-acl-ipv4-adv-3101] quit
```

6. Configure an IPsec transform set to specify the packet encapsulation mode, security protocols, and algorithms.

   The IPsec transform set settings at both sides of the IPsec tunnel must be the same.

```
[DeviceB] ipsec transform-set tran1
[DeviceB-ipsec-transform-set-tran1] encapsulation-mode tunnel
[DeviceB-ipsec-transform-set-tran1] protocol esp
[DeviceB-ipsec-transform-set-tran1] esp encryption-algorithm des-cbc
[DeviceB-ipsec-transform-set-tran1] esp authentication-algorithm sha1
[DeviceB-ipsec-transform-set-tran1] quit
```

7. Configure an IKE keychain to specify the key information used for IKE communication.

   The preshared key used by both sides of the communication must be the same.

```
[DeviceB] ikev2 keychain keychain1
[DeviceB-ikev2-keychain-keychain1] peer peer1
[DeviceB-ikev2-keychain-keychain1-peer-peer1] address 1.1.1.1 16
[DeviceB-ikev2-keychain-keychain1-peer-peer1] identity address 1.1.1.1
[DeviceB-ikev2-keychain-keychain1-peer-peer1] pre-shared-key plaintext abcde
[DeviceB-ikev2-keychain-keychain1-peer-peer1] quit
[DeviceB-ikev2-keychain-keychain1] quit
```

8. Configure an IKEv2 profile to specify the security parameters used for setting up IKE SAs.

```
[DeviceB] ikev2 profile profile1
[DeviceB-ikev2-profile-profile1] authentication-method local pre-share
[DeviceB-ikev2-profile-profile1] authentication-method remote pre-share
[DeviceB-ikev2-profile-profile1] keychain keychain1
[DeviceA-ikev2-profile-profile1] match remote identity address 1.1.1.1 255.255.0.0
[DeviceA-ikev2-profile-profile1] quit
```

9. Configure an IPsec policy to establish an IPsec tunnel to protect the specified data.

```
[DeviceB] ipsec policy use1 10 isakmp
[DeviceB-ipsec-policy-isakmp-use1-10] remote-address 1.1.1.1
[DeviceB-ipsec-policy-isakmp-use1-10] security acl 3101
[DeviceB-ipsec-policy-isakmp-use1-10] transform-set tran1
[DeviceB-ipsec-policy-isakmp-use1-10] ikev2-profile profile1
[DeviceB-ipsec-policy-isakmp-use1-10] quit
```

10. Apply the IPsec policy to GigabitEthernet 1/0/1 to protect the traffic on the interface.

```
[DeviceB] interface gigabitethernet 1/0/1
[DeviceB-GigabitEthernet1/0/1] ipsec apply policy use1
[DeviceB-GigabitEthernet1/0/1] quit
```

Verifying the configuration

# Initiate a connection from subnet 10.1.1.0/24 to subnet 10.1.2.0/24 to trigger IKEv2 negotiation. After IPsec SAs are successfully negotiated by IKEv2, traffic between the two subnets is IPsec-protected.

# Display the IKEv2 proposal and IKEv2 policy on Device A.

```
[DeviceA] display ikev2 proposal
```

```

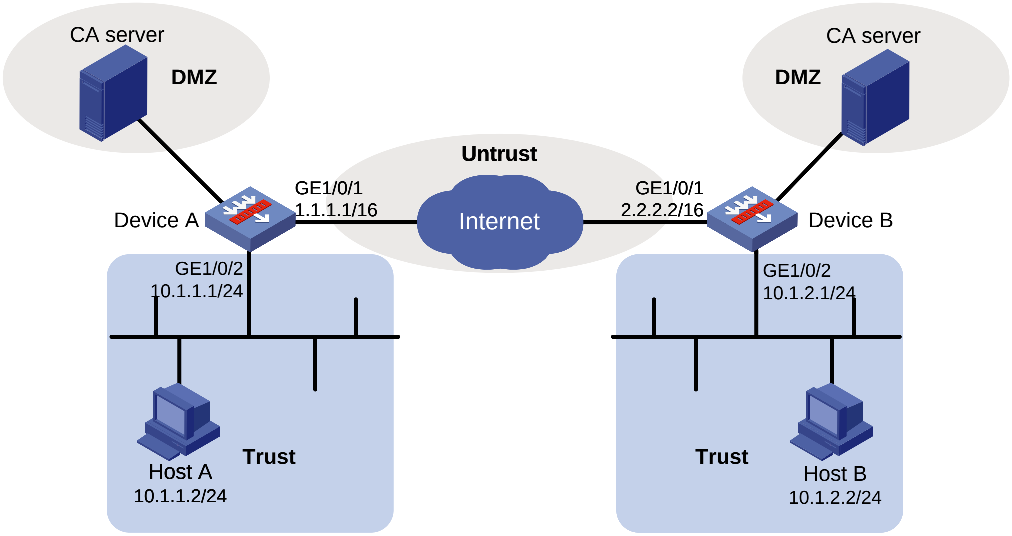
Example: Configuring an IKEv2-based IPsec tunnel for IPv4 packets between gateways (RSA signature authentication)

Network configuration

As shown in Figure 15, configure an IKE-based IPsec tunnel between Device A and Device B to secure the communication between subnet 10.1.1.0/24 and subnet 10.1.2.0/24.

Configure Device A and Device B to use IKEv2 negotiation and RSA signature authentication. Device A acts as the initiator, and the subnet where Device A resides uses IP addresses dynamically allocated.

Figure 15 Network diagram



Prerequisites

Device A has obtained CA certificate **ca.cer** and local certificate **server.pfx**.

Device B has obtained CA certificate **ca.cer** and local certificate **server.pfx**.

Configuring Device A

1. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

   ```
   <DeviceA> system-view
   [DeviceA] interface gigabitethernet 1/0/1
   [DeviceA-GigabitEthernet1/0/1] ip address 1.1.1.1 255.255.0.0
   [DeviceA-GigabitEthernet1/0/1] quit
   ```

   # Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Configure settings for routing.

   This example configures static routes, and the next hop in the routes is 1.1.1.2.

   ```
   [DeviceA] ip route-static 10.1.2.0 24 1.1.1.2
   [DeviceA] ip route-static 2.2.2.2 16 1.1.1.2
   ```

3. Add interfaces to security zones.

   ```
   [DeviceA] security-zone name trust
   [DeviceA-security-zone-Trust] import interface gigabitethernet 1/0/2
   [DeviceA-security-zone-Trust] quit
   [DeviceA] security-zone name untrust
   [DeviceA-security-zone-Untrust] import interface gigabitethernet 1/0/1
   [DeviceA-security-zone-Untrust] quit
   ```

4. Configure a security policy:

   a. Configure rules to permit traffic between the **Untrust** and **Local** security zones, so the devices can set up an IPsec tunnel:

      # Configure a rule named **ipseclocalout** to allow Device A to send IPsec negotiation packets to Device B.

      ```
      [DeviceA] security-policy ip
      [DeviceA-security-policy-ip] rule name ipseclocalout
      [DeviceA-security-policy-ip-1-ipseclocalout] source-zone local
      [DeviceA-security-policy-ip-1-ipseclocalout] destination-zone untrust
      [DeviceA-security-policy-ip-1-ipseclocalout] source-ip-host 1.1.1.1
      [DeviceA-security-policy-ip-1-ipseclocalout] destination-ip-host 2.2.2.2
      [DeviceA-security-policy-ip-1-ipseclocalout] action pass
      [DeviceA-security-policy-ip-1-ipseclocalout] quit
      ```

      # Configure a rule named **ipseclocalin** to allow Device A to receive the IPsec negotiation packets sent from Device B.

      ```
      [DeviceA-security-policy-ip] rule name ipseclocalin
      [DeviceA-security-policy-ip-2-ipseclocalin] source-zone untrust
      [DeviceA-security-policy-ip-2-ipseclocalin] destination-zone local
      [DeviceA-security-policy-ip-2-ipseclocalin] source-ip-host 2.2.2.2
      [DeviceA-security-policy-ip-2-ipseclocalin] destination-ip-host 1.1.1.1
      [DeviceA-security-policy-ip-2-ipseclocalin] action pass
      [DeviceA-security-policy-ip-2-ipseclocalin] quit
      ```

   b. Configure rules to permit the traffic between Host A and Host B:

      # Configure a rule named **trust-untrust** to permit the packets from Host A to Host B.

      ```
      [DeviceA-security-policy-ip] rule name trust-untrust
      ```

```
[DeviceA-security-policy-ip-3-trust-untrust] source-zone trust
[DeviceA-security-policy-ip-3-trust-untrust] destination-zone untrust
[DeviceA-security-policy-ip-3-trust-untrust] source-ip-subnet 10.1.1.0 24
[DeviceA-security-policy-ip-3-trust-untrust] destination-ip-subnet 10.1.2.0 24
[DeviceA-security-policy-ip-3-trust-untrust] action pass
[DeviceA-security-policy-ip-3-trust-untrust] quit
```

# Configure a rule named **untrust-trust** to permit the packets from Host B to Host A.

```
[DeviceA-security-policy-ip] rule name untrust-trust
[DeviceA-security-policy-ip-4-untrust-trust] source-zone untrust
[DeviceA-security-policy-ip-4-untrust-trust] destination-zone trust
[DeviceA-security-policy-ip-4-untrust-trust] source-ip-subnet 10.1.2.0 24
[DeviceA-security-policy-ip-4-untrust-trust] destination-ip-subnet 10.1.1.0 24
[DeviceA-security-policy-ip-4-untrust-trust] action pass
[DeviceA-security-policy-ip-4-untrust-trust] quit
[DeviceA-security-policy-ip] quit
```

5. Define the data flows to be protected:

# Configure IPv4 advanced ACL 3101 to identify traffic from subnet 10.1.1.0/24 to subnet 10.1.2.0/24.

```
[DeviceA] acl advanced 3101
[DeviceA-acl-ipv4-adv-3101] rule permit ip source 10.1.1.0 0.0.0.255 destination
10.1.2.0 0.0.0.255
[DeviceA-acl-ipv4-adv-3101] quit
```

6. Configure an IPsec transform set to specify the packet encapsulation mode, security protocols, and algorithms.

The IPsec transform set settings at both sides of the IPsec tunnel must be the same.

```
[DeviceA] ipsec transform-set tran1
[DeviceA-ipsec-transform-set-tran1] encapsulation-mode tunnel
[DeviceA-ipsec-transform-set-tran1] protocol esp
[DeviceA-ipsec-transform-set-tran1] esp encryption-algorithm des-cbc
[DeviceA-ipsec-transform-set-tran1] esp authentication-algorithm sha1
[DeviceA-ipsec-transform-set-tran1] quit
```

7. Configure a PKI entity.

```
[DeviceA] pki entity entity1
[DeviceA-pki-entity-entity1] common-name devicea
[DeviceA-pki-entity-entity1] quit
```

8. Configure a PKI domain for certificate request.

```
[DeviceA] pki domain domain1
[DeviceA-pki-domain-domain1] public-key rsa general name rsa1
[DeviceA-pki-domain-domain1] undo crl check enable
[DeviceA-pki-domain-domain1] quit
[DeviceA] pki import domain domain1 der ca filename ca.cer
[DeviceA] pki import domain domain1 p12 local filename server.pfx
```

9. Configure a certificate-based access control policy to control the user access rights.

A peer certificate is regarded valid only if it contains the specified string (**1** in this example) in the DN attribute of the subject name field.

```
[DeviceA] pki certificate access-control-policy policy1
[DeviceA-pki-cert-acp-policy1] rule 1 permit group1
[DeviceA] pki certificate attribute-group group1
```

```
[DeviceA-pki-cert-attribute-group-group1] attribute 1 subject-name dn ctn 1
```

10. Configure an IKEv2 profile to specify the security parameters used for setting up IKEv2 SAs.

```
[DeviceA] ikev2 profile profile1
[DeviceA-ikev2-profile-profile1] authentication-method local rsa-signature
[DeviceA-ikev2-profile-profile1] authentication-method remote rsa-signature
[DeviceA-ikev2-profile-profile1] certificate domain domain1
[DeviceA-ikev2-profile-profile1] local-identity dn
[DeviceA-ikev2-profile-profile1] match remote certificate policy1
[DeviceA-ikev2-profile-profile1] quit
```

11. Configure an IKEv2 proposal to specify the parameters for IKE negotiation.

```
[DeviceA] ikev2 proposal 10
[DeviceA-ikev2-proposal-10] integrity md5
[DeviceA-ikev2-proposal-10] encryption 3des-cbc
[DeviceA-ikev2-proposal-10] dh group1
[DeviceA-ikev2-proposal-10] prf md5
[DeviceA-ikev2-proposal-10] quit
```

12. Configure an IKEv2 policy, which is used to negotiate IKEv2 SAs.

```
[DeviceA] ikev2 policy 1
[DeviceA-ikev2-policy-1] proposal 10
[DeviceA-ikev2-policy-1] quit
```

13. Configure an IPsec policy to establish an IPsec tunnel to protect the specified data.

```
[DeviceA] ipsec policy map1 10 isakmp
[DeviceA-ipsec-policy-isakmp-map1-10] remote-address 2.2.2.2
[DeviceA-ipsec-policy-isakmp-map1-10] transform-set tran1
[DeviceA-ipsec-policy-isakmp-map1-10] security acl 3101
[DeviceA-ipsec-policy-isakmp-map1-10] ikev2-profile profile1
[DeviceA-ipsec-policy-isakmp-map1-10] quit
```

14. Apply the IPsec policy to GigabitEthernet 1/0/1 to protect the traffic on the interface.

```
[DeviceA] interface gigabitethernet 1/0/1
[DeviceA-GigabitEthernet1/0/1] ipsec apply policy map1
[DeviceA-GigabitEthernet1/0/1] quit
```

Configuring Device B

1. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

```
<DeviceB> system-view
[DeviceB] interface gigabitethernet 1/0/1
[DeviceB-GigabitEthernet1/0/1] ip address 2.2.2.2 255.255.0.0
[DeviceB-GigabitEthernet1/0/1] quit
```

   # Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Configure settings for routing.

   This example configures static routes, and the next hop in the routes is 2.2.2.1.

```
[DeviceB] ip route-static 10.1.1.0 24 2.2.2.1
[DeviceB] ip route-static 1.1.1.1 16 2.2.2.1
```

3. Add interfaces to security zones.

```
[DeviceB] security-zone name trust
[DeviceB-security-zone-Trust] import interface gigabitethernet 1/0/2
[DeviceB-security-zone-Trust] quit
```

```
[DeviceB] security-zone name untrust
[DeviceB-security-zone-Untrust] import interface gigabitethernet 1/0/1
[DeviceB-security-zone-Untrust] quit
```

4. Configure a security policy:
   a. Configure rules to permit traffic between the **Untrust** and **Local** security zones, so the devices can set up an IPsec tunnel:

      # Configure a rule named **ipseclocalout** to allow Device B to send IPsec negotiation packets to Device A.

      ```
      [DeviceB] security-policy ip
      [DeviceB-security-policy-ip] rule name ipseclocalout
      [DeviceB-security-policy-ip-1-ipseclocalout] source-zone local
      [DeviceB-security-policy-ip-1-ipseclocalout] destination-zone untrust
      [DeviceB-security-policy-ip-1-ipseclocalout] source-ip-host 2.2.2.2
      [DeviceB-security-policy-ip-1-ipseclocalout] destination-ip-host 1.1.1.1
      [DeviceB-security-policy-ip-1-ipseclocalout] action pass
      [DeviceB-security-policy-ip-1-ipseclocalout] quit
      ```

      # Configure a rule named **ipseclocalin** to allow Device B to receive the IPsec negotiation packets sent from Device A.

      ```
      [DeviceB-security-policy-ip] rule name ipseclocalin
      [DeviceB-security-policy-ip-2-ipseclocalin] source-zone untrust
      [DeviceB-security-policy-ip-2-ipseclocalin] destination-zone local
      [DeviceB-security-policy-ip-2-ipseclocalin] source-ip-host 1.1.1.1
      [DeviceB-security-policy-ip-2-ipseclocalin] destination-ip-host 2.2.2.2
      [DeviceB-security-policy-ip-2-ipseclocalin] action pass
      [DeviceB-security-policy-ip-2-ipseclocalin] quit
      ```

   b. Configure rules to permit the traffic between Host B and Host A:

      # Configure a rule named **trust-untrust** to permit the packets from Host B to Host A.

      ```
      [DeviceB-security-policy-ip] rule name trust-untrust
      [DeviceB-security-policy-ip-3-trust-untrust] source-zone trust
      [DeviceB-security-policy-ip-3-trust-untrust] destination-zone untrust
      [DeviceB-security-policy-ip-3-trust-untrust] source-ip-subnet 10.1.2.0 24
      [DeviceB-security-policy-ip-3-trust-untrust] destination-ip-subnet 10.1.1.0 24
      [DeviceB-security-policy-ip-3-trust-untrust] action pass
      [DeviceB-security-policy-ip-3-trust-untrust] quit
      ```

      # Configure a rule named **untrust-trust** to permit the packets from Host A to Host B.

      ```
      [DeviceB-security-policy-ip] rule name untrust-trust
      [DeviceB-security-policy-ip-4-untrust-trust] source-zone untrust
      [DeviceB-security-policy-ip-4-untrust-trust] destination-zone trust
      [DeviceB-security-policy-ip-4-untrust-trust] source-ip-subnet 10.1.1.0 24
      [DeviceB-security-policy-ip-4-untrust-trust] destination-ip-subnet 10.1.2.0 24
      [DeviceB-security-policy-ip-4-untrust-trust] action pass
      [DeviceB-security-policy-ip-4-untrust-trust] quit
      [DeviceB-security-policy-ip] quit
      ```

5. Define the data flows to be protected:

   # Configure IPv4 advanced ACL 3101 to identify traffic from subnet 10.1.2.0/24 to subnet 10.1.1.0/24.

   ```
   [DeviceB] acl advanced 3101
   ```

```
[DeviceB-acl-ipv4-adv-3101] rule permit ip source 10.1.2.0 0.0.0.255 destination
10.1.1.0 0.0.0.255
[DeviceB-acl-ipv4-adv-3101] quit
```

6. Configure an IPsec transform set to specify the packet encapsulation mode, security protocols, and algorithms.

   The IPsec transform set settings at both sides of the IPsec tunnel must be the same.

```
[DeviceB] ipsec transform-set tran1
[DeviceB-ipsec-transform-set-tran1] encapsulation-mode tunnel
[DeviceB-ipsec-transform-set-tran1] protocol esp
[DeviceB-ipsec-transform-set-tran1] esp encryption-algorithm des-cbc
[DeviceB-ipsec-transform-set-tran1] esp authentication-algorithm sha1
[DeviceB-ipsec-transform-set-tran1] quit
```

7. Configure a PKI entity.

```
[DeviceB] pki entity entity2
[DeviceB-pki-entity-entity2] common-name deviceb
[DeviceB-pki-entity-entity2] quit
```

8. Configure a PKI domain for certificate request.

```
[DeviceB] pki domain domain2
[DeviceB-pki-domain-domain2] public-key rsa general name rsa1
[DeviceB-pki-domain-domain2] undo crl check enable
[DeviceB-pki-domain-domain2] quit
[DeviceB] pki import domain domain2 der ca filename ca.cer
[DeviceB] pki import domain domain2 p12 local filename server.pfx
```

9. Configure a certificate-based access control policy to control the user access rights.

   A peer certificate is regarded valid only if it contains the specified string (**1** in this example) in the DN attribute of the subject name field.

```
[DeviceB] pki certificate access-control-policy policy1
[DeviceB-pki-cert-acp-policy1] rule 1 permit group1
[DeviceB] pki certificate attribute-group group1
[DeviceB-pki-cert-attribute-group-group1] attribute 1 subject-name dn ctn 1
```

10. Configure an IKEv2 profile to specify the security parameters used for setting up IKEv2 SAs.

```
[DeviceB] ikev2 profile profile2
[DeviceB-ikev2-profile-profile2] authentication-method local rsa-signature
[DeviceB-ikev2-profile-profile2] authentication-method remote rsa-signature
[DeviceB-ikev2-profile-profile2] certificate domain domain2
[DeviceB-ikev2-profile-profile2] local-identity dn
[DeviceB-ikev2-profile-profile2] match remote certificate policy1
[DeviceB-ikev2-profile-profile2] quit
```

11. Configure an IKEv2 proposal to specify the parameters for IKE negotiation.

```
[DeviceB] ikev2 proposal 10
[DeviceB-ikev2-proposal-10] integrity md5
[DeviceB-ikev2-proposal-10] encryption 3des-cbc
[DeviceB-ikev2-proposal-10] dh group1
[DeviceB-ikev2-proposal-10] prf md5
[DeviceB-ikev2-proposal-10] quit
```

12. Configure an IKEv2 policy, which is used to negotiate IKEv2 SAs.

```
[DeviceB] ikev2 policy 1
[DeviceB-ikev2-policy-1] proposal 10
```

```
[DeviceB-ikev2-policy-1] quit
```

13. Configure an IPsec policy template, which is used to create the IPsec policy.

```
[DeviceB] ipsec policy-template template1 1
[DeviceB-ipsec-policy-template-template1-1] remote-address 1.1.1.1
[DeviceB-ipsec-policy-template-template1-1] security acl 3101
[DeviceB-ipsec-policy-template-template1-1] transform-set tran1
[DeviceB-ipsec-policy-template-template1-1] ikev2-profile profile2
[DeviceB-ipsec-policy-template-template1-1] quit
```

14. Create an IKE-based IPsec policy entry by using IPsec policy template **template1**, so as to establish the IPsec tunnel to protect the specified data flow.

```
[DeviceB] ipsec policy use1 1 isakmp template template1
```

15. Apply the IPsec policy to GigabitEthernet 1/0/1 to protect the traffic on the interface.

```
[DeviceB] interface gigabitethernet 1/0/1
[DeviceB-GigabitEthernet1/0/1] ipsec apply policy use1
[DeviceB-GigabitEthernet1/0/1] quit
```

Verifying the configuration

# Initiate a connection from subnet 10.1.1.0/24 to subnet 10.1.2.0/24 to trigger IKEv2 negotiation. After IPsec SAs are successfully negotiated by IKEv2, traffic between the two subnets is IPsec-protected.

# Display the IKEv2 proposal configuration on Device A and Device B.

```
[DeviceA] display ikev2 proposal 10

      Status: Active
```

# Display the information about the CA certificate, local certificate, IKEv2 SA, and IPsec SA on Device B.

```
[DeviceB] display ikev2 sa
[DeviceB] display pki certificate domain domain2 ca
[DeviceB] display pki certificate domain domain2 local
[DeviceB] display ipsec sa
```

Example: Configuring an IKE-based IPsec NAT traversal tunnel for IPv4 packets between gateways

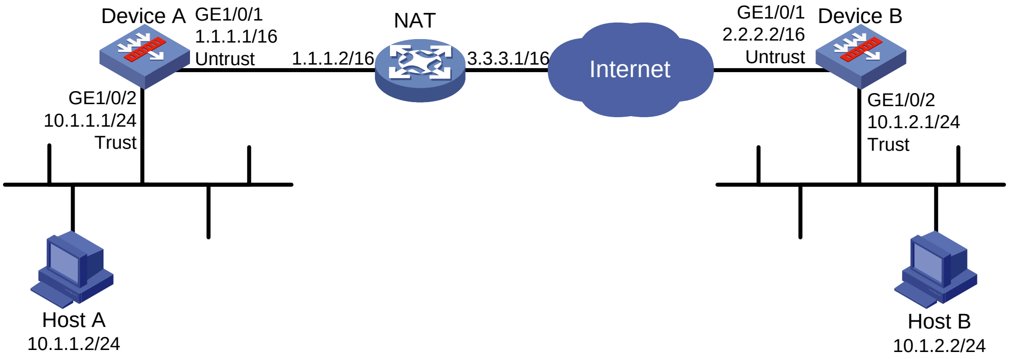
Network configuration

Device A is behind the NAT device. Hosts behind Device A use public IP address 3.3.3.1 to access the external network.

Configure an IKE-based IPsec tunnel between Device A and Device B to secure the communication between subnet 10.1.1.0/24 and subnet 10.1.2.0/24.

- Configure Device A and Device B to use the default IKE proposal for the aggressive IKE negotiation to set up the IPsec SAs.
- Configure the two devices to use the preshared key authentication method for the IKE negotiation phase 1.

Figure 16 Network diagram



Configuring Device A

1. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

   ```
   <DeviceA> system-view
   [DeviceA] interface gigabitethernet 1/0/1
   [DeviceA-GigabitEthernet1/0/1] ip address 1.1.1.1 255.255.0.0
   [DeviceA-GigabitEthernet1/0/1] quit
   ```

   # Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Configure settings for routing.

   This example configures static routes, and the next hop in the routes is 1.1.1.2.

   ```
   [DeviceA] ip route-static 10.1.2.0 24 1.1.1.2
   [DeviceA] ip route-static 2.2.2.2 16 1.1.1.2
   ```

3. Add interfaces to security zones.

   ```
   [DeviceA] security-zone name trust
   [DeviceA-security-zone-Trust] import interface gigabitethernet 1/0/2
   [DeviceA-security-zone-Trust] quit
   [DeviceA] security-zone name untrust
   [DeviceA-security-zone-Untrust] import interface gigabitethernet 1/0/1
   [DeviceA-security-zone-Untrust] quit
   ```

4. Configure a security policy:

   a. Configure rules to permit traffic between the **Untrust** and **Local** security zones, so the devices can set up an IPsec tunnel:

      # Configure a rule named **ipseclocalout** to allow Device A to send IPsec negotiation packets to Device B.

      ```
      [DeviceA] security-policy ip
      [DeviceA-security-policy-ip] rule name ipseclocalout
      [DeviceA-security-policy-ip-1-ipseclocalout] source-zone local
      [DeviceA-security-policy-ip-1-ipseclocalout] destination-zone untrust
      [DeviceA-security-policy-ip-1-ipseclocalout] source-ip-host 1.1.1.1
      [DeviceA-security-policy-ip-1-ipseclocalout] destination-ip-host 2.2.2.2
      [DeviceA-security-policy-ip-1-ipseclocalout] action pass
      ```

```
[DeviceA-security-policy-ip-1-ipseclocalout] quit
```

# Configure a rule named **ipseclocalin** to allow Device A to receive the IPsec negotiation packets sent from Device B.

```
[DeviceA-security-policy-ip] rule name ipseclocalin
[DeviceA-security-policy-ip-2-ipseclocalin] source-zone untrust
[DeviceA-security-policy-ip-2-ipseclocalin] destination-zone local
[DeviceA-security-policy-ip-2-ipseclocalin] source-ip-host 2.2.2.2
[DeviceA-security-policy-ip-2-ipseclocalin] destination-ip-host 1.1.1.1
[DeviceA-security-policy-ip-2-ipseclocalin] action pass
[DeviceA-security-policy-ip-2-ipseclocalin] quit
```

b. Configure rules to permit the traffic between Host A and Host B:

# Configure a rule named **trust-untrust** to permit the packets from Host A to Host B.

```
[DeviceA-security-policy-ip] rule name trust-untrust
[DeviceA-security-policy-ip-3-trust-untrust] source-zone trust
[DeviceA-security-policy-ip-3-trust-untrust] destination-zone untrust
[DeviceA-security-policy-ip-3-trust-untrust] source-ip-subnet 10.1.1.0 24
[DeviceA-security-policy-ip-3-trust-untrust] destination-ip-subnet 10.1.2.0 24
[DeviceA-security-policy-ip-3-trust-untrust] action pass
[DeviceA-security-policy-ip-3-trust-untrust] quit
```

# Configure a rule named **untrust-trust** to permit the packets from Host B to Host A.

```
[DeviceA-security-policy-ip] rule name untrust-trust
[DeviceA-security-policy-ip-4-untrust-trust] source-zone untrust
[DeviceA-security-policy-ip-4-untrust-trust] destination-zone trust
[DeviceA-security-policy-ip-4-untrust-trust] source-ip-subnet 10.1.2.0 24
[DeviceA-security-policy-ip-4-untrust-trust] destination-ip-subnet 10.1.1.0 24
[DeviceA-security-policy-ip-4-untrust-trust] action pass
[DeviceA-security-policy-ip-4-untrust-trust] quit
[DeviceA-security-policy-ip] quit
```

5. Define the data flows to be protected:

# Configure IPv4 advanced ACL 3000 to identify traffic from subnet 10.1.1.0/24 to subnet 10.1.2.0/24.

```
[DeviceA] acl advanced 3000
[DeviceA-acl-ipv4-adv-3000] rule 0 permit ip source 10.1.1.0 0.0.0.255 destination
10.1.2.0 0.0.0.255
[DeviceA-acl-ipv4-adv-3000] quit
```

6. Configure an IPsec transform set to specify the packet encapsulation mode, security protocols, and algorithms.

The IPsec transform set settings at both sides of the IPsec tunnel must be the same.

```
[DeviceA] ipsec transform-set transform1
[DeviceA-ipsec-transform-set-transform1] protocol esp
[DeviceA-ipsec-transform-set-transform1] esp encryption-algorithm 3des-cbc
[DeviceA-ipsec-transform-set-transform1] esp authentication-algorithm md5
[DeviceA-ipsec-transform-set-transform1] quit
```

7. Configure an IKE keychain to specify the key information used for IKE communication.

The preshared key used by both sides of the communication must be the same.

```
[DeviceA] ike keychain keychain1
[DeviceA-ike-keychain-keychain1] pre-shared-key address 2.2.2.2 255.255.0.0 key
simple 12345zxcvb!@#$%ZXCVB
```

```
[DeviceA-ike-keychain-keychain1] quit
```

8. Configure an IKE profile to specify the security parameters used for setting up IKE SAs.

```
[DeviceA] ike profile profile1
[DeviceA-ike-profile-profile1] keychain keychain1
[DeviceA-ike-profile-profile1] exchange-mode aggressive
[DeviceA-ike-profile-profile1] local-identity fqdn www.devicea.com
[DeviceA-ike-profile-profile1] match remote identity address 2.2.2.2 255.255.0.0
[DeviceA-ike-profile-profile1] quit
```

9. Configure an IPsec policy to establish an IPsec tunnel to protect the specified data.

```
[DeviceA] ipsec policy policy1 1 isakmp
[DeviceA-ipsec-policy-isakmp-policy1-1] remote-address 2.2.2.2
[DeviceA-ipsec-policy-isakmp-policy1-1] transform-set transform1
[DeviceA-ipsec-policy-isakmp-policy1-1] security acl 3000
[DeviceA-ipsec-policy-isakmp-policy1-1] ike-profile profile1
[DeviceA-ipsec-policy-isakmp-policy1-1] quit
```

10. Apply the IPsec policy to GigabitEthernet 1/0/1 to protect the traffic on the interface.

```
[DeviceA] interface gigabitethernet 1/0/1
[DeviceA-GigabitEthernet1/0/1] ipsec apply policy policy1
[DeviceA-GigabitEthernet1/0/1] quit
```

Configuring Device B

1. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

```
<DeviceB> system-view
[DeviceB] interface gigabitethernet 1/0/1
[DeviceB-GigabitEthernet1/0/1] ip address 2.2.2.2 255.255.0.0
[DeviceB-GigabitEthernet1/0/1] quit
```

   # Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Configure settings for routing.

   This example configures static routes, and the next hop in the routes is 2.2.2.1.

```
[DeviceB] ip route-static 10.1.1.0 24 2.2.2.1
[DeviceB] ip route-static 1.1.1.1 16 2.2.2.1
```

3. Add interfaces to security zones.

```
[DeviceB] security-zone name trust
[DeviceB-security-zone-Trust] import interface gigabitethernet 1/0/2
[DeviceB-security-zone-Trust] quit
[DeviceB] security-zone name untrust
[DeviceB-security-zone-Untrust] import interface gigabitethernet 1/0/1
[DeviceB-security-zone-Untrust] quit
```

4. Configure a security policy:

   a. Configure rules to permit traffic between the **Untrust** and **Local** security zones, so the devices can set up an IPsec tunnel:

      # Configure a rule named **ipseclocalout** to allow Device B to send IPsec negotiation packets to Device A.

```
[DeviceB] security-policy ip
[DeviceB-security-policy-ip] rule name ipseclocalout
[DeviceB-security-policy-ip-1-ipseclocalout] source-zone local
[DeviceB-security-policy-ip-1-ipseclocalout] destination-zone untrust
```

```
[DeviceB-security-policy-ip-1-ipseclocalout] source-ip-host 2.2.2.2
[DeviceB-security-policy-ip-1-ipseclocalout] destination-ip-host 3.3.3.1
[DeviceB-security-policy-ip-1-ipseclocalout] action pass
[DeviceB-security-policy-ip-1-ipseclocalout] quit
```

# Configure a rule named **ipseclocalin** to allow Device B to receive the IPsec negotiation packets sent from Device A.

```
[DeviceB-security-policy-ip] rule name ipseclocalin
[DeviceB-security-policy-ip-2-ipseclocalin] source-zone untrust
[DeviceB-security-policy-ip-2-ipseclocalin] destination-zone local
[DeviceB-security-policy-ip-2-ipseclocalin] source-ip-host 3.3.3.1
[DeviceB-security-policy-ip-2-ipseclocalin] destination-ip-host 2.2.2.2
[DeviceB-security-policy-ip-2-ipseclocalin] action pass
[DeviceB-security-policy-ip-2-ipseclocalin] quit
```

b. Configure rules to permit traffic between Host B and Host A:

# Configure a rule named **trust-untrust** to permit the packets from Host B to Host A.

```
[DeviceB-security-policy-ip] rule name trust-untrust
[DeviceB-security-policy-ip-3-trust-untrust] source-zone trust
[DeviceB-security-policy-ip-3-trust-untrust] destination-zone untrust
[DeviceB-security-policy-ip-3-trust-untrust] source-ip-subnet 10.1.2.0 24
[DeviceB-security-policy-ip-3-trust-untrust] destination-ip-subnet 10.1.1.0 24
[DeviceB-security-policy-ip-3-trust-untrust] action pass
[DeviceB-security-policy-ip-3-trust-untrust] quit
```

# Configure a rule named **untrust-trust** to permit the packets from Host A to Host B.

```
[DeviceB-security-policy-ip] rule name untrust-trust
[DeviceB-security-policy-ip-4-untrust-trust] source-zone untrust
[DeviceB-security-policy-ip-4-untrust-trust] destination-zone trust
[DeviceB-security-policy-ip-4-untrust-trust] source-ip-subnet 10.1.1.0 24
[DeviceB-security-policy-ip-4-untrust-trust] destination-ip-subnet 10.1.2.0 24
[DeviceB-security-policy-ip-4-untrust-trust] action pass
[DeviceB-security-policy-ip-4-untrust-trust] quit
[DeviceB-security-policy-ip] quit
```

5. Configure an IPsec transform set to specify the packet encapsulation mode, security protocols, and algorithms.

```
[DeviceB] ipsec transform-set transform1
[DeviceB-ipsec-transform-set-transform1] protocol esp
[DeviceB-ipsec-transform-set-transform1] esp encryption-algorithm 3des-cbc
[DeviceB-ipsec-transform-set-transform1] esp authentication-algorithm md5
[DeviceB-ipsec-transform-set-transform1] quit
```

6. Configure an IKE keychain to specify the key information used for IKE communication.

This example specifies **12345zxcvb!@#$%ZXCVB** in plain text as the preshared key to be used with the remote peer at 1.1.1.1. The source address of packets from 1.1.1.1 is translated into 3.3.3.1 by the NAT device, so IP address of the remote peer is specified as 3.3.3.1.

```
[DeviceB]ike keychain keychain1
[DeviceB-ike-keychain-keychain1] pre-shared-key address 3.3.3.1 255.255.0.0 key
simple 12345zxcvb!@#$%ZXCVB
[DeviceB-ike-keychain-keychain1] quit
```

7. Configure an IKE profile to specify the security parameters used for setting up IKE SAs.

```
[DeviceB] ike profile profile1
```

```
[DeviceB-ike-profile-profile1] keychain keychain1
[DeviceB-ike-profile-profile1] exchange-mode aggressive
[DeviceB-ike-profile-profile1] match remote identity fqdn www.devicea.com
[DeviceB-ike-profile-profile1] quit
```

8. Configure an IPsec policy template, which is used to create an IPsec policy.

```
[DeviceB] ipsec policy-template template1 1
[DeviceB-ipsec-policy-template-template1-1] transform-set transform1
[DeviceB-ipsec-policy-template-template1-1] local-address 2.2.2.2
[DeviceB-ipsec-policy-template-template1-1] ike-profile profile1
[DeviceB-ipsec-policy-template-template1-1] quit
```

9. Create an IKE-based IPsec policy entry by using IPsec policy template **template1**, so as to establish an IPsec tunnel to protect the specified data.

```
[DeviceB] ipsec policy policy1 1 isakmp template template1
```

10. Apply the IPsec policy to GigabitEthernet 1/0/1 to protect the traffic on the interface.

```
[DeviceB] interface gigabitethernet 1/0/1
[DeviceB-GigabitEthernet1/0/1] ipsec apply policy policy1
[DeviceB-GigabitEthernet1/0/1] quit
```

Verifying the configuration

# Initiate a connection from subnet 10.1.1.0/24 to subnet 10.1.2.0/24 to trigger IKE negotiation. After IPsec SAs are successfully negotiated by IKE, traffic between the two subnets is IPsec-protected.

# Display the IKE SA on Device A.

```
[DeviceA] display ike sa
    Connection-ID   Remote               Flag         DOI

  SA remaining duration (kilobytes/sec): 1843200/2313
  Max sent sequence-number:
  UDP encapsulation used for NAT traversal: Y
  Status: Active
```

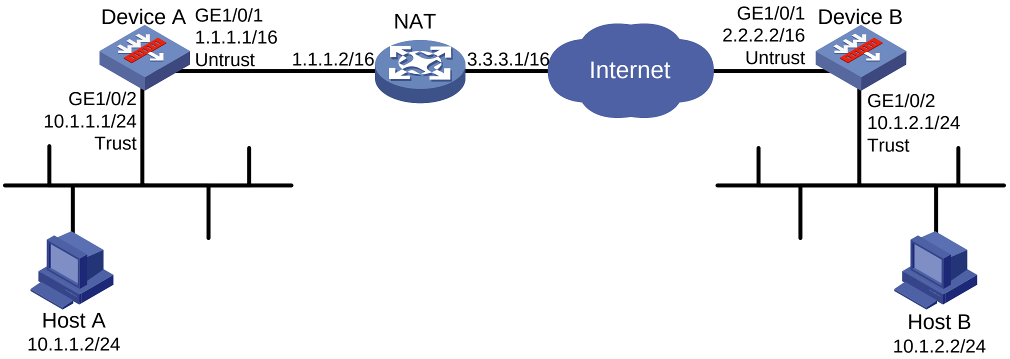
Example: Configuring an IKEv2-based IPsec NAT traversal tunnel for IPv4 packets between gateways

Network configuration

As shown in Figure 17, Device A is behind the NAT device. Configure an IKE-based IPsec tunnel between Device A and Device B to secure the communication between subnet 10.1.1.0/24 and subnet 10.1.2.0/24.

- Configure Device A and Device B to use the default IKEv2 proposal and the default IKEv2 policy in IKEv2 negotiation to set up IPsec SAs.
- Configure the two devices to use the preshared key authentication method in IKEv2 negotiation.

Figure 17 Network diagram



Configuring Device A

1. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

   ```
   <DeviceA> system-view
   [DeviceA] interface gigabitethernet 1/0/1
   [DeviceA-GigabitEthernet1/0/1] ip address 1.1.1.1 255.255.0.0
   [DeviceA-GigabitEthernet1/0/1] quit
   ```

   # Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Configure settings for routing.

   This example configures static routes, and the next hop in the routes is 1.1.1.2.

   ```
   [DeviceA] ip route-static 10.1.2.0 24 1.1.1.2
   [DeviceA] ip route-static 2.2.2.2 16 1.1.1.2
   ```

3. Add interfaces to security zones.

   ```
   [DeviceA] security-zone name trust
   ```

```
[DeviceA-security-zone-Trust] import interface gigabitethernet 1/0/2
[DeviceA-security-zone-Trust] quit
[DeviceA] security-zone name untrust
[DeviceA-security-zone-Untrust] import interface gigabitethernet 1/0/1
[DeviceA-security-zone-Untrust] quit
```

4. Configure a security policy:
   a. Configure rules to permit traffic between the **Untrust** and **Local** security zones, so the devices can set up an IPsec tunnel:

      # Configure a rule named **ipseclocalout** to allow Device A to send IPsec negotiation packets to Device B.

      ```
      [DeviceA] security-policy ip
      [DeviceA-security-policy-ip] rule name ipseclocalout
      [DeviceA-security-policy-ip-1-ipseclocalout] source-zone local
      [DeviceA-security-policy-ip-1-ipseclocalout] destination-zone untrust
      [DeviceA-security-policy-ip-1-ipseclocalout] source-ip-host 1.1.1.1
      [DeviceA-security-policy-ip-1-ipseclocalout] destination-ip-host 2.2.2.2
      [DeviceA-security-policy-ip-1-ipseclocalout] action pass
      [DeviceA-security-policy-ip-1-ipseclocalout] quit
      ```

      # Configure a rule named **ipseclocalin** to allow Device A to receive the IPsec negotiation packets sent from Device B.

      ```
      [DeviceA-security-policy-ip] rule name ipseclocalin
      [DeviceA-security-policy-ip-2-ipseclocalin] source-zone untrust
      [DeviceA-security-policy-ip-2-ipseclocalin] destination-zone local
      [DeviceA-security-policy-ip-2-ipseclocalin] source-ip-host 2.2.2.2
      [DeviceA-security-policy-ip-2-ipseclocalin] destination-ip-host 1.1.1.1
      [DeviceA-security-policy-ip-2-ipseclocalin] action pass
      [DeviceA-security-policy-ip-2-ipseclocalin] quit
      ```

   b. Configure rules to permit the traffic between Host A and Host B:

      # Configure a rule named **trust-untrust** to permit the packets from Host A to Host B.

      ```
      [DeviceA-security-policy-ip] rule name trust-untrust
      [DeviceA-security-policy-ip-3-trust-untrust] source-zone trust
      [DeviceA-security-policy-ip-3-trust-untrust] destination-zone untrust
      [DeviceA-security-policy-ip-3-trust-untrust] source-ip-subnet 10.1.1.0 24
      [DeviceA-security-policy-ip-3-trust-untrust] destination-ip-subnet 10.1.2.0 24
      [DeviceA-security-policy-ip-3-trust-untrust] action pass
      [DeviceA-security-policy-ip-3-trust-untrust] quit
      ```

      # Configure a rule named **untrust-trust** to permit the packets from Host B to Host A.

      ```
      [DeviceA-security-policy-ip] rule name untrust-trust
      [DeviceA-security-policy-ip-4-untrust-trust] source-zone untrust
      [DeviceA-security-policy-ip-4-untrust-trust] destination-zone trust
      [DeviceA-security-policy-ip-4-untrust-trust] source-ip-subnet 10.1.2.0 24
      [DeviceA-security-policy-ip-4-untrust-trust] destination-ip-subnet 10.1.1.0 24
      [DeviceA-security-policy-ip-4-untrust-trust] action pass
      [DeviceA-security-policy-ip-4-untrust-trust] quit
      [DeviceA-security-policy-ip] quit
      ```

5. Define the data flows to be protected:

   # Configure IPv4 advanced ACL 3101 to identify traffic from subnet 10.1.1.0/24 to subnet 10.1.2.0/24.

```
[DeviceA] acl advanced 3101
[DeviceA-acl-ipv4-adv-3101] rule 0 permit ip source 10.1.1.0 0.0.0.255 destination
10.1.2.0 0.0.0.255
[DeviceA-acl-ipv4-adv-3101] quit
```

6. Configure an IPsec transform set to specify the packet encapsulation mode, security protocols, and algorithms.

   The IPsec transform set settings at both sides of the IPsec tunnel must be the same.

```
[DeviceA] ipsec transform-set transform1
[DeviceA-ipsec-transform-set-transform1] protocol esp
[DeviceA-ipsec-transform-set-transform1] esp encryption-algorithm 3des-cbc
[DeviceA-ipsec-transform-set-transform1] esp authentication-algorithm md5
[DeviceA-ipsec-transform-set-transform1] quit
```

7. Configure an IKEv2 keychain to specify the key information used for IKEv2 communication.

   The preshared key used by both sides of the communication must be the same.

```
[DeviceA] ikev2 keychain keychain1
[DeviceA-ikev2-keychain-keychain1] peer peer1
[DeviceA-ikev2-keychain-keychain1-peer-peer1] address 2.2.2.2 16
[DeviceA-ikev2-keychain-keychain1-peer-peer1] identity address 2.2.2.2
[DeviceA-ikev2-keychain-keychain1-peer-peer1] pre-shared-key plaintext 123
[DeviceA-ikev2-keychain-keychain1-peer-peer1] quit
[DeviceA-ikev2-keychain-keychain1] quit
```

8. Configure an IKEv2 profile to specify the security parameters used for setting up IKE SAs.

```
[DeviceA] ikev2 profile profile1
[DeviceA-ikev2-profile-profile1] keychain keychain1
[DeviceA-ikev2-profile-profile1] identity local fqdn www.devicea.com
[DeviceA-ikev2-profile-profile1] match remote identity address 2.2.2.2 255.255.0.0
[DeviceA-ikev2-profile-profile1] authentication-method local pre-share
[DeviceA-ikev2-profile-profile1] authentication-method remote pre-share
[DeviceA-ikev2-profile-profile1] quit
```

9. Configure an IPsec policy to establish an IPsec tunnel to protect the specified data.

```
[DeviceA] ipsec policy policy1 1 isakmp
[DeviceA-ipsec-policy-isakmp-policy1-1] remote-address 2.2.2.2
[DeviceA-ipsec-policy-isakmp-policy1-1] transform-set transform1
[DeviceA-ipsec-policy-isakmp-policy1-1] security acl 3101
[DeviceA-ipsec-policy-isakmp-policy1-1] ikev2-profile profile1
[DeviceA-ipsec-policy-isakmp-policy1-1] quit
```

10. Apply the IPsec policy to GigabitEthernet 1/0/1 to protect the traffic on the interface.

```
[DeviceA] interface gigabitethernet 1/0/1
[DeviceA-GigabitEthernet1/0/1] ipsec apply policy policy1
[DeviceA-GigabitEthernet1/0/1] quit
```

Configuring Device B

1. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

```
<DeviceB> system-view
[DeviceB] interface gigabitethernet 1/0/1
[DeviceB-GigabitEthernet1/0/1] ip address 2.2.2.2 255.255.0.0
[DeviceB-GigabitEthernet1/0/1] quit
```

# Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Configure settings for routing.

   This example configures static routes, and the next hop in the routes is 2.2.2.1.

```
[DeviceB] ip route-static 10.1.1.0 24 2.2.2.1
[DeviceB] ip route-static 1.1.1.1 16 2.2.2.1
```

3. Add interfaces to security zones.

```
[DeviceB] security-zone name trust
[DeviceB-security-zone-Trust] import interface gigabitethernet 1/0/2
[DeviceB-security-zone-Trust] quit
[DeviceB] security-zone name untrust
[DeviceB-security-zone-Untrust] import interface gigabitethernet 1/0/1
[DeviceB-security-zone-Untrust] quit
```

4. Configure a security policy:

   a. Configure rules to permit traffic between the **Untrust** and **Local** security zones, so the devices can set up an IPsec tunnel:

   # Configure a rule named **ipseclocalout** to allow Device B to send IPsec negotiation packets to Device A.

```
[DeviceB] security-policy ip
[DeviceB-security-policy-ip] rule name ipseclocalout
[DeviceB-security-policy-ip-1-ipseclocalout] source-zone local
[DeviceB-security-policy-ip-1-ipseclocalout] destination-zone untrust
[DeviceB-security-policy-ip-1-ipseclocalout] source-ip-host 2.2.2.2
[DeviceB-security-policy-ip-1-ipseclocalout] destination-ip-host 3.3.3.1
[DeviceB-security-policy-ip-1-ipseclocalout] action pass
[DeviceB-security-policy-ip-1-ipseclocalout] quit
```

   # Configure a rule named **ipseclocalin** to allow Device B to receive the IPsec negotiation packets sent from Device A.

```
[DeviceB-security-policy-ip] rule name ipseclocalin
[DeviceB-security-policy-ip-2-ipseclocalin] source-zone untrust
[DeviceB-security-policy-ip-2-ipseclocalin] destination-zone local
[DeviceB-security-policy-ip-2-ipseclocalin] source-ip-host 3.3.3.1
[DeviceB-security-policy-ip-2-ipseclocalin] destination-ip-host 2.2.2.2
[DeviceB-security-policy-ip-2-ipseclocalin] action pass
[DeviceB-security-policy-ip-2-ipseclocalin] quit
```

   b. Configure rules to permit the traffic between Host B and Host A:

   # Configure a rule named **trust-untrust** to permit the packets from Host B to Host A.

```
[DeviceB-security-policy-ip] rule name trust-untrust
[DeviceB-security-policy-ip-3-trust-untrust] source-zone trust
[DeviceB-security-policy-ip-3-trust-untrust] destination-zone untrust
[DeviceB-security-policy-ip-3-trust-untrust] source-ip-subnet 10.1.2.0 24
[DeviceB-security-policy-ip-3-trust-untrust] destination-ip-subnet 10.1.1.0 24
[DeviceB-security-policy-ip-3-trust-untrust] action pass
[DeviceB-security-policy-ip-3-trust-untrust] quit
```

   # Configure a rule named **untrust-trust** to permit the packets from Host A to Host B.

```
[DeviceB-security-policy-ip] rule name untrust-trust
[DeviceB-security-policy-ip-4-untrust-trust] source-zone untrust
[DeviceB-security-policy-ip-4-untrust-trust] destination-zone trust
[DeviceB-security-policy-ip-4-untrust-trust] source-ip-subnet 10.1.1.0 24
```

```
[DeviceB-security-policy-ip-4-untrust-trust] destination-ip-subnet 10.1.2.0 24
[DeviceB-security-policy-ip-4-untrust-trust] action pass
[DeviceB-security-policy-ip-4-untrust-trust] quit
[DeviceB-security-policy-ip] quit
```

5. Define the data flows to be protected:

   # Configure IPv4 advanced ACL 3101 to identify traffic from subnet 10.1.2.0/24 to subnet 10.1.1.0/24.

   ```
   [DeviceA] acl advanced 3101
   [DeviceA-acl-ipv4-adv-3101] rule 0 permit ip source 10.1.2.0 0.0.0.255 destination
   10.1.1.0 0.0.0.255
   [DeviceA-acl-ipv4-adv-3101] quit
   ```

6. Configure an IPsec transform set to specify the packet encapsulation mode, security protocols, and algorithms.

   The IPsec transform set settings at both sides of the IPsec tunnel must be the same.

   ```
   <DeviceB> system-view
   [DeviceB] ipsec transform-set transform1
   [DeviceB-ipsec-transform-set-transform1] protocol esp
   [DeviceB-ipsec-transform-set-transform1] esp encryption-algorithm 3des-cbc
   [DeviceB-ipsec-transform-set-transform1] esp authentication-algorithm md5
   [DeviceB-ipsec-transform-set-transform1] quit
   ```

7. Configure an IKEv2 keychain to specify the key information used by both sides of the IKE communication.

   ```
   [DeviceB]ikev2 keychain keychain1
   [DeviceB-ikev2-keychain-keychain1] peer peer1
   [DeviceB-ikev2-keychain-keychain1-peer-peer1] address 3.3.3.1 16
   [DeviceB-ikev2-keychain-keychain1-peer-peer1] identity address 3.3.3.1
   [DeviceB-ikev2-keychain-keychain1-peer-peer1] pre-shared-key plaintext 123
   [DeviceB-ikev2-keychain-keychain1-peer-peer1] quit
   [DeviceB-ikev2-keychain-keychain1] quit
   ```

8. Configure an IKEv2 profile to specify the security parameters used for setting up IKE SAs.

   ```
   [DeviceB] ikev2 profile profile1
   [DeviceB-ikev2-profile-profile1] keychain keychain1
   [DeviceB-ikev2-profile-profile1] match remote identity fqdn www.devicea.com
   [DeviceB-ikev2-profile-profile1] authentication-method local pre-share
   [DeviceB-ikev2-profile-profile1] authentication-method remote pre-share
   [DeviceB-ikev2-profile-profile1] quit
   ```

9. Configure an IPsec policy template, which is used to create an IPsec policy.

   ```
   [DeviceB] ipsec policy-template template1 1
   [DeviceB-ipsec-policy-template-template1-1] remote-address 3.3.3.1
   [DeviceB-ipsec-policy-template-template1-1] security acl 3101
   [DeviceB-ipsec-policy-template-template1-1] transform-set transform1
   [DeviceB-ipsec-policy-template-template1-1] ikev2-profile profile1
   [DeviceB-ipsec-policy-template-template1-1] quit
   ```

10. Create an IKE-based IPsec policy entry by using IPsec policy template, so as to establish an IPsec tunnel to protect the specified data flow.

    ```
    [DeviceB] ipsec policy policy1 1 isakmp template template1
    ```

11. Apply the IPsec policy to GigabitEthernet 1/0/1 to protect the traffic on the interface.

    ```
    [DeviceB] interface gigabitethernet 1/0/1
    ```

```
    [DeviceB-GigabitEthernet1/0/1] ipsec apply policy policy1
    [DeviceB-GigabitEthernet1/0/1] quit
```

Verifying the configuration

# Initiate a connection from subnet 10.1.1.0/24 to subnet 10.1.2.0/24 to trigger IKEv2 negotiation. After IPsec SAs are successfully negotiated by IKEv2, traffic between the two subnets is IPsec-protected.

# Display the IKEv2 SA on Device A.

```
[DeviceA] display ikev2 sa

```

Example: Configuring an IKE-based IPsec tunnel for IPv4 packets between a host and a gateway (remote extended authentication)

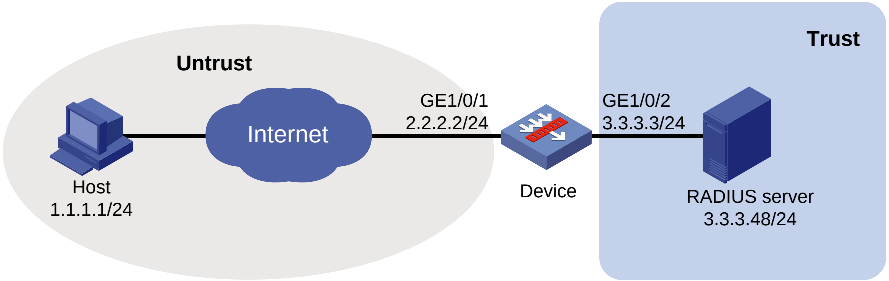
Network configuration

As shown in Figure 18, configure an IPsec tunnel to protect the traffic between the host and the device.

- Set up IPsec SAs through IKE negotiations.
- Configure the host and the device to use preshared key for authentication in the phase-1 IKE negotiation.
- Configure the device to use RADIUS to perform remote extended authentication on the host.

The RADIUS server is configured to allow user login with username **test** and password **123456TESTplat&!**.

Figure 18 Network diagram



Configuring the device

1. Assign IP addresses to interfaces.

```
<Device> system-view
[Device] interface gigabitethernet 1/0/1
[Device-GigabitEthernet1/0/1] ip address 2.2.2.2 255.255.255.0
[Device-GigabitEthernet1/0/1] quit
[Device] interface GigabitEthernet1/0/2
[Device-GigabitEthernet1/0/2] ip address 3.3.3.3 255.255.255.0
[Device-GigabitEthernet1/0/2] quit
```

2. Configure settings for routing.

   This example configures a static route, and the next hop in the route is 2.2.2.3.

```
[Device] ip route-static 1.1.1.1 24 2.2.2.3
```

3. Add interfaces to security zones.

```
[Device] security-zone name untrust
[Device-security-zone-Untrust] import interface gigabitethernet 1/0/1
[Device-security-zone-Untrust] quit
[Device] security-zone name trust
[Device-security-zone-Trust] import interface gigabitethernet 1/0/2
[Device-security-zone-Trust] quit
```

4. Configure security policy rules to permit the traffic between the **Untrust** and **Local** security zones, so the host can access the device:

   # Configure a rule named **ipseclocalout1** to allow the device to send packets to the host.

```
[Device] security-policy ip
```

```
[Device-security-policy-ip] rule name ipseclocalout1
[Device-security-policy-ip-1-ipseclocalout1] source-zone local
[Device-security-policy-ip-1-ipseclocalout1] destination-zone untrust
[Device-security-policy-ip-1-ipseclocalout1] source-ip-host 2.2.2.2
[Device-security-policy-ip-1-ipseclocalout1] destination-ip-host 1.1.1.1
[Device-security-policy-ip-1-ipseclocalout1] action pass
[Device-security-policy-ip-1-ipseclocalout1] quit
```

# Configure a rule named **ipseclocalin1** to allow the device to receive the packets sent from the host.

```
[Device-security-policy-ip] rule name ipseclocalin1
[Device-security-policy-ip-2-ipseclocalin1] source-zone untrust
[Device-security-policy-ip-2-ipseclocalin1] destination-zone local
[Device-security-policy-ip-2-ipseclocalin1] source-ip-host 1.1.1.1
[Device-security-policy-ip-2-ipseclocalin1] destination-ip-host 2.2.2.2
[Device-security-policy-ip-2-ipseclocalin1] action pass
[Device-security-policy-ip-2-ipseclocalin1] quit
```

# Configure a rule named **ipseclocalout2** to allow the device to send packets to the RADIUS server.

```
[Device-security-policy-ip] rule name ipseclocalout2
[Device-security-policy-ip-3-ipseclocalout2] source-zone local
[Device-security-policy-ip-3-ipseclocalout2] destination-zone trust
[Device-security-policy-ip-3-ipseclocalout2] source-ip-host 3.3.3.3
[Device-security-policy-ip-3-ipseclocalout2] destination-ip-host 3.3.3.48
[Device-security-policy-ip-3-ipseclocalout2] action pass
[Device-security-policy-ip-3-ipseclocalout2] quit
```

# Configure a rule named **ipseclocalin2** to allow the device to receive the packets sent from the RADIUS server.

```
[Device-security-policy-ip] rule name ipseclocalin2
[Device-security-policy-ip-4-ipseclocalin2] source-zone trust
[Device-security-policy-ip-4-ipseclocalin2] destination-zone local
[Device-security-policy-ip-4-ipseclocalin2] source-ip-host 3.3.3.48
[Device-security-policy-ip-4-ipseclocalin2] destination-ip-host 3.3.3.3
[Device-security-policy-ip-4-ipseclocalin2] action pass
[Device-security-policy-ip-4-ipseclocalin2] quit
[Device-security-policy-ip] quit
```

5. Configure a RADIUS scheme:

# Create a RADIUS scheme named **ike-scheme**.

```
[Device] radius scheme ike-scheme
```

# Specify the IP address and service port of the primary RADIUS authentication server.

```
[Device-radius-ike-scheme] primary authentication 3.3.3.48 1645
```

# Set the shared key for secure RADIUS authentication communication.

```
[Device-radius-ike-scheme] key authentication simple abc
```

# Configure the device to send the username without the ISP domain name to the RADIUS server. (The configuration varies with the RADIUS server's requirements for username.)

```
[Device-radius-ike-scheme] user-name-format without-domain
[Device-radius-ike-scheme] quit
```

6. Configure an ISP domain:

Create an ISP domain named **ike** and specify the RADIUS scheme used for authenticating the IKE users.

```
[Device] domain ike
[Device-isp-ike] authentication ike radius-scheme ike-scheme
[Device-isp-ike] quit
```

7. Configure an IPv4 advanced ACL to identify the packets to be protected.

```
[Device] acl advanced 3101
[Device-acl-ipv4-adv-3101] rule permit ip source 2.2.2.2 0.0.0.0 destination 1.1.1.1
0.0.0.0
[Device-acl-ipv4-adv-3101] quit
```

8. Configure an IPsec transform set to specify the packet encapsulation mode, security protocols, and algorithms.

   The IPsec transform set settings at both sides of the IPsec tunnel must be the same.

```
[Device] ipsec transform-set tran1
[Device-ipsec-transform-set-tran1] encapsulation-mode transport
[Device-ipsec-transform-set-tran1] protocol esp
[Device-ipsec-transform-set-tran1] esp encryption-algorithm aes-cbc-128
[Device-ipsec-transform-set-tran1] esp authentication-algorithm sha1
[Device-ipsec-transform-set-tran1] quit
```

9. Configure an IKE keychain to specify the key information used for IKE communication:

   The preshared key used by both sides of the communication must be the same.

```
[Device] ike keychain keychain1
[Device-ike-keychain-keychain1] pre-shared-key address 1.1.1.1 255.255.255.255 key
simple 123456TESTplat&!
[Device-ike-keychain-keychain1] quit
```

10. Configure an IKE profile to specify the security parameters used for setting up IKE SAs.

```
[Device] ike profile profile1
[Device-ike-profile-profile1] keychain keychain1
[Device-ike-profile-profile1] local-identity address 2.2.2.2
[Device-ike-profile-profile1] match remote identity address 1.1.1.1 255.255.255.255
[Device-ike-profile-profile1] client-authentication xauth
[Device-ike-profile-profile1] quit
```

11. Configure an IPsec policy to establish an IPsec tunnel to protect the specified data.

```
[Device] ipsec policy map1 10 isakmp
[Device-ipsec-policy-isakmp-map1-10] remote-address 1.1.1.1
[Device-ipsec-policy-isakmp-map1-10] security acl 3101
[Device-ipsec-policy-isakmp-map1-10] transform-set tran1
[Device-ipsec-policy-isakmp-map1-10] ike-profile profile1
[Device-ipsec-policy-isakmp-map1-10] quit
```

12. Apply the IPsec policy to GigabitEthernet 1/0/1.

```
[Device] interface gigabitethernet 1/0/1
[Device-GigabitEthernet1/0/1] ipsec apply policy map1
[Device-GigabitEthernet1/0/1] quit
```

Configuring the host

Perform the following tasks on the host and make sure the configuration matches that on the device:

- Specify the IP address of the remote security gateway.
- Set the preshared key used for IKE negotiation.

- Configure the username and password for IKE extended authentication.
- Specify the security protocol, encryption algorithm, and authentication algorithm.
- Configure IKE negotiation parameters.
- Configure the local ID and remote ID.

(Details not shown.)

Verifying the configuration

# Initiate a connection from the host (1.1.1.1) to the device (2.2.2.2) to trigger IKE negotiation. (Details not shown.)

# On the device, verify that an IKE SA to the peer 1.1.1.1 is established and that extended authentication is enabled for remote users.

```
[Device] display ike sa verbose remote-address 1.1.1.1
   -----------------------------------------------
   Connection ID: 18
   Outside VPN:
   Inside VPN:
   Profile: profile1
   Transmitting entity: Initiator
   Initiator cookie: 1bcf453f0a217259
   Responder cookie: 5e32a74dfa66a0a4
   -----------------------------------------------
   Local IP/port: 2.2.2.2/500
   Local ID type: IPV4_ADDR
   Local ID: 2.2.2.2

   Remote IP/port: 1.1.1.1/500
   Remote ID type: IPV4_ADDR
   Remote ID: 1.1.1.1

   Authentication-method: PRE-SHARED-KEY
   Authentication-algorithm: SHA1
   Encryption-algorithm: DES-CBC

   Life duration(sec): 86400
   Remaining key duration(sec): 84565
   Exchange-mode: Aggressive
   Diffie-Hellman group: Group 1
   NAT traversal: Detected

   Extend authentication: Enabled
   Assigned IP address:
   Vendor ID index: 0xa1d
   Vendor ID sequence number: 0x0
```

# On the host, enter the correct username and password for extended authentication. After the authentication succeeds, the IPsec tunnel will be established. (Details not shown.)

# Verify that IPsec SAs have been established on the device.

```
[Device] display ipsec sa
```

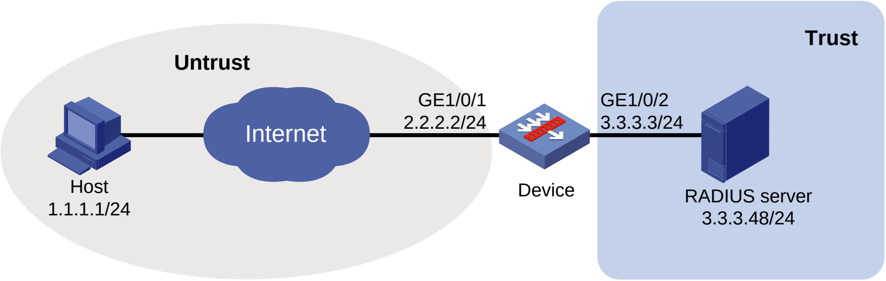
Example: Configuring an IKE-based IPsec tunnel for IPv4 packets between a host and a gateway (local extended authentication and address pool authorization)

Network configuration

As shown in Figure 19, configure an IPsec tunnel to protect the traffic between the host and the server.

- Set up IPsec SAs through IKE negotiations.
- Configure the host and the device to use preshared key for authentication in the phase-1 IKE negotiation.
- Configure the device to use AAA to perform local extended authentication on the host and assign an IPv4 address to the host.

Figure 19 Network diagram



Restrictions and guidelines

Make sure the host, device, and server can reach each other.

Configure a local user account on the device to provide identity authentication for the host. In this example, the account uses username **test** and password **123456TESTplat&!**.

Configuring the device

1. Assign IP addresses to interfaces.

```
<Device> system-view
[Device] interface gigabitethernet 1/0/1
[Device-GigabitEthernet1/0/1] ip address 2.2.2.2 255.255.255.0
[Device-GigabitEthernet1/0/1] quit
[Device] interface GigabitEthernet1/0/2
[Device-GigabitEthernet1/0/2] ip address 3.3.3.3 255.255.255.0
[Device-GigabitEthernet1/0/2] quit
```

2. Configure settings for routing.

   This example configures a static route, and the next hop in the route is 2.2.2.3.

```
[Device] ip route-static 1.1.1.1 24 2.2.2.3
```

3. Add interfaces to security zones.

```
[Device] security-zone name untrust
[Device-security-zone-Untrust] import interface gigabitethernet 1/0/1
[Device-security-zone-Untrust] quit
[Device] security-zone name trust
[Device-security-zone-Trust] import interface gigabitethernet 1/0/2
[Device-security-zone-Trust] quit
```

4. Configure security policy rules to permit the traffic between the **Untrust** and **Local** security zones, so the host can access the device:

   # Configure a rule named **ipseclocalout1** to allow the device to send packets to the host.

   ```
   [Device] security-policy ip
   [Device-security-policy-ip] rule name ipseclocalout1
   [Device-security-policy-ip-1-ipseclocalout1] source-zone local
   [Device-security-policy-ip-1-ipseclocalout1] destination-zone untrust
   [Device-security-policy-ip-1-ipseclocalout1] source-ip-host 2.2.2.2
   [Device-security-policy-ip-1-ipseclocalout1] destination-ip-host 1.1.1.1
   [Device-security-policy-ip-1-ipseclocalout1] action pass
   [Device-security-policy-ip-1-ipseclocalout1] quit
   ```

   # Configure a rule named **ipseclocalin1** to allow the device to receive the packets sent from the host.

   ```
   [Device-security-policy-ip] rule name ipseclocalin1
   [Device-security-policy-ip-2-ipseclocalin1] source-zone untrust
   [Device-security-policy-ip-2-ipseclocalin1] destination-zone local
   [Device-security-policy-ip-2-ipseclocalin1] source-ip-host 1.1.1.1
   [Device-security-policy-ip-2-ipseclocalin1] destination-ip-host 2.2.2.2
   [Device-security-policy-ip-2-ipseclocalin1] action pass
   [Device-security-policy-ip-2-ipseclocalin1] quit
   ```

   # Configure a rule named **ipseclocalout2** to allow the device to send packets to the RADIUS server.

   ```
   [Device-security-policy-ip] rule name ipseclocalout2
   [Device-security-policy-ip-3-ipseclocalout2] source-zone local
   [Device-security-policy-ip-3-ipseclocalout2] destination-zone trust
   [Device-security-policy-ip-3-ipseclocalout2] source-ip-host 3.3.3.3
   [Device-security-policy-ip-3-ipseclocalout2] destination-ip-host 3.3.3.48
   [Device-security-policy-ip-3-ipseclocalout2] action pass
   [Device-security-policy-ip-3-ipseclocalout2] quit
   ```

   # Configure a rule named **ipseclocalin2** to allow the device to receive the packets sent from the RADIUS server.

   ```
   [Device-security-policy-ip] rule name ipseclocalin2
   [Device-security-policy-ip-4-ipseclocalin2] source-zone trust
   [Device-security-policy-ip-4-ipseclocalin2] destination-zone local
   [Device-security-policy-ip-4-ipseclocalin2] source-ip-host 3.3.3.48
   [Device-security-policy-ip-4-ipseclocalin2] destination-ip-host 3.3.3.3
   [Device-security-policy-ip-4-ipseclocalin2] action pass
   [Device-security-policy-ip-4-ipseclocalin2] quit
   [Device-security-policy-ip] quit
   ```

5. Configure an ISP domain:

   # Create an ISP domain named **dm**.

   ```
   [Device] domain dm
   ```

   # Configure the device to perform IKE local authentication.

   ```
   [Device-isp-dm] authentication ike local
   ```

   # Configure the device to perform IKE local authorization.

   ```
   [Device-isp-dm] authorization ike local
   [Device-isp-dm] quit
   ```

6. Create an IKE IPv4 address pool named **pool** with the address range 20.1.1.1 to 20.1.1.20.

```
[Device] ike address-group pool 20.1.1.1 20.1.1.20
```

7. Configure local users:

   # Add a network user named **ike**.

   ```
   [Device] local-user ike class network
   ```

   # Authorize user **ike** to use the IKE service. Specify IPv4 address pool **pool** as the authorized IPv4 address pool for user **ike**.

   ```
   [Device-luser-network-ike] service-type ike
   [Device-luser-network-ike] authorization-attribute ip-pool pool
   [Device-luser-network-ike] quit
   ```

   # Add a network user named **test**.

   ```
   [Device] local-user test class network
   ```

   # Authorize user **test** to use the IKE service, and configure a password for user **test**.

   ```
   [Device-luser-network-test] service-type ike
   [Device-luser-network-test] password simple 123456TESTplat&!
   [Device-luser-network-test] quit
   ```

8. Configure an IKE keychain to specify the key information used for IKE communication:

   The preshared key used by both sides of the communication must be the same.

   ```
   [Device] ike keychain keychain1
   [Device-ike-keychain-keychain1] pre-shared-key address 1.1.1.1 255.255.255.255 key
   simple 123456TESTplat&!
   [Device-ike-keychain-keychain1] quit
   ```

9. Configure an IKE profile to specify the security parameters used for setting up IKE SAs.

   ```
   [Device] ike profile profile1
   [Device-ike-profile-profile1] keychain keychain1
   [Device-ike-profile-profile1] local-identity address 2.2.2.2
   [Device-ike-profile-profile1] match remote identity address 1.1.1.1 255.255.255.255
   [Device-ike-profile-profile1] client-authentication xauth
   [Device-ike-profile-profile1] aaa authorization domain dm username ike
   [Device-ike-profile-profile1] quit
   ```

10. Configure an IPsec transform set to specify the packet encapsulation mode, security protocols, and algorithms.

    The IPsec transform set settings at both sides of the IPsec tunnel must be the same.

    ```
    [Device] ipsec transform-set tran1
    [Device-ipsec-transform-set-tran1] encapsulation-mode transport
    [Device-ipsec-transform-set-tran1] protocol esp
    [Device-ipsec-transform-set-tran1] esp encryption-algorithm aes-cbc-256
    [Device-ipsec-transform-set-tran1] esp authentication-algorithm sha1
    [Device-ipsec-transform-set-tran1] quit
    ```

11. Configure an IPsec policy template, which is used to create an IPsec policy.

    ```
    [Device] ipsec policy-template pt 1
    [Device-ipsec-policy-template-pt-1] transform-set tran1
    [Device-ipsec-policy-template-pt-1] ike-profile profile1
    [Device-ipsec-policy-template-pt-1] reverse-route dynamic
    [Device-ipsec-policy-template-pt-1] quit
    ```

12. Use the IPsec policy template to create an IKE-based IPsec policy entry.

    ```
    [Device] ipsec policy map1 1 isakmp template pt
    ```

13. Apply the IPsec policy to GigabitEthernet 1/0/1 to protect the traffic on the interface.

    ```
    [Device] interface gigabitethernet 1/0/1
    ```

```
    [Device-GigabitEthernet1/0/1] ipsec apply policy map1
    [Device-GigabitEthernet1/0/1] quit
```

Configuring the host

Perform the following tasks on the host and make sure the configuration matches that on the device:

- Specify the IP address of the remote security gateway.
- Set the preshared key used for IKE negotiation.
- Configure the username and password for IKE client authentication.
- Specify the security protocol, encryption algorithm, and authentication algorithm.
- Configure IKE negotiation parameters.
- Configure the local ID and remote ID.

(Details not shown.)

Verifying the configuration

# Initiate a connection from the host (1.1.1.1) to the server (3.3.3.48) to trigger IKE negotiation. (Details not shown.)

# On the device, verify that an IKE SA to peer 1.1.1.1 is established and client authentication is enabled.

```
[Device] display ike sa verbose remote-address 1.1.1.1
   -----------------------------------------------
   Connection ID: 18
   Outside VPN:
   Inside VPN:
   Profile: profile1
   Transmitting entity: Responder

      UDP encapsulation used for NAT traversal: N
      Status: Active
```

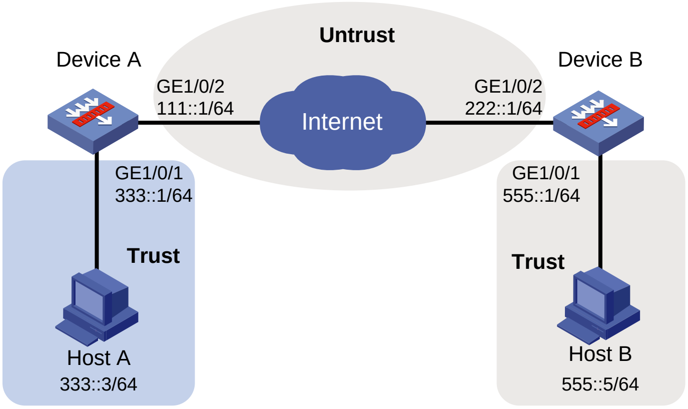
Example: Configuring an IKE-based IPsec tunnel for IPv6 packets between gateways

Network configuration

As shown in Figure 20, establish an IPsec tunnel between Device A and Device B to protect data flows between subnet 333::/64 and subnet 555::/64. Configure the IPsec tunnel as follows:

- Specify the encapsulation mode as tunnel, the security protocol as ESP, the encryption algorithm as 128-bit AES, and the authentication algorithm as HMAC-SHA1.
- Set up SAs through IKE negotiation.

Figure 20 Network diagram



Configuring Device A

1. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

   ```
   <DeviceA> system-view
   [DeviceA] interface gigabitethernet 1/0/1
   [DeviceA-GigabitEthernet1/0/1] ipv6 address 333::1/64
   [DeviceA-GigabitEthernet1/0/1] quit
   ```

   # Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Configure settings for routing.

   This example configures static routes, and the next hop in the routes is 111::2.

   ```
   [DeviceA] ipv6 route-static 555::0 64 111::2
   [DeviceA] ipv6 route-static 222::0 64 111::2
   ```

3. Add interfaces to security zones.

   ```
   [DeviceA] security-zone name trust
   [DeviceA-security-zone-Trust] import interface gigabitethernet 1/0/1
   [DeviceA-security-zone-Trust] quit
   [DeviceA] security-zone name untrust
   [DeviceA-security-zone-Untrust] import interface gigabitethernet 1/0/2
   [DeviceA-security-zone-Untrust] quit
   ```

4. Configure a security policy:

   a. Configure rules to permit traffic between the **Untrust** and **Local** security zones, so the devices can set up an IPsec tunnel:

      # Configure a rule named **ipseclocalout** to allow Device A to send IPsec negotiation packets to Device B.

```
[DeviceA] security-policy ipv6
[DeviceA-security-policy-ipv6] rule name ipseclocalout
[DeviceA-security-policy-ipv6-1-ipseclocalout] source-zone local
[DeviceA-security-policy-ipv6-1-ipseclocalout] destination-zone untrust
[DeviceA-security-policy-ipv6-1-ipseclocalout] source-ip-host 111::1
[DeviceA-security-policy-ipv6-1-ipseclocalout] destination-ip-host 222::1
[DeviceA-security-policy-ipv6-1-ipseclocalout] action pass
[DeviceA-security-policy-ipv6-1-ipseclocalout] quit
```

# Configure a rule named **ipseclocalin** to allow Device A to receive the IPsec negotiation packets sent from Device B.

```
[DeviceA-security-policy-ipv6] rule name ipseclocalin
[DeviceA-security-policy-ipv6-2-ipseclocalin] source-zone untrust
[DeviceA-security-policy-ipv6-2-ipseclocalin] destination-zone local
[DeviceA-security-policy-ipv6-2-ipseclocalin] source-ip-host 222::1
[DeviceA-security-policy-ipv6-2-ipseclocalin] destination-ip-host 111::1
[DeviceA-security-policy-ipv6-2-ipseclocalin] action pass
[DeviceA-security-policy-ipv6-2-ipseclocalin] quit
```

b. Configure rules to permit the traffic between Host A and Host B:

# Configure a rule named **trust-untrust** to permit the packets from Host A to Host B.

```
[DeviceA-security-policy-ipv6] rule name trust-untrust
[DeviceA-security-policy-ipv6-3-trust-untrust] source-zone trust
[DeviceA-security-policy-ipv6-3-trust-untrust] destination-zone untrust
[DeviceA-security-policy-ipv6-3-trust-untrust] source-ip-subnet 333::1 64
[DeviceA-security-policy-ipv6-3-trust-untrust] destination-ip-subnet 555::1 64
[DeviceA-security-policy-ipv6-3-trust-untrust] action pass
[DeviceA-security-policy-ipv6-3-trust-untrust] quit
```

# Configure a rule named **untrust-trust** to permit the packets from Host B to Host A.

```
[DeviceA-security-policy-ipv6] rule name untrust-trust
[DeviceA-security-policy-ipv6-4-untrust-trust] source-zone untrust
[DeviceA-security-policy-ipv6-4-untrust-trust] destination-zone trust
[DeviceA-security-policy-ipv6-4-untrust-trust] source-ip-subnet 555::1 64
[DeviceA-security-policy-ipv6-4-untrust-trust] destination-ip-subnet 333::1 64
[DeviceA-security-policy-ipv6-4-untrust-trust] action pass
[DeviceA-security-policy-ipv6-4-untrust-trust] quit
[DeviceA-security-policy-ipv6] quit
```

5. Define the data flows to be protected:

# Configure an IPv6 advanced ACL to identify data flows from subnet 333::/64 to subnet 555::/64.

```
[DeviceA] acl ipv6 advanced 3101
[DeviceA-acl-ipv6-adv-3101] rule permit ipv6 source 333::0 64 destination 555::0 64
[DeviceA-acl-ipv6-adv-3101] quit
```

6. Configure an IPsec transform set to specify the packet encapsulation mode, security protocols, and algorithms.

The IPsec transform set settings at both sides of the IPsec tunnel must be the same.

```
[DeviceA] ipsec transform-set tran1
[DeviceA-ipsec-transform-set-tran1] encapsulation-mode tunnel
[DeviceA-ipsec-transform-set-tran1] protocol esp
[DeviceA-ipsec-transform-set-tran1] esp encryption-algorithm aes-cbc-128
```

```
[DeviceA-ipsec-transform-set-tran1] esp authentication-algorithm sha1
[DeviceA-ipsec-transform-set-tran1] quit
```

7. **Configure an IKE keychain to specify the key information used for IKE communication.**

   The preshared key used by both sides of the communication must be the same.

   ```
   [DeviceA] ike keychain keychain1
   [DeviceA-ike-keychain-keychain1] pre-shared-key address ipv6 222::1 64 key simple
   123456TESTplat&!
   [DeviceA-ike-keychain-keychain1] quit
   ```

8. **Configure an IKE profile to specify the security parameters used for setting up IKE SAs.**

   ```
   [DeviceA] ike profile profile1
   [DeviceA-ike-profile-profile1] keychain keychain1
   [DeviceA-ike-profile-profile1] match remote identity address ipv6 222::1 64
   [DeviceA-ike-profile-profile1] quit
   ```

9. **Configure an IPsec policy, so as to establish the IPsec tunnel to protect data:**

   # Create an IKE-based IPsec policy entry, which specifies the ACL for IPsec, IPsec transform set, local and remote IP addresses, and IKE profile.

   ```
   [DeviceA] ipsec ipv6-policy map1 10 isakmp
   [DeviceA-ipsec-ipv6-policy-isakmp-map1-10] security acl ipv6 3101
   [DeviceA-ipsec-ipv6-policy-isakmp-map1-10] transform-set tran1
   [DeviceA-ipsec-ipv6-policy-isakmp-map1-10] local-address ipv6 111::1
   [DeviceA-ipsec-ipv6-policy-isakmp-map1-10] remote-address ipv6 222::1
   [DeviceA-ipsec-ipv6-policy-isakmp-map1-10] ike-profile profile1
   [DeviceA-ipsec-ipv6-policy-isakmp-map1-10] quit
   ```

10. **Apply the IPsec policy to GigabitEthernet 1/0/2 to protect traffic on the interface.**

   ```
   [DeviceA] interface gigabitethernet 1/0/2
   [DeviceA-GigabitEthernet1/0/2] ipsec apply ipv6-policy map1
   [DeviceA-GigabitEthernet1/0/2] quit
   ```

Configuring Device B

1. **Assign IP addresses to interfaces:**

   # Assign an IP address to interface GigabitEthernet 1/0/1.

   ```
   <DeviceB> system-view
   [DeviceB] interface gigabitethernet 1/0/1
   [DeviceB-GigabitEthernet1/0/1] ipv6 address 555::1/64
   [DeviceB-GigabitEthernet1/0/1] quit
   ```

   # Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. **Configure settings for routing.**

   This example configures static routes, and the next hop in the routes is 222::2.

   ```
   [DeviceB] ipv6 route-static 333::0 64 222::2
   [DeviceB] ipv6 route-static 111::0 64 222::2
   ```

3. **Add interfaces to security zones.**

   ```
   [DeviceB] security-zone name trust
   [DeviceB-security-zone-Trust] import interface gigabitethernet 1/0/1
   [DeviceB-security-zone-Trust] quit
   [DeviceB] security-zone name untrust
   [DeviceB-security-zone-Untrust] import interface gigabitethernet 1/0/2
   [DeviceB-security-zone-Untrust] quit
   ```

4. **Configure a security policy:**

a. Configure rules to permit traffic between the **Untrust** and **Local** security zones, so the devices can set up an IPsec tunnel:

   # Configure a rule named **ipseclocalout** to allow Device B to send IPsec negotiation packets to Device A.

```
[DeviceB] security-policy ipv6
[DeviceB-security-policy-ipv6] rule name ipseclocalout
[DeviceB-security-policy-ipv6-1-ipseclocalout] source-zone local
[DeviceB-security-policy-ipv6-1-ipseclocalout] destination-zone untrust
[DeviceB-security-policy-ipv6-1-ipseclocalout] source-ip-host 222::1
[DeviceB-security-policy-ipv6-1-ipseclocalout] destination-ip-host 111::1
[DeviceB-security-policy-ipv6-1-ipseclocalout] action pass
[DeviceB-security-policy-ipv6-1-ipseclocalout] quit
```

   # Configure a rule named **ipseclocalin** to allow Device B to receive the IPsec negotiation packets sent from Device A.

```
[DeviceB-security-policy-ipv6] rule name ipseclocalin
[DeviceB-security-policy-ipv6-2-ipseclocalin] source-zone untrust
[DeviceB-security-policy-ipv6-2-ipseclocalin] destination-zone local
[DeviceB-security-policy-ipv6-2-ipseclocalin] source-ip-host 111::1
[DeviceB-security-policy-ipv6-2-ipseclocalin] destination-ip-host 222::1
[DeviceB-security-policy-ipv6-2-ipseclocalin] action pass
[DeviceA-security-policy-ipv6-2-ipseclocalin] quit
```

b. Configure rules to permit traffic between Host B and Host A:

   # Configure a rule named **trust-untrust** to permit the packets from Host A to Host B.

```
[DeviceB-security-policy-ipv6] rule name trust-untrust
[DeviceB-security-policy-ipv6-3-trust-untrust] source-zone trust
[DeviceB-security-policy-ipv6-3-trust-untrust] destination-zone untrust
[DeviceB-security-policy-ipv6-3-trust-untrust] source-ip-subnet 333::1 64
[DeviceB-security-policy-ipv6-3-trust-untrust] destination-ip-subnet 555::1 64
[DeviceB-security-policy-ipv6-3-trust-untrust] action pass
[DeviceB-security-policy-ipv6-3-trust-untrust] quit
```

   # Configure a rule named **untrust-trust** to permit the packets from Host B to Host A.

```
[DeviceB-security-policy-ipv6] rule name untrust-trust
[DeviceB-security-policy-ipv6-4-untrust-trust] source-zone untrust
[DeviceB-security-policy-ipv6-4-untrust-trust] destination-zone trust
[DeviceB-security-policy-ipv6-4-untrust-trust] source-ip-subnet 555::1 64
[DeviceB-security-policy-ipv6-4-untrust-trust] destination-ip-subnet 333::1 64
[DeviceB-security-policy-ipv6-4-untrust-trust] action pass
[DeviceB-security-policy-ipv6-4-untrust-trust] quit
[DeviceB-security-policy-ipv6] quit
```

5. Define the data flows to be protected:

   # Configure an IPv6 advanced ACL to identify data flows from subnet 555::/64 to subnet 333::/64.

```
[DeviceB] acl ipv6 advanced 3101
[DeviceB-acl-ipv6-adv-3101] rule permit ipv6 source 555::/64 destination 333::/64
[DeviceB-acl-ipv6-adv-3101] quit
```

6. Configure an IPsec transform set to specify the packet encapsulation mode, security protocols, and algorithms.

   The IPsec transform set settings at both sides of the IPsec tunnel must be the same.

```
[DeviceB] ipsec transform-set tran1
[DeviceB-ipsec-transform-set-tran1] encapsulation-mode tunnel
[DeviceB-ipsec-transform-set-tran1] protocol esp
[DeviceB-ipsec-transform-set-tran1] esp encryption-algorithm aes-cbc-128
[DeviceB-ipsec-transform-set-tran1] esp authentication-algorithm sha1
[DeviceB-ipsec-transform-set-tran1] quit
```

7. Configure an IKE keychain to specify the key information used for IKE communication.

   The preshared key used by both sides of the communication must be the same.

   ```
   [DeviceB] ike keychain keychain1
   [DeviceB-ike-keychain-keychain1] pre-shared-key address ipv6 111::1 64 key simple
   123456TESTplat&!
   [DeviceB-ike-keychain-keychain1] quit
   ```

8. Configure an IKE profile to specify the security parameters used for setting up IKE SAs.

   ```
   [DeviceB] ike profile profile1
   [DeviceB-ike-profile-profile1] keychain keychain1
   [DeviceB-ike-profile-profile1] match remote identity address ipv6 111::1 64
   [DeviceB-ike-profile-profile1] quit
   ```

9. Configure an IPsec policy, so as to establish the IPsec tunnel to protect data:

   # Create an IKE-based IPsec policy entry, which specifies the ACL for IPsec, IPsec transform set, local and remote IP addresses, and IKE profile.

   ```
   [DeviceB] ipsec ipv6-policy use1 10 isakmp
   [DeviceB-ipsec-ipv6-policy-isakmp-use1-10] security acl ipv6 3101
   [DeviceB-ipsec-ipv6-policy-isakmp-use1-10] transform-set tran1
   [DeviceB-ipsec-ipv6-policy-isakmp-use1-10] local-address ipv6 222::1
   [DeviceB-ipsec-ipv6-policy-isakmp-use1-10] remote-address ipv6 111::1
   [DeviceB-ipsec-ipv6-policy-isakmp-use1-10] ike-profile profile1
   [DeviceB-ipsec-ipv6-policy-isakmp-use1-10] quit
   ```

10. Apply the IPsec policy to GigabitEthernet 1/0/2 to protect traffic on the interface.

    ```
    [DeviceB] interface gigabitethernet 1/0/2
    [DeviceB-GigabitEthernet1/0/2] ipsec apply ipv6-policy use1
    [DeviceB-GigabitEthernet1/0/2] quit
    ```

Verifying the configuration

# Initiate a connection from subnet 333::/64 to subnet 555::/64 to trigger IKE negotiation. After IPsec SAs are successfully negotiated by IKE, the traffic between the two subnets is IPsec-protected.

# Display IPsec SAs on Device A and Device B. This example uses Device A to verify the configuration.

```
[DeviceA] display ipsec sa
-------------------------------
Interface: GigabitEthernet1/0/2
-------------------------------

  -----------------------------
  IPsec policy: map1
  Sequence number: 10
  Mode: ISAKMP
  -----------------------------
    Tunnel id: 0
    Encapsulation mode: tunnel
```

```
    Perfect Forward Secrecy:
    Inside VPN:
    Extended Sequence Numbers enable: N
    Traffic Flow Confidentiality enable: N
    Transmitting entity: Initiator

      Max sent sequence-number: 1
      UDP encapsulation used for NAT traversal: N
      Status: Active
```

Example: Configuring IPsec tunnels for IPv4 packets between headquarters and branches (IPsec policy template mode)

Network configuration

The branches of an enterprise access the headquarters through IPsec VPN. Device A is the headquarters gateway. Device B and Device C are the branch gateways.

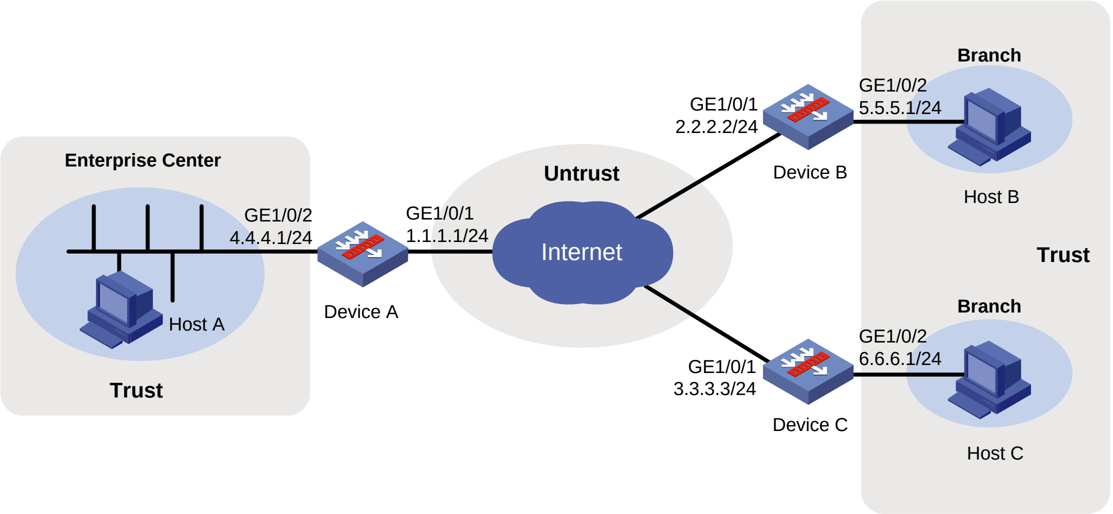
Establish an IPsec tunnel between the headquarters gateway and each branch gateway to protect the data between the headquarters network (4.4.4.0/24) and the branch networks (5.5.5.0/24 and 6.6.6.0/24)

Configure the headquarters gateway Device A to use an IKE-based IPsec policy template and the branch gateways Device B and Device C to use an IKE-based IPsec policy to establish the IPsec tunnels.

Use the ESP security protocol, DES encryption algorithm, and HMAC-SHA-1-96 authentication algorithm to establish IPsec SAs.

Use the preshared key authentication mode, 3DES encryption algorithm, and HMAC-SHA1 authentication algorithm for IKE negotiation.

Figure 21 Network diagram



Configuring Device A

1. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

```
<DeviceA> system-view
[DeviceA] interface gigabitethernet 1/0/1
[DeviceA-GigabitEthernet1/0/1] ip address 1.1.1.1 255.255.255.0
[DeviceA-GigabitEthernet1/0/1] quit
```

   # Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Configure settings for routing.

   This example configures static routes, and the next hop in the routes is 1.1.1.2.

```
[DeviceA] ip route-static 2.2.2.2 24 1.1.1.2
[DeviceA] ip route-static 3.3.3.3 24 1.1.1.2
[DeviceA] ip route-static 5.5.5.0 255.255.255.0 1.1.1.2
[DeviceA] ip route-static 6.6.6.0 255.255.255.0 1.1.1.2
```

3. Add interfaces to security zones.

```
[DeviceA] security-zone name untrust
[DeviceA-security-zone-Untrust] import interface gigabitethernet 1/0/1
[DeviceA-security-zone-Untrust] quit
[DeviceA] security-zone name trust
[DeviceA-security-zone-Trust] import interface gigabitethernet 1/0/2
[DeviceA-security-zone-Trust] quit
```

4. Configure a security policy:

   a. Configure rules to permit traffic between the **Untrust** and **Local** security zones, so the devices can set up an IPsec tunnel:

      # Configure a rule named **ipseclocalout1** to allow Device A to send IPsec negotiation packets to Device B.

```
[DeviceA] security-policy ip
```

```
[DeviceA-security-policy-ip] rule name ipseclocalout1
[DeviceA-security-policy-ip-1-ipseclocalout1] source-zone local
[DeviceA-security-policy-ip-1-ipseclocalout1] destination-zone untrust
[DeviceA-security-policy-ip-1-ipseclocalout1] source-ip-host 1.1.1.1
[DeviceA-security-policy-ip-1-ipseclocalout1] destination-ip-host 2.2.2.2
[DeviceA-security-policy-ip-1-ipseclocalout1] action pass
[DeviceA-security-policy-ip-1-ipseclocalout1] quit
```

# Configure a rule named **ipseclocalin1** to allow Device A to receive the IPsec negotiation packets sent from Device B.

```
[DeviceA-security-policy-ip] rule name ipseclocalin1
[DeviceA-security-policy-ip-2-ipseclocalin1] source-zone untrust
[DeviceA-security-policy-ip-2-ipseclocalin1] destination-zone local
[DeviceA-security-policy-ip-2-ipseclocalin1] source-ip-host 2.2.2.2
[DeviceA-security-policy-ip-2-ipseclocalin1] destination-ip-host 1.1.1.1
[DeviceA-security-policy-ip-2-ipseclocalin1] action pass
[DeviceA-security-policy-ip-2-ipseclocalin1] quit
```

# Configure a rule named **ipseclocalout2** to allow Device A to send IPsec negotiation packets to Device C.

```
[DeviceA-security-policy-ip] rule name ipseclocalout2
[DeviceA-security-policy-ip-3-ipseclocalout2] source-zone local
[DeviceA-security-policy-ip-3-ipseclocalout2] destination-zone untrust
[DeviceA-security-policy-ip-3-ipseclocalout2] source-ip-host 1.1.1.1
[DeviceA-security-policy-ip-3-ipseclocalout2] destination-ip-host 3.3.3.3
[DeviceA-security-policy-ip-3-ipseclocalout2] action pass
[DeviceA-security-policy-ip-3-ipseclocalout2] quit
```

# Configure a rule named **ipseclocalin2** to allow Device A to receive the IPsec negotiation packets sent from Device C.

```
[DeviceA-security-policy-ip] rule name ipseclocalin2
[DeviceA-security-policy-ip-4-ipseclocalin2] source-zone untrust
[DeviceA-security-policy-ip-4-ipseclocalin2] destination-zone local
[DeviceA-security-policy-ip-4-ipseclocalin2] source-ip-host 3.3.3.3
[DeviceA-security-policy-ip-4-ipseclocalin2] destination-ip-host 1.1.1.1
[DeviceA-security-policy-ip-4-ipseclocalin2] action pass
[DeviceA-security-policy-ip-4-ipseclocalin2] quit
```

b. Configure rules to permit the traffic between Host A and Host B or Host C:

# Configure a rule named **trust-untrust** to permit the packets from Host A to Host B.

```
[DeviceA-security-policy-ip] rule name trust-untrust
[DeviceA-security-policy-ip-5-trust-untrust] source-zone trust
[DeviceA-security-policy-ip-5-trust-untrust] destination-zone untrust
[DeviceA-security-policy-ip-5-trust-untrust] source-ip-subnet 4.4.4.0 24
[DeviceA-security-policy-ip-5-trust-untrust] destination-ip-subnet 5.5.5.0 24
[DeviceA-security-policy-ip-5-trust-untrust] action pass
[DeviceA-security-policy-ip-5-trust-untrust] quit
```

# Configure a rule named **untrust-trust** to permit the packets from Host B to Host A.

```
[DeviceA-security-policy-ip] rule name untrust-trust
[DeviceA-security-policy-ip-6-untrust-trust] source-zone untrust
[DeviceA-security-policy-ip-6-untrust-trust] destination-zone trust
[DeviceA-security-policy-ip-6-untrust-trust] source-ip-subnet 5.5.5.0 24
```

```
[DeviceA-security-policy-ip-6-untrust-trust] destination-ip-subnet 4.4.4.0 24
[DeviceA-security-policy-ip-6-untrust-trust] action pass
[DeviceA-security-policy-ip-6-untrust-trust] quit
```

# Configure a rule named **trust-untrust** to permit the packets from Host A to Host C.

```
[DeviceA-security-policy-ip] rule name trust-untrust
[DeviceA-security-policy-ip-7-trust-untrust] source-zone trust
[DeviceA-security-policy-ip-7-trust-untrust] destination-zone untrust
[DeviceA-security-policy-ip-7-trust-untrust] source-ip-subnet 4.4.4.0 24
[DeviceA-security-policy-ip-7-trust-untrust] destination-ip-subnet 6.6.6.0 24
[DeviceA-security-policy-ip-7-trust-untrust] action pass
[DeviceA-security-policy-ip-7-trust-untrust] quit
```

# Configure a rule named **untrust-trust** to permit the packets from Host C to Host A.

```
[DeviceA-security-policy-ip] rule name untrust-trust
[DeviceA-security-policy-ip-8-untrust-trust] source-zone untrust
[DeviceA-security-policy-ip-8-untrust-trust] destination-zone trust
[DeviceA-security-policy-ip-8-untrust-trust] source-ip-subnet 6.6.6.0 24
[DeviceA-security-policy-ip-8-untrust-trust] destination-ip-subnet 4.4.4.0 24
[DeviceA-security-policy-ip-8-untrust-trust] action pass
[DeviceA-security-policy-ip-8-untrust-trust] quit
[DeviceA-security-policy-ip] quit
```

5. Configure an IPsec transform set to specify the packet encapsulation mode, security protocols, and algorithms. The IPsec transform set settings at both sides of the IPsec tunnel must be the same.

```
[DeviceA] ipsec transform-set tran1
[DeviceA-ipsec-transform-set-tran1] encapsulation-mode tunnel
[DeviceA-ipsec-transform-set-tran1] protocol esp
[DeviceA-ipsec-transform-set-tran1] esp encryption-algorithm des-cbc
[DeviceA-ipsec-transform-set-tran1] esp authentication-algorithm sha1
[DeviceA-ipsec-transform-set-tran1] quit
```

6. Configure IKE keychains to specify the keys information used for IKE communication between peers.

# Create an IKE keychain named **key1** to specify the preshared key as **123** for communication with peer 2.2.2.2.

```
[DeviceA] ike keychain key1
[DeviceA-ike-keychain-key1] pre-shared-key address 2.2.2.2 key simple 123
[DeviceA-ike-keychain-key1] quit
```

# Create an IKE keychain named **key2** to specify the preshared key as **456** for communication with peer 3.3.3.3.

```
[DeviceA] ike keychain key2
[DeviceA-ike-keychain-key2] pre-shared-key address 3.3.3.3 key simple 456
[DeviceA-ike-keychain-key2] quit
```

7. Configure an IKE profile to specify the security parameters used for setting up IKE SAs.

```
[DeviceA] ike profile profile1
[DeviceA-ike-profile-profile1] keychain key1
[DeviceA-ike-profile-profile1] keychain key2
[DeviceA-ike-profile-profile1] match remote identity address 2.2.2.2 255.255.255.0
[DeviceA-ike-profile-profile1] match remote identity address 3.3.3.3 255.255.255.0
[DeviceA-ike-profile-profile1] quit
```

8. Configure an IPsec policy template, which is used to create an IPsec policy:

   # Create an IPsec policy template named **temp1**. Specify the IPsec transform set **tran1** and IKE profile **profile1** for the template.

   ```
   [DeviceA] ipsec policy-template temp1 1
   [DeviceA-ipsec-policy-template-temp1-1] transform-set tran1
   [DeviceA-ipsec-policy-template-temp1-1] ike-profile profile1
   ```

9. Create an IKE-based IPsec policy entry by using IPsec policy template **temp1**, so as to establish the IPsec tunnel to protect data.

   ```
   [DeviceA] ipsec policy map1 10 isakmp template temp1
   ```

10. Configure an IKE proposal to specify the security parameters used for IKE negotiation.

    # Create an IKE proposal named **1**, which uses the 3DES encryption algorithm, HMAC-SHA1 authentication algorithm, and preshared key authentication method.

    ```
    [DeviceA] ike proposal 1
    [DeviceA-ike-proposal-1] encryption-algorithm 3des-cbc
    [DeviceA-ike-proposal-1] authentication-algorithm sha
    [DeviceA-ike-proposal-1] authentication-method pre-share
    [DeviceA-ike-proposal-1] quit
    ```

11. Apply the IPsec policy to interface GigabitEthernet 1/0/1 to protect traffic on the interface.

    ```
    [DeviceA] interface gigabitethernet 1/0/1
    [DeviceA-GigabitEthernet1/0/1] ipsec apply policy map1
    [DeviceA-GigabitEthernet1/0/1] quit
    ```

Configuring Device B

1. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

   ```
   <DeviceB> system-view
   [DeviceB] interface gigabitethernet 1/0/1
   [DeviceB-GigabitEthernet1/0/1] ip address 2.2.2.2 255.255.255.0
   [DeviceB-GigabitEthernet1/0/1] quit
   ```

   # Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Configure settings for routing.

   This example configures static routes, and the next hop in the routes is 2.2.2.3.

   ```
   [DeviceB] ip route-static 4.4.4.0 24 2.2.2.3
   [DeviceB] ip route-static 1.1.1.1 24 2.2.2.3
   ```

3. Add interfaces to security zones.

   ```
   [DeviceB] security-zone name untrust
   [DeviceB-security-zone-Untrust] import interface gigabitethernet 1/0/1
   [DeviceB-security-zone-Untrust] quit
   [DeviceB] security-zone name trust
   [DeviceB-security-zone-Trust] import interface gigabitethernet 1/0/2
   [DeviceB-security-zone-Trust] quit
   ```

4. Configure a security policy:

   a. Configure rules to permit traffic between the **Untrust** and **Local** security zones, so the devices can set up an IPsec tunnel:

      # Configure a rule named **ipseclocalout** to allow Device B to send IPsec negotiation packets to Device A.

      ```
      [DeviceB] security-policy ip
      [DeviceB-security-policy-ip] rule name ipseclocalout
      ```

```
[DeviceB-security-policy-ip-1-ipseclocalout] source-zone local
[DeviceB-security-policy-ip-1-ipseclocalout] destination-zone untrust
[DeviceB-security-policy-ip-1-ipseclocalout] source-ip-host 2.2.2.2
[DeviceB-security-policy-ip-1-ipseclocalout] destination-ip-host 1.1.1.1
[DeviceB-security-policy-ip-1-ipseclocalout] action pass
[DeviceB-security-policy-ip-1-ipseclocalout] quit
```

# Configure a rule named **ipseclocalin** to allow Device B to receive the IPsec negotiation packets sent from Device A.

```
[DeviceB-security-policy-ip] rule name ipseclocalin
[DeviceB-security-policy-ip-2-ipseclocalin] source-zone untrust
[DeviceB-security-policy-ip-2-ipseclocalin] destination-zone local
[DeviceB-security-policy-ip-2-ipseclocalin] source-ip-host 1.1.1.1
[DeviceB-security-policy-ip-2-ipseclocalin] destination-ip-host 2.2.2.2
[DeviceB-security-policy-ip-2-ipseclocalin] action pass
[DeviceB-security-policy-ip-2-ipseclocalin] quit
```

b. Configure rules to permit traffic between Host B and Host A:

# Configure a rule named **trust-untrust** to permit the packets from Host B to Host A.

```
[DeviceB-security-policy-ip] rule name trust-untrust
[DeviceB-security-policy-ip-3-trust-untrust] source-zone trust
[DeviceB-security-policy-ip-3-trust-untrust] destination-zone untrust
[DeviceB-security-policy-ip-3-trust-untrust] source-ip-subnet 5.5.5.0 24
[DeviceB-security-policy-ip-3-trust-untrust] destination-ip-subnet 4.4.4.0 24
[DeviceB-security-policy-ip-3-trust-untrust] action pass
[DeviceB-security-policy-ip-3-trust-untrust] quit
```

# Configure a rule named **untrust-trust** to permit the packets from Host A to Host B.

```
[DeviceB-security-policy-ip] rule name untrust-trust
[DeviceB-security-policy-ip-4-untrust-trust] source-zone untrust
[DeviceB-security-policy-ip-4-untrust-trust] destination-zone trust
[DeviceB-security-policy-ip-4-untrust-trust] source-ip-subnet 4.4.4.0 24
[DeviceB-security-policy-ip-4-untrust-trust] destination-ip-subnet 5.5.5.0 24
[DeviceB-security-policy-ip-4-untrust-trust] action pass
[DeviceB-security-policy-ip-4-untrust-trust] quit
[DeviceB-security-policy-ip] quit
```

5. Define the data flows to be protected:

# Configure an IPv4 advanced ACL to identify data flows from subnet 5.5.5.0/24 to subnet 4.4.4.0/24.

```
[DeviceB] acl advanced 3000
[DeviceB-acl-ipv4-adv-3000] rule permit ip source 5.5.5.0 0.0.0.255 destination
4.4.4.0 0.0.0.255
[DeviceB-acl-ipv4-adv-3000] quit
```

6. Configure an IPsec transform set to specify the packet encapsulation mode, security protocols, and algorithms. The IPsec transform set settings at both sides of the IPsec tunnel must be the same.

```
[DeviceB] ipsec transform-set tran1
[DeviceB-ipsec-transform-set-tran1] encapsulation-mode tunnel
[DeviceB-ipsec-transform-set-tran1] protocol esp
[DeviceB-ipsec-transform-set-tran1] esp encryption-algorithm des-cbc
[DeviceB-ipsec-transform-set-tran1] esp authentication-algorithm sha1
[DeviceB-ipsec-transform-set-tran1] quit
```

7. Configure an IKE keychain to specify the key information used for IKE communication.

   # Create an IKE keychain named **key1** to specify the preshared key as **123** for communication with peer 1.1.1.1.

   ```
   [DeviceB] ike keychain key1
   [DeviceB-ike-keychain-key1] pre-shared-key address 1.1.1.1 key simple 123
   [DeviceB-ike-keychain-key1] quit
   ```

8. Configure an IKE profile to specify the security parameters used for setting up IKE SAs.

   ```
   [DeviceB] ike profile profile1
   [DeviceB-ike-profile-profile1] keychain key1
   [DeviceB-ike-profile-profile1] match remote identity address 1.1.1.1 255.255.255.0
   [DeviceB-ike-profile-profile1] quit
   ```

9. Configure an IPsec policy, so as to establish the IPsec tunnel to protect data:

   # Create an IKE-based IPsec policy entry, which specifies the ACL for IPsec, IPsec transform set, local and remote IP addresses, and IKE profile.

   ```
   [DeviceB] ipsec policy map1 10 isakmp
   [DeviceB-ipsec-policy-isakmp-map1-10] transform-set tran1
   [DeviceB-ipsec-policy-isakmp-map1-10] security acl 3000
   [DeviceB-ipsec-policy-isakmp-map1-10] local-address 2.2.2.2
   [DeviceB-ipsec-policy-isakmp-map1-10] remote-address 1.1.1.1
   [DeviceB-ipsec-policy-isakmp-map1-10] ike-profile profile1
   [DeviceB-ipsec-policy-isakmp-map1-10] quit
   ```

10. Configure an IKE proposal to specify the security parameters used for IKE negotiation.

    # Create an IKE proposal named **1**, which uses the 3DES encryption algorithm, HMAC-SHA1 authentication algorithm, and preshared key authentication method.

    ```
    [DeviceB] ike proposal 1
    [DeviceB-ike-proposal-1] encryption-algorithm 3des-cbc
    [DeviceB-ike-proposal-1] authentication-algorithm sha
    [DeviceB-ike-proposal-1] authentication-method pre-share
    [DeviceB-ike-proposal-1] quit
    ```

11. Apply the IPsec policy to interface GigabitEthernet 1/0/1 to protect traffic on the interface.

    ```
    [DeviceB] interface gigabitethernet 1/0/1
    [DeviceB-GigabitEthernet1/0/1] ipsec apply policy map1
    [DeviceB-GigabitEthernet1/0/1] quit
    ```

Configuring Device C

1. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

   ```
   <DeviceC> system-view
   [DeviceC] interface gigabitethernet 1/0/1
   [DeviceC-GigabitEthernet1/0/1] ip address 3.3.3.3 255.255.255.0
   [DeviceC-GigabitEthernet1/0/1] quit
   ```

   # Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Configure settings for routing.

   This example configures static routes, and the next hop in the routes is 3.3.3.4

   ```
   [DeviceC] ip route-static 4.4.4.0 24 3.3.3.4
   [DeviceC] ip route-static 1.1.1.1 24 3.3.3.4
   ```

3. Add interfaces to security zones.

   ```
   [DeviceC] security-zone name untrust
   ```

```
[DeviceC-security-zone-Untrust] import interface gigabitethernet 1/0/1
[DeviceC-security-zone-Untrust] quit
[DeviceC] security-zone name trust
[DeviceC-security-zone-Trust] import interface gigabitethernet 1/0/2
[DeviceC-security-zone-Trust] quit
```

4. Configure a security policy:
   a. Configure rules to permit traffic between the **Untrust** and **Local** security zones, so the devices can set up an IPsec tunnel:

      # Configure a rule named **ipseclocalout** to allow Device C to send IPsec negotiation packets to Device A.

      ```
      [DeviceC] security-policy ip
      [DeviceC-security-policy-ip] rule name ipseclocalout
      [DeviceC-security-policy-ip-1-ipseclocalout] source-zone local
      [DeviceC-security-policy-ip-1-ipseclocalout] destination-zone untrust
      [DeviceC-security-policy-ip-1-ipseclocalout] source-ip-host 3.3.3.3
      [DeviceC-security-policy-ip-1-ipseclocalout] destination-ip-host 1.1.1.1
      [DeviceC-security-policy-ip-1-ipseclocalout] action pass
      [DeviceC-security-policy-ip-1-ipseclocalout] quit
      ```

      # Configure a rule named **ipseclocalin** to allow Device C to receive the IPsec negotiation packets sent from Device A.

      ```
      [DeviceC-security-policy-ip] rule name ipseclocalin
      [DeviceC-security-policy-ip-2-ipseclocalin] source-zone untrust
      [DeviceC-security-policy-ip-2-ipseclocalin] destination-zone local
      [DeviceC-security-policy-ip-2-ipseclocalin] source-ip-host 1.1.1.1
      [DeviceC-security-policy-ip-2-ipseclocalin] destination-ip-host 3.3.3.3
      [DeviceC-security-policy-ip-2-ipseclocalin] action pass
      [DeviceC-security-policy-ip-2-ipseclocalin] quit
      ```

   b. Configure rules to permit traffic between Host C and Host A:

      # Configure a rule named **trust-untrust** to permit the packets from Host C to Host A.

      ```
      [DeviceC-security-policy-ip] rule name trust-untrust
      [DeviceC-security-policy-ip-3-trust-untrust] source-zone trust
      [DeviceC-security-policy-ip-3-trust-untrust] destination-zone untrust
      [DeviceC-security-policy-ip-3-trust-untrust] source-ip-subnet 6.6.6.0 24
      [DeviceC-security-policy-ip-3-trust-untrust] destination-ip-subnet 4.4.4.0 24
      [DeviceC-security-policy-ip-3-trust-untrust] action pass
      [DeviceC-security-policy-ip-3-trust-untrust] quit
      ```

      # Configure a rule named **untrust-trust** to permit the packets from Host A to Host C.

      ```
      [DeviceC-security-policy-ip] rule name untrust-trust
      [DeviceC-security-policy-ip-4-untrust-trust] source-zone untrust
      [DeviceC-security-policy-ip-4-untrust-trust] destination-zone trust
      [DeviceC-security-policy-ip-4-untrust-trust] source-ip-subnet 4.4.4.0 24
      [DeviceC-security-policy-ip-4-untrust-trust] destination-ip-subnet 6.6.6.0 24
      [DeviceC-security-policy-ip-4-untrust-trust] action pass
      [DeviceC-security-policy-ip-4-untrust-trust] quit
      [DeviceC-security-policy-ip] quit
      ```

5. Define the data flows to be protected:

   # Configure an IPv4 advanced ACL to identify data flows from subnet 6.6.6.0/24 to subnet 4.4.4.0/24.

```
[DeviceC] acl advanced 3000
[DeviceC-acl-ipv4-adv-3000] rule permit ip source 6.6.6.0 0.0.0.255 destination 
4.4.4.0 0.0.0.255
[DeviceC-acl-ipv4-adv-3000] quit
```

6. Configure an IPsec transform set to specify the packet encapsulation mode, security protocols, and algorithms. The IPsec transform set settings at both sides of the IPsec tunnel must be the same.

```
[DeviceC] ipsec transform-set tran1
[DeviceC-ipsec-transform-set-tran1] encapsulation-mode tunnel
[DeviceC-ipsec-transform-set-tran1] protocol esp
[DeviceC-ipsec-transform-set-tran1] esp encryption-algorithm des
[DeviceC-ipsec-transform-set-tran1] esp authentication-algorithm sha1
[DeviceC-ipsec-transform-set-tran1] quit
```

7. Configure an IKE keychain to specify the key information used for IKE communication.

   # Create an IKE keychain named **key1** to specify the preshared key as **456** for communication with peer 1.1.1.1.

```
[DeviceC] ike keychain key1
[DeviceC-ike-keychain-key1] pre-shared-key address 1.1.1.1 key simple 456
[DeviceC-ike-keychain-key1] quit
```

8. Configure an IKE profile to specify the security parameters used for setting up IKE SAs.

```
[DeviceC] ike profile profile1
[DeviceC-ike-profile-profile1] keychain key1
[DeviceC-ike-profile-profile1] match remote identity address 1.1.1.1 255.255.255.0
[DeviceC-ike-profile-profile1] quit
```

9. Configure an IPsec policy, so as to establish the IPsec tunnel to protect data:

   # Create an IKE-based IPsec policy entry, which specifies the ACL for IPsec, IPsec transform set, local and remote IP addresses, and IKE profile.

```
[DeviceC] ipsec policy map1 10 isakmp
[DeviceC-ipsec-policy-isakmp-map1-10] transform-set tran1
[DeviceC-ipsec-policy-isakmp-map1-10] security acl 3000
[DeviceC-ipsec-policy-isakmp-map1-10] local-address 3.3.3.3
[DeviceC-ipsec-policy-isakmp-map1-10] remote-address 1.1.1.1
[DeviceC-ipsec-policy-isakmp-map1-10] ike-profile profile1
[DeviceC-ipsec-policy-isakmp-map1-10] quit
```

10. Apply the IPsec policy to interface GigabitEthernet 1/0/1 to protect traffic on the interface.

```
[DeviceC] interface gigabitethernet 1/0/1
[DeviceC-GigabitEthernet1/0/1] ipsec apply policy map1
[DeviceC-GigabitEthernet1/0/1] quit
```

Verifying the configuration

# Initiate a connection from headquarters subnet 5.5.5.0/24 to branch subnet 4.4.4.0/24 to trigger IKE negotiation. After IPsec SAs are successfully negotiated by IKE, the traffic between the two subnets is IPsec-protected.

# Display IKE SAs on Device A.

```
[DeviceA] display ike sa
    Connection-ID   Remote                Flag         DOI
------------------------------------------------------------------
    1               2.2.2.2               RD           IPsec
Flags:
```

```
RD--READY RL--REPLACED FD-FADING RK-REKEY
```

# Display IPsec SAs on Device A.

```
[DeviceA] display ipsec sa

      UDP encapsulation used for NAT traversal: N
      Status: Active
```

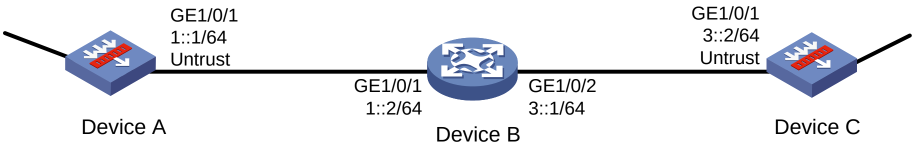
Example: Configuring IPsec for RIPng

Network configuration

As shown in Figure 22, Device A, Device B, and Device C learn IPv6 routes through RIPng.

Establish an IPsec tunnel between the devices to protect the RIPng packets transmitted in between. Specify the security protocol as ESP, the encryption algorithm as 128-bit AES, and the authentication algorithm as HMAC-SHA1 for the IPsec tunnel.

Figure 22 Network diagram



Requirements analysis

To meet the Network configuration, perform the following tasks:

1. Configure basic RIPng.

   For more information about RIPng configuration, see *Layer 3—IP Routing Configuration Guide*.
2. Configure an IPsec profile.
   - The IPsec profiles on all the devices must have IPsec transform sets that use the same security protocol, authentication and encryption algorithms, and encapsulation mode.
   - The SPI and key configured for the inbound SA and those for the outbound SA must be the same on each device.
   - The SPI and key configured for the SAs on all the devices must be the same.
3. Apply the IPsec profile to a RIPng process or to an interface.

Configuring Device A

1. Assign an IP address to interface GigabitEthernet 1/0/1.

```
<DeviceA> system-view
[DeviceA] interface gigabitethernet 1/0/1
[DeviceA-GigabitEthernet1/0/1] ipv6 address 1::1/64
[DeviceA-GigabitEthernet1/0/1] quit
```

2. Configure settings for routing.

   This example configures a static route, and the next hop in the route is 1::2.

```
[DeviceA] ipv6 route-static 3::2 64 1::2
```

3. Add interface GigabitEthernet 1/0/1 to the **Untrust** security zone.

```
[DeviceA] security-zone name untrust
[DeviceA-security-zone-Untrust] import interface gigabitethernet 1/0/1
[DeviceA-security-zone-Untrust] quit
```

4. Configure rules to permit traffic between the **Untrust** and **Local** security zones, so the devices can set up an IPsec tunnel:

   # Configure a rule named **ipseclocalout** to allow Device A to send IPsec negotiation packets to Device B.

```
[DeviceA] security-policy ipv6
[DeviceA-security-policy-ipv6] rule name ipseclocalout
[DeviceA-security-policy-ipv6-1-ipseclocalout] source-zone local
[DeviceA-security-policy-ipv6-1-ipseclocalout] destination-zone untrust
```

```
[DeviceA-security-policy-ipv6-1-ipseclocalout] source-ip-host 1::1
[DeviceA-security-policy-ipv6-1-ipseclocalout] destination-ip-host 1::2
[DeviceA-security-policy-ipv6-1-ipseclocalout] action pass
[DeviceA-security-policy-ipv6-1-ipseclocalout] quit
```

# Configure a rule named **ipseclocalin** to allow Device A to receive the IPsec negotiation packets sent from Device B.

```
[DeviceA-security-policy-ipv6] rule name ipseclocalin
[DeviceA-security-policy-ipv6-2-ipseclocalin] source-zone untrust
[DeviceA-security-policy-ipv6-2-ipseclocalin] destination-zone local
[DeviceA-security-policy-ipv6-2-ipseclocalin] source-ip-host 1::2
[DeviceA-security-policy-ipv6-2-ipseclocalin] destination-ip-host 1::1
[DeviceA-security-policy-ipv6-2-ipseclocalin] action pass
[DeviceA-security-policy-ipv6-2-ipseclocalin] quit
```

5. Configure basic RIPng.

```
[DeviceA] ripng 1
[DeviceA-ripng-1] quit
[DeviceA] interface gigabitethernet 1/0/1
[DeviceA-GigabitEthernet1/0/1] ripng 1 enable
[DeviceA-GigabitEthernet1/0/1] quit
```

6. Configure an IPsec profile to establish an IPsec tunnel to protect the specified data:

# Create and configure an IPsec transform set named **tran1**.

```
[DeviceA] ipsec transform-set tran1
[DeviceA-ipsec-transform-set-tran1] encapsulation-mode transport
[DeviceA-ipsec-transform-set-tran1] protocol esp
[DeviceA-ipsec-transform-set-tran1] esp encryption-algorithm aes-cbc-128
[DeviceA-ipsec-transform-set-tran1] esp authentication-algorithm sha1
[DeviceA-ipsec-transform-set-tran1] quit
```

# Create and configure an IPsec profile named **profile001**.

```
[DeviceA] ipsec profile profile001 manual
[DeviceA-ipsec-profile-manual-profile001] transform-set tran1
[DeviceA-ipsec-profile-manual-profile001] sa spi outbound esp 123456
[DeviceA-ipsec-profile-manual-profile001] sa spi inbound esp 123456
[DeviceA-ipsec-profile-manual-profile001] sa string-key outbound esp simple abcdefg
[DeviceA-ipsec-profile-manual-profile001] sa string-key inbound esp simple abcdefg
[DeviceA-ipsec-profile-manual-profile001] quit
```

7. Apply the IPsec profile to RIPng process 1 to protect RIPng packets with IPsec.

```
[DeviceA] ripng 1
[DeviceA-ripng-1] enable ipsec-profile profile001
[DeviceA-ripng-1] quit
```

Configuring Device B

1. Assign an IP address to interface GigabitEthernet 1/0/1.

```
<DeviceB> system-view
[DeviceB] interface gigabitethernet 1/0/1
[DeviceB-GigabitEthernet1/0/1] ipv6 address 1::2/64
[DeviceB-GigabitEthernet1/0/1] quit
```

# Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Configure basic RIPng.

```
<DeviceB> system-view
[DeviceB] ripng 1
[DeviceB-ripng-1] quit
[DeviceB] interface gigabitethernet 1/0/1
[DeviceB-GigabitEthernet1/0/1] ripng 1 enable
[DeviceB-GigabitEthernet1/0/1] quit
[DeviceB] interface gigabitethernet 1/0/2
[DeviceB-GigabitEthernet1/0/2] ripng 1 enable
[DeviceB-GigabitEthernet1/0/2] quit
```

3. Configure an IPsec profile to establish an IPsec tunnel to protect the specified data:

   # Create and configure an IPsec transform set named **tran1**.

   ```
   [DeviceB] ipsec transform-set tran1
   [DeviceB-ipsec-transform-set-tran1] encapsulation-mode transport
   [DeviceB-ipsec-transform-set-tran1] protocol esp
   [DeviceB-ipsec-transform-set-tran1] esp encryption-algorithm aes-cbc-128
   [DeviceB-ipsec-transform-set-tran1] esp authentication-algorithm sha1
   [DeviceB-ipsec-transform-set-tran1] quit
   ```

   # Create and configure an IPsec profile named **profile001**.

   ```
   [DeviceB] ipsec profile profile001 manual
   [DeviceB-ipsec-profile-manual-profile001] transform-set tran1
   [DeviceB-ipsec-profile-manual-profile001] sa spi outbound esp 123456
   [DeviceB-ipsec-profile-manual-profile001] sa spi inbound esp 123456
   [DeviceB-ipsec-profile-manual-profile001] sa string-key outbound esp simple abcdefg
   [DeviceB-ipsec-profile-manual-profile001] sa string-key inbound esp simple abcdefg
   [DeviceB-ipsec-profile-manual-profile001] quit
   ```

4. Apply the IPsec profile to RIPng process 1 to protect RIPng packets with IPsec.

   ```
   [DeviceB] ripng 1
   [DeviceB-ripng-1] enable ipsec-profile profile001
   [DeviceB-ripng-1] quit
   ```

Configuring Device C

1. Assign an IP address to interface GigabitEthernet 1/0/1.

   ```
   <DeviceC> system-view
   [DeviceC] interface gigabitethernet 1/0/1
   [DeviceC-GigabitEthernet1/0/1] ipv6 address 3::2/64
   [DeviceC-GigabitEthernet1/0/1] quit
   ```

2. Configure settings for routing.

   This example configures a static route, and the next hop in the route is 3::1.

   ```
   [DeviceC] ipv6 route-static 1::1 64 3::1
   ```

3. Add interface GigabitEthernet 1/0/1 to the **Untrust** security zone.

   ```
   [DeviceC] security-zone name untrust
   [DeviceC-security-zone-Untrust] import interface gigabitethernet 1/0/1
   [DeviceC-security-zone-Untrust] quit
   ```

4. Configure rules to permit traffic between the **Untrust** and **Local** security zones, so the devices can set up an IPsec tunnel:

   # Configure a rule named **ipseclocalout** to allow Device C to send IPsec negotiation packets to Device B.

   ```
   [DeviceC] security-policy ipv6
   ```

```
[DeviceC-security-policy-ipv6] rule name ipseclocalout
[DeviceC-security-policy-ipv6-1-ipseclocalout] source-zone local
[DeviceC-security-policy-ipv6-1-ipseclocalout] destination-zone untrust
[DeviceC-security-policy-ipv6-1-ipseclocalout] source-ip-host 3::2
[DeviceC-security-policy-ipv6-1-ipseclocalout] destination-ip-host 3::1
[DeviceC-security-policy-ipv6-1-ipseclocalout] action pass
[DeviceC-security-policy-ipv6-1-ipseclocalout] quit
```

# Configure a rule named **ipseclocalin** to allow Device C to receive the IPsec negotiation packets sent from Device B.

```
[DeviceC-security-policy-ipv6] rule name ipseclocalin
[DeviceC-security-policy-ipv6-2-ipseclocalin] source-zone untrust
[DeviceC-security-policy-ipv6-2-ipseclocalin] destination-zone local
[DeviceC-security-policy-ipv6-2-ipseclocalin] source-ip-host 3::1
[DeviceC-security-policy-ipv6-2-ipseclocalin] destination-ip-host 3::2
[DeviceC-security-policy-ipv6-2-ipseclocalin] action pass
[DeviceC-security-policy-ipv6-2-ipseclocalin] quit
```

5. Configure basic RIPng.

```
[DeviceC] ripng 1
[DeviceC-ripng-1] quit
[DeviceC] interface gigabitethernet 1/0/1
[DeviceC-GigabitEthernet1/0/1] ripng 1 enable
[DeviceC-GigabitEthernet1/0/1] quit
```

6. Configure an IPsec profile, so as to establish the IPsec tunnel to protect data:

# Create and configure an IPsec transform set named **tran1**.

```
[DeviceC] ipsec transform-set tran1
[DeviceC-ipsec-transform-set-tran1] encapsulation-mode transport
[DeviceC-ipsec-transform-set-tran1] protocol esp
[DeviceC-ipsec-transform-set-tran1] esp encryption-algorithm aes-cbc-128
[DeviceC-ipsec-transform-set-tran1] esp authentication-algorithm sha1
[DeviceC-ipsec-transform-set-tran1] quit
```

# Create and configure an IPsec profile named **profile001**.

```
[DeviceC] ipsec profile profile001 manual
[DeviceC-ipsec-profile-manual-profile001] transform-set tran1
[DeviceC-ipsec-profile-manual-profile001] sa spi outbound esp 123456
[DeviceC-ipsec-profile-manual-profile001] sa spi inbound esp 123456
[DeviceC-ipsec-profile-manual-profile001] sa string-key outbound esp simple abcdefg
[DeviceC-ipsec-profile-manual-profile001] sa string-key inbound esp simple abcdefg
[DeviceC-ipsec-profile-manual-profile001] quit
```

7. Apply the IPsec profile to RIPng process 1 to protect RIPng packets with IPsec.

```
[DeviceC] ripng 1
[DeviceC-ripng-1] enable ipsec-profile profile001
[DeviceC-ripng-1] quit
```

Verifying the configuration

After the configuration is completed, Device A, Device B, and Device C learn IPv6 routing information through RIPng. IPsec SAs are set up successfully on the devices to protect RIPng packets. This example uses Device A to verify the configuration.

# Display the RIPng configuration.

```
[DeviceA] display ripng 1
```

```
    RIPng process : 1
       Preference : 100
       Checkzero : Enabled
       Default Cost : 0
       Maximum number of load balanced routes : 8
       Update time   :   30 secs  Timeout time         :  180 secs
       Suppress time :  120 secs  Garbage-Collect time :  120 secs
       Update output delay:   20(ms)  Output count:    3
       Graceful-restart interval:   60 secs
       Triggered Interval : 5 50 200
       Number of periodic updates sent : 186
       Number of triggered updates sent : 1
       IPsec profile name: profile001
```

The output shows that the IPsec profile **profile001** has been applied to RIPng process 1.

# Display the established IPsec SAs.

```
[DeviceA] display ipsec sa
-------------------------------
Global IPsec SA
-------------------------------

  -----------------------------
  IPsec profile: profile001
  Mode: Manual
  -----------------------------
    Encapsulation mode: transport
    [Inbound ESP SA]
      SPI: 123456 (0x3039)
      Connection ID: 1

      No duration limit for this SA
    [Outbound ESP SA]
      SPI: 123456 (0x3039)
      Connection ID: 2
      Transform set: ESP-ENCRYPT-AES-CBC-128 ESP-AUTH-SHA1
      No duration limit for this SA
```

Example: Configuring IPsec RRI

Network configuration

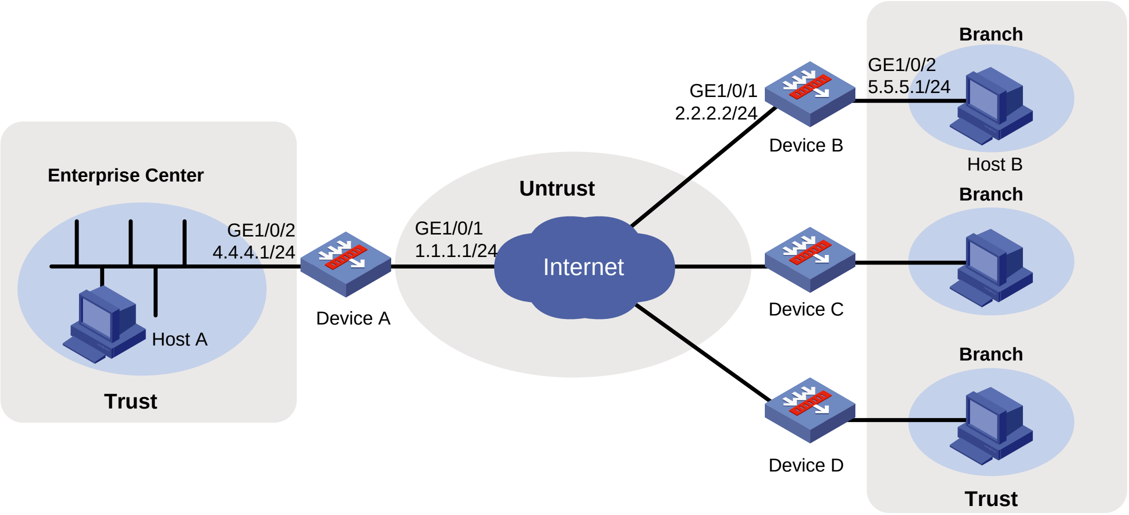
As shown in Figure 23, branches access the corporate headquarters through an IPsec VPN.

Configure the IPsec VPN as follows:

- Configure an IPsec tunnel between Device A and each branch gateway (Device B, Device C, and Device D) to protect traffic between subnets 4.4.4.0/24 and 5.5.5.0/24.
- Configure the tunnels to use the security protocol ESP, the encryption algorithm DES, and the authentication algorithm SHA1-HMAC-96. Use IKE for IPsec SA negotiation.
- Configure IKE proposal to use the preshared key authentication method, encryption algorithm 3DES, and authentication algorithm HMAC-SHA1.

- Configure IPsec RRI on Device A to automatically create static routes to the branches based on the established IPsec SAs.

Figure 23 Network diagram



Configuring Device A

1. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

   ```
   <DeviceA> system-view
   [DeviceA] interface gigabitethernet 1/0/1
   [DeviceA-GigabitEthernet1/0/1] ip address 1.1.1.1 255.255.255.0
   [DeviceA-GigabitEthernet1/0/1] quit
   ```

   # Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Configure settings for routing.

   This example configures a static route, and the next hop in the route is 1.1.1.2.

   ```
   [DeviceA] ip route-static 2.2.2.2 24 1.1.1.2
   ```

3. Add interfaces to security zones.

   ```
   [DeviceA] security-zone name untrust
   [DeviceA-security-zone-Untrust] import interface gigabitethernet 1/0/1
   [DeviceA-security-zone-Untrust] quit
   [DeviceA] security-zone name trust
   [DeviceA-security-zone-Trust] import interface gigabitethernet 1/0/2
   [DeviceA-security-zone-Trust] quit
   ```

4. Configure a security policy:

   a. Configure rules to permit traffic between the **Untrust** and **Local** security zones, so the devices can set up an IPsec tunnel:

   # Configure a rule named **ipseclocalout** to allow Device A to send IPsec negotiation packets to Device B.

   ```
   [DeviceA] security-policy ip
   [DeviceA-security-policy-ip] rule name ipseclocalout
   [DeviceA-security-policy-ip-1-ipseclocalout] source-zone local
   [DeviceA-security-policy-ip-1-ipseclocalout] destination-zone untrust
   [DeviceA-security-policy-ip-1-ipseclocalout] source-ip-host 1.1.1.1
   [DeviceA-security-policy-ip-1-ipseclocalout] destination-ip-host 2.2.2.2
   ```

```
[DeviceA-security-policy-ip-1-ipseclocalout] action pass
[DeviceA-security-policy-ip-1-ipseclocalout] quit
```

# Configure a rule named **ipseclocalin** to allow Device A to receive the IPsec negotiation packets sent from Device B.

```
[DeviceA-security-policy-ip] rule name ipseclocalin
[DeviceA-security-policy-ip-2-ipseclocalin] source-zone untrust
[DeviceA-security-policy-ip-2-ipseclocalin] destination-zone local
[DeviceA-security-policy-ip-2-ipseclocalin] source-ip-host 2.2.2.2
[DeviceA-security-policy-ip-2-ipseclocalin] destination-ip-host 1.1.1.1
[DeviceA-security-policy-ip-2-ipseclocalin] action pass
[DeviceA-security-policy-ip-2-ipseclocalin] quit
```

b. Configure rules to permit the traffic between Host A and Host B:

# Configure a rule named **trust-untrust** to permit the packets from Host A to Host B.

```
[DeviceA-security-policy-ip] rule name trust-untrust
[DeviceA-security-policy-ip-3-trust-untrust] source-zone trust
[DeviceA-security-policy-ip-3-trust-untrust] destination-zone untrust
[DeviceA-security-policy-ip-3-trust-untrust] source-ip-subnet 4.4.4.0 24
[DeviceA-security-policy-ip-3-trust-untrust] destination-ip-subnet 5.5.5.0 24
[DeviceA-security-policy-ip-3-trust-untrust] action pass
[DeviceA-security-policy-ip-3-trust-untrust] quit
```

# Configure a rule named **untrust-trust** to permit the packets from Host B to Host A.

```
[DeviceA-security-policy-ip] rule name untrust-trust
[DeviceA-security-policy-ip-4-untrust-trust] source-zone untrust
[DeviceA-security-policy-ip-4-untrust-trust] destination-zone trust
[DeviceA-security-policy-ip-4-untrust-trust] source-ip-subnet 5.5.5.0 24
[DeviceA-security-policy-ip-4-untrust-trust] destination-ip-subnet 4.4.4.0 24
[DeviceA-security-policy-ip-4-untrust-trust] action pass
[DeviceA-security-policy-ip-4-untrust-trust] quit
[DeviceA-security-policy-ip] quit
```

5. Configure an IPsec transform set to specify the packet encapsulation mode, security protocols, and algorithms.

The IPsec transform set settings at both sides of the IPsec tunnel must be the same.

```
[DeviceA] ipsec transform-set tran1
[DeviceA-ipsec-transform-set-tran1] encapsulation-mode tunnel
[DeviceA-ipsec-transform-set-tran1] protocol esp
[DeviceA-ipsec-transform-set-tran1] esp encryption-algorithm des
[DeviceA-ipsec-transform-set-tran1] esp authentication-algorithm sha1
[DeviceA-ipsec-transform-set-tran1] quit
```

6. Configure an IKE keychain to specify the key information used for IKE communication with peer 2.2.2.2.

```
[DeviceA] ike keychain key1
[DeviceA-ike-keychain-key1] pre-shared-key address 2.2.2.2 key simple 123
[DeviceA-ike-keychain-key1] quit
```

7. Configure an IKE profile to specify the security parameters used for setting up IKE SAs.

```
[DeviceA] ike profile profile1
[DeviceA-ike-profile-profile1] keychain key1
[DeviceA-ike-profile-profile1] match remote identity address 2.2.2.2 255.255.255.0
[DeviceA-ike-profile-profile1] quit
```

8. Create an IPsec policy template named **temp1**. Specify IPsec transform set **tran1** and IKE profile **profile1** for the IPsec policy template.

```
[DeviceA] ipsec policy-template temp1 1
[DeviceA-ipsec-policy-template-temp1-1] transform-set tran1
[DeviceA-ipsec-policy-template-temp1-1] ike-profile profile1
```

9. Configure IPsec RRI:

   # Enable IPsec RRI, and set the preference to 100 and the tag to 1000 for the static routes created by IPsec RRI.

```
[DeviceA-ipsec-policy-template-temp1-1] reverse-route dynamic
[DeviceA-ipsec-policy-template-temp1-1] reverse-route preference 100
[DeviceA-ipsec-policy-template-temp1-1] reverse-route tag 1000
[DeviceA-ipsec-policy-template-temp1-1] quit
```

10. Use IPsec policy template **temp1** to create an IKE-based IPsec policy to establish an IPsec tunnel to protect the specified data.

```
[DeviceA] ipsec policy map1 10 isakmp template temp1
```

11. Configure an IKE proposal to specify the security parameters used for IKE negotiation.

    # Create an IKE proposal named **1**, and specify **3DES** as the encryption algorithm, **HMAC-SHA1** as the authentication algorithm, and **pre-share** as the authentication method.

```
[DeviceA] ike proposal 1
[DeviceA-ike-proposal-1] encryption-algorithm 3des-cbc
[DeviceA-ike-proposal-1] authentication-algorithm sha
[DeviceA-ike-proposal-1] authentication-method pre-share
[DeviceA-ike-proposal-1] quit
```

12. Apply the IPsec policy to GigabitEthernet 1/0/1 to protect traffic on the interface.

```
[DeviceA] interface gigabitethernet 1/0/1
[DeviceA-GigabitEthernet1/0/1] ipsec apply policy map1
[DeviceA-GigabitEthernet1/0/1] quit
```

Configuring Device B

1. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

```
<DeviceB> system-view
[DeviceB] interface gigabitethernet 1/0/1
[DeviceB-GigabitEthernet1/0/1] ip address 2.2.2.2 255.255.255.0
[DeviceB-GigabitEthernet1/0/1] quit
```

   # Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Configure settings for routing.

   This example configures static routes, and the next hop in the routes is 2.2.2.3.

```
[DeviceB] ip route-static 4.4.4.0 24 2.2.2.3
[DeviceB] ip route-static 1.1.1.1 24 2.2.2.3
```

3. Add interfaces to security zones.

```
[DeviceB] security-zone name untrust
[DeviceB-security-zone-Untrust] import interface gigabitethernet 1/0/1
[DeviceB-security-zone-Untrust] quit
[DeviceB] security-zone name trust
[DeviceB-security-zone-Trust] import interface gigabitethernet 1/0/2
[DeviceB-security-zone-Trust] quit
```

4. Configure a security policy:

a. Configure rules to permit traffic between the **Untrust** and **Local** security zones, so the devices can set up an IPsec tunnel:

# Configure a rule named **ipseclocalout** to allow Device B to send IPsec negotiation packets to Device A.

```
[DeviceB] security-policy ip
[DeviceB-security-policy-ip] rule name ipseclocalout
[DeviceB-security-policy-ip-1-ipseclocalout] source-zone local
[DeviceB-security-policy-ip-1-ipseclocalout] destination-zone untrust
[DeviceB-security-policy-ip-1-ipseclocalout] source-ip-host 1.1.1.1
[DeviceB-security-policy-ip-1-ipseclocalout] destination-ip-host 2.2.2.2
[DeviceB-security-policy-ip-1-ipseclocalout] action pass
[DeviceB-security-policy-ip-1-ipseclocalout] quit
```

# Configure a rule named **ipseclocalin** to allow Device B to receive the IPsec negotiation packets sent from Device A.

```
[DeviceB-security-policy-ip] rule name ipseclocalin
[DeviceB-security-policy-ip-2-ipseclocalin] source-zone untrust
[DeviceB-security-policy-ip-2-ipseclocalin] destination-zone local
[DeviceB-security-policy-ip-2-ipseclocalin] source-ip-host 2.2.2.2
[DeviceB-security-policy-ip-2-ipseclocalin] destination-ip-host 1.1.1.1
[DeviceB-security-policy-ip-2-ipseclocalin] action pass
[DeviceB-security-policy-ip-2-ipseclocalin] quit
```

b. Configure rules to permit traffic between Host B and Host A:

# Configure a rule named **trust-untrust** to permit the packets from Host B to Host A.

```
[DeviceB-security-policy-ip] rule name trust-untrust
[DeviceB-security-policy-ip-3-trust-untrust] source-zone trust
[DeviceB-security-policy-ip-3-trust-untrust] destination-zone untrust
[DeviceB-security-policy-ip-3-trust-untrust] source-ip-subnet 5.5.5.0 24
[DeviceB-security-policy-ip-3-trust-untrust] destination-ip-subnet 4.4.4.0 24
[DeviceB-security-policy-ip-3-trust-untrust] action pass
[DeviceB-security-policy-ip-3-trust-untrust] quit
```

# Configure a rule named **untrust-trust** to permit the packets from Host A to Host B.

```
[DeviceB-security-policy-ip] rule name untrust-trust
[DeviceB-security-policy-ip-4-untrust-trust] source-zone untrust
[DeviceB-security-policy-ip-4-untrust-trust] destination-zone trust
[DeviceB-security-policy-ip-4-untrust-trust] source-ip-subnet 4.4.4.0 24
[DeviceB-security-policy-ip-4-untrust-trust] destination-ip-subnet 5.5.5.0 24
[DeviceB-security-policy-ip-4-untrust-trust] action pass
[DeviceB-security-policy-ip-4-untrust-trust] quit
[DeviceB-security-policy-ip] quit
```

5. Configure an ACL to define the data flows to be protected by IPsec. IPsec RRI generates routes based on this ACL, too.

# Configure ACL 3000 to protect data from subnet 5.5.5.0/24 to subnet 4.4.4.0/24.

```
[DeviceB] acl advanced 3000
[DeviceB-acl-ipv4-adv-3000] rule permit ip source 5.5.5.0 0.0.0.255 destination 4.4.4.0 0.0.0.255
[DeviceB-acl-ipv4-adv-3000] quit
```

6. Configure an IPsec transform set to specify the packet encapsulation mode, security protocols, and algorithms.

The IPsec transform set settings at both sides of the IPsec tunnel must be the same.

```
[DeviceB] ipsec transform-set tran1
[DeviceB-ipsec-transform-set-tran1] encapsulation-mode tunnel
[DeviceB-ipsec-transform-set-tran1] protocol esp
[DeviceB-ipsec-transform-set-tran1] esp encryption-algorithm des
[DeviceB-ipsec-transform-set-tran1] esp authentication-algorithm sha1
[DeviceB-ipsec-transform-set-tran1] quit
```

7. Configure an IKE keychain to specify the key information used for IKE communication.

   The preshared key used by both sides of a communication must be the same.

   ```
   [DeviceB] ike keychain key1
   [DeviceB-ike-keychain-key1] pre-shared-key address 1.1.1.1 key simple 123
   [DeviceB-ike-keychain-key1] quit
   ```

8. Configure an IKE profile to specify the security parameters used for setting up IKE SAs.

   ```
   [DeviceB] ike profile profile1
   [DeviceB-ike-profile-profile1] keychain key1
   [DeviceB-ike-profile-profile1] match remote identity address 1.1.1.1 255.255.255.0
   [DeviceB-ike-profile-profile1] quit
   ```

9. Configure an IKE-based IPsec policy to establish an IPsec tunnel to protect the specified data.

   # Create an IKE-based IPsec policy entry named **map1** and configure the following settings for the policy entry:

   - Set the sequence number to 10.
   - Specify transform set **tran1** and ACL 3000.
   - Specify the remote IP address for the tunnel as 1.1.1.1.
   - Specify IKE profile **profile1**.

   ```
   [DeviceB] ipsec policy map1 10 isakmp
   [DeviceB-ipsec-policy-isakmp-map1-10] transform-set tran1
   [DeviceB-ipsec-policy-isakmp-map1-10] security acl 3000
   [DeviceB-ipsec-policy-isakmp-map1-10] remote-address 1.1.1.1
   [DeviceB-ipsec-policy-isakmp-map1-10] ike-profile profile1
   [DeviceB-ipsec-policy-isakmp-map1-10] quit
   ```

10. Configure an IKE proposal to specify the security parameters for IKE negotiation.

    # Create an IKE proposal named **1**, and specify **3DES** as the encryption algorithm, **HMAC-SHA1** as the authentication algorithm, and **pre-share** as the authentication method.

    ```
    [DeviceB] ike proposal 1
    [DeviceB-ike-proposal-1] encryption-algorithm 3des-cbc
    [DeviceB-ike-proposal-1] authentication-algorithm sha
    [DeviceB-ike-proposal-1] authentication-method pre-share
    [DeviceB-ike-proposal-1] quit
    ```

11. Apply the IPsec policy to GigabitEthernet 1/0/1 to protect traffic on the interface.

    ```
    [DeviceB] interface gigabitethernet 1/0/1
    [DeviceB-GigabitEthernet1/0/1] ipsec apply policy map1
    [DeviceB-GigabitEthernet1/0/1] quit
    ```

    Make sure Device B has a route to the peer private network, with the outgoing interface as GigabitEthernet 1/0/1.

Configuring Device C and Device D

Configure Device C and Device D in the same way Device B is configured.

Verifying the configuration

1. Verify that IPsec RRI can automatically create a static route from Device A to Device B:

   # Initiate a connection from subnet 5.5.5.0/24 to subnet 4.4.4.0/24. IKE negotiation is triggered to establish IPsec SAs between Device A and Device B. (Details not shown.)

   # Verify that IPsec SAs are established on Device A.

```
[DeviceA] display ipsec sa
-------------------------------
Interface: GigabitEthernet1/0/1
-------------------------------

  -----------------------------
  IPsec policy: map1
  Sequence number: 10
  Mode: Template
  -----------------------------
    Tunnel id: 0
    Encapsulation mode: tunnel
    Perfect Forward Secrecy:
    Inside VPN:
    Extended Sequence Numbers enable: N
    Traffic Flow Confidentiality enable: N
    Transmitting entity: Initiator
    Path MTU: 1463
    Tunnel:
        local  address: 1.1.1.1
        remote address: 2.2.2.2
    Flow:
    sour addr: 4.4.4.0/255.255.255.0  port: 0  protocol: ip
    dest addr: 5.5.5.0/255.255.255.0  port: 0  protocol: ip

      Status: Active

    [Outbound ESP SAs]
      SPI: 4011716027 (0xef1dedbb)
      Connection ID: 2
      Transform set: ESP-ENCRYPT-DES-CBC ESP-AUTH-SHA1
      SA duration (kilobytes/sec): 1843200/3600
      SA remaining duration (kilobytes/sec): 1843199/3590
```

```
Max sent sequence-number: 4
UDP encapsulation used for NAT traversal: N
Status: Active
```

# Verify that IPsec RRI has created a static route to reach Device B.

```
[DeviceA] display ip routing-table verbose
```

2. Verify that Device A can automatically create static routes to Device C and Device D in the same way that you verify the IPsec RRI feature by using Device A and Device B. (Details not shown.)

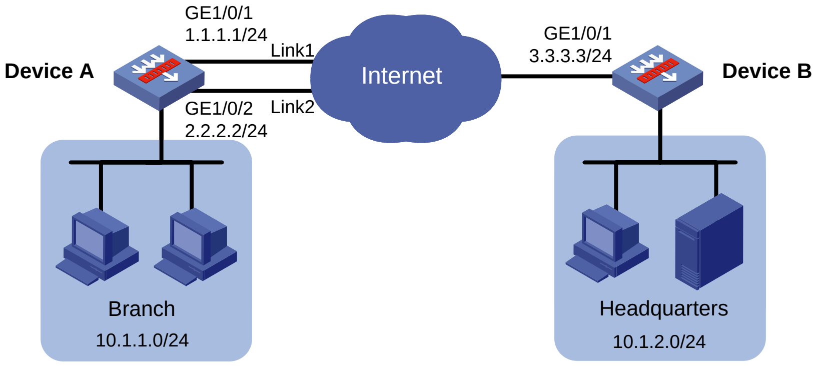
Example: Configuring IPsec smart link selection

Network configuration

As shown in Figure 24, Device A acts the IPsec gateway of the branch. Device B is the IPsec gateway of the headquarters. Configure IPsec smart link selection so the branch can establish an IPsec tunnel to the headquarters over link 1 or link 2, whichever has a better link quality.

- Device A first uses link 1 to establish the IPsec tunnel.
- When link 1 suffers high packet loss ratio or delay, Device A automatically switches traffic to the IPsec tunnel established based on link 2.

Figure 24 Network diagram



Configuring Device A

1. Configure the IP addresses and gateway addresses for GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2:

# Configure an IP address for GigabitEthernet 1/0/1 and specify the gateway address for the interface. This example uses 1.1.1.3 as the gateway address.

```
<DeviceA> system-view
[DeviceA] interface gigabitethernet 1/0/1
[DeviceA-GigabitEthernet1/0/1] ip address 1.1.1.1 24
[DeviceA-GigabitEthernet1/0/1] gateway 1.1.1.3
[DeviceA-GigabitEthernet1/0/1] quit
```

# Configure an IP address for GigabitEthernet 1/0/2 and specify the gateway address for the interface. This example uses 2.2.2.3 as the gateway address.

```
[DeviceA] interface gigabitethernet 1/0/2
[DeviceA-GigabitEthernet1/0/2] ip address 2.2.2.2 24
[DeviceA-GigabitEthernet1/0/2] gateway 2.2.2.3
[DeviceA-GigabitEthernet1/0/2] quit
```

2. Add interfaces to security zones.

```
[DeviceA] security-zone name trust
```

```
[DeviceA-security-zone-Trust] import interface gigabitethernet 1/0/3
[DeviceA-security-zone-Trust] quit
[DeviceA] security-zone name untrust
[DeviceA-security-zone-Untrust] import interface gigabitethernet 1/0/1
[DeviceA-security-zone-Untrust] import interface gigabitethernet 1/0/2
[DeviceA-security-zone-Untrust] quit
```

3. Configure a security policy:
   a. Configure rules to permit traffic between the **Untrust** and **Local** security zones, so the devices can set up an IPsec tunnel:

      # Configure a rule named **ipseclocalout** to allow Device A to send IPsec negotiation packets to Device B.

      ```
      [DeviceA] security-policy ip
      [DeviceA-security-policy-ip] rule name ipseclocalout
      [DeviceA-security-policy-ip-1-ipseclocalout] source-zone local
      [DeviceA-security-policy-ip-1-ipseclocalout] destination-zone untrust
      [DeviceA-security-policy-ip-1-ipseclocalout] source-ip-host 1.1.1.1
      [DeviceA-security-policy-ip-1-ipseclocalout] source-ip-host 2.2.2.2
      [DeviceA-security-policy-ip-1-ipseclocalout] destination-ip-host 3.3.3.3
      [DeviceA-security-policy-ip-1-ipseclocalout] action pass
      [DeviceA-security-policy-ip-1-ipseclocalout] quit
      ```

      # Configure a rule named **ipseclocalin** to allow Device A to receive the IPsec negotiation packets sent from Device B.

      ```
      [DeviceA-security-policy-ip] rule name ipseclocalin
      [DeviceA-security-policy-ip-2-ipseclocalin] source-zone untrust
      [DeviceA-security-policy-ip-2-ipseclocalin] destination-zone local
      [DeviceA-security-policy-ip-2-ipseclocalin] source-ip-host 3.3.3.3
      [DeviceA-security-policy-ip-2-ipseclocalin] destination-ip-host 1.1.1.1
      [DeviceA-security-policy-ip-2-ipseclocalin] destination-ip-host 2.2.2.2
      [DeviceA-security-policy-ip-2-ipseclocalin] action pass
      [DeviceA-security-policy-ip-2-ipseclocalin] quit
      ```

   b. Configure rules to permit the traffic between Host A and Host B:

      # Configure a rule named **trust-untrust** to permit the packets from Host A to Host B.

      ```
      [DeviceA-security-policy-ip] rule name trust-untrust
      [DeviceA-security-policy-ip-3-trust-untrust] source-zone trust
      [DeviceA-security-policy-ip-3-trust-untrust] destination-zone untrust
      [DeviceA-security-policy-ip-3-trust-untrust] source-ip-subnet 10.1.1.0 24
      [DeviceA-security-policy-ip-3-trust-untrust] destination-ip-subnet 10.1.2.0 24
      [DeviceA-security-policy-ip-3-trust-untrust] action pass
      [DeviceA-security-policy-ip-3-trust-untrust] quit
      ```

      # Configure a rule named **untrust-trust** to permit the packets from Host B to Host A.

      ```
      [DeviceA-security-policy-ip] rule name untrust-trust
      [DeviceA-security-policy-ip-4-untrust-trust] source-zone untrust
      [DeviceA-security-policy-ip-4-untrust-trust] destination-zone trust
      [DeviceA-security-policy-ip-4-untrust-trust] source-ip-subnet 10.1.2.0 24
      [DeviceA-security-policy-ip-4-untrust-trust] destination-ip-subnet 10.1.1.0 24
      [DeviceA-security-policy-ip-4-untrust-trust] action pass
      [DeviceA-security-policy-ip-4-untrust-trust] quit
      [DeviceA-security-policy-ip] quit
      ```

4. Configure an IPsec smart link policy, so that the device can select a qualified link to establish an IPsec tunnel with the headquarters.

```
[DeviceA] ipsec smart-link policy policy1
[DeviceA-ipsec-smart-link-policy-policy1] link 1 interface gigabitethernet 1/0/1
remote 3.3.3.3
[DeviceA-ipsec-smart-link-policy-policy1] link 2 interface gigabitethernet 1/0/2
remote 3.3.3.3
[DeviceA-ipsec-smart-link-policy-policy1] link-switch cycles 4
[DeviceA-ipsec-smart-link-policy-policy1] smart-link enable
[DeviceA-ipsec-smart-link-policy-policy1] quit
```

5. Configure an ACL to define the data flows to be protected by IPsec.

```
[DeviceA] acl advanced 3000
[DeviceA-acl-ipv4-adv-3000] rule permit ip source 10.1.1.0 0.0.0.255 destination
10.1.2.0 0.0.0.255
[DeviceA-acl-ipv4-adv-3000] quit
```

6. Configure an IPsec transform set to specify the packet encapsulation mode, security protocols, and algorithms.

   The IPsec transform set settings at both sides of the IPsec tunnel must be the same.

```
[DeviceA] ipsec transform-set tran1
[DeviceA-ipsec-transform-set-tran1] encapsulation-mode tunnel
[DeviceA-ipsec-transform-set-tran1] protocol esp
[DeviceA-ipsec-transform-set-tran1] esp encryption-algorithm aes-cbc-128
[DeviceA-ipsec-transform-set-tran1] esp authentication-algorithm sha1
[DeviceA-ipsec-transform-set-tran1] quit
```

7. Configure an IKE keychain to specify the key information used for IKE communication.

   The preshared key used by both sides of the communication must be the same.

```
[DeviceA] ike keychain keychain1
[DeviceA-ike-keychain-keychain1] pre-shared-key address 3.3.3.3 24 key simple 123456
[DeviceA-ike-keychain-keychain1] quit
```

8. Configure an IKE profile to specify the security parameters used for setting up IKE SAs.

```
[DeviceA] ike profile profile1
[DeviceA-ike-profile-profile1] keychain keychain1
[DeviceA-ike-profile-profile1] match remote identity address 3.3.3.3 24
[DeviceA-ike-profile-profile1] quit
```

9. Configure an IPsec policy, so as to establish the IPsec tunnel to protect data.

```
[DeviceA] ipsec policy policy1 10 isakmp
[DeviceA-ipsec-policy-isakmp-policy1-10] security acl 3000
[DeviceA-ipsec-policy-isakmp-policy1-10] transform-set tran1
[DeviceA-ipsec-policy-isakmp-policy1-10] ike-profile profile1
[DeviceA-ipsec-policy-isakmp-policy1-10] smart-link policy policy1
[DeviceA-ipsec-policy-isakmp-policy1-10] quit
```

Configuring Device B

1. Assign an IP address to interface GigabitEthernet 1/0/1, and configure the gateway address. In this example, the gateway address is the direct next hop address 3.3.3.4.

```
<DeviceB> system-view
[DeviceB] interface gigabitethernet 1/0/1
[DeviceB-GigabitEthernet1/0/1] ip address 3.3.3.3 24
[DeviceB-GigabitEthernet1/0/1] gateway 3.3.3.4
```

```
[DeviceB-GigabitEthernet1/0/1] quit
```

2. Add interfaces to security zones.

```
[DeviceB] security-zone name trust
[DeviceB-security-zone-Trust] import interface gigabitethernet 1/0/2
[DeviceB-security-zone-Trust] quit
[DeviceB] security-zone name untrust
[DeviceB-security-zone-Untrust] import interface gigabitethernet 1/0/1
[DeviceB-security-zone-Untrust] quit
```

3. Configure a security policy:

   a. Configure rules to permit traffic between the **Untrust** and **Local** security zones, so the devices can set up an IPsec tunnel:

   # Configure a rule named **ipseclocalout** to allow Device B to send IPsec negotiation packets to Device A.

```
[DeviceB] security-policy ip
[DeviceB-security-policy-ip] rule name ipseclocalout
[DeviceB-security-policy-ip-1-ipseclocalout] source-zone local
[DeviceB-security-policy-ip-1-ipseclocalout] destination-zone untrust
[DeviceB-security-policy-ip-1-ipseclocalout] source-ip-host 3.3.3.3
[DeviceB-security-policy-ip-1-ipseclocalout] destination-ip-host 1.1.1.1
[DeviceB-security-policy-ip-1-ipseclocalout] destination-ip-host 2.2.2.2
[DeviceB-security-policy-ip-1-ipseclocalout] action pass
[DeviceB-security-policy-ip-1-ipseclocalout] quit
```

   # Configure a rule named **ipseclocalin** to allow Device B to receive the IPsec negotiation packets sent from Device A.

```
[DeviceB-security-policy-ip] rule name ipseclocalin
[DeviceB-security-policy-ip-2-ipseclocalin] source-zone untrust
[DeviceB-security-policy-ip-2-ipseclocalin] destination-zone local
[DeviceB-security-policy-ip-2-ipseclocalin] source-ip-host 1.1.1.1
[DeviceB-security-policy-ip-2-ipseclocalin] source-ip-host 2.2.2.2
[DeviceB-security-policy-ip-2-ipseclocalin] destination-ip-host 3.3.3.3
[DeviceB-security-policy-ip-2-ipseclocalin] action pass
[DeviceB-security-policy-ip-2-ipseclocalin] quit
```

   b. Configure rules to permit the traffic between Host A and Host B:

   # Configure a rule named **trust-untrust** to permit the packets from Host B to Host A.

```
[DeviceB-security-policy-ip] rule name trust-untrust
[DeviceB-security-policy-ip-3-trust-untrust] source-zone trust
[DeviceB-security-policy-ip-3-trust-untrust] destination-zone untrust
[DeviceB-security-policy-ip-3-trust-untrust] source-ip-subnet 10.1.2.0 24
[DeviceB-security-policy-ip-3-trust-untrust] destination-ip-subnet 10.1.1.0 24
[DeviceB-security-policy-ip-3-trust-untrust] action pass
[DeviceB-security-policy-ip-3-trust-untrust] quit
```

   # Configure a rule named **untrust-trust** to permit the packets from Host A to Host B.

```
[DeviceB-security-policy-ip] rule name untrust-trust
[DeviceB-security-policy-ip-4-untrust-trust] source-zone untrust
[DeviceB-security-policy-ip-4-untrust-trust] destination-zone trust
[DeviceB-security-policy-ip-4-untrust-trust] source-ip-subnet 10.1.1.0 24
[DeviceB-security-policy-ip-4-untrust-trust] destination-ip-subnet 10.1.2.0 24
[DeviceB-security-policy-ip-4-untrust-trust] action pass
```

```
[DeviceB-security-policy-ip-4-untrust-trust] quit
[DeviceB-security-policy-ip] quit
```

4. Configure an ACL to define the data flows to be protected by IPsec.

```
[DeviceB] acl advanced 3000
[DeviceB-acl-ipv4-adv-3000] rule permit ip source 10.1.2.0 0.0.0.255 destination 10.1.1.0 0.0.0.255
[DeviceB-acl-ipv4-adv-3000] rule permit ip source 3.3.3.0 0.0.0.255 destination 1.1.1.0 0.0.0.255
[DeviceB-acl-ipv4-adv-3000] rule permit ip source 3.3.3.0 0.0.0.255 destination 2.2.2.0 0.0.0.255
[DeviceB-acl-ipv4-adv-3000] quit
```

5. Configure an IPsec transform set to specify the packet encapsulation mode, security protocols, and algorithms.

   The IPsec transform set settings at both sides of the IPsec tunnel must be the same.

```
[DeviceB] ipsec transform-set tran1
[DeviceB-ipsec-transform-set-tran1] encapsulation-mode tunnel
[DeviceB-ipsec-transform-set-tran1] protocol esp
[DeviceB-ipsec-transform-set-tran1] esp encryption-algorithm aes-cbc-128
[DeviceB-ipsec-transform-set-tran1] esp authentication-algorithm sha1
[DeviceB-ipsec-transform-set-tran1] quit
```

6. Configure an IKE keychain to specify the key information used for IKE communication.

   The preshared key used by both sides of the communication must be the same.

```
[DeviceB] ike keychain keychain1
[DeviceB-ike-keychain-keychain1] pre-shared-key address 0.0.0.0 0 key simple 123456
[DeviceB-ike-keychain-keychain1] quit
```

7. Configure an IKE profile to specify the security parameters used for setting up IKE SAs.

```
[DeviceB] ike profile profile1
[DeviceB-ike-profile-profile1] keychain keychain1
[DeviceB-ike-profile-profile1] match remote identity address 0.0.0.0 0
[DeviceB-ike-profile-profile1] quit
```

8. Configure an IPsec policy template, which is used to create IPsec policies.

```
[DeviceB] ipsec policy-template template1 10
[DeviceB-ipsec-policy-template-template1-10] security acl 3000
[DeviceB-ipsec-policy-template-template1-10] transform-set tran1
[DeviceB-ipsec-policy-template-template1-10] local-address 3.3.3.3
[DeviceB-ipsec-policy-template-template1-10] ike-profile profile1
[DeviceB-ipsec-policy-template-template1-10] quit
```

9. Create an IKE-based IPsec policy by using IPsec policy template **template1**, so as to establish the IPsec tunnel to proctect data.

```
[DeviceB] ipsec policy policy1 10 isakmp template template1
```

10. Apply the IPsec policy to GigabitEthernet 1/0/1 to protect traffic on the interface.

```
[DeviceB] interface gigabitethernet 1/0/1
[DeviceB-GigabitEthernet1/0/1] ipsec apply policy policy1
[DeviceB-GigabitEthernet1/0/1] quit
```

Verifying the configuration

# Display IPsec smart link policy information on Device A.

```
[DeviceA] display ipsec smart-link policy
---------------------------------------------------------------------------
```

```
Policy name                  : policy1
State                        :Enabled
Probe count                  :10
Probe interval               :1 sec
Probe source IP address      :1.1.1.1
Probe destination IP address :3.3.3.3
Max link switch cycles       :4
IPsec policy name            :policy1
Interface                    :GigabitEthernet1/0/1
IPsec policy sequence number :10
Link ID   Local address   Remote address   Loss(%)   Delay(ms)   State
1         1.1.1.1         3.3.3.3          0.0         1.0       Active
2         2.2.2.2         3.3.3.3          25.0        1.0       Inactive
---------------------------------------------------------------------------
```

# Display information about the IPsec policy to which IPsec smart link policy **policy1** is applied.

```
[DeviceA] display ipsec policy
-------------------------------------------
IPsec Policy: policy1
Interface: GigabitEthernet1/0/1
-------------------------------------------

  -----------------------------
  Sequence number: 10
  Mode: ISAKMP
  -----------------------------
  Traffic Flow Confidentiality: Disabled
  Security data flow: 3000
  Selector mode: standard
  Local address: 1.1.1.1
  Remote address: 3.3.3.3
  Transform set:  tran1
  IKE profile: profile1
  IKEv2 profile:
  smart-link policy: policy1
  SA trigger mode: Auto
  SA duration(time based): 3600 seconds
  SA duration(traffic based): 1843200 kilobytes
  SA idle time: 100 seconds
```

# Display the ACL rules in the ACL used by IPsec policy **policy1**.

```
[DeviceA] display acl 3000
Advanced IPv4 ACL 3000, 3 rules,
ACL's step is 5
rule 0 permit ip source 10.1.1.0 0.0.0.255 destination 10.1.2.0 0.0.0.255
rule 5 permit ip source 1.1.1.0 0.0.0.255 destination 3.3.3.3 0 (Dynamic) (10 times matched)
```

The command output shows that an ACL rule (rule 5) is automatically added to permit the link quality probe packets.

# Verify that IPsec SAs are established on Device A.

```
[DeviceA]display ipsec sa
```

```

      UDP encapsulation used for NAT traversal: N
      Status: Active
```

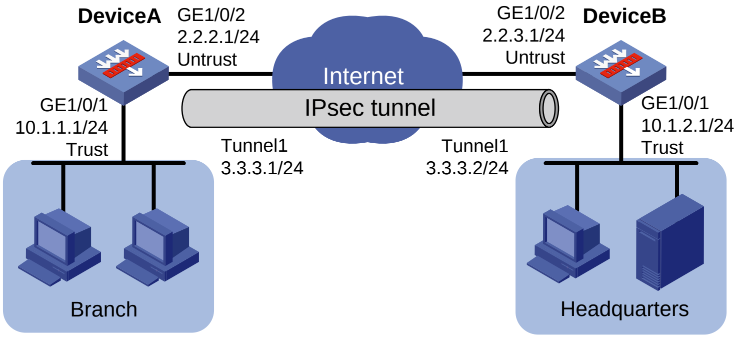
Example: Configuring IPsec tunnel interface-based IPsec for IPv4 packets (preshared key authentication)

Network configuration

As shown in Figure 25, both the branch and the headquarters use fixed IP addresses to access the Internet.

Configure IPsec tunnel interface-based IPsec on Device A and Device B to protect the traffic between the branch (10.1.1.0/24) and the headquarters (10.1.2.0/24). This IPsec implementation ensures that the IPsec configuration of the headquarters remains stable despite of changes of the branch subnet.

Figure 25 Network diagram



Configuring Device A

1. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

   ```
   <DeviceA> system-view
   [DeviceA] interface gigabitethernet 1/0/1
   [DeviceA-GigabitEthernet1/0/1] ip address 10.1.1.1 255.255.255.0
   [DeviceA-GigabitEthernet1/0/1] quit
   ```

   # Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Configure settings for routing.

   This example configures static routes.

   # Configure static routes to reach the headquarters' gateway and network. The next hop in the routes is 2.2.2.2.

   ```
   [DeviceA] ip route-static 10.1.2.0 24 2.2.2.2
   [DeviceA] ip route-static 2.2.3.1 24 2.2.2.2
   ```

   # Configure a static route to direct the traffic to be protected to the IPsec tunnel interface.

   ```
   [DeviceA] ip route-static 10.1.2.0 255.255.255.0 tunnel 1
   ```

3. Add interfaces to security zones.

   ```
   [DeviceA] security-zone name trust
   [DeviceA-security-zone-Trust] import interface gigabitethernet 1/0/1
   [DeviceA-security-zone-Trust] quit
   [DeviceA] security-zone name untrust
   [DeviceA-security-zone-Untrust] import interface gigabitethernet 1/0/2
   [DeviceA-security-zone-Untrust] import interface tunnel 1
   [DeviceA-security-zone-Untrust] quit
   ```

4. Configure a security policy:

a. Configure rules to permit traffic between the **Untrust** and **Local** security zones, so the devices can set up an IPsec tunnel:

# Configure a rule named **ipseclocalout** to allow Device A to send IPsec negotiation packets to Device B.

```
[DeviceA] security-policy ip
[DeviceA-security-policy-ip] rule name ipseclocalout
[DeviceA-security-policy-ip-1-ipseclocalout] source-zone local
[DeviceA-security-policy-ip-1-ipseclocalout] destination-zone untrust
[DeviceA-security-policy-ip-1-ipseclocalout] source-ip-host 2.2.2.1
[DeviceA-security-policy-ip-1-ipseclocalout] destination-ip-host 2.2.3.1
[DeviceA-security-policy-ip-1-ipseclocalout] action pass
[DeviceA-security-policy-ip-1-ipseclocalout] quit
```

# Configure a rule named **ipseclocalin** to allow Device A to receive the IPsec negotiation packets sent from Device B.

```
[DeviceA-security-policy-ip] rule name ipseclocalin
[DeviceA-security-policy-ip-2-ipseclocalin] source-zone untrust
[DeviceA-security-policy-ip-2-ipseclocalin] destination-zone local
[DeviceA-security-policy-ip-2-ipseclocalin] source-ip-host 2.2.3.1
[DeviceA-security-policy-ip-2-ipseclocalin] destination-ip-host 2.2.2.1
[DeviceA-security-policy-ip-2-ipseclocalin] action pass
[DeviceA-security-policy-ip-2-ipseclocalin] quit
```

b. Configure rules to permit the traffic between Host A and Host B:

# Configure a rule named **trust-untrust** to permit the packets from Host A to Host B.

```
[DeviceA-security-policy-ip] rule name trust-untrust
[DeviceA-security-policy-ip-3-trust-untrust] source-zone trust
[DeviceA-security-policy-ip-3-trust-untrust] destination-zone untrust
[DeviceA-security-policy-ip-3-trust-untrust] source-ip-subnet 10.1.1.0 24
[DeviceA-security-policy-ip-3-trust-untrust] destination-ip-subnet 10.1.2.0 24
[DeviceA-security-policy-ip-3-trust-untrust] action pass
[DeviceA-security-policy-ip-3-trust-untrust] quit
```

# Configure a rule named **untrust-trust** to permit the packets from Host B to Host A.

```
[DeviceA-security-policy-ip] rule name untrust-trust
[DeviceA-security-policy-ip-4-untrust-trust] source-zone untrust
[DeviceA-security-policy-ip-4-untrust-trust] destination-zone trust
[DeviceA-security-policy-ip-4-untrust-trust] source-ip-subnet 10.1.2.0 24
[DeviceA-security-policy-ip-4-untrust-trust] destination-ip-subnet 10.1.1.0 24
[DeviceA-security-policy-ip-4-untrust-trust] action pass
[DeviceA-security-policy-ip-4-untrust-trust] quit
[DeviceA-security-policy-ip] quit
```

5. Configure an IPsec profile to establish an IPsec tunnel to protect the specified data.

```
[DeviceA] ike keychain abc
[DeviceA-ike-keychain-abc] pre-shared-key address 2.2.3.1 255.255.255.0 key simple
123456TESTplat&!
[DeviceA-ike-keychain-abc] quit
[DeviceA] ike profile abc
[DeviceA-ike-profile-abc] keychain abc
[DeviceA-ike-profile-abc] local-identity address 2.2.2.1
[DeviceA-ike-profile-abc] match remote identity address 2.2.3.1 24
[DeviceA-ike-profile-abc] exchange-mode aggressive
```

```
[DeviceA-ike-profile-abc] quit
[DeviceA] ipsec transform-set abc
[DeviceA-ipsec-transform-set-abc] esp encryption-algorithm aes-cbc-128
[DeviceA-ipsec-transform-set-abc] esp authentication-algorithm sha1
[DeviceA-ipsec-transform-set-abc] quit
[DeviceA] ipsec profile abc isakmp
[DeviceA-ipsec-profile-isakmp-abc] transform-set abc
[DeviceA-ipsec-profile-isakmp-abc] ike-profile abc
[DeviceA-ipsec-profile-isakmp-abc] quit
```

6. Configure an IPsec tunnel interface, which encapsulates the traffic to be protected with IPsec.

```
[DeviceA] interface tunnel 1 mode ipsec
[DeviceA-Tunnel1] ip address 3.3.3.1 255.255.255.0
[DeviceA-Tunnel1] source 2.2.2.1
[DeviceA-Tunnel1] destination 2.2.3.1
[DeviceA-Tunnel1] tunnel protection ipsec profile abc
[DeviceA-Tunnel1] quit
```

Configuring Device B

1. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

```
<DeviceB> system-view
[DeviceB] interface gigabitethernet 1/0/1
[DeviceB-GigabitEthernet1/0/1] ip address 10.1.2.1 255.255.255.0
[DeviceB-GigabitEthernet1/0/1] quit
```

   # Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Configure settings for routing.

   This example configures static routes

   # Configure static routes to reach the branch's gateway and network. The next hop in the routes is 2.2.3.2.

```
[DeviceB] ip route-static 10.1.1.0 24 2.2.3.2
[DeviceB] ip route-static 2.2.2.1 24 2.2.3.2
```

   # Configure a static route to direct the traffic to be protected to the IPsec tunnel interface.

```
[DeviceA] ip route-static 10.1.1.0 255.255.255.0 tunnel 1
```

3. Add interfaces to security zones.

```
[DeviceB] security-zone name trust
[DeviceB-security-zone-Trust] import interface gigabitethernet 1/0/1
[DeviceB-security-zone-Trust] quit
[DeviceB] security-zone name untrust
[DeviceB-security-zone-Untrust] import interface gigabitethernet 1/0/2
[DeviceA-security-zone-Untrust] import interface tunnel 1
[DeviceB-security-zone-Untrust] quit
```

4. Configure a security policy:

   a. Configure rules to permit traffic between the **Untrust** and **Local** security zones, so the devices can set up an IPsec tunnel:

      # Configure a rule named **ipseclocalout** to allow Device B to send IPsec negotiation packets to Device A.

```
[DeviceB] security-policy ip
[DeviceB-security-policy-ip] rule name ipseclocalout
```

```
[DeviceB-security-policy-ip-1-ipseclocalout] source-zone local
[DeviceB-security-policy-ip-1-ipseclocalout] destination-zone untrust
[DeviceB-security-policy-ip-1-ipseclocalout] source-ip-host 2.2.3.1
[DeviceB-security-policy-ip-1-ipseclocalout] destination-ip-host 2.2.2.1
[DeviceB-security-policy-ip-1-ipseclocalout] action pass
[DeviceB-security-policy-ip-1-ipseclocalout] quit
```

# Configure a rule named **ipseclocalin** to allow Device B to receive the IPsec negotiation packets sent from Device A.

```
[DeviceB-security-policy-ip] rule name ipseclocalin
[DeviceB-security-policy-ip-2-ipseclocalin] source-zone untrust
[DeviceB-security-policy-ip-2-ipseclocalin] destination-zone local
[DeviceB-security-policy-ip-2-ipseclocalin] source-ip-host 2.2.2.1
[DeviceB-security-policy-ip-2-ipseclocalin] destination-ip-host 2.2.3.1
[DeviceB-security-policy-ip-2-ipseclocalin] action pass
[DeviceB-security-policy-ip-2-ipseclocalin] quit
```

b. Configure rules to permit traffic between Host B and Host A:

# Configure a rule named **trust-untrust** to permit the packets from Host B to Host A.

```
[DeviceB-security-policy-ip] rule name trust-untrust
[DeviceB-security-policy-ip-3-trust-untrust] source-zone trust
[DeviceB-security-policy-ip-3-trust-untrust] destination-zone untrust
[DeviceB-security-policy-ip-3-trust-untrust] source-ip-subnet 10.1.2.0 24
[DeviceB-security-policy-ip-3-trust-untrust] destination-ip-subnet 10.1.1.0 24
[DeviceB-security-policy-ip-3-trust-untrust] action pass
[DeviceB-security-policy-ip-3-trust-untrust] quit
```

# Configure a rule named **untrust-trust** to permit the packets from Host A to Host B.

```
[DeviceB-security-policy-ip] rule name untrust-trust
[DeviceB-security-policy-ip-4-untrust-trust] source-zone untrust
[DeviceB-security-policy-ip-4-untrust-trust] destination-zone trust
[DeviceB-security-policy-ip-4-untrust-trust] source-ip-subnet 10.1.1.0 24
[DeviceB-security-policy-ip-4-untrust-trust] destination-ip-subnet 10.1.2.0 24
[DeviceB-security-policy-ip-4-untrust-trust] action pass
[DeviceB-security-policy-ip-4-untrust-trust] quit
[DeviceB-security-policy-ip] quit
```

5. Configure an IPsec profile to establish an IPsec tunnel to protect the specified data.

```
[DeviceB] ike keychain abc
[DeviceB-ike-keychain-abc] pre-shared-key address 2.2.2.1 255.255.255.0 key simple
123456TESTplat&!
[DeviceB-ike-keychain-abc] quit
[DeviceB] ike profile abc
[DeviceB-ike-profile-abc] keychain abc
[DeviceB-ike-profile-abc] local-identity address 2.2.3.1
[DeviceB-ike-profile-abc] match remote identity address 2.2.2.1 24
[DeviceB-ike-profile-abc] exchange-mode aggressive
[DeviceB-ike-profile-abc] quit
[DeviceB] ipsec transform-set abc
[DeviceB-ipsec-transform-set-abc] esp encryption-algorithm aes-cbc-128
[DeviceB-ipsec-transform-set-abc] esp authentication-algorithm sha1
[DeviceB-ipsec-transform-set-abc] quit
```

```
[DeviceB] ipsec profile abc isakmp
[DeviceB-ipsec-profile-isakmp-abc] transform-set abc
[DeviceB-ipsec-profile-isakmp-abc] ike-profile abc
[DeviceB-ipsec-profile-isakmp-abc] quit
```

6. Configure an IPsec tunnel interface, which encapsulates the traffic to be protected with IPsec.

```
[DeviceB] interface tunnel 1 mode ipsec
[DeviceB-Tunnel1] ip address 3.3.3.2 255.255.255.0
[DeviceB-Tunnel1] source 2.2.3.1
[DeviceB-Tunnel1] destination 2.2.2.1
[DeviceB-Tunnel1] tunnel protection ipsec profile abc
[DeviceB-Tunnel1] quit
```

Verifying the configuration

After the configuration is completed, Device A will automatically initiate IKE negotiation with Device B. After IKE negotiation succeeds, the tunnel interface will come up and traffic between the branch and the headquarters will be IPsec-protected. This example uses Device A to verify the configuration.

# Display brief IP configuration for interfaces on Device A.

```
<DeviceA> display ip interface brief
*down: administratively down
(s): spoofing  (l): loopback
Interface           Physical Protocol IP address/Mask    VPN instance Description

```

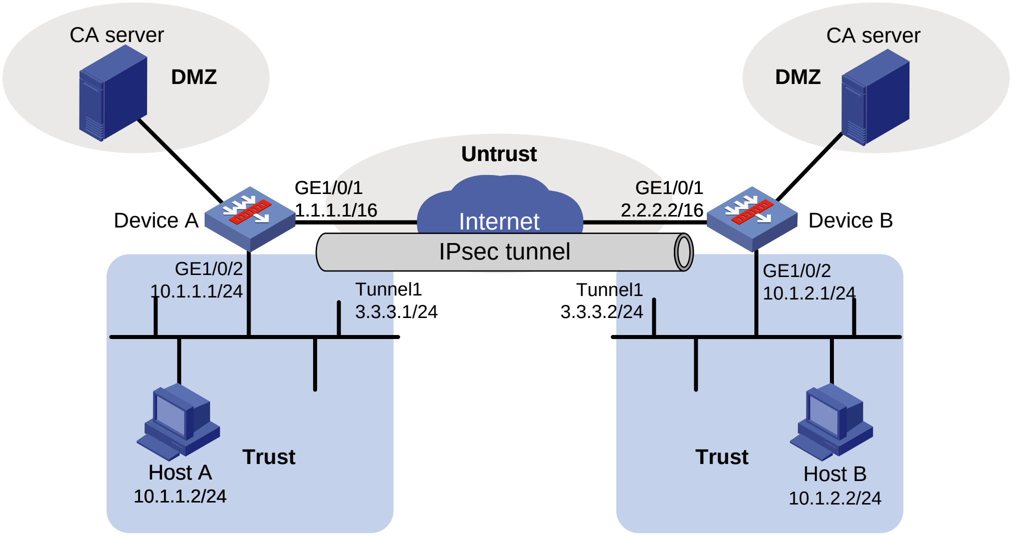
Example: Configuring IPsec tunnel interface-based IPsec for IPv4 packets (RSA signature authentication)

Network configuration

As shown in Figure 26, configure IPsec tunnel interface-based IPsec on Device A and Device B to protect the traffic between subnet 10.1.1.0/24 and subnet 10.1.2.0/24.

Configure Device A and Device B to use aggressive mode for IKE negotiation phase 1 and to use RSA signature authentication. Device A acts as the initiator, and the subnet where Device A resides uses IP addresses dynamically allocated.

Figure 26 Network diagram



Prerequisites

Device A has obtained CA certificate **ca.cer** and local certificate **server.pfx**.

Device B has obtained CA certificate **ca.cer** and local certificate **server.pfx**.

Configuring Device A

1. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

   ```
   <DeviceA> system-view
   [DeviceA] interface gigabitethernet 1/0/1
   [DeviceA-GigabitEthernet1/0/1] ip address 1.1.1.1 255.255.0.0
   [DeviceA-GigabitEthernet1/0/1] quit
   ```

   # Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Configure settings for routing.

   This example configures static routes, and the next hop in the routes is 1.1.1.2.

   ```
   [DeviceA] ip route-static 2.2.2.2 16 1.1.1.2
   ```

3. Add interfaces to security zones.

```
[DeviceA] security-zone name trust
[DeviceA-security-zone-Trust] import interface gigabitethernet 1/0/2
[DeviceA-security-zone-Trust] quit
[DeviceA] security-zone name untrust
[DeviceA-security-zone-Untrust] import interface gigabitethernet 1/0/1
[DeviceA-security-zone-Untrust] quit
```

4. Configure a security policy:
   a. Configure rules to permit traffic between the **Untrust** and **Local** security zones, so the devices can set up an IPsec tunnel:

      # Configure a rule named **ipseclocalout** to allow Device A to send IPsec negotiation packets to Device B.

```
[DeviceA] security-policy ip
[DeviceA-security-policy-ip] rule name ipseclocalout
[DeviceA-security-policy-ip-1-ipseclocalout] source-zone local
[DeviceA-security-policy-ip-1-ipseclocalout] destination-zone untrust
[DeviceA-security-policy-ip-1-ipseclocalout] source-ip-host 1.1.1.1
[DeviceA-security-policy-ip-1-ipseclocalout] destination-ip-host 2.2.2.2
[DeviceA-security-policy-ip-1-ipseclocalout] action pass
[DeviceA-security-policy-ip-1-ipseclocalout] quit
```

      # Configure a rule named **ipseclocalin** to allow Device A to receive the IPsec negotiation packets sent from Device B.

```
[DeviceA-security-policy-ip] rule name ipseclocalin
[DeviceA-security-policy-ip-2-ipseclocalin] source-zone untrust
[DeviceA-security-policy-ip-2-ipseclocalin] destination-zone local
[DeviceA-security-policy-ip-2-ipseclocalin] source-ip-host 2.2.2.2
[DeviceA-security-policy-ip-2-ipseclocalin] destination-ip-host 1.1.1.1
[DeviceA-security-policy-ip-2-ipseclocalin] action pass
[DeviceA-security-policy-ip-2-ipseclocalin] quit
```

   b. Configure rules to permit the traffic between Host A and Host B:

      # Configure a rule named **trust-untrust** to permit the packets from Host A to Host B.

```
[DeviceA-security-policy-ip] rule name trust-untrust
[DeviceA-security-policy-ip-3-trust-untrust] source-zone trust
[DeviceA-security-policy-ip-3-trust-untrust] destination-zone untrust
[DeviceA-security-policy-ip-3-trust-untrust] source-ip-subnet 10.1.1.0 24
[DeviceA-security-policy-ip-3-trust-untrust] destination-ip-subnet 10.1.2.0 24
[DeviceA-security-policy-ip-3-trust-untrust] action pass
[DeviceA-security-policy-ip-3-trust-untrust] quit
```

      # Configure a rule named **untrust-trust** to permit the packets from Host B to Host A.

```
[DeviceA-security-policy-ip] rule name untrust-trust
[DeviceA-security-policy-ip-4-untrust-trust] source-zone untrust
[DeviceA-security-policy-ip-4-untrust-trust] destination-zone trust
[DeviceA-security-policy-ip-4-untrust-trust] source-ip-subnet 10.1.2.0 24
[DeviceA-security-policy-ip-4-untrust-trust] destination-ip-subnet 10.1.1.0 24
[DeviceA-security-policy-ip-4-untrust-trust] action pass
[DeviceA-security-policy-ip-4-untrust-trust] quit
[DeviceA-security-policy-ip] quit
```

5. Configure an IPsec transform set to specify the packet encapsulation mode, security protocols, and algorithms.

The IPsec transform set settings at both sides of the IPsec tunnel must be the same.

```
[DeviceA] ipsec transform-set tran1
[DeviceA-ipsec-transform-set-tran1] encapsulation-mode tunnel
[DeviceA-ipsec-transform-set-tran1] protocol esp
[DeviceA-ipsec-transform-set-tran1] esp encryption-algorithm des-cbc
[DeviceA-ipsec-transform-set-tran1] esp authentication-algorithm sha1
[DeviceA-ipsec-transform-set-tran1] quit
```

6. Configure a PKI entity.

```
[DeviceA] pki entity entity1
[DeviceA-pki-entity-entity1] common-name devicea
[DeviceA-pki-entity-entity1] quit
```

7. Configure a PKI domain for certificate requests.

```
[DeviceA] pki domain domain1
[DeviceA-pki-domain-domain1] public-key rsa general name rsa1
[DeviceA-pki-domain-domain1] undo crl check enable
[DeviceA-pki-domain-domain1] quit
[DeviceA] pki import domain domain1 der ca filename ca.cer
[DeviceA] pki import domain domain1 p12 local filename server.pfx
```

8. Configure a certificate-based access control policy to control user access rights.

   A peer certificate is regarded valid only if it contains the specified string (**1** in this example) in the DN attribute of the subject name field.

```
[DeviceA] pki certificate access-control-policy policy1
[DeviceA-pki-cert-acp-policy1] rule 1 permit group1
[DeviceA] pki certificate attribute-group group1
[DeviceA-pki-cert-attribute-group-group1] attribute 1 subject-name dn ctn 1
```

9. Configure an IKE profile to specify the security parameters used for setting up IKE SAs.

```
[DeviceA] ike profile profile1
[DeviceA-ike-profile-profile1] certificate domain domain1
[DeviceA-ike-profile-profile1] exchange-mode aggressive
[DeviceA-ike-profile-profile1] local-identity dn
[DeviceA-ike-profile-profile1] match remote certificate policy1
[DeviceA-ike-profile-profile1] quit
```

10. Configure an IKE proposal to specify the parameters used for IKE negotiation.

```
[DeviceA] ike proposal 10
[DeviceA-ike-proposal-10] authentication-algorithm md5
[DeviceA-ike-proposal-10] authentication-method rsa-signature
[DeviceA-ike-proposal-10] quit
```

11. Configure an IPsec profile to establish an IPsec tunnel to protect the specified data:

```
[DeviceA] ipsec profile abc isakmp
[DeviceA-ipsec-profile-isakmp-abc] transform-set tran1
[DeviceA-ipsec-profile-isakmp-abc] ike-profile profile1
[DeviceA-ipsec-profile-isakmp-abc] quit
```

12. Configure an IPsec tunnel interface, which encapsulates the traffic to be protected with IPsec:

    # Create an IPsec tunnel interface, and apply the IPsec profile.

```
[DeviceA] interface tunnel 1 mode ipsec
[DeviceA-Tunnel1] ip address 3.3.3.1 255.255.255.0
[DeviceA-Tunnel1] source 1.1.1.1
[DeviceA-Tunnel1] destination 2.2.2.2
```

```
[DeviceA-Tunnel1] tunnel protection ipsec profile abc
[DeviceA-Tunnel1] quit
```

# Add the IPsec tunnel interface to security zone **Untrust**.

```
[DeviceA] security-zone name untrust
[DeviceA-security-zone-Untrust] import interface tunnel 1
[DeviceA-security-zone-Untrust] quit
```

# Configure a static route to direct the traffic to be protected to the IPsec tunnel interface.

```
[DeviceA] ip route-static 10.1.2.0 255.255.255.0 tunnel 1
```

Configuring Device B

1. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

   ```
   <DeviceB> system-view
   [DeviceB] interface gigabitethernet 1/0/1
   [DeviceB-GigabitEthernet1/0/1] ip address 2.2.2.2 255.255.0.0
   [DeviceB-GigabitEthernet1/0/1] quit
   ```

   # Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Configure settings for routing.

   This example configures static routes, and the next hop in the routes is 2.2.2.1.

   ```
   [DeviceB] ip route-static 1.1.1.1 16 2.2.2.1
   ```

3. Add interfaces to security zones.

   ```
   [DeviceB] security-zone name trust
   [DeviceB-security-zone-Trust] import interface gigabitethernet 1/0/2
   [DeviceB-security-zone-Trust] quit
   [DeviceB] security-zone name untrust
   [DeviceB-security-zone-Untrust] import interface gigabitethernet 1/0/1
   [DeviceB-security-zone-Untrust] quit
   ```

4. Configure a security policy:

   a. Configure rules to permit traffic between the **Untrust** and **Local** security zones, so the devices can set up an IPsec tunnel:

      # Configure a rule named **ipseclocalout** to allow Device B to send IPsec negotiation packets to Device A.

      ```
      [DeviceB] security-policy ip
      [DeviceB-security-policy-ip] rule name ipseclocalout
      [DeviceB-security-policy-ip-1-ipseclocalout] source-zone local
      [DeviceB-security-policy-ip-1-ipseclocalout] destination-zone untrust
      [DeviceB-security-policy-ip-1-ipseclocalout] source-ip-host 2.2.2.2
      [DeviceB-security-policy-ip-1-ipseclocalout] destination-ip-host 1.1.1.1
      [DeviceB-security-policy-ip-1-ipseclocalout] action pass
      [DeviceB-security-policy-ip-1-ipseclocalout] quit
      ```

      # Configure a rule named **ipseclocalin** to allow Device B to receive the IPsec negotiation packets sent from Device A.

      ```
      [DeviceB-security-policy-ip] rule name ipseclocalin
      [DeviceB-security-policy-ip-2-ipseclocalin] source-zone untrust
      [DeviceB-security-policy-ip-2-ipseclocalin] destination-zone local
      [DeviceB-security-policy-ip-2-ipseclocalin] source-ip-host 1.1.1.1
      [DeviceB-security-policy-ip-2-ipseclocalin] destination-ip-host 2.2.2.2
      [DeviceB-security-policy-ip-2-ipseclocalin] action pass
      ```

```
[DeviceB-security-policy-ip-2-ipseclocalin] quit
```

b. Configure rules to permit traffic between Host B and Host A:

# Configure a rule named **trust-untrust** to permit the packets from Host B to Host A.

```
[DeviceB-security-policy-ip] rule name trust-untrust
[DeviceB-security-policy-ip-3-trust-untrust] source-zone trust
[DeviceB-security-policy-ip-3-trust-untrust] destination-zone untrust
[DeviceB-security-policy-ip-3-trust-untrust] source-ip-subnet 10.1.2.0 24
[DeviceB-security-policy-ip-3-trust-untrust] destination-ip-subnet 10.1.1.0 24
[DeviceB-security-policy-ip-3-trust-untrust] action pass
[DeviceB-security-policy-ip-3-trust-untrust] quit
```

# Configure a rule named **untrust-trust** to permit the packets from Host A to Host B.

```
[DeviceB-security-policy-ip] rule name untrust-trust
[DeviceB-security-policy-ip-4-untrust-trust] source-zone untrust
[DeviceB-security-policy-ip-4-untrust-trust] destination-zone trust
[DeviceB-security-policy-ip-4-untrust-trust] source-ip-subnet 10.1.1.0 24
[DeviceB-security-policy-ip-4-untrust-trust] destination-ip-subnet 10.1.2.0 24
[DeviceB-security-policy-ip-4-untrust-trust] action pass
[DeviceB-security-policy-ip-4-untrust-trust] quit
[DeviceB-security-policy-ip] quit
```

5. Configure an IPsec transform set to specify the packet encapsulation mode, security protocols, and algorithms.

The IPsec transform set settings at both sides of the IPsec tunnel must be the same.

```
[DeviceB] ipsec transform-set tran1
[DeviceB-ipsec-transform-set-tran1] encapsulation-mode tunnel
[DeviceB-ipsec-transform-set-tran1] protocol esp
[DeviceB-ipsec-transform-set-tran1] esp encryption-algorithm des-cbc
[DeviceB-ipsec-transform-set-tran1] esp authentication-algorithm sha1
[DeviceB-ipsec-transform-set-tran1] quit
```

6. Configure a PKI entity.

```
[DeviceB] pki entity entity2
[DeviceB-pki-entity-entity2] common-name deviceb
[DeviceB-pki-entity-entity2] quit
```

7. Configure a PKI domain for certificate request.

```
[DeviceB] pki domain domain2
[DeviceB-pki-domain-domain2] public-key rsa general name rsa1
[DeviceB-pki-domain-domain2] undo crl check enable
[DeviceB-pki-domain-domain2] quit
[DeviceB] pki import domain domain2 der ca filename ca.cer
[DeviceB] pki import domain domain2 p12 local filename server.pfx
```

8. Configure a certificate-based access control policy to control user access rights.

A peer certificate is regarded valid only if it contains the specified string (**1** in this example) in the DN attribute of the subject name field.

```
[DeviceB] pki certificate access-control-policy policy1
[DeviceB-pki-cert-acp-policy1] rule 1 permit group1
[DeviceB] pki certificate attribute-group group1
[DeviceB-pki-cert-attribute-group-group1] attribute 1 subject-name dn ctn 1
```

9. Configure an IKE profile to specify the security parameters used for setting up IKE SAs.

```
[DeviceB] ike profile profile2
```

```
[DeviceB-ike-profile-profile2] certificate domain domain2
[DeviceB-ike-profile-profile2] exchange-mode aggressive
[DeviceB-ike-profile-profile2] local-identity dn
[DeviceB-ike-profile-profile2] match remote certificate policy1
[DeviceB-ike-profile-profile2] quit
```

10. Configure an IKE proposal to specify the security parameters for IKE negotiation.

```
[DeviceB] ike proposal 10
[DeviceB-ike-proposal-10] authentication-algorithm md5
[DeviceB-ike-proposal-10] authentication-method rsa-signature
[DeviceB-ike-proposal-10] quit
```

11. Configure an IPsec profile to establish an IPsec tunnel to protect the specified data:

```
[DeviceB] ipsec profile abc isakmp
[DeviceB-ipsec-profile-isakmp-abc] transform-set tran1
[DeviceB-ipsec-profile-isakmp-abc] ike-profile profile2
[DeviceB-ipsec-profile-isakmp-abc] quit
```

12. Configure an IPsec tunnel interface, which encapsulates the traffic to be protected with IPsec:

# Create an IPsec tunnel interface, and apply the IPsec profile.

```
[DeviceB] interface tunnel 1 mode ipsec
[DeviceB-Tunnel1] ip address 3.3.3.2 255.255.255.0
[DeviceB-Tunnel1] source 2.2.2.2
[DeviceB-Tunnel1] destination 1.1.1.1
[DeviceB-Tunnel1] tunnel protection ipsec profile abc
[DeviceB-Tunnel1] quit
```

# Add the IPsec tunnel interface to security zone **Untrust**.

```
[DeviceB] security-zone name untrust
[DeviceB-security-zone-Untrust] import interface tunnel 1
[DeviceB-security-zone-Untrust] quit
```

# Configure a static route to direct the traffic to be protected to the IPsec tunnel interface.

```
[DeviceB] ip route-static 10.1.1.0 255.255.255.0 tunnel 1
```

Verifying the configuration

After the configuration is completed, Device A will automatically initiate IKE negotiation with Device B. After IKE negotiation succeeds, the tunnel interface will come up and traffic between two subnets will be IPsec-protected. This example uses Device A to verify the configuration.

# Display brief IP configuration for interfaces on Device A.

```
[DeviceA] display ip interface brief
*down: administratively down
(s): spoofing  (l): loopback
Interface           Physical Protocol IP address/Mask    VPN instance Description

```

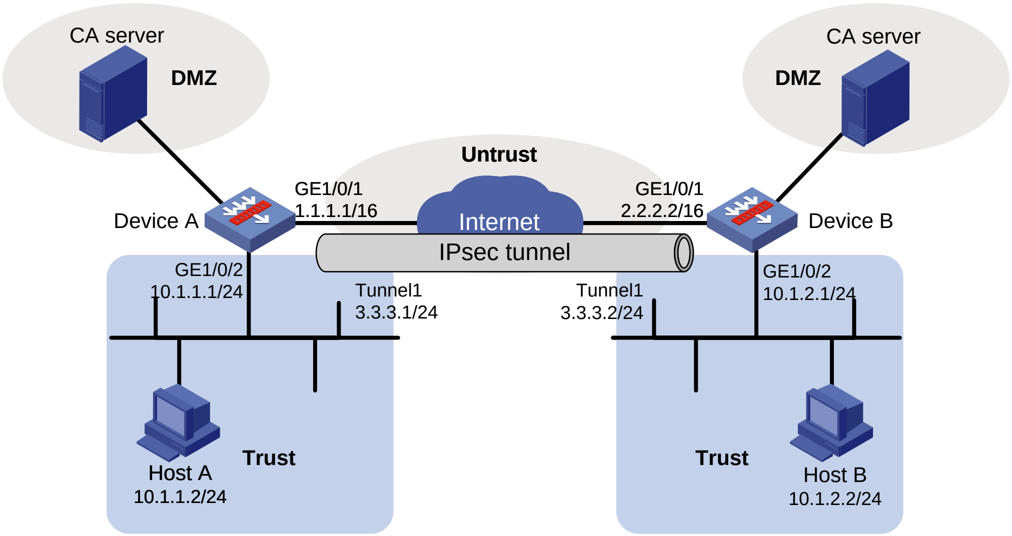
Example: Configuring IPsec tunnel interface-based IPsec for IPv4 packets (SM2-DE digital envelop authentication)

Network configuration

As shown in Figure 27, configure IPsec tunnel interface-based IPsec on Device A and Device B to protect the traffic between subnet 10.1.1.0/24 and subnet 10.1.2.0/24.

Configure Device A and Device B to use GM main mode and SM2-DE digital envelop authentication for the IKE negotiation phase 1.

Figure 27 Network diagram



Prerequisites

Device A has obtained CA certificate **ca.cer** and local certificate **server.pfx**.

Device B has obtained CA certificate **ca.cer** and local certificate **server.pfx**.

Configuring Device A

1. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

   ```
   <DeviceA> system-view
   [DeviceA] interface gigabitethernet 1/0/1
   [DeviceA-GigabitEthernet1/0/1] ip address 1.1.1.1 255.255.0.0
   [DeviceA-GigabitEthernet1/0/1] quit
   ```

   # Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Configure settings for routing.

   This example configures static routes, and the next hop in the routes is 1.1.1.2.

   ```
   [DeviceA] ip route-static 2.2.2.2 16 1.1.1.2
   ```

3. Add interfaces to security zones.

   ```
   [DeviceA] security-zone name trust
   [DeviceA-security-zone-Trust] import interface gigabitethernet 1/0/2
   [DeviceA-security-zone-Trust] quit
   [DeviceA] security-zone name untrust
   [DeviceA-security-zone-Untrust] import interface gigabitethernet 1/0/1
   [DeviceA-security-zone-Untrust] quit
   ```

4. Configure a security policy:

   a. Configure rules to permit traffic between the **Untrust** and **Local** security zones, so the devices can set up an IPsec tunnel:

      # Configure a rule named **ipseclocalout** to allow Device A to send IPsec negotiation packets to Device B.

      ```
      [DeviceA] security-policy ip
      [DeviceA-security-policy-ip] rule name ipseclocalout
      [DeviceA-security-policy-ip-1-ipseclocalout] source-zone local
      [DeviceA-security-policy-ip-1-ipseclocalout] destination-zone untrust
      [DeviceA-security-policy-ip-1-ipseclocalout] source-ip-host 1.1.1.1
      [DeviceA-security-policy-ip-1-ipseclocalout] destination-ip-host 2.2.2.2
      [DeviceA-security-policy-ip-1-ipseclocalout] action pass
      [DeviceA-security-policy-ip-1-ipseclocalout] quit
      ```

      # Configure a rule named **ipseclocalin** to allow Device A to receive the IPsec negotiation packets sent from Device B.

      ```
      [DeviceA-security-policy-ip] rule name ipseclocalin
      [DeviceA-security-policy-ip-2-ipseclocalin] source-zone untrust
      [DeviceA-security-policy-ip-2-ipseclocalin] destination-zone local
      [DeviceA-security-policy-ip-2-ipseclocalin] source-ip-host 2.2.2.2
      [DeviceA-security-policy-ip-2-ipseclocalin] destination-ip-host 1.1.1.1
      [DeviceA-security-policy-ip-2-ipseclocalin] action pass
      [DeviceA-security-policy-ip-2-ipseclocalin] quit
      ```

   b. Configure rules to permit the traffic between Host A and Host B:

      # Configure a rule named **trust-untrust** to permit the packets from Host A to Host B.

      ```
      [DeviceA-security-policy-ip] rule name trust-untrust
      [DeviceA-security-policy-ip-3-trust-untrust] source-zone trust
      [DeviceA-security-policy-ip-3-trust-untrust] destination-zone untrust
      [DeviceA-security-policy-ip-3-trust-untrust] source-ip-subnet 10.1.1.0 24
      [DeviceA-security-policy-ip-3-trust-untrust] destination-ip-subnet 10.1.2.0 24
      [DeviceA-security-policy-ip-3-trust-untrust] action pass
      ```

```
[DeviceA-security-policy-ip-3-trust-untrust] quit
```

# Configure a rule named **untrust-trust** to permit the packets from Host B to Host A.

```
[DeviceA-security-policy-ip] rule name untrust-trust
[DeviceA-security-policy-ip-4-untrust-trust] source-zone untrust
[DeviceA-security-policy-ip-4-untrust-trust] destination-zone trust
[DeviceA-security-policy-ip-4-untrust-trust] source-ip-subnet 10.1.2.0 24
[DeviceA-security-policy-ip-4-untrust-trust] destination-ip-subnet 10.1.1.0 24
[DeviceA-security-policy-ip-4-untrust-trust] action pass
[DeviceA-security-policy-ip-4-untrust-trust] quit
[DeviceA-security-policy-ip] quit
```

5. Configure an IPsec transform set to specify the packet encapsulation mode, security protocols, and algorithms.

   The IPsec transform set settings at both sides of the IPsec tunnel must be the same.

   ```
   [DeviceA] ipsec transform-set tran1
   [DeviceA-ipsec-transform-set-tran1] encapsulation-mode tunnel
   [DeviceA-ipsec-transform-set-tran1] protocol esp
   [DeviceA-ipsec-transform-set-tran1] esp encryption-algorithm sm1-cbc-128
   [DeviceA-ipsec-transform-set-tran1] esp authentication-algorithm sm3
   [DeviceA-ipsec-transform-set-tran1] quit
   ```

6. Configure a PKI entity.

   ```
   [DeviceA] pki entity entity1
   [DeviceA-pki-entity-entity1] common-name devicea
   [DeviceA-pki-entity-entity1] quit
   ```

7. Configure a PKI domain for certificate requests.

   ```
   [DeviceA] pki domain domain1
   [DeviceA-pki-domain-domain1] public-key sm2 general name sm2-1
   [DeviceA-pki-domain-domain1] undo crl check enable
   [DeviceA-pki-domain-domain1] quit
   [DeviceA] pki import domain domain1 der ca filename ca.cer
   [DeviceA] pki import domain domain1 p12 local filename server.pfx
   ```

8. Configure an IKE proposal to specify the parameters for IKE neogitiation.

   ```
   [DeviceA] ike proposal 10
   [DeviceA-ike-proposal-10] authentication-method sm2-de
   [DeviceA-ike-proposal-10] authentication-algorithm sm3
   [DeviceA-ike-proposal-10] encryption-algorithm sm1-cbc-128
   [DeviceA-ike-proposal-10] quit
   ```

9. Configure an IKE profile to specify the security parameters used to establish IKE SAs.

   ```
   [DeviceA] ike profile profile1
   [DeviceA-ike-profile-profile1] exchange-mode gm-main
   [DeviceA-ike-profile-profile1] certificate domain domain1
   [DeviceA-ike-profile-profile1] proposal 10
   [DeviceA-ike-profile-profile1] local-identity address 1.1.1.1
   [DeviceA-ike-profile-profile1] match remote identity address 2.2.2.2 255.255.0.0
   [DeviceA-ike-profile-profile1] quit
   ```

10. Configure an IPsec profile to establish an IPsec tunnel to protect the specified data:

    ```
    [DeviceA] ipsec profile abc isakmp
    [DeviceA-ipsec-profile-isakmp-abc] transform-set tran1
    [DeviceA-ipsec-profile-isakmp-abc] ike-profile profile1
    ```

```
[DeviceA-ipsec-profile-isakmp-abc] quit
```

11. Configure an IPsec tunnel interface, which encapsulates the traffic to be protected with IPsec:

    # Create an IPsec tunnel interface, and apply the IPsec profile.

    ```
    [DeviceA] interface tunnel 1 mode ipsec
    [DeviceA-Tunnel1] ip address 3.3.3.1 255.255.255.0
    [DeviceA-Tunnel1] source 1.1.1.1
    [DeviceA-Tunnel1] destination 2.2.2.2
    [DeviceA-Tunnel1] tunnel protection ipsec profile abc
    [DeviceA-Tunnel1] quit
    ```

    # Add the IPsec tunnel interface to security zone **Untrust**.

    ```
    [DeviceA] security-zone name untrust
    [DeviceA-security-zone-Untrust] import interface tunnel 1
    [DeviceA-security-zone-Untrust] quit
    ```

    # Configure a static route to direct the traffic to be protected to the IPsec tunnel interface.

    ```
    [DeviceA] ip route-static 10.1.2.0 255.255.255.0 tunnel 1
    ```

Configuring Device B

1. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

   ```
   <DeviceB> system-view
   [DeviceB] interface gigabitethernet 1/0/1
   [DeviceB-GigabitEthernet1/0/1] ip address 2.2.2.2 255.255.0.0
   [DeviceB-GigabitEthernet1/0/1] quit
   ```

   # Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Configure settings for routing.

   This example configures static routes, and the next hop in the routes is 2.2.2.1.

   ```
   [DeviceB] ip route-static 1.1.1.1 16 2.2.2.1
   ```

3. Add interfaces to security zones.

   ```
   [DeviceB] security-zone name trust
   [DeviceB-security-zone-Trust] import interface gigabitethernet 1/0/2
   [DeviceB-security-zone-Trust] quit
   [DeviceB] security-zone name untrust
   [DeviceB-security-zone-Untrust] import interface gigabitethernet 1/0/1
   [DeviceB-security-zone-Untrust] quit
   ```

4. Configure a security policy:

   a. Configure rules to permit traffic between the **Untrust** and **Local** security zones, so the devices can set up an IPsec tunnel:

      # Configure a rule named **ipseclocalout** to allow Device B to send IPsec negotiation packets to Device A.

      ```
      [DeviceB] security-policy ip
      [DeviceB-security-policy-ip] rule name ipseclocalout
      [DeviceB-security-policy-ip-1-ipseclocalout] source-zone local
      [DeviceB-security-policy-ip-1-ipseclocalout] destination-zone untrust
      [DeviceB-security-policy-ip-1-ipseclocalout] source-ip-host 2.2.2.2
      [DeviceB-security-policy-ip-1-ipseclocalout] destination-ip-host 1.1.1.1
      [DeviceB-security-policy-ip-1-ipseclocalout] action pass
      [DeviceB-security-policy-ip-1-ipseclocalout] quit
      ```

# Configure a rule named **ipseclocalin** to allow Device B to receive the IPsec negotiation packets sent from Device A.

```
[DeviceB-security-policy-ip] rule name ipseclocalin
[DeviceB-security-policy-ip-2-ipseclocalin] source-zone untrust
[DeviceB-security-policy-ip-2-ipseclocalin] destination-zone local
[DeviceB-security-policy-ip-2-ipseclocalin] source-ip-host 1.1.1.1
[DeviceB-security-policy-ip-2-ipseclocalin] destination-ip-host 2.2.2.2
[DeviceB-security-policy-ip-2-ipseclocalin] action pass
[DeviceB-security-policy-ip-2-ipseclocalin] quit
```

b. Configure rules to permit traffic between Host B and Host A:

# Configure a rule named **trust-untrust** to permit the packets from Host B to Host A.

```
[DeviceB-security-policy-ip] rule name trust-untrust
[DeviceB-security-policy-ip-3-trust-untrust] source-zone trust
[DeviceB-security-policy-ip-3-trust-untrust] destination-zone untrust
[DeviceB-security-policy-ip-3-trust-untrust] source-ip-subnet 10.1.2.0 24
[DeviceB-security-policy-ip-3-trust-untrust] destination-ip-subnet 10.1.1.0 24
[DeviceB-security-policy-ip-3-trust-untrust] action pass
[DeviceB-security-policy-ip-3-trust-untrust] quit
```

# Configure a rule named **untrust-trust** to permit the packets from Host A to Host B.

```
[DeviceB-security-policy-ip] rule name untrust-trust
[DeviceB-security-policy-ip-4-untrust-trust] source-zone untrust
[DeviceB-security-policy-ip-4-untrust-trust] destination-zone trust
[DeviceB-security-policy-ip-4-untrust-trust] source-ip-subnet 10.1.1.0 24
[DeviceB-security-policy-ip-4-untrust-trust] destination-ip-subnet 10.1.2.0 24
[DeviceB-security-policy-ip-4-untrust-trust] action pass
[DeviceB-security-policy-ip-4-untrust-trust] quit
[DeviceB-security-policy-ip] quit
```

5. Configure an IPsec transform set to specify the packet encapsulation mode, security protocols, and algorithms.

```
[DeviceB] ipsec transform-set tran1
[DeviceB-ipsec-transform-set-tran1] encapsulation-mode tunnel
[DeviceB-ipsec-transform-set-tran1] protocol esp
[DeviceB-ipsec-transform-set-tran1] esp encryption-algorithm sm1-cbc-128
[DeviceB-ipsec-transform-set-tran1] esp authentication-algorithm sm3
[DeviceB-ipsec-transform-set-tran1] quit
```

6. Configure a PKI entity.

```
[DeviceB] pki entity entity2
[DeviceB-pki-entity-entity2] common-name deviceb
[DeviceB-pki-entity-entity2] quit
```

7. Configure a PKI domain for certificate request.

```
[DeviceB] pki domain domain2
[DeviceB-pki-domain-domain2] public-key sm2 general name sm2-1
[DeviceB-pki-domain-domain2] undo crl check enable
[DeviceB-pki-domain-domain2] quit
[DeviceB] pki import domain domain2 der ca filename ca.cer
[DeviceB] pki import domain domain2 p12 local filename server.pfx
```

8. Configure an IKE proposal to specify the parameters for IKE neogitiation.

```
[DeviceB] ike proposal 10
```

```
[DeviceB-ike-proposal-10] authentication-method sm2-de
[DeviceB-ike-proposal-10] authentication-algorithm sm3
[DeviceB-ike-proposal-10] encryption-algorithm sm1-cbc-128
[DeviceB-ike-proposal-10] quit
```

9. Configure an IKE profile to specify the security parameters used to establish IKE SAs.

```
[DeviceB] ike profile profile1
[DeviceB-ike-profile-profile1] exchange-mode gm-main
[DeviceB-ike-profile-profile1] certificate domain domain2
[DeviceB-ike-profile-profile1] proposal 10
[DeviceB-ike-profile-profile1] local-identity address 2.2.2.2
[DeviceB-ike-profile-profile1] match remote identity address 1.1.1.1 255.255.0.0
[DeviceB-ike-profile-profile1] quit
```

10. Configure an IPsec profile to establish an IPsec tunnel to protect the specified data:

```
[DeviceB] ipsec profile abc isakmp
[DeviceB-ipsec-profile-isakmp-abc] transform-set tran1
[DeviceB-ipsec-profile-isakmp-abc] ike-profile profile1
[DeviceB-ipsec-profile-isakmp-abc] quit
```

11. Configure an IPsec tunnel interface, which encapsulates the traffic to be protected with IPsec:

# Create an IPsec tunnel interface, and apply the IPsec profile.

```
[DeviceB] interface tunnel 1 mode ipsec
[DeviceB-Tunnel1] ip address 3.3.3.2 255.255.255.0
[DeviceB-Tunnel1] source 2.2.2.2
[DeviceB-Tunnel1] destination 1.1.1.1
[DeviceB-Tunnel1] tunnel protection ipsec profile abc
[DeviceB-Tunnel1] quit
```

# Add the IPsec tunnel interface to security zone **Untrust**.

```
[DeviceB] security-zone name untrust
[DeviceB-security-zone-Untrust] import interface tunnel 1
[DeviceB-security-zone-Untrust] quit
```

# Configure a static route to direct the traffic to be protected to the IPsec tunnel interface.

```
[DeviceB] ip route-static 10.1.1.0 255.255.255.0 tunnel 1
```

Verifying the configuration

After the configuration is completed, Device A will automatically initiate IKE negotiation with Device B. After IKE negotiation succeeds, the tunnel interface will come up and traffic between two subnets will be IPsec-protected. This example uses Device A to verify the configuration.

# Display brief IP configuration for interfaces on Device A.

```
[DeviceA] display ip interface brief
*down: administratively down
(s): spoofing  (l): loopback
Interface           Physical Protocol IP address/Mask    VPN instance Description

```

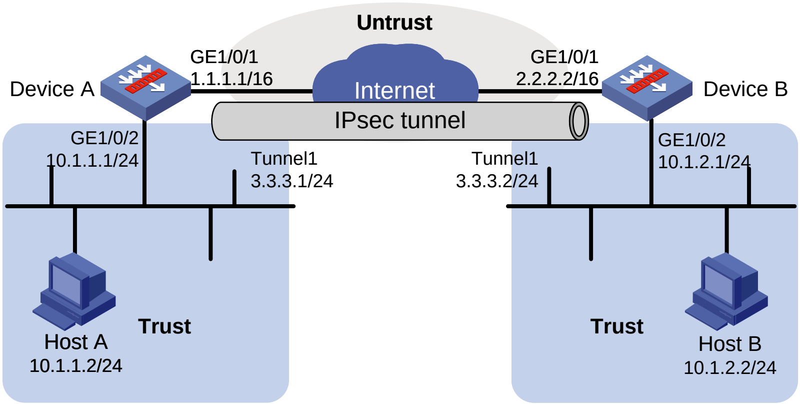
Example: Configuring IPsec tunnel interface-based IPsec for IPv4 packets (IKEv2 with preshared key authentication)

Network configuration

As shown in Figure 28, configure IPsec tunnel interface-based IPsec on Device A and Device B to protect the traffic between subnet 10.1.1.0/24 and subnet 10.1.2.0/24.

- Specify the encapsulation mode as tunnel, the security protocol as ESP, the encryption algorithm as DES-CBC, and the authentication algorithm as HMAC-SHA1.
- Set up SAs through IKEv2 negotiation.

Figure 28 Network diagram



Configuring Device A

1. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

```
<DeviceA> system-view
[DeviceA] interface gigabitethernet 1/0/1
[DeviceA-GigabitEthernet1/0/1] ip address 1.1.1.1 255.255.0.0
[DeviceA-GigabitEthernet1/0/1] quit
```

# Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Configure settings for routing.

   This example configures static routes, and the next hop in the routes is 1.1.1.2.

   ```
   [DeviceA] ip route-static 2.2.2.2 16 1.1.1.2
   ```

3. Add interfaces to security zones.

   ```
   [DeviceA] security-zone name trust
   [DeviceA-security-zone-Trust] import interface gigabitethernet 1/0/2
   [DeviceA-security-zone-Trust] quit
   [DeviceA] security-zone name untrust
   [DeviceA-security-zone-Untrust] import interface gigabitethernet 1/0/1
   [DeviceA-security-zone-Untrust] quit
   ```

4. Configure a security policy:

   a. Configure rules to permit traffic between the **Untrust** and **Local** security zones, so the devices can set up an IPsec tunnel:

      # Configure a rule named **ipseclocalout** to allow Device A to send IPsec negotiation packets to Device B.

      ```
      [DeviceA] security-policy ip
      [DeviceA-security-policy-ip] rule name ipseclocalout
      [DeviceA-security-policy-ip-1-ipseclocalout] source-zone local
      [DeviceA-security-policy-ip-1-ipseclocalout] destination-zone untrust
      [DeviceA-security-policy-ip-1-ipseclocalout] source-ip-host 1.1.1.1
      [DeviceA-security-policy-ip-1-ipseclocalout] destination-ip-host 2.2.2.2
      [DeviceA-security-policy-ip-1-ipseclocalout] action pass
      [DeviceA-security-policy-ip-1-ipseclocalout] quit
      ```

      # Configure a rule named **ipseclocalin** to allow Device A to receive the IPsec negotiation packets sent from Device B.

      ```
      [DeviceA-security-policy-ip] rule name ipseclocalin
      [DeviceA-security-policy-ip-2-ipseclocalin] source-zone untrust
      [DeviceA-security-policy-ip-2-ipseclocalin] destination-zone local
      [DeviceA-security-policy-ip-2-ipseclocalin] source-ip-host 2.2.2.2
      [DeviceA-security-policy-ip-2-ipseclocalin] destination-ip-host 1.1.1.1
      [DeviceA-security-policy-ip-2-ipseclocalin] action pass
      [DeviceA-security-policy-ip-2-ipseclocalin] quit
      ```

   b. Configure rules to permit the traffic between Host A and Host B:

      # Configure a rule named **trust-untrust** to permit the packets from Host A to Host B.

      ```
      [DeviceA-security-policy-ip] rule name trust-untrust
      [DeviceA-security-policy-ip-3-trust-untrust] source-zone trust
      [DeviceA-security-policy-ip-3-trust-untrust] destination-zone untrust
      [DeviceA-security-policy-ip-3-trust-untrust] source-ip-subnet 10.1.1.0 24
      [DeviceA-security-policy-ip-3-trust-untrust] destination-ip-subnet 10.1.2.0 24
      [DeviceA-security-policy-ip-3-trust-untrust] action pass
      [DeviceA-security-policy-ip-3-trust-untrust] quit
      ```

      # Configure a rule named **untrust-trust** to permit the packets from Host B to Host A.

      ```
      [DeviceA-security-policy-ip] rule name untrust-trust
      ```

```
[DeviceA-security-policy-ip-4-untrust-trust] source-zone untrust
[DeviceA-security-policy-ip-4-untrust-trust] destination-zone trust
[DeviceA-security-policy-ip-4-untrust-trust] source-ip-subnet 10.1.2.0 24
[DeviceA-security-policy-ip-4-untrust-trust] destination-ip-subnet 10.1.1.0 24
[DeviceA-security-policy-ip-4-untrust-trust] action pass
[DeviceA-security-policy-ip-4-untrust-trust] quit
[DeviceA-security-policy-ip] quit
```

5. Configure an IPsec transform set to specify the packet encapsulation mode, security protocols, and algorithms.

```
[DeviceA] ipsec transform-set tran1
[DeviceA-ipsec-transform-set-tran1] encapsulation-mode tunnel
[DeviceA-ipsec-transform-set-tran1] protocol esp
[DeviceA-ipsec-transform-set-tran1] esp encryption-algorithm des-cbc
[DeviceA-ipsec-transform-set-tran1] esp authentication-algorithm sha1
[DeviceA-ipsec-transform-set-tran1] quit
```

6. Configure an IKEv2 keychain to specify the key information used for IKEv2 communication.

```
[DeviceA] ikev2 keychain keychain1
[DeviceA-ikev2-keychain-keychain1] peer peer1
[DeviceA-ikev2-keychain-keychain1-peer-peer1] address 2.2.2.2 16
[DeviceA-ikev2-keychain-keychain1-peer-peer1] identity address 2.2.2.2
[DeviceA-ikev2-keychain-keychain1-peer-peer1] pre-shared-key plaintext abcde
[DeviceA-ikev2-keychain-keychain1-peer-peer1] quit
[DeviceA-ikev2-keychain-keychain1] quit
```

7. Configure an IKEv2 profile to specify the security parameters used for setting up IKEv2 SAs.

```
[DeviceA] ikev2 profile profile1
[DeviceA-ikev2-profile-profile1] authentication-method local pre-share
[DeviceA-ikev2-profile-profile1] authentication-method remote pre-share
[DeviceA-ikev2-profile-profile1] keychain keychain1
[DeviceA-ikev2-profile-profile1] match remote identity address 2.2.2.2 255.255.0.0
[DeviceA-ikev2-profile-profile1] quit
```

8. Configure an IPsec profile to establish an IPsec tunnel to protect the specified data:

```
[DeviceA] ipsec profile abc isakmp
[DeviceA-ipsec-profile-isakmp-abc] transform-set tran1
[DeviceA-ipsec-profile-isakmp-abc] ikev2-profile profile1
[DeviceA-ipsec-profile-isakmp-abc] quit
```

9. Configure an IPsec tunnel interface, which encapsulates the traffic to be protected with IPsec:

# Create an IPsec tunnel interface, and apply the IPsec profile.

```
[DeviceA] interface tunnel 1 mode ipsec
[DeviceA-Tunnel1] ip address 3.3.3.1 255.255.255.0
[DeviceA-Tunnel1] source 1.1.1.1
[DeviceA-Tunnel1] destination 2.2.2.2
[DeviceA-Tunnel1] tunnel protection ipsec profile abc
[DeviceA-Tunnel1] quit
```

# Add the IPsec tunnel interface to security zone **Untrust**.

```
[DeviceA] security-zone name untrust
[DeviceA-security-zone-Untrust] import interface tunnel 1
[DeviceA-security-zone-Untrust] quit
```

# Configure a static route to direct the traffic to be protected to the IPsec tunnel interface.

```
[DeviceA] ip route-static 10.1.2.0 255.255.255.0 tunnel 1
```

Configuring Device B

1. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

   ```
   <DeviceB> system-view
   [DeviceB] interface gigabitethernet 1/0/1
   [DeviceB-GigabitEthernet1/0/1] ip address 2.2.2.2 255.255.0.0
   [DeviceB-GigabitEthernet1/0/1] quit
   ```

   # Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Configure settings for routing.

   This example configures static routes, and the next hop in the routes is 2.2.2.1.

   ```
   [DeviceB] ip route-static 1.1.1.1 16 2.2.2.1
   ```

3. Add interfaces to security zones.

   ```
   [DeviceB] security-zone name trust
   [DeviceB-security-zone-Trust] import interface gigabitethernet 1/0/2
   [DeviceB-security-zone-Trust] quit
   [DeviceB] security-zone name untrust
   [DeviceB-security-zone-Untrust] import interface gigabitethernet 1/0/1
   [DeviceB-security-zone-Untrust] quit
   ```

4. Configure a security policy:

   a. Configure rules to permit traffic between the **Untrust** and **Local** security zones, so the devices can set up an IPsec tunnel:

      # Configure a rule named **ipseclocalout** to allow Device B to send IPsec negotiation packets to Device A.

      ```
      [DeviceB] security-policy ip
      [DeviceB-security-policy-ip] rule name ipseclocalout
      [DeviceB-security-policy-ip-1-ipseclocalout] source-zone local
      [DeviceB-security-policy-ip-1-ipseclocalout] destination-zone untrust
      [DeviceB-security-policy-ip-1-ipseclocalout] source-ip-host 2.2.2.2
      [DeviceB-security-policy-ip-1-ipseclocalout] destination-ip-host 1.1.1.1
      [DeviceB-security-policy-ip-1-ipseclocalout] action pass
      [DeviceB-security-policy-ip-1-ipseclocalout] quit
      ```

      # Configure a rule named **ipseclocalin** to allow Device B to receive the IPsec negotiation packets sent from Device A.

      ```
      [DeviceB-security-policy-ip] rule name ipseclocalin
      [DeviceB-security-policy-ip-2-ipseclocalin] source-zone untrust
      [DeviceB-security-policy-ip-2-ipseclocalin] destination-zone local
      [DeviceB-security-policy-ip-2-ipseclocalin] source-ip-host 1.1.1.1
      [DeviceB-security-policy-ip-2-ipseclocalin] destination-ip-host 2.2.2.2
      [DeviceB-security-policy-ip-2-ipseclocalin] action pass
      [DeviceB-security-policy-ip-2-ipseclocalin] quit
      ```

   b. Configure rules to permit traffic between Host B and Host A:

      # Configure a rule named **trust-untrust** to permit the packets from Host B to Host A.

      ```
      [DeviceB-security-policy-ip] rule name trust-untrust
      [DeviceB-security-policy-ip-3-trust-untrust] source-zone trust
      [DeviceB-security-policy-ip-3-trust-untrust] destination-zone untrust
      [DeviceB-security-policy-ip-3-trust-untrust] source-ip-subnet 10.1.2.0 24
      ```

```
[DeviceB-security-policy-ip-3-trust-untrust] destination-ip-subnet 10.1.1.0 24
[DeviceB-security-policy-ip-3-trust-untrust] action pass
[DeviceB-security-policy-ip-3-trust-untrust] quit
```

# Configure a rule named **untrust-trust** to permit the packets from Host A to Host B.

```
[DeviceB-security-policy-ip] rule name untrust-trust
[DeviceB-security-policy-ip-4-untrust-trust] source-zone untrust
[DeviceB-security-policy-ip-4-untrust-trust] destination-zone trust
[DeviceB-security-policy-ip-4-untrust-trust] source-ip-subnet 10.1.1.0 24
[DeviceB-security-policy-ip-4-untrust-trust] destination-ip-subnet 10.1.2.0 24
[DeviceB-security-policy-ip-4-untrust-trust] action pass
[DeviceB-security-policy-ip-4-untrust-trust] quit
[DeviceB-security-policy-ip] quit
```

5. Configure an IPsec transform set to specify the packet encapsulation mode, security protocols, and algorithms.

```
[DeviceB] ipsec transform-set tran1
[DeviceB-ipsec-transform-set-tran1] encapsulation-mode tunnel
[DeviceB-ipsec-transform-set-tran1] protocol esp
[DeviceB-ipsec-transform-set-tran1] esp encryption-algorithm des-cbc
[DeviceB-ipsec-transform-set-tran1] esp authentication-algorithm sha1
[DeviceB-ipsec-transform-set-tran1] quit
```

6. Configure an IKEv2 keychain to specify the key information used for IKEv2 communication.

```
[DeviceB] ikev2 keychain keychain1
[DeviceB-ikev2-keychain-keychain1] peer peer1
[DeviceB-ikev2-keychain-keychain1-peer-peer1] address 1.1.1.1 16
[DeviceB-ikev2-keychain-keychain1-peer-peer1] identity address 1.1.1.1
[DeviceB-ikev2-keychain-keychain1-peer-peer1] pre-shared-key plaintext abcde
[DeviceB-ikev2-keychain-keychain1-peer-peer1] quit
[DeviceB-ikev2-keychain-keychain1] quit
```

7. Configure an IKEv2 profile to specify the security parameters used for setting up IKEv2 SAs.

```
[DeviceB] ikev2 profile profile1
[DeviceB-ikev2-profile-profile1] authentication-method local pre-share
[DeviceB-ikev2-profile-profile1] authentication-method remote pre-share
[DeviceB-ikev2-profile-profile1] keychain keychain1
[DeviceA-ikev2-profile-profile1] match remote identity address 1.1.1.1 255.255.0.0
[DeviceA-ikev2-profile-profile1] quit
```

8. Configure an IPsec profile to establish an IPsec tunnel to protect the specified data:

```
[DeviceB] ipsec profile abc isakmp
[DeviceB-ipsec-profile-isakmp-abc] transform-set tran1
[DeviceB-ipsec-profile-isakmp-abc] ikev2-profile profile1
[DeviceB-ipsec-profile-isakmp-abc] quit
```

9. Configure an IPsec tunnel interface, which encapsulates the traffic to be protected with IPsec:

# Create an IPsec tunnel interface, and apply the IPsec profile.

```
[DeviceB] interface tunnel 1 mode ipsec
[DeviceB-Tunnel1] ip address 3.3.3.2 255.255.255.0
[DeviceB-Tunnel1] source 2.2.2.2
[DeviceB-Tunnel1] destination 1.1.1.1
[DeviceB-Tunnel1] tunnel protection ipsec profile abc
[DeviceB-Tunnel1] quit
```

# Add the IPsec tunnel interface to security zone **Untrust**.

```
[DeviceB] security-zone name untrust
[DeviceB-security-zone-Untrust] import interface tunnel 1
[DeviceB-security-zone-Untrust] quit
```

# Configure a static route to direct the traffic to be protected to the IPsec tunnel interface.

```
[DeviceB] ip route-static 10.1.1.0 255.255.255.0 tunnel 1
```

Verifying the configuration

After the configuration is completed, Device A will automatically initiate IKEv2 negotiation with Device B. After IKEv2 negotiation succeeds, the tunnel interface will come up and traffic between two subnets will be IPsec-protected. This example uses Device A to verify the configuration.

# Display brief IP configuration for interfaces on Device A.

```
[DeviceA] display ip interface brief
*down: administratively down
(s): spoofing  (l): loopback
Interface           Physical Protocol IP address/Mask    VPN instance Description

```

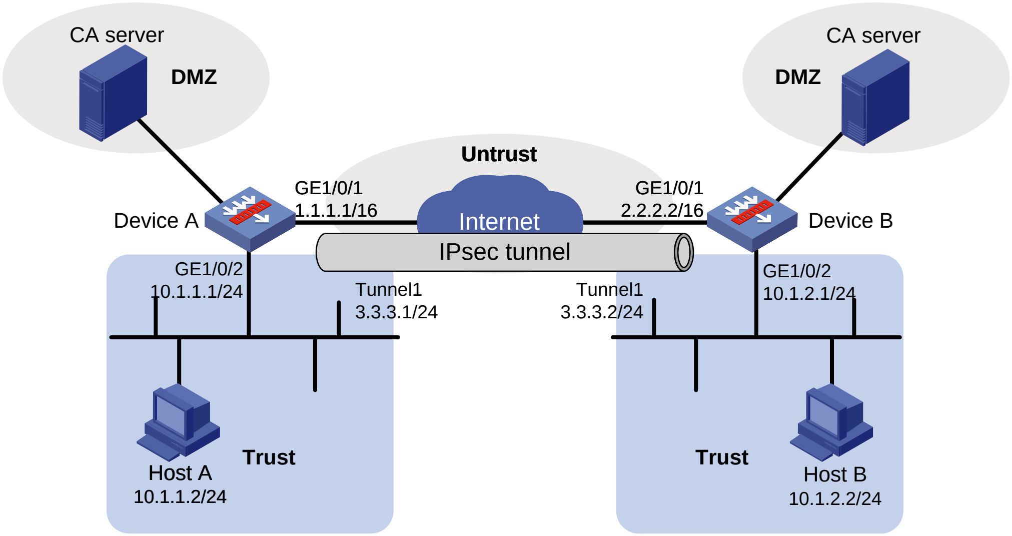
Example: Configuring IPsec tunnel interface-based IPsec for IPv4 packets (IKEv2 with RSA signature authentication)

Network configuration

As shown in Figure 29, configure IPsec tunnel interface-based IPsec on Device A and Device B to protect the traffic between subnet 10.1.1.0/24 and subnet 10.1.2.0/24.

Configure Device A and Device B to set up SAs through IKEv2 negotiation and to use RSA signature authentication. Device A acts as the initiator, and the subnet where Device A resides uses IP addresses dynamically allocated.

Figure 29 Network diagram



Prerequisites

Device A has obtained CA certificate **ca.cer** and local certificate **server.pfx**.

Device B has obtained CA certificate **ca.cer** and local certificate **server.pfx**.

Configuring Device A

1. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

   ```
   <DeviceA> system-view
   [DeviceA] interface gigabitethernet 1/0/1
   [DeviceA-GigabitEthernet1/0/1] ip address 1.1.1.1 255.255.0.0
   [DeviceA-GigabitEthernet1/0/1] quit
   ```

   # Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Configure settings for routing.

   This example configures static routes, and the next hop in the routes is 1.1.1.2.

   ```
   [DeviceA] ip route-static 2.2.2.2 16 1.1.1.2
   ```

3. Add interfaces to security zones.

   ```
   [DeviceA] security-zone name trust
   [DeviceA-security-zone-Trust] import interface gigabitethernet 1/0/2
   [DeviceA-security-zone-Trust] quit
   [DeviceA] security-zone name untrust
   [DeviceA-security-zone-Untrust] import interface gigabitethernet 1/0/1
   ```

```
[DeviceA-security-zone-Untrust] quit
```

4. Configure a security policy:
   - **a.** Configure rules to permit traffic between the **Untrust** and **Local** security zones, so the devices can set up an IPsec tunnel:

     # Configure a rule named **ipseclocalout** to allow Device A to send IPsec negotiation packets to Device B.

     ```
     [DeviceA] security-policy ip
     [DeviceA-security-policy-ip] rule name ipseclocalout
     [DeviceA-security-policy-ip-1-ipseclocalout] source-zone local
     [DeviceA-security-policy-ip-1-ipseclocalout] destination-zone untrust
     [DeviceA-security-policy-ip-1-ipseclocalout] source-ip-host 1.1.1.1
     [DeviceA-security-policy-ip-1-ipseclocalout] destination-ip-host 2.2.2.2
     [DeviceA-security-policy-ip-1-ipseclocalout] action pass
     [DeviceA-security-policy-ip-1-ipseclocalout] quit
     ```

     # Configure a rule named **ipseclocalin** to allow Device A to receive the IPsec negotiation packets sent from Device B.

     ```
     [DeviceA-security-policy-ip] rule name ipseclocalin
     [DeviceA-security-policy-ip-2-ipseclocalin] source-zone untrust
     [DeviceA-security-policy-ip-2-ipseclocalin] destination-zone local
     [DeviceA-security-policy-ip-2-ipseclocalin] source-ip-host 2.2.2.2
     [DeviceA-security-policy-ip-2-ipseclocalin] destination-ip-host 1.1.1.1
     [DeviceA-security-policy-ip-2-ipseclocalin] action pass
     [DeviceA-security-policy-ip-2-ipseclocalin] quit
     ```

   - **b.** Configure rules to permit the traffic between Host A and Host B:

     # Configure a rule named **trust-untrust** to permit the packets from Host A to Host B.

     ```
     [DeviceA-security-policy-ip] rule name trust-untrust
     [DeviceA-security-policy-ip-3-trust-untrust] source-zone trust
     [DeviceA-security-policy-ip-3-trust-untrust] destination-zone untrust
     [DeviceA-security-policy-ip-3-trust-untrust] source-ip-subnet 10.1.1.0 24
     [DeviceA-security-policy-ip-3-trust-untrust] destination-ip-subnet 10.1.2.0 24
     [DeviceA-security-policy-ip-3-trust-untrust] action pass
     [DeviceA-security-policy-ip-3-trust-untrust] quit
     ```

     # Configure a rule named **untrust-trust** to permit the packets from Host B to Host A.

     ```
     [DeviceA-security-policy-ip] rule name untrust-trust
     [DeviceA-security-policy-ip-4-untrust-trust] source-zone untrust
     [DeviceA-security-policy-ip-4-untrust-trust] destination-zone trust
     [DeviceA-security-policy-ip-4-untrust-trust] source-ip-subnet 10.1.2.0 24
     [DeviceA-security-policy-ip-4-untrust-trust] destination-ip-subnet 10.1.1.0 24
     [DeviceA-security-policy-ip-4-untrust-trust] action pass
     [DeviceA-security-policy-ip-4-untrust-trust] quit
     [DeviceA-security-policy-ip] quit
     ```

5. Configure an IPsec transform set to specify the packet encapsulation mode, security protocols, and algorithms.

   The IPsec transform set settings at both sides of the IPsec tunnel must be the same.

   ```
   [DeviceA] ipsec transform-set tran1
   [DeviceA-ipsec-transform-set-tran1] encapsulation-mode tunnel
   [DeviceA-ipsec-transform-set-tran1] protocol esp
   [DeviceA-ipsec-transform-set-tran1] esp encryption-algorithm des-cbc
   ```

```
[DeviceA-ipsec-transform-set-tran1] esp authentication-algorithm sha1
[DeviceA-ipsec-transform-set-tran1] quit
```

6. Configure a PKI entity.

```
[DeviceA] pki entity entity1
[DeviceA-pki-entity-entity1] common-name devicea
[DeviceA-pki-entity-entity1] quit
```

7. Configure a PKI domain for certificate requests.

```
[DeviceA] pki domain domain1
[DeviceA-pki-domain-domain1] public-key rsa general name rsa1
[DeviceA-pki-domain-domain1] undo crl check enable
[DeviceA-pki-domain-domain1] quit
[DeviceA] pki import domain domain1 der ca filename ca.cer
[DeviceA] pki import domain domain1 p12 local filename server.pfx
```

8. Configure a certificate-based access control policy to control user access rights.

   A peer certificate is regarded valid only if it contains the specified string (**1** in this example) in the DN attribute of the subject name field.

```
[DeviceA] pki certificate access-control-policy policy1
[DeviceA-pki-cert-acp-policy1] rule 1 permit group1
[DeviceA] pki certificate attribute-group group1
[DeviceA-pki-cert-attribute-group-group1] attribute 1 subject-name dn ctn 1
```

9. Configure an IKEv2 profile to specify the security parameters used for setting up IKEv2 SAs.

```
[DeviceA] ikev2 profile profile1
[DeviceA-ikev2-profile-profile1] authentication-method local rsa-signature
[DeviceA-ikev2-profile-profile1] authentication-method remote rsa-signature
[DeviceA-ikev2-profile-profile1] certificate domain domain1
[DeviceA-ikev2-profile-profile1] identity local dn
[DeviceA-ikev2-profile-profile1] match remote certificate policy1
[DeviceA-ikev2-profile-profile1] quit
```

10. Configure an IPsec profile to establish an IPsec tunnel to protect the specified data:

```
[DeviceA] ipsec profile abc isakmp
[DeviceA-ipsec-profile-isakmp-abc] transform-set tran1
[DeviceA-ipsec-profile-isakmp-abc] ikev2-profile profile1
[DeviceA-ipsec-profile-isakmp-abc] quit
```

11. Configure an IPsec tunnel interface, which encapsulates the traffic to be protected with IPsec:

    # Create an IPsec tunnel interface, and apply the IPsec profile.

```
[DeviceA] interface tunnel 1 mode ipsec
[DeviceA-Tunnel1] ip address 3.3.3.1 255.255.255.0
[DeviceA-Tunnel1] source 1.1.1.1
[DeviceA-Tunnel1] destination 2.2.2.2
[DeviceA-Tunnel1] tunnel protection ipsec profile abc
[DeviceA-Tunnel1] quit
```

    # Add the IPsec tunnel interface to security zone **Untrust**.

```
[DeviceA] security-zone name untrust
[DeviceA-security-zone-Untrust] import interface tunnel 1
[DeviceA-security-zone-Untrust] quit
```

    # Configure a static route to direct the traffic to be protected to the IPsec tunnel interface.

```
[DeviceA] ip route-static 10.1.2.0 255.255.255.0 tunnel 1
```

Configuring Device B

1. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

   ```
   <DeviceB> system-view
   [DeviceB] interface gigabitethernet 1/0/1
   [DeviceB-GigabitEthernet1/0/1] ip address 2.2.2.2 255.255.0.0
   [DeviceB-GigabitEthernet1/0/1] quit
   ```

   # Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Configure settings for routing.

   This example configures static routes, and the next hop in the routes is 2.2.2.1.

   ```
   [DeviceB] ip route-static 1.1.1.1 16 2.2.2.1
   ```

3. Add interfaces to security zones.

   ```
   [DeviceB] security-zone name trust
   [DeviceB-security-zone-Trust] import interface gigabitethernet 1/0/2
   [DeviceB-security-zone-Trust] quit
   [DeviceB] security-zone name untrust
   [DeviceB-security-zone-Untrust] import interface gigabitethernet 1/0/1
   [DeviceB-security-zone-Untrust] quit
   ```

4. Configure a security policy:

   a. Configure rules to permit traffic between the **Untrust** and **Local** security zones, so the devices can set up an IPsec tunnel:

      # Configure a rule named **ipseclocalout** to allow Device B to send IPsec negotiation packets to Device A.

      ```
      [DeviceB] security-policy ip
      [DeviceB-security-policy-ip] rule name ipseclocalout
      [DeviceB-security-policy-ip-1-ipseclocalout] source-zone local
      [DeviceB-security-policy-ip-1-ipseclocalout] destination-zone untrust
      [DeviceB-security-policy-ip-1-ipseclocalout] source-ip-host 2.2.2.2
      [DeviceB-security-policy-ip-1-ipseclocalout] destination-ip-host 1.1.1.1
      [DeviceB-security-policy-ip-1-ipseclocalout] action pass
      [DeviceB-security-policy-ip-1-ipseclocalout] quit
      ```

      # Configure a rule named **ipseclocalin** to allow Device B to receive the IPsec negotiation packets sent from Device A.

      ```
      [DeviceB-security-policy-ip] rule name ipseclocalin
      [DeviceB-security-policy-ip-2-ipseclocalin] source-zone untrust
      [DeviceB-security-policy-ip-2-ipseclocalin] destination-zone local
      [DeviceB-security-policy-ip-2-ipseclocalin] source-ip-host 1.1.1.1
      [DeviceB-security-policy-ip-2-ipseclocalin] destination-ip-host 2.2.2.2
      [DeviceB-security-policy-ip-2-ipseclocalin] action pass
      [DeviceB-security-policy-ip-2-ipseclocalin] quit
      ```

   b. Configure rules to permit traffic between Host B and Host A:

      # Configure a rule named **trust-untrust** to permit the packets from Host B to Host A.

      ```
      [DeviceB-security-policy-ip] rule name trust-untrust
      [DeviceB-security-policy-ip-3-trust-untrust] source-zone trust
      [DeviceB-security-policy-ip-3-trust-untrust] destination-zone untrust
      [DeviceB-security-policy-ip-3-trust-untrust] source-ip-subnet 10.1.2.0 24
      [DeviceB-security-policy-ip-3-trust-untrust] destination-ip-subnet 10.1.1.0 24
      [DeviceB-security-policy-ip-3-trust-untrust] action pass
      ```

```
[DeviceB-security-policy-ip-3-trust-untrust] quit
```

# Configure a rule named **untrust-trust** to permit the packets from Host A to Host B.

```
[DeviceB-security-policy-ip] rule name untrust-trust
[DeviceB-security-policy-ip-4-untrust-trust] source-zone untrust
[DeviceB-security-policy-ip-4-untrust-trust] destination-zone trust
[DeviceB-security-policy-ip-4-untrust-trust] source-ip-subnet 10.1.1.0 24
[DeviceB-security-policy-ip-4-untrust-trust] destination-ip-subnet 10.1.2.0 24
[DeviceB-security-policy-ip-4-untrust-trust] action pass
[DeviceB-security-policy-ip-4-untrust-trust] quit
[DeviceB-security-policy-ip] quit
```

5. Configure an IPsec transform set to specify the packet encapsulation mode, security protocols, and algorithms.

   The IPsec transform set settings at both sides of the IPsec tunnel must be the same.

```
[DeviceB] ipsec transform-set tran1
[DeviceB-ipsec-transform-set-tran1] encapsulation-mode tunnel
[DeviceB-ipsec-transform-set-tran1] protocol esp
[DeviceB-ipsec-transform-set-tran1] esp encryption-algorithm des-cbc
[DeviceB-ipsec-transform-set-tran1] esp authentication-algorithm sha1
[DeviceB-ipsec-transform-set-tran1] quit
```

6. Configure a PKI entity.

```
[DeviceB] pki entity entity2
[DeviceB-pki-entity-entity2] common-name deviceb
[DeviceB-pki-entity-entity2] quit
```

7. Configure a PKI domain for certificate request.

```
[DeviceB] pki domain domain2
[DeviceB-pki-domain-domain2] public-key rsa general name rsa1
[DeviceB-pki-domain-domain2] undo crl check enable
[DeviceB-pki-domain-domain2] quit
[DeviceB] pki import domain domain2 der ca filename ca.cer
[DeviceB] pki import domain domain2 p12 local filename server.pfx
```

8. Configure a certificate-based access control policy to control user access rights.

   A peer certificate is regarded valid only if it contains the specified string (**1** in this example) in the DN attribute of the subject name field.

```
[DeviceB] pki certificate access-control-policy policy1
[DeviceB-pki-cert-acp-policy1] rule 1 permit group1
[DeviceB] pki certificate attribute-group group1
[DeviceB-pki-cert-attribute-group-group1] attribute 1 subject-name dn ctn 1
```

9. Configure an IKEv2 profile to specify the security parameters used for setting up IKEv2 SAs.

```
[DeviceB] ikev2 profile profile2
[DeviceB-ikev2-profile-profile2] authentication-method local rsa-signature
[DeviceB-ikev2-profile-profile2] authentication-method remote rsa-signature
[DeviceB-ikev2-profile-profile2] certificate domain domain2
[DeviceB-ikev2-profile-profile2] identity local dn
[DeviceB-ikev2-profile-profile2] match remote certificate policy1
[DeviceB-ikev2-profile-profile2] quit
```

10. Configure an IPsec profile to establish an IPsec tunnel to protect the specified data:

```
[DeviceB] ipsec profile abc isakmp
[DeviceB-ipsec-profile-isakmp-abc] transform-set tran1
```

```
[DeviceB-ipsec-profile-isakmp-abc] ikev2-profile profile2
[DeviceB-ipsec-profile-isakmp-abc] quit
```

11. Configure an IPsec tunnel interface, which encapsulates the traffic to be protected with IPsec:

    # Create an IPsec tunnel interface, and apply the IPsec profile.

    ```
    [DeviceB] interface tunnel 1 mode ipsec
    [DeviceB-Tunnel1] ip address 3.3.3.2 255.255.255.0
    [DeviceB-Tunnel1] source 2.2.2.2
    [DeviceB-Tunnel1] destination 1.1.1.1
    [DeviceB-Tunnel1] tunnel protection ipsec profile abc
    [DeviceB-Tunnel1] quit
    ```

    # Add the IPsec tunnel interface to security zone **Untrust**.

    ```
    [DeviceB] security-zone name untrust
    [DeviceB-security-zone-Untrust] import interface tunnel 1
    [DeviceB-security-zone-Untrust] quit
    ```

    # Configure a static route to direct the traffic to be protected to the IPsec tunnel interface.

    ```
    [DeviceB] ip route-static 10.1.1.0 255.255.255.0 tunnel 1
    ```

Verifying the configuration

After the configuration is completed, Device A will automatically initiate IKEv2 negotiation with Device B. After IKEv2 negotiation succeeds, the tunnel interface will come up and traffic between two subnets will be IPsec-protected. This example uses Device A to verify the configuration.

# Display brief IP configuration for interfaces on Device A.

```
[DeviceA] display ip interface brief
*down: administratively down
(s): spoofing  (l): loopback
Interface           Physical Protocol IP address/Mask    VPN instance Description
GE1/0/1             up       up       1.1.1.1/16         --           --
GE1/0/2             up       up       10.1.1.1/24        --           --
Tun1                up       up       3.3.3.1/24         --           --
```

# Display tunnel interface information on Device A.

```
[DeviceA] display interface Tunnel 1
Tunnel1

```

Example: Configuring an IKE-based IPsec NAT traversal tunnel between gateways

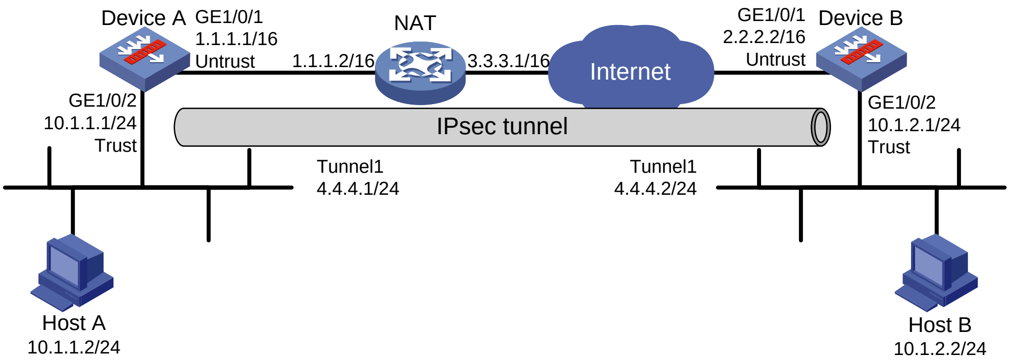
Network configuration

Device A is behind the NAT device. Hosts behind Device A use public IP address 3.3.3.1 to access the external network.

Configure IPsec tunnel interface-based IPsec on Device A and Device B to protect the traffic between subnet 10.1.1.0/24 and subnet 10.1.2.0/24.

- Configure Device A and Device B to use the default IKE proposal for the aggressive IKE negotiation to set up the IPsec SAs.
- Configure the two devices to use the preshared key authentication method for the IKE negotiation phase 1.

Figure 30 Network diagram



Configuring Device A

1. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

   ```
   <DeviceA> system-view
   [DeviceA] interface gigabitethernet 1/0/1
   [DeviceA-GigabitEthernet1/0/1] ip address 1.1.1.1 255.255.0.0
   [DeviceA-GigabitEthernet1/0/1] quit
   ```

   # Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Configure settings for routing.

   This example configures static routes, and the next hop in the routes is 1.1.1.2.

   ```
   [DeviceA] ip route-static 2.2.2.2 16 1.1.1.2
   ```

3. Add interfaces to security zones.

   ```
   [DeviceA] security-zone name trust
   [DeviceA-security-zone-Trust] import interface gigabitethernet 1/0/2
   [DeviceA-security-zone-Trust] quit
   [DeviceA] security-zone name untrust
   ```

```
[DeviceA-security-zone-Untrust] import interface gigabitethernet 1/0/1
[DeviceA-security-zone-Untrust] quit
```

4. Configure a security policy:
   a. Configure rules to permit traffic between the **Untrust** and **Local** security zones, so the devices can set up an IPsec tunnel:

      # Configure a rule named **ipseclocalout** to allow Device A to send IPsec negotiation packets to Device B.

      ```
      [DeviceA] security-policy ip
      [DeviceA-security-policy-ip] rule name ipseclocalout
      [DeviceA-security-policy-ip-1-ipseclocalout] source-zone local
      [DeviceA-security-policy-ip-1-ipseclocalout] destination-zone untrust
      [DeviceA-security-policy-ip-1-ipseclocalout] source-ip-host 1.1.1.1
      [DeviceA-security-policy-ip-1-ipseclocalout] destination-ip-host 2.2.2.2
      [DeviceA-security-policy-ip-1-ipseclocalout] action pass
      [DeviceA-security-policy-ip-1-ipseclocalout] quit
      ```

      # Configure a rule named **ipseclocalin** to allow Device A to receive the IPsec negotiation packets sent from Device B.

      ```
      [DeviceA-security-policy-ip] rule name ipseclocalin
      [DeviceA-security-policy-ip-2-ipseclocalin] source-zone untrust
      [DeviceA-security-policy-ip-2-ipseclocalin] destination-zone local
      [DeviceA-security-policy-ip-2-ipseclocalin] source-ip-host 2.2.2.2
      [DeviceA-security-policy-ip-2-ipseclocalin] destination-ip-host 1.1.1.1
      [DeviceA-security-policy-ip-2-ipseclocalin] action pass
      [DeviceA-security-policy-ip-2-ipseclocalin] quit
      ```

   b. Configure rules to permit the traffic between Host A and Host B:

      # Configure a rule named **trust-untrust** to permit the packets from Host A to Host B.

      ```
      [DeviceA-security-policy-ip] rule name trust-untrust
      [DeviceA-security-policy-ip-3-trust-untrust] source-zone trust
      [DeviceA-security-policy-ip-3-trust-untrust] destination-zone untrust
      [DeviceA-security-policy-ip-3-trust-untrust] source-ip-subnet 10.1.1.0 24
      [DeviceA-security-policy-ip-3-trust-untrust] destination-ip-subnet 10.1.2.0 24
      [DeviceA-security-policy-ip-3-trust-untrust] action pass
      [DeviceA-security-policy-ip-3-trust-untrust] quit
      ```

      # Configure a rule named **untrust-trust** to permit the packets from Host B to Host A.

      ```
      [DeviceA-security-policy-ip] rule name untrust-trust
      [DeviceA-security-policy-ip-4-untrust-trust] source-zone untrust
      [DeviceA-security-policy-ip-4-untrust-trust] destination-zone trust
      [DeviceA-security-policy-ip-4-untrust-trust] source-ip-subnet 10.1.2.0 24
      [DeviceA-security-policy-ip-4-untrust-trust] destination-ip-subnet 10.1.1.0 24
      [DeviceA-security-policy-ip-4-untrust-trust] action pass
      [DeviceA-security-policy-ip-4-untrust-trust] quit
      [DeviceA-security-policy-ip] quit
      ```

5. Configure an IPsec transform set to specify the packet encapsulation mode, security protocols, and algorithms.

   ```
   [DeviceA] ipsec transform-set transform1
   [DeviceA-ipsec-transform-set-transform1] protocol esp
   [DeviceA-ipsec-transform-set-transform1] esp encryption-algorithm 3des-cbc
   [DeviceA-ipsec-transform-set-transform1] esp authentication-algorithm md5
   ```

```
[DeviceA-ipsec-transform-set-transform1] quit
```

6. Configure an IKE keychain to specify the key information used for IKE communication.

   The preshared key used by both sides of the communication must be the same.

   ```
   [DeviceA] ike keychain keychain1
   [DeviceA-ike-keychain-keychain1] pre-shared-key address 2.2.2.2 255.255.0.0 key
   simple 12345zxcvb!@#$%ZXCVB
   [DeviceA-ike-keychain-keychain1] quit
   ```

7. Configure an IKE profile to specify the security parameters used for setting up IKE SAs.

   ```
   [DeviceA] ike profile profile1
   [DeviceA-ike-profile-profile1] keychain keychain1
   [DeviceA-ike-profile-profile1] exchange-mode aggressive
   [DeviceA-ike-profile-profile1] local-identity fqdn www.devicea.com
   [DeviceA-ike-profile-profile1] match remote identity address 2.2.2.2 255.255.0.0
   [DeviceA-ike-profile-profile1] quit
   ```

8. Configure an IPsec profile to establish an IPsec tunnel to protect the specified data:

   ```
   [DeviceA] ipsec profile abc isakmp
   [DeviceA-ipsec-profile-isakmp-abc] transform-set transform1
   [DeviceA-ipsec-profile-isakmp-abc] ike-profile profile1
   [DeviceA-ipsec-profile-isakmp-abc] quit
   ```

9. Configure an IPsec tunnel interface, which encapsulates the traffic to be protected with IPsec:

   # Create an IPsec tunnel interface, and apply the IPsec profile.

   ```
   [DeviceA] interface tunnel 1 mode ipsec
   [DeviceA-Tunnel1] ip address 4.4.4.1 255.255.255.0
   [DeviceA-Tunnel1] source 1.1.1.1
   [DeviceA-Tunnel1] destination 2.2.2.2
   [DeviceA-Tunnel1] tunnel protection ipsec profile abc
   [DeviceA-Tunnel1] quit
   ```

   # Add the IPsec tunnel interface to security zone **Untrust**.

   ```
   [DeviceA] security-zone name untrust
   [DeviceA-security-zone-Untrust] import interface tunnel 1
   [DeviceA-security-zone-Untrust] quit
   ```

   # Configure a static route to direct the traffic to be protected to the IPsec tunnel interface.

   ```
   [DeviceA] ip route-static 10.1.2.0 255.255.255.0 tunnel 1
   ```

Configuring Device B

1. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

   ```
   <DeviceB> system-view
   [DeviceB] interface gigabitethernet 1/0/1
   [DeviceB-GigabitEthernet1/0/1] ip address 2.2.2.2 255.255.0.0
   [DeviceB-GigabitEthernet1/0/1] quit
   ```

   # Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Configure settings for routing.

   This example configures static routes, and the next hop in the routes is 2.2.2.1.

   ```
   [DeviceB] ip route-static 3.3.3.1 16 2.2.2.1
   ```

3. Add interfaces to security zones.

   ```
   [DeviceB] security-zone name trust
   [DeviceB-security-zone-Trust] import interface gigabitethernet 1/0/2
   ```

```
[DeviceB-security-zone-Trust] quit
[DeviceB] security-zone name untrust
[DeviceB-security-zone-Untrust] import interface gigabitethernet 1/0/1
[DeviceB-security-zone-Untrust] quit
```

4. Configure a security policy:
   a. Configure rules to permit traffic between the **Untrust** and **Local** security zones, so the devices can set up an IPsec tunnel:

      # Configure a rule named **ipseclocalout** to allow Device B to send IPsec negotiation packets to Device A.

      ```
      [DeviceB] security-policy ip
      [DeviceB-security-policy-ip] rule name ipseclocalout
      [DeviceB-security-policy-ip-1-ipseclocalout] source-zone local
      [DeviceB-security-policy-ip-1-ipseclocalout] destination-zone untrust
      [DeviceB-security-policy-ip-1-ipseclocalout] source-ip-host 2.2.2.2
      [DeviceB-security-policy-ip-1-ipseclocalout] destination-ip-host 3.3.3.1
      [DeviceB-security-policy-ip-1-ipseclocalout] action pass
      [DeviceB-security-policy-ip-1-ipseclocalout] quit
      ```

      # Configure a rule named **ipseclocalin** to allow Device B to receive the IPsec negotiation packets sent from Device A.

      ```
      [DeviceB-security-policy-ip] rule name ipseclocalin
      [DeviceB-security-policy-ip-2-ipseclocalin] source-zone untrust
      [DeviceB-security-policy-ip-2-ipseclocalin] destination-zone local
      [DeviceB-security-policy-ip-2-ipseclocalin] source-ip-host 3.3.3.1
      [DeviceB-security-policy-ip-2-ipseclocalin] destination-ip-host 2.2.2.2
      [DeviceB-security-policy-ip-2-ipseclocalin] action pass
      [DeviceB-security-policy-ip-2-ipseclocalin] quit
      ```

   b. Configure rules to permit traffic between Host B and Host A:

      # Configure a rule named **trust-untrust** to permit the packets from Host B to Host A.

      ```
      [DeviceB-security-policy-ip] rule name trust-untrust
      [DeviceB-security-policy-ip-3-trust-untrust] source-zone trust
      [DeviceB-security-policy-ip-3-trust-untrust] destination-zone untrust
      [DeviceB-security-policy-ip-3-trust-untrust] source-ip-subnet 10.1.2.0 24
      [DeviceB-security-policy-ip-3-trust-untrust] destination-ip-subnet 10.1.1.0 24
      [DeviceB-security-policy-ip-3-trust-untrust] action pass
      [DeviceB-security-policy-ip-3-trust-untrust] quit
      ```

      # Configure a rule named **untrust-trust** to permit the packets from Host A to Host B.

      ```
      [DeviceB-security-policy-ip] rule name untrust-trust
      [DeviceB-security-policy-ip-4-untrust-trust] source-zone untrust
      [DeviceB-security-policy-ip-4-untrust-trust] destination-zone trust
      [DeviceB-security-policy-ip-4-untrust-trust] source-ip-subnet 10.1.1.0 24
      [DeviceB-security-policy-ip-4-untrust-trust] destination-ip-subnet 10.1.2.0 24
      [DeviceB-security-policy-ip-4-untrust-trust] action pass
      [DeviceB-security-policy-ip-4-untrust-trust] quit
      [DeviceB-security-policy-ip] quit
      ```

5. Configure an IPsec transform set to specify the packet encapsulation mode, security protocols, and algorithms.

   ```
   [DeviceB] ipsec transform-set transform1
   [DeviceB-ipsec-transform-set-transform1] protocol esp
   ```

```
[DeviceB-ipsec-transform-set-transform1] esp encryption-algorithm 3des-cbc
[DeviceB-ipsec-transform-set-transform1] esp authentication-algorithm md5
[DeviceB-ipsec-transform-set-transform1] quit
```

6. Configure an IKE keychain to specify the key information used for IKE communication.

   This example specifies **12345zxcvb!@#$%ZXCVB** in plain text as the preshared key to be used with the remote peer at 1.1.1.1. The source address of packets from 1.1.1.1 is translated into 3.3.3.1 by the NAT device, so IP address of the remote peer is specified as 3.3.3.1.

```
[DeviceB]ike keychain keychain1
[DeviceB-ike-keychain-keychain1] pre-shared-key address 3.3.3.1 255.255.0.0 key
simple 12345zxcvb!@#$%ZXCVB
[DeviceB-ike-keychain-keychain1] quit
```

7. Configure an IKE profile to specify the security parameters used for setting up IKE SAs.

```
[DeviceB] ike profile profile1
[DeviceB-ike-profile-profile1] keychain keychain1
[DeviceB-ike-profile-profile1] exchange-mode aggressive
[DeviceB-ike-profile-profile1] match remote identity fqdn www.devicea.com
[DeviceB-ike-profile-profile1] quit
```

8. Configure an IPsec profile to establish an IPsec tunnel to protect the specified data:

```
[DeviceB] ipsec profile abc isakmp
[DeviceB-ipsec-profile-isakmp-abc] transform-set transform1
[DeviceB-ipsec-profile-isakmp-abc] ike-profile profile1
[DeviceB-ipsec-profile-isakmp-abc] quit
```

9. Configure an IPsec tunnel interface, which encapsulates the traffic to be protected with IPsec:

   # Create an IPsec tunnel interface, and apply the IPsec profile.

```
[DeviceB] interface tunnel 1 mode ipsec
[DeviceB-Tunnel1] ip address 4.4.4.2 255.255.255.0
[DeviceB-Tunnel1] source 2.2.2.2
[DeviceB-Tunnel1] destination 3.3.3.1
[DeviceB-Tunnel1] tunnel protection ipsec profile abc
[DeviceB-Tunnel1] quit
```

   # Add the IPsec tunnel interface to security zone **Untrust**.

```
[DeviceB] security-zone name untrust
[DeviceB-security-zone-Untrust] import interface tunnel 1
[DeviceB-security-zone-Untrust] quit
```

   # Configure a static route to direct the traffic to be protected to the IPsec tunnel interface.

```
[DeviceB] ip route-static 10.1.1.0 255.255.255.0 tunnel 1
```

Verifying the configuration

After the configuration is completed, Device A will automatically initiate IKE negotiation with Device B. After IKE negotiation succeeds, the tunnel interface will come up and traffic between two subnets will be IPsec-protected. This example uses Device A to verify the configuration.

# Display brief IP configuration for interfaces on Device A.

```
[DeviceA] display ip interface brief
*down: administratively down
(s): spoofing  (l): loopback
Interface           Physical Protocol IP address/Mask    VPN instance Description
GE1/0/1             up       up       1.1.1.1/16         --           --
GE1/0/2             up       up       10.1.1.1/24        --           --
Tun1                up       up       4.4.4.1/24         --           --
```

# Display tunnel interface information on Device A.

```
[DeviceA] display interface Tunnel 1

```

Example: Configuring headquarters to use dual links to establish IPsec tunnels with branches

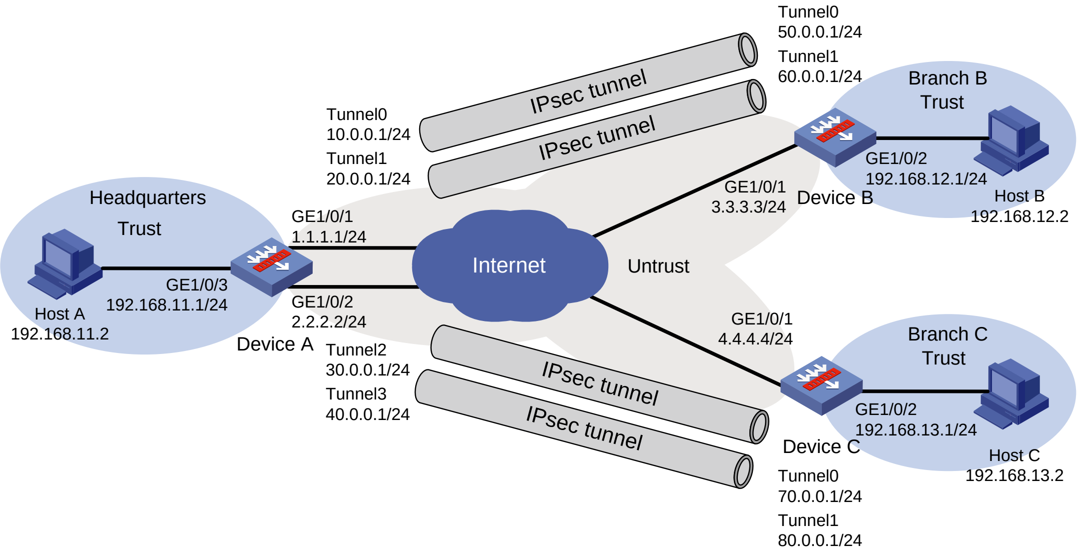
Network configuration

As shown in Figure 31, the headquarters gateway device Device A has two links connected to the Internet. Branch gateway devices Device B and Device C each has one link connected to the Internet.

Configure IPsec tunnel interface-based IPsec on the devices protect the traffic between the headquarters and the branches.

The headquarters and the branches select high-quality, low-latency links based on the NQA test results to dynamically establish IPsec tunnels.

Figure 31 Network diagram



Configuring Device A

1. Assign IP addresses to interfaces:

# Assign an IP address to interface GigabitEthernet 1/0/1.

```
<DeviceA> system-view
[DeviceA] interface gigabitethernet 1/0/1
[DeviceA-GigabitEthernet1/0/1] ip address 10.1.1.1 255.255.255.0
[DeviceA-GigabitEthernet1/0/1] quit
```

# Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Create IPsec tunnel interfaces:

# Create IPsec tunnel interface Tunnel 0.

```
[DeviceA] interface tunnel 0 mode ipsec
[DeviceA-Tunnel0] ip address 10.0.0.1 255.255.255.0
[DeviceA-Tunnel0] source 1.1.1.1
[DeviceA-Tunnel0] destination 3.3.3.3
[DeviceA-Tunnel0] quit
```

# Create IPsec tunnel interface Tunnel 1.

```
[DeviceA] interface tunnel 1 mode ipsec
[DeviceA-Tunnel1] ip address 20.0.0.1 255.255.255.0
[DeviceA-Tunnel1] source 2.2.2.2
[DeviceA-Tunnel1] destination 3.3.3.3
[DeviceA-Tunnel1] quit
```

# Create IPsec tunnel interface Tunnel 2.

```
[DeviceA] interface tunnel 2 mode ipsec
[DeviceA-Tunnel2] ip address 30.0.0.1 255.255.255.0
[DeviceA-Tunnel2] source 1.1.1.1
[DeviceA-Tunnel2] destination 4.4.4.4
[DeviceA-Tunnel2] quit
```

# Create IPsec tunnel interface Tunnel 3.

```
[DeviceA] interface tunnel 3 mode ipsec
[DeviceA-Tunnel3] ip address 40.0.0.1 255.255.255.0
```

```
[DeviceA-Tunnel3] source 2.2.2.2
[DeviceA-Tunnel3] destination 4.4.4.4
[DeviceA-Tunnel3] quit
```

3. Add interfaces to security zones.

```
[DeviceA] security-zone name trust
[DeviceA-security-zone-Trust] import interface gigabitethernet 1/0/3
[DeviceA-security-zone-Trust] quit
[DeviceA] security-zone name untrust
[DeviceA-security-zone-Untrust] import interface gigabitethernet 1/0/1
[DeviceA-security-zone-Untrust] import interface gigabitethernet 1/0/2
[DeviceA-security-zone-Untrust] import interface tunnel 0
[DeviceA-security-zone-Untrust] import interface tunnel 1
[DeviceA-security-zone-Untrust] import interface tunnel 2
[DeviceA-security-zone-Untrust] import interface tunnel 3
[DeviceA-security-zone-Untrust] quit
```

4. Configure a security policy:
   a. Configure rules to permit traffic between the **Untrust** and **Local** security zones, so the devices can set up an IPsec tunnel:

   # Configure a rule named **ipseclocalout** to allow Device A to send IPsec negotiation packets to Device B and Device C.

```
[DeviceA] security-policy ip
[DeviceA-security-policy-ip] rule name ipseclocalout
[DeviceA-security-policy-ip-1-ipseclocalout] source-zone local
[DeviceA-security-policy-ip-1-ipseclocalout] destination-zone untrust
[DeviceA-security-policy-ip-1-ipseclocalout] source-ip-host 1.1.1.1
[DeviceA-security-policy-ip-1-ipseclocalout] source-ip-host 2.2.2.2
[DeviceA-security-policy-ip-1-ipseclocalout] destination-ip-host 3.3.3.3
[DeviceA-security-policy-ip-1-ipseclocalout] destination-ip-host 4.4.4.4
[DeviceA-security-policy-ip-1-ipseclocalout] action pass
[DeviceA-security-policy-ip-1-ipseclocalout] quit
```

   # Configure a rule named **ipseclocalin** to allow Device A to receive the IPsec negotiation packets sent from Device B and Device C.

```
[DeviceA-security-policy-ip] rule name ipseclocalin
[DeviceA-security-policy-ip-2-ipseclocalin] source-zone untrust
[DeviceA-security-policy-ip-2-ipseclocalin] destination-zone local
[DeviceA-security-policy-ip-2-ipseclocalin] source-ip-host 3.3.3.3
[DeviceA-security-policy-ip-2-ipseclocalin] source-ip-host 4.4.4.4
[DeviceA-security-policy-ip-2-ipseclocalin] destination-ip-host 1.1.1.1
[DeviceA-security-policy-ip-2-ipseclocalin] destination-ip-host 2.2.2.2
[DeviceA-security-policy-ip-2-ipseclocalin] action pass
[DeviceA-security-policy-ip-2-ipseclocalin] quit
```

   b. Configure rules to permit the traffic between Host A and Host B and between Host A and Host C:

   # Configure a rule named **trust-untrust** to permit the packets from Host A to Host B and Host C.

```
[DeviceA-security-policy-ip] rule name trust-untrust
[DeviceA-security-policy-ip-3-trust-untrust] source-zone trust
[DeviceA-security-policy-ip-3-trust-untrust] destination-zone untrust
[DeviceA-security-policy-ip-3-trust-untrust] source-ip-subnet 192.168.11.0 24
```

```
[DeviceA-security-policy-ip-3-trust-untrust] destination-ip-subnet 192.168.12.0
24
[DeviceA-security-policy-ip-3-trust-untrust] destination-ip-subnet 192.168.13.0
24
[DeviceA-security-policy-ip-3-trust-untrust] action pass
[DeviceA-security-policy-ip-3-trust-untrust] quit
```

# Configure a rule named **untrust-trust** to permit the packets from Host B and Host C to Host A.

```
[DeviceA-security-policy-ip] rule name untrust-trust
[DeviceA-security-policy-ip-4-untrust-trust] source-zone untrust
[DeviceA-security-policy-ip-4-untrust-trust] destination-zone trust
[DeviceA-security-policy-ip-4-untrust-trust] source-ip-subnet 192.168.12.0 24
[DeviceA-security-policy-ip-4-untrust-trust] source-ip-subnet 192.168.13.0 24
[DeviceA-security-policy-ip-4-untrust-trust] destination-ip-subnet 192.168.11.0
24
[DeviceA-security-policy-ip-4-untrust-trust] action pass
[DeviceA-security-policy-ip-4-untrust-trust] quit
[DeviceA-security-policy-ip] quit
```

5. Configure IPsec profiles to establish IPsec tunnels to protect the specified data:

# Configure IPsec profile **t0**.

```
[DeviceA] ike keychain t0
[DeviceA-ike-keychain-t0] pre-shared-key address 3.3.3.3 255.255.255.0 key simple
123456TESTplat&!
[DeviceA-ike-keychain-t0] quit
[DeviceA] ike profile t0
[DeviceA-ike-profile-t0] keychain t0
[DeviceA-ike-profile-t0] match local address Tunnel0
[DeviceA-ike-profile-t0] match remote identity address 3.3.3.3 24
[DeviceA-ike-profile-t0] exchange-mode aggressive
[DeviceA-ike-profile-t0] dpd interval 30 periodic
[DeviceA-ike-profile-t0] quit
[DeviceA] ipsec transform-set t0
[DeviceA-ipsec-transform-set-t0] esp encryption-algorithm aes-cbc-128
[DeviceA-ipsec-transform-set-t0] esp authentication-algorithm sha1
[DeviceA-ipsec-transform-set-t0] quit
[DeviceA] ipsec profile t0 isakmp
[DeviceA-ipsec-profile-isakmp-t0] transform-set t0
[DeviceA-ipsec-profile-isakmp-t0] ike-profile t0
[DeviceA-ipsec-profile-isakmp-t0] quit
```

# Configure IPsec profile **t1**.

```
[DeviceA] ike keychain t1
[DeviceA-ike-keychain-t1] pre-shared-key address 3.3.3.3 255.255.255.0 key simple
123456TESTplat&!
[DeviceA-ike-keychain-t1] quit
[DeviceA] ike profile t1
[DeviceA-ike-profile-t1] keychain t1
[DeviceA-ike-profile-t1] match local address Tunnel1
[DeviceA-ike-profile-t1] match remote identity address 3.3.3.3 24
[DeviceA-ike-profile-t1] exchange-mode aggressive
```

```
[DeviceA-ike-profile-t1] dpd interval 30 periodic
[DeviceA-ike-profile-t1] quit
[DeviceA] ipsec transform-set t1
[DeviceA-ipsec-transform-set-t1] esp encryption-algorithm aes-cbc-128
[DeviceA-ipsec-transform-set-t1] esp authentication-algorithm sha1
[DeviceA-ipsec-transform-set-t1] quit
[DeviceA] ipsec profile t1 isakmp
[DeviceA-ipsec-profile-isakmp-t1] transform-set t1
[DeviceA-ipsec-profile-isakmp-t1] ike-profile t1
[DeviceA-ipsec-profile-isakmp-t1] quit
```

# Configure IPsec profile **t2**.

```
[DeviceA] ike keychain t2
[DeviceA-ike-keychain-t2] pre-shared-key address 4.4.4.4 255.255.255.0 key simple
123456TESTplat&!
[DeviceA-ike-keychain-t2] quit
[DeviceA] ike profile t2
[DeviceA-ike-profile-t2] keychain t2
[DeviceA-ike-profile-t2] match local address Tunnel2
[DeviceA-ike-profile-t2] match remote identity address 4.4.4.4 24
[DeviceA-ike-profile-t2] exchange-mode aggressive
[DeviceA-ike-profile-t2] dpd interval 30 periodic
[DeviceA-ike-profile-t2] quit
[DeviceA] ipsec transform-set t2
[DeviceA-ipsec-transform-set-t2] esp encryption-algorithm aes-cbc-128
[DeviceA-ipsec-transform-set-t2] esp authentication-algorithm sha1
[DeviceA-ipsec-transform-set-t2] quit
[DeviceA] ipsec profile t2 isakmp
[DeviceA-ipsec-profile-isakmp-t2] transform-set t2
[DeviceA-ipsec-profile-isakmp-t2] ike-profile t2
[DeviceA-ipsec-profile-isakmp-t2] quit
```

# Configure IPsec profile **t3**.

```
[DeviceA] ike keychain t3
[DeviceA-ike-keychain-t3] pre-shared-key address 4.4.4.4 255.255.255.0 key simple
123456TESTplat&!
[DeviceA-ike-keychain-t3] quit
[DeviceA] ike profile t3
[DeviceA-ike-profile-t3] keychain t3
[DeviceA-ike-profile-t3] match local address Tunnel3
[DeviceA-ike-profile-t3] match remote identity address 4.4.4.4 24
[DeviceA-ike-profile-t3] exchange-mode aggressive
[DeviceA-ike-profile-t3] dpd interval 30 periodic
[DeviceA-ike-profile-t3] quit
[DeviceA] ipsec transform-set t3
[DeviceA-ipsec-transform-set-t3] esp encryption-algorithm aes-cbc-128
[DeviceA-ipsec-transform-set-t3] esp authentication-algorithm sha1
[DeviceA-ipsec-transform-set-t3] quit
[DeviceA] ipsec profile t3 isakmp
[DeviceA-ipsec-profile-isakmp-t3] transform-set t3
[DeviceA-ipsec-profile-isakmp-t3] ike-profile t3
```

```
[DeviceA-ipsec-profile-isakmp-t3] quit
```

6. Configure IPsec tunnel interfaces, which encapsulate the traffic to be protected with IPsec.

# Configure IPsec tunnel interface Tunnel 0 to use IPsec profile **t0** to establish an IPsec tunnel.

```
[DeviceA] interface tunnel 0
[DeviceA-Tunnel0] tunnel protection ipsec profile t0
[DeviceA-Tunnel0] quit
```

# Configure IPsec tunnel interface Tunnel 1 to use IPsec profile **t1** to establish an IPsec tunnel.

```
[DeviceA] interface tunnel 1
[DeviceA-Tunnel1] tunnel protection ipsec profile t1
[DeviceA-Tunnel1] quit
```

# Configure IPsec tunnel interface Tunnel 2 to use IPsec profile **t2** to establish an IPsec tunnel.

```
[DeviceA] interface tunnel 2
[DeviceA-Tunnel2] tunnel protection ipsec profile t2
[DeviceA-Tunnel2] quit
```

# Configure IPsec tunnel interface Tunnel 3 to use IPsec profile **t3** to establish an IPsec tunnel.

```
[DeviceA] interface tunnel 3
[DeviceA-Tunnel3] tunnel protection ipsec profile t3
[DeviceA-Tunnel3] quit
```

7. Configure NQA operation and Track collaboration to probe the status of links:

# Configure NQA operation with administrator name **admin** and operation tag **test1**.

```
[DeviceA] nqa entry admin test1
[DeviceA-nqa-admin-test1] type icmp-echo
[DeviceA-nqa-admin-test1-icmp-echo] destination ip 3.3.3.3
[DeviceA-nqa-admin-test1-icmp-echo] frequency 3000
[DeviceA-nqa-admin-test1-icmp-echo] history-record enable
[DeviceA-nqa-admin-test1-icmp-echo] next-hop ip 1.1.1.2
[DeviceA-nqa-admin-test1-icmp-echo] probe count 5
[DeviceA-nqa-admin-test1-icmp-echo] reaction 1 checked-element probe-fail
threshold-type consecutive 3 action-type trigger-only
[DeviceA-nqa-admin-test1-icmp-echo] quit
[DeviceA] nqa schedule admin test1 start-time now lifetime forever
```

# Create track entry 110 and associate it with reaction entry 1 of NQA operation **admin-test1**.

```
[DeviceA] track 110 nqa entry admin test1 reaction 1
[DeviceA-track-110] quit
```

# Configure NQA operation with administrator name **admin** and operation tag **test2**.

```
[DeviceA] nqa entry admin test2
[DeviceA-nqa-admin-test2] type icmp-echo
[DeviceA-nqa-admin-test2-icmp-echo] destination ip 3.3.3.3
[DeviceA-nqa-admin-test2-icmp-echo] frequency 3000
[DeviceA-nqa-admin-test2-icmp-echo] history-record enable
[DeviceA-nqa-admin-test2-icmp-echo] probe count 5
[DeviceA-nqa-admin-test2-icmp-echo] next-hop ip 2.2.2.3
[DeviceA-nqa-admin-test2-icmp-echo] reaction 1 checked-element probe-fail
threshold-type consecutive 3 action-type trigger-only
[DeviceA-nqa-admin-test2-icmp-echo] quit
[DeviceA] nqa schedule admin test2 start-time now lifetime forever
```

# Create track entry 120 and associate it with reaction entry 1 of NQA operation **admin-test2**.

```
[DeviceA] track 120 nqa entry admin test2 reaction 1
```

```
[DeviceA-track-120] quit
```

# Configure NQA operation with administrator name **admin** and operation tag **test3**.

```
[DeviceA] nqa entry admin test3
[DeviceA-nqa-admin-test3] type icmp-echo
[DeviceA-nqa-admin-test3-icmp-echo] destination ip 4.4.4.4
[DeviceA-nqa-admin-test3-icmp-echo] frequency 3000
[DeviceA-nqa-admin-test3-icmp-echo] history-record enable
[DeviceA-nqa-admin-test3-icmp-echo] probe count 5
[DeviceA-nqa-admin-test3-icmp-echo] next-hop ip 1.1.1.2
[DeviceA-nqa-admin-test3-icmp-echo] reaction 1 checked-element probe-fail
threshold-type consecutive 3 action-type trigger-only
[DeviceA-nqa-admin-test3-icmp-echo] quit
[DeviceA] nqa schedule admin test3 start-time now lifetime forever
```

# Create track entry 130 and associate it with reaction entry 1 of NQA operation **admin-test3**.

```
[DeviceA] track 130 nqa entry admin test3 reaction 1
[DeviceA-track-130] quit
```

# Configure NQA operation with administrator name **admin** and operation tag **test4**.

```
[DeviceA] nqa entry admin test4
[DeviceA-nqa-admin-test4] type icmp-echo
[DeviceA-nqa-admin-test4-icmp-echo] destination ip 4.4.4.4
[DeviceA-nqa-admin-test4-icmp-echo] frequency 3000
[DeviceA-nqa-admin-test4-icmp-echo] history-record enable
[DeviceA-nqa-admin-test4-icmp-echo] probe count 5
[DeviceA-nqa-admin-test4-icmp-echo] next-hop ip 2.2.2.3
[DeviceA-nqa-admin-test4-icmp-echo] reaction 1 checked-element probe-fail
threshold-type consecutive 3 action-type trigger-only
[DeviceA-nqa-admin-test4-icmp-echo] quit
[DeviceA] nqa schedule admin test4 start-time now lifetime forever
```

# Create track entry 140 and associate it with reaction entry 1 of NQA operation **admin-test4**.

```
[DeviceA] track 140 nqa entry admin test4 reaction 1
[DeviceA-track-140] quit
```

8. Configure settings for routing.

   This example configures static routes.

   # Configure static routes to direct the traffic to be protected to the IPsec tunnel interfaces. Configure static routes to reach the branches' gateways and the next hops in the routes are 1.1.1.2 and 2.2.2.3.

```
[DeviceA] ip route-static 192.168.12.0 24 tunnel 0 track 110 preference 100
[DeviceA] ip route-static 192.168.12.0 24 tunnel 1 track 120 preference 110
[DeviceA] ip route-static 192.168.13.0 24 tunnel 2 track 130 preference 100
[DeviceA] ip route-static 192.168.13.0 24 tunnel 3 track 140 preference 110
[DeviceA] ip route-static 3.3.3.3 24 1.1.1.2 track 110 preference 100
[DeviceA] ip route-static 3.3.3.3 24 2.2.2.3 track 120 preference 110
[DeviceA] ip route-static 4.4.4.4 24 1.1.1.2 track 130 preference 100
[DeviceA] ip route-static 4.4.4.4 24 2.2.2.3 track 140 preference 110
```

Configuring Device B

1. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

```
<DeviceB> system-view
```

```
[DeviceB] interface gigabitethernet 1/0/1
[DeviceB-GigabitEthernet1/0/1] ip address 3.3.3.3 255.255.255.0
[DeviceB-GigabitEthernet1/0/1] quit
```

# Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Create IPsec tunnel interfaces:

   # Create IPsec tunnel interface Tunnel 0.

   ```
   [DeviceB] interface tunnel 0 mode ipsec
   [DeviceB-Tunnel0] ip address 50.0.0.1 255.255.255.0
   [DeviceB-Tunnel0] source 3.3.3.3
   [DeviceB-Tunnel0] destination 1.1.1.1
   [DeviceB-Tunnel0] quit
   ```

   # Create IPsec tunnel interface Tunnel 1.

   ```
   [DeviceB] interface tunnel 1 mode ipsec
   [DeviceB-Tunnel1] ip address 60.0.0.1 255.255.255.0
   [DeviceB-Tunnel1] source 3.3.3.3
   [DeviceB-Tunnel1] destination 2.2.2.2
   [DeviceB-Tunnel1] quit
   ```

3. Add interfaces to security zones.

   ```
   [DeviceB] security-zone name trust
   [DeviceB-security-zone-Trust] import interface gigabitethernet 1/0/2
   [DeviceB-security-zone-Trust] quit
   [DeviceB] security-zone name untrust
   [DeviceB-security-zone-Untrust] import interface gigabitethernet 1/0/1
   [DeviceB-security-zone-Untrust] import interface tunnel 0
   [DeviceB-security-zone-Untrust] import interface tunnel 1
   [DeviceB-security-zone-Untrust] quit
   ```

4. Configure a security policy:

   a. Configure rules to permit traffic between the **Untrust** and **Local** security zones, so the devices can set up an IPsec tunnel:

      # Configure a rule named **ipseclocalout** to allow Device B to send IPsec negotiation packets to Device A.

      ```
      [DeviceB] security-policy ip
      [DeviceB-security-policy-ip] rule name ipseclocalout
      [DeviceB-security-policy-ip-1-ipseclocalout] source-zone local
      [DeviceB-security-policy-ip-1-ipseclocalout] destination-zone untrust
      [DeviceB-security-policy-ip-1-ipseclocalout] source-ip-host 3.3.3.3
      [DeviceB-security-policy-ip-1-ipseclocalout] destination-ip-host 1.1.1.1
      [DeviceB-security-policy-ip-1-ipseclocalout] destination-ip-host 2.2.2.2
      [DeviceB-security-policy-ip-1-ipseclocalout] action pass
      [DeviceB-security-policy-ip-1-ipseclocalout] quit
      ```

      # Configure a rule named **ipseclocalin** to allow Device B to receive the IPsec negotiation packets sent from Device A.

      ```
      [DeviceB-security-policy-ip] rule name ipseclocalin
      [DeviceB-security-policy-ip-2-ipseclocalin] source-zone untrust
      [DeviceB-security-policy-ip-2-ipseclocalin] destination-zone local
      [DeviceB-security-policy-ip-2-ipseclocalin] source-ip-host 1.1.1.1
      [DeviceB-security-policy-ip-2-ipseclocalin] source-ip-host 2.2.2.2
      [DeviceB-security-policy-ip-2-ipseclocalin] destination-ip-host 3.3.3.3
      ```

```
[DeviceB-security-policy-ip-2-ipseclocalin] action pass
[DeviceB-security-policy-ip-2-ipseclocalin] quit
```

b. Configure rules to permit the traffic between Host B and Host A:

# Configure a rule named **trust-untrust** to permit the packets from Host B to Host A.

```
[DeviceB-security-policy-ip] rule name trust-untrust
[DeviceB-security-policy-ip-3-trust-untrust] source-zone trust
[DeviceB-security-policy-ip-3-trust-untrust] destination-zone untrust
[DeviceB-security-policy-ip-3-trust-untrust] source-ip-subnet 192.168.12.0 24
[DeviceB-security-policy-ip-3-trust-untrust] destination-ip-subnet 192.168.11.0
24
[DeviceB-security-policy-ip-3-trust-untrust] action pass
[DeviceB-security-policy-ip-3-trust-untrust] quit
```

# Configure a rule named **untrust-trust** to permit the packets from Host A to Host B.

```
[DeviceB-security-policy-ip] rule name untrust-trust
[DeviceB-security-policy-ip-4-untrust-trust] source-zone untrust
[DeviceB-security-policy-ip-4-untrust-trust] destination-zone trust
[DeviceB-security-policy-ip-4-untrust-trust] source-ip-subnet 192.168.11.0 24
[DeviceB-security-policy-ip-4-untrust-trust] destination-ip-subnet 192.168.12.0
24
[DeviceB-security-policy-ip-4-untrust-trust] action pass
[DeviceB-security-policy-ip-4-untrust-trust] quit
[DeviceB-security-policy-ip] quit
```

5. Configure IPsec profiles to establish IPsec tunnels to protect the specified data:

# Configure IPsec profile **t0**.

```
[DeviceB] ike keychain t0
[DeviceB-ike-keychain-t0] pre-shared-key address 1.1.1.1 255.255.255.0 key simple
123456TESTplat&!
[DeviceB-ike-keychain-t0] quit
[DeviceB] ike profile t0
[DeviceB-ike-profile-t0] keychain t0
[DeviceB-ike-profile-t0] match local address Tunnel0
[DeviceB-ike-profile-t0] match remote identity address 1.1.1.1 24
[DeviceB-ike-profile-t0] exchange-mode aggressive
[DeviceB-ike-profile-t0] dpd interval 30 periodic
[DeviceB-ike-profile-t0] quit
[DeviceB] ipsec transform-set t0
[DeviceB-ipsec-transform-set-t0] esp encryption-algorithm aes-cbc-128
[DeviceB-ipsec-transform-set-t0] esp authentication-algorithm sha1
[DeviceB-ipsec-transform-set-t0] quit
[DeviceB] ipsec profile t0 isakmp
[DeviceB-ipsec-profile-isakmp-t0] transform-set t0
[DeviceB-ipsec-profile-isakmp-t0] ike-profile t0
[DeviceB-ipsec-profile-isakmp-t0] quit
```

# Configure IPsec profile **t1**.

```
[DeviceB] ike keychain t1
[DeviceB-ike-keychain-t1] pre-shared-key address 2.2.2.2 255.255.255.0 key simple
123456TESTplat&!
[DeviceB-ike-keychain-t1] quit
```

```
[DeviceB] ike profile t1
[DeviceB-ike-profile-t1] keychain t1
[DeviceB-ike-profile-t1] match local address Tunnel1
[DeviceB-ike-profile-t1] match remote identity address 2.2.2.2 24
[DeviceB-ike-profile-t1] exchange-mode aggressive
[DeviceB-ike-profile-t1] dpd interval 30 periodic
[DeviceB-ike-profile-t1] quit
[DeviceB] ipsec transform-set t1
[DeviceB-ipsec-transform-set-t1] esp encryption-algorithm aes-cbc-128
[DeviceB-ipsec-transform-set-t1] esp authentication-algorithm sha1
[DeviceB-ipsec-transform-set-t1] quit
[DeviceB] ipsec profile t1 isakmp
[DeviceB-ipsec-profile-isakmp-t1] transform-set t1
[DeviceB-ipsec-profile-isakmp-t1] ike-profile t1
[DeviceB-ipsec-profile-isakmp-t1] quit
```

6. Configure IPsec tunnel interfaces, which encapsulate the traffic to be protected with IPsec.

   # Configure IPsec tunnel interface Tunnel 0 to use IPsec profile **t0** to establish an IPsec tunnel.

```
[DeviceB] interface tunnel 0
[DeviceB-Tunnel0] tunnel protection ipsec profile t0
[DeviceB-Tunnel0] quit
```

   # Configure IPsec tunnel interface Tunnel 1 to use IPsec profile **t1** to establish an IPsec tunnel.

```
[DeviceB] interface tunnel 1
[DeviceB-Tunnel1] tunnel protection ipsec profile t1
[DeviceB-Tunnel1] quit
```

7. Configure NQA operation and Track collaboration to probe the status of links:

   # Configure NQA operation with administrator name **admin** and operation tag **test1**.

```
[DeviceB] nqa entry admin test1
[DeviceB-nqa-admin-test1] type icmp-echo
[DeviceB-nqa-admin-test1-icmp-echo] destination ip 1.1.1.1
[DeviceB-nqa-admin-test1-icmp-echo] frequency 3000
[DeviceB-nqa-admin-test1-icmp-echo] history-record enable
[DeviceB-nqa-admin-test1-icmp-echo] probe count 5
[DeviceB-nqa-admin-test1-icmp-echo] next-hop ip 3.3.3.4
[DeviceB-nqa-admin-test1-icmp-echo] reaction 1 checked-element probe-fail
threshold-type consecutive 3 action-type trigger-only
[DeviceB-nqa-admin-test1-icmp-echo] quit
[DeviceB] nqa schedule admin test1 start-time now lifetime forever
```

   # Create track entry 110 and associate it with reaction entry 1 of NQA operation **admin-test1**.

```
[DeviceB] track 110 nqa entry admin test1 reaction 1
[DeviceB-track-110] quit
```

   # Configure NQA operation with administrator name **admin** and operation tag **test2**.

```
[DeviceB] nqa entry admin test2
[DeviceB-nqa-admin-test2] type icmp-echo
[DeviceB-nqa-admin-test2-icmp-echo] destination ip 2.2.2.2
[DeviceB-nqa-admin-test2-icmp-echo] frequency 3000
[DeviceB-nqa-admin-test2-icmp-echo] history-record enable
[DeviceB-nqa-admin-test2-icmp-echo] probe count 5
[DeviceB-nqa-admin-test2-icmp-echo] next-hop ip 3.3.3.4
```

```
[DeviceB-nqa-admin-test2-icmp-echo] reaction 1 checked-element probe-fail
threshold-type consecutive 3 action-type trigger-only
[DeviceB-nqa-admin-test2-icmp-echo] quit
[DeviceB] nqa schedule admin test2 start-time now lifetime forever
```

# Create track entry 120 and associate it with reaction entry 1 of NQA operation **admin-test2**.

```
[DeviceB] track 120 nqa entry admin test2 reaction 1
[DeviceB-track-120] quit
```

8. Configure settings for routing.

   This example configures static routes.

   # Configure static routes to direct the traffic to be protected to the IPsec tunnel interfaces. Configure static routes to reach the headquarters' gateway and the next hop in the routes is 3.3.3.4.

```
[DeviceB] ip route-static 192.168.11.0 24 tunnel 0 track 110 preference 100
[DeviceB] ip route-static 192.168.11.0 24 tunnel 1 track 120 preference 110
[DeviceB] ip route-static 1.1.1.1 24 3.3.3.4
[DeviceB] ip route-static 2.2.2.2 24 3.3.3.4
```

Configuring Device C

1. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

```
<DeviceC> system-view
[DeviceC] interface gigabitethernet 1/0/1
[DeviceC-GigabitEthernet1/0/1] ip address 4.4.4.4 255.255.255.0
[DeviceC-GigabitEthernet1/0/1] quit
```

   # Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Create IPsec tunnel interfaces:

   # Create IPsec tunnel interface Tunnel 0.

```
[DeviceC] interface tunnel 0 mode ipsec
[DeviceC-Tunnel0] ip address 70.0.0.1 255.255.255.0
[DeviceC-Tunnel0] source 4.4.4.4
[DeviceC-Tunnel0] destination 1.1.1.1
[DeviceC-Tunnel0] quit
```

   # Create IPsec tunnel interface Tunnel 1.

```
[DeviceC] interface tunnel 1 mode ipsec
[DeviceC-Tunnel1] ip address 80.0.0.1 255.255.255.0
[DeviceC-Tunnel1] source 4.4.4.4
[DeviceC-Tunnel1] destination 2.2.2.2
[DeviceC-Tunnel1] quit
```

3. Add interfaces to security zones.

```
[DeviceC] security-zone name trust
[DeviceC-security-zone-Trust] import interface gigabitethernet 1/0/2
[DeviceC-security-zone-Trust] quit
[DeviceC] security-zone name untrust
[DeviceC-security-zone-Untrust] import interface gigabitethernet 1/0/1
[DeviceC-security-zone-Untrust] import interface tunnel 0
[DeviceC-security-zone-Untrust] import interface tunnel 1
[DeviceC-security-zone-Untrust] quit
```

4. Configure a security policy:

a. Configure rules to permit traffic between the **Untrust** and **Local** security zones, so the devices can set up an IPsec tunnel:

   # Configure a rule named **ipseclocalout** to allow Device C to send IPsec negotiation packets to Device A.

```
[DeviceC] security-policy ip
[DeviceC-security-policy-ip] rule name ipseclocalout
[DeviceC-security-policy-ip-1-ipseclocalout] source-zone local
[DeviceC-security-policy-ip-1-ipseclocalout] destination-zone untrust
[DeviceC-security-policy-ip-1-ipseclocalout] source-ip-host 4.4.4.4
[DeviceC-security-policy-ip-1-ipseclocalout] destination-ip-host 1.1.1.1
[DeviceC-security-policy-ip-1-ipseclocalout] destination-ip-host 2.2.2.2
[DeviceC-security-policy-ip-1-ipseclocalout] action pass
[DeviceC-security-policy-ip-1-ipseclocalout] quit
```

   # Configure a rule named **ipseclocalin** to allow Device C to receive the IPsec negotiation packets sent from Device A.

```
[DeviceC-security-policy-ip] rule name ipseclocalin
[DeviceC-security-policy-ip-2-ipseclocalin] source-zone untrust
[DeviceC-security-policy-ip-2-ipseclocalin] destination-zone local
[DeviceC-security-policy-ip-2-ipseclocalin] source-ip-host 1.1.1.1
[DeviceC-security-policy-ip-2-ipseclocalin] source-ip-host 2.2.2.2
[DeviceC-security-policy-ip-2-ipseclocalin] destination-ip-host 4.4.4.4
[DeviceC-security-policy-ip-2-ipseclocalin] action pass
[DeviceC-security-policy-ip-2-ipseclocalin] quit
```

b. Configure rules to permit the traffic between Host C and Host A:

   # Configure a rule named **trust-untrust** to permit the packets from Host C to Host A.

```
[DeviceC-security-policy-ip] rule name trust-untrust
[DeviceC-security-policy-ip-3-trust-untrust] source-zone trust
[DeviceC-security-policy-ip-3-trust-untrust] destination-zone untrust
[DeviceC-security-policy-ip-3-trust-untrust] source-ip-subnet 192.168.13.0 24
[DeviceC-security-policy-ip-3-trust-untrust] destination-ip-subnet 192.168.11.0
24
[DeviceC-security-policy-ip-3-trust-untrust] action pass
[DeviceC-security-policy-ip-3-trust-untrust] quit
```

   # Configure a rule named **untrust-trust** to permit the packets from Host A to Host C.

```
[DeviceC-security-policy-ip] rule name untrust-trust
[DeviceC-security-policy-ip-4-untrust-trust] source-zone untrust
[DeviceC-security-policy-ip-4-untrust-trust] destination-zone trust
[DeviceC-security-policy-ip-4-untrust-trust] source-ip-subnet 192.168.11.0 24
[DeviceC-security-policy-ip-4-untrust-trust] destination-ip-subnet 192.168.13.0
24
[DeviceC-security-policy-ip-4-untrust-trust] action pass
[DeviceC-security-policy-ip-4-untrust-trust] quit
[DeviceC-security-policy-ip] quit
```

5. Configure IPsec profiles to establish IPsec tunnels to protect the specified data:

   # Configure IPsec profile **t0**.

```
[DeviceC] ike keychain t0
[DeviceC-ike-keychain-t0] pre-shared-key address 1.1.1.1 255.255.255.0 key simple
123456TESTplat&!
[DeviceC-ike-keychain-t0] quit
```

```
[DeviceC] ike profile t0
[DeviceC-ike-profile-t0] keychain t0
[DeviceC-ike-profile-t0] match local address Tunnel0
[DeviceC-ike-profile-t0] match remote identity address 1.1.1.1 24
[DeviceC-ike-profile-t0] exchange-mode aggressive
[DeviceC-ike-profile-t0] dpd interval 30 periodic
[DeviceC-ike-profile-t0] quit
[DeviceC] ipsec transform-set t0
[DeviceC-ipsec-transform-set-t0] esp encryption-algorithm aes-cbc-128
[DeviceC-ipsec-transform-set-t0] esp authentication-algorithm sha1
[DeviceC-ipsec-transform-set-t0] quit
[DeviceC] ipsec profile t0 isakmp
[DeviceC-ipsec-profile-isakmp-t0] transform-set t0
[DeviceC-ipsec-profile-isakmp-t0] ike-profile t0
[DeviceC-ipsec-profile-isakmp-t0] quit
```

# Configure IPsec profile **t1**.

```
[DeviceC] ike keychain t1
[DeviceC-ike-keychain-t1] pre-shared-key address 2.2.2.2 255.255.255.0 key simple
123456TESTplat&!
[DeviceC-ike-keychain-t1] quit
[DeviceC] ike profile t1
[DeviceC-ike-profile-t1] keychain t1
[DeviceC-ike-profile-t1] match local address Tunnel1
[DeviceC-ike-profile-t1] match remote identity address 2.2.2.2 24
[DeviceC-ike-profile-t1] exchange-mode aggressive
[DeviceC-ike-profile-t1] dpd interval 30 periodic
[DeviceC-ike-profile-t1] quit
[DeviceC] ipsec transform-set t1
[DeviceC-ipsec-transform-set-t1] esp encryption-algorithm aes-cbc-128
[DeviceC-ipsec-transform-set-t1] esp authentication-algorithm sha1
[DeviceC-ipsec-transform-set-t1] quit
[DeviceC] ipsec profile t1 isakmp
[DeviceC-ipsec-profile-isakmp-t1] transform-set t1
[DeviceC-ipsec-profile-isakmp-t1] ike-profile t1
[DeviceC-ipsec-profile-isakmp-t1] quit
```

6. Configure IPsec tunnel interfaces, which encapsulate the traffic to be protected with IPsec.

# Configure IPsec tunnel interface Tunnel 0 to use IPsec profile **t0** to establish an IPsec tunnel.

```
[DeviceC] interface tunnel 0
[DeviceC-Tunnel0] tunnel protection ipsec profile t0
[DeviceC-Tunnel0] quit
```

# Configure IPsec tunnel interface Tunnel 1 to use IPsec profile **t1** to establish an IPsec tunnel.

```
[DeviceC] interface tunnel 1
[DeviceC-Tunnel1] tunnel protection ipsec profile t1
[DeviceC-Tunnel1] quit
```

7. Configure NQA operation and Track collaboration to probe the status of links:

# Configure NQA operation with administrator name **admin** and operation tag **test1**.

```
[DeviceC] nqa entry admin test1
[DeviceC-nqa-admin-test1] type icmp-echo
```

```
[DeviceC-nqa-admin-test1-icmp-echo] destination ip 1.1.1.1
[DeviceC-nqa-admin-test1-icmp-echo] frequency 3000
[DeviceC-nqa-admin-test1-icmp-echo] history-record enable
[DeviceC-nqa-admin-test1-icmp-echo] probe count 5
[DeviceC-nqa-admin-test1-icmp-echo] next-hop ip 4.4.4.5
[DeviceC-nqa-admin-test1-icmp-echo] reaction 1 checked-element probe-fail
threshold-type consecutive 3 action-type trigger-only
[DeviceC-nqa-admin-test1-icmp-echo] quit
[DeviceC] nqa schedule admin test1 start-time now lifetime forever
```

# Create track entry 110 and associate it with reaction entry 1 of NQA operation **admin-test1**.

```
[DeviceC] track 110 nqa entry admin test1 reaction 1
[DeviceC-track-110] quit
```

# Configure NQA operation with administrator name **admin** and operation tag **test2**.

```
[DeviceC] nqa entry admin test2
[DeviceC-nqa-admin-test2] type icmp-echo
[DeviceC-nqa-admin-test2-icmp-echo] destination ip 2.2.2.2
[DeviceC-nqa-admin-test2-icmp-echo] frequency 3000
[DeviceC-nqa-admin-test2-icmp-echo] history-record enable
[DeviceC-nqa-admin-test2-icmp-echo] probe count 5
[DeviceC-nqa-admin-test2-icmp-echo] next-hop ip 4.4.4.5
[DeviceC-nqa-admin-test2-icmp-echo] reaction 1 checked-element probe-fail
threshold-type consecutive 3 action-type trigger-only
[DeviceC-nqa-admin-test2-icmp-echo] quit
[DeviceC] nqa schedule admin test2 start-time now lifetime forever
```

# Create track entry 120 and associate it with reaction entry 1 of NQA operation **admin-test2**.

```
[DeviceC] track 120 nqa entry admin test2 reaction 1
[DeviceC-track-120] quit
```

8. Configure settings for routing.

   This example configures static routes.

   # Configure static routes to direct the traffic to be protected to the IPsec tunnel interfaces. Configure static routes to reach the headquarters' gateway and the next hop in the routes is 4.4.4.5.

```
[DeviceC] ip route-static 192.168.11.0 24 tunnel 0 track 110 preference 100
[DeviceC] ip route-static 192.168.11.0 24 tunnel 1 track 120 preference 110
[DeviceC] ip route-static 1.1.1.1 24 4.4.4.5
[DeviceC] ip route-static 2.2.2.2 24 4.4.4.5
```

Verifying the configuration

After the configuration is completed, Device A will automatically initiate IKE negotiation with Device B and Device C. After IKE negotiation succeeds, the tunnel interfaces on the devices will come up and traffic between the branch and the headquarters will be IPsec-protected. This example uses Device A to verify the configuration.

# Display brief IP configuration for interfaces on Device A.

```
<DeviceA> display ip interface brief
*down: administratively down
(s): spoofing  (l): loopback
Interface           Physical Protocol IP address/Mask    VPN instance Description
GE1/0/1             up       up       1.1.1.1/24          --           --
GE1/0/2             up       up       2.2.2.2/24          --           --
```

```
GE1/0/3             up       up       192.168.11.1/24     --           --

# After the link connected to GigabitEthernet 1/0/1 of Device A recovers, IPsec traffic is switched back to the link of Tunnel 0.

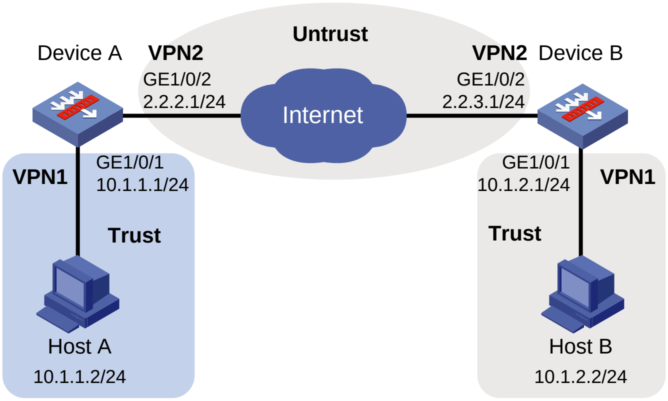
Example: Configuring IPsec with multiple VPN instances

Network configuration

As shown in Figure 32, establish an IPsec tunnel between Device A and Device B to protect data flows between subnet 10.1.1.0/24 and subnet 10.1.2.0/24. Configure the tunnel as follows:

- Specify the encapsulation mode as tunnel, the security protocol as ESP, the encryption algorithm as 128-bit AES, and the authentication algorithm as HMAC-SHA1.
- Set up SAs through IKE negotiation.
- The intranet and exanet of Device A and Device B belong to different VPN instances.

Figure 32 Network diagram



Configuring Device A

1. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

   ```
   <DeviceA> system-view
   [DeviceA] ip vpn-instance vpn1
   [DeviceA-vpn-instance-vpn1] route-distinguisher 100:1
   [DeviceA-vpn-instance-vpn1] quit
   [DeviceA] interface gigabitethernet 1/0/1
   [DeviceA-GigabitEthernet1/0/1] ip binding vpn-instance vpn1
   ```

```
[DeviceA-GigabitEthernet1/0/1] ip address 10.1.1.1 255.255.255.0
[DeviceA-GigabitEthernet1/0/1] quit
[DeviceA] ip vpn-instance vpn2
[DeviceA-vpn-instance-vpn2] route-distinguisher 100:2
[DeviceA-vpn-instance-vpn2] quit
[DeviceA] interface
[DeviceA-] ip binding vpn-instance vpn2
[DeviceA-] ip address 2.2.2.1 255.255.255.0
[DeviceA-] quit
```

# Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Configure settings for routing.

This example configures static routes, and the next hop in the routes is 2.2.2.2.

```
[DeviceA] ip route-static vpn-instance vpn1 10.1.2.0 24 vpn-instance vpn2 2.2.2.2
[DeviceA] ip route-static vpn-instance vpn2 2.2.3.1 24 2.2.2.2
```

3. Add interfaces to security zones.

```
[DeviceA] security-zone name trust
[DeviceA-security-zone-Trust] import interface gigabitethernet 1/0/1
[DeviceA-security-zone-Trust] quit
[DeviceA] security-zone name untrust
[DeviceA-security-zone-Untrust] import interface gigabitethernet 1/0/2
[DeviceA-security-zone-Untrust] quit
```

4. Configure a security policy:

a. Configure rules to permit traffic between the **Untrust** and **Local** security zones, so the devices can set up an IPsec tunnel:

# Configure a rule named **ipseclocalout** to allow Device A to send IPsec negotiation packets to Device B.

```
[DeviceA] security-policy ip
[DeviceA-security-policy-ip] rule name ipseclocalout
[DeviceA-security-policy-ip-1-ipseclocalout] source-zone local
[DeviceA-security-policy-ip-1-ipseclocalout] destination-zone untrust
[DeviceA-security-policy-ip-1-ipseclocalout] source-ip-host 2.2.2.1
[DeviceA-security-policy-ip-1-ipseclocalout] destination-ip-host 2.2.3.1
[DeviceA-security-policy-ip-1-ipseclocalout] action pass
[DeviceA-security-policy-ip-1-ipseclocalout] vrf vpn2
[DeviceA-security-policy-ip-1-ipseclocalout] quit
```

# Configure a rule named **ipseclocalin** to allow Device A to receive the IPsec negotiation packets sent from Device B.

```
[DeviceA-security-policy-ip] rule name ipseclocalin
[DeviceA-security-policy-ip-2-ipseclocalin] source-zone untrust
[DeviceA-security-policy-ip-2-ipseclocalin] destination-zone local
[DeviceA-security-policy-ip-2-ipseclocalin] source-ip-host 2.2.3.1
[DeviceA-security-policy-ip-2-ipseclocalin] destination-ip-host 2.2.2.1
[DeviceA-security-policy-ip-2-ipseclocalin] action pass
[DeviceA-security-policy-ip-2-ipseclocalout] vrf vpn2
[DeviceA-security-policy-ip-2-ipseclocalin] quit
```

b. Configure rules to permit the traffic between Host A and Host B:

# Configure a rule named **trust-untrust** to permit the packets from Host A to Host B.

```
[DeviceA-security-policy-ip] rule name trust-untrust
```

```
[DeviceA-security-policy-ip-3-trust-untrust] source-zone trust
[DeviceA-security-policy-ip-3-trust-untrust] destination-zone untrust
[DeviceA-security-policy-ip-3-trust-untrust] source-ip-subnet 10.1.1.0 24
[DeviceA-security-policy-ip-3-trust-untrust] destination-ip-subnet 10.1.2.0 24
[DeviceA-security-policy-ip-3-trust-untrust] action pass
[DeviceA-security-policy-ip-3-ipseclocalout] vrf vpn1
[DeviceA-security-policy-ip-3-trust-untrust] quit
```

# Configure a rule named **untrust-trust** to permit the packets from Host B to Host A.

```
[DeviceA-security-policy-ip] rule name untrust-trust
[DeviceA-security-policy-ip-4-untrust-trust] source-zone untrust
[DeviceA-security-policy-ip-4-untrust-trust] destination-zone trust
[DeviceA-security-policy-ip-4-untrust-trust] source-ip-subnet 10.1.2.0 24
[DeviceA-security-policy-ip-4-untrust-trust] destination-ip-subnet 10.1.1.0 24
[DeviceA-security-policy-ip-4-untrust-trust] action pass
[DeviceA-security-policy-ip-4-ipseclocalout] vrf vpn1
[DeviceA-security-policy-ip-4-untrust-trust] quit
[DeviceA-security-policy-ip] quit
```

5. Define the data flows to be protected:

   # Configure an IPv4 advanced ACL to identify data flows from subnet 10.1.1.0/24 to subnet 10.1.2.0/24.

```
[DeviceA] acl advanced 3101
[DeviceA-acl-ipv4-adv-3101] rule permit ip vpn-instance vpn1 source 10.1.1.0
0.0.0.255 destination 10.1.2.0 0.0.0.255
[DeviceA-acl-ipv4-adv-3101] quit
```

6. Configure an IPsec transform set to specify the packet encapsulation mode, security protocols, and algorithms.

   The IPsec transform set settings at both sides of the IPsec tunnel must be the same.

```
[DeviceA] ipsec transform-set tran1
[DeviceA-ipsec-transform-set-tran1] encapsulation-mode tunnel
[DeviceA-ipsec-transform-set-tran1] protocol esp
[DeviceA-ipsec-transform-set-tran1] esp encryption-algorithm aes-cbc-128
[DeviceA-ipsec-transform-set-tran1] esp authentication-algorithm sha1
[DeviceA-ipsec-transform-set-tran1] quit
```

7. Configure an IKE keychain to specify the key information used for IKE communication.

   The preshared key used by both sides of the communication must be the same.

```
[DeviceA] ike keychain keychain1 vpn-instance vpn2
[DeviceA-ike-keychain-keychain1] pre-shared-key address 2.2.3.1 255.255.255.0 key
simple 123456TESTplat&!
[DeviceA-ike-keychain-keychain1] quit
```

8. Configure an IKE profile to specify the security parameters used for setting up IKE SAs.

```
[DeviceA] ike profile profile1
[DeviceA-ike-profile-profile1] keychain keychain1
[DeviceA-ike-profile-profile1] match remote identity address 2.2.3.1 255.255.255.0
vpn-instance vpn2
[DeviceA-ike-profile-profile1] inside-vpn vpn-instance vpn1
[DeviceA-ike-profile-profile1] quit
```

9. Configure an IPsec policy, so as to establish the IPsec tunnel to protect data:

# Create an IKE-based IPsec policy entry, which specifies the ACL for IPsec, IPsec transform set, local and remote IP addresses, and IKE profile.

```
[DeviceA] ipsec policy map1 10 isakmp
[DeviceA-ipsec-policy-isakmp-map1-10] security acl 3101
[DeviceA-ipsec-policy-isakmp-map1-10] transform-set tran1
[DeviceA-ipsec-policy-isakmp-map1-10] local-address 2.2.2.1
[DeviceA-ipsec-policy-isakmp-map1-10] remote-address 2.2.3.1
[DeviceA-ipsec-policy-isakmp-map1-10] ike-profile profile1
[DeviceA-ipsec-policy-isakmp-map1-10] quit
```

10. Apply the IPsec policy to GigabitEthernet 1/0/2 to protect traffic on the interface.

```
[DeviceA] interface gigabitethernet 1/0/2
[DeviceA-GigabitEthernet1/0/2] ipsec apply policy map1
[DeviceA-GigabitEthernet1/0/2] quit
```

Configuring Device B

1. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

```
<DeviceB> system-view
[DeviceB] ip vpn-instance vpn1
[DeviceB-vpn-instance-vpn1] route-distinguisher 200:1
[DeviceB-vpn-instance-vpn1] quit
[DeviceB] interface gigabitethernet 1/0/1
[DeviceB-GigabitEthernet1/0/1] ip binding vpn-instance vpn1
[DeviceB-GigabitEthernet1/0/1] ip address 10.1.2.1 255.255.255.0
[DeviceB-GigabitEthernet1/0/1] quit
[DeviceB] ip vpn-instance vpn2
[DeviceB-vpn-instance-vpn2] route-distinguisher 200:2
[DeviceB-vpn-instance-vpn2] quit
[DeviceB] interface
[DeviceB-] ip binding vpn-instance vpn2
[DeviceB-] ip address 2.2.3.1 255.255.255.0
[DeviceB-] quit
```

   # Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Configure settings for routing.

   This example configures static routes, and the next hop in the routes is 2.2.3.2.

```
[DeviceB] ip route-static vpn-instance vpn1 10.1.1.0 24 vpn-instance vpn2 2.2.3.2
[DeviceB] ip route-static vpn-instance vpn2 2.2.2.1 24 2.2.3.2
```

3. Add interfaces to security zones.

```
[DeviceB] security-zone name trust
[DeviceB-security-zone-Trust] import interface gigabitethernet 1/0/1
[DeviceB-security-zone-Trust] quit
[DeviceB] security-zone name untrust
[DeviceB-security-zone-Untrust] import interface gigabitethernet 1/0/2
[DeviceB-security-zone-Untrust] quit
```

4. Configure a security policy:

   a. Configure rules to permit traffic between the **Untrust** and **Local** security zones, so the devices can set up an IPsec tunnel:

# Configure a rule named **ipseclocalout** to allow Device B to send IPsec negotiation packets to Device A.

```
[DeviceB] security-policy ip
[DeviceB-security-policy-ip] rule name ipseclocalout
[DeviceB-security-policy-ip-1-ipseclocalout] source-zone local
[DeviceB-security-policy-ip-1-ipseclocalout] destination-zone untrust
[DeviceB-security-policy-ip-1-ipseclocalout] source-ip-host 2.2.3.1
[DeviceB-security-policy-ip-1-ipseclocalout] destination-ip-host 2.2.2.1
[DeviceB-security-policy-ip-1-ipseclocalout] action pass
[DeviceB-security-policy-ip-1-ipseclocalout] vrf vpn2
[DeviceB-security-policy-ip-1-ipseclocalout] quit
```

# Configure a rule named **ipseclocalin** to allow Device B to receive the IPsec negotiation packets sent from Device A.

```
[DeviceB-security-policy-ip] rule name ipseclocalin
[DeviceB-security-policy-ip-2-ipseclocalin] source-zone untrust
[DeviceB-security-policy-ip-2-ipseclocalin] destination-zone local
[DeviceB-security-policy-ip-2-ipseclocalin] source-ip-host 2.2.2.1
[DeviceB-security-policy-ip-2-ipseclocalin] destination-ip-host 2.2.3.1
[DeviceB-security-policy-ip-2-ipseclocalin] action pass
[DeviceB-security-policy-ip-2-ipseclocalout] vrf vpn2
[DeviceB-security-policy-ip-2-ipseclocalin] quit
```

b. Configure rules to permit the traffic between Host B and Host A:

# Configure a rule named **trust-untrust** to permit the packets from Host B to Host A.

```
[DeviceB-security-policy-ip] rule name trust-untrust
[DeviceB-security-policy-ip-3-trust-untrust] source-zone trust
[DeviceB-security-policy-ip-3-trust-untrust] destination-zone untrust
[DeviceB-security-policy-ip-3-trust-untrust] source-ip-subnet 10.1.2.0 24
[DeviceB-security-policy-ip-3-trust-untrust] destination-ip-subnet 10.1.1.0 24
[DeviceB-security-policy-ip-3-trust-untrust] action pass
[DeviceB-security-policy-ip-3-ipseclocalout] vrf vpn1
[DeviceB-security-policy-ip-3-trust-untrust] quit
```

# Configure a rule named **untrust-trust** to permit the packets from Host A to Host B.

```
[DeviceB-security-policy-ip] rule name untrust-trust
[DeviceB-security-policy-ip-4-untrust-trust] source-zone untrust
[DeviceB-security-policy-ip-4-untrust-trust] destination-zone trust
[DeviceB-security-policy-ip-4-untrust-trust] source-ip-subnet 10.1.1.0 24
[DeviceB-security-policy-ip-4-untrust-trust] destination-ip-subnet 10.1.2.0 24
[DeviceB-security-policy-ip-4-untrust-trust] action pass
[DeviceB-security-policy-ip-4-ipseclocalout] vrf vpn1
[DeviceB-security-policy-ip-4-untrust-trust] quit
[DeviceB-security-policy-ip] quit
```

5. Define the data flows to be protected:

# Configure an IPv4 advanced ACL to identify data flows from subnet 10.1.2.0/24 to subnet 10.1.1.0/24.

```
[DeviceB] acl advanced 3101
[DeviceB-acl-ipv4-adv-3101] rule permit ip vpn-instance vpn1 source 10.1.2.0
0.0.0.255 destination 10.1.1.0 0.0.0.255
[DeviceB-acl-ipv4-adv-3101] quit
```

6. Configure an IPsec transform set to specify the packet encapsulation mode, security protocols, and algorithms.

   The IPsec transform set settings at both sides of the IPsec tunnel must be the same.

```
[DeviceB] ipsec transform-set tran1
[DeviceB-ipsec-transform-set-tran1] encapsulation-mode tunnel
[DeviceB-ipsec-transform-set-tran1] protocol esp
[DeviceB-ipsec-transform-set-tran1] esp encryption-algorithm aes-cbc-128
[DeviceB-ipsec-transform-set-tran1] esp authentication-algorithm sha1
[DeviceB-ipsec-transform-set-tran1] quit
```

7. Configure an IKE keychain to specify the key information used for IKE communication.

   The preshared key used by both sides of the communication must be the same.

```
[DeviceB] ike keychain keychain1 vpn-instance vpn2
[DeviceB-ike-keychain-keychain1] pre-shared-key address 2.2.2.1 255.255.255.0 key
simple 123456TESTplat&!
[DeviceB-ike-keychain-keychain1] quit
```

8. Configure an IKE profile to specify the security parameters used for setting up IKE SAs.

```
[DeviceB] ike profile profile1
[DeviceB-ike-profile-profile1] keychain keychain1
[DeviceB-ike-profile-profile1] match remote identity address 2.2.2.1 255.255.255.0
vpn-instance vpn2
[DeviceB-ike-profile-profile1] inside-vpn vpn-instance vpn1
[DeviceB-ike-profile-profile1] quit
```

9. Configure an IPsec policy, so as to establish the IPsec tunnel to protect data:

   # Create an IKE-based IPsec policy entry, which specifies the ACL for IPsec, IPsec transform set, local and remote IP addresses, and IKE profile.

```
[DeviceB] ipsec policy use1 10 isakmp
[DeviceB-ipsec-policy-isakmp-use1-10] security acl 3101
[DeviceB-ipsec-policy-isakmp-use1-10] transform-set tran1
[DeviceB-ipsec-policy-isakmp-use1-10] local-address 2.2.3.1
[DeviceB-ipsec-policy-isakmp-use1-10] remote-address 2.2.2.1
[DeviceB-ipsec-policy-isakmp-use1-10] ike-profile profile1
[DeviceB-ipsec-policy-isakmp-use1-10] quit
```

10. Apply the IPsec policy to GigabitEthernet 1/0/2 to protect traffic on the interface.

```
[DeviceB] interface gigabitethernet 1/0/2
[DeviceB-GigabitEthernet1/0/2] ipsec apply policy use1
[DeviceB-GigabitEthernet1/0/2] quit
```

Verifying the configuration

# Initiate a connection from subnet 10.1.1.0/24 to subnet 10.1.2.0/24 to trigger IKE negotiation. After IPsec SAs are successfully negotiated by IKE, the traffic between the two subnets is IPsec-protected.

# Display IPsec SAs on Device A and Device B. This example uses Device A to verify the configuration.

```
[DeviceA] display ipsec sa
-------------------------------
Interface: GigabitEthernet 1/0/2
-------------------------------

  -----------------------------
```

```
IPsec policy: map1
Sequence number: 10
Alisa: map1-10
Mode: ISAKMP
-----------------------------
  Tunnel id: 0
  Encapsulation mode: tunnel
  Perfect Forward Secrecy:
  Inside VPN: vpn1

    UDP encapsulation used for NAT traversal: N
    Status: Active
```

Example: Configuring an IKEv2-based IPsec NAT traversal tunnel between gateways

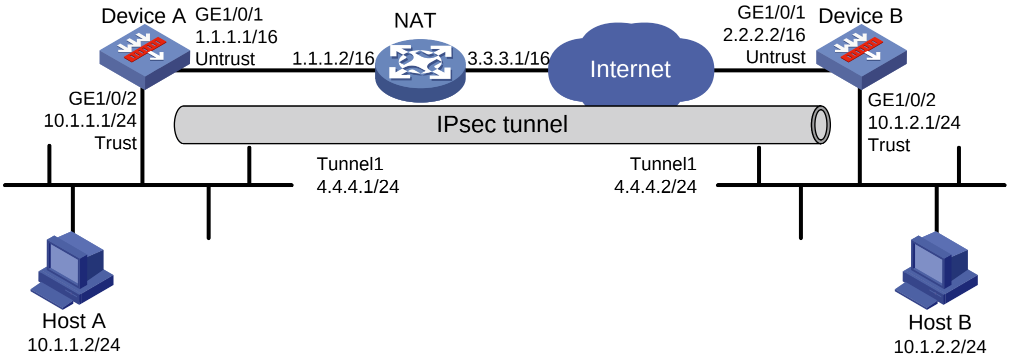
Network configuration

Device A is behind the NAT device. Hosts behind Device A use public IP address 3.3.3.1 to access the external network.

Configure IPsec tunnel interface-based IPsec on Device A and Device B to protect the traffic between subnet 10.1.1.0/24 and subnet 10.1.2.0/24.

- Configure Device A and Device B to use the default IKEv2 proposal and the default IKEv2 policy in IKEv2 negotiation to set up IPsec SAs.
- Configure the two devices to use the preshared key authentication method in IKEv2 negotiation phase 1.

Figure 33 Network diagram



Configuring Device A

1. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

   ```
   <DeviceA> system-view
   [DeviceA] interface gigabitethernet 1/0/1
   [DeviceA-GigabitEthernet1/0/1] ip address 1.1.1.1 255.255.0.0
   [DeviceA-GigabitEthernet1/0/1] quit
   ```

   # Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Configure settings for routing.

   This example configures static routes, and the next hop in the routes is 1.1.1.2.

   ```
   [DeviceA] ip route-static 2.2.2.2 16 1.1.1.2
   ```

3. Add interfaces to security zones.

   ```
   [DeviceA] security-zone name trust
   [DeviceA-security-zone-Trust] import interface gigabitethernet 1/0/2
   [DeviceA-security-zone-Trust] quit
   [DeviceA] security-zone name untrust
   [DeviceA-security-zone-Untrust] import interface gigabitethernet 1/0/1
   [DeviceA-security-zone-Untrust] quit
   ```

4. Configure a security policy:

   a. Configure rules to permit traffic between the **Untrust** and **Local** security zones, so the devices can set up an IPsec tunnel:

      # Configure a rule named **ipseclocalout** to allow Device A to send IPsec negotiation packets to Device B.

      ```
      [DeviceA] security-policy ip
      [DeviceA-security-policy-ip] rule name ipseclocalout
      [DeviceA-security-policy-ip-1-ipseclocalout] source-zone local
      [DeviceA-security-policy-ip-1-ipseclocalout] destination-zone untrust
      [DeviceA-security-policy-ip-1-ipseclocalout] source-ip-host 1.1.1.1
      [DeviceA-security-policy-ip-1-ipseclocalout] destination-ip-host 2.2.2.2
      [DeviceA-security-policy-ip-1-ipseclocalout] action pass
      [DeviceA-security-policy-ip-1-ipseclocalout] quit
      ```

# Configure a rule named **ipseclocalin** to allow Device A to receive the IPsec negotiation packets sent from Device B.

```
[DeviceA-security-policy-ip] rule name ipseclocalin
[DeviceA-security-policy-ip-2-ipseclocalin] source-zone untrust
[DeviceA-security-policy-ip-2-ipseclocalin] destination-zone local
[DeviceA-security-policy-ip-2-ipseclocalin] source-ip-host 2.2.2.2
[DeviceA-security-policy-ip-2-ipseclocalin] destination-ip-host 1.1.1.1
[DeviceA-security-policy-ip-2-ipseclocalin] action pass
[DeviceA-security-policy-ip-2-ipseclocalin] quit
```

b. Configure rules to permit the traffic between Host A and Host B:

# Configure a rule named **trust-untrust** to permit the packets from Host A to Host B.

```
[DeviceA-security-policy-ip] rule name trust-untrust
[DeviceA-security-policy-ip-3-trust-untrust] source-zone trust
[DeviceA-security-policy-ip-3-trust-untrust] destination-zone untrust
[DeviceA-security-policy-ip-3-trust-untrust] source-ip-subnet 10.1.1.0 24
[DeviceA-security-policy-ip-3-trust-untrust] destination-ip-subnet 10.1.2.0 24
[DeviceA-security-policy-ip-3-trust-untrust] action pass
[DeviceA-security-policy-ip-3-trust-untrust] quit
```

# Configure a rule named **untrust-trust** to permit the packets from Host B to Host A.

```
[DeviceA-security-policy-ip] rule name untrust-trust
[DeviceA-security-policy-ip-4-untrust-trust] source-zone untrust
[DeviceA-security-policy-ip-4-untrust-trust] destination-zone trust
[DeviceA-security-policy-ip-4-untrust-trust] source-ip-subnet 10.1.2.0 24
[DeviceA-security-policy-ip-4-untrust-trust] destination-ip-subnet 10.1.1.0 24
[DeviceA-security-policy-ip-4-untrust-trust] action pass
[DeviceA-security-policy-ip-4-untrust-trust] quit
[DeviceA-security-policy-ip] quit
```

5. Configure an IPsec transform set to specify the packet encapsulation mode, security protocols, and algorithms.

The IPsec transform set settings at both sides of the IPsec tunnel must be the same.

```
[DeviceA] ipsec transform-set transform1
[DeviceA-ipsec-transform-set-transform1] protocol esp
[DeviceA-ipsec-transform-set-transform1] esp encryption-algorithm 3des-cbc
[DeviceA-ipsec-transform-set-transform1] esp authentication-algorithm md5
[DeviceA-ipsec-transform-set-transform1] quit
```

6. Configure an IKEv2 keychain to specify the key information used for IKEv2 communication.

The preshared key used by both sides of the communication must be the same.

```
[DeviceA] ikev2 keychain keychain1
[DeviceA-ikev2-keychain-keychain1] peer peer1
[DeviceA-ikev2-keychain-keychain1-peer-peer1] address 2.2.2.2 16
[DeviceA-ikev2-keychain-keychain1-peer-peer1] identity address 2.2.2.2
[DeviceA-ikev2-keychain-keychain1-peer-peer1] pre-shared-key plaintext 123
[DeviceA-ikev2-keychain-keychain1-peer-peer1] quit
[DeviceA-ikev2-keychain-keychain1] quit
```

7. Configure an IKEv2 profile to specify the security parameters used for setting up IKEv2 SAs.

```
[DeviceA] ikev2 profile profile1
[DeviceA-ikev2-profile-profile1] keychain keychain1
[DeviceA-ikev2-profile-profile1] identity local fqdn www.devicea.com
```

```
[DeviceA-ikev2-profile-profile1] match remote identity address 2.2.2.2 255.255.0.0
[DeviceA-ikev2-profile-profile1] authentication-method local pre-share
[DeviceA-ikev2-profile-profile1] authentication-method remote pre-share
[DeviceA-ikev2-profile-profile1] quit
```

8. Configure an IPsec profile to establish an IPsec tunnel to protect the specified data:

```
[DeviceA] ipsec profile abc isakmp
[DeviceA-ipsec-profile-isakmp-abc] transform-set transform1
[DeviceA-ipsec-profile-isakmp-abc] ikev2-profile profile1
[DeviceA-ipsec-profile-isakmp-abc] quit
```

9. Configure an IPsec tunnel interface, which encapsulates the traffic to be protected with IPsec:

# Create an IPsec tunnel interface, and apply the IPsec profile.

```
[DeviceA] interface tunnel 1 mode ipsec
[DeviceA-Tunnel1] ip address 4.4.4.1 255.255.255.0
[DeviceA-Tunnel1] source 1.1.1.1
[DeviceA-Tunnel1] destination 2.2.2.2
[DeviceA-Tunnel1] tunnel protection ipsec profile abc
[DeviceA-Tunnel1] quit
```

# Add the IPsec tunnel interface to security zone **Untrust**.

```
[DeviceA] security-zone name untrust
[DeviceA-security-zone-Untrust] import interface tunnel 1
[DeviceA-security-zone-Untrust] quit
```

# Configure a static route to direct the traffic to be protected to the IPsec tunnel interface.

```
[DeviceA] ip route-static 10.1.2.0 255.255.255.0 tunnel 1
```

Configuring Device B

1. Assign IP addresses to interfaces:

# Assign an IP address to interface GigabitEthernet 1/0/1.

```
<DeviceB> system-view
[DeviceB] interface gigabitethernet 1/0/1
[DeviceB-GigabitEthernet1/0/1] ip address 2.2.2.2 255.255.0.0
[DeviceB-GigabitEthernet1/0/1] quit
```

# Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Configure settings for routing.

This example configures static routes, and the next hop in the routes is 2.2.2.1.

```
[DeviceB] ip route-static 3.3.3.1 16 2.2.2.1
```

3. Add interfaces to security zones.

```
[DeviceB] security-zone name trust
[DeviceB-security-zone-Trust] import interface gigabitethernet 1/0/2
[DeviceB-security-zone-Trust] quit
[DeviceB] security-zone name untrust
[DeviceB-security-zone-Untrust] import interface gigabitethernet 1/0/1
[DeviceB-security-zone-Untrust] quit
```

4. Configure a security policy:

   a. Configure rules to permit traffic between the **Untrust** and **Local** security zones, so the devices can set up an IPsec tunnel:

   # Configure a rule named **ipseclocalout** to allow Device B to send IPsec negotiation packets to Device A.

```
[DeviceB] security-policy ip
```

```
[DeviceB-security-policy-ip] rule name ipseclocalout
[DeviceB-security-policy-ip-1-ipseclocalout] source-zone local
[DeviceB-security-policy-ip-1-ipseclocalout] destination-zone untrust
[DeviceB-security-policy-ip-1-ipseclocalout] source-ip-host 2.2.2.2
[DeviceB-security-policy-ip-1-ipseclocalout] destination-ip-host 3.3.3.1
[DeviceB-security-policy-ip-1-ipseclocalout] action pass
[DeviceB-security-policy-ip-1-ipseclocalout] quit
```

# Configure a rule named **ipseclocalin** to allow Device B to receive the IPsec negotiation packets sent from Device A.

```
[DeviceB-security-policy-ip] rule name ipseclocalin
[DeviceB-security-policy-ip-2-ipseclocalin] source-zone untrust
[DeviceB-security-policy-ip-2-ipseclocalin] destination-zone local
[DeviceB-security-policy-ip-2-ipseclocalin] source-ip-host 3.3.3.1
[DeviceB-security-policy-ip-2-ipseclocalin] destination-ip-host 2.2.2.2
[DeviceB-security-policy-ip-2-ipseclocalin] action pass
[DeviceB-security-policy-ip-2-ipseclocalin] quit
```

b. Configure rules to permit traffic between Host B and Host A:

# Configure a rule named **trust-untrust** to permit the packets from Host B to Host A.

```
[DeviceB-security-policy-ip] rule name trust-untrust
[DeviceB-security-policy-ip-3-trust-untrust] source-zone trust
[DeviceB-security-policy-ip-3-trust-untrust] destination-zone untrust
[DeviceB-security-policy-ip-3-trust-untrust] source-ip-subnet 10.1.2.0 24
[DeviceB-security-policy-ip-3-trust-untrust] destination-ip-subnet 10.1.1.0 24
[DeviceB-security-policy-ip-3-trust-untrust] action pass
[DeviceB-security-policy-ip-3-trust-untrust] quit
```

# Configure a rule named **untrust-trust** to permit the packets from Host A to Host B.

```
[DeviceB-security-policy-ip] rule name untrust-trust
[DeviceB-security-policy-ip-4-untrust-trust] source-zone untrust
[DeviceB-security-policy-ip-4-untrust-trust] destination-zone trust
[DeviceB-security-policy-ip-4-untrust-trust] source-ip-subnet 10.1.1.0 24
[DeviceB-security-policy-ip-4-untrust-trust] destination-ip-subnet 10.1.2.0 24
[DeviceB-security-policy-ip-4-untrust-trust] action pass
[DeviceB-security-policy-ip-4-untrust-trust] quit
[DeviceB-security-policy-ip] quit
```

5. Configure an IPsec transform set to specify the packet encapsulation mode, security protocols, and algorithms.

The IPsec transform set settings at both sides of the IPsec tunnel must be the same.

```
[DeviceB] ipsec transform-set transform1
[DeviceB-ipsec-transform-set-transform1] protocol esp
[DeviceB-ipsec-transform-set-transform1] esp encryption-algorithm 3des-cbc
[DeviceB-ipsec-transform-set-transform1] esp authentication-algorithm md5
[DeviceB-ipsec-transform-set-transform1] quit
```

6. Configure an IKEv2 keychain to specify the key information used for IKEv2 communication.

```
[DeviceB]ikev2 keychain keychain1
[DeviceB-ikev2-keychain-keychain1] peer peer1
[DeviceB-ikev2-keychain-keychain1-peer-peer1] address 3.3.3.1 16
[DeviceB-ikev2-keychain-keychain1-peer-peer1] identity address 3.3.3.1
[DeviceB-ikev2-keychain-keychain1-peer-peer1] pre-shared-key plaintext 123
```

```
[DeviceB-ikev2-keychain-keychain1-peer-peer1] quit
[DeviceB-ikev2-keychain-keychain1] quit
```

7. Configure an IKEv2 profile to specify the security parameters used for setting up IKEv2 SAs.

```
[DeviceB] ikev2 profile profile1
[DeviceB-ikev2-profile-profile1] keychain keychain1
[DeviceB-ikev2-profile-profile1] match remote identity fqdn www.devicea.com
[DeviceB-ikev2-profile-profile1] authentication-method local pre-share
[DeviceB-ikev2-profile-profile1] authentication-method remote pre-share
[DeviceB-ikev2-profile-profile1] quit
```

8. Configure an IPsec profile to establish an IPsec tunnel to protect the specified data:

```
[DeviceB] ipsec profile abc isakmp
[DeviceB-ipsec-profile-isakmp-abc] transform-set transform1
[DeviceB-ipsec-profile-isakmp-abc] ikev2-profile profile1
[DeviceB-ipsec-profile-isakmp-abc] quit
```

9. Configure an IPsec tunnel interface, which encapsulates the traffic to be protected with IPsec:

# Create an IPsec tunnel interface, and apply the IPsec profile.

```
[DeviceB] interface tunnel 1 mode ipsec
[DeviceB-Tunnel1] ip address 4.4.4.2 255.255.255.0
[DeviceB-Tunnel1] source 2.2.2.2
[DeviceB-Tunnel1] destination 3.3.3.1
[DeviceB-Tunnel1] tunnel protection ipsec profile abc
[DeviceB-Tunnel1] quit
```

# Add the IPsec tunnel interface to security zone **Untrust**.

```
[DeviceB] security-zone name untrust
[DeviceB-security-zone-Untrust] import interface tunnel 1
[DeviceB-security-zone-Untrust] quit
```

# Configure a static route to direct the traffic to be protected to the IPsec tunnel interface.

```
[DeviceB] ip route-static 10.1.1.0 255.255.255.0 tunnel 1
```

Verifying the configuration

After the configuration is completed, Device A will automatically initiate IKE negotiation with Device B. After IKE negotiation succeeds, the tunnel interface will come up and traffic between two subnets will be IPsec-protected. This example uses Device A to verify the configuration.

# Display brief IP configuration for interfaces on Device A.

```
[DeviceA] display ip interface brief
*down: administratively down
(s): spoofing  (l): loopback
Interface           Physical Protocol IP address/Mask    VPN instance Description
GE1/0/1             up       up       1.1.1.1/16         --           --
GE1/0/2             up       up       10.1.1.1/24        --           --
Tun1                up       up       4.4.4.1/24         --           --
```

# Display tunnel interface information on Device A.

```
[DeviceA] display interface Tunnel 1
Tunnel1
Current state: UP
Line protocol state: UP

```

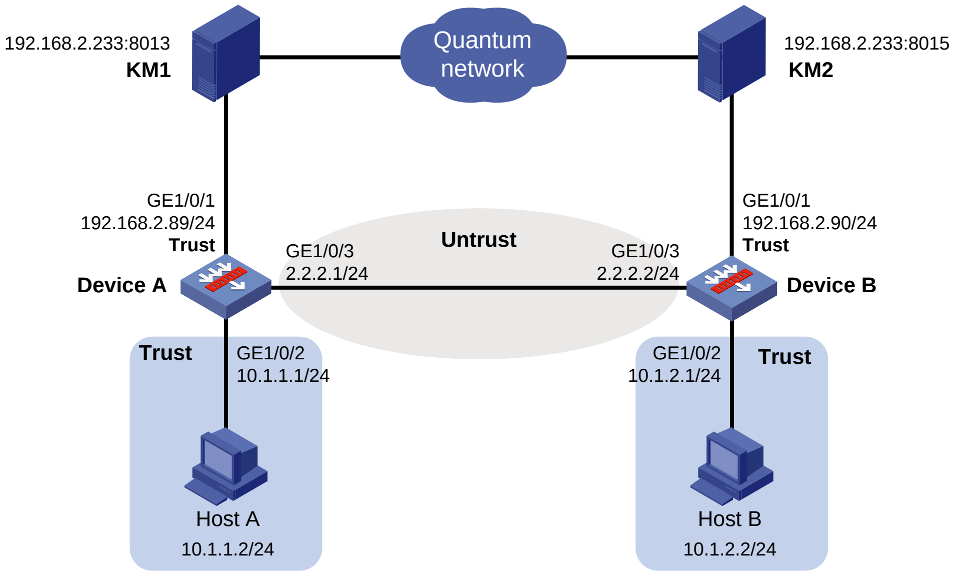
Example: Configuring IPsec GD-quantum encryption

Network configuration

Device A and Device B establish an IPsec tunnel through IKE negotiation and use quantum keys to encrypt the traffic between subnet 10.1.1.0/24 and subnet 10.1.2.0/24.

Device A and Device B obtain the quantum keys for IPsec from GD-quantum servers KM 1 and KM 2, and use the default IKE proposal to negotiate IPsec SAs.

Figure 34 Network diagram



Analysis

Assume that GD-quantum servers KM1 and KM2 have been deployed successfully.

To establish an IPsec connection between Device A and Device B, finish the IKE and IPsec related configuration.

For Device A and Device B to obtain the quantum keys for IPsec, enable GD-quantum encryption on the devices, and connect Device A and Device B to KM 1 and KM2, respectively.

Restrictions and guidelines

As a best practice, deploy the devices that use quantum keys and the GD-quantum servers in the same LAN.

GD-quantum encryption is supported only by NSFOCUS devices. It cannot communicate with devices from other vendors.

GD-quantum encryption supports only IKEv1 in main mode.

GD-quantum encryption is not supported in non-default vSystems.

Configuring Device A

1. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

   ```
   <DeviceA> system-view
   [DeviceA] interface gigabitethernet 1/0/1
   [DeviceA-GigabitEthernet1/0/1] ip address 192.168.2.89 255.255.255.0
   [DeviceA-GigabitEthernet1/0/1] quit
   ```

   # Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Configure settings for routing.

   This example configures static routes, and the next hop in the routes is 2.2.2.2.

   ```
   [DeviceA] ip route-static 10.1.2.0 24 2.2.2.2
   ```

3. Add interfaces to security zones.

   ```
   [DeviceA] security-zone name trust
   [DeviceA-security-zone-Trust] import interface gigabitethernet 1/0/1
   [DeviceA-security-zone-Trust] import interface gigabitethernet 1/0/2
   [DeviceA-security-zone-Trust] quit
   [DeviceA] security-zone name untrust
   [DeviceA-security-zone-Untrust] import interface gigabitethernet 1/0/3
   [DeviceA-security-zone-Untrust] quit
   ```

4. Configure a security policy:

   a. Configure rules to permit traffic between the **Untrust** and **Local** security zones, so the devices can set up an IPsec tunnel:

      # Configure a rule named **ipseclocalout1** to allow Device A to send IPsec negotiation packets to Device B.

      ```
      [DeviceA] security-policy ip
      [DeviceA-security-policy-ip] rule name ipseclocalout1
      [DeviceA-security-policy-ip-1-ipseclocalout1] source-zone local
      [DeviceA-security-policy-ip-1-ipseclocalout1] destination-zone untrust
      [DeviceA-security-policy-ip-1-ipseclocalout1] source-ip-host 2.2.2.1
      [DeviceA-security-policy-ip-1-ipseclocalout1] destination-ip-host 2.2.2.2
      [DeviceA-security-policy-ip-1-ipseclocalout1] action pass
      [DeviceA-security-policy-ip-1-ipseclocalout1] quit
      ```

      # Configure a rule named **ipseclocalin1** to allow Device A to receive the IPsec negotiation packets sent from Device B.

      ```
      [DeviceA-security-policy-ip] rule name ipseclocalin1
      [DeviceA-security-policy-ip-2-ipseclocalin1] source-zone untrust
      [DeviceA-security-policy-ip-2-ipseclocalin1] destination-zone local
      [DeviceA-security-policy-ip-2-ipseclocalin1] source-ip-host 2.2.2.2
      ```

```
[DeviceA-security-policy-ip-2-ipseclocalin1] destination-ip-host 2.2.2.1
[DeviceA-security-policy-ip-2-ipseclocalin1] action pass
[DeviceA-security-policy-ip-2-ipseclocalin1] quit
```

b. Configure rules to permit the traffic between Host A and Host B:

# Configure a rule named **trust-untrust** to permit the packets from Host A to Host B.

```
[DeviceA-security-policy-ip] rule name trust-untrust
[DeviceA-security-policy-ip-3-trust-untrust] source-zone trust
[DeviceA-security-policy-ip-3-trust-untrust] destination-zone untrust
[DeviceA-security-policy-ip-3-trust-untrust] source-ip-subnet 10.1.1.0 24
[DeviceA-security-policy-ip-3-trust-untrust] destination-ip-subnet 10.1.2.0 24
[DeviceA-security-policy-ip-3-trust-untrust] action pass
[DeviceA-security-policy-ip-3-trust-untrust] quit
```

# Configure a rule named **untrust-trust** to permit the packets from Host B to Host A.

```
[DeviceA-security-policy-ip] rule name untrust-trust
[DeviceA-security-policy-ip-4-untrust-trust] source-zone untrust
[DeviceA-security-policy-ip-4-untrust-trust] destination-zone trust
[DeviceA-security-policy-ip-4-untrust-trust] source-ip-subnet 10.1.2.0 24
[DeviceA-security-policy-ip-4-untrust-trust] destination-ip-subnet 10.1.1.0 24
[DeviceA-security-policy-ip-4-untrust-trust] action pass
[DeviceA-security-policy-ip-4-untrust-trust] quit
[DeviceA-security-policy-ip] quit
```

c. Configure rules to permit traffic between Device A and KM 1.

# Configure a rule named **ipseclocalout2** to allow Device A to send packets to KM 1.

```
[DeviceA-security-policy-ip] rule name ipseclocalout2
[DeviceA-security-policy-ip-5-ipseclocalout2] source-zone local
[DeviceA-security-policy-ip-5-ipseclocalout2] destination-zone trust
[DeviceA-security-policy-ip-5-ipseclocalout2] source-ip-host 192.168.2.89
[DeviceA-security-policy-ip-5-ipseclocalout2] destination-ip-host 192.168.2.233
[DeviceA-security-policy-ip-5-ipseclocalout2] action pass
[DeviceA-security-policy-ip-5-ipseclocalout2] quit
```

# Configure a rule named **ipseclocalin2** to allow Device A to receive packets from KM 1.

```
[DeviceA-security-policy-ip] rule name ipseclocalin2
[DeviceA-security-policy-ip-6-ipseclocalin2] source-zone trust
[DeviceA-security-policy-ip-6-ipseclocalin2] destination-zone local
[DeviceA-security-policy-ip-6-ipseclocalin2] source-ip-host 192.168.2.233
[DeviceA-security-policy-ip-6-ipseclocalin2] destination-ip-host 192.168.2.89
[DeviceA-security-policy-ip-6-ipseclocalin2] action pass
[DeviceA-security-policy-ip-6-ipseclocalin2] quit
[DeviceA-security-policy-ip] quit
```

5. Define the data flows to be protected:

# Configure IPv4 advanced ACL 3000 to identify traffic from subnet 10.1.1.0/24 to subnet 10.1.2.0/24.

```
[DeviceA] acl advanced 3001
[DeviceA-acl-ipv4-adv-3001] rule permit ip source 10.1.1.0 0.0.0.255 destination 10.1.2.0 0.0.0.255
[DeviceA-acl-ipv4-adv-3001] quit
```

6. Configure an IPsec transform set to specify the packet encapsulation mode, security protocols, and algorithms.

The IPsec transform set settings used by both sides of the tunnel must be the same.

```
[DeviceA] ipsec transform-set tran1
[DeviceA-ipsec-transform-set-tran1] encapsulation-mode tunnel
[DeviceA-ipsec-transform-set-tran1] protocol esp
[DeviceA-ipsec-transform-set-tran1] esp encryption-algorithm aes-cbc-128
[DeviceA-ipsec-transform-set-tran1] esp authentication-algorithm sha1
[DeviceA-ipsec-transform-set-tran1] quit
```

7. Configure an IKE keychain to specify the key information used for IKE communication.

   The preshared key used by both sides of the communication must be the same.

   ```
   [DeviceA] ike keychain keychain1
   [DeviceA-ike-keychain-keychain1] pre-shared-key address 2.2.2.2 255.255.255.0 key
   simple 123456TESTplat&!
   [DeviceA-ike-keychain-keychain1] quit
   ```

8. Configure an IKE profile to specify the security parameters used for setting up IKE SAs.

   ```
   [DeviceA] ike profile profile1
   [DeviceA-ike-profile-profile1] keychain keychain1
   [DeviceA-ike-profile-profile1] local-identity address 2.2.2.1
   [DeviceA-ike-profile-profile1] match remote identity address 2.2.2.2 255.255.255.0
   [DeviceA-ike-profile-profile1] quit
   ```

9. Configure an IPsec policy, so as to establish the IPsec tunnel to protect data:

   # Create an IKE-based IPsec policy entry, which specifies the ACL for IPsec, IPsec transform set, local and remote IP addresses, and IKE profile.

   ```
   [DeviceA] ipsec policy map1 10 isakmp
   [DeviceA-ipsec-policy-isakmp-map1-10] remote-address 2.2.2.2
   [DeviceA-ipsec-policy-isakmp-map1-10] security acl 3001
   [DeviceA-ipsec-policy-isakmp-map1-10] transform-set tran1
   [DeviceA-ipsec-policy-isakmp-map1-10] ike-profile profile1
   [DeviceA-ipsec-policy-isakmp-map1-10] quit
   ```

10. Apply the IPsec policy to GigabitEthernet 1/0/3 to protect traffic on the interface.

    ```
    [DeviceA] interface gigabitethernet 1/0/3
    [DeviceA-GigabitEthernet1/0/3] ipsec apply policy map1
    [DeviceA-GigabitEthernet1/0/3] quit
    ```

11. Enable GD-quantum encryption, and configure related parameters.

    ```
    [DeviceA] ike gd-quantum
    [DeviceA-ike-gdquantum] app-dev-info 341300002
    [DeviceA-ike-gdquantum] server-address 192.168.2.233 port 8013
    [DeviceA-ike-gdquantum] auth-key simple
    66c7f0f462eeedd9d1f2d46bdc10e4e24167c4875cf2f7a2297da02b8f4ba8e0
    [DeviceA-ike-gdquantum] decrypt-quantum-key simple
    66c7f0f462eeedd9d1f2d46bdc10e4e24167c4875cf2f7a2297da02b8f4ba8e0
    [DeviceA-ike-gdquantum] quit
    ```

Configuring Device B

1. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

   ```
   <DeviceB> system-view
   [DeviceB] interface gigabitethernet 1/0/1
   [DeviceB-GigabitEthernet1/0/1] ip address 192.168.2.90 255.255.255.0
   [DeviceB-GigabitEthernet1/0/1] quit
   ```

# Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Configure settings for routing.

   This example configures static routes, and the next hop in the routes is 2.2.2.1.

   ```
   [DeviceB] ip route-static 10.1.1.0 24 2.2.2.1
   ```

3. Add interfaces to security zones.

   ```
   [DeviceB] security-zone name trust
   [DeviceB-security-zone-Trust] import interface gigabitethernet 1/0/1
   [DeviceB-security-zone-Trust] import interface gigabitethernet 1/0/2
   [DeviceB-security-zone-Trust] quit
   [DeviceB] security-zone name untrust
   [DeviceB-security-zone-Untrust] import interface gigabitethernet 1/0/3
   [DeviceB-security-zone-Untrust] quit
   ```

4. Configure a security policy:

   a. Configure rules to permit traffic between the **Untrust** and **Local** security zones, so the devices can set up an IPsec tunnel:

      # Configure a rule named **ipseclocalout1** to allow Device B to send IPsec negotiation packets to Device A.

      ```
      [DeviceB] security-policy ip
      [DeviceB-security-policy-ip] rule name ipseclocalout1
      [DeviceB-security-policy-ip-1-ipseclocalout1] source-zone local
      [DeviceB-security-policy-ip-1-ipseclocalout1] destination-zone untrust
      [DeviceB-security-policy-ip-1-ipseclocalout1] source-ip-host 2.2.2.2
      [DeviceB-security-policy-ip-1-ipseclocalout1] destination-ip-host 2.2.2.1
      [DeviceB-security-policy-ip-1-ipseclocalout1] action pass
      [DeviceB-security-policy-ip-1-ipseclocalout1] quit
      ```

      # Configure a rule named **ipseclocalin1** to allow Device B to receive the IPsec negotiation packets sent from Device A.

      ```
      [DeviceB-security-policy-ip] rule name ipseclocalin1
      [DeviceB-security-policy-ip-2-ipseclocalin1] source-zone untrust
      [DeviceB-security-policy-ip-2-ipseclocalin1] destination-zone local
      [DeviceB-security-policy-ip-2-ipseclocalin1] source-ip-host 2.2.2.1
      [DeviceB-security-policy-ip-2-ipseclocalin1] destination-ip-host 2.2.2.2
      [DeviceB-security-policy-ip-2-ipseclocalin1] action pass
      [DeviceB-security-policy-ip-2-ipseclocalin1] quit
      ```

   b. Configure rules to permit traffic between Host B and Host A:

      # Configure a rule named **trust-untrust** to permit the packets from Host B to Host A.

      ```
      [DeviceB-security-policy-ip] rule name trust-untrust
      [DeviceB-security-policy-ip-3-trust-untrust] source-zone trust
      [DeviceB-security-policy-ip-3-trust-untrust] destination-zone untrust
      [DeviceB-security-policy-ip-3-trust-untrust] source-ip-subnet 10.1.2.0 24
      [DeviceB-security-policy-ip-3-trust-untrust] destination-ip-subnet 10.1.1.0 24
      [DeviceB-security-policy-ip-3-trust-untrust] action pass
      [DeviceB-security-policy-ip-3-trust-untrust] quit
      ```

      # Configure a rule named **untrust-trust** to permit the packets from Host A to Host B.

      ```
      [DeviceB-security-policy-ip] rule name untrust-trust
      [DeviceB-security-policy-ip-4-untrust-trust] source-zone untrust
      [DeviceB-security-policy-ip-4-untrust-trust] destination-zone trust
      [DeviceB-security-policy-ip-4-untrust-trust] source-ip-subnet 10.1.1.0 24
      ```

```
[DeviceB-security-policy-ip-4-untrust-trust] destination-ip-subnet 10.1.2.0 24
[DeviceB-security-policy-ip-4-untrust-trust] action pass
[DeviceB-security-policy-ip-4-untrust-trust] quit
[DeviceB-security-policy-ip] quit
```

c. Configure rules to permit traffic between Device B and KM 2.

# Configure a rule named **ipseclocalout2** to allow Device B to send packets to KM 2.

```
[DeviceB-security-policy-ip] rule name ipseclocalout2
[DeviceB-security-policy-ip-5-ipseclocalout2] source-zone local
[DeviceB-security-policy-ip-5-ipseclocalout2] destination-zone trust
[DeviceB-security-policy-ip-5-ipseclocalout2] source-ip-host 192.168.2.90
[DeviceB-security-policy-ip-5-ipseclocalout2] destination-ip-host 192.168.2.233
[DeviceB-security-policy-ip-5-ipseclocalout2] action pass
[DeviceB-security-policy-ip-5-ipseclocalout2] quit
```

# Configure a rule named **ipseclocalin2** to allow Device B to receive packets from KM 2.

```
[DeviceB-security-policy-ip] rule name ipseclocalin2
[DeviceB-security-policy-ip-6-ipseclocalin2] source-zone trust
[DeviceB-security-policy-ip-6-ipseclocalin2] destination-zone local
[DeviceB-security-policy-ip-6-ipseclocalin2] source-ip-host 192.168.2.233
[DeviceB-security-policy-ip-6-ipseclocalin2] destination-ip-host 192.168.2.90
[DeviceB-security-policy-ip-6-ipseclocalin2] action pass
[DeviceB-security-policy-ip-6-ipseclocalin2] quit
[DeviceB-security-policy-ip] quit
```

5. Define the data flows to be protected:

# Configure IPv4 advanced ACL 3001 to identify traffic from subnet 10.1.2.0/24 to subnet 10.1.1.0/24.

```
[DeviceB] acl advanced 3001
[DeviceB-acl-ipv4-adv-3001] rule permit ip source 10.1.2.0 0.0.0.255 destination
10.1.1.0 0.0.0.255
[DeviceB-acl-ipv4-adv-3001] quit
```

6. Configure an IPsec transform set to specify the packet encapsulation mode, security protocols, and algorithms.

The IPsec transform set settings used by both sides of the tunnel must be the same.

```
[DeviceB] ipsec transform-set tran1
[DeviceB-ipsec-transform-set-tran1] encapsulation-mode tunnel
[DeviceB-ipsec-transform-set-tran1] protocol esp
[DeviceB-ipsec-transform-set-tran1] esp encryption-algorithm aes-cbc-128
[DeviceB-ipsec-transform-set-tran1] esp authentication-algorithm sha1
[DeviceB-ipsec-transform-set-tran1] quit
```

7. Configure an IKE keychain to specify the key information used for IKE communication.

The preshared key used by both sides of the communication must be the same.

```
[DeviceB]ike keychain keychain1
[DeviceB-ike-keychain-keychain1] pre-shared-key address 2.2.2.1 255.255.255.0 key
simple 123456TESTplat&!
[DeviceB-ike-keychain-keychain1] quit
```

8. Configure an IKE profile to specify the security parameters used for setting up IKE SAs.

```
[DeviceB] ike profile profile1
[DeviceB-ike-profile-profile1] keychain keychain1
[DeviceB-ike-profile-profile1] local-identity address 2.2.2.2
```

```
[DeviceB-ike-profile-profile1] match remote identity address 2.2.2.1 255.255.255.0
[DeviceB-ike-profile-profile1] quit
```

9. Configure an IPsec policy, so as to establish the IPsec tunnel to protect data:

   # Create an IKE-based IPsec policy entry.

   ```
   [DeviceB] ipsec policy use1 10 isakmp
   [DeviceB-ipsec-policy-isakmp-use1-10] remote-address 2.2.2.1
   [DeviceB-ipsec-policy-isakmp-use1-10] security acl 3001
   [DeviceB-ipsec-policy-isakmp-use1-10] transform-set tran1
   [DeviceB-ipsec-policy-isakmp-use1-10] ike-profile profile1
   [DeviceB-ipsec-policy-isakmp-use1-10] quit
   ```

10. Apply the IPsec policy to GigabitEthernet 1/0/3 to protect traffic on the interface.

    ```
    [DeviceB] interface gigabitethernet 1/0/3
    [DeviceB-GigabitEthernet1/0/3] ipsec apply policy use1
    [DeviceB-GigabitEthernet1/0/3] quit
    ```

11. Enable GD-quantum encryption, and configure related parameters.

    ```
    [DeviceB] ike gd-quantum
    [DeviceB-ike-gdquantum] app-dev-info 341300001
    [DeviceB-ike-gdquantum] server-address 192.168.2.233 port 8015
    [DeviceB-ike-gdquantum] auth-key simple
    66c7f0f462eeedd9d1f2d46bdc10e4e24167c4875cf2f7a2297da02b8f4ba8e0
    [DeviceB-ike-gdquantum] decrypt-quantum-key simple
    66c7f0f462eeedd9d1f2d46bdc10e4e24167c4875cf2f7a2297da02b8f4ba8e0
    [DeviceB-ike-gdquantum] quit
    ```

Verifying the configuration

# Initiate a connection from subnet 10.1.1.0/24 to subnet 10.1.2.0/24 to trigger IKE negotiation. After IKE SAs are successfully negotiated, Device A and Device B request an encrypted quantum key from KM 1 and KM 2, respectively. They decrypt the quantum key by using the configured decryption key to get the quantum key for IPsec.

# Verify that a private IP address in subnet 10.1.1.0/24 can ping a private IP address in subnet 10.1.2.0/24 successfully.

```
<Device A>ping -a 10.1.1.1 10.1.2.1
Ping 10.1.2.1 (10.1.2.1) from 10.1.1.1: 56 data bytes, press CTRL_C to break
Request time out
56 bytes from 10.1.2.1: icmp_seq=1 ttl=255 time=0.652 ms
56 bytes from 10.1.2.1: icmp_seq=2 ttl=255 time=0.294 ms
56 bytes from 10.1.2.1: icmp_seq=3 ttl=255 time=0.244 ms
56 bytes from 10.1.2.1: icmp_seq=4 ttl=255 time=0.237 ms

--- Ping statistics for 10.1.2.1 ---
5 packet(s) transmitted, 4 packet(s) received, 20.0% packet loss
round-trip min/avg/max/std-dev = 0.237/0.357/0.652/0.172 ms
```

# Display the IKE proposal configuration on Device A and Device B. The default IKE proposal is displayed.

```
[DeviceA] display ike proposal

```

On Device B, display the established IKE SAs and IPsec SAs in the same way. (Details not shown.)

Configuring IKE

Unless otherwise specified, the term "IKE" in this chapter refers to IKEv1.

About IKE

Built on a framework defined by ISAKMP, Internet Key Exchange (IKE) provides automatic key negotiation and SA establishment services for IPsec.

Benefits of IKE

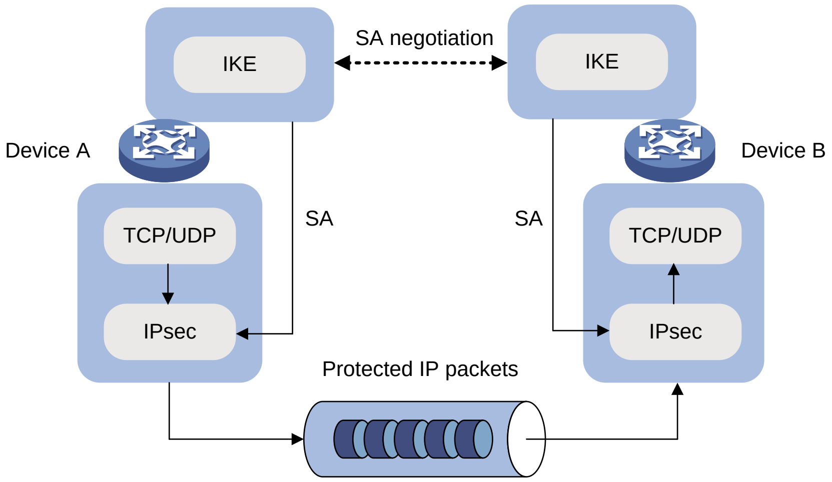
IKE provides the following benefits for IPsec:

- Automatically negotiates IPsec parameters.
- Performs DH exchanges to calculate shared keys, making sure each SA has a key that is independent of other keys.
- Automatically negotiates SAs when the sequence number in the AH or ESP header overflows, making sure IPsec can provide the anti-replay service by using the sequence number.

Relationship between IPsec and IKE

As shown in Figure 35, IKE negotiates SAs for IPsec and transfers the SAs to IPsec, and IPsec uses the SAs to protect IP packets.

Figure 35 Relationship between IKE and IPsec



IKE negotiation process

IKE negotiates keys and SAs for IPsec in two phases:

1. **Phase 1**—The two peers establish an IKE SA, a secure, authenticated channel for communication.
2. **Phase 2**—Using the IKE SA established in phase 1, the two peers negotiate to establish IPsec SAs.

Phase 1 negotiation can use the main mode, GM main mode, or aggressive mode.

IKE exchange process in main mode

As shown in Figure 36, the main mode of IKE negotiation in phase 1 involves three pairs of messages:

- **SA exchange**—Used for negotiating the IKE security policy.
- **Key exchange**—Used for exchanging the DH public value and other values, such as the random number. The two peers use the exchanged data to generate key data and use the encryption key and authentication key to ensure the security of IP packets.
- **ID and authentication data exchange**—Used for identity authentication.

Generate the key
Initiator's identity and authentication data
Identity authentication
Perform ID/exchange authentication
Receiver's identity and authentication data
ID and authentication data exchange
Perform ID/exchange authentication

IKE exchange process in aggressive mode

As shown in Figure 37, the process of phase 1 IKE negotiation in aggressive mode is as follows:

1. The initiator (peer 1) sends a message containing the local IKE information to peer 2. The message includes parameters used for IKE SA establishment, keying data, and peer 1's identity information.
2. Peer 2 chooses the IKE establishment parameters to use, generate the key, and authenticate peer 1's identity. Then it sends the IKE data to peer 1.
3. Peer 1 generates the key, authenticates peer 2's identity, and sends the results to peer 1.

After the preceding process, an IKE SA is established between peer 1 and peer 2.

The aggressive mode is faster than the main mode but it does not provide identity information protection. The main mode provides identity information protection but is slower. Choose the appropriate negotiation mode according to your requirements.

Initiator's authentication results
IKE SA established

IKE exchange process in GM main mode

If the local end uses the GM main mode, the two IKE peers must use the RSA-DE or SM2-DE digital envelop authentication method.

IKE security mechanism

IKE has a series of self-protection mechanisms and supports secure identity authentication, key distribution, and IPsec SA establishment on insecure networks.

Identity authentication

The IKE identity authentication mechanism is used to authenticate the identity of the communicating peers. The device supports the following identity authentication methods:

- **Preshared key authentication**—Two communicating peers use the pre-configured shared key for identity authentication.
- **RSA signature authentication** and **DSA signature authentication**—Two communicating peers use the digital certificates issued by the CA for identity authentication.

The preshared key authentication method does not require certificates and is easy to configure. It is usually deployed in small networks.

The signature authentication methods provide higher security and are usually deployed in networks with the headquarters and some branches. When deployed in a network with many branches, a signature authentication method can simplify the configuration because only one PKI domain is required. If you use the preshared key authentication method, you must configure a preshared key for each branch on the Headquarters node.

DH algorithm

The DH algorithm is a public key algorithm. With this algorithm, two peers can exchange keying material and then use the material to calculate the shared keys. Due to the decryption complexity, a third party cannot decrypt the keys even after intercepting all keying materials.

PFS

The Perfect Forward Secrecy (PFS) feature is a security feature based on the DH algorithm. After PFS is enabled, an additional DH exchange is performed in IKE phase 2 to make sure IPsec keys have no derivative relations with IKE keys and a broken key brings no threats to other keys.

Protocols and standards

- RFC 2408, *Internet Security Association and Key Management Protocol (ISAKMP)*
- RFC 2409, *The Internet Key Exchange (IKE)*
- RFC 2412, *The OAKLEY Key Determination Protocol*

- Internet Draft, *draft-ietf-ipsec-isakmp-xauth-06*

IKE tasks at a glance

To configure IKE, perform the following tasks:

1. (Optional.) Configuring an IKE profile
   a. Creating an IKE profile
   b. Configuring peer IDs for the IKE profile
   c. Specifying the IKE keychain or PKI domain
   d. Configuring the IKE phase 1 negotiation mode
   e. Specifying IKE proposals for the IKE profile
   f. Configuring the local ID for the IKE profile
   g. Specifying an inside VPN instance for the IKE profile
   h. Configuring optional features for the IKE profile
2. Configuring an IKE proposal
3. Configuring an IKE keychain
4. (Optional.) Configuring accessibility features for IKE negotiation
   - Configuring the global identity information
   - Configuring the IKE keepalive feature
   - Configuring the IKE NAT keepalive feature
   - Configuring global IKE DPD
   - Enabling invalid SPI recovery
   - Setting the maximum number of IKE SAs
   - Configuring IKE address pools
   - Configuring IKE negotiation compatibility
   - Configuring GD-quantum encryption
   - Configuring SNMP notifications and logging for IKE

Prerequisites for IKE configuration

Determine the following parameters prior to IKE configuration:

- The algorithms to be used during IKE negotiation, including the identity authentication method, encryption algorithm, authentication algorithm, and DH group.
  - Different algorithms provide different levels of protection. A stronger algorithm provides more resistance to decryption but uses more resources.
  - A DH group that uses more bits provides higher security but needs more time for processing.
- The preshared key or PKI domain for IKE negotiation. For more information about PKI, see "Configuring PKI."
- The IKE-based IPsec policies for the communicating peers. If you do not specify an IKE profile in an IPsec policy, the device selects an IKE profile for the IPsec policy. If no IKE profile is configured, the globally configured IKE settings are used. For more information about IPsec, see "Configuring IPsec."

Configuring an IKE profile

Creating an IKE profile

About this task

Perform this task to create an IKE profile.

An IKE profile is intended to provide a set of parameters for IKE negotiation.

Procedure

1. Enter system view.
   system-view
2. Create an IKE profile and enter its view.
   ike profile *profile-name*

Configuring peer IDs for the IKE profile

About this task

Perform this task to configure the peer IDs for IKE profile matching. When the device needs to select an IKE profile for IKE negotiation with a peer, it compares the received peer ID with the peer IDs of its local IKE profiles. If a match is found, it uses the IKE profile with the matching peer ID for IKE negotiation.

Restrictions and guidelines

For an IKE profile, you can configure multiple peer IDs. A peer ID configured earlier has a higher priority.

Two IKE peers must both have or both not have peer IDs configured.

Procedure

1. Enter system view.
   system-view
2. Enter IKE profile view.
   ike profile *profile-name*
3. Configure a peer ID for the IKE profile.
   match remote { **certificate** *policy-name* | **identity** { **address** { { *ipv4-address* [*mask* | *mask-length*] | **range** *low-ipv4-address high-ipv4-address* } | **ipv6** { *ipv6-address* [*prefix-length*] | **range** *low-ipv6-address high-ipv6-address* } } [**vpn-instance** *vpn-instance-name*] | **fqdn** *fqdn-name* | **user-fqdn** *user-fqdn-name* } }

Specifying the IKE keychain or PKI domain

Restrictions and guidelines

Configure the IKE keychain or PKI domain for the IKE proposals to use. To use digital signature authentication, configure a PKI domain. To use preshared key authentication, configure an IKE keychain.

Procedure

1. Enter system view.

system-view

2. Enter IKE profile view.

   ike profile *profile-name*

3. Specify the keychain for preshared key authentication or the PKI domain used to request a certificate for digital signature authentication.

   - Specify the keychain.

     keychain *keychain-name*

   - Specify the PKI domain.

     certificate domain *domain-name*

   By default, no IKE keychain or PKI domain is specified in an IKE profile.

Configuring the IKE phase 1 negotiation mode

Restrictions and guidelines

Specify the IKE phase 1 negotiation mode (main or aggressive) that the device uses as the initiator. When the device acts as the responder, it uses the IKE negotiation mode of the initiator.

Procedure

1. Enter system view.

   system-view

2. Enter IKE profile view.

   ike profile *profile-name*

3. Specify the IKE negotiation mode for phase 1.

   exchange-mode { **aggressive** | **gm-main** | **main** }

   By default, IKE negotiation in phase 1 uses the main mode.

Specifying IKE proposals for the IKE profile

Restrictions and guidelines

Specify the IKE proposals that the device can use as the initiator. An IKE proposal specified earlier has a higher priority. When the device acts as the responder, it uses the IKE proposals configured in system view to match the IKE proposals received from the initiator. If no matching proposal is found, the negotiation fails.

Procedure

1. Enter system view.

   system-view

2. Enter IKE profile view.

   ike profile *profile-name*

3. Specify IKE proposals for the IKE profile.

   proposal *proposal-number*&<1-6>

   By default, no IKE proposals are specified for an IKE profile and the IKE proposals configured in system view are used for IKE negotiation.

Configuring the local ID for the IKE profile

Restrictions and guidelines

For digital signature authentication, the device can use an ID of any type. If the local ID is an IP address that is different from the IP address in the local certificate, the device uses the FQDN (the device name configured by using the **sysname** command) instead.

For preshared key authentication, the device can use an ID of any type other than the DN.

Procedure

1. Enter system view.

   system-view

2. Enter IKE profile view.

   ike profile *profile-name*

3. Configure the local ID.

   local-identity { **address** { *ipv4-address* | **ipv6** *ipv6-address* } | **dn** | **fqdn** [*fqdn-name*] | **user-fqdn** [*user-fqdn-name*] }

   By default, no local ID is configured for an IKE profile, and an IKE profile uses the local ID configured in system view. If the local ID is not configured in system view, the IKE profile uses the IP address of the interface to which the IPsec policy or IPsec policy template is applied as the local ID.

Specifying an inside VPN instance for the IKE profile

About this task

The inside MPLS L3VPN instance determines where the device should forward received IPsec protected data. If you specify an inside VPN instance, the device looks for a route in the specified VPN instance to forward the data. If you do not specify an inside VPN instance, the device looks for a route in the VPN instance where the receiving interface resides to forward the data.

Restrictions and guidelines

The inside VPN instance specified in an IKE profile takes effect only on IPsec policies that use the IKE profile. It does not take effect on IPsec profiles that use the IKE profile.

Procedure

1. Enter system view.

   system-view

2. Enter IKE profile view.

   ike profile *profile-name*

3. Specify an inside VPN instance.

   inside-vpn vpn-instance *vpn-instance-name*

   By default, no inside VPN instance is specified for an IKE profile, and the device forwards protected data to the VPN instance where the interface receiving the data resides.

Configuring optional features for the IKE profile

1. Enter system view.

   system-view

2. Enter IKE profile view.

ike profile *profile-name*

3. Configure optional features as needed.
   - Configure IKE DPD.

     dpd interval *interval* [**retry** *seconds*] { **on-demand** | **periodic** }

     By default, IKE DPD is not configured for an IKE profile and an IKE profile uses the DPD settings configured in system view. If IKE DPD is not configured in system view either, the device does not perform dead IKE peer detection.

     The IKE DPD settings configured in the IKE profile view take precedence over those configured in system view.
   - Specify the local interface or IP address to which the IKE profile can be applied.

     match local address { *interface-type interface-number* | { *ipv4-address* | **ipv6** *ipv6-address* } [**vpn-instance** *vpn-instance-name*] }

     By default, an IKE profile can be applied to any local interface or IP address.

     An IKE profile configured with this command has a higher priority over those not configured with this command.
   - Specify a priority for the IKE profile.

     priority *priority*

     By default, the priority of an IKE profile is 100.

     The device selects a local IKE profile for IKE negotiation as follows:
     - First, it selects an IKE profile with the **match local address** command configured.
     - If a tie exists, it selects the IKE profile with a smaller priority number.
     - If a tie still exists, it selects the IKE profile configured earlier.
   - Enable client authentication.

     client-authentication xauth

     By default, client authentication is disabled.

     Configure this command in the IKE profile used by the IPsec gateway at the enterprise center. This command enables the IPsec gateway to perform extended (XAUTH) authentication on remote users through AAA after IKE phase 1 negotiation. AAA configuration is also required on the IPsec gateway for client authentication.
   - Specify the username and password for client authentication.

     client-authentication xauth user

     By default, the username and password for client authentication are not specified.

     Configure this command in the IKE profile used by a branch gateway. The branch gateway can then use the username and password to pass AAA authentication and establish an IPsec tunnel with the IPsec gateway at the enterprise center.
   - Enable AAA authorization.

     aaa authorization domain *domain-name* **username** *user-name*

     By default, AAA authorization is disabled.

     The AAA authorization feature enables IKE to request authorization attributes, such as the IKE address pool, from AAA. IKE uses the address pool to assign IP addresses to remote users. For more information about AAA authorization, see "Configuring AAA."
   - (Optional.) Set the IKE SA soft lifetime buffer time.

     sa soft-duration buffer *seconds*

     By default, the IKE SA soft lifetime buffer time is not configured.

Set the IKE SA soft lifetime buffer time to determine the IKE SA soft lifetime. The SA soft lifetime is calculated as follows: SA soft lifetime = SA lifetime – SA soft lifetime buffer. A new IKE SA will be negotiated when the SA soft lifetime timer expires.

- Specify the version of the SM4 algorithm used for IKE GM main negotiations.

  ike gm-main sm4-version { **draft** | **standard** }

  By default, the standard SM4 algorithm is used in IKE GM main negotiations.

  Specify the SM4 version used by the device to initiate an IKE negotiation with a device from other vendors to make sure the two devices use the same SM4 version in the negotiation.

Configuring an IKE proposal

About this task

An IKE proposal defines a set of attributes describing how IKE negotiation in phase 1 should take place. You can create multiple IKE proposals with different priorities. The priority of an IKE proposal is represented by its sequence number. The lower the sequence number, the higher the priority.

Two peers must have at least one matching IKE proposal for successful IKE negotiation. During IKE negotiation:

- The initiator sends its IKE proposals to the peer.
  - If the initiator is using an IPsec policy with an IKE profile, the initiator sends all IKE proposals specified in the IKE profile to the peer. An IKE proposal specified earlier for the IKE profile has a higher priority.
  - If the initiator is using an IPsec policy with no IKE profile, the initiator sends all its IKE proposals to the peer. An IKE proposal with a smaller number has a higher priority.
- The peer searches its own IKE proposals for a match. The search starts from the IKE proposal with the highest priority and proceeds in descending order of priority until a match is found. The matching IKE proposals are used to establish the IKE SA. If all user-defined IKE proposals are found mismatching, the two peers use their default IKE proposals to establish the IKE SA.

Two matching IKE proposals have the same encryption algorithm, authentication method, authentication algorithm, and DH group. The SA lifetime takes the smaller one of the two proposals' SA lifetime settings.

Procedure

1. Enter system view.

   system-view

2. Create an IKE proposal and enter its view.

   ike proposal *proposal-number*

   By default, a default IKE proposal exists.

3. Configure a description for the IKE proposal.

   description

   By default, an IKE proposal does not have a description.

4. Specify an encryption algorithm for the IKE proposal.

   encryption-algorithm { **3des-cbc** | **aes-cbc-128** | **aes-cbc-192** | **aes-cbc-256** | **des-cbc** | **sm1-cbc-128** | **sm4-cbc** }

   By default, the 56-bit DES encryption algorithm in CBC mode is used.

5. Specify an authentication method for the IKE proposal.

   authentication-method { **dsa-signature** | **pre-share** | **rsa-de** | **rsa-signature** | **sm2-de** }

   By default, the preshared key authentication method is used.

6. Specify an authentication algorithm for the IKE proposal.

   authentication-algorithm { **md5** | **sha** | **sha256** | **sha384** | **sha512** | **sm3** }

   By default, the HMAC-SHA1 authentication algorithm is used.

7. Specify a DH group for key negotiation in phase 1.

   dh { **group1** | **group14** | **group2** | **group24** | **group5** }

   DH group 1 (the 768-bit DH group) is used by default.

8. (Optional.) Set the IKE SA lifetime for the IKE proposal.

   sa duration *seconds*

   By default, the IKE SA lifetime is 86400 seconds.

   If the IPsec SA lifetime is also configured, set the IKE SA lifetime longer than the IPsec SA lifetime as a best practice.

Configuring an IKE keychain

About this task

Perform this task when you configure the IKE to use the preshared key for authentication.

Follow these guidelines when you configure an IKE keychain:

- Two peers must be configured with the same preshared key to pass preshared key authentication.
- You can specify the local address configured in IPsec policy or IPsec policy template view (using the **local-address** command) for the IKE keychain to be applied. If no local address is configured, specify the IP address of the interface that uses the IPsec policy.
- The device determines the priority of an IKE keychain as follows:
  a. The device examines the existence of the **match local address** command. An IKE keychain with the **match local address** command configured has a higher priority.
  b. If a tie exists, the device compares the priority numbers. An IKE keychain with a smaller priority number has a higher priority.
  c. If a tie still exists, the device prefers an IKE keychain configured earlier.

Procedure

1. Enter system view.

   system-view

2. Create an IKE keychain and enter its view.

   ike keychain *keychain-name* [**vpn-instance** *vpn-instance-name*]

3. Configure a preshared key.

   pre-shared-key { **address** { *ipv4-address* [*mask* | *mask-length*] | **ipv6** *ipv6-address* [*prefix-length*] } | **hostname** *host-name* } **key** { **cipher** | **simple** } *string*

   By default, no preshared key is configured.

4. (Optional.) Specify a local interface or IP address to which the IKE keychain can be applied.

   match local address { *interface-type interface-number* | { *ipv4-address* | **ipv6** *ipv6-address* } [**vpn-instance** *vpn-instance-name*] }

   By default, an IKE keychain can be applied to any local interface or IP address.

5. (Optional.) Specify a priority for the IKE keychain.

   priority *priority*

   The default priority is 100.

Configuring the global identity information

Restrictions and guidelines

The global identity can be used by the device for all IKE SA negotiations, and the local identity (set by the **`local-identity`** command) can be used only by the device that uses the IKE profile.

When signature authentication is used, you can set any type of the identity information.

When preshared key authentication is used, you cannot set the DN as the identity.

Procedure

1. Enter system view.

   `system-view`

2. Configure the global identity to be used by the local end.

   `ike identity` { **`address`** { *`ipv4-address`* | **`ipv6`** *`ipv6-address`* }| **`dn`** | **`fqdn`** [*`fqdn-name`*] | **`user-fqdn`** [*`user-fqdn-name`*] }

   By default, the IP address of the interface to which the IPsec policy or IPsec policy template is applied is used as the IKE identity.

3. (Optional.) Configure the local device to always obtain the identity information from the local certificate for signature authentication.

   `ike signature-identity from-certificate`

   By default, the local end uses the identity information specified by **`local-identity`** or **`ike identity`** for signature authentication.

   Configure this command when the aggressive mode and signature authentication are used and the device interconnects with a NF 5-based peer device. NF supports only DN for signature authentication.

Configuring the IKE keepalive feature

About this task

IKE sends keepalive packets to query the liveness of the peer. If the peer is configured with the keepalive timeout time, you must configure the keepalive interval on the local device. If the peer receives no keepalive packets during the timeout time, the IKE SA is deleted along with the IPsec SAs it negotiated.

Restrictions and guidelines

Configure IKE DPD instead of IKE keepalive unless IKE DPD is not supported on the peer. The IKE keepalive feature sends keepalives at regular intervals, which consumes network bandwidth and resources.

The keepalive timeout time configured on the local device must be longer than the keepalive interval configured at the peer. Since it seldom occurs that more than three consecutive packets are lost on a network, you can set the keepalive timeout three times as long as the keepalive interval.

Procedure

1. Enter system view.

   `system-view`

2. Set the IKE SA keepalive interval.

   `ike keepalive interval`*`interval`*

   By default, no keepalives are sent to the peer.

3. Set the IKE SA keepalive timeout time.

```
ike keepalive timeout seconds
```

By default, IKE SA keepalive never times out.

Configuring the IKE NAT keepalive feature

About this task

If IPsec traffic passes through a NAT device, you must configure the NAT traversal feature. If no packet travels across an IPsec tunnel in a period of time, the NAT sessions are aged and deleted, disabling the tunnel from transmitting data to the intended end. To prevent NAT sessions from being aged, configure the NAT keepalive feature on the IKE gateway behind the NAT device to send NAT keepalive packets to its peer periodically to keep the NAT session alive.

Procedure

1. Enter system view.

   ```
   system-view
   ```

2. Set the IKE NAT keepalive interval.

   ```
   ike nat-keepalive seconds
   ```

   The default interval is 20 seconds.

Configuring global IKE DPD

About this task

DPD detects dead peers. It can operate in periodic mode or on-demand mode.

- **Periodic DPD**—Sends a DPD message at regular intervals. It features an earlier detection of dead peers, but consumes more bandwidth and CPU.
- **On-demand DPD**—Sends a DPD message based on traffic. When the device has traffic to send and is not aware of the liveness of the peer, it sends a DPD message to query the status of the peer. If the device has no traffic to send, it never sends DPD messages. As a best practice, use the on-demand mode.

The IKE DPD works as follows:

1. The local device sends a DPD message to the peer, and waits for a response from the peer.
2. If the peer does not respond within the retry interval specified by the **retry** *seconds* parameter, the local device resends the message.
3. If still no response is received within the retry interval, the local end sends the DPD message again. The system allows a maximum of four retries.
4. If the local device receives no response after four retries, the device considers the peer to be dead, and deletes the IKE SA along with the IPsec SAs it negotiated.
5. If the local device receives a response from the peer during the detection process, the peer is considered alive. The local device performs a DPD detection again when the triggering interval is reached or it has traffic to send, depending on the DPD mode.

Restrictions and guidelines

When DPD settings are configured in both IKE profile view and system view, the DPD settings in IKE profile view apply. If DPD is not configured in IKE profile view, the DPD settings in system view apply.

It is a good practice to set the triggering interval longer than the retry interval so that a DPD detection is not triggered during a DPD retry.

Procedure

1. Enter system view.

```
system-view
```

2. Enable sending IKE DPD messages.

   ike dpd interval *interval* [**retry** *seconds*] { **on-demand** | **periodic** }

   By default, IKE DPD is disabled.

Enabling invalid SPI recovery

About this task

An IPsec "black hole" occurs when one IPsec peer fails (for example, a peer can fail if a reboot occurs). One peer fails and loses its SAs with the other peer. When an IPsec peer receives a data packet for which it cannot find an SA, an invalid SPI is encountered. The peer drops the data packet and tries to send an SPI invalid notification to the data originator. This notification is sent by using the IKE SA. Because no IKE SA is available, the notification is not sent. The originating peer continues sending the data by using the IPsec SA that has the invalid SPI, and the receiving peer keeps dropping the traffic.

The invalid SPI recovery feature enables the receiving peer to set up an IKE SA with the originator so that an SPI invalid notification can be sent. Upon receiving the notification, the originating peer deletes the IPsec SA that has the invalid SPI. If the originator has data to send, new SAs will be set up.

Restrictions and guidelines

Use caution when you enable the invalid SPI recovery feature because using this feature can result in a DoS attack. Attackers can make a great number of invalid SPI notifications to the same peer.

Procedure

1. Enter system view.

   ```
   system-view
   ```

2. Enable invalid SPI recovery.

   ```
   ike invalid-spi-recovery enable
   ```

   By default, the invalid SPI recovery is disabled.

Setting the maximum number of IKE SAs

About this task

You can set the maximum number of half-open IKE SAs and the maximum number of established IKE SAs.

- The supported maximum number of half-open IKE SAs depends on the device's processing capability. Adjust the maximum number of half-open IKE SAs to make full use of the device's processing capability without affecting the IKE SA negotiation efficiency.
- The supported maximum number of established IKE SAs depends on the device's memory space. Adjust the maximum number of established IKE SAs to make full use of the device's memory space without affecting other applications in the system.

Procedure

1. Enter system view.

   ```
   system-view
   ```

2. Set the maximum number of half-open IKE SAs and the maximum number of established IKE SAs.

   ike limit { **max-negotiating-sa** *negotiation-limit* | **max-sa** *sa-limit* }

By default, the maximum number of half-open IKE SAs and IPsec SAs is 200, and there is no limit to the maximum number of established IKE SAs.

Configuring IKE address pools

About this task

To perform centralized management on remote users, an IPsec gateway can use an address pool to assign private IP addresses to remote users.

You must use an IKE address pool together with AAA authorization by specifying the IKE address pool as an AAA authorization attribute. For more information about AAA authorization, see "Configuring AAA."

Procedure

1. Enter system view.

   `system-view`

2. Configure an IKE IPv4 address pool.

   `ike address-group` *`group-name start-ipv4-address end-ipv4-address`* `[` *`mask`* `|` *`mask-length`* `]`

3. Configure an IKE IPv6 address pool.

   `ike ipv6-address-group` *`group-name`* **`prefix`** *`prefix/prefix-len`* **`assign-len`** *`assign-len`*

Configuring IKE negotiation compatibility

About this task

IKE negotiation between two peers using the SM4-CBC encryption algorithm will fail if the peers use different SM4-CBC key lengths. You can enable SM4-CBC key length compatibility on the device, so the device can successfully negotiate with a remote peer that uses a different SM4-CBC key length.

IKE peers running different software versions might have the GM main mode compatibility issue (signature verification failure) during IKE negotiation. If the device encounters this issue with its peer, you can enable the GM mode compatibility on the device. Do not enable GM mode compatibility on the device if the device does not have the compatibility issue with its peers.

Procedure

1. Enter system view.

   `system-view`

2. Enable SM4-CBC key length compatibility.

   `ike compatible-sm4 enable`

   By default, SM4-CBC key length compatibility is disabled.

3. Enable GM main mode compatibility.

   `ike compatible-gm-main enable`

   By default, the GM main mode compatibility is disabled.

Configuring GD-quantum encryption

About this task

After enabling GD-quantum encryption for IKE, the device can use the symmetric key provided by the GD-quantum server to encrypt the IPsec protected data, which further enhance the security of IPsec.

The device obtains keys from the GD-quantum server in the following steps:

1. **Connecting the GD-quantum server**—After all commands in IKE GD-quantum view are configured, the device establishes a connection with the specified GD-quantum server.
2. **Logging in to the GD-quantum server**—After the connection is established, the device sends a login request to the GD-quantum server, carrying the GD-quantum access ID and the GD-quantum authentication key. Only devices with verified GD-quantum access IDs and GD-quantum authentication keys can successfully log in to the GD-quantum server.
3. **Obtaining the GD-quantum keys**—After successful login and the IKE phase 1 negotiation, the device obtains the encrypted GD-quantum keys from the GD-quantum server, decrypt them with the GD-quantum decryption keys configured on the device, and finally obtain the GD-quantum keys for IPsec.

When enabling GD-quantum encryption for IKE, the device enters IKE GD-quantum view. Configure the IP address and port number of the GD-quantum server, the GD-quantum access IDs and GD-quantum authentication keys, and the GD-quantum decryption keys in this view.

Hardware and feature compatibility

Models	Feature compatibility
NFNX5-HD6480	Yes
NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB1780, NFNX3-HDB3080, NFNX3-HDB1180, NFNX3-HDB1480, NFNX3-HDB680, NFNX3-HDB1080	No

Prerequisites

Before configuring the GD-quantum encryption feature, contact the administrator of the GD-quantum server to obtain the GD-quantum access ID, the GD-quantum authentication key, and the GD-quantum decryption key.

Procedure

1. Enter system view.

   `system-view`

2. Enable GD-quantum encryption for IKE and enter IKE GD-quantum view.

   `ike gd-quantum`

   By default, GD-quantum encryption for IKE is disabled.

3. Specify the IP address and port number of the GD-quantum server.

   server-address *ip-address* [**port** *port-number*]

   By default, no IP address or port number of the GD-quantum server is specified.

4. Specify a GD-quantum access ID.

   app-dev-info *app-dev-info*

   By default, no GD-quantum access ID is specified.

5. Configure a GD-quantum authentication key.

   auth-key { **cipher** | **simple** } *key-value*

By default, no GD-quantum authentication key is configured.

6. Configure a GD-quantum decryption key.

   decrypt-quantum-key { **cipher** | **simple** } *key-value*

   By default, no GD-quantum decryption key is configured.

Configuring SNMP notifications and logging for IKE

Configuring SNMP notifications for IKE

About this task

After you enable SNMP notifications for IKE, the IKE module notifies the NMS of important module events. The notifications are sent to the device's SNMP module. For the notifications to be sent correctly, you must also configure SNMP on the device. For more information about SNMP notifications, see *Network Management and Monitoring Configuration Guide*.

To generate and output SNMP notifications for a specific IKE failure or event type, perform the following tasks:

1. Enable SNMP notifications for IKE globally.
2. Enable SNMP notifications for the failure or event type.

Procedure

1. Enter system view

   system-view

2. Enable SNMP notifications for IKE globally.

   snmp-agent trap enable ike global

   By default, SNMP notifications for IKE are disabled.

3. Enable SNMP notifications for the specified failure or event types.

   snmp-agent trap enable ike [**attr-not-support** | **auth-failure** | **cert-type-unsupport** | **cert-unavailable** | **decrypt-failure** | **encrypt-failure** | **invalid-cert-auth** | **invalid-cookie** | **invalid-id** | **invalid-proposal** | **invalid-protocol** | **invalid-sign** | **no-sa-failure** | **proposal-add** | **proposal–delete** | **tunnel-start** | **tunnel-stop** | **unsupport-exch-type**] *

   By default, SNMP notifications for all failure and event types are disabled.

Enabling logging for IKE negotiation

About this task

This feature enables the device to output logs for the IKE negotiation process.

Procedure

1. Enter system view.

   system-view

2. Enable logging for IKE negotiation.

   ike logging negotiation enable

   By default, logging for IKE negotiation is enabled.

Display and maintenance commands for IKE

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display configuration information about all IKE proposals.	**display ike proposal**
Display information about the current IKE SAs.	**display ike sa** [**verbose** [**connection-id** *connection-id* | **remote-address** [**ipv6**] *remote-address* [**vpn-instance** *vpn-instance-name*]]]
Display IKE statistics.	**display ike statistics**
Delete IKE SAs.	**reset ike sa** [**connection-id** *connection-id*]
Clear IKE MIB statistics.	**reset ike statistics**

Troubleshooting IKE

IKE negotiation failed because no matching IKE proposals were found

Symptom

1. The IKE SA is in Unknown state.

```
<Sysname> display ike sa
    Connection-ID   Remote                Flag         DOI
------------------------------------------------------------------
    1               192.168.222.5/500     Unknown      IPsec
Flags:
RD--READY RL--REPLACED FD-FADING RK-REKEY
```

2. When IKE event debugging and packet debugging are enabled, the following messages appear:

   IKE event debugging message:

```
The attributes are unacceptable.
```

   IKE packet debugging message:

```
Construct notification packet: NO_PROPOSAL_CHOSEN.
```

Analysis

Certain IKE proposal settings are incorrect.

Solution

1. Examine the IKE proposal configuration to see whether the two ends have matching IKE proposals.
2. Modify the IKE proposal configuration to make sure the two ends have matching IKE proposals.
3. If the problem persists, contact NSFOCUS Support.

IKE negotiation failed because no IKE proposals or IKE keychains are specified correctly

Symptom

1. The IKE SA is in Unknown state.

```
<Sysname> display ike sa
    Connection-ID   Remote               Flag         DOI
------------------------------------------------------------------
    1               192.168.222.5/500     Unknown      IPsec
Flags:
RD--READY RL--REPLACED FD-FADING RK-REKEY
```

2. The following IKE event debugging or packet debugging message appeared:

   IKE event debugging message:

```
Notification PAYLOAD_MALFORMED is received.
```

   IKE packet debugging message:

```
Construct notification packet: PAYLOAD_MALFORMED.
```

Analysis

- If the following debugging information appeared, the matched IKE profile is not using the matched IKE proposal:

```
Failed to find proposal 1 in profile profile1.
```

- If the following debugging information appeared, the matched IKE profile is not using the matched IKE keychain:

```
Failed to find keychain keychain1 in profile profile1.
```

Solution

1. Verify that the matched IKE proposal (IKE proposal 1 in this debugging message example) is specified for the IKE profile (IKE profile 1 in the example).
2. Verify that the matched IKE keychain (IKE keychain 1 in this debugging message example) is specified for the IKE profile (IKE profile 1 in the example).
3. If the problem persists, contact NSFOCUS Support.

IPsec SA negotiation failed because no matching IPsec transform sets were found

Symptom

1. The **display ike sa** command shows that the IKE SA negotiation succeeded and the IKE SA is in RD state, but the **display ipsec sa** command shows that the expected IPsec SA has not been negotiated yet.
2. The following IKE debugging message appeared:

```
The attributes are unacceptable.
```

   Or:

```
Construct notification packet: NO_PROPOSAL_CHOSEN.
```

Analysis

Certain IPsec policy settings are incorrect.

Solution

1. Examine the IPsec configuration to see whether the two ends have matching IPsec transform sets.
2. Modify the IPsec configuration to make sure the two ends have matching IPsec transform sets.
3. If the problem persists, contact NSFOCUS Support.

IPsec SA negotiation failed due to invalid identity information

Symptom

1. The **`display ike sa`** command shows that the IKE SA negotiation succeeded and the IKE SA is in RD state, but the **`display ipsec sa`** command shows that the expected IPsec SA has not been negotiated yet.
2. The following IKE debugging message appeared:

   ```
   Notification INVALID_ID_INFORMATION is received.
   ```

   Or:

   ```
   Failed to get IPsec policy when renegotiating IPsec SA. Delete IPsec SA.
   Construct notification packet: INVALID_ID_INFORMATION.
   ```

Analysis

Certain IPsec policy settings of the responder are incorrect. Verify the settings as follows:

1. Verify that matching IKE profiles were found in IKE negotiation phase 1.

   If no matching IKE profiles were found, the IPsec policy must not use an IKE profile, so the global IKE settings can be used for IKE negotiation. If no matching IKE profiles were found and the IPsec policy is using an IKE profile, the IPsec SA negotiation fails.

   # Identify whether matching IKE profiles were found in IKE negotiation phase 1. The following output shows that no matching IKE profile was found:

   ```
   <Sysname> display ike sa verbose
      -----------------------------------------------
      Connection ID: 3
      Outside VPN:
      Inside VPN:
      Profile:
      Transmitting entity: Responder
      Initiator cookie: 1bcf453f0a217259
      Responder cookie: 5e32a74dfa66a0a4
      -----------------------------------------------
      Local IP/port: 192.168.222.5/500
      Local ID type: IPV4_ADDR
      Local ID: 192.168.222.5

      Remote IP/port: 192.168.222.71/500
      Remote ID type: IPV4_ADDR
      Remote ID: 192.168.222.71

      Authentication-method: PRE-SHARED-KEY
      Authentication-algorithm: MD5
      Encryption-algorithm: 3DES-CBC
   ```

```
   Life duration(sec): 86400
   Remaining key duration(sec): 85847
   Exchange-mode: Main
   Diffie-Hellman group: Group 1
   NAT traversal: Not detected
   Vendor ID index: 0xa1d
   Vendor ID sequence number: 0x0
```

# Identify whether the IPsec policy is using an IKE profile. The following output shows that no IKE profile is used by the IPsec policy.

```
[Sysname] display ipsec policy
-------------------------------------------
IPsec Policy: policy1
Interface: GigabitEthernet1/0/1
-------------------------------------------

  -----------------------------
  Sequence number: 1
  Mode: ISAKMP
  -----------------------------
  Description:
  Security data flow: 3000
  Selector mode: aggregation
  Local address: 192.168.222.5
  Remote address: 192.168.222.71
  Transform set:  transform1
  IKE profile: profile1
  smart-link policy:
  SA trigger mode: Auto
  SA duration(time based): 3600 seconds
  SA duration(traffic based): 1843200 kilobytes
  SA soft-duration buffer(time based): 1000 seconds
  SA soft-duration buffer(traffic based): 43200 kilobytes
  SA idle time: 100 seconds
```

2. Verify that the ACL specified for the IPsec policy is correctly configured. If the flow range defined by the responder's ACL is smaller than that defined by the initiator's ACL, IPsec proposal matching will fail.

   For example, if the initiator's ACL defines a flow from one network segment to another but the responder's ACL defines a flow from one host to another host, IPsec proposal matching will fail.

   # On the initiator:

```
[Sysname] display acl 3000
Advanced IPv4 ACL 3000, 1 rule,
ACL's step is 5
 rule 0 permit ip source 192.168.222.0 0.0.0.255 destination 192.168.222.0 0.0.0.255
```

   # On the responder:

```
[Sysname] display acl 3000
Advanced IPv4 ACL 3000, 1 rule,
ACL's step is 5
 rule 0 permit ip source 192.168.222.71 0 destination 192.168.222.5 0
```

3. Verify that the IPsec policy has a remote address and an IPsec transform set configured and that the IPsec transform set has all necessary settings configured.

   If, for example, the IPsec policy has no remote address configured, the IPsec SA negotiation will fail:

```
[Sysname] display ipsec policy
-------------------------------------------
IPsec Policy: policy1
Interface: GigabitEthernet1/0/1
-------------------------------------------

  -----------------------------
  Sequence number: 1
  Mode: ISAKMP
  -----------------------------
  Security data flow: 3000
  Selector mode: aggregation
  Local address: 192.168.222.5
  Remote address:
  Transform set:  transform1
  IKE profile: profile1
  smart-link policy:
  SA trigger mode: Auto
  SA duration(time based): 3600 seconds
  SA duration(traffic based): 1843200 kilobytes
  SA soft-duration buffer(time based): 1000 seconds
  SA soft-duration buffer(traffic based): 43200 kilobytes
  SA idle time: 100 seconds
```

Solution

1. If the IPsec policy specifies an IKE profile but no matching IKE profiles was found in IKE negotiation, perform one of the following tasks on the responder:
   - Remove the specified IKE profile from the IPsec policy.
   - Modify the specified IKE profile to match the IKE profile of the initiator.
2. If the flow range defined by the responder's ACL is smaller than that defined by the initiator's ACL, modify the responder's ACL so the ACL defines a flow range equal to or greater than that of the initiator's ACL.

   For example:

```
[Sysname] display acl 3000
Advanced IPv4 ACL 3000, 2 rules,
ACL's step is 5
 rule 0 permit ip source 192.168.222.0 0.0.0.255 destination 192.168.222.0 0.0.0.255
```

3. Configure the missing settings (for example, the remote address).
4. If the problem persists, contact NSFOCUS Support.

Configuring IKEv2

About IKEv2

Internet Key Exchange version 2 (IKEv2) is an enhanced version of IKEv1. The same as IKEv1, IKEv2 has a set of self-protection mechanisms and can be used on insecure networks for reliable identity authentication, key distribution, and IPsec SA negotiation. IKEv2 provides stronger protection against attacks and higher key exchange ability and needs fewer message exchanges than IKEv1.

IKEv2 negotiation process

Compared with IKEv1, IKEv2 simplifies the negotiation process and is much more efficient.

IKEv2 defines three types of exchanges: initial exchanges, CREATE_CHILD_SA exchange, and INFORMATIONAL exchange.

As shown in Figure 38, IKEv2 uses two exchanges during the initial exchange process: IKE_SA_INIT and IKE_AUTH, each with two messages.

- **IKE_SA_INIT exchange**—Negotiates IKE SA parameters and exchanges keys.
- **IKE_AUTH exchange**—Authenticates the identity of the peer and establishes IPsec SAs.

After the four-message initial exchanges, IKEv2 sets up one IKE SA and one pair of IPsec SAs. For IKEv1 to set up one IKE SA and one pair of IPsec SAs, it must go through two phases that use a minimum of six messages.

To set up one more pair of IPsec SAs within the IKE SA, IKEv2 goes on to perform an additional two-message exchange—the CREATE_CHILD_SA exchange. One CREATE_CHILD_SA exchange creates one pair of IPsec SAs. IKEv2 also uses the CREATE_CHILD_SA exchange to rekey IKE SAs and Child SAs.

IKEv2 uses the INFORMATIONAL exchange to convey control messages about errors and notifications.

Figure 38 IKEv2 Initial exchange process

Perform ID and exchange authentication and negotiate IPsec SAs
Perform ID and exchange authentication and negotiate IPsec SAs

New features in IKEv2

DH guessing

In the IKE_SA_INIT exchange, the initiator guesses the DH group that the responder is most likely to use and sends it in an IKE_SA_INIT request message. If the initiator's guess is correct, the responder responds with an IKE_SA_INIT response message and the IKE_SA_INIT exchange is finished. If the guess is wrong, the responder responds with an INVALID_KE_PAYLOAD message that contains the DH group that it wants to use. The initiator then uses the DH group selected by the responder to reinitiate the IKE_SA_INIT exchange. The DH guessing mechanism allows for more flexible DH group configuration and enables the initiator to adapt to different responders.

Cookie challenging

Messages for the IKE_SA_INIT exchange are in plain text. An IKEv1 responder cannot confirm the validity of the initiators and must maintain half-open IKE SAs, which makes the responder susceptible to DoS attacks. An attacker can send a large number of IKE_SA_INIT requests with forged source IP addresses to the responder, exhausting the responder's system resources.

IKEv2 introduces the cookie challenging mechanism to prevent such DoS attacks. When an IKEv2 responder maintains a threshold number of half-open IKE SAs, it starts the cookie challenging mechanism. The responder generates a cookie and includes it in the response sent to the initiator. If the initiator initiates a new IKE_SA_INIT request that carries the correct cookie, the responder considers the initiator valid and proceeds with the negotiation. If the carried cookie is incorrect, the responder terminates the negotiation.

The cookie challenging mechanism automatically stops working when the number of half-open IKE SAs drops below the threshold.

IKEv2 SA rekeying

For security purposes, both IKE SAs and IPsec SAs have a lifetime and must be rekeyed when the lifetime expires. An IKEv1 SA lifetime is negotiated. An IKEv2 SA lifetime, in contrast, is configured. If two peers are configured with different lifetimes, the peer with the shorter lifetime always initiates the SA rekeying. This mechanism reduces the possibility that two peers will simultaneously initiate a rekeying. Simultaneous rekeying results in redundant SAs and SA status inconsistency on the two peers.

IKEv2 message retransmission

Unlike IKEv1 messages, IKEv2 messages appear in request/response pairs. IKEv2 uses the Message ID field in the message header to identify the request/response pair. If an initiator sends a request but receives no response with the same Message ID value within a specific period of time, the initiator retransmits the request.

It is always the IKEv2 initiator that initiates the retransmission, and the retransmitted message must use the same Message ID value.

Protocols and standards

- RFC 2408, *Internet Security Association and Key Management Protocol (ISAKMP)*
- RFC 4306, *Internet Key Exchange (IKEv2) Protocol*
- RFC 4718, *IKEv2 Clarifications and Implementation Guidelines*
- RFC 2412, *The OAKLEY Key Determination Protocol*
- RFC 5996, *Internet Key Exchange Protocol Version 2 (IKEv2)*

IKEv2 tasks at a glance

To configure IKEv2, perform the following tasks:

1. Configuring an IKEv2 profile
   a. Creating an IKEv2 profile
   b. Specifying the local and remote identity authentication methods
   c. Configuring the IKEv2 keychain or PKI domain
   d. Configuring the local ID for the IKEv2 profile
   e. Configuring peer IDs for the IKEv2 profile
   f. Specifying a VPN instance for the IKEv2 profile
   g. Specifying an inside VPN instance for the IKEv2 profile
   h. Configuring optional features for the IKEv2 profile
2. Configuring an IKEv2 policy
3. Configuring an IKEv2 proposal

   If you specify an IKEv2 proposal in an IKEv2 policy, you must configure the IKEv2 proposal.
4. Configuring an IKEv2 keychain

   This task is required when either end or both ends use the preshared key authentication method.
5. (Optional.) Enabling the cookie challenging feature

   The cookie challenging feature takes effect only on IKEv2 responders.
6. (Optional.) Configuring the IKEv2 DPD feature
7. (Optional.) Configuring the IKEv2 NAT keepalive feature
8. (Optional.) Configuring IKEv2 address pools

Prerequisites for IKEv2 configuration

Determine the following parameters prior to IKEv2 configuration:

- The strength of the algorithms for IKEv2 negotiation, including the encryption algorithms, integrity protection algorithms, PRF algorithms, and DH groups. Different algorithms provide different levels of protection. A stronger algorithm means better resistance to decryption of protected data but requires more resources. Typically, the longer the key, the stronger the algorithm.
- The local and remote identity authentication methods.
  - To use the preshared key authentication method, you must determine the preshared key.
  - To use the RSA digital signature authentication method, you must determine the PKI domain for the local end to use. For information about PKI, see "Configuring PKI."

Configuring an IKEv2 profile

Creating an IKEv2 profile

About this task

An IKEv2 profile is intended to provide a set of parameters for IKEv2 negotiation.

Procedure

1. Enter system view.

   ```
   system-view
   ```
2. Create an IKEv2 profile and enter its view.

   ```
   ikev2 profile profile-name
   ```

Specifying the local and remote identity authentication methods

Restrictions and guidelines

The local and remote identity authentication methods must both be specified and they can be different. You can specify only one local identity authentication method and multiple remote identity authentication methods.

Procedure

1. Enter system view.

   system-view

2. Enter IKEv2 profile view.

   ikev2 profile *profile-name*

3. Specify the local and remote identity authentication methods.

   authentication-method { **local** | **remote** } { **dsa-signature** | **ecdsa-signature** | **pre-share** | **rsa-signature** }

   By default, no local or remote identity authentication method is configured.

Configuring the IKEv2 keychain or PKI domain

Restrictions and guidelines

Configure the IKEv2 keychain or PKI domain for the IKEv2 profile to use. To use digital signature authentication, configure a PKI domain. To use preshared key authentication, configure an IKEv2 keychain.

Procedure

1. Enter system view.

   system-view

2. Enter IKEv2 profile view.

   ikev2 profile *profile-name*

3. Specify the keychain for preshared key authentication or the PKI domain used to request a certificate for digital signature authentication.

   - Specify the keychain.

     keychain *keychain-name*

   - Specify the PKI domain.

     certificate domain *domain-name* [**sign** | **verify**]

   By default, no IKEv2 keychain or PKI domain is specified for an IKEv2 profile.

Configuring the local ID for the IKEv2 profile

Restrictions and guidelines

For digital signature authentication, the device can use an ID of any type. If the local ID is an IP address that is different from the IP address in the local certificate, the device uses the FQDN as the local ID. The FQDN is the device name configured by using the **sysname** command.

For preshared key authentication, the device can use an ID of any type other than the DN.

Procedure

1. Enter system view.

   system-view

2. Enter IKEv2 profile view.

   ikev2 profile *profile-name*

3. Configure the local ID.

   identity local { **address** { *ipv4-address* | **ipv6** *ipv6-address* } | **dn** | **email** *email-string* | **fqdn** *fqdn-name* | **key-id** *key-id-string* }

   By default, no local ID is configured, and the device uses the IP address of the interface where the IPsec policy applies as the local ID.

Configuring peer IDs for the IKEv2 profile

About this task

Perform this task to configure the peer ID for IKEv2 profile matching. When the device needs to select an IKEv2 profile for IKEv2 negotiation with a peer, it compares the received peer ID with the peer IDs of its local IKE profiles. If a match is found, it uses the IKEv2 profile with the matching peer ID for negotiation. IKEv2 profiles will be compared in descending order of their priorities.

Procedure

1. Enter system view.

   system-view

2. Enter IKEv2 profile view.

   ikev2 profile *profile-name*

3. Configure a peer ID.

   match remote { **certificate** *policy-name* | **identity** { **address** { { *ipv4-address* [*mask* | *mask-length*] | **range** *low-ipv4-address high-ipv4-address* } | **ipv6** { *ipv6-address* [*prefix-length*] | **range** *low-ipv6-address high-ipv6-address* } } | **fqdn** *fqdn-name* | **email** *email-string* | **key-id** *key-id-string* } }

   You must configure a minimum of one peer ID on each of the two peers.

Specifying a VPN instance for the IKEv2 profile

About this task

After you specify a VPN instance for an IKEv2 profile, the IKEv2 profile can be used for IKEv2 negotiation only on the interfaces that belong to the VPN instance.

Procedure

1. Enter system view.

   system-view

2. Enter IKEv2 profile view.

   ikev2 profile *profile-name*

3. Specify a VPN instance for the IKEv2 profile.

   match vrf { **name** *vrf-name* | **any** }

   By default, an IKEv2 profile belongs to the public network.

Specifying an inside VPN instance for the IKEv2 profile

About this task

The inside VPN instance determines where the device should forward received IPsec packets after it de-encapsulates the packets. If you specify an inside VPN instance, the device looks for a route in the specified VPN instance to forward the packets. If you do not specify an inside VPN instance, the internal and external networks are in the same VPN instance. The device looks for a route in this VPN instance to forward the packets.

Restrictions and guidelines

The inside VPN instance specified in an IKEv2 profile takes effect only on IPsec policies that use the IKEv2 profile. It does not take effect on IPsec profiles that use the IKEv2 profile.

Procedure

1. Enter system view.

   system-view

2. Enter IKEv2 profile view.

   ikev2 profile *profile-name*

3. Specify an inside VPN instance.

   inside-vrf *vrf-name*

   By default, no inside VPN instance is specified for an IKEv2 profile. The internal and external networks are in the same VPN instance. The device forwards protected data to this VPN instance.

Configuring optional features for the IKEv2 profile

1. Enter system view.

   system-view

2. Enter IKEv2 profile view.

   ikev2 profile *profile-name*

3. Configure optional features as needed.

   - Configure IKEv2 DPD.

     dpd interval *interval* [**retry** *seconds*] { **on-demand** | **periodic** }

     By default, IKEv2 DPD is not configured for an IKEv2 profile and an IKEv2 profile uses the DPD settings configured in system view. If IKEv2 DPD is not configured in system view either, the device does not perform dead IKEv2 peer detection.

   - Specify the local interface or IP address to which the IKEv2 profile can be applied.

     match local address { *interface-type interface-number* | *ipv4-address* | **ipv6** *ipv6-address* }

     By default, an IKEv2 profile can be applied to any local interface or local IP address.

     Use this command to specify which address or interface can use the IKEv2 profile for IKEv2 negotiation. Specify the local address configured in IPsec policy or IPsec policy template view (using the **local-address** command) for this command. If no local address is configured, specify the IP address of the interface that uses the IPsec policy.

   - Specify a priority for the IKEv2 profile.

     priority *priority*

     By default, the priority of an IKEv2 profile is 100.

When the device needs to select an IKEv2 profile for IKEv2 negotiation with a peer, it compares the received peer ID with the peer ID of its local IKEv2 profiles in descending order of their priorities

- Set the IKEv2 SA lifetime for the IKEv2 profile.

  sa duration *seconds*

  By default, the IKEv2 SA lifetime is 86400 seconds.

  The local and remote ends can use different IKEv2 SA lifetimes and they do not negotiate the lifetime. The end with a smaller SA lifetime will initiate an SA negotiation when the lifetime expires.

- Set the IKEv2 NAT keepalive interval.

  nat-keepalive *seconds*

  By default, the global IKEv2 NAT keepalive setting is used.

  Configure this command when the device is behind a NAT gateway. The device sends NAT keepalive packets regularly to its peer to prevent the NAT session from being aged because of no matching traffic.

- Enable the configuration exchange feature.

  config-exchange { **request** | **set** { **accept** | **send** } }

  By default, all configuration exchange options are disabled.

  This feature applies to scenarios where the headquarters and branches communicate through virtual tunnels. It enables exchanges of IP address request and set messages between the IPsec gateway at a branch and the IPsec gateway at the headquarters.

  Table 2 Parameter descriptions

Parameter	Description
request	Enables the IPsec gateway at a branch to submit IP address request messages to the IPsec gateway at the headquarters.
set accept	Enables the IPsec gateway at a branch to accept the IP addresses pushed by the IPsec gateway at the headquarters.
set send	Enables the IPsec gateway at the headquarters to push IP addresses to IPsec gateways at branches.

- Enable AAA authorization.

  aaa authorization domain *domain-name* **username** *user-name*

  By default, AAA authorization is disabled.

  The AAA authorization feature enables IKEv2 to request authorization attributes, such as the IKEv2 address pool, from AAA. IKEv2 uses the address pool to assign IP addresses to remote users. For more information about AAA authorization, see "Configuring AAA."

Configuring an IKEv2 policy

About this task

During the IKE_SA_INIT exchange, each end tries to find a matching IKEv2 policy, using the IP address of the local security gateway as the matching criterion.

- If IKEv2 policies are configured, IKEv2 searches for an IKEv2 policy that uses the IP address of the local security gateway. If no IKEv2 policy uses the IP address or the policy is using an incomplete proposal, the IKE_SA_INIT exchange fails.
- If no IKEv2 policy is configured, IKEv2 uses the system default IKEv2 policy **default**.

The device matches IKEv2 policies in the descending order of their priorities. To determine the priority of an IKEv2 policy:

1. First, the device examines the existence of the **match local address** command. An IKEv2 policy with the **match local address** command configured has a higher priority.
2. If a tie exists, the device compares the priority numbers. An IKEv2 policy with a smaller priority number has a higher priority.
3. If a tie still exists, the device prefers an IKEv2 policy configured earlier.

Procedure

1. Enter system view.

   system-view
2. Create an IKEv2 policy and enter its view.

   ikev2 policy *policy-name*

   By default, an IKEv2 policy named **default** exists.
3. Specify the local interface or address used for IKEv2 policy matching.

   match local address { *interface-type interface-number* | *ipv4-address* | **ipv6** *ipv6-address* }

   By default, no local interface or address is used for IKEv2 policy matching, and the policy matches any local interface or address.
4. Specify a VPN instance for IKEv2 policy matching.

   match vrf { **name** *vrf-name* | **any** }

   By default, no VPN instance is specified for IKEv2 policy matching. The IKEv2 policy matches all local addresses in the public network.
5. Specify an IKEv2 proposal for the IKEv2 policy.

   proposal *proposal-name*

   By default, no IKEv2 proposal is specified for an IKEv2 policy.
6. Specify a priority for the IKEv2 policy.

   priority *priority*

   By default, the priority of an IKEv2 policy is 100.

Configuring an IKEv2 proposal

About this task

An IKEv2 proposal contains security parameters used in IKE_SA_INIT exchanges, including the encryption algorithms, integrity protection algorithms, PRF algorithms, and DH groups. An algorithm specified earlier has a higher priority.

Restrictions and guidelines

A complete IKEv2 proposal must have at least one set of security parameters, including one encryption algorithm, one integrity protection algorithm, one PRF algorithm, and one DH group.

You can specify multiple IKEv2 proposals for an IKEv2 policy. A proposal specified earlier has a higher priority.

Procedure

1. Enter system view.

   system-view
2. Create an IKEv2 proposal and enter its view.

   ikev2 proposal *proposal-name*

By default, an IKEv2 proposal named **default** exists.

The default proposal uses the following settings:

- Encryption algorithms AES-CBC-128 and 3DES.
- Integrity protection algorithms HMAC-SHA1 and HMAC-MD5.
- PRF algorithms HMAC-SHA1 and HMAC-MD5.
- DH groups 2 and 5.

3. Specify the encryption algorithms.

   encryption { **3des-cbc** | **aes-cbc-128** | **aes-cbc-192** | **aes-cbc-256** | **aes-ctr-128** | **aes-ctr-192** | **aes-ctr-256** | **camellia-cbc-128** | **camellia-cbc-192** | **camellia-cbc-256** | **des-cbc** } *

   By default, an IKEv2 proposal does not have any encryption algorithms.
4. Specify the integrity protection algorithms.

   integrity { **aes-xcbc-mac** | **md5** | **sha1** | **sha256** | **sha384** | **sha512** } *

   By default, an IKEv2 proposal does not have any integrity protection algorithms.
5. Specify the DH groups.

   dh { **group1** | **group14** | **group2** | **group24** | **group5** | **group19** | **group20** } *

   By default, an IKEv2 proposal does not have any DH groups.
6. Specify the PRF algorithms.

   prf { **aes-xcbc-mac** | **md5** | **sha1** | **sha256** | **sha384** | **sha512** } *

   By default, an IKEv2 proposal uses the integrity protection algorithms as the PRF algorithms.

Configuring an IKEv2 keychain

About this task

An IKEv2 keychain specifies the preshared keys used for IKEv2 negotiation.

An IKEv2 keychain can have multiple IKEv2 peers. Each peer has a symmetric preshared key or an asymmetric preshared key pair, and information for identifying the peer (such as the peer's host name, IP address or address range, or ID).

An IKEv2 negotiation initiator uses the peer host name or IP address/address range as the matching criterion to search for a peer. A responder uses the peer host IP address/address range or ID as the matching criterion to search for a peer.

Procedure

1. Enter system view.

   system-view
2. Create an IKEv2 keychain and enter its view.

   ikev2 keychain *keychain-name*
3. Create an IKEv2 peer and enter its view.

   peer *name*
4. Configure a host name for the peer:

   hostname *name*

   By default, no host name is configured for an IKEv2 peer.
5. Configure a host IP address or address range for the peer:

address { *ipv4-address* [*mask* | *mask-length*] | **ipv6** *ipv6-address* [*prefix-length*] }

By default, no host IP address or address range is configured for an IKEv2 peer.

You must configure different host IP addresses/address ranges for different peers.

6. Configure an ID for the peer:

   identity { **address** { *ipv4-address* | **ipv6** { *ipv6-address* } } | **fqdn** *fqdn-name* | **email** *email-string* | **key-id** *key-id-string* }

   By default, no identity information is configured for an IKEv2 peer.

7. Configure a preshared key for the peer.

   pre-shared-key [**local** | **remote**] { **ciphertext** | **plaintext** } *string*

   By default, an IKEv2 peer does not have a preshared key.

Configure global IKEv2 parameters

Enabling the cookie challenging feature

About this task

Enable cookie challenging on responders to protect them against DoS attacks that use a large number of source IP addresses to forge IKE_SA_INIT requests.

Procedure

1. Enter system view.

   system-view

2. Enable IKEv2 cookie challenging.

   ikev2 cookie-challenge *number*

   By default, IKEv2 cookie challenging is disabled.

Configuring the IKEv2 DPD feature

About this task

IKEv2 DPD detects dead IKEv2 peers in periodic or on-demand mode.

- **Periodic IKEv2 DPD**—Verifies the liveness of an IKEv2 peer by sending DPD messages at regular intervals.
- **On-demand IKEv2 DPD**—Verifies the liveness of an IKEv2 peer by sending DPD messages before sending data.
  - Before the device sends data, it identifies the time interval for which the last IPsec packet has been received from the peer. If the time interval exceeds the DPD interval, it sends a DPD message to the peer to detect its liveliness.
  - If the device has no data to send, it never sends DPD messages.

Restrictions and guidelines

If you configure IKEv2 DPD in both IKEv2 profile view and system view, the IKEv2 DPD settings in IKEv2 profile view apply. If you do not configure IKEv2 DPD in IKEv2 profile view, the IKEv2 DPD settings in system view apply.

Procedure

1. Enter system view.

   system-view

2. Configure global IKEv2 DPD.

   ikev2 dpd interval *interval* [**retry** *seconds*] { **on-demand** | **periodic** }

   By default, global DPD is disabled.

Configuring the IKEv2 NAT keepalive feature

About this task

Configure this feature on the IKEv2 gateway behind the NAT device. The gateway then sends NAT keepalive packets regularly to its peer to keep the NAT session alive, so that the peer can access the device.

The NAT keepalive interval must be shorter than the NAT session lifetime.

This feature takes effect after the device detects the NAT device.

Procedure

1. Enter system view.

   system-view

2. Set the IKEv2 NAT keepalive interval.

   ikev2 nat-keepalive *seconds*

   By default, the IKEv2 NAT keepalive interval is 10 seconds.

Configuring IKEv2 address pools

About this task

To perform centralized management on remote users, an IPsec gateway can use an address pool to assign private IP addresses to remote users.

You must use an IKEv2 address pool together with AAA authorization by specifying the IKEv2 address pool as an AAA authorization attribute. For more information about AAA authorization, see "Configuring AAA."

Procedure

1. Enter system view.

   system-view

2. Configure an IKEv2 IPv4 address pool.

   ikev2 address-group *group-name start-ipv4-address end-ipv4-address* [*mask* | *mask-length*]

3. Configure an IKEv2 IPv6 address pool.

   ikev2 ipv6-address-group *group-name* **prefix** *prefix/prefix-len* **assign-len** *assign-len*

Display and maintenance commands for IKEv2

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display the IKEv2 policy configuration.	**display ikev2 policy** [*policy-name* | **default**]

Task	Command
Display the IKEv2 profile configuration.	**display ikev2 profile** [*profile-name*]
Display the IKEv2 proposal configuration.	**display ikev2 proposal** [*name* | **default**]
Display the IKEv2 SA information.	**display ikev2 sa** [**count** | [{ **local** | **remote** } { *ipv4-address* | **ipv6** *ipv6-address* } [**vpn-instance** *vpn-instance-name*]] [**verbose** [**tunnel** *tunnel-id*]]]
Display IKEv2 statistics.	**display ikev2 statistics**
Delete IKEv2 SAs and the child SAs negotiated through the IKEv2 SAs.	**reset ikev2 sa** [[{ **local** | **remote** } { *ipv4-address* | **ipv6** *ipv6-address* } [**vpn-instance** *vpn-instance-name*]] | **tunnel** *tunnel-id*] [**fast**]
Clear IKEv2 statistics.	**reset ikev2 statistics**

Troubleshooting IKEv2

IKEv2 negotiation failed because no matching IKEv2 proposals were found

Symptom

The IKEv2 SA is in IN-NEGO status.

```
<Sysname> display ikev2 sa
Tunnel ID   Local                          Remote                         Status
  ---------------------------------------------------------------------------
  5          123.234.234.124/500         123.234.234.123/500         IN-NEGO
Status:
IN-NEGO: Negotiating, EST: Established, DEL:Deleting
```

Analysis

Certain IKEv2 proposal settings are incorrect.

Solution

1. Examine the IKEv2 proposal configuration to see whether the two ends have matching IKEv2 proposals.
2. Modify the IKEv2 proposal configuration to make sure the two ends have matching IKEv2 proposals.
3. If the problem persists, contact NSFOCUS Support.

IPsec SA negotiation failed because no matching IPsec transform sets were found

Symptom

The **`display ikev2 sa`** command shows that the IKEv2 SA negotiation succeeded and the IKEv2 SA is in EST status. The **`display ipsec sa`** command shows that the expected IPsec SAs have not been negotiated yet.

Analysis

Certain IPsec policy settings are incorrect.

Solution

1. Examine the IPsec configuration to see whether the two ends have matching IPsec transform sets.
2. Modify the IPsec configuration to make sure the two ends have matching IPsec transform sets.
3. If the problem persists, contact NSFOCUS Support.

IPsec tunnel establishment failed

Symptom

The ACLs and IKEv2 proposals are correctly configured on both ends. The two ends cannot establish an IPsec tunnel or cannot communicate through the established IPsec tunnel.

Analysis

The IKEv2 SA or IPsec SAs on either end are lost. The reason might be that the network is unstable and the device reboots.

Solution

1. Use the **`display ikev2 sa`** command to examine whether an IKEv2 SA exists on both ends. If the IKEv2 SA on one end is lost, delete the IKEv2 SA on the other end by using the **`reset ikev2 sa`** command and trigger new negotiation. If an IKEv2 SA exists on both ends, go to the next step.
2. Use the **`display ipsec sa`** command to examine whether IPsec SAs exist on both ends. If the IPsec SAs on one end are lost, delete the IPsec SAs on the other end by using the **`reset ipsec sa`** command and trigger new negotiation.
3. If the problem persists, contact NSFOCUS Support.

Contents

Configuring tunneling

This chapter describes tunnel interface configuration. For information about tunnel modes, see the subsequent chapters.

About tunneling

Tunneling encapsulates the packets of a network protocol within the packets of a second network protocol and transfers them over a virtual point-to-point connection. The virtual connection is called a tunnel. Packets are encapsulated at the tunnel source and de-encapsulated at the tunnel destination.

Supported tunneling technologies

Tunneling supports the following technologies:

- ADVPN tunneling. For more information, see "Configuring ADVPN."
- GRE tunneling. For more information, see "Configuring GRE."
- IPsec tunneling. For more information, see *Security Configuration Guide*.
- VXLAN tunneling. For more information, see *VXLAN Configuration Guide*.
- IPv6 over IPv4 tunneling, IPv4 over IPv4 tunneling, and IPv4/IPv6 over IPv6 tunneling.

Restrictions and guidelines: Tunnel interface configuration

Do not specify the same tunnel source and destination addresses for different tunnels on the same device.

If the length for the tunnel headers of a packet is too long, the device might fail to process the packet. As a best practice, the number of nested encapsulations for a packet cannot exceed 5.

On IPv4 and IPv6 VXLAN tunnel interfaces and VXLAN-DCI tunnel interfaces, IP addresses (assigned by **ip address** and **ipv6 address** commands) are meaningless. As a best practice, do not assign IP addresses to those types of tunnel interfaces.

Configuring a tunnel interface

About tunnel interface configuration

Configure a tunnel interface (Layer 3 virtual interface) at both ends of a tunnel. The devices use the tunnel interface to identify, process, and send packets for the tunnel.

Tunnel interface configuration tasks at a glance

To configure a tunnel interface, perform the following tasks:

1. Creating a tunnel interface
2. (Optional.) Configuring parameters for tunneled packets

3. (Optional.) Specifying the tunnel destination VPN instance
4. (Optional.) Restoring the default settings of a tunnel interface

Creating a tunnel interface

1. Enter system view.

   system-view

2. Create a tunnel interface, specify the tunnel mode, and enter tunnel interface view.

   interface tunnel *number* **mode** { **advpn** { **gre** | **udp** } [**ipv6**] | **ds-lite-aftr** | **gre** [**ipv6**] | **gre-p2mp** [**ipv6**] | **ipsec** [**ipv6**] | **ipv4-ipv4** | **ipv6** | **ipv6-ipv4** [**6rd** | **6to4** | **auto-tunnel** | **isatap**] | **vxlan** }

   For packet tunneling to succeed, the two ends of a tunnel must use the same tunnel mode.

   Support for the following keywords depends on the device model:

   - **advpn** { **gre** | **udp** } [**ipv6**].
   - **gre-p2mp** [**ipv6**].
   - **ipsec** [**ipv6**].
   - **ipv6-ipv4 6rd**.
   - **vxlan**.

   For more information, see the command reference.

3. Configure a source address or source interface for the tunnel.

   source { *ipv4-address* | *ipv6-address* | *interface-type interface-number* }

   By default, no source address or source interface is configured for a tunnel.

   If you specify a source address, it is used as the source address of tunneled packets.

   If you specify a source interface, the primary IP address of this interface is used as the source IP address of tunneled packets.

4. Configure a destination address for the tunnel.

   destination { *ipv4-address* | *ipv6-address* | **dhcp-alloc** *interface-type interface-number* }

   By default, no destination address is configured for a tunnel.

   The tunnel destination address must be the IP address of the receiving interface on the tunnel peer. It is used as the destination IP address of tunneled packets.

5. (Optional.) Configure a description for the interface.

   description *text*

   By default, the description for a tunnel interface is **Tunnel** *number* **Interface**.

6. (Optional.) Set the MTU of the tunnel interface.

   mtu *size*

   The default settings are as follows:

   - If the tunnel interface has never been up, the MTU is 64000 bytes.
   - If the tunnel interface is up, its MTU is identical to the outgoing interface's MTU minus the length of the tunnel headers. The outgoing interface is automatically obtained through routing table lookup based on the tunnel destination address.

7. (Optional.) Set the expected bandwidth for the tunnel interface.

   bandwidth *bandwidth-value*

   The default expected bandwidth (in kbps) is the interface maximum rate divided by 1000.

The expected bandwidth is an informational parameter used only by higher-layer protocols for calculation. You cannot adjust the actual bandwidth of an interface by using this command.

8. Bring up the tunnel interface.

   undo shutdown

   By default, a tunnel interface is not administratively down.

Configuring parameters for tunneled packets

1. Enter system view.

   system-view

2. Enter tunnel interface view.

   interface tunnel *number*

3. Set the ToS for tunneled packets.

   tunnel tos { **copy-inner-tos** | *tos-value* }

   The default settings are as follows:

   - For VXLAN tunneled packets, the ToS is 0.
   - For non-VXLAN tunneled packets, the ToS is the same as the ToS of the original packets.

   The **copy-inner-tos** keyword is supported only by VXLAN tunnels.

4. Set the TTL for tunneled packets.

   tunnel ttl *ttl-value*

   The default TTL for tunneled packets is 255.

Specifying the tunnel destination VPN instance

Restrictions and guidelines

For a tunnel interface to come up, the tunnel source and destination must belong to the same VPN instance. To specify a VPN instance for the tunnel source, use the **ip binding vpn-instance** command on the tunnel source interface. For more information about this command, see *VPN instance in VPN Command Reference*.

Procedure

1. Enter system view.

   system-view

2. Enter tunnel interface view.

   interface tunnel *number*

3. Specify the VPN instance to which the tunnel destination belongs.

   tunnel vpn-instance *vpn-instance-name*

   By default, the tunnel destination belongs to the public network.

Restoring the default settings of a tunnel interface

Restrictions and guidelines

△ **CAUTION:**

This operation might interrupt ongoing network services. Make sure you are fully aware of the impact of this operation when you perform it on a live network.

This operation might fail to restore the default settings for some commands for reasons such as command dependencies or system restrictions. Use the **display this** command in interface view to identify these commands. Use their **undo** forms or follow the command reference to restore their default settings. If your restoration attempt still fails, follow the error message instructions to resolve the problem.

Procedure

1. Enter system view.
   system-view
2. Enter tunnel interface view.
   interface tunnel *number*
3. Restore the default settings of the tunnel interface.
   default

Display and maintenance commands for tunnel interface configuration

Execute **display** commands in any view and **reset** commands in user view.

Task	Command	Remarks
Display information about tunnel interfaces.	**display interface** [**tunnel** [*number*]] [**brief** [**description** | **down**]]	N/A
Display IPv6 information on tunnel interfaces.	**display ipv6 interface** [**tunnel** [*number*]] [**brief**]	For more information about this command, see IPv6 basics in *Layer 3—IP Services Command Reference*.
Clear statistics on tunnel interfaces.	**reset counters interface** [**tunnel** [*number*]]	N/A
Clear IPv6 statistics on tunnel interfaces.	**reset ipv6 statistics** [**slot** *slot-number*]	For more information about this command, see IPv6 basics in *Layer 3—IP Services Command Reference*.

Troubleshooting tunnel interface configuration

Tunnel interface not up

Symptom

A tunnel interface configured with related parameters such as tunnel source address, tunnel destination address, and tunnel mode cannot come up.

Analysis

The physical interface of the tunnel does not come up, or the tunnel destination is unreachable.

Solution

1. To resolve the problem:

- Use the **`display interface`** or **`display ipv6 interface`** command to verify that the physical interface of the tunnel is up. If the physical interface is down, check the network connection.
- Use the **`display ipv6 routing-table`** or **`display ip routing-table`** command to verify that the tunnel destination is reachable. If the route is not available, configure a route to reach the tunnel destination.

2. If the problem persists, contact NSFOCUS Support.

IPv6 over IPv4 tunneling

About IPv6 over IPv4 tunneling

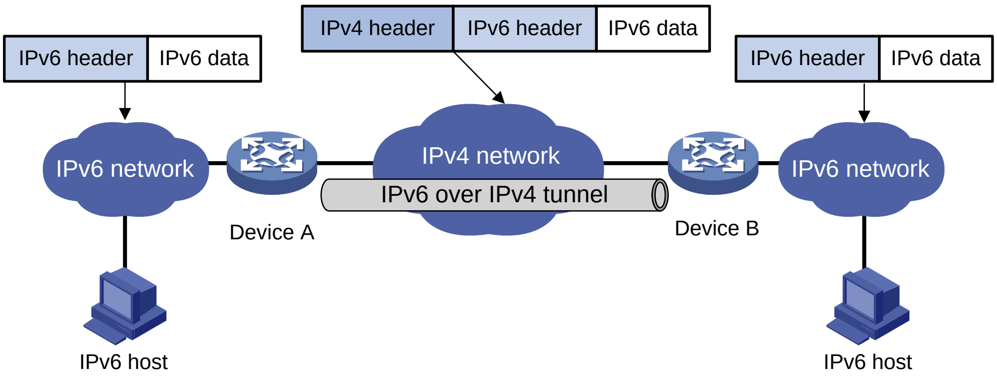
Implementation

IPv6 over IPv4 tunneling enables isolated IPv6 networks to communicate, as shown in Figure 1.

NOTE:

The devices at both ends of an IPv6 over IPv4 tunnel must support the IPv4/IPv6 dual stack.

Figure 1 IPv6 over IPv4 tunnel



The IPv6 over IPv4 tunnel processes packets by using the following steps:

1. A host in the IPv6 network sends an IPv6 packet to Device A at the tunnel source.
2. After Device A receives the IPv6 packet, it processes the packet as follows:
   a. Searches the routing table to identify the outgoing interface for the IPv6 packet.

      The outgoing interface is the tunnel interface, so Device A knows that the packet needs to be forwarded through the tunnel.

   b. Adds an IPv4 header to the IPv6 packet and forwards the packet through the physical interface of the tunnel.

      In the IPv4 header, the source IPv4 address is the IPv4 address of the tunnel source, and the destination IPv4 address is the IPv4 address of the tunnel destination.
3. Upon receiving the packet, Device B de-encapsulates the packet.
4. If the destination address of the IPv6 packet is itself, Device B forwards it to the upper-layer protocol. If it is not, Device B forwards it according to the routing table.

Tunnel modes

IPv6 over IPv4 tunnels include manually configured tunnels and automatic tunnels, depending on how the IPv4 address of the tunnel destination is obtained.

- **Manually configured tunnel**—The destination IPv4 address of the tunnel cannot be automatically obtained from the destination IPv6 address of an IPv6 packet at the tunnel source. It must be manually configured.

- **Automatic tunnel**—The destination IPv4 address of the tunnel can be automatically obtained from the destination IPv6 address (with an IPv4 address embedded) of an IPv6 packet at the tunnel source.

The source IPv4 addresses for all IPv6 over IPv4 tunnels are manually configured.

According to the way an IPv6 packet is encapsulated, IPv6 over IPv4 tunnels are divided into the modes shown in the following sections.

IPv6 over IPv4 manual tunneling

An IPv6 over IPv4 manual tunnel is a point-to-point link. To establish a manual tunnel, you must manually configure the source and destination addresses of the tunnel at both ends of the tunnel.

Manual tunneling provides the following solutions:

- Connects isolated IPv6 networks over an IPv4 network.
- Connects an IPv6 network and an IPv4/IPv6 dual-stack host over an IPv4 network.

Automatic IPv4-compatible IPv6 tunneling

An automatic IPv4-compatible IPv6 tunnel is a point-to-multipoint link. The ends of an automatic IPv4-compatible IPv6 tunnel are IPv4-compatible IPv6 addresses. The address format is 0:0:0:0:0:0:a.b.c.d/96, where a.b.c.d is an IPv4 address. The destination IPv4 address of an automatic IPv4-compatible IPv6 tunnel is embedded in the destination IPv4-compatible IPv6 address. This mechanism enables the device to automatically obtain the tunnel destination address.

Automatic IPv4-compatible IPv6 tunnels have limitations because IPv4-compatible IPv6 addresses must use globally unique IPv4 addresses.

6to4 tunneling

- Ordinary 6to4 tunneling

  A 6to4 tunnel is a point-to-multipoint automatic tunnel. It is used to connect multiple isolated IPv6 networks over an IPv4 network.

  The ends of a 6to4 tunnel are 6to4 addresses. The address format is 2002:abcd:efgh:subnet number::interface ID/48.

  - 2002 is the fixed IPv6 address prefix.
  - abcd:efgh represents a 32-bit globally unique IPv4 address in hexadecimal notation.

    For example, 1.1.1.1 can be represented by 0101:0101. The IPv4 address identifies a 6to4 network (an IPv6 network where all hosts use 6to4 addresses). The border router of a 6to4 network must have the IPv4 address abcd:efgh configured on the interface connected to the IPv4 network.
  - The subnet number identifies a subnet in the 6to4 network.
  - The subnet number::interface ID uniquely identifies a host in the 6to4 network.

  The destination IPv4 address of a 6to4 tunnel is embedded in the destination 6to4 address. This mechanism enables the device to automatically obtain the tunnel destination address.

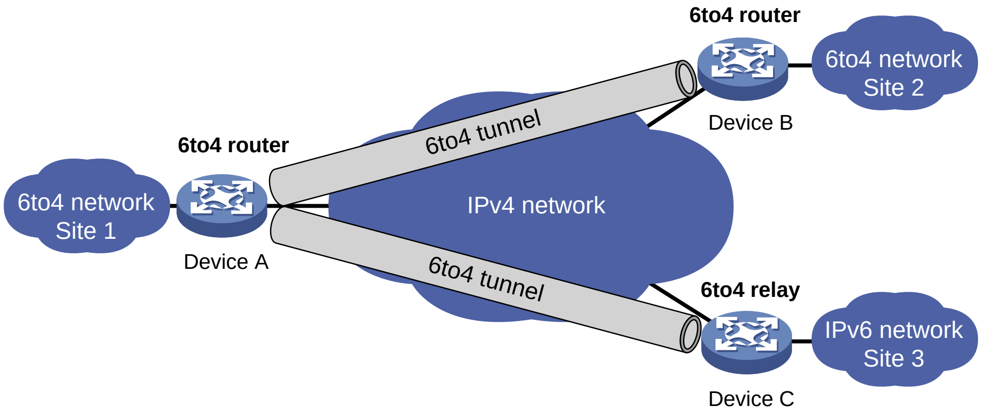
  6to4 tunneling uses an IPv4 address to identify a 6to4 network. This method overcomes the limitations of automatic IPv4-compatible IPv6 tunneling.

- 6to4 relay

  6to4 relay connects a 6to4 network and an IPv6 network that uses an IP prefix other than 2002::/16. A 6to4 relay router is a gateway that forwards packets from a 6to4 network to an IPv6 network.

  As shown in Figure 2, 6to4 network Site 1 communicates with IPv6 network Site 3 over a 6to4 tunnel. Configure a static route on the border router (Device A) in the 6to4 network. The next hop address must be the 6to4 address of the 6to4 relay router (Device C). Device A forwards all packets destined for the IPv6 network over the 6to4 tunnel, and Device C then forwards them to the IPv6 network.

Figure 2 Principle of 6to4 tunneling and 6to4 relay



ISATAP tunneling

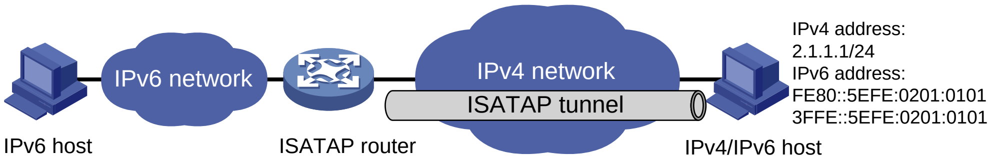
An ISATAP tunnel is a point-to-multipoint automatic tunnel. It provides a solution to connect an IPv6 host and an IPv6 network over an IPv4 network.

The destination address of an ISATAP tunnel is an ISATAP address. The address format is prefix:0:5EFE:abcd:efgh/64.

- The 64-bit prefix is a valid IPv6 unicast address prefix.
- The abcd:efgh/64 segments represent a 32-bit IPv4 address in hexadecimal notation, which identifies the tunnel destination but does not require global uniqueness.

ISATAP tunnels are mainly used for communication between IPv6 routers or between an IPv6 host and an IPv6 router over an IPv4 network.

Figure 3 Principle of ISATAP tunneling



6RD tunneling

- Ordinary 6RD tunneling

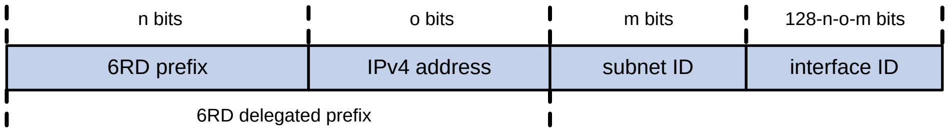
  A 6RD tunnel is a point-to-multipoint automatic tunnel. It is an extension of 6to4 tunneling. The IPv6 prefix of a 6RD network is assigned by the service provider and is not limited to the prefix 2002::/16. 6RD does not require embedding all 32 bits of an IPv4 address in a 6RD address.

  Figure 4 shows the format of 6RD address—an IPv6 address with a 6RD prefix and an embedded IPv4 address.

  - **6RD prefix**—IPv6 prefix assigned by the service provider to a 6RD network.
  - **IPv4 address**—All or part of the IPv4 tunnel source address in hexadecimal notation. For example, assume that the IPv4 tunnel source address is 1.2.3.4 and both the IPv4 prefix length and suffix length are specified as 8 bits. Then, the prefix of the IPv4 address 1.2.3.4 is 01, the suffix is 04, and the embedded IPv4 address is 0203.
  - **6RD delegated prefix**—The 6RD prefix and the embedded IPv4 address together form a 6RD delegated prefix. It uniquely identifies a 6RD network (an IPv6 network where all hosts use 6RD addresses).
  - **Subnet ID**—Identifies a subnet in the 6RD network.
  - **Interface ID**—The subnet ID and the interface ID together identify a host in the 6RD network.

The device automatically identifies the tunnel destination IPv4 address according to the IPv4 address embedded in the 6RD address, the 6RD prefix, and the IPv4 prefix and suffix.

Figure 4 6RD address format

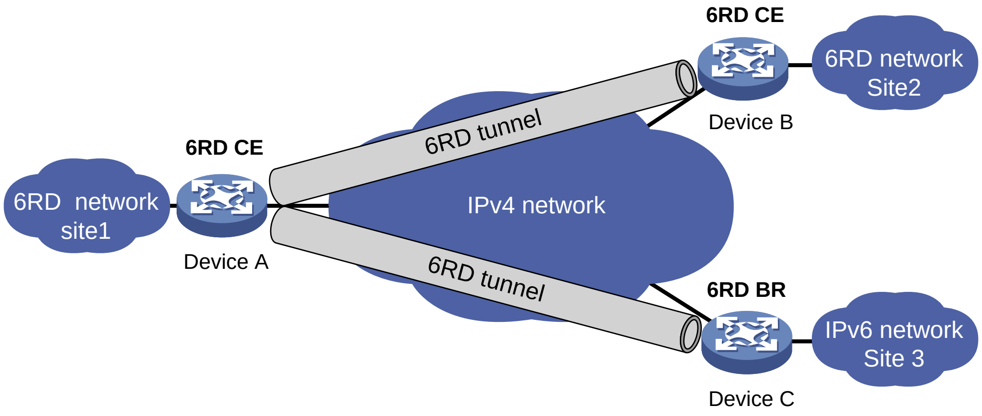


- 6RD relay

  6 RD relay connects a 6RD network and an IPv6 network that uses a prefix other than a 6RD delegated prefix. A 6RD border relay (BR) router is a gateway that forwards packets from a 6RD network to an IPv6 network. The border router connected to the 6RD network is called 6RD CE.

  As shown in Figure 5, for the 6RD network site 1 to communicate with the IPv6 network site 3 over a 6RD tunnel, you must configure 6RD relay. Configure a static route on the border router (Device A) in the 6RD network. The next hop address must be the 6RD address of the 6RD BR router (Device C). Device A forwards all packets destined for the IPv6 network over the 6RD tunnel, and Device C then forwards them to the IPv6 network.

Figure 5 Principle of 6RD tunneling and 6RD relay



IPv6 over IPv4 tunneling tasks at a glance

To configure IPv6 over IPv4 tunneling, perform the following tasks:

1. Configuring an IPv6 over IPv4 tunnel

   Choose one of the following tasks:

   - Configuring an IPv6 over IPv4
   - Configuring an automatic IPv4-compatible IPv6 tunnel
   - Configuring a 6to4 tunnel
   - Configuring an ISATAP tunnel
   - Configuring a 6RD tunnel
2. (Optional.) Enabling dropping IPv6 packets that use IPv4-compatible IPv6 addresses

Configuring an IPv6 over IPv4 manual tunnel

Restrictions and guidelines

When you perform tasks in this section, follow these restrictions and guidelines:

- The tunnel destination address specified on the local device must be identical with the tunnel source address specified on the tunnel peer device.
- Do not specify the same tunnel source and destination addresses for different tunnels in the same mode on a device.
- To ensure correct packet forwarding, identify whether the destination IPv6 network and the IPv6 address of the local tunnel interface are on the same subnet. If they are not, configure a route reaching the destination IPv6 network through the tunnel interface. You can configure the route by using one of the following methods:
  - Configure a static route, and specify the local tunnel interface as the egress interface or specify the IPv6 address of the peer tunnel interface as the next hop.
  - Enable a dynamic routing protocol on both the local and remote tunnel interfaces.

  For more information about route configuration, see *Layer 3—IP Routing Configuration Guide*.

Procedure

1. Enter system view.

   system-view

2. Enter IPv6 over IPv4 manual tunnel interface view.

   interface tunnel *number* [**mode ipv6-ipv4**]

3. Specify an IPv6 address for the tunnel interface.

   See "Configuring basic IPv6 settings."

4. Configure a source address or source interface for the tunnel.

   source { *ipv4-address* | *interface-type interface-number* }

   By default, no source address or source interface is configured for a tunnel.

   If you specify a source address, it is used as the source IP address of tunneled packets.

   If you specify a source interface, the primary IP address of this interface is used as the source IP address of tunneled packets.

5. Configure a destination address for the tunnel.

   destination *ipv4-address*

   By default, no destination address is configured for a tunnel.

   The tunnel destination address must be the IP address of the receiving interface on the tunnel peer. It is used as the destination IP address of tunneled packets.

6. (Optional.) Set the DF bit for tunneled packets.

   tunnel dfbit enable

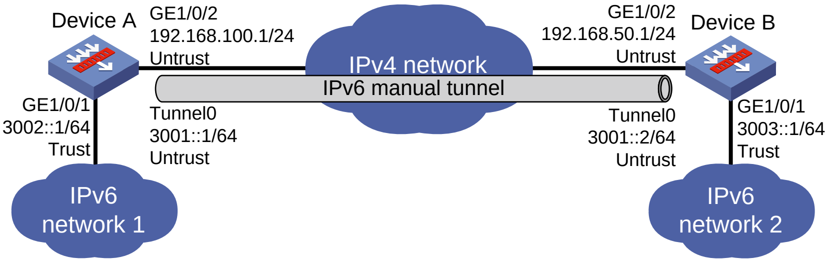
   By default, the DF bit is not set for tunneled packets.

Example: Configuring an IPv6 over IPv4 manual tunnel

Network configuration

As shown in Figure 6, configure an IPv6 over IPv4 tunnel between Device A and Device B so the two IPv6 networks can reach each other over the IPv4 network. Because the tunnel destination IPv4 address cannot be automatically obtained from the destination IPv6 addresses, configure an IPv6 over IPv4 manual tunnel.

Figure 6 Network diagram



Procedure

1. Configure Device A:

# Assign IP addresses to interfaces GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2.

```
<DeviceA> system-view
[DeviceA] interface gigabitethernet 1/0/1
[DeviceA-GigabitEthernet1/0/1] ipv6 address 3002:1/64
[DeviceA-GigabitEthernet1/0/1] quit
[DeviceA] interface gigabitethernet 1/0/2
[DeviceA-GigabitEthernet1/0/2] ip address 192.168.100.1 255.255.255.0
[DeviceA-GigabitEthernet1/0/2] quit
```

# Create IPv6 over IPv4 manual tunnel interface **Tunnel 0**.

```
[DeviceA] interface tunnel 0 mode ipv6-ipv4
[DeviceA-Tunnel0] ipv6 address 3001::1/64
[DeviceA-Tunnel0] source gigabitethernet 1/0/2
[DeviceA-Tunnel0] destination 192.168.50.1
[DeviceA-Tunnel0] quit
```

# Configure settings for routing. This example configures static routes. In the routes, the output interface is Tunnel 0 and the next hop is 192.168.100.2.

```
[DeviceA] ip route-static 192.168.50.1 24 192.168.100.2
[DeviceA] ipv6 route-static 3003:: 64 tunnel 0
```

# Add interfaces to security zones.

```
[DeviceA] security-zone name Untrust
[DeviceA-security-zone-Untrust] import interface Tunnel 0
[DeviceA-security-zone-Untrust] import interface gigabitethernet 1/0/2
[DeviceA-security-zone-Untrust] quit
[DeviceA] security-zone name Trust
[DeviceA-security-zone-Trust] import interface gigabitethernet 1/0/1
[DeviceA-security-zone-Trust] quit
```

# Configure a rule named **tunnellocalout** in the IPv4 security policy to allow Device A to send packets to Device B.

```
[DeviceA] security-policy ip
[DeviceA-security-policy-ip] rule name tunnellocalout
[DeviceA-security-policy-ip-1-tunnellocalout] source-zone local
[DeviceA-security-policy-ip-1-tunnellocalout] destination-zone untrust
[DeviceA-security-policy-ip-1-tunnellocalout] source-ip-host 192.168.100.1

Verifying the configuration

# Use the **`display ipv6 interface`** command to display tunnel interface status on Device A and Device B. Verify that interface tunnel 0 is up. (Details not shown.)

# Verify that Device B and Device A can ping the IPv6 address of GigabitEthernet 1/0/1 of each other. This example uses Device A.

```
[DeviceA] ping ipv6 3003::1
Ping6(56 data bytes) 3001::1 --> 3003::1, press CTRL C to break
56 bytes from 3003::1, icmp_seq=0 hlim=64 time=45.000 ms
56 bytes from 3003::1, icmp_seq=1 hlim=64 time=10.000 ms
56 bytes from 3003::1, icmp_seq=2 hlim=64 time=4.000 ms
56 bytes from 3003::1, icmp_seq=3 hlim=64 time=10.000 ms
56 bytes from 3003::1, icmp_seq=4 hlim=64 time=11.000 ms

--- Ping6 statistics for 3003::1 ---
5 packet(s) transmitted, 5 packet(s) received, 0.0% packet loss
round-trip min/avg/max/std-dev = 4.000/16.000/45.000/14.711 ms
```

Configuring an automatic IPv4-compatible IPv6 tunnel

Restrictions and guidelines

Follow these guidelines when you configure an automatic IPv4-compatible IPv6 tunnel:

- You do not need to configure a destination address for an automatic IPv4-compatible IPv6 tunnel. The destination address of the tunnel is embedded in the destination IPv4-compatible IPv6 address.
- Do not specify the same tunnel source addresses for tunnels of the same tunnel mode.

Procedure

1. Enter system view.

   `system-view`

2. Enter automatic IPv4-compatible IPv6 tunnel interface view.

   `interface tunnel` *`number`* [**`mode ipv6-ipv4 auto-tunnel`**]

3. Specify an IPv6 address for the tunnel interface.

   See "Configuring basic IPv6 settings."

4. Configure a source address or source interface for the tunnel.

   `source` { *`ipv4-address`* | *`interface-type interface-number`* }

   By default, no source address or source interface is configured for a tunnel.

   If you specify a source address, it is used as the source IP address of tunneled packets.

   If you specify a source interface, the primary IP address of this interface is used as the source IP address of tunneled packets.

5. (Optional.) Set the DF bit for tunneled packets.

   `tunnel dfbit enable`

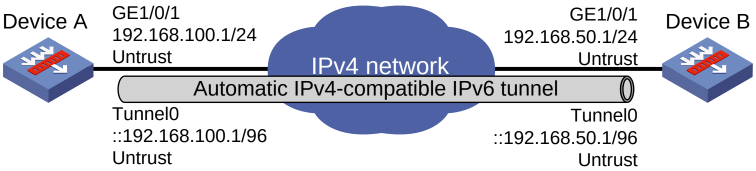
   By default, the DF bit is not set for tunneled packets.

Example: Configuring an automatic IPv4-compatible IPv6 tunnel

Network configuration

As shown in Figure 7, dual-stack devices Device A and Device B communicate over an IPv4 network. Configure an automatic IPv4-compatible IPv6 tunnel between the two devices to enable IPv6 communications over the IPv4 network.

Figure 7 Network diagram



Procedure

1. Configure Device A:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

```
<DeviceA> system-view
[DeviceA] interface gigabitethernet 1/0/1
[DeviceA-GigabitEthernet1/0/1] ip address 192.168.100.1 255.255.255.0
[DeviceA-GigabitEthernet1/0/1] quit
```

   # Create an automatic IPv4-compatible IPv6 tunnel interface.

```
[DeviceA] interface tunnel 0 mode ipv6-ipv4 auto-tunnel
[DeviceA-Tunnel0] ipv6 address ::192.168.100.1/96
[DeviceA-Tunnel0] source gigabitethernet 1/0/1
```

   # Configure settings for routing. This example configures a static route, and the next hop in the route is 192.168.100.2.

```
[DeviceA] ip route-static 192.168.50.1 24 192.168.100.2
```

   # Add interfaces to security zone **Untrust**.

```
[DeviceA] security-zone name Untrust
[DeviceA-security-zone-Untrust] import interface Tunnel 0
[DeviceA-security-zone-Untrust] import interface gigabitethernet 1/0/1
[DeviceA-security-zone-Untrust] quit
```

   # Configure a rule named **tunnellocalout** in the IPv4 security policy to allow Device A to send packets to Device B.

```
[DeviceA] security-policy ip
[DeviceA-security-policy-ip] rule name tunnellocalout
[DeviceA-security-policy-ip-1-tunnellocalout] source-zone local

56 bytes from ::192.168.50.1, icmp_seq=3 hlim=64 time=9.000 ms
56 bytes from ::192.168.50.1, icmp_seq=4 hlim=64 time=11.000 ms

--- Ping6 statistics for ::192.168.50.1 ---
5 packet(s) transmitted, 5 packet(s) received, 0.0% packet loss
round-trip min/avg/max/std-dev = 9.000/11.400/17.000/2.939 ms
```

Configuring a 6to4 tunnel

Restrictions and guidelines

Follow these guidelines when you configure a 6to4 tunnel:

- You do not need to configure a destination address for a 6to4 tunnel, because the destination IPv4 address is embedded in the 6to4 IPv6 address.
- Do not specify the same tunnel source addresses for tunnels of the same tunnel mode.
- Automatic tunnels do not support dynamic routing. You must configure a static route destined for the destination IPv6 network if the destination IPv6 network is not in the same subnet as the IPv6 address of the tunnel interface. You can specify the local tunnel interface as the egress interface of the route or specify the IPv6 address of the peer tunnel interface as the next hop of the route. For more information about route configuration, see *Layer 3—IP Routing Configuration Guide*.

Procedure

1. Enter system view.

   system-view

2. Enter 6to4 tunnel interface view.

   interface tunnel *number* [**mode ipv6-ipv4 6to4**]

3. Specify an IPv6 address for the tunnel interface.

   See "Configuring basic IPv6 settings."

4. Configure a source address or source interface for the tunnel.

   source { *ipv4-address* | *interface-type interface-number* }

   By default, no source address or source interface is configured for a tunnel.

   If you specify a source address, it is used as the source IP address of tunneled packets.

   If you specify a source interface, the primary IP address of this interface is used as the source IP address of tunneled packets.

5. (Optional.) Set the DF bit for tunneled packets.

```
tunnel dfbit enable
```

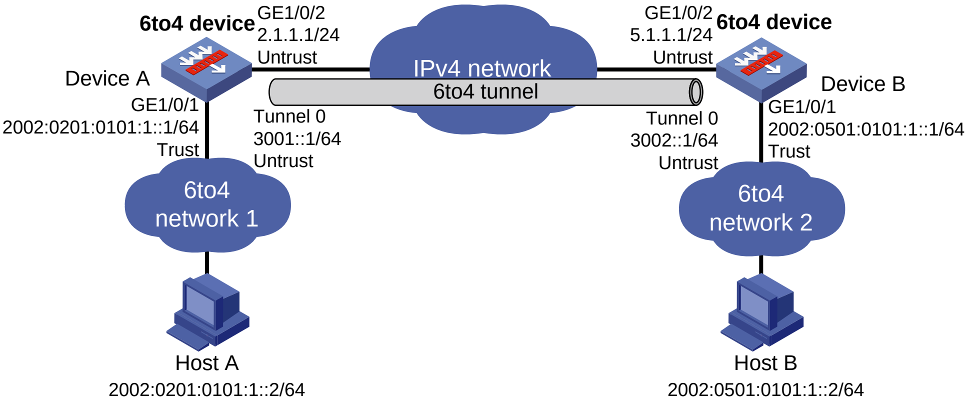
By default, the DF bit is not set for tunneled packets.

Example: Configuring a 6to4 tunnel

Network configuration

As shown in Figure 8, configure a 6to4 tunnel between 6to4 devices Device A and Device B so the two hosts can reach each other over the IPv4 network.

Figure 8 Network diagram



Analysis

To enable communication between 6to4 networks, configure 6to4 addresses for 6to4 devices and hosts in the 6to4 networks.

- The IPv4 address of GigabitEthernet 1/0/2 on Device A is 2.1.1.1/24, and the corresponding 6to4 prefix is 2002:0201:0101::/48. Host A must use this prefix.
- The IPv4 address of GigabitEthernet 1/0/2 on Device B is 5.1.1.1/24, and the corresponding 6to4 prefix is 2002:0501:0101::/48. Host B must use this prefix.

Procedure

1. Configure Device A:

   # Assign IP addresses to interfaces GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2.

```
<DeviceA> system-view
[DeviceA] interface gigabitethernet 1/0/1
[DeviceA-GigabitEthernet1/0/1] ipv6 address 2002:0201:0101:1::1/64
[DeviceA-GigabitEthernet1/0/1] quit
[DeviceA] interface gigabitethernet 1/0/2
[DeviceA-GigabitEthernet1/0/2] ip address 2.1.1.1 255.255.255.0
[DeviceA-GigabitEthernet1/0/2] quit
```

   # Create 6to4 tunnel interface **Tunnel 0**.

```
[DeviceA] interface tunnel 0 mode ipv6-ipv4 6to4
[DeviceA-Tunnel0] ipv6 address 3001::1/64
[DeviceA-Tunnel0] source gigabitethernet 1/0/2
[DeviceA-Tunnel0] quit
```

   # Configure settings for routing. This example configures static routes. In the routes, the output interface is Tunnel 0 and the next hop is 2.1.1.2.

```
[DeviceA] ip route-static 5.1.1.1 24 2.1.1.2
[DeviceA] ipv6 route-static 2002:0501:: 32 tunnel 0
```

# Add interfaces to security zones.

```
[DeviceA] security-zone name Untrust
[DeviceA-security-zone-Untrust] import interface Tunnel 0
[DeviceA-security-zone-Untrust] import interface gigabitethernet 1/0/2
[DeviceA-security-zone-Untrust] quit
[DeviceA] security-zone name Trust
[DeviceA-security-zone-Trust] import interface gigabitethernet 1/0/1
[DeviceA-security-zone-Trust] quit
```

# Configure a rule named **tunnellocalout** in the IPv4 security policy to allow Device A to send packets to Device B.

```
[DeviceA] security-policy ip
[DeviceA-security-policy-ip] rule name tunnellocalout
[DeviceA-security-policy-ip-1-tunnellocalout] source-zone local
[DeviceA-security-policy-ip-1-tunnellocalout] destination-zone untrust
[DeviceA-security-policy-ip-1-tunnellocalout] source-ip-host 2.1.1.1
[DeviceA-security-policy-ip-1-tunnellocalout] destination-ip-host 5.1.1.1
[DeviceA-security-policy-ip-1-tunnellocalout] action pass
[DeviceA-security-policy-ip-1-tunnellocalout] quit
[DeviceA-security-policy-ip] quit
```

# Configure a rule named **trust-untrust** in the IPv6 security policy to permit the packets from Host A to Host B.

```
[DeviceA] security-policy ipv6
[DeviceA-security-policy-ipv6] rule name trust-untrust
[DeviceA-security-policy-ipv6-1-trust-untrust] source-zone trust
[DeviceA-security-policy-ipv6-1-trust-untrust] destination-zone untrust
[DeviceA-security-policy-ipv6-1-trust-untrust] source-ip-subnet 2002:0201:: 32
[DeviceA-security-policy-ipv6-1-trust-untrust] destination-ip-subnet 2002:0501::
32
[DeviceA-security-policy-ipv6-1-trust-untrust] action pass
[DeviceA-security-policy-ipv6-1-trust-untrust] quit
[DeviceA-security-policy-ipv6] quit
```

# Configure a rule named **tunnellocalin** in the IPv4 security policy to allow Device A to receive the packets sent from Device B.

```
[DeviceA] security-policy ip
[DeviceA-security-policy-ip] rule name tunnellocalin
[DeviceA-security-policy-ip-2-tunnellocalin] source-zone untrust

```

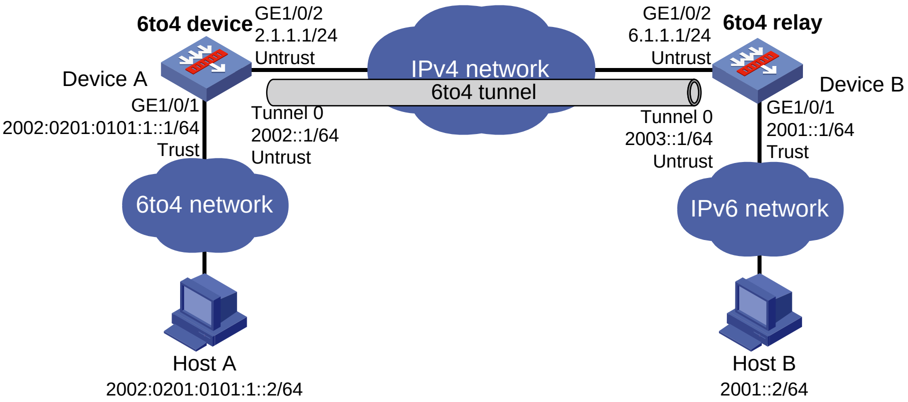
Example: Configuring 6to4 relay

Network configuration

As shown in Figure 9, Device A is a 6to4 device, and 6to4 addresses are used on the connected IPv6 network. Device B acts as a 6to4 relay device and is connected to an IPv6 network (2001::/16). Configure a 6to4 tunnel between Device A and Device B to make Host A and Host B reachable to each other.

The configuration on a 6to4 relay device is similar to that on a 6to4 device. However, to enable communication between the 6to4 network and the IPv6 network, you must configure a route to the IPv6 network on the 6to4 device. The IPv4 address of GigabitEthernet 1/0/2 on the relay device is 6.1.1.1/24 and its corresponding 6to4 prefix is 2002:0601:0101::/48. The next hop of the static route must be an address using this prefix.

Figure 9 Network diagram



Procedure

1. Configure Device A:

# Assign IP addresses to interfaces GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2.

```
<DeviceA> system-view
[DeviceA] interface gigabitethernet 1/0/1
[DeviceA-GigabitEthernet1/0/1] ipv6 address 2002:0201:0101:1::1/64
[DeviceA-GigabitEthernet1/0/1] quit
[DeviceA] interface gigabitethernet 1/0/2
[DeviceA-GigabitEthernet1/0/2] ip address 2.1.1.1 255.255.255.0
[DeviceA-GigabitEthernet1/0/2] quit
```

# Create 6to4 tunnel interface **Tunnel 0**.

```
[DeviceA] interface tunnel 0 mode ipv6-ipv4 6to4
[DeviceA-Tunnel0] ipv6 address 2002::1/64
[DeviceA-Tunnel0] source gigabitethernet 1/0/2
[DeviceA-Tunnel0] quit
```

# Configure settings for routing. This example configures static routes. The route with a destination prefix of **::/0**. is a default route, and the next hop is the 6to4 address of the relay device. In the other routes, the output interface is Tunnel 0 and the next hop is 2.1.1.2.

```
[DeviceA] ip route-static 6.1.1.1 24 2.1.1.2
[DeviceA] ipv6 route-static 2002:0601:0101:: 64 tunnel 0
[DeviceA] ipv6 route-static :: 0 2002:0601:0101::1
```

# Add interfaces to security zones.

```

Pinging 2001::2
from 2002:201:101:1::2 with 32 bytes of data:

Reply from 2001::2: bytes=32 time=13ms
Reply from 2001::2: bytes=32 time=1ms
Reply from 2001::2: bytes=32 time=1ms
Reply from 2001::2: bytes=32 time<1ms

Ping statistics for 2001::2:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
Approximate round trip times in milli-seconds:
    Minimum = 0ms, Maximum = 13ms, Average = 3ms
```

Configuring an ISATAP tunnel

Restrictions and guidelines

Follow these guidelines when you configure an ISATAP tunnel:

- You do not need to configure a destination address for an ISATAP tunnel, because the destination IPv4 address is embedded in the ISATAP address.
- Do not specify the same tunnel source addresses for tunnels of the same tunnel mode.
- Because automatic tunnels do not support dynamic routing, configure a static route destined for the destination IPv6 network at each tunnel end. You can specify the local tunnel interface as the egress interface of the route or specify the IPv6 address of the peer tunnel interface as the next hop of the route. For more information about route configuration, see *Layer 3—IP Routing Configuration Guide*.

Procedure

1. Enter system view.

   system-view

2. Enter ISATAP tunnel interface view.

   interface tunnel *number* [**mode ipv6-ipv4 isatap**]

3. Specify an IPv6 address for the tunnel interface.

   See "Configuring basic IPv6 settings."

4. Configure a source address or source interface for the tunnel.

   source { *ipv4-address* | *interface-type interface-number* }

   By default, no source address or source interface is configured for a tunnel.

   If you specify a source address, it is used as the source IP address of tunneled packets.

   If you specify a source interface, the primary IP address of this interface is used as the source IP address of tunneled packets.

5. (Optional.) Set the DF bit for tunneled packets.

   tunnel dfbit enable

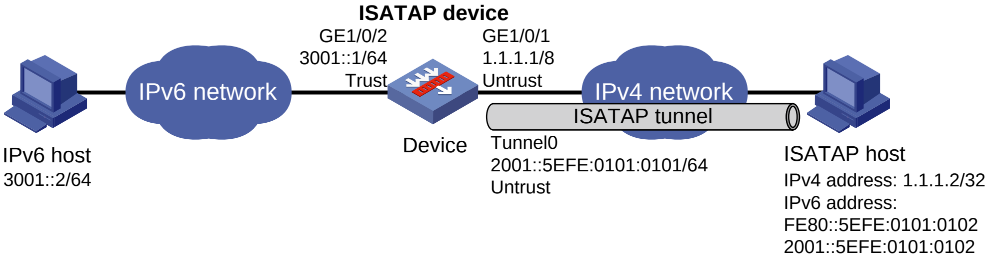
   By default, the DF bit is not set for tunneled packets.

Example: Configuring an ISATAP tunnel

Network configuration

As shown in Figure 10, configure an ISATAP tunnel between the device and the ISATAP host so the ISATAP host in the IPv4 network can access the IPv6 network.

Figure 10 Network diagram



Procedure

1. Configure the device:

   # Assign IP addresses to interfaces GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2.

   ```
   <Device> system-view
   [Device] interface gigabitethernet 1/0/1
   [Device-GigabitEthernet1/0/1] ip address 1.1.1.1 8
   [Device-GigabitEthernet1/0/1] quit
   [Device] interface gigabitethernet 1/0/2
   [Device-GigabitEthernet1/0/2] ipv6 address 3001::1/64
   [Device-GigabitEthernet1/0/2] quit
   ```

   # Create ISATAP tunnel interface **Tunnel 0**.

   ```
   [Device] interface tunnel 0 mode ipv6-ipv4 isatap
   [Device-Tunnel0] ipv6 address 2001:: 64 eui-64
   [Device-Tunnel0] source gigabitethernet 1/0/1
   [Device-Tunnel0] undo ipv6 nd ra halt
   [Device-Tunnel0] quit
   ```

   # Add interfaces to security zones.

   ```
   [Device] security-zone name Untrust
   [Device-security-zone-Untrust] import interface Tunnel 0
   [Device-security-zone-Untrust] import interface gigabitethernet 1/0/1
   [Device-security-zone-Untrust] quit
   [Device] security-zone name Trust
   [Device-security-zone-Trust] import interface gigabitethernet 1/0/2
   [Device-security-zone-Trust] quit
   ```

   # Configure a rule named **tunnellocalout** in the IPv4 security policy to allow the device to send packets to the ISATAP host.

   ```
   [Device] security-policy ip
   [Device-security-policy-ip] rule name tunnellocalout
   [Device-security-policy-ip-1-tunnellocalout] source-zone local
   [Device-security-policy-ip-1-tunnellocalout] destination-zone untrust
   [Device-security-policy-ip-1-tunnellocalout] source-ip-host 1.1.1.1
   [Device-security-policy-ip-1-tunnellocalout] destination-ip-host 1.1.1.2
   [Device-security-policy-ip-1-tunnellocalout] action pass
   [Device-security-policy-ip-1-tunnellocalout] quit
   [Device-security-policy-ip] quit
   ```

   # Configure a rule named **trust-untrust** in the IPv6 security policy to permit the packets from the IPv6 host to the ISATAP host.

   ```
   [Device] security-policy ipv6
   [Device-security-policy-ipv6] rule name trust-untrust
   [Device-security-policy-ipv6-1-trust-untrust] source-zone trust
   [Device-security-policy-ipv6-1-trust-untrust] destination-zone untrust
   [Device-security-policy-ipv6-1-trust-untrust] source-ip-subnet 3001:: 64
   [Device-security-policy-ipv6-1-trust-untrust] destination-ip-subnet 2001:: 64
   [Device-security-policy-ipv6-1-trust-untrust] action pass
   [Device-security-policy-ipv6-1-trust-untrust] quit
   [Device-security-policy-ipv6] quit
   ```

   # Configure a rule named **tunnellocalin** in the IPv4 security policy to allow the device to receive the packets sent from the ISATAP host.

```
[Device] security-policy ip
[Device-security-policy-ip] rule name tunnellocalin
[Device-security-policy-ip-2-tunnellocalin] source-zone untrust
[Device-security-policy-ip-2-tunnellocalin] destination-zone local
[Device-security-policy-ip-2-tunnellocalin] source-ip-host 1.1.1.2
[Device-security-policy-ip-2-tunnellocalin] destination-ip-host 1.1.1.1
[Device-security-policy-ip-2-tunnellocalin] action pass
[Device-security-policy-ip-2-tunnellocalin] quit
[Device-security-policy-ip] quit
```

# Configure a rule named **untrust-trust** in the IPv6 security policy to permit the packets from the ISATAP host to the IPv6 host.

```
[Device] security-policy ipv6
[Device-security-policy-ipv6] rule name untrust-trust
[Device-security-policy-ipv6-2-untrust-trust] source-zone untrust
[Device-security-policy-ipv6-2-untrust-trust] destination-zone trust
[Device-security-policy-ipv6-2-untrust-trust] source-ip-subnet 2001:: 64
[Device-security-policy-ipv6-2-untrust-trust] destination-ip-subnet 3001:: 64
[Device-security-policy-ipv6-2-untrust-trust] action pass
[Device-security-policy-ipv6-2-untrust-trust] quit
[Device-security-policy-ipv6] quit
```

2. Configure the ISATAP host:

   Settings on the ISATAP host vary by operating system. The following configuration is performed on Windows XP.

   # Install IPv6.

```
C:\>ipv6 install
```

   # On a host running Windows XP, the ISATAP interface is typically interface 2. Display information about the ISATAP interface.

```
C:\>ipv6 if 2
Interface 2: Automatic Tunneling Pseudo-Interface

    uses Router Discovery
    routing preference 1
    EUI-64 embedded IPv4 address: 1.1.1.2
    router link-layer address: 1.1.1.1
    preferred global 2001::5efe:1.1.1.2, life 29d23h59m46s/6d23h59m46s (public)
    preferred link-local fe80::5efe:1.1.1.2, life infinite
    link MTU 1500 (true link MTU 65515)
    current hop limit 255
    reachable time 42500ms (base 30000ms)
    retransmission interval 1000ms
    DAD transmits 0
    default site prefix length 48
```

The host has obtained the prefix 2001::/64 and has automatically generated the global unicast address 2001::5efe:1.1.1.2. The message "uses Router Discovery" indicates that the router discovery feature is enabled on the host.

# Display information about IPv6 routes on the host.

```
C:\>ipv6 rt
2001::/64 -> 2 pref 1if+8=9 life 29d23h59m43s (autoconf)
::/0 -> 2/fe80::5efe:1.1.1.1 pref 1if+256=257 life 29m43s (autoconf)
```

3. On the IPv6 host, configure a route to the ISATAP device.

```
C:\>netsh interface ipv6 set route 2001::/64 5 3001::1
```

Verifying the configuration

# Verify that the ISATAP host can ping the IPv6 host.

```
C:\>ping 3001::2

Pinging 3001::2 with 32 bytes of data:

Reply from 3001::2: time=1ms
Reply from 3001::2: time=1ms
Reply from 3001::2: time=1ms
Reply from 3001::2: time=1ms

Ping statistics for 3001::2:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
Approximate round trip times in milli-seconds:
    Minimum = 1ms, Maximum = 1ms, Average = 1ms
```

Configuring a 6RD tunnel

Hardware compatibility with 6RD tunneling

Models	6RD tunneling compatibility
NFNX5-HD6480, NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB1780, NFNX3-HDB3080, NFNX3-HDB1180, NFNX3-HDB1480	No

NFNX3-HDB680, NFNX3-HDB1080	Yes

Restrictions and guidelines

Follow these guidelines when you configure a 6RD tunnel:

- You do not need to configure a destination address for a 6RD tunnel. The device automatically identifies the destination IPv4 address according to the IPv4 address embedded in the 6RD address, the 6RD prefix, and the IPv4 prefix and suffix.
- Do not specify the same tunnel source addresses for tunnels of the same tunnel mode.
- Automatic tunnels do not support dynamic routing. You must configure a static route destined for the destination IPv6 network if the destination IPv6 network is not in the same subnet as the IPv6 address of the tunnel interface. You can specify the local tunnel interface as the egress interface of the route or specify the IPv6 address of the peer tunnel interface as the next hop of the route. For more information about route configuration, see *Layer 3—IP Routing Configuration Guide*.

Procedure

1. Enter system view.

   ```
   system-view
   ```

2. Enter 6RD tunnel interface view.

   ```
   interface tunnel number mode ipv6-ipv4 6rd
   ```

3. Specify an IPv6 address for the tunnel interface.

   See "Configuring basic IPv6 settings."

4. Configure a source address or source interface for the tunnel.

   ```
   source { ipv4-address | interface-type interface-number }
   ```

   By default, no source address or source interface is configured for a tunnel.

   If you specify a source address, it is used as the source IP address of tunneled packets.

   If you specify a source interface, the primary IP address of this interface is used as the source IP address of tunneled packets.

5. Configure the 6RD prefix for the tunnel.

   ```
   tunnel 6rd prefix ipv6-prefix/prefix-length
   ```

   By default, no 6RD prefix is configured for the tunnel.

6. (Optional.) Specify a prefix length and suffix length for the tunnel source address.

   ```
   tunnel 6rd ipv4 { prefix-length length | suffix-length length } *
   ```

   By default, all 32 bits of the IPv4 tunnel source address are used to create the 6RD delegated prefix.

7. (Optional.) Specify a BR address for the tunnel.

   ```
   tunnel 6rd br ipv4-address
   ```

   By default, no BR address is specified for a 6RD tunnel.

8. (Optional.) Set the DF bit for tunneled packets.

   ```
   tunnel dfbit enable
   ```

   By default, the DF bit is not set for tunneled packets.

Display and maintenance commands for 6RD tunneling

Execute **display** commands in any view.

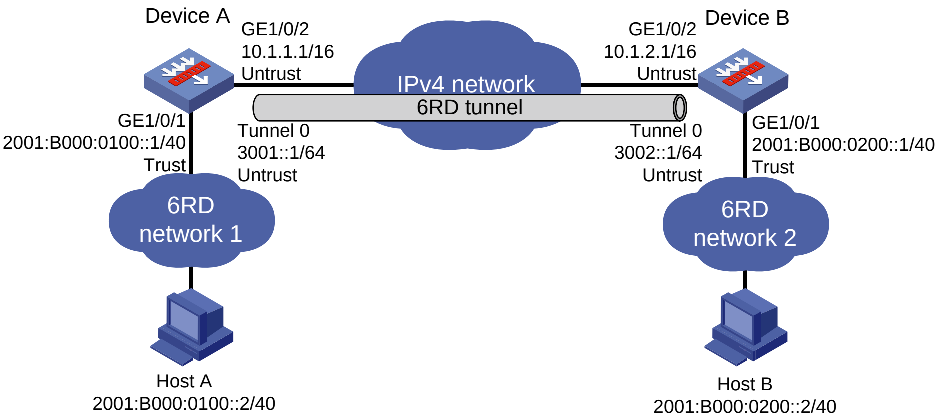
Task	Command
Display information about 6RD tunnel interfaces.	**display 6rd** [**interface tunnel** *number*]
Display a 6RD tunnel destination address.	**display 6rd destination prefix** *ipv6-prefix* **interface tunnel** *number*
Display a 6RD delegated prefix.	**display 6rd prefix destination** *ipv4-address* **interface tunnel** *number*

Example: Configuring a 6RD tunnel

Network configuration

As shown in Figure 11, Host A and Host B are in different 6RD networks. Configure a 6RD tunnel between Device A and Device B so Host A and Host B can reach each other over the IPv4 network.

Figure 11 Network diagram



Requirements analysis

To enable communication between 6RD networks, you must perform the following tasks in addition to the 6RD tunnel configuration:

- On Device A and Device B, configure the 6RD prefix as 2001:B000::/32, the IPv4 prefix length as 16, and the IPv4 suffix length as 8.
- Configure 6RD addresses for Device A, Device B, and the hosts.
    - On Device A, the tunnel source IPv4 address is 10.1.1.1/16, the IPv4 address of GigabitEthernet 1/0/2. Calculated based on this IPv4 address, the 6RD prefix, and the IPv4 prefix and suffix lengths, the 6RD delegated prefix for 6RD network 1 is 2001:B000:100::/40. The 6RD addresses of Device A and Host A must use this prefix.
    - On Device B, the tunnel source IPv4 address is 10.1.2.1/16, the IPv4 address of GigabitEthernet 1/0/2. Calculated based on this IPv4 address, the 6RD prefix, and the IPv4 prefix and suffix lengths, the 6RD delegated prefix for 6RD network 2 is 2001:B000:200::/40. The 6RD addresses of Device B and Host B must use this prefix.

Procedure

Make sure Device A and Device B can reach each other through IPv4.

1. Configure Device A:

# Assign an IPv4 address to interface GigabitEthernet 1/0/2.

```
<DeviceA> system-view
[DeviceA] interface gigabitethernet 1/0/2
[DeviceA-GigabitEthernet1/0/2] ip address 10.1.1.1 16
[DeviceA-GigabitEthernet1/0/2] quit
```

# Assign a 6RD address to interface GigabitEthernet 1/0/1.

```
[DeviceA] interface gigabitethernet 1/0/1
[DeviceA-GigabitEthernet1/0/1] ipv6 address 2001:b000:0100::1/40
[DeviceA-GigabitEthernet1/0/1] quit
```

# Create 6RD tunnel interface **Tunnel 0**.

```
[DeviceA] interface tunnel 0 mode ipv6-ipv4 6rd
```

# Assign an IPv6 address to the tunnel interface.

```
[DeviceA-Tunnel0] ipv6 address 3001::1/64
```

# Specify GigabitEthernet 1/0/2 as the source interface of the tunnel.

```
[DeviceA-Tunnel0] source gigabitethernet 1/0/2
```

# Configure the 6RD prefix of the tunnel.

```
[DeviceA-Tunnel0] tunnel 6rd prefix 2001:b000::/32
```

# Specify a prefix length and a suffix length for the tunnel.

```
[DeviceA-Tunnel0] tunnel 6rd ipv4 prefix-len 16 suffix-len 8
[DeviceA-Tunnel0] quit
```

# Configure a static route destined for 2001:B000::/32 through the tunnel.

```
[DeviceA] ipv6 route-static 2001:b000:: 32 tunnel 0
```

# Add interfaces to security zones.

```
[DeviceA] security-zone name Untrust
[DeviceA-security-zone-Untrust] import interface Tunnel 0
[DeviceA-security-zone-Untrust] import interface gigabitethernet 1/0/2
[DeviceA-security-zone-Untrust] quit
[DeviceA] security-zone name Trust
[DeviceA-security-zone-Trust] import interface gigabitethernet 1/0/1
[DeviceA-security-zone-Trust] quit
```

# Configure a rule named **tunnellocalout** in the IPv4 security policy to allow Device A to send packets to Device B.

```
[DeviceA] security-policy ip
[DeviceA-security-policy-ip] rule name tunnellocalout

```

Verifying the configuration

# Verify that Host A and Host B can ping each other.

```
D:\>ping6 -s 2001:b000:0100::2 2001:b000:0200::2

Pinging 2001:B000:0200::2
from 2001:B000:0100::2 with 32 bytes of data:

Reply from 2001:B000:0200::2: bytes=32 time=13ms
Reply from 2001:B000:0200::2: bytes=32 time=1ms
Reply from 2001:B000:0200::2: bytes=32 time=1ms
Reply from 2001:B000:0200::2: bytes=32 time<1ms

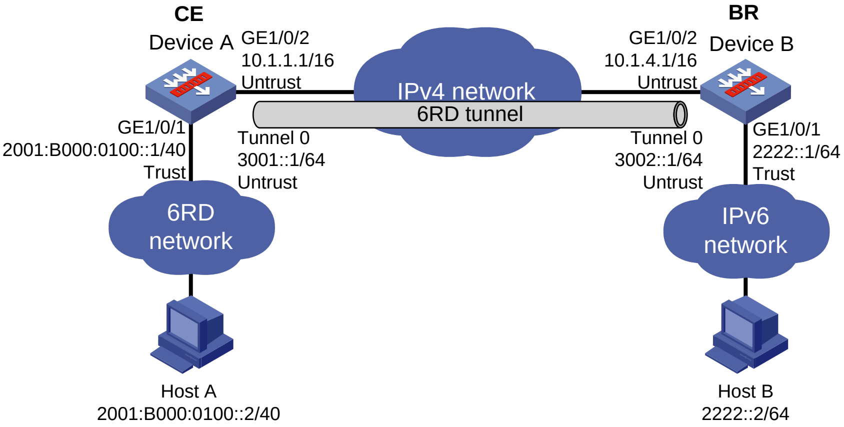
Ping statistics for 2001:B000:0200::2:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
Approximate round trip times in milli-seconds:
    Minimum = 0ms, Maximum = 13ms, Average = 3ms
```

Example: Configuring 6RD relay

Network configuration

As shown in Figure 12, Host A is in a 6RD network connected to Device A (a 6RD CE). Host B is in a common IPv6 network connected to Device B (a 6RD BR router). Configure a 6RD tunnel between Device A and Device B to make Host A and Host B reachable to each other.

Figure 12 Network diagram



Requirements analysis

To enable communication between the 6RD network and the IPv6 network, you must perform the following tasks in addition to the 6RD tunnel configuration:

- On Device A and Device B, configure the 6RD prefix as 2001:B000::/32, the IPv4 prefix length as 16, and the IPv4 suffix length as 8.
- Configure 6RD addresses for Device A and Host A in the 6RD network.

  On Device A, the tunnel source IPv4 address is 10.1.1.1/16, the IPv4 address of GigabitEthernet 1/0/2. Calculated based on this IPv4 address, the 6RD prefix, and the IPv4 prefix and suffix lengths, the 6RD delegated prefix for the 6RD network is 2001:B000:100::/40. The 6RD addresses of Device A and Host A must use this prefix.
- On Device A, you must configure a static route to the IPv6 network. The next hop address of the route is a 6RD address of Device B.

  On Device B, the tunnel source IPv4 address is 10.1.4.1/16, the IPv4 address of GigabitEthernet 1/0/2. Calculated based on this IPv4 address, the 6RD prefix, and the IPv4 prefix and suffix lengths, the 6RD delegated prefix is 2001:B000:0400::/40. The next hop address of the static route can be any address using this prefix.

Procedure

Make sure Device A and Device B can reach each other through IPv4.

1. Configure Device A:

   # Assign an IPv4 address to interface GigabitEthernet 1/0/2.

   ```
   <DeviceA> system-view
   [DeviceA] interface gigabitethernet 1/0/2
   [DeviceA-GigabitEthernet1/0/2] ip address 10.1.1.1 16
   [DeviceA-GigabitEthernet1/0/2] quit
   ```

   # Assign a 6RD address to interface GigabitEthernet 1/0/1.

   ```
   [DeviceA] interface gigabitethernet 1/0/1
   [DeviceA-GigabitEthernet1/0/1] ipv6 address 2001:b000:0100::1/40
   [DeviceA-GigabitEthernet1/0/1] quit
   ```

   # Create 6RD tunnel interface **Tunnel 0**.

   ```
   [DeviceA] interface tunnel 0 mode ipv6-ipv4 6rd
   ```

   # Assign an IPv6 address to the tunnel interface.

   ```
   [DeviceA-Tunnel0] ipv6 address 3001::1/64
   ```

   # Specify GigabitEthernet 1/0/2 as the source interface of the tunnel.

   ```
   [DeviceA-Tunnel0] source gigabitethernet 1/0/2
   ```

# Configure the 6RD prefix of the tunnel.

```
[DeviceA-Tunnel0] tunnel 6rd prefix 2001:b000::/32
```

# Specify a prefix length and a suffix length for the tunnel.

```
[DeviceA-Tunnel0] tunnel 6rd ipv4 prefix-len 16 suffix-len 8
```

# Specify the BR address on the tunnel interface.

```
[DeviceA-Tunnel0] tunnel 6rd br 10.1.4.1
[DeviceA-Tunnel0] quit
```

# Configure a default route to reach the IPv6 network, which specifies the next hop as the 6RD address of Device B.

```

D:\>ping6 -s 2001:b000:0100::2 2222::2

Pinging 2222::2
from 2001:B000:0100::2 with 32 bytes of data:

Reply from 2222::2: bytes=32 time=13ms
Reply from 2222::2: bytes=32 time=1ms
Reply from 2222::2: bytes=32 time=1ms
Reply from 2222::2: bytes=32 time<1ms

Ping statistics for 2222::2:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
Approximate round trip times in milli-seconds:
    Minimum = 0ms, Maximum = 13ms, Average = 3ms
```

Enabling dropping IPv6 packets that use IPv4-compatible IPv6 addresses

Restrictions and guidelines

Automatic IPv4-compatible IPv6 tunnels do not support this feature.

Procedure

1. Enter system view.
   `system-view`
2. Enable dropping IPv6 packets that use IPv4-compatible IPv6 addresses.
   `tunnel discard ipv4-compatible-packet`
   By default, IPv6 packets that use IPv4-compatible IPv6 addresses are not dropped.

IPv4 over IPv4 tunneling

About IPv4 over IPv4 tunneling

IPv4 over IPv4 tunneling (RFC 1853) enables isolated IPv4 networks to communicate. For example, an IPv4 over IPv4 tunnel can connect isolated private IPv4 networks over a public IPv4 network.

Figure 13 IPv4 over IPv4 tunnel

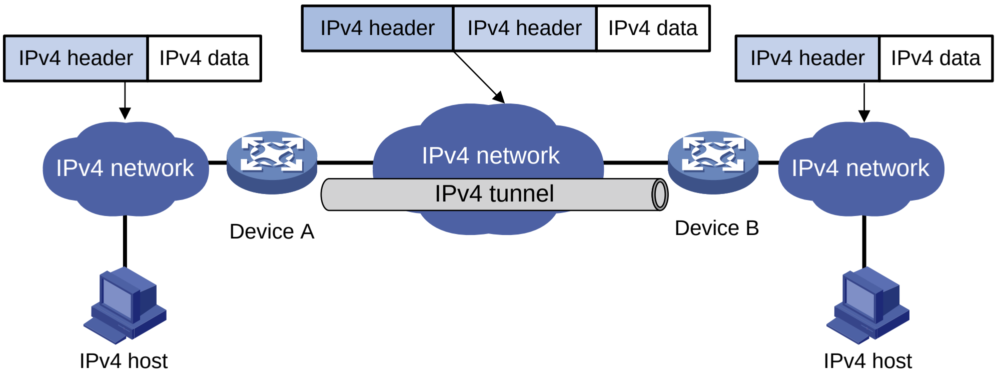

Figure 13 shows the encapsulation and de-encapsulation processes.

- Encapsulation:
  - **a.** Device A receives an IP packet from an IPv4 host and submits it to the IP protocol stack.
  - **b.** The IPv4 protocol stack determines how to forward the packet according to the destination address in the IP header. If the packet is destined for the IPv4 host connected to Device B, Device A delivers the packet to the tunnel interface.
  - **c.** The tunnel interface adds a new IPv4 header to the IPv4 packet and submits it to the IP protocol stack.

    In the new header, the source IP address specifies the tunnel source, and the destination IP address specifies the tunnel destination.
  - **d.** The IP protocol stack uses the destination IP address of the new IP header to look up the routing table, and then sends the packet out.
- De-encapsulation:
  - **a.** After receiving the packet, Device B delivers it to the IP protocol stack.
  - **b.** If the protocol number is 4 (indicating an IPv4 packet is encapsulated within the packet), the IP protocol stack delivers the packet to the tunnel module for de-encapsulation.
  - **c.** The tunnel module de-encapsulates the IP packet and sends it back to the IP protocol stack.
  - **d.** The protocol stack forwards the de-encapsulated packet.

Restrictions and guidelines: IPv4 over IPv4 tunnel configuration

Follow these guidelines when you configure an IPv4 over IPv4 tunnel:

- The tunnel destination address specified on the local device must be identical with the tunnel source address specified on the tunnel peer device.

- Do not specify the same tunnel source and destination addresses for tunnels of the same tunnel mode.
- The IPv4 address of the local tunnel interface cannot be on the same subnet as the destination address configured on the tunnel interface.
- To ensure correct packet forwarding, identify whether the destination IPv4 network and the IPv4 address of the local tunnel interface are on the same subnet. If they are not, configure a route reaching the destination IPv4 network through the tunnel interface. You can configure the route by using one of the following methods:
  - Configure a static route, and specify the local tunnel interface as the egress interface or specify the IPv4 address of the peer tunnel interface as the next hop.
  - Enable a dynamic routing protocol on both the local and remote tunnel interfaces.

  For more information about route configuration, see *Layer 3—IP Routing Configuration Guide*.
- The destination address of the route passing the tunnel interface cannot be on the same subnet as the destination address configured on the tunnel interface.

Configuring an IPv4 over IPv4 tunnel

1. Enter system view.

   system-view
2. Enter IPv4 over IPv4 tunnel interface view.

   interface tunnel *number* [**mode ipv4-ipv4**]
3. Configure an IPv4 address for the tunnel interface.

   ip address *ip-address* { *mask* | *mask-length* } [**sub**]
4. Configure a source address or source interface for the tunnel.

   source { *ipv4-address* | *interface-type interface-number* }

   By default, no source address or source interface is configured for a tunnel.

   If you specify a source address, it is used as the source IP address of tunneled packets.

   If you specify a source interface, the primary IP address of this interface is used as the source IP address of tunneled packets.
5. Configure a destination address for the tunnel.

   destination *ipv4-address*

   By default, no destination address is configured for a tunnel.

   The tunnel destination address must be the IP address of the receiving interface on the tunnel peer. It is used as the destination IP address of tunneled packets.
6. (Optional.) Set the DF bit for tunneled packets.

   tunnel dfbit enable

   By default, the DF bit is not set for tunneled packets.

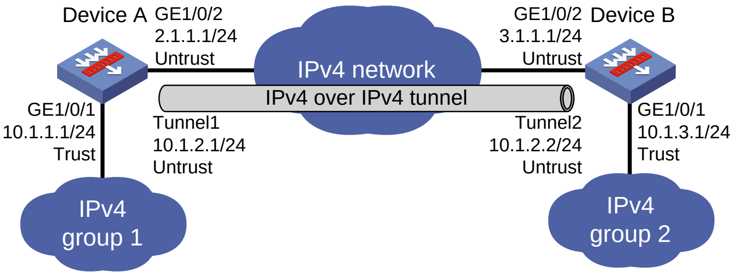
IPv4 over IPv4 tunnel configuration examples

Example: Configuring an IPv4 over IPv4 tunnel

Network configuration

As shown in Figure 14, the two subnets IPv4 group 1 and IPv4 group 2 use private IPv4 addresses. Configure an IPv4 over IPv4 tunnel between Device A and Device B to make the two subnets reachable to each other.

Figure 14 Network diagram



Procedure

1. Configure Device A:

# Assign an IP addresse to interface GigabitEthernet 1/0/1.

```
<DeviceA> system-view
[DeviceA] interface gigabitethernet 1/0/1
[DeviceA-GigabitEthernet1/0/1] ip address 10.1.1.1 24
[DeviceA-GigabitEthernet1/0/1] quit
```

# Assign IP addresses to other interfaces in the same way. (Details not shown.)

# Create IPv4 over IPv4 tunnel interface **Tunnel 1**.

```
[DeviceA] interface tunnel 1 mode ipv4-ipv4
[DeviceA-Tunnel1] ip address 10.1.2.1 255.255.255.0
[DeviceA-Tunnel1] source 2.1.1.1
[DeviceA-Tunnel1] destination 3.1.1.1
[DeviceA-Tunnel1] quit
```

# Configure settings for routing. This example configures static routes. In the routes, the output interface is Tunnel 1 and the next hop is 2.1.1.2.

```
[DeviceA] ip route-static 3.1.1.1 24 2.1.1.2
[DeviceA] ip route-static 10.1.3.0 24 tunnel 1
```

# Add interfaces to security zones.

```
[DeviceA] security-zone name Untrust
[DeviceA-security-zone-Untrust] import interface tunnel 1
[DeviceA-security-zone-Untrust] import interface gigabitethernet 1/0/2
[DeviceA-security-zone-Untrust] quit
[DeviceA] security-zone name Trust
[DeviceA-security-zone-Trust] import interface gigabitethernet 1/0/1
[DeviceA-security-zone-Trust] quit
```

# Configure a rule named **tunnellocalout** in the IPv4 security policy to allow Device A to send packets to Device B.

```
[DeviceA] security-policy ip
[DeviceA-security-policy-ip] rule name tunnellocalout
[DeviceA-security-policy-ip-1-tunnellocalout] source-zone local
[DeviceA-security-policy-ip-1-tunnellocalout] destination-zone untrust
[DeviceA-security-policy-ip-1-tunnellocalout] source-ip-host 2.1.1.1
[DeviceA-security-policy-ip-1-tunnellocalout] destination-ip-host 3.1.1.1
[DeviceA-security-policy-ip-1-tunnellocalout] action pass
[DeviceA-security-policy-ip-1-tunnellocalout] quit
```

# Configure a rule named **trust-untrust** in the IPv4 security policy to permit the packets from IPv4 group 1 to IPv4 group 2.

```
[DeviceA-security-policy-ip] rule name trust-untrust
[DeviceA-security-policy-ip-2-trust-untrust] source-zone trust
[DeviceA-security-policy-ip-2-trust-untrust] destination-zone untrust
[DeviceA-security-policy-ip-2-trust-untrust] source-ip-subnet 10.1.1.0 24
[DeviceA-security-policy-ip-2-trust-untrust] destination-ip-subnet 10.1.3.0 24
[DeviceA-security-policy-ip-2-trust-untrust] action pass
[DeviceA-security-policy-ip-2-trust-untrust] quit
```

# Configure a rule named **tunnellocalin** in the IPv4 security policy to allow Device A to receive the packets sent from Device B.

```
[DeviceA-security-policy-ip] rule name tunnellocalin
[DeviceA-security-policy-ip-3-tunnellocalin] source-zone untrust
[DeviceA-security-policy-ip-3-tunnellocalin] destination-zone local
[DeviceA-security-policy-ip-3-tunnellocalin] source-ip-host 3.1.1.1
[DeviceA-security-policy-ip-3-tunnellocalin] destination-ip-host 2.1.1.1
[DeviceA-security-policy-ip-3-tunnellocalin] action pass
[DeviceA-security-policy-ip-3-tunnellocalin] quit
```

# Configure a rule named **untrust-trust** in the IPv4 security policy to permit the packets from IPv4 group 2 to IPv4 group 1.

```
[DeviceA-security-policy-ip] rule name untrust-trust
[DeviceA-security-policy-ip-4-untrust-trust] source-zone untrust
[DeviceA-security-policy-ip-4-untrust-trust] destination-zone trust
[DeviceA-security-policy-ip-4-untrust-trust] source-ip-subnet 10.1.3.0 24
[DeviceA-security-policy-ip-4-untrust-trust] destination-ip-subnet 10.1.1.0 24
[DeviceA-security-policy-ip-4-untrust-trust] action pass
[DeviceA-security-policy-ip-4-untrust-trust] quit
[DeviceA-security-policy-ip] quit
```

2. Configure Device B:

# Assign an IP address to interface GigabitEthernet 1/0/1.

```
<DeviceB> system-view
[DeviceB] interface gigabitethernet 1/0/1
[DeviceB-GigabitEthernet1/0/1] ip address 10.1.3.1 24
[DeviceB-GigabitEthernet1/0/1] quit
```

# Assign IP addresses to other interfaces in the same way. (Details not shown.)

# Create IPv4 over IPv4 tunnel interface **Tunnel 2**.

```
[DeviceB] interface tunnel 2 mode ipv4-ipv4
[DeviceB-Tunnel2] ip address 10.1.2.2 255.255.255.0
[DeviceB-Tunnel2] source 3.1.1.1
[DeviceB-Tunnel2] destination 2.1.1.1
[DeviceB-Tunnel2] quit
```

# Configure settings for routing. This example configures static routes. In the routes, the output interface is Tunnel 2 and the next hop is 3.1.1.2.

```
[DeviceB] ip route-static 2.1.1.1 24 3.1.1.2
[DeviceB] ip route-static 10.1.1.0 24 tunnel 2
```

# Add interfaces to security zones.

```
[DeviceB] security-zone name Untrust
[DeviceB-security-zone-Untrust] import interface tunnel 2
[DeviceB-security-zone-Untrust] import interface gigabitethernet 1/0/2
[DeviceB-security-zone-Untrust] quit
```

```
[DeviceB] security-zone name Trust
[DeviceB-security-zone-Trust] import interface gigabitethernet 1/0/1
[DeviceB-security-zone-Trust] quit
```

# Configure a rule named **tunnellocalout** in the IPv4 security policy to allow Device B to send packets to Device A.

```
[DeviceB] security-policy ip
[DeviceB-security-policy-ip] rule name tunnellocalout
[DeviceB-security-policy-ip-1-tunnellocalout] source-zone local
[DeviceB-security-policy-ip-1-tunnellocalout] destination-zone untrust
[DeviceB-security-policy-ip-1-tunnellocalout] source-ip-host 3.1.1.1
[DeviceB-security-policy-ip-1-tunnellocalout] destination-ip-host 2.1.1.1
[DeviceB-security-policy-ip-1-tunnellocalout] action pass
[DeviceB-security-policy-ip-1-tunnellocalout] quit
```

# Configure a rule named **trust-untrust** in the IPv4 security policy to permit the packets from IPv4 group 2 to IPv4 group 1.

```
[DeviceB-security-policy-ip] rule name trust-untrust
[DeviceB-security-policy-ip-2-trust-untrust] source-zone trust
[DeviceB-security-policy-ip-2-trust-untrust] destination-zone untrust
[DeviceB-security-policy-ip-2-trust-untrust] source-ip-subnet 10.1.3.0 24
[DeviceB-security-policy-ip-2-trust-untrust] destination-ip-subnet 10.1.1.0 24
[DeviceB-security-policy-ip-2-trust-untrust] action pass
[DeviceB-security-policy-ip-2-trust-untrust] quit
```

# Configure a rule named **tunnellocalin** in the IPv4 security policy to allow Device B to receive the packets sent from Device A.

```
[DeviceB-security-policy-ip] rule name tunnellocalin
[DeviceB-security-policy-ip-3-tunnellocalin] source-zone untrust
[DeviceB-security-policy-ip-3-tunnellocalin] destination-zone local
[DeviceB-security-policy-ip-3-tunnellocalin] source-ip-host 2.1.1.1
[DeviceB-security-policy-ip-3-tunnellocalin] destination-ip-host 3.1.1.1
[DeviceB-security-policy-ip-3-tunnellocalin] action pass
[DeviceB-security-policy-ip-3-tunnellocalin] quit
```

# Configure a rule named **tunnellocalin** in the IPv4 security policy to permit the packets from IPv4 group 1 to IPv4 group 2.

```
[DeviceB-security-policy-ip] rule name tunnellocalin
[DeviceB-security-policy-ip-4-tunnellocalin] source-zone untrust
[DeviceB-security-policy-ip-4-tunnellocalin] destination-zone local
[DeviceB-security-policy-ip-4-tunnellocalin] source-ip-subnet 10.1.1.0 24
[DeviceB-security-policy-ip-4-tunnellocalin] destination-ip-subnet 10.1.3.0 24
[DeviceB-security-policy-ip-4-tunnellocalin] action pass
[DeviceB-security-policy-ip-4-tunnellocalin] quit
[DeviceB-security-policy-ip] quit
```

Verifying the configuration

# Use the **`display interface tunnel`** command to display the status of the tunnel interfaces on Device A and Device B. Verify that the tunnel interfaces are up. (Details not shown.)

# Verify that Device A and Device B can ping the IPv4 address of the peer interface GigabitEthernet 1/0/1. This example uses Device A.

```
[DeviceA] ping -a 10.1.1.1 10.1.3.1
Ping 10.1.3.1 (10.1.3.1) from 10.1.1.1: 56 data bytes, press CTRL_C to break
```

```
56 bytes from 10.1.3.1: icmp_seq=0 ttl=255 time=2.000 ms
56 bytes from 10.1.3.1: icmp_seq=1 ttl=255 time=1.000 ms
56 bytes from 10.1.3.1: icmp_seq=2 ttl=255 time=0.000 ms
56 bytes from 10.1.3.1: icmp_seq=3 ttl=255 time=1.000 ms
56 bytes from 10.1.3.1: icmp_seq=4 ttl=255 time=1.000 ms

--- Ping statistics for 10.1.3.1 ---
5 packet(s) transmitted, 5 packet(s) received, 0.0% packet loss
round-trip min/avg/max/std-dev = 0.000/1.000/2.000/0.632 ms
```

IPv4 over IPv6 tunneling

About IPv4 over IPv6 tunneling

Implementation

IPv4 over IPv6 tunneling adds an IPv6 header to IPv4 packets so that the IPv4 packets can pass an IPv6 network through a tunnel to realize interworking between isolated IPv4 networks.

Figure 15 IPv4 over IPv6 tunnel

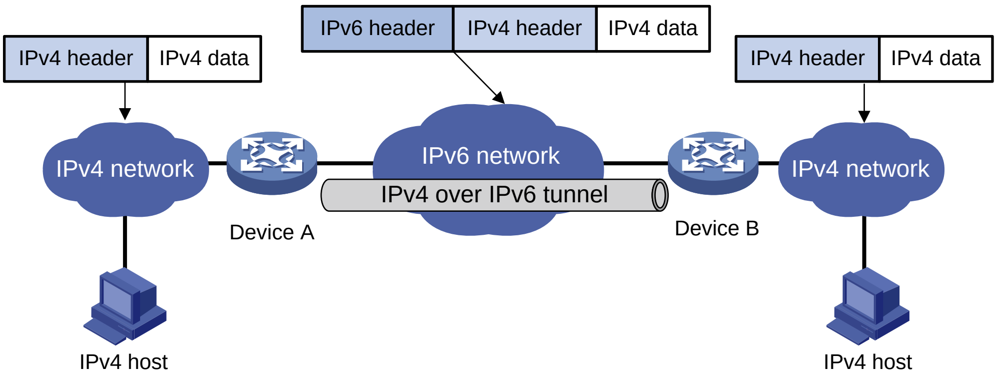


Figure 15 shows the encapsulation and de-encapsulation processes.

- Encapsulation:
  - **a.** Upon receiving an IPv4 packet, Device A delivers it to the IPv4 protocol stack.
  - **b.** The IPv4 protocol stack uses the destination address of the packet to determine the egress interface. If the egress interface is the tunnel interface, the IPv4 protocol stack delivers the packet to the tunnel interface.
  - **c.** The tunnel interface adds an IPv6 header to the original IPv4 packet and delivers the packet to the IPv6 protocol stack.
  - **d.** The IPv6 protocol stack uses the destination IPv6 address of the packet to look up the routing table, and then sends it out.
- De-encapsulation:
  - **a.** Upon receiving the IPv6 packet from the attached IPv6 network, Device B delivers the packet to the IPv6 protocol stack to examine the protocol type encapsulated in the data portion of the packet.
  - **b.** If the protocol type is IPv4, the IPv6 protocol stack delivers the packet to the tunneling module.
  - **c.** The tunneling module removes the IPv6 header and delivers the remaining IPv4 packet to the IPv4 protocol stack.
  - **d.** The IPv4 protocol stack forwards the IPv4 packet.

Tunnel modes

IPv4 over IPv6 tunnels include IPv4 over IPv6 manual tunnels and DS-Lite tunnels.

IPv4 over IPv6 manual tunnel

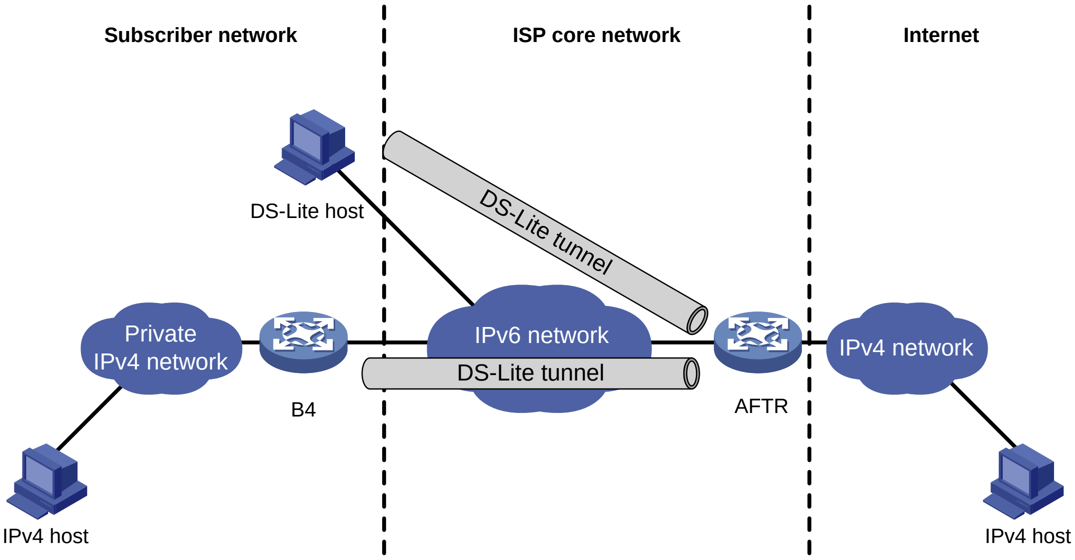
An IPv4 over IPv6 manual tunnel is a point-to-point link and its source and destination IPv6 addresses are manually configured. You can establish an IPv4 over IPv6 manual tunnel to connect isolated IPv4 networks over an IPv6 network.

DS-Lite tunnel

Dual Stack Lite (DS-Lite) is a combination of the tunneling and NAT technologies. NAT translates the private IPv4 addresses of the IPv4 hosts before the hosts reach the IPv4 public network.

DS-Lite tunnel supports only an IPv4 host in a private network initiating communication with an IPv4 host on the Internet. It does not support an IPv4 host on the Internet initiating communication with an IPv4 host in a private network.

Figure 16 DS-Lite tunnel



As shown in Figure 16, the DS-Lite feature contains the following components:

- Basic Bridging BroadBand (B4) element

  The B4 element is typically a CPE router that connects end hosts. IPv4 packets entering the B4 router are encapsulated into IPv6 packets and sent to the AFTR. IPv6 packets from the AFTR are de-encapsulated into IPv4 packets and sent to the subscriber's network.

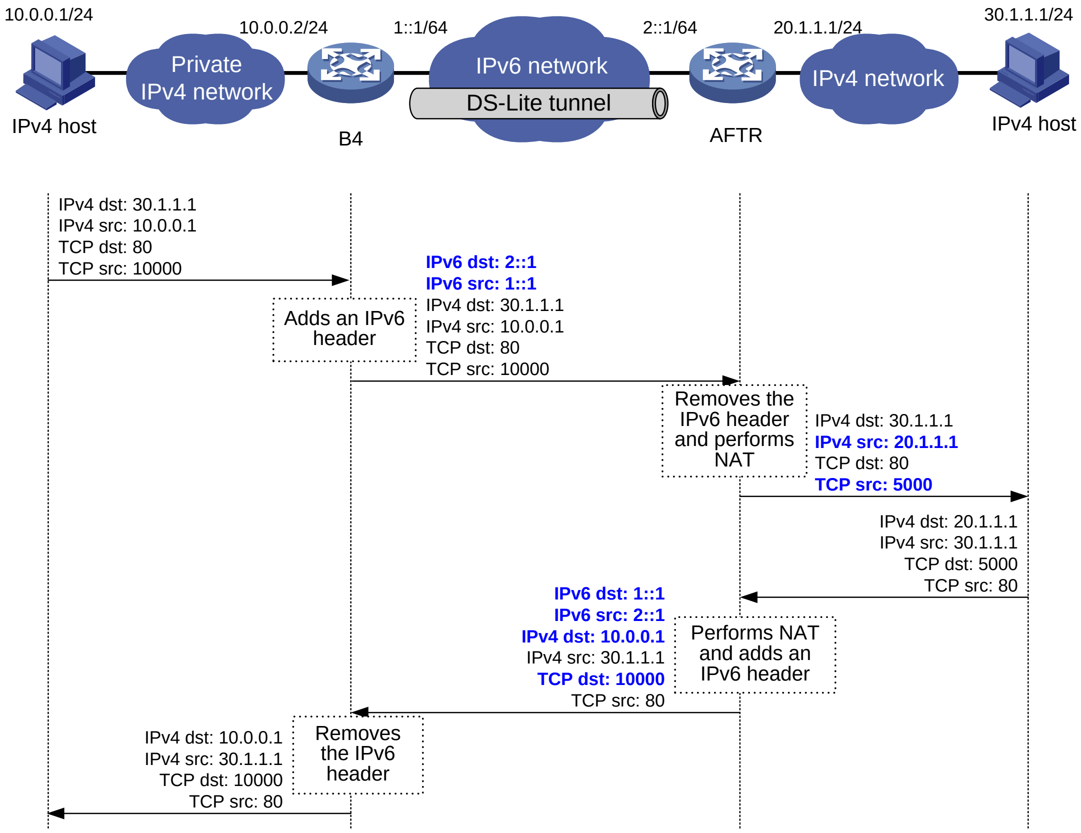
  Hosts that can act as the B4 router are referred to as DS-Lite hosts.

- Address Family Transition Router (AFTR)

  An AFTR resides in the ISP network and terminates the tunnel from the B4 router. NAT is also implemented on the interface that is connected to the public IPv4 network.

  An AFTR de-encapsulates the tunneled packet, translates the network address, and routes the packet to the destination IPv4 network. For IPv4 packets coming from the public IPv4 network, the AFTR performs reverse address translation and sends them to the B4 router by using the DS-Lite tunnel.

Figure 17 Packet forwarding process in DS-Lite



As shown in Figure 17, the packet forwarding process in DS-Lite is as follows:

1. Upon receiving a packet from the private IPv4 network, the B4 router adds an IPv6 header to the packet and sends the IPv6 packet to the AFTR through the tunnel.
2. The AFTR performs the following operations:
   a. Removes the IPv6 header from the tunneled packet.
   b. Assigns a tunnel ID for the B4 router.
   c. Records the mapping between the IPv6 address of the B4 router (the source IPv6 address of the packet), and the tunnel ID.
3. After de-encapsulation, the AFTR translates the source private IPv4 address of the packet into a public IPv4 address and sends the packet to the destination IPv4 host. The AFTR also maps the NAT entries to the tunnel ID so that IPv4 networks connected to different B4 routers can use the same address space.
4. Upon receiving the response packet from the public network, the AFTR translates the destination public IPv4 address into the private IPv4 address. The AFTR performs the following operations:
   a. Looks up the IPv6 address-tunnel ID mapping to obtain the IP address of the B4 router.
   b. Uses the address as the destination address of the encapsulated IPv6 packet.
   c. Forwards the packet to the B4 router.

Figure 17 shows an example of PAT translation for dynamic NAT. Typically, dynamic NAT is used. When you use static NAT for DS-Lite tunneling, make sure the IP addresses of private IPv4 networks connected to different B4 routers do not overlap. For more information about NAT, see *NAT Configuration Guide*.

Configuring an IPv4 over IPv6 manual tunnel

Restrictions and guidelines

When you perform the tasks in this section, follow these restrictions and guidelines:

- The tunnel destination address specified on the local device must be identical with the tunnel source address specified on the tunnel peer device.
- Do not specify the same tunnel source and destination addresses for tunnels of the same tunnel mode.
- To ensure correct packet forwarding, identify whether the destination IPv4 network and the IPv4 address of the local tunnel interface are on the same subnet. If they are not, configure a route reaching the destination IPv4 network through the tunnel interface. You can configure the route by using one of the following methods:
    - Configure a static route, and specify the local tunnel interface as the egress interface or specify the IPv6 address of the peer tunnel interface as the next hop.
    - Enable a dynamic routing protocol on both the local and remote tunnel interfaces.

  For more information about route configuration, see *Layer 3—IP Routing Configuration Guide*.

Procedure

1. Enter system view.
   `system-view`
2. Enter IPv6 tunnel interface view.
   `interface tunnel` *`number`* `[` **`mode ipv6`** `]`
3. Configure an IPv4 address for the tunnel interface.
   `ip address` *`ip-address`* `{` *`mask`* `|` *`mask-length`* `} [` **`sub`** `]`
4. Configure a source address or interface for the tunnel.
   `source` `{` *`ipv6-address`* `|` *`interface-type interface-number`* `}`

   By default, no source address or interface is configured for a tunnel.

   If you specify a source address, it is used as the source IPv6 address of tunneled packets.

   If you specify a source interface, the lowest IPv6 address of this interface is used as the source IPv6 address of tunneled packets.
5. Configure a destination address for the tunnel.
   `destination` *`ipv6-address`*

   By default, no destination address is configured for a tunnel.

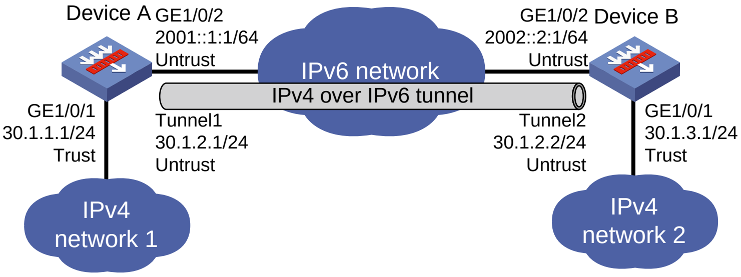
   The tunnel destination address must be the IPv6 address of the receiving interface on the tunnel peer. It is used as the destination IPv6 address of tunneled packets.

Example: Configuring an IPv4 over IPv6 manual tunnel

Network configuration

As shown in Figure 18, configure an IPv4 over IPv6 manual tunnel between Device A and Device B so the two networks can reach each other over the IPv6 network.

Figure 18 Network diagram



Procedure

1. Configure Device A:

   # Assign IP addresses to interfaces GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2.

```
<DeviceA> system-view
[DeviceA] interface gigabitethernet 1/0/1
[DeviceA-GigabitEthernet1/0/1] ip address 30.1.1.1 24
[DeviceA-GigabitEthernet1/0/1] quit
[DeviceA] interface gigabitethernet 1/0/2
[DeviceA-GigabitEthernet1/0/2] ipv6 address 2001::1:1 64
[DeviceA-GigabitEthernet1/0/2] quit
```

   # Create IPv6 tunnel interface **Tunnel 1**.

```
[DeviceA] interface tunnel 1 mode ipv6
[DeviceA-Tunnel1] ip address 30.1.2.1 255.255.255.0
[DeviceA-Tunnel1] source 2001::1:1
[DeviceA-Tunnel1] destination 2002::2:1
[DeviceA-Tunnel1] quit
```

   # Configure settings for routing. This example configures static routes. In the routes, the output interface is Tunnel 1 and the next hop is 2001::1:2.

```
[DeviceA] ipv6 route-static 2002::2:1 64 2001::1:2
[DeviceA] ip route-static 30.1.3.0 24 tunnel 1
```

   # Add interfaces to security zones.

```
[DeviceA] security-zone name Untrust
[DeviceA-security-zone-Untrust] import interface tunnel 1
[DeviceA-security-zone-Untrust] import interface gigabitethernet 1/0/2
[DeviceA-security-zone-Untrust] quit

[DeviceB-security-policy-ip] quit
```

Verifying the configuration

# Use the **`display interface tunnel`** command to display the status of the tunnel interfaces on Device A and Device B. Verify that the tunnel interfaces are up. (Details not shown.)

# Verify that Device A and Device B can ping the IPv4 address of the peer interface GigabitEthernet 1/0/1. This example uses Device A.

```
[DeviceA] ping -a 30.1.1.1 30.1.3.1
Ping 30.1.3.1 (30.1.3.1) from 30.1.1.1: 56 data bytes, press CTRL_C to break
56 bytes from 30.1.3.1: icmp_seq=0 ttl=255 time=3.000 ms
56 bytes from 30.1.3.1: icmp_seq=1 ttl=255 time=1.000 ms
56 bytes from 30.1.3.1: icmp_seq=2 ttl=255 time=0.000 ms
56 bytes from 30.1.3.1: icmp_seq=3 ttl=255 time=1.000 ms
56 bytes from 30.1.3.1: icmp_seq=4 ttl=255 time=1.000 ms

--- Ping statistics for 30.1.3.1 ---
5 packet(s) transmitted, 5 packet(s) received, 0.0% packet loss
round-trip min/avg/max/std-dev = 0.000/1.200/3.000/0.980 ms
```

Configuring a DS-Lite tunnel

Restrictions and guidelines for DS-Lite tunnel configuration

A B4 tunnel interface can establish a tunnel with only one AFTR tunnel interface, but an AFTR tunnel interface can establish tunnels with multiple B4 tunnel interfaces.

Follow these guidelines when you configure the B4 router of a DS-Lite tunnel:

- Do not specify the same tunnel source addresses for tunnels of the same tunnel mode.
- The tunnel destination address specified on the B4 router must be the tunnel source address specified on the AFTR.
- To ensure correct packet forwarding, identify whether the destination IPv4 network and the IPv4 address of the local tunnel interface are on the same subnet. If they are not, configure a route reaching the destination IPv4 network through the tunnel interface. You can configure the route by using one of the following methods:
    - Configure a static route, and specify the local tunnel interface as the egress interface or specify the IPv6 address of the peer tunnel interface as the next hop.
    - Enable a dynamic routing protocol on both the local and remote tunnel interfaces.

  For more information about route configuration, see *Layer 3—IP Routing Configuration Guide*.
- For a B4 router to automatically establish a DS-Lite tunnel with an AFTR, configure DHCPv6 client, static or dynamic IPv6 DNS, and the **`destination dhcp-alloc`** command on the B4 router. In addition, make sure a DHCPv6 server and an IPv6 DNS server (for dynamic DNS) exist in the network. For more information about DHCPv6 server, DHCPv6 client, and IPv6 DNS, see *Layer 3—IP Services Configuration Guide*.

Follow these guidelines when you configure the AFTR of a DS-Lite tunnel:

- Do not specify the same tunnel source addresses for tunnels of the same tunnel mode.
- Enable NAT on the interface that is connected to the public IPv4 interface.
- The tunnel destination cannot be configured on the AFTR. The AFTR uses the address of the B4 router as the IPv6 address of the tunnel destination.
- It is not necessary to configure a route to the destination IPv4 address for forwarding packets through the tunnel interface.

Configuring the B4 router of a DS-Lite tunnel

1. Enter system view.

   system-view

2. Enter IPv6 tunnel interface view.

   interface tunnel *number* [**mode ipv6**]

3. Specify an IPv4 address for the tunnel interface.

   ip address *ip-address* { *mask* | *mask-length* } [**sub**]

4. Specify a source address or source interface for the tunnel.

   source { *ipv6-address* | *interface-type interface-number* }

   By default, no source address or interface is specified for a tunnel.

   If you specify a source address, it is used as the source IPv6 address of tunneled packets.

   If you specify a source interface, the lowest IPv6 address of this interface is used as the source IPv6 address of tunneled packets.

5. Specify a destination address for the tunnel.

   destination { *ipv6-address* | **dhcp-alloc** *interface-type interface-number* }

   By default, no destination address is configured for a tunnel.

   The tunnel destination address must be the IPv6 address of the receiving interface on the tunnel peer. It is used as the destination IPv6 address of tunneled packets.

Parameter	Remarks
ipv6-address	Specifies the tunnel source address configured on the AFTR as the destination address.
dhcp-alloc *interface-type interface-number*	Specifies an interface to obtain the AFTR's IPv6 address from the received DHCPv6 packets for automatic DS-Lite tunnel establishment.

Configuring the AFTR of a DS-Lite tunnel

1. Enter system view.

   system-view

2. Enter the view of the tunnel interface on the AFTR.

   interface tunnel *number* [**mode ds-lite-aftr**]

3. Specify an IPv4 address for the tunnel interface.

   ip address *ip-address* { *mask* | *mask-length* } [**sub**]

4. Specify a source address or source interface for the tunnel.

   source { *ipv6-address* | *interface-type interface-number* }

By default, no source address or interface is specified for a tunnel.

The specified source address or the lowest IPv6 address of the specified source interface is used as the source IPv6 address of tunneled packets.

5. Return to system view.

   quit

6. Enter the view of the interface that is connected to the IPv4 public network.

   interface *interface-type interface-number*

7. Enable DS-Lite tunneling on the interface.

   ds-lite enable

   By default, DS-Lite tunneling is disabled.

   Only after you use this command, the AFTR can tunnel IPv4 packets from the public IPv4 network to the B4 router.

8. Display information about the connected B4 routers on the AFTR.

   display ds-lite b4 information

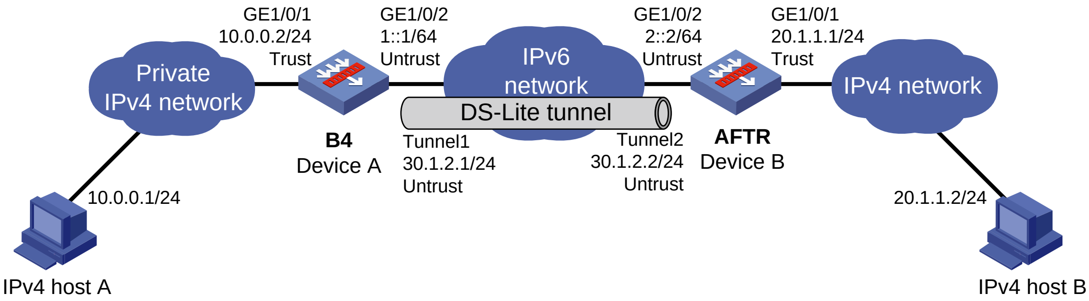
Example: Configuring a DS-Lite tunnel

Network configuration

As shown in Figure 19, to enable hosts in the private IPv4 network to access the public IPv4 network over the IPv6 network, perform the following tasks:

- Configure a DS-Lite tunnel between Device A and Device B.
- Configure NAT on GigabitEthernet 1/0/1 on the AFTR.

Figure 19 Network diagram



Procedure

1. Configure Device A:

   # Assign IP addresses to interfaces GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2.

```
<DeviceA> system-view
[DeviceA] interface gigabitethernet 1/0/1
[DeviceA-GigabitEthernet1/0/1] ip address 10.0.0.2 24
[DeviceA-GigabitEthernet1/0/1] quit
[DeviceA] interface gigabitethernet 1/0/2
[DeviceA-GigabitEthernet1/0/2] ipv6 address 1::1 64
[DeviceA-GigabitEthernet1/0/2] quit
```

   # Create IPv6 tunnel interface **Tunnel 1**.

```
[DeviceA] interface tunnel 1 mode ipv6
[DeviceA-Tunnel1] ip address 30.1.2.1 255.255.255.0
[DeviceA-Tunnel1] source 1::1
```

```
[DeviceA-Tunnel1] destination 2::2
[DeviceA-Tunnel1] quit
```

# Configure settings for routing. This example configures static routes. In the routes, the output interface is Tunnel 1 and the next hop is 1::2.

```
[DeviceA] ipv6 route-static 2002::2:1 64 1::2
[DeviceA] ip route-static 20.1.1.0 24 tunnel 1
```

# Add interfaces to security zones.

```
[DeviceA] security-zone name Untrust
[DeviceA-security-zone-Untrust] import interface tunnel 1
[DeviceA-security-zone-Untrust] import interface gigabitethernet 1/0/2
[DeviceA-security-zone-Untrust] quit
[DeviceA] security-zone name Trust
[DeviceA-security-zone-Trust] import interface gigabitethernet 1/0/1
[DeviceA-security-zone-Trust] quit
```

# Configure a rule named **tunnellocalout** in the IPv6 security policy to allow Device A to send packets to Device B.

```
[DeviceA] security-policy ipv6
[DeviceA-security-policy-ipv6] rule name tunnellocalout
[DeviceA-security-policy-ipv6-1-tunnellocalout] source-zone local
[DeviceA-security-policy-ipv6-1-tunnellocalout] destination-zone untrust
[DeviceA-security-policy-ipv6-1-tunnellocalout] source-ip-host 1::1
[DeviceA-security-policy-ipv6-1-tunnellocalout] destination-ip-host 2::2
[DeviceA-security-policy-ipv6-1-tunnellocalout] action pass
[DeviceA-security-policy-ipv6-1-tunnellocalout] quit
[DeviceA-security-policy-ipv6] quit
```

# Configure a rule named **trust-untrust** in the IPv4 security policy to permit the packets from IPv4 host A to IPv4 host B.

```
[DeviceA] security-policy ip
[DeviceA-security-policy-ip] rule name trust-untrust
[DeviceA-security-policy-ip-1-trust-untrust] source-zone trust
[DeviceA-security-policy-ip-1-trust-untrust] destination-zone untrust
[DeviceA-security-policy-ip-1-trust-untrust] source-ip-subnet 10.0.0.0 24
[DeviceA-security-policy-ip-1-trust-untrust] destination-ip-subnet 20.1.1.0 24
[DeviceA-security-policy-ip-1-trust-untrust] action pass
[DeviceA-security-policy-ip-1-trust-untrust] quit
[DeviceA-security-policy-ip] quit
```

# Configure a rule named **tunnellocalin** in the IPv6 security policy to allow Device A to receive the packets sent from Device B.

```
[DeviceA] security-policy ipv6
[DeviceA-security-policy-ipv6] rule name tunnellocalin
[DeviceA-security-policy-ipv6-2-tunnellocalin] source-zone untrust
[DeviceA-security-policy-ipv6-2-tunnellocalin] destination-zone local
[DeviceA-security-policy-ipv6-2-tunnellocalin] source-ip-host 2::2
[DeviceA-security-policy-ipv6-2-tunnellocalin] destination-ip-host 1::1
[DeviceA-security-policy-ipv6-2-tunnellocalin] action pass
[DeviceA-security-policy-ipv6-2-tunnellocalin] quit
[DeviceA-security-policy-ipv6] quit
```

# Configure a rule named **untrust-trust** in the IPv4 security policy to permit the packets from IPv4 host B to IPv4 host A.

```
[DeviceA] security-policy ip
[DeviceA-security-policy-ip] rule name untrust-trust
[DeviceA-security-policy-ip-2-untrust-trust] source-zone untrust
[DeviceA-security-policy-ip-2-untrust-trust] destination-zone trust
[DeviceA-security-policy-ip-2-untrust-trust] source-ip-subnet 20.1.1.0 24
[DeviceA-security-policy-ip-2-untrust-trust] destination-ip-subnet 10.0.0.0 24
[DeviceA-security-policy-ip-2-untrust-trust] action pass
[DeviceA-security-policy-ip-2-untrust-trust] quit
[DeviceA-security-policy-ip] quit
```

2. Configure Device B:

# Assign IP addresses to interfaces GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2.

```
<DeviceB> system-view
[DeviceB] interface gigabitethernet 1/0/1
[DeviceB-GigabitEthernet1/0/1] ip address 20.1.1.1 24
[DeviceB-GigabitEthernet1/0/1] quit
[DeviceB] interface gigabitethernet 1/0/2
[DeviceB-GigabitEthernet1/0/2] ipv6 address 2::2 64
[DeviceB-GigabitEthernet1/0/2] quit
```

# Create DS-Lite tunnel interface **Tunnel 2**.

```
[DeviceB] interface tunnel 2 mode ds-lite-aftr
[DeviceB-Tunnel2] ip address 30.1.2.2 255.255.255.0
[DeviceB-Tunnel2] source gigabitethernet 1/0/2
[DeviceB-Tunnel2] quit
```

# Enable DS-Lite tunneling on GigabitEthernet 1/0/1.

```
[DeviceB] interface gigabitethernet 1/0/1
[DeviceB-GigabitEthernet1/0/1] ds-lite enable
```

# Enable NAT on GigabitEthernet 1/0/1 and use the IP address of GigabitEthernet 1/0/1 as the translated address.

```
[DeviceB-GigabitEthernet1/0/1] nat outbound
[DeviceB-GigabitEthernet1/0/1] quit
```

# Configure settings for routing. This example configures a static route, and the next hop in the route is 2::3.

```
[DeviceB] ipv6 route-static 1::1 64 2::3
```

# Add interfaces to security zones.

```
[DeviceB] security-zone name Untrust
[DeviceB-security-zone-Untrust] import interface tunnel 2
[DeviceB-security-zone-Untrust] import interface gigabitethernet 1/0/2
[DeviceB-security-zone-Untrust] quit
[DeviceB] security-zone name Trust
[DeviceB-security-zone-Trust] import interface gigabitethernet 1/0/1
[DeviceB-security-zone-Trust] quit
```

# Configure a rule named **tunnellocalout** in the IPv6 security policy to allow Device B to send packets to Device A.

```
[DeviceB] security-policy ipv6
[DeviceB-security-policy-ipv6] rule name tunnellocalout
[DeviceB-security-policy-ipv6-1-tunnellocalout] source-zone local

[DeviceB-security-policy-ip-2-trust-untrust] destination-ip-subnet 10.0.0.0 24
[DeviceB-security-policy-ip-2-trust-untrust] action pass
[DeviceB-security-policy-ip-2-trust-untrust] quit
[DeviceB-security-policy-ip] quit
```

# Configure a rule named **tunnellocalin** in the IPv6 security policy to allow Device B to receive the packets sent from Device A.

```
[DeviceB] security-policy ipv6
[DeviceB-security-policy-ipv6] rule name tunnellocalin
[DeviceB-security-policy-ipv6-3-tunnellocalin] source-zone untrust
[DeviceB-security-policy-ipv6-3-tunnellocalin] destination-zone local
[DeviceB-security-policy-ipv6-3-tunnellocalin] source-ip-host 1::1
[DeviceB-security-policy-ipv6-3-tunnellocalin] destination-ip-host 2::2
[DeviceB-security-policy-ipv6-3-tunnellocalin] action pass
[DeviceB-security-policy-ipv6-3-tunnellocalin] quit
[DeviceB-security-policy-ipv6] quit
```

# Configure a rule named **untrust-trust** in the IPv4 security policy to permit the packets from IPv4 host A to IPv4 host B.

```
[DeviceB] security-policy ip
[DeviceB-security-policy-ip] rule name untrust-trust
[DeviceB-security-policy-ip-4-untrust-trust] source-zone untrust
[DeviceB-security-policy-ip-4-untrust-trust] destination-zone trust
[DeviceB-security-policy-ip-4-untrust-trust] source-ip-subnet 10.0.0.0 24
[DeviceB-security-policy-ip-4-untrust-trust] destination-ip-subnet 20.1.1.0 24
[DeviceB-security-policy-ip-4-untrust-trust] action pass
[DeviceB-security-policy-ip-4-untrust-trust] quit
[DeviceB-security-policy-ip] quit
```

3. On host A, specify the IP address for the host as 10.0.0.1 and configure a static route to 20.1.1.0/24 with next hop 10.0.0.2. (Details not shown.)
4. On host B, specify the IP address for the host as 20.1.1.2. (Details not shown.)

Verifying the configuration

# Use the **`display interface tunnel`** command to display the status of the tunnel interfaces on Device A and Device B. Verify that the tunnel interfaces are up. (Details not shown.)

# Verify that host A can ping host B.

```
C:\> ping 20.1.1.2
Pinging 20.1.1.2 with 32 bytes of data:
Reply from 20.1.1.2: bytes=32 time=51ms TTL=255
Reply from 20.1.1.2: bytes=32 time=44ms TTL=255
Reply from 20.1.1.2: bytes=32 time=1ms TTL=255
Reply from 20.1.1.2: bytes=32 time=1ms TTL=255

Approximate round trip times in milli-seconds:
    Minimum = 1ms, Maximum = 51ms, Average = 24ms
```

IPv6 over IPv6 tunneling

About IPv6 over IPv6 tunneling

IPv6 over IPv6 tunneling (RFC 2473) enables isolated IPv6 networks to communicate with each other over another IPv6 network. For example, two isolated IPv6 networks that do not want to show their addresses to the Internet can use an IPv6 over IPv6 tunnel to communicate with each other.

Figure 20 Principle of IPv6 over IPv6 tunneling

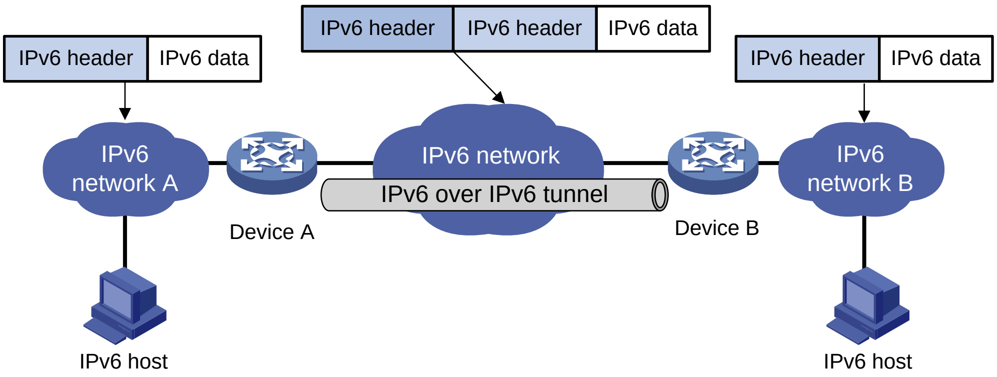

Figure 20 shows the encapsulation and de-encapsulation processes.

- Encapsulation:
  - **a.** After receiving an IPv6 packet, Device A submits it to the IPv6 protocol stack.
  - **b.** The IPv6 protocol stack uses the destination IPv6 address of the packet to find the egress interface. If the egress interface is the tunnel interface, the stack delivers it to the tunnel interface.
  - **c.** After receiving the packet, the tunnel interface adds an IPv6 header to it and submits it to the IPv6 protocol stack.
  - **d.** The IPv6 protocol stack forwards the packet according to its destination IPv6 address.
- De-encapsulation:
  - **a.** Upon receiving the IPv6 packet, Device B delivers it to the IPv6 protocol stack.
  - **b.** The IPv6 protocol stack checks the protocol type of the data portion encapsulated in the IPv6 packet. If the encapsulation protocol is IPv6, the stack delivers the packet to the tunnel module.
  - **c.** The tunnel module de-encapsulates the packet and sends it back to the IPv6 protocol stack.
  - **d.** The IPv6 protocol stack forwards the IPv6 packet.

Restrictions and guidelines: IPv6 over IPv6 tunnel configuration

Follow these guidelines when you configure an IPv6 over IPv6 tunnel:

- The tunnel destination address specified on the local device must be identical with the tunnel source address specified on the tunnel peer device.
- Do not specify the same tunnel source and destination addresses for tunnels of the same tunnel mode.

- The IPv6 address of the tunnel interface cannot be on the same subnet as the destination address configured for the tunnel interface.
- To ensure correct packet forwarding, identify whether the destination IPv6 network and the IPv6 address of the local tunnel interface are on the same subnet. If they are not, configure a route reaching the destination IPv6 network through the tunnel interface. You can configure the route by using one of the following methods:
  - Configure a static route, and specify the local tunnel interface as the egress interface or specify the IPv6 address of the peer tunnel interface as the next hop.
  - Enable a dynamic routing protocol on both the local and remote tunnel interfaces.

  For more information about route configuration, see *Layer 3—IP Routing Configuration Guide*.
- The destination address of the route passing the tunnel interface cannot be on the same subnet as the destination address configured on the tunnel interface.

IPv6 over IPv6 tunnel configuration tasks at a glance

To configure an IPv6 over IPv6 tunnel, perform the following tasks:

1. Configuring an IPv6 over IPv6 tunnel
2. (Optional.) Enabling dropping IPv6 packets that use IPv4-compatible IPv6 addresses

Configuring an IPv6 over IPv6 tunnel

1. Enter system view.

   system-view
2. Enter IPv6 tunnel interface view.

   interface tunnel *number* [**mode ipv6**]
3. Configure an IPv6 address for the tunnel interface.

   See "Configuring basic IPv6 settings."
4. Configure a source address or source interface for the tunnel.

   source { *ipv6-address* | *interface-type interface-number* }

   By default, no source address or interface is configured for a tunnel.

   If you specify a source address, it is used as the source IPv6 address of tunneled packets.

   If you specify a source interface, the lowest IPv6 address of this interface is used as the source IPv6 address of tunneled packets.
5. Configure a destination address for the tunnel.

   destination *ipv6-address*

   By default, no destination address is configured for a tunnel.

   The tunnel destination address must be the IPv6 address of the receiving interface on the tunnel peer. It is used as the destination IPv6 address of tunneled packets.
6. (Optional.) Set the maximum number of nested encapsulations of a packet.

   encapsulation-limit *number*

   By default, there is no limit to the nested encapsulations of a packet.

Enabling dropping IPv6 packets that use IPv4-compatible IPv6 addresses

1. Enter system view.

   `system-view`

2. Enable dropping IPv6 packets that use IPv4-compatible IPv6 addresses.

   `tunnel discard ipv4-compatible-packet`

   By default, IPv6 packets that use IPv4-compatible IPv6 addresses are not dropped.

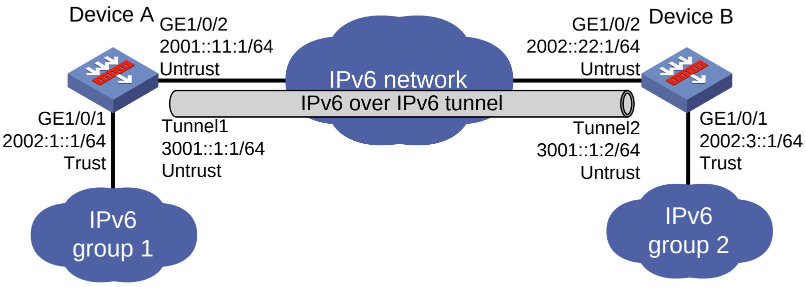
IPv6 over IPv6 tunnel configuration examples

Example: Configuring an IPv6 over IPv6 tunnel

Network configuration

As shown in Figure 21, configure an IPv6 over IPv6 tunnel between Device A and Device B so the two networks can reach each other without disclosing their IPv6 addresses.

Figure 21 Network diagram



Procedure

1. Configure Device A:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

   ```
   <DeviceA> system-view
   [DeviceA] interface gigabitethernet 1/0/1
   [DeviceA-GigabitEthernet1/0/1] ipv6 address 2002:1::1 64
   [DeviceA-GigabitEthernet1/0/1] quit
   ```

   # Assign IP addresses to other interfaces in the same way. (Details not shown.)

   # Create IPv6 tunnel interface **Tunnel 1**.

   ```
   [DeviceA] interface tunnel 1 mode ipv6
   [DeviceA-Tunnel1] ipv6 address 3001::1:1 64
   [DeviceA-Tunnel1] source 2001::11:1
   [DeviceA-Tunnel1] destination 2002::22:1
   [DeviceA-Tunnel1] quit
   ```

   # Configure settings for routing. This example configures static routes. In the routes, the output interface is Tunnel 1 and the next hop is 2001::11:2.

   ```
   [DeviceA] ipv6 route-static 2002::22:1 64 2001::11:2
   [DeviceA] ipv6 route-static 2002:3:: 64 tunnel 1
   ```

# Add interfaces to security zones.

```
[DeviceA] security-zone name Untrust
[DeviceA-security-zone-Untrust] import interface tunnel 1
[DeviceA-security-zone-Untrust] import interface gigabitethernet 1/0/2
[DeviceA-security-zone-Untrust] quit
[DeviceA] security-zone name Trust
[DeviceA-security-zone-Trust] import interface gigabitethernet 1/0/1
[DeviceA-security-zone-Trust] quit
```

# Configure a rule named **tunnellocalout** in the IPv6 security policy to allow Device A to send packets to Device B.

```
[DeviceA] security-policy ipv6
[DeviceA-security-policy-ipv6] rule name tunnellocalout
[DeviceA-security-policy-ipv6-1-tunnellocalout] source-zone local
[DeviceA-security-policy-ipv6-1-tunnellocalout] destination-zone untrust
[DeviceA-security-policy-ipv6-1-tunnellocalout] source-ip-host 2001::11:1
[DeviceA-security-policy-ipv6-1-tunnellocalout] destination-ip-host 2002::22:1
[DeviceA-security-policy-ipv6-1-tunnellocalout] action pass
[DeviceA-security-policy-ipv6-1-tunnellocalout] quit
```

# Configure a rule named **trust-untrust** in the IPv6 security policy to permit the packets from IPv6 group 1 to IPv6 group 2.

```
[DeviceA-security-policy-ipv6] rule name trust-untrust
[DeviceA-security-policy-ipv6-2-trust-untrust] source-zone trust
[DeviceA-security-policy-ipv6-2-trust-untrust] destination-zone untrust
[DeviceA-security-policy-ipv6-2-trust-untrust] source-ip-subnet 2002:1::1 64
[DeviceA-security-policy-ipv6-2-trust-untrust] destination-ip-subnet 2002:3::1 64
[DeviceA-security-policy-ipv6-2-trust-untrust] action pass
[DeviceA-security-policy-ipv6-2-trust-untrust] quit
```

# Configure a rule named **tunnellocalin** in the IPv6 security policy to allow Device A to receive the packets sent from Device B.

```
[DeviceA-security-policy-ipv6] rule name tunnellocalin
[DeviceA-security-policy-ipv6-3-tunnellocalin] source-zone untrust
[DeviceA-security-policy-ipv6-3-tunnellocalin] destination-zone local
[DeviceA-security-policy-ipv6-3-tunnellocalin] source-ip-host 2002::22:1
[DeviceA-security-policy-ipv6-3-tunnellocalin] destination-ip-host 2001::11:1
[DeviceA-security-policy-ipv6-3-tunnellocalin] action pass
[DeviceA-security-policy-ipv6-3-tunnellocalin] quit
```

# Configure a rule named **untrust-trust** in the IPv6 security policy to permit the packets from IPv6 group 2 to IPv6 group 1.

```
[DeviceA-security-policy-ipv6] rule name untrust-trust
[DeviceA-security-policy-ipv6-4-untrust-trust] source-zone untrust
[DeviceA-security-policy-ipv6-4-untrust-trust] destination-zone trust
[DeviceA-security-policy-ipv6-4-untrust-trust] source-ip-subnet 2002:3::1 64
[DeviceA-security-policy-ipv6-4-untrust-trust] destination-ip-subnet 2002:1::1 64
[DeviceA-security-policy-ipv6-4-untrust-trust] action pass
[DeviceA-security-policy-ipv6-4-untrust-trust] quit
[DeviceA-security-policy-ipv6] quit
```

2. Configure Device B:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

```
<DeviceB> system-view
```

```
[DeviceB] interface gigabitethernet 1/0/1
[DeviceB-GigabitEthernet1/0/1] ipv6 address 2002:3::1 64
[DeviceB-GigabitEthernet1/0/1] quit
```

# Assign IP addresses to other interfaces in the same way. (Details not shown.)

# Create IPv6 tunnel interface **Tunnel 2**.

```
[DeviceB] interface tunnel 2 mode ipv6
[DeviceB-Tunnel2] ipv6 address 3001::1:2 64
[DeviceB-Tunnel2] source 2002::22:1
[DeviceB-Tunnel2] destination 2001::11:1
[DeviceB-Tunnel2] quit
```

# Configure settings for routing. This example configures static routes. In the routes, the output interface is Tunnel 2 and the next hop is 2002::22:2.

```
[DeviceB] ipv6 route-static 2001::1:1 64 2002::22:2
[DeviceB] ipv6 route-static 2002:1::1 64 tunnel 2
```

# Add interfaces to security zones.

```
[DeviceB] security-zone name Untrust
[DeviceB-security-zone-Untrust] import interface tunnel 2
[DeviceB-security-zone-Untrust] import interface gigabitethernet 1/0/2
[DeviceB-security-zone-Untrust] quit
[DeviceB] security-zone name Trust
[DeviceB-security-zone-Trust] import interface gigabitethernet 1/0/1
[DeviceB-security-zone-Trust] quit
```

# Configure a rule named **tunnellocalout** in the IPv6 security policy to allow Device B to send packets to Device A.

```
[DeviceB] security-policy ipv6
[DeviceB-security-policy-ipv6] rule name tunnellocalout
[DeviceB-security-policy-ipv6-1-tunnellocalout] source-zone local
[DeviceB-security-policy-ipv6-1-tunnellocalout] destination-zone untrust
[DeviceB-security-policy-ipv6-1-tunnellocalout] source-ip-host 2002::22:1
[DeviceB-security-policy-ipv6-1-tunnellocalout] destination-ip-host 2001::11:1
[DeviceB-security-policy-ipv6-1-tunnellocalout] action pass
[DeviceB-security-policy-ipv6-1-tunnellocalout] quit
```

# Configure a rule named **trust-untrust** in the IPv6 security policy to permit the packets from IPv6 group 2 to IPv6 group 1.

```
[DeviceB-security-policy-ipv6] rule name trust-untrust
[DeviceB-security-policy-ipv6-2-trust-untrust] source-zone trust
[DeviceB-security-policy-ipv6-2-trust-untrust] destination-zone untrust
[DeviceB-security-policy-ipv6-2-trust-untrust] source-ip-subnet 2002:3::1 64
[DeviceB-security-policy-ipv6-2-trust-untrust] destination-ip-subnet 2002:1::1 64
[DeviceB-security-policy-ipv6-2-trust-untrust] action pass
[DeviceB-security-policy-ipv6-2-trust-untrust] quit
```

# Configure a rule named **tunnellocalin** in the IPv6 security policy to allow Device B to receive the packets sent from Device A.

```
[DeviceB-security-policy-ipv6] rule name tunnellocalin
[DeviceB-security-policy-ipv6-3-tunnellocalin] source-zone untrust
[DeviceB-security-policy-ipv6-3-tunnellocalin] destination-zone local
[DeviceB-security-policy-ipv6-3-tunnellocalin] source-ip-host 2001::11:1
[DeviceB-security-policy-ipv6-3-tunnellocalin] destination-ip-host 2002::22:1
```

```
[DeviceB-security-policy-ipv6-3-tunnellocalin] action pass
[DeviceB-security-policy-ipv6-3-tunnellocalin] quit
```

# Configure a rule named **tunnellocalin** in the IPv6 security policy to permit the packets from IPv6 group 1 to IPv6 group 2.

```
[DeviceB-security-policy-ipv6] rule name tunnellocalin
[DeviceB-security-policy-ipv6-4-tunnellocalin] source-zone untrust
[DeviceB-security-policy-ipv6-4-tunnellocalin] destination-zone local
[DeviceB-security-policy-ipv6-4-tunnellocalin] source-ip-subnet 2002:1::1 64
[DeviceB-security-policy-ipv6-4-tunnellocalin] destination-ip-subnet 2002:3::1 64
[DeviceB-security-policy-ipv6-4-tunnellocalin] action pass
[DeviceB-security-policy-ipv6-4-tunnellocalin] quit
[DeviceB-security-policy-ipv6] quit
```

Verifying the configuration

# Use the **`display ipv6 interface`** command to display the status of the tunnel interfaces on Device A and Device B. Verify that the tunnel interfaces are up. (Details not shown.)

# Verify that Device A and Device B can ping the IPv6 address of the peer interface GigabitEthernet 1/0/1. This example uses Device A.

```
[DeviceA] ping ipv6 -a 2002:1::1 2002:3::1
Ping6(56 data bytes) 2002:1::1 --> 2002:3::1, press CTRL_C to break
56 bytes from 2002:3::1, icmp_seq=0 hlim=64 time=9.000 ms
56 bytes from 2002:3::1, icmp_seq=1 hlim=64 time=1.000 ms
56 bytes from 2002:3::1, icmp_seq=2 hlim=64 time=0.000 ms
56 bytes from 2002:3::1, icmp_seq=3 hlim=64 time=0.000 ms
56 bytes from 2002:3::1, icmp_seq=4 hlim=64 time=0.000 ms

--- Ping6 statistics for 2002:3::1 ---
5 packet(s) transmitted, 5 packet(s) received, 0.0% packet loss
round-trip min/avg/max/std-dev = 0.000/2.000/9.000/3.521 ms
```

Configuring GRE

About GRE

Generic Routing Encapsulation (GRE) is a tunneling protocol that can encapsulate a protocol (such as IP or Ethernet) into a virtual point-to-point tunnel over a network (such as an IP network). Packets are encapsulated at one tunnel end and de-encapsulated at the other tunnel end. The network layer protocol of the packets before encapsulation and after encapsulation can be the same or different.

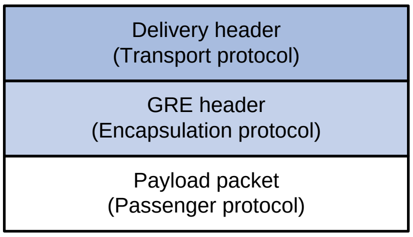
GRE encapsulation format

As shown in Figure 1, a GRE-tunneled packet includes the following parts:

- **Payload packet**—Original packet. The protocol type of the payload packet is called the passenger protocol. The passenger protocol can be any network layer protocol.
- **GRE header**—Header that is added to the payload packet to change the payload packet to a GRE packet. A GRE header includes the number of encapsulations, version, passenger protocol type, checksum, and key. GRE is called the encapsulation protocol.
- **Delivery header**—Header that is added to the GRE packet to deliver it to the tunnel end. The transport protocol (or delivery protocol) is the network layer protocol that transfers GRE packets.

The device supports GRE tunnels with IPv4 and IPv6 as the transport protocols. When the transport protocol is IPv4, the GRE tunnel mode is GRE over IPv4 (GRE/IPv4). When the transport protocol is IPv6, the GRE tunnel mode is GRE over IPv6 (GRE/IPv6).

Figure 1 GRE encapsulation format



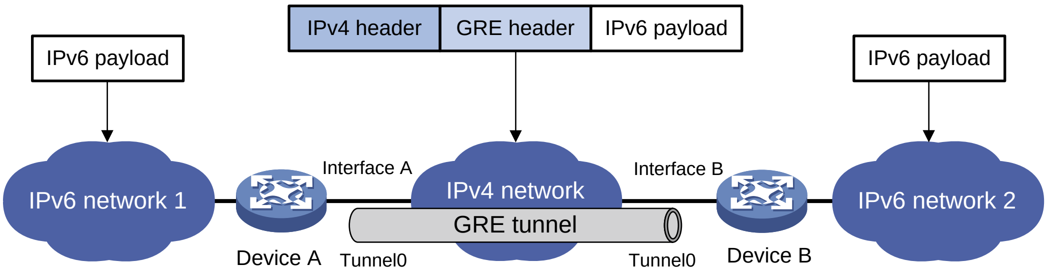
GRE tunnel operating principle

As shown in Figure 2, an IPv6 protocol packet traverses an IPv4 network through a GRE tunnel as follows:

1. After receiving an IPv6 packet from the interface connected to IPv6 network 1, Device A processes the packet as follows:
   a. Looks up the routing table to identify the outgoing interface for the IPv6 packet.
   b. Submits the IPv6 packet to the outgoing interface—the GRE tunnel interface Tunnel 0.
2. Upon receiving the packet, the tunnel interface encapsulates the packet with GRE and then with IPv4. In the IPv4 header:
   - The source address is the tunnel's source address (the IP address of Interface A of Device A).
   - The destination address is the tunnel's destination address (the IP address of Interface B of Device B).

3. Device A looks up the routing table according to the destination address in the IPv4 header, and forwards the IPv4 packet out of the physical interface (Interface A) of the GRE tunnel.
4. When the IPv4 arrives at the GRE tunnel destination Device B, Device B checks the destination address. Because the destination is Device B itself and the protocol number in the IP header is 47 (the protocol number for GRE), Device B submits the packet to GRE for de-encapsulation.
5. GRE first removes the IPv4 header, and then checks the GRE key, checksum, and packet sequence number. After GRE finishes the checking, it removes the GRE header, and submits the payload to the IPv6 protocol for forwarding.

Figure 2 IPv6 networks interconnected through a GRE tunnel



GRE security mechanisms

GRE supports the GRE key and GRE checksum security mechanisms.

GRE key

GRE keys ensure packet validity. The sender adds a GRE key into a packet. The receiver compares the GRE key with its own GRE key. If the two keys are the same, the receiver accepts the packet. If the two keys are different, the receiver drops the packet.

GRE checksum

GRE checksums ensure packet integrity. The sender calculates a checksum for the GRE header and payload and sends the packet containing the checksum to the tunnel peer. The receiver calculates a checksum for the received packet and compares it with that carried in the packet. If the checksums are the same, the receiver considers the packet intact and continues to process the packet. If the checksums are different, the receiver discards the packet.

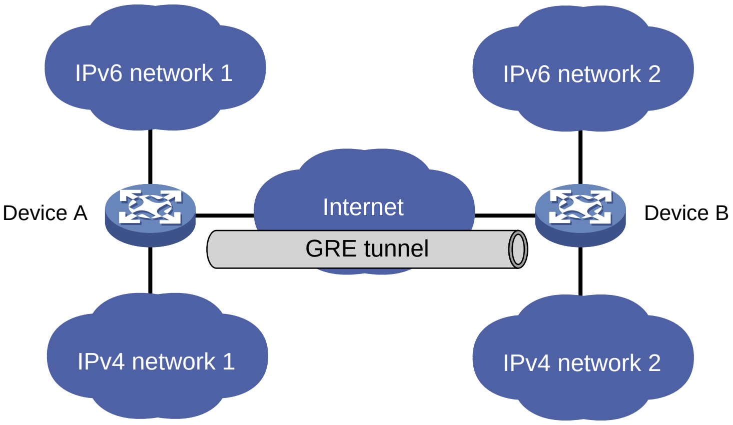
GRE application scenarios

The following shows typical GRE application scenarios:

Connecting networks running different protocols over a single backbone

As shown in Figure 3, IPv6 network 1 and IPv6 network 2 are IPv6 networks, and IPv4 network 1 and IPv4 network 2 are IPv4 networks. Through the GRE tunnel between Device A and Device B, IPv6 network 1 can communicate with IPv6 network 2 and IPv4 network 1 can communicate with IPv4 network 2, without affecting each other.

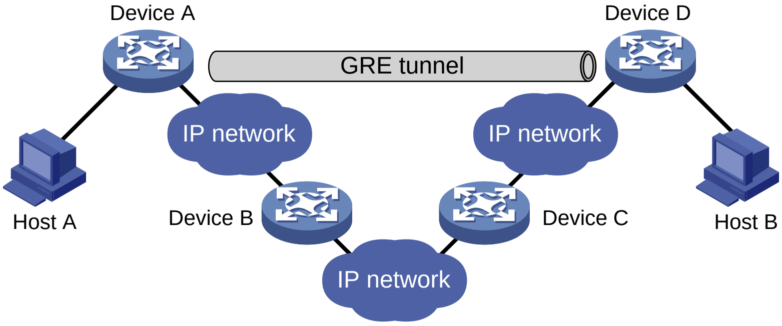
Figure 3 Network diagram



Enlarging network scope

In an IP network, the maximum TTL value of a packet is 255. If two devices have more than 255 hops in between, they cannot communicate with each other. By using a GRE tunnel, you can hide some hops to enlarge the network scope. As shown in Figure 4, only the tunnel-end devices (Device A and Device D) of the GRE tunnel are counted in hop count calculation. Therefore, there are only three hops between Host A and Host B.

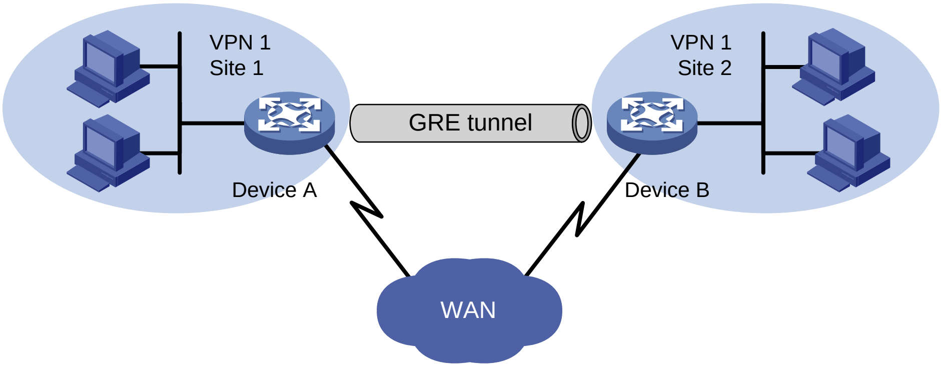
Figure 4 Network diagram



Constructing VPN

As shown in Figure 5, Site 1 and Site 2 both belong to VPN 1 and are located in different cities. Using a GRE tunnel can connect the two VPN sites across the WAN.

Figure 5 Network diagram

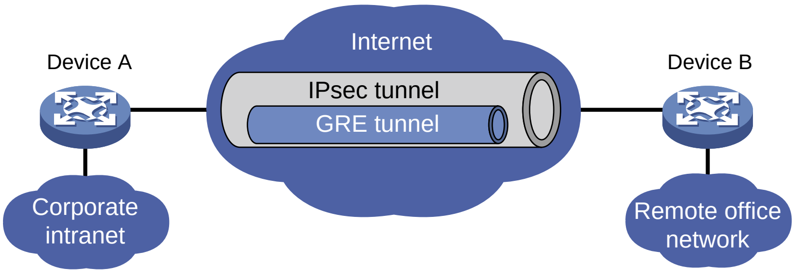


Operating with IPsec

As shown in Figure 6, GRE can be used together with IPsec to form a GRE over IPsec tunnel. Packets (for example, routing protocol packets, voice data, and video data) are first encapsulated with GRE and then with IPsec. GRE over IPsec delivers the following benefits:

- Improves transmission security.
- Allows IPsec to protect not only unicast packets. GRE supports encapsulating multicast, broadcast, and non-IP packets. After GRE encapsulation, these packets become common unicast packets, which can be protected by IPsec.
- Simplifies IPsec configuration. Packets are first encapsulated by GRE. You can define the packets to be protected by IPsec according to the GRE tunnel's source and destination addresses, without considering the source and destination addresses of the original packets.

Figure 6 Network diagram



GRE and IPsec can also form IPsec over GRE tunnels. As a best practice, use GRE over IPsec tunnels instead of IPsec over GRE tunnels.

For more information about IPsec, see *Security Configuration Guide*.

Protocols and standards

- RFC 1701, *Generic Routing Encapsulation (GRE)*
- RFC 1702, *Generic Routing Encapsulation over IPv4 networks*
- RFC 2784, *Generic Routing Encapsulation (GRE)*
- RFC 2890, *Key and Sequence Number Extensions to GRE*

Restrictions and guidelines: GRE configuration

When you configure a GRE tunnel, follow these restrictions and guidelines:

- You must configure the tunnel source address and destination address at both ends of a tunnel. The tunnel source or destination address at one end must be the tunnel destination or source address at the other end.
- As a best practice, do not configure the same tunnel source and destination addresses for local tunnel interfaces that use the same tunnel mode.
- Do not configure the same tunnel source and destination addresses for a GRE tunnel interface and a GRE P2MP tunnel interface.
- You can enable or disable GRE checksum at each end of a tunnel. If GRE checksum is enabled at a tunnel end, the tunnel end sends packets carrying the checksum to the peer end. A tunnel end checks the GRE checksum of a received packet if the packet carries a GRE checksum, whether or not the tunnel end is enabled with GRE checksum.
- To ensure correct packet forwarding, identify whether the destination network of packets and the IP address of the local tunnel interface are on the same subnet. If they are not, configure a

route reaching the destination network through the tunnel interface. You can configure the route by using one of the following methods:

  - Configure a static route, using the local tunnel interface as the outgoing interface of the route.
  - Enable a dynamic routing protocol on both the tunnel interface and the interface connecting the private network. This allows the dynamic routing protocol to establish a routing entry with the tunnel interface as the outgoing interface.

- GRE encapsulation and de-encapsulation can decrease the forwarding efficiency of tunnel-end devices.

Configuring a GRE/IPv4 tunnel

Restrictions and guidelines

This task describes only GRE/IPv4 tunnel required tunnel interface commands (the **`interface tunnel`**, **`source`**, and **`destination`** commands). For more tunnel interface commands, see "Configuring tunneling."

Procedure

1. Enter system view.

   `system-view`

2. Create a GRE tunnel interface, and specify the tunnel mode as GRE/IPv4.

   `interface tunnel` *`number`* **`mode gre`**

   You must configure the same tunnel mode on both ends of a tunnel. Otherwise, packet delivery might fail.

3. Configure an IP address for the tunnel interface based on the passenger protocol.

   IPv4:

   For information about how to assign an IPv4 address to an interface, see "Configuring IP addressing."

   IPv6:

   For information about how to assign an IPv6 address to an interface, see "Configuring basic IPv6 settings."

   By default, no IP address is configured for a tunnel interface.

4. Configure a source address or source interface for the tunnel.

   `source` { *`ip-address`* | *`interface-type interface-number`* }

   By default, no source address or interface is configured for a tunnel.

   If you configure a source address, the tunnel interface uses the source address as the source address of encapsulated packets.

   If you configure a source interface, the tunnel interface uses the primary IP address of the source interface as the source address of encapsulated packets.

5. Configure a destination address for the tunnel.

   `destination` *`ip-address`*

   By default, no destination address is configured for a tunnel.

   The destination address is the address of the physical interface that the tunnel remote end uses to receive packets from the GRE tunnel.

   The tunnel local end uses this address as the destination address of encapsulated packets.

   The tunnel destination address and the IP address of the tunnel interface must be in different subnets.

6. (Optional.) Enable GRE keepalive, and set the keepalive interval and keepalive number.

keepalive [*interval* [*times*]]

By default, GRE keepalive is disabled.

7. (Optional.) Configure GRE security mechanisms.
   - Enable GRE checksum.

     gre checksum

     By default, GRE checksum is disabled.
   - Configure a GRE key for the GRE tunnel interface.

     gre key *key*

     By default, no GRE key is configured for a GRE tunnel interface.

     The two ends of a GRE tunnel must have the same key or both have no key.
8. (Optional.) Set the DF bit for encapsulated packets.

   tunnel dfbit enable

   By default, the DF bit is not set, allowing encapsulated packets to be fragmented.

Configuring a GRE/IPv6 tunnel

Restrictions and guidelines

This task describes only GRE/IPv6 tunnel required tunnel interface commands (the **interface tunnel**, **source**, and **destination** commands). For more tunnel interface commands, see "Configuring tunneling."

Procedure

1. Enter system view.

   system-view
2. Create a GRE tunnel interface, and specify the tunnel mode as GRE/IPv6.

   interface tunnel *number* **mode gre ipv6**

   You must configure the same tunnel mode on both ends of a tunnel. Otherwise, packet delivery might fail.
3. Configure an IP address for the tunnel interface based on the passenger protocol.

   IPv4:

   For information about how to assign an IPv4 address to an interface, see "Configuring IP addressing."

   IPv6:

   For information about how to assign an IPv6 address to an interface, see "Configuring basic IPv6 settings."

   By default, no IP address is configured for a tunnel interface.
4. Configure a source IPv6 address or source interface for the tunnel.

   source { *ipv6-address* | *interface-type interface-number* }

   By default, no source IPv6 address or interface is configured for a tunnel.

   If you configure a source IPv6 address, the tunnel interface uses the source IPv6 address as the source IPv6 address of encapsulated packets.

   If you configure a source interface, the tunnel interface uses the IPv6 address of the source interface as the source IPv6 address of encapsulated packets.
5. Configure a destination IPv6 address for the tunnel.

   destination *ipv6-address*

   By default, no destination IPv6 address is configured for a tunnel.

The destination IPv6 address is the IPv6 address of the physical interface that the tunnel remote end uses to receive packets from the GRE tunnel.

The tunnel local end uses this address as the destination IPv6 address of encapsulated packets.

The tunnel destination address and the IP address of the tunnel interface must be in different subnets.

6. (Optional.) Configure GRE security mechanisms.
   - Enable GRE checksum.

     gre checksum

     By default, GRE checksum is disabled.
   - (Optional.) Configure a GRE key for the tunnel interface.

     gre key *key*

     By default, no GRE key is configured for a GRE tunnel interface.

     The two ends of a GRE tunnel must have the same key or both have no key.

Enabling dropping IPv6 packets that use IPv4-compatible IPv6 addresses

About this task

This feature enables the device to check the source and destination IPv6 addresses of the de-encapsulated IPv6 packets from a tunnel. If a packet uses an IPv4-compatible IPv6 address as the source or destination address, the device discards the packet.

Procedure

1. Enter system view.

   system-view
2. Configure the device to discard IPv6 packets with IPv4-compatible IPv6 addresses.

   tunnel discard ipv4-compatible-packet

   By default, the device does not discard such IPv6 packets.

   For more information about this command, see tunneling in *VPN Command Reference*.

Display and maintenance commands for GRE

Execute **display** commands in any view and **reset** commands in user view.

Task	Command	Remarks
Display information about tunnel interfaces.	**display interface** [**tunnel** [*number*]] [**brief** [**description** | **down**]]	For more information about the commands, see tunneling in *VPN Command Reference*.
Display IPv6 information about tunnel interface.	**display ipv6 interface** [**tunnel** [*number*]] [**brief**]	For more information about this command, see IPv6 basics in *Layer 3—IP Services Command Reference*.
Clear tunnel interface statistics.	**reset counters interface** [**tunnel** [*number*]]	For more information about this command, see tunneling in *VPN Command Reference*.

Task	Command	Remarks
Clear IPv6 statistics on tunnel interfaces.	**reset ipv6 statistics** [**slot** *slot-number*]	For more information about this command, see IPv6 basics in *Layer 3—IP Services Command Reference*.

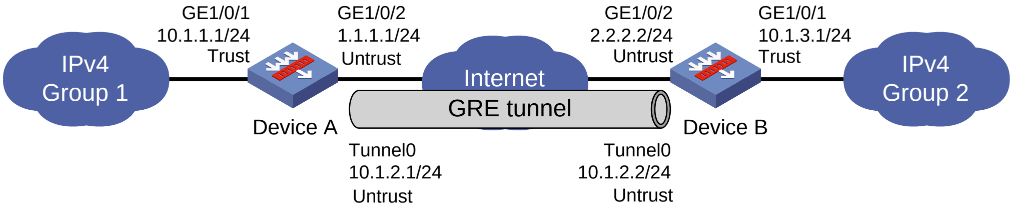
GRE configuration examples

Example: Configuring an IPv4 over IPv4 GRE tunnel

Network configuration

As shown in Figure 7, Group 1 and Group 2 are two private IPv4 networks. The two networks both use private network addresses and belong to the same VPN. Establish a GRE tunnel between Device A and Device B to interconnect the two private IPv4 networks Group 1 and Group 2.

Figure 7 Network diagram



Procedure

1. Configure Device A:

# Assign an IP addresse to interface GigabitEthernet 1/0/1.

```
<DeviceA> system-view
[DeviceA] interface gigabitethernet 1/0/1
[DeviceA-GigabitEthernet1/0/1] ip address 10.1.1.1 255.255.255.0
[DeviceA-GigabitEthernet1/0/1] quit
```

# Assign IP addresses to other interfaces in the same way. (Details not shown.)

# Create tunnel interface **Tunnel 0**, and specify the tunnel mode as GRE/IPv4.

```
[DeviceA] interface tunnel 0 mode gre
[DeviceA-Tunnel0] ip address 10.1.2.1 255.255.255.0
[DeviceA-Tunnel0] source 1.1.1.1
[DeviceA-Tunnel0] destination 2.2.2.2
[DeviceA-Tunnel0] quit
```

# Configure settings for routing. This example configures static routes. In the routes, the output interface is Tunnel 0 and the next hop is 1.1.1.2.

```
[DeviceA] ip route-static 2.2.2.2 24 1.1.1.2
[DeviceA] ip route-static 10.1.3.0 24 tunnel 0
```

# Add interfaces to security zones.

```
[DeviceA] security-zone name Untrust
[DeviceA-security-zone-Untrust] import interface Tunnel 0
[DeviceA-security-zone-Untrust] import interface gigabitethernet 1/0/1
[DeviceA-security-zone-Untrust] quit
[DeviceA] security-zone name Trust
```

```
[DeviceA-security-zone-Trust] import interface gigabitethernet 1/0/2
[DeviceA-security-zone-Trust] quit
```

# Configure a rule named **grelocalout** in the IPv4 security policy to allow Device A to send packets to Device B.

```
[DeviceA] security-policy ip
[DeviceA-security-policy-ip] rule name grelocalout
[DeviceA-security-policy-ip-1-grelocalout] source-zone local
[DeviceA-security-policy-ip-1-grelocalout] destination-zone untrust

56 bytes from 10.1.1.1: icmp_seq=4 ttl=255 time=0.000 ms

--- Ping statistics for 10.1.1.1 ---
5 packet(s) transmitted, 5 packet(s) received, 0.0% packet loss
round-trip min/avg/max/std-dev = 0.000/2.400/11.000/4.317 ms
```

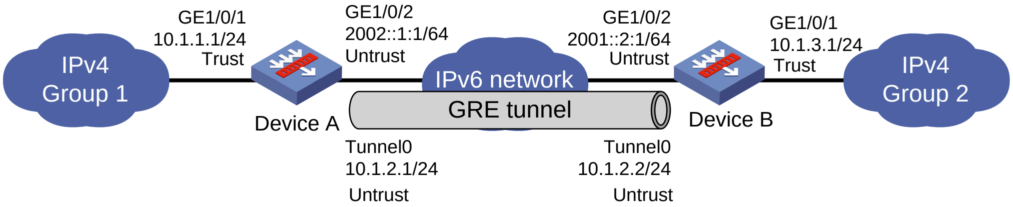
The output shows that Device B can successfully ping Device A.

Example: Configuring an IPv4 over IPv6 GRE tunnel

Network configuration

As shown in Figure 8, two IPv4 subnets Group 1 and Group 2 are connected to an IPv6 network. Create a GRE/IPv6 tunnel between Device A and Device B, so the two IPv4 subnets can communicate with each other through the GRE tunnel over the IPv6 network.

Figure 8 Network diagram



Procedure

1. Configure Device A:

# Assign IP addresses to interfaces GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2.

```
<DeviceA> system-view
[DeviceA] interface gigabitethernet 1/0/1
[DeviceA-GigabitEthernet1/0/1] ip address 10.1.1.1 255.255.255.0
[DeviceA-GigabitEthernet1/0/1] quit
[DeviceA] interface gigabitethernet 1/0/2
[DeviceA-GigabitEthernet1/0/2] ipv6 address 2002::1.1/64
[DeviceA-GigabitEthernet1/0/2] quit
```

# Create tunnel interface **Tunnel 0**, and specify the tunnel mode as GRE/IPv6.

```
[DeviceA] interface tunnel 0 mode gre ipv6
[DeviceA-Tunnel0] ip address 10.1.2.1 255.255.255.0
[DeviceA-Tunnel0] source 2002::1:1
[DeviceA-Tunnel0] destination 2001::2:1
[DeviceA-Tunnel0] quit
```

# Configure settings for routing. This example configures static routes. In the routes, the output interface is Tunnel 0 and the next hop is 2002::1:2.

```
[DeviceA] ipv6 route-static 2001::2:1 64 2002::1:2
[DeviceA] ip route-static 10.1.3.0 24 tunnel 0
```

# Add interfaces to security zones.

```
[DeviceA] security-zone name Untrust
[DeviceA-security-zone-Untrust] import interface Tunnel 0
[DeviceA-security-zone-Untrust] import interface gigabitethernet 1/0/1
[DeviceA-security-zone-Untrust] quit

Output: 10 packets, 840 bytes, 0 drops
```

# From Device B, ping the IP address of GigabitEthernet 1/0/1 on Device A.

```
[DeviceB] ping -a 10.1.3.1 10.1.1.1
Ping 10.1.1.1 (10.1.1.1) from 10.1.3.1: 56 data bytes, press CTRL_C to break
56 bytes from 10.1.1.1: icmp_seq=0 ttl=255 time=2.000 ms
56 bytes from 10.1.1.1: icmp_seq=1 ttl=255 time=1.000 ms
56 bytes from 10.1.1.1: icmp_seq=2 ttl=255 time=1.000 ms
56 bytes from 10.1.1.1: icmp_seq=3 ttl=255 time=0.000 ms
56 bytes from 10.1.1.1: icmp_seq=4 ttl=255 time=1.000 ms

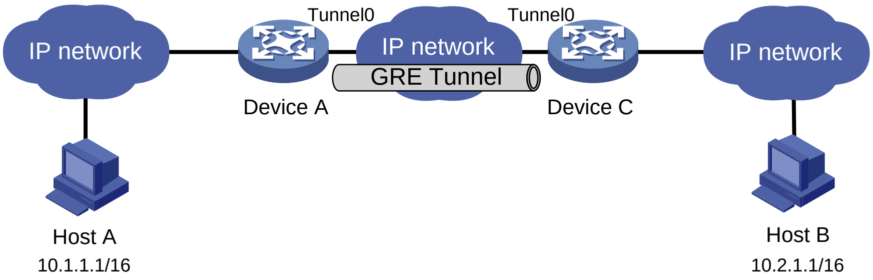
--- Ping statistics for 10.1.1.1 ---
5 packet(s) transmitted, 5 packet(s) received, 0.0% packet loss
round-trip min/avg/max/std-dev = 0.000/1.000/2.000/0.632 ms
```

The output shows that Device B can successfully ping Device A.

Troubleshooting GRE

The key to configuring GRE is to keep the configuration consistent. Most faults can be located by using the **`debugging gre`** or **`debugging tunnel`** command. This section analyzes one type of fault for illustration, with the scenario shown in Figure 9.

Figure 9 Network diagram



Hosts at both ends of a GRE tunnel cannot ping each other

Symptom

The interfaces at both ends of the tunnel are configured correctly and can ping each other, but Host A and Host B cannot ping each other.

Solution

To resolve the issue:

1. Execute the **`display ip routing-table`** command on Device A and Device C to view whether Device A has a route over tunnel 0 to 10.2.0.0/16 and whether Device C has a route over tunnel 0 to 10.1.0.0/16.
2. If such a route does not exist, execute the **`ip route-static`** command in system view to add the route. Take Device A as an example:

   ```
   [DeviceA] ip route-static 10.2.0.0 255.255.0.0 tunnel 0
   ```
3. If the issue persists, contact NSFOCUS Support.

Configuring GRE P2MP tunnels

About GRE P2MP tunnels

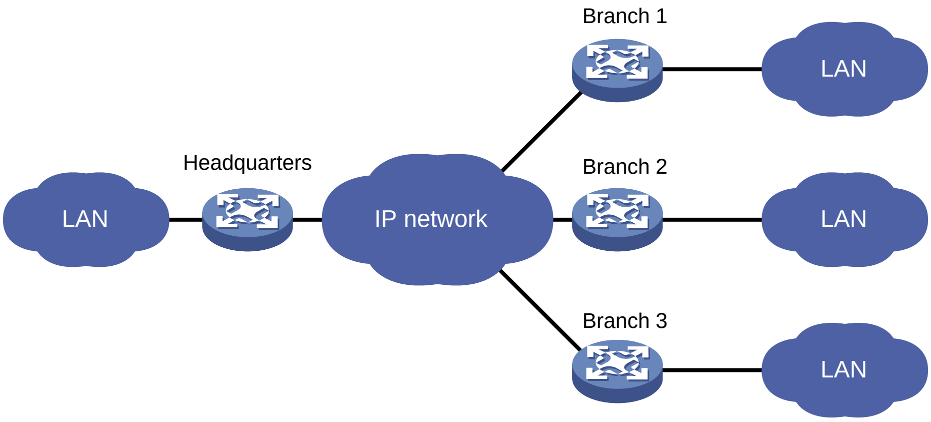
The GRE point-to-multipoint (P2MP) tunnel technology allows the device to use a GRE P2MP tunnel interface to establish a tunnel with multiple destinations.

Application scenario

As shown in Figure 10, an enterprise has multiple branches. For the headquarters to communicate with the branches through tunnels, you can deploy GRE P2MP.

Configure a GRE P2MP tunnel interface on the gateway of the headquarters. Configure GRE/IPv4 or GRE/IPv6 tunnel interfaces (also called point-to-point GRE tunnel interfaces) on the gateways of the branch networks. Use the GRE P2MP tunnel interface on the headquarters gateway to set up a point-to-multipoint tunnel with the point-to-point GRE tunnel interfaces on the branch gateways.

Figure 10 GRE P2MP tunnel application



Benefits

Compared with GRE point-to-point tunnels and other dynamic VPN technologies, GRE P2MP has the following benefits:

- **Simplified configuration**—One GRE P2MP tunnel interface can set up a point-to-multipoint tunnel with multiple point-to-point GRE tunnel interfaces. You do not need to create multiple GRE tunnel interfaces for the headquarters gateway to establish point-to-point tunnels with each branch.
- **Easy maintenance**—When a new branch is added, the headquarters gateway can dynamically learn the tunnel destination address through GRE packets received from the branch. The gateway can automatically set up a tunnel with the branch. Manual configuration is not required.
- **Flexible access**—The headquarters can dynamically learn the tunnel destination addresses. Whether the branch network obtains public addresses dynamically or not does not affect the configuration in the headquarters.
- **Good interoperability and decreased TCO**—The device implements GRE P2MP based on the standard GRE protocol. It does not require other proprietary protocols. GRE P2MP does not have special requirements for the branch gateways. You can use any devices that support GRE as branch gateways.

- **High availability**—Support for tunnel backup in the headquarters and branches.

Working mechanisms

GRE uses the same packet encapsulation and de-encapsulation processes for point-to-multipoint and point-to-point tunnels.

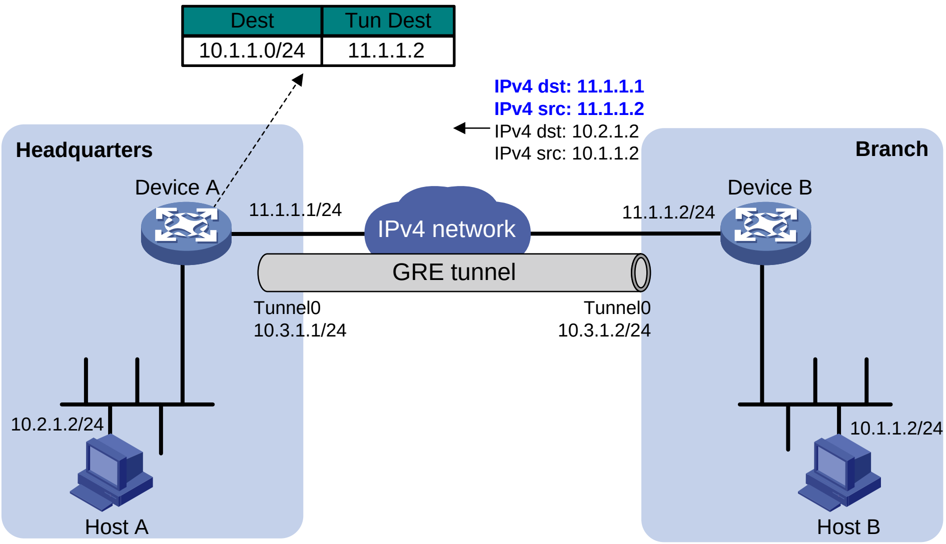
When the device uses a GRE P2MP tunnel to forward traffic, it searches the tunnel entries for the tunnel destination address based on the packet destination IP address. GRE encapsulates the tunnel destination address as the destination IP address in the GRE transport protocol header.

GRE P2MP tunnel entries include dynamic entries and static entries. Dynamic and static entries cannot coexist.

GRE P2MP dynamic tunnel entry learning

As shown in Figure 11, Device A dynamically learns GRE P2MP tunnel entry information (tunnel destination address and packet destination address) from the GRE packets received from the branch. The tunnel destination address is the source IP address in the transport protocol header of the received GRE packet. The packet destination address (branch network address) is the source IP address in passenger protocol header of the received GRE packet.

Figure 11 Dynamically learning a GRE P2MP tunnel entry



GRE P2MP static tunnel entry configuration

In a dynamic GRE P2MP tunnel network, the headquarters gateway cannot actively send packets to branch networks. If the gateway does not receive GRE packets from a branch, it cannot create a dynamic tunnel entry for the branch. To resolve this issue, you can configure GRE P2MP static tunnel entries by applying a GRE P2MP tunnel template to the GRE P2MP tunnel interface. The tunnel mapping entries in the tunnel template are static tunnel entries. A static tunnel entry includes the following information:

- Tunnel destination address.
- Branch network address.
- VPN instance of the branch network.

In the current software version, the device supports only IPv4 static tunnel entries for GRE P2MP.

GRE P2MP tunnel backup

This feature applies only to dynamic GRE P2MP tunnels.

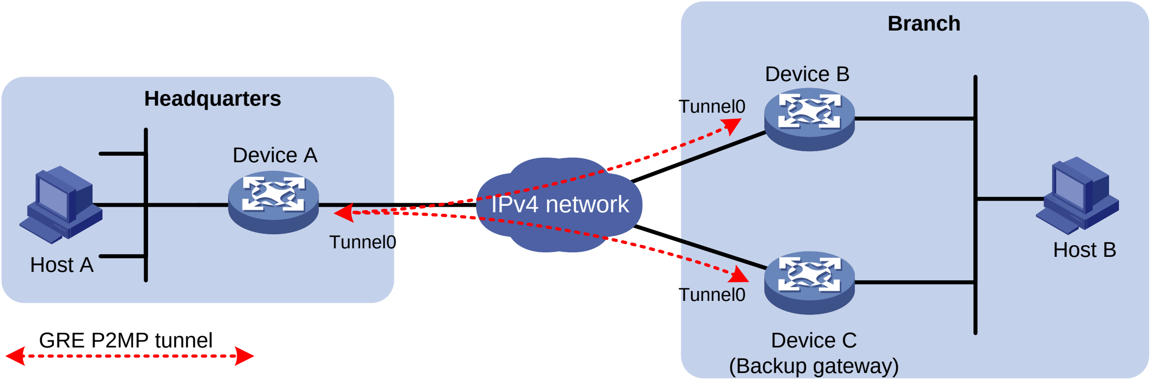
GRE tunnel backup in branches

As shown in Figure 12, deploy redundant gateways in the branch network. Configure a GRE P2MP tunnel interface on the gateway of the headquarters. Use the GRE P2MP tunnel interface to set up a dynamic P2MP tunnel with each branch gateway.

Assign different GRE keys to the tunnel interfaces on the branch gateways. The headquarters gateway selects a dynamic tunnel entry for the branch in the following order:

1. The dynamic tunnel entry that does not have a GRE key.
2. The dynamic tunnel entry that has a GRE key with a lower value.
3. The latest learned dynamic tunnel entry.

Figure 12 GRE tunnel backup in a branch



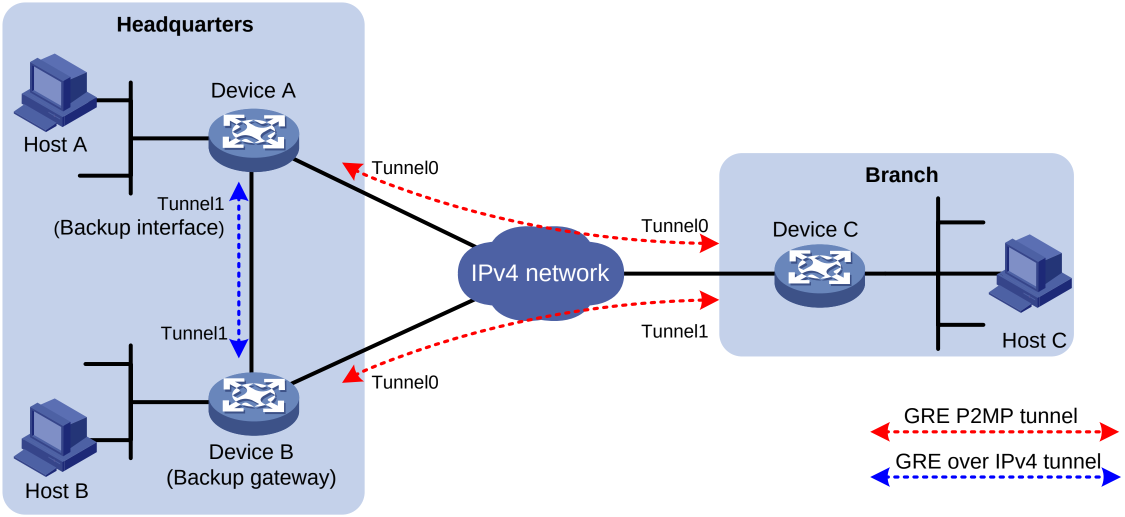
GRE tunnel backup in the headquarters

As shown in Figure 13, deploy redundant gateways in the headquarters, one primary and one backup. Configure a GRE P2MP tunnel interface and a GRE/IPv4 or GRE/IPv6 tunnel interface on each gateway. Specify the GRE/IPv4 or GRE/IPv6 tunnel interface on the primary gateway as the backup interface of its GRE P2MP tunnel interface.

When the primary gateway cannot reach the branch network, it sends the traffic destined for the branch network to the backup gateway through the backup interface. Then, the backup gateway sends the traffic to the destination.

The backup interface is also included for tunnel selection on the primary gateway. If the backup interface does not have a GRE key, its priority is lower than all GRE P2MP dynamic tunnel entries. If the backup interface has a GRE key, the headquarters gateway compares the GRE key with the GRE keys of GRE P2MP dynamic tunnel entries. The lower the value, the higher the priority.

Figure 13 Tunnel backup in the headquarters



Restrictions: Hardware compatibility with GRE P2MP tunnels

Models	GRE P2MP tunnel compatibility
NFNX5-HD6480, NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB1780, NFNX3-HDB3080	Yes
NFNX3-HDB1180, NFNX3-HDB1480, NFNX3-HDB680, NFNX3-HDB1080	No

Restrictions and guidelines: GRE P2MP tunnel configuration

For more information about the **`interface tunnel`**, **`source`**, and **`tunnel discard ipv4-compatible-packet`** commands and additional configuration commands on a tunnel interface, see "Configuring tunneling" and tunneling commands in *VPN Command Reference*.

Restrictions and guidelines for the headquarters end of a P2MP tunnel

When you configure the headquarters end of a P2MP tunnel, follow these restrictions and guidelines:

- Do not configure the same tunnel source address for multiple P2MP tunnel interfaces on the gateway.
- Do not configure the same tunnel source and destination addresses for a GRE P2MP tunnel interface and a GRE tunnel interface.
- Do not configure a GRE key on a GRE P2MP tunnel interface.
- You can specify a mask or prefix length for the headquarters gateway to create dynamic tunnel entries for branch networks. The gateway generates only one dynamic tunnel entry for each branch. Make sure the gateway can reach the devices in all branches by using the dynamic tunnel entries.

Restrictions and guidelines for the branch ends of a P2MP tunnel

The branch networks cannot communicate with one another. They do not have tunnels to reach one another.

When you configure the branch ends of a P2MP tunnel, follow these restrictions and guidelines:

- The tunnel destination address at each branch end must be the tunnel source address configured on the P2MP tunnel interface on the headquarters.
- On each gateway, the IP address of the tunnel interface and the tunnel destination address configured on the tunnel interface must be in different subnets.
- You can configure GRE keys on the branch GRE tunnel interfaces for the headquarters to determine the dynamic tunnel entry priority of each branch.

Restrictions and guidelines for all ends of a P2MP tunnel

The following restrictions and guidelines apply to all ends of a P2MP tunnel:

- You can enable or disable GRE checksum at each end of a tunnel. If GRE checksum is enabled at a tunnel end, the tunnel end sends packets carrying the checksum to the peer end. A tunnel end checks the GRE checksum of a received packet if the packet carries a GRE checksum, whether or not the tunnel end is enabled with GRE checksum.
- Configure routes reaching the destination networks through the local tunnel interface. You can configure the routes by using one of the following methods:
  - Configure static routes, using the local tunnel interface as the outgoing interface of the routes.
  - Enable a dynamic routing protocol on both the tunnel interface and the interface connecting the private network. This allows the dynamic routing protocol to establish routing entries with the tunnel interface as the outgoing interface.
- Dynamic entry-based GRE P2MP tunnels cannot forward private traffic.

GRE P2MP tunnel interface configuration tasks at a glance

To configure a GRE P2MP tunnel interface, perform one of the following tasks:

- Configuring a GRE P2MP tunnel interface for dynamic entry-based tunnel setup
- Configuring a GRE P2MP tunnel interface for static entry-based tunnel setup

Configuring a GRE P2MP tunnel interface

Configuring a GRE P2MP tunnel interface for dynamic entry-based tunnel setup

1. Enter system view.

   `system-view`

2. Create a GRE P2MP tunnel interface and enter tunnel interface view.

   interface tunnel *interface-number* **mode gre-p2mp** [**ipv6**]

   In this mode, the transport and passenger protocols support both IPv4 and IPv6.

   The other end of a GRE P2MP tunnel interface must be a GRE/IPv4 or GRE/IPv6 tunnel interface.

3. Configure an IP address for the tunnel interface.

IPv4:

For information about how to assign an IPv4 address to an interface, see "Configuring IP addressing."

IPv6:

For information about how to assign an IPv6 address to an interface, see "Configuring basic IPv6 settings."

By default, no IP address is configured for a tunnel interface.

4. Configure a source IP address or source interface for the tunnel.

   ```
   source { ipv4-address | ipv6-address | interface-type
   interface-number }
   ```

   By default, no source IP address or interface is configured for a tunnel.

   If you configure a source IP address, the tunnel interface uses the source IP address as the source IP address of encapsulated packets.

   If you configure a source interface, the tunnel interface uses the following IP address as the source IP address of encapsulated packets:

   - Primary IP address of the source interface in an IPv4 network.
   - The lowest IP address of the source interface in an IPv6 network.

5. (Optional.) Enable GRE checksum.

   ```
   gre checksum
   ```

   By default, GRE checksum is disabled.

6. (Optional.) Set an aging timer for dynamic tunnel entries of the GRE P2MP tunnel interface.

   ```
   gre p2mp aging-time aging-time
   ```

   By default, the aging timer is 5 seconds for dynamic tunnel entries of a GRE P2MP tunnel interface.

7. (Optional.) Specify a backup interface for the GRE P2MP tunnel interface.

   ```
   gre p2mp backup-interface tunnel number
   ```

   By default, no backup interface is specified for a GRE P2MP tunnel interface.

   The backup interface must be a GRE/IPv4 or GRE/IPv6 tunnel interface. The backup interface must exist.

8. (Optional.) Specify an IPv4 address mask or IPv6 address prefix for the branch networks.

   ```
   gre p2mp branch-network-mask { mask | mask-length | ipv6 prefix-length }
   ```

   By default, the IPv4 address mask is 255.255.255.255 (the mask length is 32) and the IPv6 address prefix length is 128.

9. (Optional.) Enable next hop host route learning.

   ```
   gre p2mp nexthop-learning
   ```

   By default, next hop host route learning is disabled.

   This command is supported only on GRE/IPv4 P2MP tunnel interfaces.

10. Return to system view.

    ```
    quit
    ```

11. (Optional.) Enable dropping IPv6 packets that use IPv4-compatible IPv6 addresses.

    ```
    tunnel discard ipv4-compatible-packet
    ```

    By default, IPv6 packets that use IPv4-compatible IPv6 packets are not dropped.

Configuring a GRE P2MP tunnel interface for static entry-based tunnel setup

1. Enter system view.

   system-view

2. Create a GRE P2MP tunnel template and enter its view.

   gre p2mp-template *template-name*

3. Configure a tunnel mapping entry.

   map [**vpn-instance** *vpn-instance-name*] **branch-network-address** *branch-network-address* { *mask* | *mask-length* } **tunnel-destination** *tunnel-dest-address* [**checksum-fill** *checksum-value*]

   By default, no tunnel mapping entries are configured for a GRE P2MP tunnel template.

   Specify the **checksum-fill** *checksum-value* option depending on your network. The option might cause GRE checksum failures.

4. Return to system view.

   quit

5. Create a GRE P2MP tunnel interface and enter its view.

   interface tunnel *interface-number* **mode gre-p2mp**

   The other end of a GRE P2MP tunnel interface must be a GRE/IPv4 tunnel interface.

6. Configure an IPv4 address for the tunnel interface.

   For information about how to assign an IPv4 address to an interface, see "Configuring IP addressing."

   By default, no IPv4 address is configured for a tunnel interface.

7. Configure a source IP address or source interface for the tunnel.

   source { *ipv4-address* | *interface-type interface-number* }

   By default, no source IP address or interface is configured for a tunnel.

   If you configure a source IP address, the tunnel interface uses the source IP address as the source IP address of encapsulated packets.

   If you configure a source interface, the tunnel interface uses the primary IP address of the source interface as the source IP address of encapsulated packets.

8. Apply the GRE P2MP tunnel template to the tunnel interface.

   gre p2mp-template *template-name*

   By default, no GRE P2MP tunnel template is applied to a GRE P2MP tunnel interface.

   You must specify an existing GRE P2MP tunnel template for this command.

9. (Optional.) Enable GRE checksum.

   gre checksum

   By default, GRE checksum is disabled.

10. (Optional.) Enable GRE packets to carry VPC information.

    gre vpc enable

    By default, GRE packets do not carry VPC information.

11. (Optional.) Configure the preference of static routes issued by the tunnel mapping entries in the GRE P2MP tunnel template.

    tunnel route-static [**preference** *preference-value*]

    By default, the preference is 60.

Display and maintenance commands for GRE P2MP tunnels

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display dynamic tunnel entry information for a GRE P2MP tunnel interface.	**display gre p2mp tunnel-table interface tunnel** *number* [**ipv4** | **ipv6**]
Display packet statistics of static tunnel entries for a GRE P2MP tunnel interface.	**display gre p2mp tunnel-table statistics interface tunnel** *number* [**vpn-instance** *vpn-instance-name*] [**branch-network-address** *branch-network-address* { *mask* | *mask-length* }]
Clear dynamic tunnel entry information for a GRE P2MP tunnel interface.	**reset gre p2mp tunnel-table interface tunnel** *number* [**destination** { *dest-address* | **ipv6** *dest-ipv6-address* } **tunnel-destination** { *tunnel-dest-address* | **ipv6** *tunnel-dest-address* }]
Clear packet statistics of static tunnel entries for a GRE P2MP tunnel interface.	**reset gre p2mp tunnel-table statistics interface tunnel** *number* [**vpn-instance** *vpn-instance-name*] [**branch-network-address** *branch-network-address* { *mask* | *mask-length* }]

GRE P2MP tunnel configuration examples

Example: Configuring a GRE P2MP tunnel

Network configuration

As shown in Figure 14, Device A is the gateway of the headquarters, and Device B and Device C are the gateways of the branches.

Configure the devices to meet the following requirements:

- Device A can dynamically set up a GRE P2MP tunnel with multiple branch gateways.
- Device B and Device C each can set up a GRE tunnel with Device A.
- Branch 1 and Branch 2 cannot communicate.

Figure 14 Network diagram

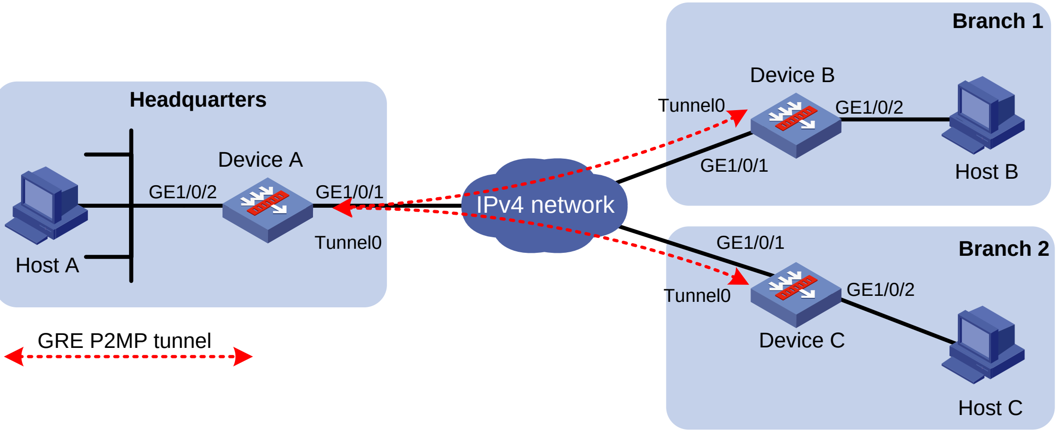


Table 1 IP address assignment

Device	Interface	IP address	Security zone
Device A	GE1/0/1	11.1.1.1/24	Untrust
	GE1/0/2	192.168.11.1/24	Trust
	Tunnel 0	192.168.22.1/24	Untrust
Device B	GE1/0/1	11.1.2.2/24	Untrust
	GE1/0/2	192.168.12.1/24	Trust
	Tunnel 0	192.168.22.2/24	Untrust
Device C	GE1/0/1	11.1.2.3/24	Untrust
	GE1/0/2	192.168.13.1/24	Trust
	Tunnel 0	192.168.22.3/24	Untrust

Procedure

This example uses Device B to describe the gateway configuration for a branch. The gateway configuration for other branches is the same as the gateway configuration on Device B.

1. Configure Device A:

# Assign an IP addresse to interface GigabitEthernet 1/0/1.

```
<DeviceA> system-view
[DeviceA] interface gigabitethernet 1/0/1
[DeviceA-GigabitEthernet1/0/1] ip address 11.1.1.1 255.255.255.0
[DeviceA-GigabitEthernet1/0/1] quit
```

# Assign IP addresses to other interfaces in the same way. (Details not shown.)

# Create tunnel interface **Tunnel 0** and specify the tunnel mode as GRE P2MP.

```
[DeviceA] interface tunnel 0 mode gre-p2mp
[DeviceA-Tunnel0] ip address 192.168.22.1 255.255.255.0
[DeviceA-Tunnel0] source 11.1.1.1
[DeviceA-Tunnel0] gre p2mp branch-network-mask 255.255.255.0
[DeviceA-Tunnel0] gre p2mp aging-time 20
[DeviceA-Tunnel0] quit
```

# Configure settings for routing. This example configures static routes. In the routes, the output interface is Tunnel 0 and the next hop is 11.1.2.2.

```
[DeviceA] ip route-static 11.1.2.2 24 11.1.1.2
[DeviceA] ip route-static 192.168.12.0 255.255.255.0 tunnel 0
```

# Add interfaces to security zones.

```
[DeviceA] security-zone name Untrust
[DeviceA-security-zone-Untrust] import interface Tunnel 0
[DeviceA-security-zone-Untrust] import interface gigabitethernet 1/0/1
[DeviceA-security-zone-Untrust] quit
[DeviceA] security-zone name Trust
[DeviceA-security-zone-Trust] import interface gigabitethernet 1/0/2
[DeviceA-security-zone-Trust] quit
```

# Configure a rule named **grelocalout** in the IPv4 security policy to allow Device A to send packets to Device B.

```
[DeviceA] security-policy ip
[DeviceA-security-policy-ip] rule name grelocalout
[DeviceA-security-policy-ip-1-grelocalout] source-zone local
[DeviceA-security-policy-ip-1-grelocalout] destination-zone untrust
[DeviceA-security-policy-ip-1-grelocalout] source-ip-host 11.1.1.1
[DeviceA-security-policy-ip-1-grelocalout] source-ip-host 192.168.22.1
[DeviceA-security-policy-ip-1-grelocalout] source-ip-host 192.168.11.1
[DeviceA-security-policy-ip-1-grelocalout] destination-ip-host 11.1.2.2
[DeviceA-security-policy-ip-1-grelocalout] destination-ip-host 192.168.22.2
[DeviceA-security-policy-ip-1-grelocalout] destination-ip-host 192.168.12.1
[DeviceA-security-policy-ip-1-grelocalout] action pass
[DeviceA-security-policy-ip-1-grelocalout] quit
```

# Configure a rule named **grelocalin** in the IPv4 security policy to to allow Device A to receive the packets sent from Device B.

```
[DeviceA-security-policy-ip] rule name grelocalin
[DeviceA-security-policy-ip-2-grelocalin] source-zone untrust
[DeviceA-security-policy-ip-2-grelocalin] destination-zone local
[DeviceA-security-policy-ip-2-grelocalin] source-ip-host 11.1.2.2
[DeviceA-security-policy-ip-2-grelocalin] source-ip-host 192.168.22.2
[DeviceA-security-policy-ip-2-grelocalin] source-ip-host 192.168.12.1
[DeviceA-security-policy-ip-2-grelocalin] destination-ip-host 11.1.1.1
[DeviceA-security-policy-ip-2-grelocalin] destination-ip-host 192.168.22.1
[DeviceA-security-policy-ip-2-grelocalin] destination-ip-host 192.168.11.1
[DeviceA-security-policy-ip-2-grelocalin] action pass
[DeviceA-security-policy-ip-2-grelocalin] quit
[DeviceA-security-policy-ip] quit
```

2. Configure Device B:

# Assign an IP addresse to interface GigabitEthernet 1/0/1.

```
<DeviceB> system-view
[DeviceB] interface gigabitethernet 1/0/1
[DeviceB-GigabitEthernet1/0/1] ip address 11.1.2.2 255.255.255.0
[DeviceB-GigabitEthernet1/0/1] quit
```

# Assign IP addresses to other interfaces in the same way. (Details not shown.)

# Create tunnel interface **Tunnel 0** and specify the tunnel mode as GRE/IPv4.

```
[DeviceB] interface tunnel 0 mode gre
[DeviceB-Tunnel0] ip address 192.168.22.2 255.255.255.0
```

```
[DeviceB-Tunnel0] source 11.1.2.2
[DeviceB-Tunnel0] destination 11.1.1.1
[DeviceB-Tunnel0] quit
```

# Configure settings for routing. This example configures static routes. In the routes, the output interface is Tunnel 0 and the next hop is 11.1.2.3.

```
[DeviceB] ip route-static 11.1.1.1 24 11.1.2.3
[DeviceB] ip route-static 192.168.11.0 24 tunnel 0
```

# Add interfaces to security zones.

```
[DeviceB] security-zone name Untrust
[DeviceB-security-zone-Untrust] import interface Tunnel 0
[DeviceB-security-zone-Untrust] import interface gigabitethernet 1/0/1
[DeviceB-security-zone-Untrust] quit
[DeviceB] security-zone name Trust
[DeviceB-security-zone-Trust] import interface gigabitethernet 1/0/2
[DeviceB-security-zone-Trust] quit
```

# Configure a rule named **grelocalout** in the IPv4 security policy to allow Device B to send packets to Device A.

```
[DeviceB] security-policy ip
[DeviceB-security-policy-ip] rule name grelocalout
[DeviceB-security-policy-ip-1-grelocalout] source-zone local
[DeviceB-security-policy-ip-1-grelocalout] destination-zone untrust
[DeviceB-security-policy-ip-1-grelocalout] source-ip-host 11.1.2.2
[DeviceB-security-policy-ip-1-grelocalout] source-ip-host 192.168.22.2
[DeviceB-security-policy-ip-1-grelocalout] source-ip-host 192.168.12.1
[DeviceB-security-policy-ip-1-grelocalout] destination-ip-host 11.1.1.1
[DeviceB-security-policy-ip-1-grelocalout] destination-ip-host 192.168.22.1
[DeviceB-security-policy-ip-1-grelocalout] destination-ip-host 192.168.11.1
[DeviceB-security-policy-ip-1-grelocalout] action pass
[DeviceB-security-policy-ip-1-grelocalout] quit
```

# Configure a rule named **grelocalin** in the IPv4 security policy to to allow Device B to receive the packets sent from Device A.

```
[DeviceB-security-policy-ip] rule name grelocalin
[DeviceB-security-policy-ip-2-grelocalin] source-zone untrust
[DeviceB-security-policy-ip-2-grelocalin] destination-zone local
[DeviceB-security-policy-ip-2-grelocalin] source-ip-host 11.1.1.1
[DeviceB-security-policy-ip-2-grelocalin] source-ip-host 192.168.22.1
[DeviceB-security-policy-ip-2-grelocalin] source-ip-host 192.168.11.1
[DeviceB-security-policy-ip-2-grelocalin] destination-ip-host 11.1.2.2
[DeviceB-security-policy-ip-2-grelocalin] destination-ip-host 192.168.22.2
[DeviceB-security-policy-ip-2-grelocalin] destination-ip-host 192.168.12.1
[DeviceB-security-policy-ip-2-grelocalin] action pass
[DeviceB-security-policy-ip-2-grelocalin] quit
[DeviceB-security-policy-ip] quit
```

Verifying the configuration

# Display GRE P2MP tunnel entries on Device A. The output shows that Device A does not have GRE P2MP tunnel entries.

```
[DeviceA] display gre p2mp tunnel-table interface tunnel 0
Total number:0
```

```
Dest Addr               Mask/Prefix Len Tunnel Dest Addr        Gre Key   Aging
```

# Ping Host A from Host B. The ping operation succeeds. (Details not shown.)

# Display GRE P2MP tunnel entries again on Device A. The output shows that Device A has created a GRE P2MP tunnel entry destined for the branch.

```
[DeviceA] display gre p2mp tunnel-table interface tunnel 0
Total number:1
Dest Addr               Mask/Prefix Len Tunnel Dest Addr        Gre Key   Aging
192.168.12.0            255.255.255.0   11.1.2.2                          5
```

Example: Configuring GRE P2MP headquarters-side tunnel backup

Network configuration

As shown in Figure 15, Device A is the gateway of the headquarters, Device B is the backup gateway of the headquarters, and Device C is the gateway of the branch.

Configure the devices as follows:

- Configure a GRE P2MP tunnel interface on Device A and Device B, respectively. Device A and Device B use the interfaces to establish GRE P2MP tunnels with Device C.
- Configure a GRE/IPv4 tunnel interface on Device A and Device B, respectively. Configure the GRE/IPv4 tunnel interface on Device A as the backup interface of the GRE P2MP tunnel interface. To avoid loops, do not configure the GRE/IPv4 tunnel interface on Device B as the backup interface of the GRE P2MP tunnel interface.
- Configure GRE/IPv4 tunnel interfaces on Device C for the device to establish tunnels with Device A and Device B.

Figure 15 Network diagram

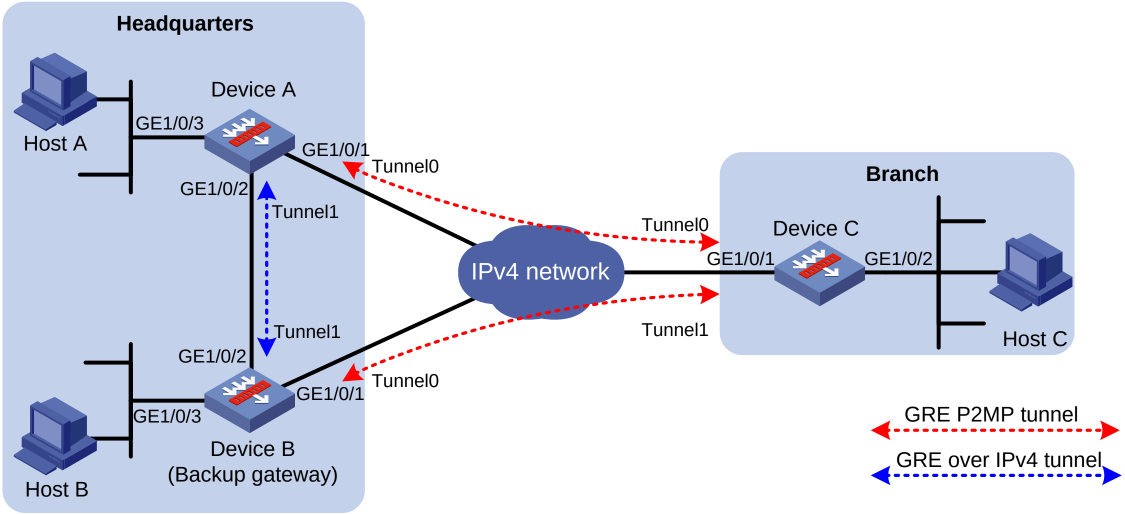

Table 2 IP address assignment

Device	Interface	IP address	Security zone
Device A	GE1/0/1	11.1.1.1/24	Untrust
	GE1/0/2	10.1.1.1/24	Trust
	GE1/0/3	192.168.11.1/24	Trust

Device	Interface	IP address	Security zone
	Tunnel 0	172.168.1.1/24	Untrust
	Tunnel 1	192.168.22.1/24	Trust
Device B	GE1/0/1	11.1.2.2/24	Untrust
	GE1/0/2	10.1.1.2/24	Trust
	GE1/0/3	192.168.11.2/24	Trust
	Tunnel 0	172.168.2.2/24	Untrust
	Tunnel 1	192.168.22.2/24	Trust
Device C	GE1/0/1	11.1.2.3/24	Untrust
	GE1/0/2	192.168.12.1/24	Trust
	Tunnel 0	172.168.1.3/24	Untrust
	Tunnel 1	172.168.2.3/24	Untrust

Restrictions and guidelines

You need to disconnect the link between Device A and Device C to verify the tunnel backup feature. To make sure Device C can detect the link loss and switch the traffic forwarding path to the link connecting Device B, perform one of the following tasks:

- If Device C and Device A are directly connected, configure static routes on Device C.
- If Device C and Device A are not directly connected, use one of the following methods:
  - Configure a dynamic routing protocol on Device A, Device B, and Device C.
  - Configure static routes on Device C and associate the routes with track entries for detecting the route reachability status. For more information about track entries, see Track in *Network Management and Monitoring Configuration Guide*.

This example uses the static routes method.

Procedure

1. Configure Device A:

   # Assign an IP addresse to interface GigabitEthernet 1/0/1.

```
<DeviceA> system-view
[DeviceA] interface gigabitethernet 1/0/1
[DeviceA-GigabitEthernet1/0/1] ip address 11.1.1.1 255.255.255.0
[DeviceA-GigabitEthernet1/0/1] quit
```

   # Assign IP addresses to other interfaces in the same way. (Details not shown.)

   # Create tunnel interface **Tunnel 1** and specify the tunnel mode as GRE/IPv4.

```
[DeviceA] interface tunnel 1 mode gre
[DeviceA-Tunnel1] ip address 192.168.22.1 255.255.255.0
[DeviceA-Tunnel1] source 10.1.1.1
[DeviceA-Tunnel1] destination 10.1.2.2
[DeviceA-Tunnel1] quit
```

   # Create tunnel interface **Tunnel 0** and specify the tunnel mode as GRE P2MP.

```
[DeviceA] interface tunnel 0 mode gre-p2mp
[DeviceA-Tunnel0] ip address 172.168.1.1 255.255.255.0
[DeviceA-Tunnel0] source 11.1.1.1
[DeviceA-Tunnel0] gre p2mp branch-network-mask 255.255.255.0
```

```
[DeviceA-Tunnel0] gre p2mp aging-time 20
[DeviceA-Tunnel0] gre p2mp backup-interface tunnel 1
[DeviceA-Tunnel0] quit
```

# Configure settings for routing. This example configures static routes. In the routes, the output interface is Tunnel 0 and the next hop is 11.1.1.2.

```
[DeviceA] ip route-static 11.1.3.3 24 11.1.1.2
[DeviceA] ip route-static 192.168.12.0 255.255.255.0 tunnel 0
```

# Add interfaces to security zones.

```
[DeviceA] security-zone name Untrust
[DeviceA-security-zone-Untrust] import interface Tunnel 0
[DeviceA-security-zone-Untrust] import interface gigabitethernet 1/0/1
[DeviceA-security-zone-Untrust] quit
[DeviceA] security-zone name Trust
[DeviceA-security-zone-Trust] import interface gigabitethernet 1/0/2
[DeviceA-security-zone-Trust] import interface gigabitethernet 1/0/2
[DeviceA-security-zone-Untrust] import interface Tunnel 1
[DeviceA-security-zone-Trust] quit
```

# Configure a rule named **grelocalout** in the IPv4 security policy to allow Device A to send packets to Device C.

```
[DeviceA] security-policy ip
[DeviceA-security-policy-ip] rule name grelocalout
[DeviceA-security-policy-ip-1-grelocalout] source-zone local
[DeviceA-security-policy-ip-1-grelocalout] destination-zone untrust
[DeviceA-security-policy-ip-1-grelocalout] source-ip-host 11.1.1.1
[DeviceA-security-policy-ip-1-grelocalout] source-ip-host 172.168.1.1
[DeviceA-security-policy-ip-1-grelocalout] source-ip-host 192.168.11.1
[DeviceA-security-policy-ip-1-grelocalout] destination-ip-host 11.1.3.3
[DeviceA-security-policy-ip-1-grelocalout] destination-ip-host 172.168.1.3
[DeviceA-security-policy-ip-1-grelocalout] destination-ip-host 192.168.12.1
[DeviceA-security-policy-ip-1-grelocalout] action pass
[DeviceA-security-policy-ip-1-grelocalout] quit
```

# Configure a rule named **grelocalin** in the IPv4 security policy to allow Device A to receive the packets sent from Device C.

```
[DeviceA-security-policy-ip] rule name grelocalin
[DeviceA-security-policy-ip-2-grelocalin] source-zone untrust

[DeviceC-security-policy-ip-2-grelocalin] destination-ip-host 172.168.2.3
[DeviceC-security-policy-ip-2-grelocalin] destination-ip-host 192.168.12.1
[DeviceC-security-policy-ip-2-grelocalin] action pass
[DeviceC-security-policy-ip-2-grelocalin] quit
[DeviceC-security-policy-ip] quit
```

Verifying the configuration

# Ping Host A from Host C. The ping operation succeeds. (Details not shown.)

# Display GRE P2MP tunnel entries on Device A.

```
[DeviceA] display gre p2mp tunnel-table interface tunnel 0
Total number:1
Dest Addr             Mask/Prefix Len Tunnel Dest Addr        Gre Key   Aging
192.168.12.0          255.255.255.0   11.1.3.3                          10
```

The output shows that Device A has a GRE P2MP tunnel entry for the branch.

# Shut down tunnel interface **Tunnel 0** on Device C.

```
[DeviceC] interface tunnel 0
[DeviceC-Tunnel0] shutdown
[DeviceC-Tunnel0] quit
```

# Verify that Device A has deleted the GRE P2MP tunnel entry for the branch after the tunnel entry aging timer expires.

```
[DeviceA] display gre p2mp tunnel-table interface tunnel 0
Total number:0
Dest Addr             Mask/Prefix Len Tunnel Dest Addr        Gre Key   Aging
```

# Ping Host A from Host C. The ping operation succeeds. (Details not shown.)

# Display GRE P2MP tunnel entries on Device B.

```
[DeviceB] display gre p2mp tunnel-table interface tunnel 0
Total number:1
Dest Addr             Mask/Prefix Len Tunnel Dest Addr        Gre Key   Aging
192.168.12.0          255.255.255.0   11.1.3.3                          10
```

The output shows that Device B has created a tunnel entry destined for the branch. This indicates that Device A forwarded traffic destined for the branch to Device B through the backup tunnel interface.

Example: Configuring GRE P2MP branch-side tunnel backup

Network configuration

As shown in Figure 16, Device A is the gateway of the headquarters, Device B is the gateway of the branch, and Device C is the backup gateway of the branch.

Configure the devices as follows:

- Configure a GRE P2MP tunnel interface on Device A. Device A uses the interface to establish a GRE P2MP tunnel with Device B and Device C.
- Configure a GRE/IPv4 tunnel interface on Device B and Device C, respectively. The devices use the tunnel interfaces to establish tunnels with Device A.
- Assign different GRE keys to the GRE/IPv4 tunnel interfaces on Device B and Device C. Device A selects the tunnel that has a GRE key with a higher priority to forward traffic. In this example, the tunnel destined for Device B has a higher priority.

Figure 16 Network diagram

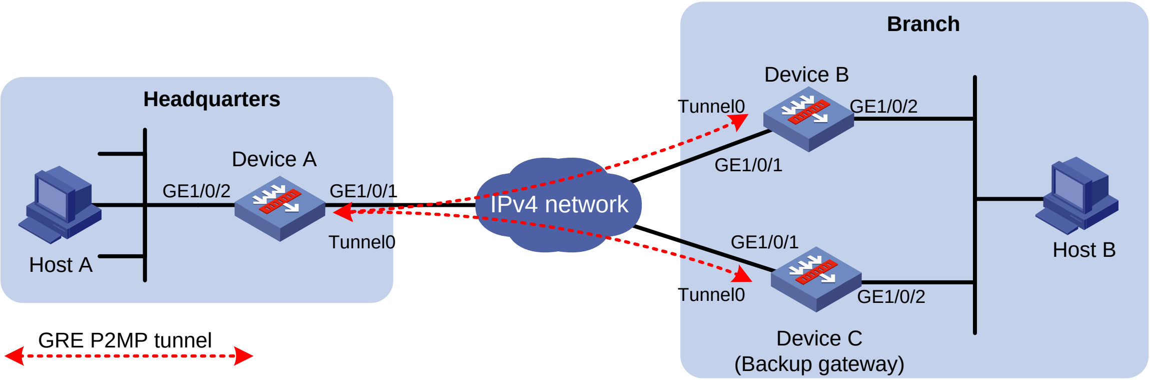

Table 3 IP address assignment

Device	Interface	IP address	Security zone
Device A	GE1/0/1	11.1.1.1/24	Untrust
	GE1/0/2	172.17.17.1/24	Trust
	Tunnel 0	192.168.22.1/24	Untrust
Device B	GE1/0/1	11.1.2.2/24	Untrust
	GE1/0/2	192.168.1.2/24	Trust
	Tunnel 0	192.168.22.2/24	Untrust
Device C	GE1/0/1	11.1.3.3/24	Untrust
	GE1/0/2	192.168.1.3/24	Trust
	Tunnel 0	192.168.22.3/24	Untrust

Procedure

1. Configure Device A:

# Assign IP addresses to interfaces GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2.

```
<DeviceA> system-view
[DeviceA] interface gigabitethernet 1/0/1
[DeviceA-GigabitEthernet1/0/1] ip address 11.1.1.1 255.255.255.0
[DeviceA-GigabitEthernet1/0/1] quit
[DeviceA] interface gigabitethernet 1/0/2
[DeviceA-GigabitEthernet1/0/2] ip address 172.17.17.1 255.255.255.0
[DeviceA-GigabitEthernet1/0/2] quit
```

# Create tunnel interface **Tunnel 0** and specify the tunnel mode as GRE P2MP.

```
[DeviceA] interface tunnel 0 mode gre-p2mp
[DeviceA-Tunnel0] ip address 192.168.22.1 255.255.255.0
[DeviceA-Tunnel0] gre p2mp branch-network-mask 255.255.255.0
[DeviceA-Tunnel0] gre p2mp aging-time 20
[DeviceA-Tunnel0] source 11.1.1.1
[DeviceA-Tunnel0] quit
```

# Configure settings for routing. This example configures static routes. In the routes, the output interface is Tunnel 0 and the next hop is 11.1.1.2.

```
[DeviceA] ip route-static 11.1.2.2 24 11.1.1.2
[DeviceA] ip route-static 11.1.3.3 24 11.1.1.2
[DeviceA] ip route-static 192.168.1.0 24 tunnel 0
```

# Add interfaces to security zones.

```
[DeviceA] security-zone name Untrust
[DeviceA-security-zone-Untrust] import interface Tunnel 0
[DeviceA-security-zone-Untrust] import interface gigabitethernet 1/0/1
[DeviceA-security-zone-Untrust] quit
[DeviceA] security-zone name Trust
[DeviceA-security-zone-Trust] import interface gigabitethernet 1/0/2
[DeviceA-security-zone-Trust] quit
```

# Configure a rule named **grelocalout** in the IPv4 security policy to allow Device A to send packets to Device B and Device C.

```
[DeviceA] security-policy ip
```

```

[DeviceC-security-policy-ip-2-grelocalin] destination-ip-host 192.168.1.3
[DeviceC-security-policy-ip-2-grelocalin] action pass
[DeviceC-security-policy-ip-2-grelocalin] quit
[DeviceC-security-policy-ip] quit
```

Verifying the configuration

# Configure Device C as the default gateway of Host B, and then ping Host A from Host B. The ping operation succeeds. (Details not shown.)

# Display GRE P2MP tunnel entries on Device A.

```
[DeviceA] display gre p2mp tunnel-table interface tunnel 0
Total number:1
Dest Addr             Mask/Prefix Len Tunnel Dest Addr        Gre Key   Aging
192.168.1.0           255.255.255.0   11.1.3.3                2         20
```

# Configure the default gateway of Host B as Device B, and then ping Host A from Host B. The ping operation succeeds. (Details not shown).

# Display GRE P2MP tunnel entries on Device A.

```
[DeviceA] display gre p2mp tunnel-table interface tunnel 0
Total number:2
Dest Addr             Mask/Prefix Len Tunnel Dest Addr        Gre Key   Aging
192.168.1.0           255.255.255.0   11.1.3.3                2         20
192.168.1.0           255.255.255.0   11.1.2.2                1         20
```

The output shows that Device A has two GRE P2MP tunnel entries destined for the branch. The device prefers the tunnel entry with a lower GRE key value. The entry destined for Device B is preferred.

# Shut down tunnel interface **Tunnel 0** on Device B.

```
[DeviceB] interface tunnel 0
[DeviceB-Tunnel0] shutdown
[DeviceB-Tunnel0] quit
```

# Change the default gateway of Host B to Device C. (Details not shown.)

# Ping Host A from Host B after the GRE P2MP tunnel entry destined for Device B ages. The ping operation succeeds. (Details not shown.)

# Display GRE P2MP tunnel entries on Device A.

```
[DeviceA] display gre p2mp tunnel-table interface tunnel 0
Total number:1
Dest Addr             Mask/Prefix Len Tunnel Dest Addr        Gre Key   Aging
192.168.1.0           255.255.255.0   11.1.1.3                2         10
```

The output shows that Device A can forward traffic to hosts in the branch only through Device C.

Configuring L2TP

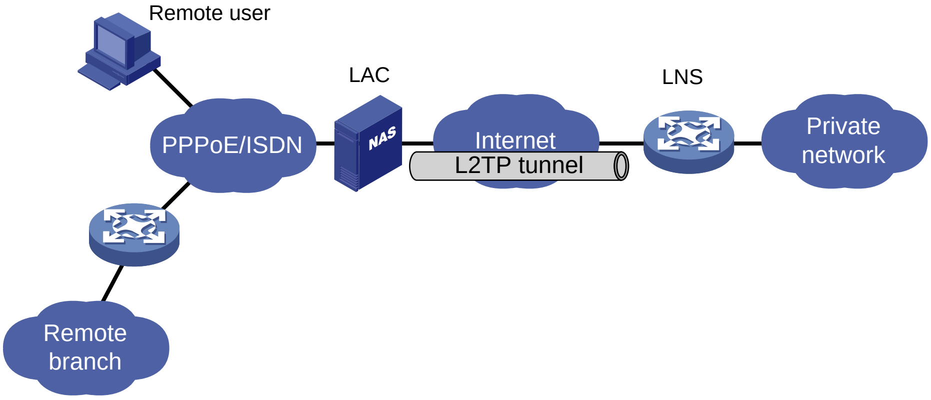
About L2TP

The Layer 2 Tunneling Protocol (L2TP) is a Virtual Private Dialup Network (VPDN) tunneling protocol. L2TP sets up point-to-point tunnels across a public network (for example, the Internet) and transmits encapsulated PPP frames (L2TP packets) over the tunnels. With L2TP, remote users can access the private networks through L2TP tunnels after connecting to a public network by using PPP.

As a Layer 2 VPN technology, L2TP provides a secure, cost-effective solution for remote users to access private networks.

Typical L2TP networking

Figure 1 L2TP network diagram



As shown in Figure 1, a typical L2TP network has the following components:

- **Remote system**—A remote system is usually a remote user's host or a remote branch's device that needs to access the private network.
- **LAC**—An L2TP access concentrator (LAC) is both PPP and L2TP capable. It is usually a network access server (NAS) located at a local ISP, which provides access services mainly for PPP users.

  An LAC is an endpoint of an L2TP tunnel and lies between an LNS and a remote system. It encapsulates packets received from a remote system by using L2TP and then sends the encapsulated packets to the LNS. It decapsulates packets received from the LNS and then sends the decapsulated packets to the intended remote system.
- **LNS**—An L2TP network server (LNS) is both PPP and L2TP capable. It is usually an edge device on an enterprise network.

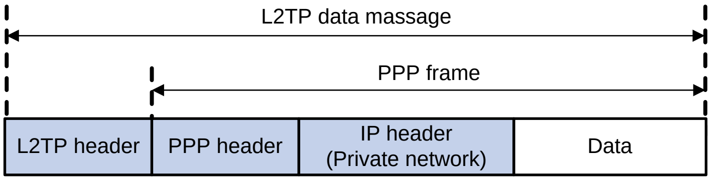
  An LNS is the other endpoint of an L2TP tunnel. It is the logical termination point of a PPP session tunneled by the LAC. L2TP extends the termination point of a PPP session from a NAS to an LNS by establishing a tunnel.

L2TP message types and encapsulation structure

L2TP uses the following types of messages:

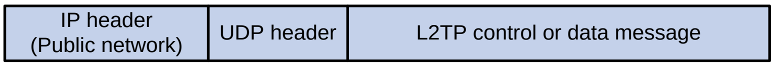
- **Control messages**—Used to establish, maintain, and delete L2TP tunnels and sessions. Control messages are transmitted over a reliable control channel, which supports flow control and congestion control.
- **Data messages**—Used to encapsulate PPP frames, as shown in Figure 2. Data messages are transmitted over an unreliable data channel and are not retransmitted when packet loss occurs. Data messages can use sequence numbers to reorder packets that are disordered during transport.

Figure 2 Data message format



As shown in Figure 3, both control messages and data messages are encapsulated in UDP datagrams.

Figure 3 L2TP encapsulation structure



L2TP tunnel and session

An L2TP tunnel is a virtual point-to-point connection between an LAC and an LNS. Multiple L2TP tunnels can be established between an LNS and an LAC. An L2TP tunnel can carry one or more L2TP sessions. Each L2TP session corresponds to a PPP session and is multiplexed on an L2TP tunnel. An L2TP session is established between the LAC and LNS when an end-to-end PPP session is established between a remote system and the LNS. Data frames for the PPP session are transmitted over the tunnel between the LAC and LNS.

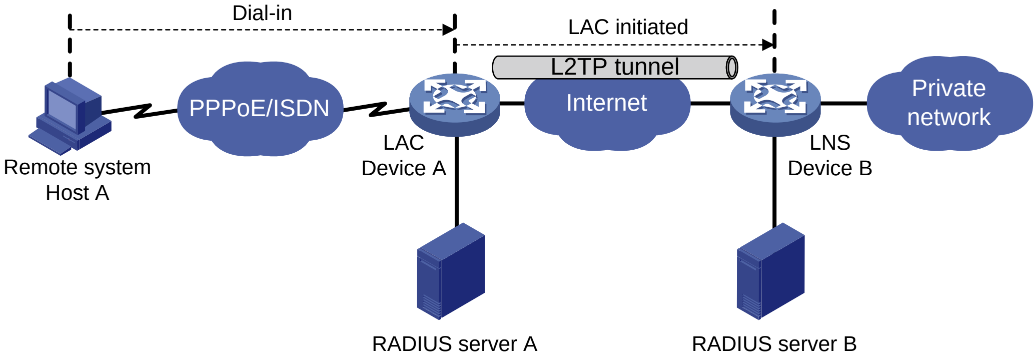
L2TP tunneling modes and tunnel establishment process

L2TP tunneling modes include NAS-initiated, client-initiated, and LAC-auto-initiated.

NAS-initiated tunneling mode

As shown in Figure 4, a remote system dials in to the LAC through a PPPoE network. The LAC initiates a tunneling request to the LNS over the Internet.

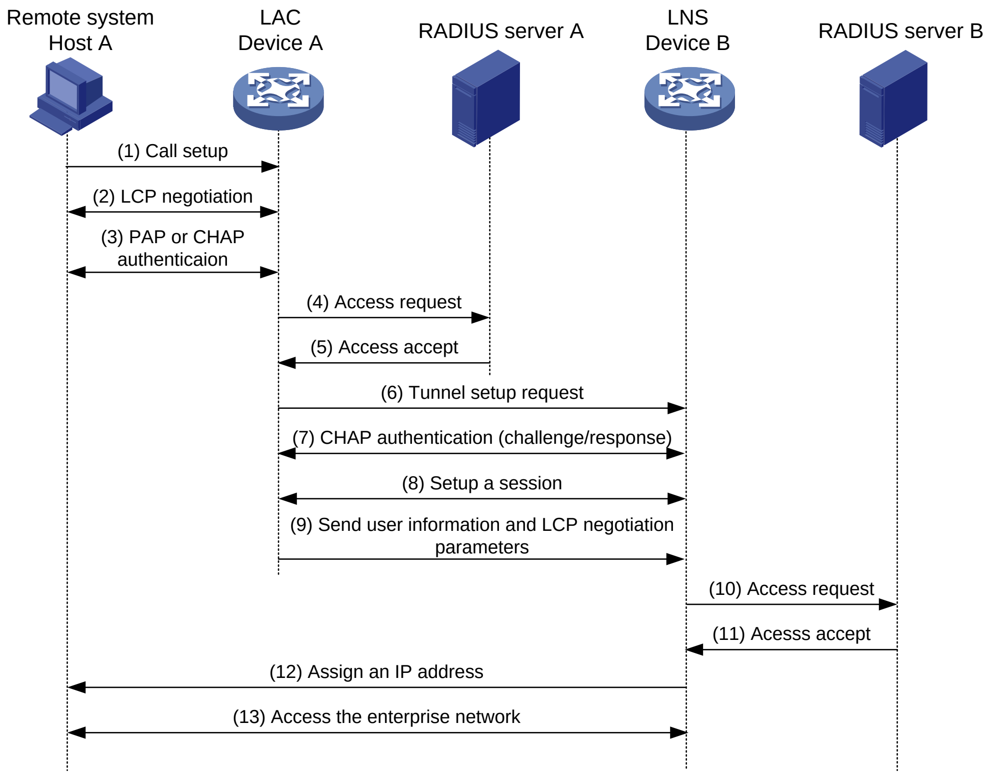
Figure 4 NAS-initiated tunneling mode



A NAS-initiated tunnel has the following characteristics:

- The remote system only needs to support PPP, and it does not need to support L2TP.
- Authentication and accounting of the remote system can be implemented on the LAC or LNS.

Figure 5 NAS-initiated tunnel establishment process



As shown in Figure 5, the following workflow is used to establish a NAS-initiated tunnel:

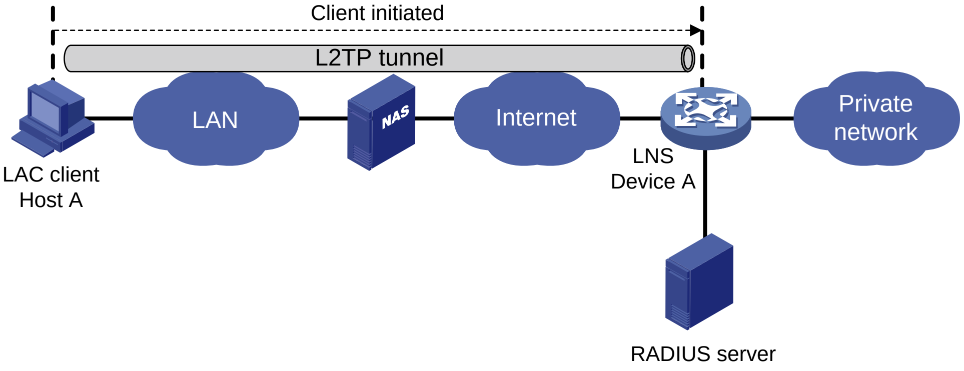
1. A remote system (Host A) initiates a PPP connection to the LAC (Device A).
2. The remote system and LAC perform PPP LCP negotiation.
3. The LAC authenticates PPP user information of Host A by using PAP or CHAP.
4. The LAC sends the authentication information (username and password) to its RADIUS server (RADIUS server A) for authentication.
5. RADIUS server A authenticates the user and returns the result.
6. The LAC initiates an L2TP tunneling request to the LNS (Device B) when the following conditions exist:
   - The user passes the authentication.
   - The user is determined to be an L2TP user according to the username or the ISP domain to which the user belongs.
7. If tunnel authentication is needed, the LAC and LNS send CHAP challenge messages to authenticate each other before successfully establishing an L2TP tunnel.
8. The LAC and LNS negotiate to establish L2TP sessions.
9. The LAC sends PPP user information and PPP negotiation parameters to the LNS.
10. The LNS sends the authentication information to its RADIUS server (RADIUS server B) for authentication.
11. RADIUS server B authenticates the user and returns the result.
12. If the user passes the authentication, the LNS assigns a private IP address to the remote system (Host A).
13. The PPP user can access internal resources of the enterprise.

In steps 12 and 13, the LAC forwards packets for the remote system and LNS. Host A and LAC exchange PPP frames, and the LAC and LNS exchange L2TP packets.

Client-initiated tunneling mode

As shown in Figure 6, a remote system running L2TP (LAC client) has a public IP address to communicate with the LNS through the Internet. The LAC client can directly initiate a tunneling request to the LNS without any dedicated LAC devices.

Figure 6 Client-initiated tunneling mode

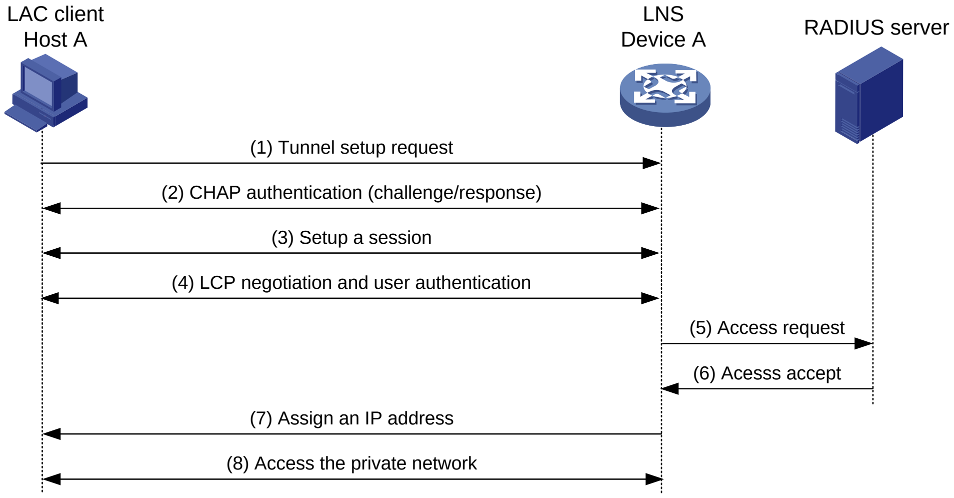


A client-initiated tunnel has the following characteristics:

- A client-initiated tunnel has higher security because it is established between a remote system and the LNS.
- The remote system must support L2TP and be able to communicate with the LNS. This causes poor expandability.

As shown in Figure 7, the workflow for establishing a client-initiated tunnel is similar to that for establishing a NAS-initiated tunnel. (Details not shown.)

Figure 7 Client-initiated tunnel establishment process

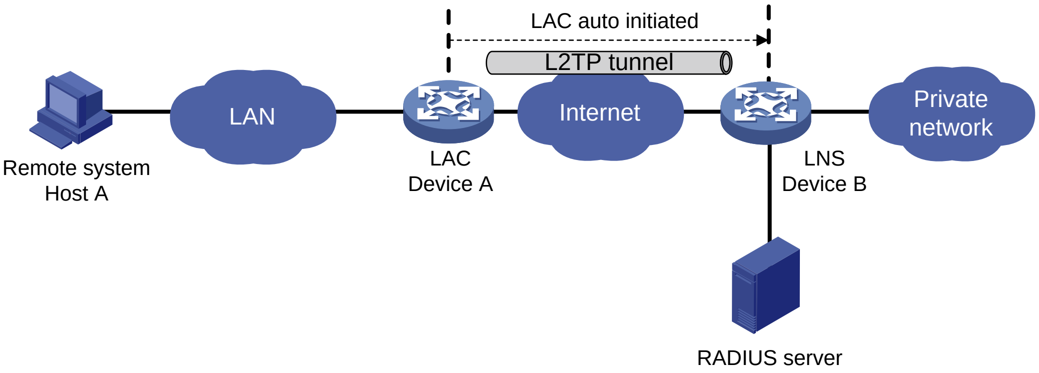


LAC-auto-initiated tunneling mode

In NAS-initiated mode, a remote system must successfully dial in to the LAC through PPPoE.

In LAC-auto-initiated mode, you can use the **`l2tp-auto-client`** command on the LAC to trigger the LAC to initiate a tunneling request to the LNS. When a remote system accesses the private network, the LAC forwards data through the L2TP tunnel.

Figure 8 LAC-auto-initiated tunneling mode

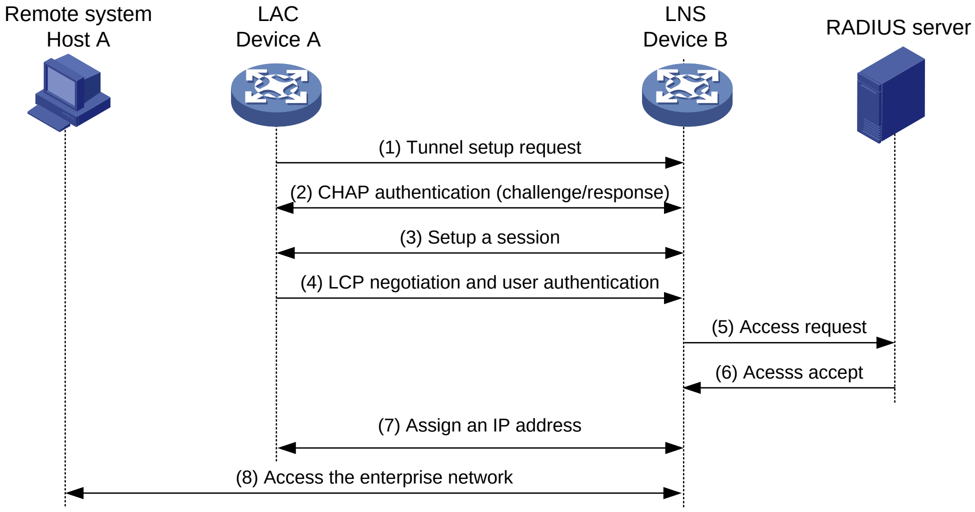


An LAC-auto-initiated tunnel has the following characteristics:

- The connection between a remote system and the LAC is not confined to a dial-up connection and can be any IP-based connection.
- An L2TP session is established immediately after an L2TP tunnel is established. Then, the LAC and LNS, acting as the PPPoE client and PPPoE server, respectively, perform PPP negotiation.
- The LNS assigns a private IP address to the LAC instead of to the remote system.

As shown in Figure 9, the workflow for establishing an LAC-auto-initiated tunnel is similar to that for establishing a NAS-initiated tunnel. (Details not shown.)

Figure 9 Establishment process for LAC-auto-initiated tunnels



L2TP features

- **Flexible identity authentication mechanism and high security**—L2TP by itself does not provide security for connections. However, it has all the security features of PPP and allows for PPP authentication (CHAP or PAP). L2TP can also cooperate with IPsec to improve security for tunneled data.
- **Multiprotocol transmission**—L2TP tunnels PPP frames, which can be used to encapsulate packets of multiple network layer protocols.
- **RADIUS authentication**—An LAC or LNS can send the username and password of a remote user to a RADIUS server for authentication.

- **Private address allocation**—An LNS can dynamically allocate private addresses to remote users. This facilitates address allocation for private internets (RFC 1918) and improves security.
- **Flexible accounting**—Accounting can be simultaneously performed on the LAC and LNS. This allows bills to be generated on the ISP side and charging and auditing to be processed on the enterprise gateway. L2TP can provide accounting data, including inbound and outbound traffic statistics (in packets and bytes) and the connection's start time and end time. The AAA server uses these data for flexible accounting.
- **Reliability**—L2TP supports LNS backup. When the connection to the primary LNS is torn down, an LAC can establish a new connection to a secondary LNS. This redundancy enhances the reliability of L2TP services.
- **Issuing tunnel attributes by RADIUS server to LAC**—In NAS-initiated mode, the tunnel attributes can be issued by the RADIUS server to the LAC. For the LAC to receive these attributes, enable L2TP and configure remote AAA authentication for PPP users on the LAC.

  When an L2TP user dials in to the LAC, the LAC as the RADIUS client sends the user information to the RADIUS server. The RADIUS server authenticates the PPP user, returns the result to the LAC, and issues L2TP tunnel attributes for the PPP user to the LAC. The LAC then sets up an L2TP tunnel and sessions based on the issued L2TP tunnel attributes.

  Table 1 Tunnel attributes that can be issued by the RADIUS server

Attribute number	Attribute name	Description
64	Tunnel-Type	Tunnel type, which can only be L2TP.
65	Tunnel-Medium-Type	Transmission medium type for the tunnel, which can only be IPv4.
67	Tunnel-Server-Endpoint	IP address of the LNS.
69	Tunnel-Password	Key used to authenticate a peer of the tunnel.
81	Tunnel-Private-Group-ID	Group ID for the tunnel. The LAC sends this value to the LNS for the LNS to perform an operation accordingly.
82	Tunnel-Assignment-ID	Assignment ID for the tunnel. It is used to indicate the tunnel to which a session is assigned. L2TP users with the same Tunnel-Assignment-ID, Tunnel-Server-Endpoint, and Tunnel-Password attributes share an L2TP tunnel.
90	Tunnel-Client-Auth-ID	Tunnel name. It is used to indicate the local tunnel.

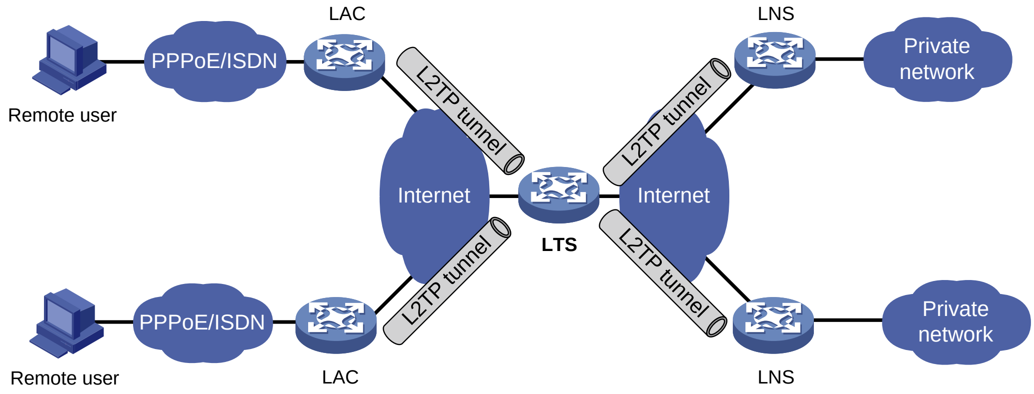
  The RADIUS server can issue only one set of the L2TP tunnel attributes in a RADIUS packet.

  The RADIUS-issued tunnel attributes override the tunnel attributes manually configured on the LAC, but not vice versa.
- **L2TP tunnel switching**—Also called multihop L2TP tunneling. As shown in Figure 10, the Layer 2 tunnel switch (LTS) terminates L2TP packets from each LAC as an LNS. It then sends these packets to a destination LNS as an LAC.

  L2TP tunnel switching has the following features:
  - **Simplified configuration and deployment**—When LACs and LNSs are in different management domains:
    - All LACs consider the LTS as an LNS and do not need to differentiate LNSs on the network.
    - All LNSs consider the LTS as an LAC and are not affected by the addition or deletion of LACs.

- **L2TP tunnel sharing**—Different users can share the same L2TP tunnel between the LAC and the LTS. The LTS distributes data of different users to different LNSs.

Figure 10 L2TP tunnel switching network diagram



L2TP-based EAD

EAD authenticates PPP users that pass the access authentication. PPP users that pass EAD authentication can access network resources. PPP users that fail EAD authentication can only access the resources in the quarantine areas.

EAD uses the following procedure:

1. The iNode client uses L2TP to access the LNS. After the client passes the PPP authentication, the CAMS/IMC server assigns isolation ACLs to the LNS. The LNS uses the isolation ACLs to filter incoming packets.
2. After the IPCP negotiation, the LNS sends the IP address of the CAMS/IMC server to the iNode client. The server IP address is permitted by the isolation ACLs.
3. The CAMS/IMC server authenticates the iNode client and performs security check for the iNode client. If the iNode client passes security check, the CAMS/IMC server assigns security ACLs for the iNode client to the LNS. The iNode client can access network resources.

Protocols and standards

- RFC 1661, *The Point-to-Point Protocol (PPP)*
- RFC 1918, *Address Allocation for Private Internets*
- RFC 2661, *Layer Two Tunneling Protocol "L2TP"*
- RFC 2868, *RADIUS Attributes for Tunnel Protocol Support*

Prerequisites for L2TP

When you configure L2TP, perform the following tasks:

1. Determine the network devices needed according to the networking environment.
   - For NAS-initiated mode and LAC-auto-initiated mode, configure both the LAC and the LNS.
   - For client-initiated mode, you only need to configure the LNS.
2. Configure the devices based on the intended role (LAC or LNS) on the network.

L2TP tasks at a glance

LAC tasks at a glance

To configure a device as an LAC in NAS-initiated or LAC-auto-initiated mode, complete the following tasks:

1. Configuring basic L2TP capabilities
2. Configuring an LAC
   - Configuring an LAC to initiate tunneling requests for a user

     This task is required for NAS-initiated mode and unnecessary for LAC-auto-initiated mode.
   - Specifying LNS IP addresses
   - Configuring the source IP address of L2TP tunnel packets
   - (Optional) Enabling transferring AVP data in hidden mode
   - Configuring AAA authentication on an LAC

     This task is required for NAS-initiated mode and unnecessary for LAC-auto-initiated mode.
   - Configuring an LAC to automatically establish an L2TP tunnel

     This task is required for NAS-initiated mode and unnecessary for LAC-auto-initiated mode.
   - (Optional) Configuring the polling feature
   - (Optional) Restoring the default settings for a virtual PPP interface
3. (Optional) Configuring optional L2TP parameters
   - Configuring L2TP tunnel authentication
   - Setting the Hello interval
   - Enabling session flow control
   - Setting the DSCP value of L2TP packets
   - Assigning a tunnel peer to a VPN
   - Setting the TSA ID of the LTS

LNS tasks at a glance

1. Configuring basic L2TP capabilities
2. Configuring an LNS
   - Creating a VT interface
   - (Optional.) Configuring a static VA pool
   - Configuring an LNS to accept L2TP tunneling requests from an LAC
   - (Optional.) Configuring user authentication on an LNS
   - (Optional.) Configuring AAA authentication on an LNS
   - (Optional.) Setting the maximum number of ICRQ packets that the LNS can process per second
   - (Optional.) Logging out an old L2TP user when the IP addresses of the old user and new user conflict
3. (Optional) Configuring optional L2TP parameters
   - Configuring L2TP tunnel authentication
   - Setting the Hello interval
   - Enabling session flow control

Configuring basic L2TP capabilities

About this task

Basic L2TP capability configuration includes the following tasks:

- **Enabling L2TP**—L2TP must be enabled for L2TP configurations to take effect.
- **Creating an L2TP group**—An L2TP group is intended to represent a group of parameters. This enables not only flexible L2TP configuration on devices, but also one-to-one and one-to-many networking applications for LACs and LNSs. An L2TP group has local significance only. However, the relevant settings of the L2TP groups on the LAC and LNS must match. For example, the local tunnel name configured on the LAC must match the tunnel peer name configured on the LNS.
- **Configuring the local tunnel name**—The local tunnel name identifies the tunnel at the local end during tunnel negotiation between an LAC and an LNS.

Procedure

1. Enter system view.

   `system-view`

2. Enable L2TP.

   `l2tp enable`

   By default, L2TP is disabled.

3. Create an L2TP group, specify its mode, and enter its view.

   `l2tp-group` *`group-number`* **`mode`** { **`lac`** | **`lns`** }

   Specify the mode as **`lac`** on the LAC side and as **`lns`** on the LNS side.

4. Specify the local tunnel name.

   `tunnel name` *`name`*

   By default, the device name is used.

   The local tunnel name configured on the LAC must match the tunnel peer name configured on the LNS.

Configuring an LAC

Configuring an LAC to initiate tunneling requests for a user

About this task

This task configures an LAC to initiate tunneling requests to an LNS for a user. When the PPP user information matches the specified user, the LAC determines that the PPP user is an L2TP user and initiates tunneling requests to the LNS.

You can specify a user by configuring one of the following items:

- **Fully qualified name**—The LAC initiates tunneling requests to the LNS only if the username of a PPP user matches the configured fully qualified name.

- **Domain name**—The LAC initiates tunneling requests to the LNS only if the ISP domain name of a PPP user matches the configured domain name.

Procedure

1. Enter system view.

   system-view

2. Enter L2TP group view in LAC mode.

   l2tp-group *group-number* [**mode lac**]

3. Configure the LAC to initiate tunneling requests for a user.

   user { **domain** *domain-name* | **fullusername** *user-name* }

   By default, an LAC does not initiate tunneling requests for any users.

Specifying LNS IP addresses

About this task

You can specify up to five LNS IP addresses and domain names (the total number of IP addresses and domain names cannot exceed five). The LAC initiates an L2TP tunneling request to its specified LNSs consecutively in their configuration order until it receives an acknowledgment from an LNS. That LNS then becomes the tunnel peer.

When the IP address of an LNS is fixed, you can specify the LNS IP address by using the **lns-ip** *ip-address* command. When the IP address of an LNS is not fixed, you can specify the LNS domain name by using the **lns-ip host-name** command. In this case, the LAC will deliver the domain name to the DNS module for processing. Then, the LAC can initiate an L2TP tunneling request to the LNS according to the returned IP address. For more information about DNS, see *Layer 3—IP Services Configuration Guide*.

Procedure

1. Enter system view.

   system-view

2. Enter L2TP group view in LAC mode.

   l2tp-group *group-number* [**mode lac**]

3. Specify LNS IP addresses or domain names.

   lns-ip { *ip-address* | **host-name** *name* }&<1-5>

   By default, no LNS IP addresses or domain names are specified.

Configuring the source IP address of L2TP tunnel packets

Restrictions and guidelines

For high availability, as a best practice, use the IP address of a loopback interface as the source IP address of L2TP tunnel packets on the LAC. If equal cost routing paths exist between the LAC and LNS, you must use the IP address of a loopback interface as the source IP address of L2TP tunnel packets. To do so, use the **source-ip** command or use the RADIUS server to assign a loopback interface address.

Procedure

1. Enter system view.

   system-view

2. Enter L2TP group view in LAC mode.

   l2tp-group *group-number* [**mode lac**]

3. Configure the source IP address of L2TP tunnel packets.

   ```
   source-ip ip-address
   ```

   By default, the source IP address of L2TP tunnel packets is the IP address of the egress interface.

Enabling transferring AVP data in hidden mode

About this task

L2TP uses Attribute Value Pairs (AVPs) to transmit tunnel negotiation parameters, session negotiation parameters, and user authentication information. Transferring AVP data in hidden mode can hide sensitive AVP data such as user passwords. This feature encrypts AVP data with the key configured by using the **tunnel password** command before transmission.

Restrictions and guidelines

This configuration takes effect only when the tunnel authentication feature is enabled. For more information about configuring tunnel authentication, see "Configuring L2TP tunnel authentication."

Procedure

1. Enter system view.

   ```
   system-view
   ```

2. Enter L2TP group view in LAC mode.

   ```
   l2tp-group group-number [ mode lac ]
   ```

3. Enable transferring AVP data in hidden mode.

   ```
   tunnel avp-hidden
   ```

   By default, AVP data is transferred in plain text.

Configuring AAA authentication on an LAC

You can configure AAA authentication on an LAC to authenticate the remote dialup users and initiate a tunneling request only for qualified users. A tunnel will not be established for unqualified users.

The device supports both local AAA authentication and remote AAA authentication.

- For local AAA authentication, create a local user and configure a password for each remote user on the LAC. The LAC then authenticates a remote user by matching the provided username and password with those configured locally.
- For remote AAA authentication, configure the username and password of each user on the RADIUS/HWTACACS server. The LAC then sends the remote user's username and password to the server for authentication.

For more information about AAA, see *Security Configuration Guide*.

To enable AAA authentication on an LAC, you also need to configure PAP or CHAP authentication for PPP users on the user access interfaces. For information about configuring PAP or CHAP, see Configuring PPP in *Layer 2—WAN Access Configuration Guide.*

Configuring an LAC to automatically establish an L2TP tunnel

1. Enter system view.

   ```
   system-view
   ```

2. Create a virtual PPP interface and enter its view.

interface virtual-ppp *interface-number*

3. Configure the IP address of the virtual PPP interface.
   - Assign an IP address to the virtual PPP interface.

     ip address *address mask*

     By default, no IP address is configured.
   - Enable IP address negotiation on the virtual PPP interface.

     ip address ppp-negotiate

     By default, IP address negotiation on a virtual PPP interface is disabled.
4. Configure the peer to be authenticated.

   Use the **ppp pap** or **ppp chap** command to specify the PPP authentication method and configure the username and password of the PPP user. The LNS then authenticates the PPP user. For more information, see PPP commands in *Layer 2—WAN Access Command Reference.*
5. (Optional.) Set the description for the interface.

   description *text*

   By default, the description of an interface is in the format of *interface-name* **Interface**, for example, **Virtual-PPP254 Interface**.
6. (Optional.) Set the MTU size of the interface.

   mtu *size*

   The default setting is 1500 bytes.
7. (Optional.) Set the expected bandwidth for the interface.

   bandwidth *bandwidth-value*

   By default, the expected bandwidth (in kbps) is interface baudrate divided by 1000.
8. (Optional.) Bring up the interface.

   undo shutdown

   By default, an interface is up.
9. Configure the LAC to automatically establish an L2TP tunnel with the LNS.

   l2tp-auto-client l2tp-group *group-number*

   By default, an LAC does not establish an L2TP tunnel.

   An L2TP tunnel automatically established in LAC-auto-initiated mode exists until you remove the tunnel by using the **undo l2tp-auto-client** or **undo l2tp-group** *group-number* command.

Configuring the polling feature

About this task

The polling feature checks L2TP link state.

On an interface that uses L2TP encapsulation, the link layer sends keepalives at keepalive intervals to detect the availability of the peer. If the interface fails to receive keepalives when the keepalive retry limit is reached, it tears down the link and reports a link layer down event.

To set the keepalive retry limit, use the **timer-hold retry** command.

The keepalive interval of 0 disables sending of keepalives.

Restrictions and guidelines

On a slow link, increase the keepalive interval to prevent false shutdown of the interface. This situation might occur when keepalives are delayed because a large packet is being transmitted on the link.

The keepalive interval must be smaller than the negotiation timeout time.

Procedure

1. Enter system view.
   system-view
2. Enter virtual PPP interface view.
   interface virtual-ppp *interface-number*
3. Set the keepalive interval.
   timer-hold *seconds*
   The default setting is 10 seconds.
4. Set the keepalive retry limit.
   timer-hold retry *retries*
   The default setting is 5.

Restoring the default settings for a virtual PPP interface

Restrictions and guidelines

The **default** command might interrupt ongoing network services. Make sure you are fully aware of the impact of this command when you execute it on a live network.

The **default** command might fail to restore the default settings for some commands for reasons such as command dependencies or system restrictions. Use the **display this** command in interface view to identify these commands. Use the **undo** forms of these commands or follow the command reference to individually restore their default settings. If your restoration attempt still fails, follow the error message instructions to resolve the problem.

Procedure

1. Enter system view.
   system-view
2. Enter virtual PPP interface view.
   interface virtual-ppp *interface-number*
3. Restore the default settings for the interface.
   default

Configuring an LNS

Creating a VT interface

After an L2TP session is established, a virtual access (VA) interface is needed for data exchange with the peer. The system will dynamically create VA interfaces based on the parameters of the virtual template (VT) interface. To configure an LNS, first create a VT interface and configure the following parameters for it:

- Interface IP address.
- Authentication mode for PPP users.

- IP addresses allocated by the LNS to PPP users.

For information about configuring VT interfaces, see PPP configuration in *Layer 2—WAN Access Configuration Guide* and IP addressing configuration in *Layer 3—IP Services Configuration Guide*.

Configuring a static VA pool

About this task

A VA pool contains a group of VA interfaces. You can configure a VA pool to improve the performance of establishing or terminating L2TP connections. The LNS selects a VA interface from the pool for a requesting user and releases the VA interface when the user goes offline.

Restrictions and guidelines

On a device that does not support dynamic VA pools:

When you configure a static VA pool, follow these guidelines:

- A VT interface can be associated with only one static VA pool. To change the capacity of a static VA pool, delete the previous configuration, and reconfigure the static VA pool.
- Creating or deleting a static VA pool takes time. During the process of creating or deleting a static VA pool, users can come online or go offline, but the static VA pool does not take effect.
- The system might create a static VA pool that contains VA interfaces less than the specified number because of insufficient resources. In this case, you can use the **`display l2tp va-pool`** command to view the number of available VA interfaces and current state of the static VA pool.
- Create a static VA pool with an appropriate capacity, because a static VA pool occupies much system memory.
- Deleting a static VA pool does not log off the users who are using VA interfaces in the static VA pool.

On a device that supports dynamic VA pools:

L2TP supports the following types of VA pools:

- **Static VA pool**—VA pool manually created by using the **`l2tp virtual-template va-pool`** command.
- **Dynamic VA pool**—VA pool automatically created by the device.

When an L2TP user comes online, the device select a VA interface for the user in the following order:

1. VA interfaces in the static VA pool.
2. VA interfaces in the dynamic VA pool.

If no static VA pool is configured for a VT interface or the static VA pool configured for a VT interface is exhausted, the following rules apply when a new L2TP user comes online:

- If no dynamic VA pool is created for the VT interface, the device first creates a dynamic VA pool containing 128 VA interfaces for the VT interface. Then, the device allocates a VA interface in the dynamic VA pool to the user.
- If a dynamic VA pool with more than 64 available VA interfaces exists for the VT interface, the device will allocate a VA interface in the dynamic VA pool to the user.
- If a dynamic VA pool with less than 64 available VA interfaces exists for the VT interface, the device adds 128 VA interfaces to the dynamic VA pool. Then, the device allocates a VA interface in the dynamic VA pool to the user.

The VA pool occupies certain memory resources. When the device memory is large or the user scale is stable, as a best practice, create a static VA pool of a suitable capacity. When the device memory is small or the user scale is uncertain, as a best practice, use a dynamic VA pool. In this case, the device can automatically create a dynamic VA pool with the number of VA interfaces at the step of 128 according to the network user scale.

For a VA pool, follow these restrictions and guidelines:

- Static VA pool
  - A VT interface can be associated with only one static VA pool. To change the capacity of a static VA pool, delete the previous configuration, and reconfigure the static VA pool.
  - Creating or deleting a static VA pool takes time. During the process of creating or deleting a static VA pool, users can come online or go offline, but the static VA pool does not take effect.
  - The system might create a static VA pool that contains VA interfaces less than the specified number because of insufficient resources. In this case, you can use the **display l2tp va-pool** command to view the number of available VA interfaces and current state of the static VA pool.
  - Create a static VA pool with an appropriate capacity, because a static VA pool occupies much system memory.
  - Deleting a static VA pool does not log off the users who are using VA interfaces in the static VA pool.
- Dynamic VA pool
  - A dynamic VA pool is automatically created by the device. It cannot be manually configured, modified, or deleted.
  - The device automatically deletes VA interfaces that are not used for a long period of time from the dynamic VA pool to release the memory resources.

Procedure

1. Enter system view.
   system-view
2. Create a static VA pool.
   l2tp virtual-template *template-number* **va-pool** *va-volume*
   By default, no VA pool exists.

Configuring an LNS to accept L2TP tunneling requests from an LAC

About this task

When receiving a tunneling request, an LNS performs the following operations:

- Determines whether to accept the tunneling request by checking whether the name of the tunnel peer (LAC) matches the one configured.
- Determines the VT interface to be used for creating the VA interface.

Procedure

1. Enter system view.
   system-view
2. Enter L2TP group view in LNS mode.
   l2tp-group *group-number* [**mode lns**]
3. Configure the LNS to accept tunneling requests from an LAC and specify the VT interface to be used for tunnel setup.
   - If the L2TP group number is 1:

allow l2tp virtual-template *virtual-template-number* [**remote** *remote-name*]

- If the L2TP group number is not 1:

  allow l2tp virtual-template *virtual-template-number* **remote** *remote-name*

By default, an LNS denies tunneling requests from any LAC.

If the L2TP group number is 1, the **remote** *remote-name* option is optional. If you do not specify this option, the LNS accepts tunneling requests from any LAC.

Configuring user authentication on an LNS

About this task

An LNS can be configured to authenticate a user that has passed authentication on the LAC to increase security. In this case, the user is authenticated once on the LAC and once on the LNS. An L2TP tunnel can be established only when both authentications succeed.

An LNS provides the following authentication methods in ascending order of priority:

- **Proxy authentication**—The LNS uses the LAC as an authentication proxy. The LAC sends the LNS all user authentication information from users and the authentication method configured on the LAC itself. The LNS then checks the user validity according to the received information and the locally configured authentication method.
- **Mandatory CHAP authentication**—The LNS uses CHAP authentication to reauthenticate users who have passed authentication on the LAC.
- **LCP renegotiation**—The LNS ignores the LAC proxy authentication information and performs a new round of LCP negotiation with the user.

The LNS chooses an authentication method depending on your configuration.

- If you configure both LCP renegotiation and mandatory CHAP authentication, the LNS uses LCP renegotiation.
- If you configure only mandatory CHAP authentication, the LNS performs CHAP authentication for users after proxy authentication succeeds.
- If you configure neither LCP renegotiation nor mandatory CHAP authentication, the LNS uses the LAC for proxy authentication.

Restrictions and guidelines for user authentication on an LNS

This mandatory CHAP authentication and LCP renegotiation methods are effective only on NAS-initiated L2TP tunnels.

For mandatory CHAP authentication to take effect, you must also configure CHAP authentication for the PPP user on the VT interface of the LNS.

For the LNS not to accept LCP negotiation parameters, configure this feature to perform a new round of LCP negotiation between the LNS and the user. In this case, the LNS authenticates the user by using the authentication method configured on the corresponding VT interface.

Configuring mandatory CHAP authentication

1. Enter system view.

   system-view

2. Enter L2TP group view in LNS mode.

   l2tp-group *group-number* [**mode lns**]

3. Configure mandatory CHAP authentication.

   mandatory-chap

   By default, CHAP authentication is not performed on an LNS.

Some users might not support the authentication on the LNS. In this situation, do not enable this feature, because CHAP authentication on the LNS will fail.

4. Return to system view.

   ```
   quit
   ```

5. Enter VT interface view and set the authentication type of PPP users to CHAP.

   For more information about VT interfaces, see PPP configuration in *Layer 2—WAN Access Configuration Guide.*

Configuring LCP renegotiation

1. Enter system view.

   ```
   system-view
   ```

2. Enter L2TP group view in LNS mode.

   ```
   l2tp-group group-number [ mode lns ]
   ```

3. Configure the LNS to perform LCP renegotiation with users.

   ```
   mandatory-lcp
   ```

   By default, an LNS does not perform LCP renegotiation with users.

   This command is effective only on NAS-initiated L2TP tunnels.

   If you enable LCP renegotiation but configure no authentication for the corresponding VT interface, the LNS does not perform an additional authentication for users.

Configuring AAA authentication on an LNS

After you configure AAA authentication on an LNS, the LNS can authenticate the usernames and passwords of remote access users. If a user passes AAA authentication, the user can communicate with the LNS to access the private network.

Configure AAA authentication on the LNS in one of the following cases:

- LCP renegotiation is not configured in NAS-initiated mode.
- The VT interface is configured with PPP user authentication and LCP renegotiation is configured in NAS-initiated mode.
- The VT interface is configured with PPP user authentication in client-initiated mode or LAC-auto-initiated mode.

LNS side AAA configurations are similar to those on an LAC (see "Configuring AAA authentication on an LAC").

Setting the maximum number of ICRQ packets that the LNS can process per second

Restrictions and guidelines

To avoid device performance degradation and make sure the LNS can processes ICRQ requests correctly, use this feature to adjust the ICRQ packet processing rate limit.

Procedure

1. Enter system view.

   ```
   system-view
   ```

2. Set the maximum number of ICRQ packets that the LNS can process per second.

   ```
   l2tp icrq-limit number
   ```

By default, the maximum number of ICRQ packets that the LNS can process per second is not limited.

Logging out an old L2TP user when the IP addresses of the old user and new user conflict

About this task

When the IP addresses of a new L2TP user and an old L2TP user conflict, you can select to forbid the new user from coming online or log out the old user.

Procedure

1. Enter system view.

   `system-view`

2. Allow a new L2TP user to come online and log out an old L2TP user when the IP addresses of the two user conflict.

   `l2tp user-ip-conflict offline`

   By default, a new L2TP user cannot come online and an old L2TP user keeps online when the IP addresses of the two user conflict.

Configuring optional L2TP parameters

Configuring L2TP tunnel authentication

About this task

Tunnel authentication allows the LAC and LNS to authenticate each other. Either the LAC or the LNS can initiate a tunnel authentication request.

You can enable tunnel authentication on both sides or either side.

To ensure a successful tunnel establishment when tunnel authentication is enabled on both sides or either side, set the same non-null key on the LAC and the LNS. To set the tunnel authentication key, use the **`tunnel password`** command.

When neither side is enabled with tunnel authentication, the key settings of the LAC and the LNS do not affect the tunnel establishment.

Restrictions and guidelines

To ensure tunnel security, enable tunnel authentication.

Modifying the tunnel authentication key does not affect the normal communication of current tunnels. The tunnel authentication key change takes effect at next tunnel establishment.

Procedure

1. Enter system view.

   `system-view`

2. Enter L2TP group view.

   `l2tp-group` *`group-number`* `[` **`mode`** `{` **`lac`** `|` **`lns`** `} ]`

3. Enable L2TP tunnel authentication.

   `tunnel authentication`

   By default, L2TP tunnel authentication is enabled.

4. Set the tunnel authentication key.

tunnel password { **cipher** | **simple** } *string*

By default, no key is set.

Setting the Hello interval

About this task

To check the connectivity of a tunnel, the LAC and LNS periodically send each other Hello packets. At receipt of a Hello packet, the LAC or LNS returns a response packet. If the LAC or LNS receives no response packets from the peer within the Hello interval, it retransmits the Hello packet. If it receives no response packets from the peer after transmitting the Hello packet five times, it considers the L2TP tunnel to be down.

Procedure

1. Enter system view.

   system-view

2. Enter L2TP group view.

   l2tp-group *group-number* [**mode** { **lac** | **lns** }]

3. Set the Hello interval.

   tunnel timer hello *hello-interval*

   The default setting is 60 seconds.

Enabling session flow control

About this task

This feature adds sequence numbers to transmitted packets and uses them to reorder packets arriving out of order and to detect lost packets.

This feature takes effect on both sent and received L2TP data messages. The L2TP sessions support this feature if either the LAC or LNS is enabled with this feature.

Procedure

1. Enter system view.

   system-view

2. Enter L2TP group view.

   l2tp-group *group-number* [**mode** { **lac** | **lns** }]

3. Enable the session flow control feature.

   tunnel flow-control

   By default, this feature is disabled.

Setting the DSCP value of L2TP packets

About this task

The DSCP field is the first 6 bits of the IP ToS byte. This field marks the priority of IP packets for forwarding. This feature sets the DSCP value for the IP packet when L2TP encapsulates a PPP frame into an IP packet.

Procedure

1. Enter system view.

   system-view

2. Enter L2TP group view.

   l2tp-group *group-number* [**mode** { **lac** | **lns** }]

3. Set the DSCP value of L2TP packets.

   ip dscp *dscp-value*

   The default setting is 0.

Assigning a tunnel peer to a VPN

About this task

By default, the device transmits L2TP control messages and data messages over the public network. With this feature, the device transmits them in a VPN by searching the routing table in the VPN.

Restrictions and guidelines

When one L2TP endpoint is in a VPN, assign the peer endpoint to the VPN for correct packet forwarding between the two endpoints.

The tunnel peer and the physical port connecting to the tunnel peer must belong to the same VPN. The VPN to which this physical port belongs is configured by using the **ip binding vpn-instance** command.

Procedure

1. Enter system view.

   system-view

2. Enter L2TP group view.

   l2tp-group *group-number* [**mode** { **lac** | **lns** }]

3. Assign the tunnel peer to a VPN.

   vpn-instance *vpn-instance-name*

   By default, a tunnel peer belongs to the public network.

Setting the TSA ID of the LTS

About this task

To detect loops, the LTS compares the configured TSA ID with each TSA ID AVP in a received ICRQ packet.

- If a match is found, a loop exists. The LTS immediately tears down the session.
- If no match is found, the LTS performs the following operations:
  - Encapsulates the configured TSA ID into a new TSA ID AVP.
  - Appends it to the packet.
  - Sends the packet to the next hop LTS.

Restrictions and guidelines

To avoid loop detection errors, make sure the TSA ID of each LTS is unique.

Procedure

1. Enter system view.

   system-view

2. Set the TSA ID of the LTS and enable L2TP loop detection on the LTS.

   l2tp tsa-id *tsa-id*

By default, the TSA ID of the LTS is not configured, and L2TP loop detection is disabled on the LTS.

Setting the receiving window size for an L2TP tunnel

About this task

To enable the device to process a larger number of disordered packets, use this command to enlarge the receiving window size for an L2TP tunnel.

The device uses a receiving window to reorder disordered packets based on packet sequence numbers.

If the sequence number of a packet is within the receiving window but does not equal the minimum value of the window, the device performs the following operations:

1. The device buffers the packet.
2. The minimum value and maximum value of the receiving window increment by one.
3. The device continues to check the next arriving packet.

If the sequence number of a packet equals the minimum value of the receiving window, the device performs the following operations:

1. The device processes the packet.
2. The minimum value and maximum value of the receiving window increment by one.
3. The device checks buffered packets for a packet with the sequence number equal to the new minimum value of the receiving window.
4. If no required packet is found, the device checks the next arriving packet.

If the sequence number of a packet is not within the receiving window, the device drops the packet.

Restrictions and guidelines

In the L2TP tunnel establishment process, the device uses the value specified in L2TP group view as the receiving window size.

Changing the receiving window size after an L2TP tunnel is established does not affect the established L2TP tunnel.

Procedure

1. Enter system view.

   `system-view`

2. Enter L2TP group view.

   `l2tp-group` *`group-number`* [**mode** { **lac** | **lns** }]

3. Set the receiving window size for the L2TP group.

   `tunnel window receive` *`size`*

   By default, the receiving window size for an L2TP tunnel is 1024.

Setting the sending window size for an L2TP tunnel

About this task

The packet processing capability of a peer end might mismatch the receiving window size of the peer end in some networks. For example, the actual packet processing capability of the peer end is 10, but the receiving window size of the peer end is 20. To ensure stable L2TP services, you can adjust the sending window size for the device to match the actual packet processing capability of the peer end.

Restrictions and guidelines

The sending window size set in L2TP group view is obtained in the L2TP tunnel establishment process.

- If the sending window size is 0, the device uses the default sending window size.
- If the sending window size is not 0, the device uses the specified value as the sending window size.

Changing the sending window size after an L2TP tunnel is established does not affect the established L2TP tunnel.

Procedure

1. Enter system view.

   `system-view`

2. Enter L2TP group view.

   `l2tp-group` *`group-number`* [**`mode`** { **`lac`** | **`lns`** }]

3. Set the sending window size for the L2TP group.

   `tunnel window send` *`size`*

   By default, the sending window size for an L2TP tunnel is 0, which means using the value of the receiving window size carried in messages sent by the peer end in the tunnel establishment process. If the messages from the peer end carry no receiving window size in the tunnel establishment process, the sending window size for the device is 4.

Enabling L2TP-based EAD

About this task

In some network environments that require high security, configure this feature and use the security policy server to perform further security check for users that pass the L2TP authentication. Users that pass EAD authentication can access network resources. Users that fail EAD authentication can only access the resources in the quarantine areas.

Restrictions and guidelines

EAD authentication fails if no or incorrect ACLs or rules are configured on the CAMS/IMC server even if EAD is enabled on the LNS.

The LNS can use different ACLs to filter packets from different iNode clients.

As a best practice, use EAD authentication for iNode clients on the Internet and use Portal authentication for iNode clients on a LAN.

Prerequisites

Make sure AAA, RADIUS, L2TP, Portal, and the security policy server are configured as required before you enable L2TP-based EAD.

For more information about AAA, RADIUS, and Portal, see *Security Configuration Guide*.

For more information about configuring the security policy server, see *IMC EAD Security Policy Manager Help*.

Procedure

1. Enter system view.

   `system-view`

2. Create a VT interface and enter its view

   `interface virtual-template` *`interface-number`*

3. Enable L2TP-based EAD.

ppp access-control enable

By default, L2TP-based EAD is disabled.

Display and maintenance commands for L2TP

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display L2TP tunnel information.	**display l2tp tunnel** [**statistics**]
Display L2TP session information.	**display l2tp session** [**statistics**]
Display information about temporary L2TP sessions.	**display l2tp session temporary**
Display information about virtual PPP interfaces.	**display interface** [**virtual-ppp** [*interface-number*]] [**brief** [**description** | **down**]]
Display VA pool information for L2TP.	**display l2tp va-pool** [**dynamic**]
Disconnect an L2TP tunnel.	**reset l2tp tunnel** { **id** *tunnel-id* | **name** *remote-name* }
Clear the statistics for virtual PPP interfaces.	**reset counters interface** [**virtual-ppp** [*interface-number*]]

L2TP configuration examples

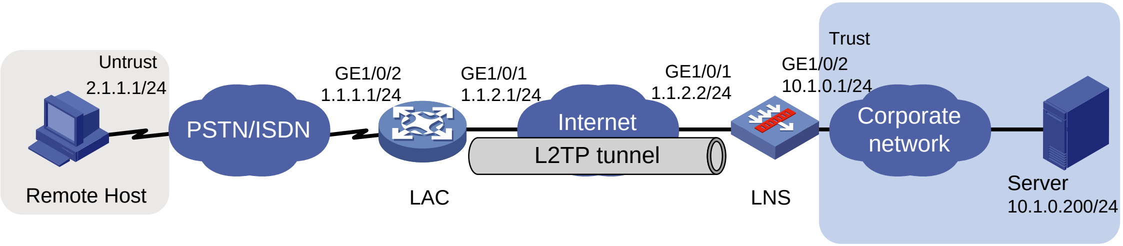
Example: Configuring a NAS-initiated L2TP tunnel

Network requirements

As shown in Figure 11, a PPP user is connected to an LNS through an LAC.

Set up an L2TP tunnel between the LAC and LNS to allow the PPP user to access the corporate network.

Figure 11 Network diagram



Configuration guidelines

You must add the Virtual-Template interface on the LNS to a security zone, and permit the traffic from security zone **Untrust** to security zone **Trust** and the traffic from security zone **Untrust** to security zone **Local**.

Configuration procedure

1. Configure the LAC:

# Create a local user named **vpdnuser**, set the password, and enable the PPP service.

```
<LAC> system-view
[LAC] local-user vpdnuser class network
[LAC-luser-network-vpdnuser] password simple Hello
[LAC-luser-network-vpdnuser] service-type ppp
[LAC-luser-network-vpdnuser] quit
```

# Configure local authentication for PPP users in ISP domain **system**.

```
[LAC] domain system
[LAC-isp-system] authentication ppp local
[LAC-isp-system] quit
```

# Configure CHAP authentication on interface GigabitEthernet 1/0/2.

```
[LAC] interface gigabitethernet 1/0/2
[LAC-GigabitEthernet1/0/2] ppp authentication-mode chap
[LAC-GigabitEthernet1/0/2] quit
```

# Enable L2TP.

```
[LAC] l2tp enable
```

# Create L2TP group 1 in LAC mode.

```
[LAC] l2tp-group 1 mode lac
```

# Configure the local tunnel name as **LAC**.

```
[LAC-l2tp1] tunnel name LAC
```

# Specify PPP user **vpdnuser** as the condition for the LAC to initiate tunneling requests.

```
[LAC-l2tp1] user fullusername vpdnuser
```

# Specify the LNS IP address as 1.1.2.2.

```
[LAC-l2tp1] lns-ip 1.1.2.2
```

# Enable tunnel authentication, and specify the tunnel authentication key as **aabbcc**.

```
[LAC-l2tp1] tunnel authentication
[LAC-l2tp1] tunnel password simple aabbcc
[LAC-l2tp1] quit
```

2. Configure the LNS:

# Assign an IP address to GigabitEthernet 1/0/1.

```
<LNS> system-view
[LNS] interface gigabitethernet 1/0/1
[LNS-GigabitEthernet1/0/1] ip address 1.1.2.2 255.255.255.0
[LNS-GigabitEthernet1/0/1] quit
```

# Assign IP addresses to other interfaces in the same way. (Details not shown.)

# Create a PPP address pool.

```
[LNS] ip pool aaa 192.168.0.10 192.168.0.20
[LNS] ip pool aaa gateway 192.168.0.1
```

# Create Virtual-Template 1, specify its PPP authentication mode as CHAP, assign an IP address to it, and use address pool **aaa** to assign IP addresses to the PPP users.

```
[LNS] interface virtual-template 1
[LNS-Virtual-Template1] ppp authentication-mode chap domain system
[LNS-Virtual-Template1] ip address 192.168.0.1 24
[LNS-Virtual-Template1] remote address pool aaa
[LNS-Virtual-Template1] quit
```

# Configure settings for routing. This example configures a static route, and the next hop in the route is 192.168.0.10, IP address that the LNS assigns to the LAC.

```
[LNS] ip route-static 2.1.1.1 24 192.168.0.10
```

# Add interfaces to security zones.

```
[LNS] security-zone name Untrust
[LNS-security-zone-Untrust] import interface Virtual-Template 1
[LNS-security-zone-Untrust] import interface gigabitethernet 1/0/1
[LNS-security-zone-Untrust] quit
[LNS] security-zone name Trust
[LNS-security-zone-Trust] import interface gigabitethernet 1/0/2
[LNS-security-zone-Trust] quit
```

# Configure a security policy rule named **l2tplocalout** to allow the LNS to send packets to the LAC.

```
[LNS] security-policy ip
[LNS-security-policy-ip] rule name l2tplocalout
[LNS-security-policy-ip-1-l2tplocalout] source-zone local
[LNS-security-policy-ip-1-l2tplocalout] destination-zone untrust
[LNS-security-policy-ip-1-l2tplocalout] source-ip-host 1.1.2.2
[LNS-security-policy-ip-1-l2tplocalout] destination-ip-host 1.1.2.1
[LNS-security-policy-ip-1-l2tplocalout] action pass
[LNS-security-policy-ip-1-l2tplocalout] quit
```

# Configure a security policy rule named **l2tplocalin** to allow the LNS to receive packets from the remote host.

```
[LNS-security-policy-ip] rule name l2tplocalin
[LNS-security-policy-ip-2-l2tplocalin] source-zone untrust
[LNS-security-policy-ip-2-l2tplocalin] destination-zone local
[LNS-security-policy-ip-2-l2tplocalin] source-ip-host 1.1.2.1
[LNS-security-policy-ip-2-l2tplocalin] destination-ip-host 1.1.2.2
[LNS-security-policy-ip-2-l2tplocalin] action pass
[LNS-security-policy-ip-2-l2tplocalin] quit
```

# Configure a security policy rule named **untrust-trust** to allow the LAC to access the server.

```
[LNS-security-policy-ip] rule name untrust-trust
[LNS-security-policy-ip-5-untrust-trust] source-zone untrust
[LNS-security-policy-ip-5-untrust-trust] destination-zone trust
[LNS-security-policy-ip-5-untrust-trust] source-ip-range 192.168.0.10 192.168.0.20
[LNS-security-policy-ip-5-untrust-trust] destination-ip-host 10.1.0.200
[LNS-security-policy-ip-5-untrust-trust] action pass
[LNS-security-policy-ip-5-untrust-trust] quit
```

# Configure a security policy rule named **trust-untrust** to allow the server to send packets to the LAC.

```
[LNS-security-policy-ip] rule name trust-untrust
[LNS-security-policy-ip-6-trust-untrust] source-zone trust
[LNS-security-policy-ip-6-trust-untrust] destination-zone untrust
[LNS-security-policy-ip-6-trust-untrust] source-ip-host 10.1.0.200
[LNS-security-policy-ip-6-trust-untrust] destination-ip-range 192.168.0.10
192.168.0.20
[LNS-security-policy-ip-6-trust-untrust] action pass
[LNS-security-policy-ip-6-trust-untrust] quit
[LNS-security-policy-ip] quit
```

# Create a local user named **vpdnuser**, set the password, and enable the PPP service.

```
[LNS] local-user vpdnuser class network
[LNS-luser-network-vpdnuser] password simple Hello
[LNS-luser-network-vpdnuser] service-type ppp
[LNS-luser-network-vpdnuser] quit
```

# Configure local authentication for PPP users in ISP domain **system**.

```
[LNS] domain system
[LNS-isp-system] authentication ppp local
[LNS-isp-system] quit
```

# Enable L2TP.

```
[LNS] l2tp enable
```

# Create L2TP group 1 in LNS mode.

```
[LNS] l2tp-group 1 mode lns
```

# Configure the local tunnel name as **LNS**.

```
[LNS-l2tp1] tunnel name LNS
```

# Specify Virtual-Template 1 for receiving calls from an LAC.

```
[LNS-l2tp1] allow l2tp virtual-template 1 remote LAC
```

# Enable tunnel authentication, and specify the tunnel authentication key as **aabbcc**.

```
[LNS-l2tp1] tunnel authentication
[LNS-l2tp1] tunnel password simple aabbcc
[LNS-l2tp1] quit
```

3. On the remote system, enter **vpdnuser** as the username and **Hello** as the password in the dial-up network window to dial a connection.

Verifying the configuration

After the dial-up connection is established, the remote system can obtain an IP address and can ping the private IP address of the LNS.

# On the LNS, use the **display l2tp tunnel** command to check the established L2TP tunnels.

```
[LNS] display l2tp tunnel
LocalTID RemoteTID State         Sessions RemoteAddress    RemotePort RemoteName
196      3542      Established   1        1.1.2.1          1701       LAC
```

# On the LNS, use the **display l2tp session** command to check the established L2TP sessions.

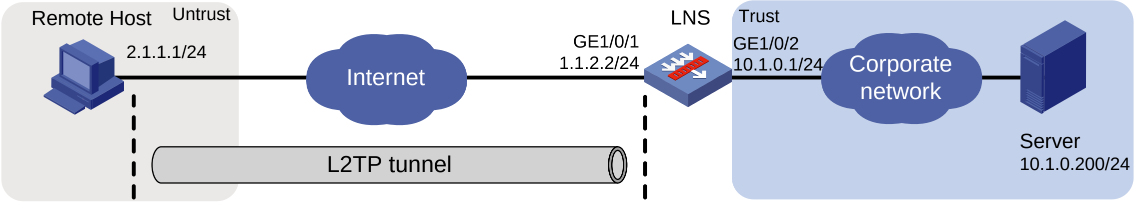
```
[LNS] display l2tp session
LocalSID      RemoteSID      LocalTID      State
2041          64             196           Established
```

Example: Configuring a client-initiated L2TP tunnel

Network requirements

As shown in Figure 12, a PPP user directly initiates a tunneling request to the LNS to access the corporate network.

Figure 12 Network diagram



Configuration guidelines

You must add the Virtual-Template interface on the LNS to a security zone, and permit the traffic from security zone **Untrust** to security zone **Trust** and the traffic from security zone **Untrust** to security zone **Local**.

Configuration procedure

1. Configure the LNS:

# Assign an IP address to GigabitEthernet 1/0/1.

```
<LNS> system-view
[LNS] interface gigabitethernet 1/0/1
[LNS-GigabitEthernet1/0/1] ip address 1.1.2.2 255.255.255.0
[LNS-GigabitEthernet1/0/1] quit
```

# Assign IP addresses to other interfaces in the same way. (Details not shown.)

# Create a PPP address pool.

```
[LNS] ip pool aaa 192.168.0.10 192.168.0.20
[LNS] ip pool aaa gateway 192.168.0.1
```

# Create Virtual-Template 1, specify its PPP authentication mode as CHAP, assign an IP address to it, and use address pool **aaa** to assign IP addresses to the PPP users.

```
[LNS] interface virtual-template 1
[LNS-Virtual-Template1] ppp authentication-mode chap domain system
[LNS-Virtual-Template1] ip address 192.168.0.1 24
[LNS-Virtual-Template1] remote address pool aaa
[LNS-Virtual-Template1] quit
```

# Configure settings for routing. This example configures a static route, and the next hop in the route is 1.1.2.3.

```
[LNS] ip route-static 2.1.1.1 24 1.1.2.3
```

# Add interfaces to security zones.

```
[LNS] security-zone name Untrust
[LNS-security-zone-Untrust] import interface Virtual-Template 1
[LNS-security-zone-Untrust] import interface gigabitethernet 1/0/1
[LNS-security-zone-Untrust] quit
[LNS] security-zone name Trust
[LNS-security-zone-Trust] import interface gigabitethernet 1/0/2
[LNS-security-zone-Trust] quit
```

# Configure a security policy rule named **l2tplocalout** to allow the LNS to send packets to the remote host.

```
[LNS] security-policy ip
[LNS-security-policy-ip] rule name l2tplocalout
[LNS-security-policy-ip-1-l2tplocalout] source-zone local
[LNS-security-policy-ip-1-l2tplocalout] destination-zone untrust
[LNS-security-policy-ip-1-l2tplocalout] source-ip-host 1.1.2.2
```

```
[LNS-security-policy-ip-1-l2tplocalout] destination-ip-host 2.1.1.1
[LNS-security-policy-ip-1-l2tplocalout] action pass
[LNS-security-policy-ip-1-l2tplocalout] quit
```

# Configure a security policy rule named **l2tplocalin** to allow the LNS to receive packets from the remote host.

```
[LNS-security-policy-ip] rule name l2tplocalin
[LNS-security-policy-ip-2-l2tplocalin] source-zone untrust
[LNS-security-policy-ip-2-l2tplocalin] destination-zone local
[LNS-security-policy-ip-2-l2tplocalin] source-ip-host 2.1.1.1
[LNS-security-policy-ip-2-l2tplocalin] destination-ip-host 1.1.2.2
[LNS-security-policy-ip-2-l2tplocalin] action pass
[LNS-security-policy-ip-2-l2tplocalin] quit
```

# Configure a security policy rule named **untrust-trust** to allow the remote host to access the server.

```
[LNS-security-policy-ip] rule name untrust-trust
[LNS-security-policy-ip-5-untrust-trust] source-zone untrust
[LNS-security-policy-ip-5-untrust-trust] destination-zone trust
[LNS-security-policy-ip-5-untrust-trust] source-ip-range 192.168.0.10 192.168.0.20
[LNS-security-policy-ip-5-untrust-trust] destination-ip-host 10.1.0.200
[LNS-security-policy-ip-5-untrust-trust] action pass
[LNS-security-policy-ip-5-untrust-trust] quit
```

# Configure a security policy rule named **trust-untrust** to allow the server to send packets to the remote host.

```
[LNS-security-policy-ip] rule name trust-untrust
[LNS-security-policy-ip-6-trust-untrust] source-zone trust
[LNS-security-policy-ip-6-trust-untrust] destination-zone untrust
[LNS-security-policy-ip-6-trust-untrust] source-ip-host 10.1.0.200
[LNS-security-policy-ip-6-trust-untrust] destination-ip-range 192.168.0.10
192.168.0.20
[LNS-security-policy-ip-6-trust-untrust] action pass
[LNS-security-policy-ip-6-trust-untrust] quit
[LNS-security-policy-ip] quit
```

# Create a local user named **vpdnuser**, set the password, and enable the PPP service.

```
[LNS] local-user vpdnuser class network
[LNS-luser-network-vpdnuser] password simple Hello
[LNS-luser-network-vpdnuser] service-type ppp
[LNS-luser-network-vpdnuser] quit
```

# Configure local authentication for PPP users in ISP domain **system**.

```
[LNS] domain system
[LNS-isp-system] authentication ppp local
[LNS-isp-system] quit
```

# Enable L2TP.

```
[LNS] l2tp enable
```

# Create L2TP group 1 in LNS mode.

```
[LNS] l2tp-group 1 mode lns
```

# Configure the local tunnel name as **LNS**.

```
[LNS-l2tp1] tunnel name LNS
```

# Specify Virtual-Template 1 for receiving calls.

```
[LNS-l2tp1] allow l2tp virtual-template 1
```

# Disable tunnel authentication.

```
[LNS-l2tp1] undo tunnel authentication
[LNS-l2tp1] quit
```

2. Configure the remote host:

   # Configure the IP address of the remote host as 2.1.1.1, and configure a route to the LNS (1.1.2.2).

   # Create a virtual private network connection by using the Windows system, or install the L2TP LAC client software.

   # Complete the following configuration procedure (the procedure depends on the client software):

   - Specify the PPP username as **vpdnuser** and the password as **Hello**.
   - Specify the Internet interface address of the security gateway as the IP address of the LNS. In this example, the Ethernet interface for the tunnel on the LNS has an IP address of 1.1.2.2.
   - Modify the connection attributes: set the protocol to **L2TP**, the encryption attribute to **customized**, and the authentication mode to **CHAP**.

Verifying the configuration

# On the remote host, initiate the L2TP connection. After the connection is established, the remote host can obtain the IP address 192.168.0.2 and ping the private IP address of the LNS (192.168.0.1).

# On the LNS, use the **`display l2tp session`** command to check the established L2TP session.

```
[LNS] display l2tp session
LocalSID    RemoteSID    LocalTID    State
39945       1            37263       Established
```

# On the LNS, use the **`display l2tp tunnel`** command to check the established L2TP tunnel.

```
[LNS] display l2tp tunnel
LocalTID RemoteTID State         Sessions RemoteAddress    RemotePort RemoteName
37263    4         Established   1        2.1.1.1          1701       PC
```

# On the remote host, verify that you can ping the server 10.1.0.200 in the corporate network.

```
C:\> ping 10.1.0.200

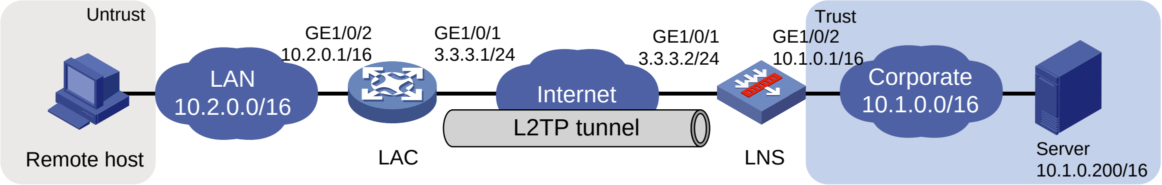
Pinging 10.1.0.200 with 32 bytes of data:
Reply from 10.1.0.200: bytes=32 time<1ms TTL=254
Reply from 10.1.0.200: bytes=32 time<1ms TTL=254
Reply from 10.1.0.200: bytes=32 time<1ms TTL=254
Reply from 10.1.0.200: bytes=32 time<1ms TTL=254
Ping statistics for 10.1.0.200:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
Approximate round trip times in milli-seconds:
    Minimum = 0ms, Maximum = 0ms, Average = 0ms
```

Example: Configuring a LAC-auto-initiated L2TP tunnel

Network requirements

As shown in Figure 13, configure the LAC to establish an L2TP tunnel with the LNS in LAC-auto-initiated mode. When the PPP user initiates a connection, it uses the established tunnel to access the corporate network.

Figure 13 Network diagram



Configuration guidelines

You must add the Virtual-Template interface on the LNS to a security zone, and permit the traffic from security zone **Untrust** to security zone **Trust** and the traffic from security zone **Untrust** to security zone **Local**.

Configuration procedure

1. Configure the LAC:

# Assign an IP address to GigabitEthernet 1/0/1.

```
<LAC> system-view
[LAC] interface gigabitethernet 1/0/1
[LAC-GigabitEthernet1/0/1] ip address 3.3.3.1 255.255.0.0
[LAC-GigabitEthernet1/0/1] quit
```

# Assign IP addresses to other interfaces in the same way. (Details not shown.)

# Create Virtual-PPP 1. Configure its username and password as **vpdnuser** and **Hello** and PPP authentication as PAP.

```
[LAC] interface virtual-ppp 1
[LAC-Virtual-PPP1] ip address ppp-negotiate
[LAC-Virtual-PPP1] ppp pap local-user vpdnuser password simple Hello
[LAC-Virtual-PPP1] quit
```

# Configure a static route so that packets destined for the corporate network will be forwarded through the L2TP tunnel.

```
[LAC] ip route-static 10.1.0.0 16 virtual-ppp 1
```

# Enable L2TP.

```
[LAC] l2tp enable
```

# Create L2TP group 1 in LAC mode.

```
[LAC] l2tp-group 1 mode lac
```

# Configure the local tunnel name as **LAC**, and specify the IP address of the tunnel peer (LNS) as 3.3.3.2.

```
[LAC-l2tp1] tunnel name LAC
[LAC-l2tp1] lns-ip 3.3.3.2
```

# Enable tunnel authentication, and configure the authentication key as **aabbcc**.

```
[LAC-l2tp1] tunnel authentication
[LAC-l2tp1] tunnel password simple aabbcc
[LAC-l2tp1] quit
```

# Trigger the LAC to establish an L2TP tunnel with the LNS.

```
[LAC] interface virtual-ppp 1
[LAC-Virtual-PPP1] l2tp-auto-client l2tp-group 1
[LAC-Virtual-PPP1] quit
```

2. Configure the LNS:

# Assign an IP address to GigabitEthernet 1/0/1.

```
<LNS> system-view
```

```
[LNS] interface gigabitethernet 1/0/1
[LNS-GigabitEthernet1/0/1] ip address 3.3.3.2 255.255.0.0
[LNS-GigabitEthernet1/0/1] quit
```

# Assign IP addresses to other interfaces in the same way. (Details not shown.)

# Create Virtual-Template 1, assign an IP address to it, specify its PPP authentication mode as PAP, and assign the IP address 192.168.0.10 to the PPP user.

```
 [LNS] interface virtual-template 1
[LNS-Virtual-Template1] ip address 192.168.0.1 24
[LNS-Virtual-Template1] ppp authentication-mode pap
[LNS-Virtual-Template1] remote address 192.168.0.10
[LNS-Virtual-Template1] quit
```

# Configure settings for routing. This example configures a static route, and the next hop in the routes is 192.168.0.10.

```
[LNS] ip route-static 10.2.0.0 16 192.168.0.10
```

# Add interfaces to security zones.

```
[LNS] security-zone name Untrust
[LNS-security-zone-Untrust] import interface Virtual-Template 1
[LNS-security-zone-Untrust] import interface gigabitethernet 1/0/1
[LNS-security-zone-Untrust] quit
[LNS] security-zone name Trust
[LNS-security-zone-Trust] import interface gigabitethernet 1/0/2
[LNS-security-zone-Trust] quit
```

# Configure a security policy rule named **l2tplocalout** to allow the LNS to send packets to the LAC.

```
[LNS] security-policy ip
[LNS-security-policy-ip] rule name l2tplocalout
[LNS-security-policy-ip-1-l2tplocalout] source-zone local
[LNS-security-policy-ip-1-l2tplocalout] destination-zone untrust
[LNS-security-policy-ip-1-l2tplocalout] source-ip-host 3.3.3.2
[LNS-security-policy-ip-1-l2tplocalout] destination-ip-host 3.3.3.1
[LNS-security-policy-ip-1-l2tplocalout] action pass
[LNS-security-policy-ip-1-l2tplocalout] quit
```

# Configure a security policy rule named **l2tplocalin** to allow the LNS to receive packets from the LAC.

```
[LNS-security-policy-ip] rule name l2tplocalin
[LNS-security-policy-ip-2-l2tplocalin] source-zone untrust
[LNS-security-policy-ip-2-l2tplocalin] destination-zone local
[LNS-security-policy-ip-2-l2tplocalin] source-ip-host 3.3.3.1
[LNS-security-policy-ip-2-l2tplocalin] destination-ip-host 3.3.3.2
[LNS-security-policy-ip-2-l2tplocalin] action pass
[LNS-security-policy-ip-2-l2tplocalin] quit
```

# Configure a security policy rule named **untrust-trust** to allow the LAC to access the server.

```
[LNS-security-policy-ip] rule name untrust-trust
[LNS-security-policy-ip-5-untrust-trust] source-zone untrust
[LNS-security-policy-ip-5-untrust-trust] destination-zone trust
[LNS-security-policy-ip-5-untrust-trust] source-ip-host 192.168.0.10
[LNS-security-policy-ip-5-untrust-trust] destination-ip-host 10.1.0.200
[LNS-security-policy-ip-5-untrust-trust] action pass
```

```
[LNS-security-policy-ip-5-untrust-trust] quit
```

# Configure a security policy rule named **trust-untrust** to allow the server to send packets to the LAC.

```
[LNS-security-policy-ip] rule name trust-untrust
[LNS-security-policy-ip-6-trust-untrust] source-zone trust
[LNS-security-policy-ip-6-trust-untrust] destination-zone untrust
[LNS-security-policy-ip-6-trust-untrust] source-ip-host 10.1.0.200
[LNS-security-policy-ip-6-trust-untrust] destination-ip-host 192.168.0.10
[LNS-security-policy-ip-6-trust-untrust] action pass
[LNS-security-policy-ip-6-trust-untrust] quit
[LNS-security-policy-ip] quit
```

# Create a local user named **vpdnuser**, set the password, and enable the PPP service.

```
[LNS] local-user vpdnuser class network
[LNS-luser-network-vpdnuser] password simple Hello
[LNS-luser-network-vpdnuser] service-type ppp
[LNS-luser-network-vpdnuser] quit
```

# Configure local authentication for PPP users in ISP domain **system**.

```
[LNS] domain system
[LNS-isp-system] authentication ppp local
[LNS-isp-system] quit
```

# Enable L2TP, and create L2TP group 1 in LNS mode.

```
[LNS] l2tp enable
[LNS] l2tp-group 1 mode lns
```

# Configure the local tunnel name as **LNS**, and specify Virtual-Template 1 for receiving tunneling requests from an LAC.

```
[LNS-l2tp1] tunnel name LNS
[LNS-l2tp1] allow l2tp virtual-template 1 remote LAC
```

# Enable tunnel authentication, and configure the authentication key as **aabbcc**.

```
[LNS-l2tp1] tunnel authentication
[LNS-l2tp1] tunnel password simple aabbcc
[LNS-l2tp1] quit
```

3. On the remote host, configure the LAC as the gateway.

Verifying the configuration

# On the LNS, use the **`display l2tp session`** command to display the established L2TP session.

```
[LNS] display l2tp session
LocalSID    RemoteSID    LocalTID    State
21073       11183        52525       Established
```

# On the LNS, use the **`display l2tp tunnel`** command to display the established L2TP tunnel.

```
[LNS] display l2tp tunnel
LocalTID RemoteTID State        Sessions RemoteAddress   RemotePort RemoteName
52525    33375     Established  1        3.3.3.1         1701       LAC
```

# On the remote host, verify that you can ping the server 10.1.0.200 in the corporate network.

```
C:\> ping 10.1.0.200

Ping statistics for 10.1.0.200:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
Approximate round trip times in milli-seconds:
    Minimum = 0ms, Maximum = 0ms, Average = 0ms
```

Troubleshooting L2TP

Failure to access the private network

Symptom

The remote system cannot access the private network.

Solution

To resolve the problem:

1. Verify the following items to avoid tunnel setup failures:
   - The address of the LNS is configured correctly on the LAC. For more information, see the **lns-ip** command.
   - The LNS can accept L2TP tunneling requests from the LAC. For more information, see the **allow** command.
   - Tunnel authentication is enabled on both the LAC and the LNS, and the tunnel authentication keys configured on the two sides match.
2. Verify the following items to avoid PPP negotiation failures:
   - Usernames and passwords are correctly configured on the LAC and LNS.
   - IP address negotiation settings are correct on the remote system and LNS.
   - The authentication type is consistent. For example, the default authentication type for a VPN connection created on Windows 2000 is MS-CHAP. If the peer does not support MS-CHAP, change the authentication type to CHAP on Windows 2000.

Data transmission failure

Symptom

Data transmission fails. A connection is established, but data cannot be transmitted. For example, the LAC and LNS cannot ping each other.

Solution

To resolve the problem:

1. Use the **display ip routing-table** command on the LAC and LNS to verify that the LAC has a route to the private network behind the LNS, and vice versa. If no route is available, configure a static route or a dynamic routing protocol.
2. Increase the link bandwidth to enhance the link availability.

   Internet backbone congestion and high packet loss ratio might cause data transmission failures. L2TP data transmission is based on UDP, which does not provide the packet error control feature. If the line is unstable, the LAC and LNS might be unable to ping each other.

Configuring ADVPN

About ADVPN

Auto Discovery Virtual Private Network (ADVPN) enables enterprise branches that use dynamic public addresses to establish a VPN network. ADVPN uses the VPN Address Management (VAM) protocol to collect, maintain, and distribute dynamic public addresses.

VAM protocol

VAM uses the client/server model. All VAM clients register their public addresses with the VAM server. A VAM client obtains the public addresses of other clients from the server to establish ADVPN tunnels.

ADVPN structures

ADVPN uses domains to identify VPNs. VAM clients in a VPN must be assigned to the same ADVPN domain. A VAM client can belong to only one ADVPN domain. A VAM server can serve multiple ADVPN domains and manage their clients.

VAM clients include hubs and spokes.

- **Hub**—A hub is the exchange center of routing information. A hub in a hub-spoke network is also a data forwarding center.
- **Spoke**—A spoke is the gateway of a branch. It does not forward data received from other ADVPN nodes.

ADVPN supports full-mesh, hub-spoke, and hub-group structures.

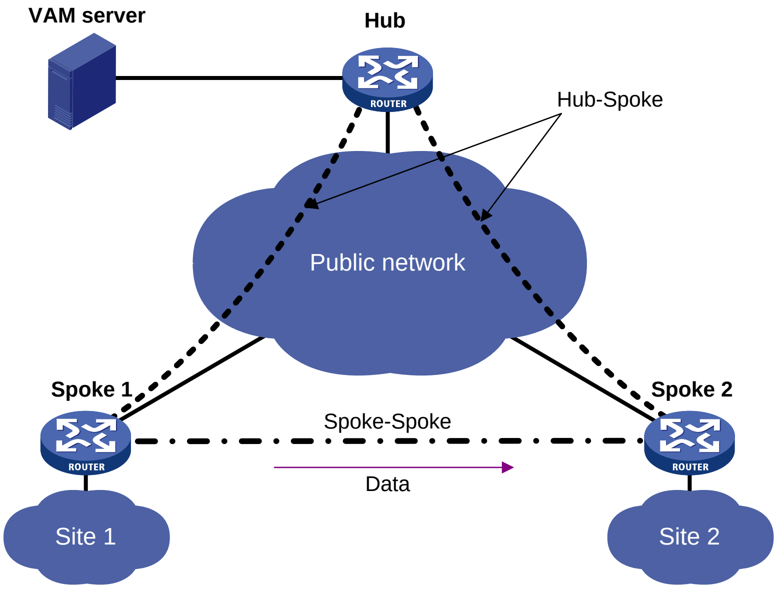
Full-mesh ADVPN

In a full-mesh ADVPN, spokes can directly communicate with each other. The hub acts as the route exchange center.

As shown in Figure 1, the spokes register with the VAM server and get hub information in the ADVPN domain. Then, they establish permanent tunnels to the hub.

Any two spokes can establish a dynamic tunnel to directly exchange data. The tunnel is deleted if no data exists during the idle timeout time.

Figure 1 Full-mesh ADVPN

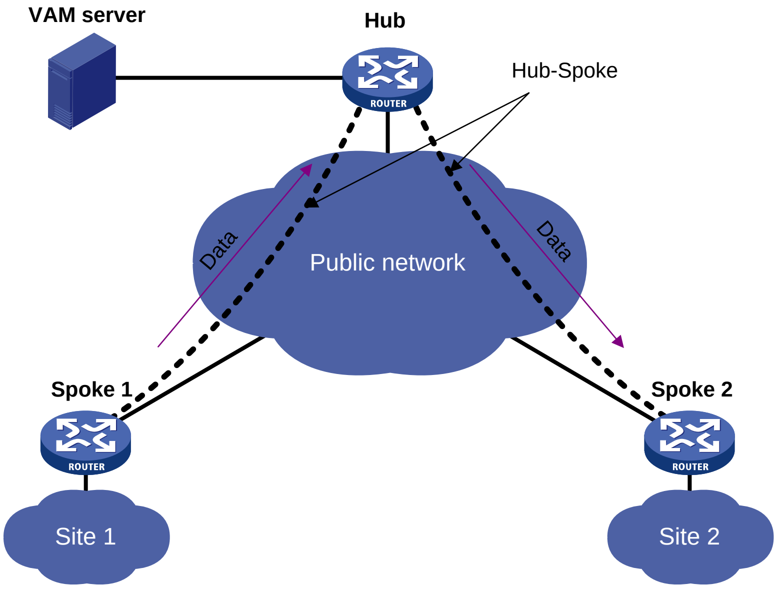


Hub-spoke ADVPN

In a hub-spoke ADVPN, spokes communicate with each other through the hub. The hub acts as both the route exchange center and data forwarding center.

As shown in Figure 2, each spoke establishes a permanent tunnel to the hub. Spokes communicate with each other through the hub.

Figure 2 Hub-spoke ADVPN



Hub-group ADVPN

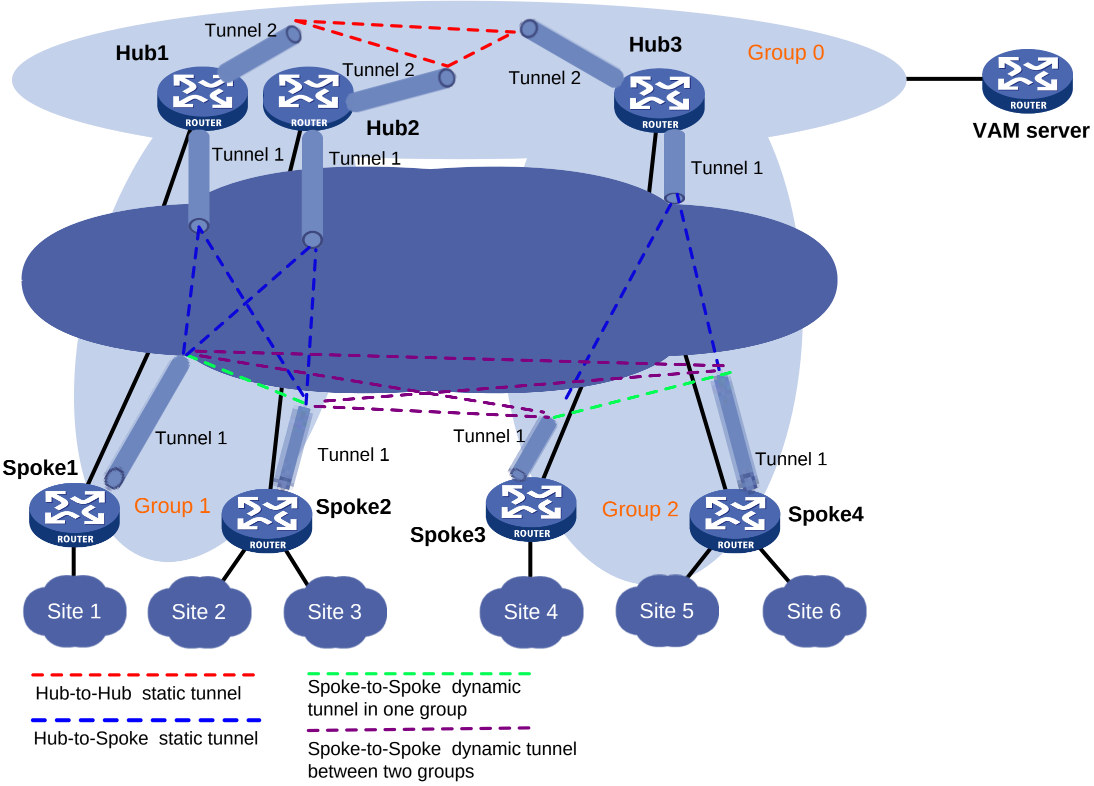
A hub-group ADVPN can accommodate more ADVPN clients. This allows one hub to manage all clients. As shown in Figure 3, a hub-group ADVPN contains multiple hub groups. Each hub group has one or multiple hubs and spokes.

Follow these guidelines to classify hub groups:

- All hubs must belong to the backbone hub group. This hub group forms the full-mesh backbone area. All hubs obtain information about other hubs from the VAM server and establish permanent ADVPN tunnels to each other.
- Spokes must belong to non-backbone hub groups. Each non-backbone hub group includes at least one hub and uses either the full-mesh or hub-spoke structure. Spokes obtain hub information in the ADVPN domain from the VAM server, and establish permanent tunnels to the hub. Spokes can establish tunnels only to the hubs in the hub group.

Tunnel establishment and data forwarding in a hub group depend on the network structure. Inter-group communications between spokes need to pass the hubs of the groups. To reduce the pressure on hubs during inter-group communications, you can allow spokes in different hub groups to establish a dynamic tunnel. The dynamic tunnel is deleted if no data exists during the idle timeout time.

Figure 3 Hub-group ADVPN



How ADVPN operates

The VAM server must have a static public address. VAM clients have both a public address and a private address. The public address is the address of the interface connected to the public network. It can be manually configured or dynamically assigned. The private address is the address of the ADVPN tunnel interface. It must be manually configured. All the private addresses of clients in an ADVPN domain must belong to the same network segment.

ADVPN includes the following phases:

- Connection initialization.
- Registration.
- Tunnel establishment.
- Route learning and packet forwarding.

Connection initialization

As shown in Figure 4, a client and a server perform the following operations to initialize a connection:

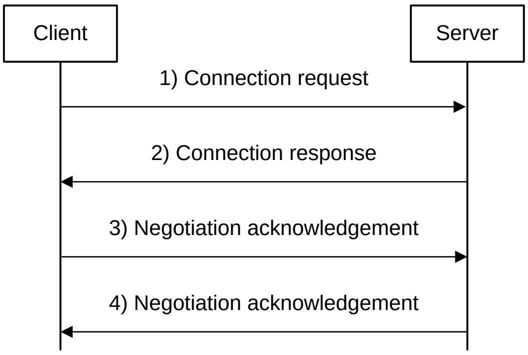
1. The client sends encryption and authentication algorithms to the server in a connection request.
2. The server compares its algorithms in descending order of priority with the algorithms sent by the client.
3. The server sends the matching algorithms to the client.

   If no match is found, the negotiation fails.
4. The server and the client generate encryption and authentication keys based on the preshared key.

   If authentication and encryption are not needed, they do not generate keys.
5. The server and the client exchange negotiation acknowledgment packets protected by using the keys.
6. The server and the client use the keys to protect subsequent packets if they can restore the protected negotiation acknowledgment packets.

   If they cannot restore the packets, the negotiation fails.

Figure 4 Connection initialization process



Client
Server
1) Connection request
2) Connection response
3) Negotiation acknowledgement
4) Negotiation acknowledgement

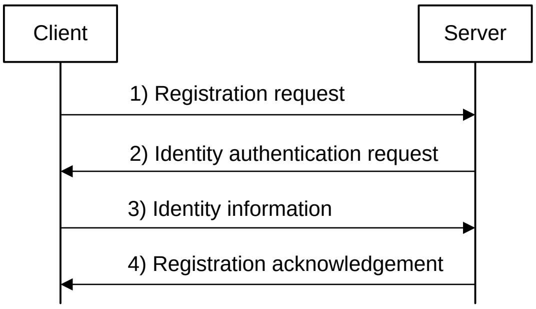
Registration

Figure 5 shows the following registration process:

1. The client sends the server a registration request that includes its public address, private address, and the connected private network.
2. The server sends the client an identity authentication request that specifies the authentication algorithm.

   If authentication is not required, the server directly registers the client and sends the client a registration acknowledgement. VAM supports both PAP and CHAP authentication.
3. The client submits its identity information to the server.
4. The server performs authentication and accounting for the client through the AAA server.
5. The server sends the client a registration acknowledgement that includes hub information.

Figure 5 Registration process



Client
Server
1) Registration request
2) Identity authentication request
3) Identity information
4) Registration acknowledgement

Tunnel establishment

A spoke can establish permanent tunnels to any number of hubs. Hubs in an ADVPN domain must establish permanent tunnels.

Figure 6 shows the tunnel establishment process.

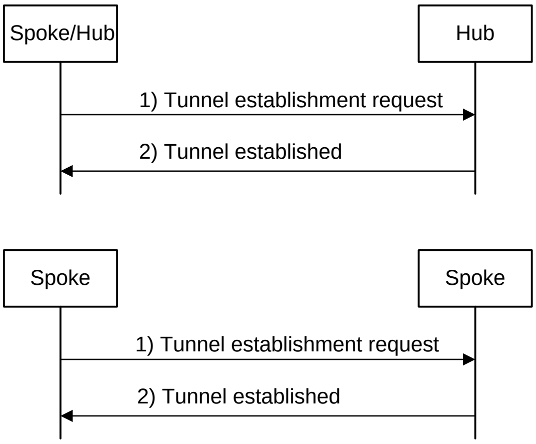
1. The initiator originates a tunnel establishment request.
   - **To establish a hub-spoke tunnel:**

     The spoke checks whether a tunnel to each hub exists. If not, the spoke sends a tunnel establishment request to the hub.
   - **To establish a hub-hub tunnel:**

     The hub checks whether a tunnel to each peer hub exists. If not, the hub sends a tunnel establishment request to the peer hub.
   - **To establish a spoke-spoke tunnel:**

     In a full-mesh network, when a spoke receives a data packet but finds no tunnel for forwarding the packet, it sends an address resolution request to the server. After receiving the resolved address, the spoke sends a tunnel establishment request to the peer spoke.
2. The receiver saves tunnel information in the request and sends a response to the sender.

Figure 6 Tunnel establishment process



Route learning and packet forwarding

ADVPN nodes use the following methods to learn private routes:

- **Static or dynamic routing**—It must be configured for private networks and ADVPN tunnel interfaces to ensure connectivity among private networks. A dynamic routing protocol discovers neighbors, updates routes, and establishes a routing table over ADVPN tunnels. From the perspective of private networks, ADVPN tunnels are links that connect different private networks. The routing protocol exchanges routes between hub and hub, and between hub and spoke. It does not directly exchange routes between spoke and spoke.

When a spoke receives a packet destined to a remote private network, it performs the following operations to forward the packet:

- **a.** Locates the private next hop from the routing table.
- **b.** Uses the private next hop to obtain the corresponding public address from the VAM server.
- **c.** Sends the packet to the public address over the ADVPN tunnel.

Full-mesh and hub-spoke structures are determined by routing. If the next hop is a spoke, the structure is full-mesh. If the next hop is a hub, the structure is hub-spoke.

- **Registration and query from the VAM server**—VAM clients register information about the connected private networks on the VAM server.

  When a spoke receives a packet destined to a remote private network, it performs the following operations to forward the packet:

  - **a.** Sends the destination address of the packet to the VAM server.
  - **b.** Queries the VAM server for information about the ADVPN node (public and private addresses of the node) connected to the remote private network.
  - **c.** Generates a route to the remote private network through the ADVPN node.
  - **d.** Sends the packet to the public address of the ADVPN node over the ADVPN tunnel.

If both methods are used, the spoke sends both the private next hop and the destination address of the packet to the VAM server. The VAM server preferentially obtains the private network according to the destination address. If the route to the remote private network is learned by using both methods, the route with a lower preference is used.

NAT traversal

An ADVPN tunnel can traverse a NAT gateway.

- If only the tunnel initiator resides behind a NAT gateway, a spoke-spoke tunnel can be established through the NAT gateway.
- If the tunnel receiver resides behind a NAT gateway, packets must be forwarded by a hub before the receiver originates a tunnel establishment request. If the NAT gateway uses Endpoint-Independent Mapping, a spoke-spoke tunnel can be established through the NAT gateway.
- If both ends reside behind a NAT gateway, no tunnel can be established and packets between them must be forwarded by a hub.

ADVPN tasks at a glance

Configure ADVPN in the order of VAM servers, hubs, and spokes. Whether an ADVPN node is a hub or a spoke is specified on the VAM servers.

To configure ADVPN, perform the following tasks:

1. Configuring the VAM server
2. Configuring ADVPN nodes
   - **a.** Configuring the VAM client
   - **b.** Configuring routing
   - **c.** Configuring an ADVPN tunnel interface
   - **d.** (Optional.) Configuring IPsec for ADVPN tunnels
   - **e.** (Optional.) Enabling ADVPN logging

Configuring the VAM server

Hardware compatibility with VAM server

Models	VAM server compatibility
NFNX5-HD6480, NFNX3-HDB3280, NFNX5-T6280, NFNX5-HD5280, NFNX3-HDB1780, NFNX3-HDB3080	Yes
NFNX3-HDB1180, NFNX3-HDB1480, NFNX3-HDB680, NFNX3-HDB1080	No

VAM server tasks at a glance

To configure the VAM server, perform the following tasks:

1. Creating an ADVPN domain
2. Enabling the VAM server
3. Configuring a preshared key for the VAM server
4. Configuring hub groups
5. (Optional.) Setting the port number of the VAM server
6. (Optional.) Specifying authentication and encryption algorithms for the VAM server
7. (Optional.) Configuring an authentication method
8. (Optional.) Configuring keepalive parameters
9. (Optional.) Setting the retry timer

Creating an ADVPN domain

1. Enter system view.
   system-view
2. Create an ADVPN domain and enter ADVPN domain view.
   vam server advpn-domain *domain-name* **id** *domain-id*

Enabling the VAM server

1. Enter system view.
   system-view
2. Enable the VAM server. Choose one of the following tasks:
   - In system view, enable the VAM server for one or all ADVPN domains.
     vam server enable [**advpn-domain** *domain-name*]
   - Execute the following commands in sequence to enable the VAM server for an ADVPN domain:
     vam server advpn-domain *domain-name* [**id** *domain-id*]
     server enable

   By default, the VAM server is disabled.

Configuring a preshared key for the VAM server

About this task

The preshared key is used to generate initial encryption and authentication keys during connection initialization. It is also used to generate encryption and authentication keys for subsequent packets if encryption and authentication are needed.

If the preshared key on the VAM server is different than the VAM clients, packet decryption and integrity verification will fail. The VAM server and clients cannot establish connections.

Restrictions and guidelines

The VAM server and the VAM clients in the same ADVPN domain must have the same preshared key.

Procedure

1. Enter system view.

   `system-view`

2. Enter ADVPN domain view.

   `vam server advpn-domain` *`domain-name`* [**`id`** *`domain-id`*]

3. Configure a preshared key for the VAM server.

   `pre-shared-key` { **`cipher`** | **`simple`** } *`string`*

   By default, no preshared key is configured.

Configuring hub groups

About this task

Hub groups apply to large ADVPN networks. You can classify spokes to different hub groups, and specify one or more hubs for each group. The VAM server assigns a client only the hub information of the client's own hub group. A client establishes permanent ADVPN tunnels only to the hubs in its own hub group.

By default, spokes are not allowed to establish direct tunnels. If an ACL is specified to control establishing spoke-spoke tunnels, the VAM server assigns the specified ACL to an online hub. The hub uses the ACL to match received packets. If a match is found, the hub sends a redirect packet to the spoke that sent the packet. Then, the spoke sends the VAM server the destination address of the packet, obtains the remote spoke information, and establishes a direct tunnel to the remote spoke.

After a spoke-spoke tunnel is established, the spokes directly exchange packets.

When a VAM client registers with the VAM server, the VAM server selects a hub group for the client as follows:

1. The server matches the private address of the client against the private addresses of hubs in different hub groups in lexicographic order.
2. If a match is found, the server assigns the client to the hub group as a hub.
3. If no match is found, the server matches the client's private address against the private addresses of spokes in different hub groups in lexicographic order.
4. If a match is found, the server assigns the client to the hub group as a spoke.
5. If no match is found, the registration fails.

Procedure

1. Enter system view.

   `system-view`

2. Enter ADVPN domain view.

vam server advpn-domain *domain-name* [**id** *domain-id*]

3. Create a hub group and enter hub group view.

   hub-group *group-name*

4. Configure a hub private address.

   IPv4:

   hub private-address *private-ip-address* [**public-address** { *public-ipv4-address* | *public-ipv6-address* } [**advpn-port** *port-number*]]

   IPv6:

   hub ipv6 private-address *private-ipv6-address* [**public-address** { *public-ipv4-address* | *public-ipv6-address* } [**advpn-port** *port-number*]]

   By default, no hub private addresses are configured.

   A hub group must have a minimum of one hub private address.

5. Configure a spoke private address range.

   IPv4:

   spoke private-address { **network** *ip-address* { *mask-length* | *mask* } | **range** *start-ipv4-address end-ipv4-address* }

   IPv6:

   spoke ipv6 private-address { **network** *prefix prefix-length* | **range** *start-ipv6-address end-ipv6-address* }

   By default, no spoke private address ranges are configured.

   You can configure multiple spoke private IPv4 and IPv6 address ranges in a hub group.

6. Specify an ACL to control establishing spoke-to-spoke tunnels.

   IPv4:

   shortcut interest { **acl** { *acl-number* | **name** *acl-name* } **all** }

   IPv6:

   shortcut ipv6 interest { **acl** { *ipv6-acl-number* | **name** *ipv6-acl-name* } | **all** }

   By default, spokes are not allowed to establish direct tunnels.

Setting the port number of the VAM server

Restrictions and guidelines

The port number of the VAM server must be the same as that configured on the VAM clients.

Procedure

1. Enter system view.

   system-view

2. Set the port number of the VAM server.

   vam server listen-port *port-number*

   The default port number is 18000.

Specifying authentication and encryption algorithms for the VAM server

About this task

The VAM server uses the specified algorithms to negotiate with the VAM client.

The VAM server and client use SHA-1 and AES-CBC-128 during connection initialization, and use the negotiated algorithms after connection initialization.

Restrictions and guidelines

The algorithm specified earlier in a command line has a higher priority.

The configuration of the commands that specify authentication and encryption algorithms does not affect registered VAM clients. It applies to subsequently registered VAM clients.

Procedure

1. Enter system view.

   system-view

2. Enter ADVPN domain view.

   vam server advpn-domain *domain-name* [**id** *domain-id*]

3. Specify authentication algorithms.

   authentication-algorithm { **aes-xcbc-mac** | **md5** | **none** | **sha-1** | **sha-256** } *

   The default authentication algorithm is SHA-1.

4. Specify encryption algorithms.

   encryption-algorithm { **3des-cbc** | **aes-cbc-128** | **aes-cbc-192** | **aes-cbc-256** | **aes-ctr-128** | **aes-ctr-192** | **aes-ctr-256** | **des-cbc** | **none** } *

   The default encryption algorithms are AES-CBC-256, AES-CBC-192, AES-CBC-128, AES-CTR-256, AES-CTR-192, AES-CTR-128, 3DES-CBC, and DES-CBC in descending order of priority.

Configuring an authentication method

About this task

The VAM server uses the specified method to authenticate clients in the ADVPN domain. The authentication method includes none authentication and AAA authentication. If AAA is used, the VAM server supports PAP and CHAP authentication. Only VAM clients that pass identity authentication can access the ADVPN domain. For information about AAA configuration on the VAM server, see *Security Configuration Guide*.

Restrictions and guidelines

If the specified ISP domain does not exist, the authentication will fail.

A newly configured authentication method does not affect registered VAM clients. It applies to subsequently registered VAM clients.

Procedure

1. Enter system view.

   system-view

2. Enter ADVPN domain view.

   vam server advpn-domain *domain-name* [**id** *domain-id*]

3. Specify an authentication method.

   authentication-method { **none** | { **chap** | **pap** } [**domain** *isp-name*] }

   By default, the authentication method is CHAP, and the default ISP domain is used.

Configuring keepalive parameters

About this task

Keepalive parameters include a keepalive interval and a maximum number of keepalive retries. The VAM server assigns the configured keepalive parameters to clients in the ADVPN domain.

A client sends keepalives to the server at the specified interval. If a client does not receive any responses from the server after the maximum keepalive attempts (keepalive retries + 1), the client stops sending keepalives. If the VAM server does not receive any keepalives from a client before the timeout timer expires, the server removes information about the client and logs off the client. The timeout time is the product of the keepalive interval and keepalive attempts.

Restrictions and guidelines

Newly configured keepalive parameters do not affect registered VAM clients. They apply to subsequently registered clients.

If a device configured with dynamic NAT exists between the VAM server and VAM clients, configure the keepalive interval to be shorter than the aging time of NAT entries.

Configure proper values for the keepalive parameters depending on the network condition.

Procedure

1. Enter system view.

   system-view

2. Enter ADVPN domain view.

   vam server advpn-domain *domain-name* [**id** *domain-id*]

3. Configure keepalive parameters.

   keepalive interval *interval* **retry** *retries*

   By default, the keepalive interval is 180 seconds, and the maximum number of keepalive retries is 3.

Setting the retry timer

About this task

The VAM server starts the retry timer after it sends a request to a client. If the server does not receive a response from the client before the retry timer expires, the server resends the request. The server stops sending the request after receiving a response from the client or after the timeout timer (product of the keepalive interval and keepalive attempts) expires.

Procedure

1. Enter system view.

   system-view

2. Enter ADVPN domain view.

   vam server advpn-domain *domain-name* [**id** *domain-id*]

3. Set the retry timer.

   retry interval *interval*

   By default, the retry timer is 5 seconds.

Configuring the VAM client

VAM client tasks at a glance

To configure the VAM client, perform the following tasks:

1. Creating a VAM client
2. Enabling VAM clients
3. Specifying VAM servers
4. Specifying an ADVPN domain for a VAM client
5. Configuring a preshared key for a VAM client
6. (Optional.) Setting the retry interval and retry number for a VAM client
7. (Optional.) Setting the dumb timer for a VAM client
8. (Optional.) Configuring a username and password for a VAM client

Creating a VAM client

1. Enter system view.

   system-view
2. Create a VAM client and enter its view.

   vam client name *client-name*

Enabling VAM clients

1. Enter system view.

   system-view
2. Enable VAM clients. Choose one of the following tasks:
   - Enable one or all VAM clients.

     vam client enable [**name** *client-name*]
   - Execute the following commands in sequence to enable a VAM client:

     vam client name *client-name*

     client enable

   By default, no VAM clients are enabled.

Specifying VAM servers

About this task

You can specify a primary VAM server and a secondary VAM server for a VAM client. The client registers with both servers, and accepts settings from the server that first registers the client. When the server fails, the client uses the settings from the other server.

Restrictions and guidelines

If the specified primary and secondary VAM servers have the same address or name, only the primary VAM server takes effect.

The port number of a VAM server must be the same as that configured on the VAM server.

Procedure

1. Enter system view.

   system-view

2. Enter VAM client view.

   vam client name *client-name*

3. Specify the primary VAM server.

   server primary { **ip-address** *ip-address* | **ipv6-address** *ipv6-address* | **name** *host-name* } [**port** *port-number*]

   By default, no VAM server is specified.

4. (Optional.) Specify the secondary VAM server.

   server secondary { **ip-address** *ip-address* | **ipv6-address** *ipv6-address* | **name** *host-name* } [**port** *port-number*]

   By default, no VAM server is specified.

Specifying an ADVPN domain for a VAM client

1. Enter system view.

   system-view

2. Enter VAM client view.

   vam client name *client-name*

3. Specify an ADVPN domain for the VAM client.

   advpn-domain *domain-name*

   By default, no ADVPN domain is specified for a VAM client.

Configuring a preshared key for a VAM client

About this task

The preshared key is used to generate initial encryption and authentication keys during connection initialization. It is also used to generate encryption and authentication keys for subsequent packets if encryption and authentication are needed.

If a VAM client and the VAM server have different preshared keys, packet decryption and integrity verification will fail. The VAM client and server cannot establish a connection.

Restrictions and guidelines

The VAM server and the VAM clients in the same ADVPN domain must have the same preshared key.

Procedure

1. Enter system view.

   system-view

2. Enter VAM client view.

   vam client name *client-name*

3. Configure a preshared key for the VAM client.

   pre-shared-key { **cipher** | **simple** } *string*

   By default, no preshared key is configured for a VAM client.

Setting the retry interval and retry number for a VAM client

About this task

After a VAM client sends a request to the server, it resends the request if it does not receive any responses within the retry interval. If the client fails to receive a response after maximum attempts (retry times + 1), the client determines that the server is unreachable.

The *retry-times* setting does not apply to register and update requests. The client sends those requests at the retry interval until it goes offline.

Procedure

1. Enter system view.

   system-view

2. Enter VAM client view.

   vam client name *client-name*

3. Set the retry interval and retry number.

   retry interval *interval* **count** *retries*

   By default, the retry interval is 5 seconds, and the retry number is 3.

Setting the dumb timer for a VAM client

About this task

A VAM client starts the dumb timer after the timeout timer expires. The client does not process any packets during the dumb time. When the dumb timer expires, the client sends a new connection request to the VAM server.

Procedure

1. Enter system view.

   system-view

2. Enter VAM client view.

   vam client name *client-name*

3. Set the dumb timer.

   dumb-time *time-interval*

   By default, the dumb timer is 120 seconds.

Configuring a username and password for a VAM client

About this task

A VAM client uses its username and password for authentication on the VAM server.

Procedure

1. Enter system view.

   system-view

2. Enter VAM client view.

   vam client name *client-name*

3. Configure a username and password for the client.

   user *username* **password** { **cipher** | **simple** } *string*

   By default, no username and password are configured for a VAM client.

Configuring routing

ADVPN supports OSPF, RIP, and BGP for IPv4.

- When OSPF is used, set the network type of an OSPF interface to broadcast in a full-mesh network or to P2MP in a hub-spoke network. For more information about OSPF configuration, see *Layer 3—IP Routing Configuration Guide*.
- Full-mesh ADVPN does not support RIP. Only hub-spoke ADVPN supports RIP. When RIP is used in a hub-spoke network, you must disable split horizon. For more information about RIP configuration, see *Layer 3—IP Routing Configuration Guide*.
- When BGP is used, configure a routing policy to make sure the next hop of a route destined for a remote private network meets the following requirements:
  - In a full-mesh network, the next hop is the IP address of the peer spoke. EBGP does not support full-mesh.
  - In a hub-spoke network, the next hop is the IP address of the hub.

  For more information about BGP and routing policy configuration, see *Layer 3—IP Routing Configuration Guide*.

ADVPN supports OSPFv3, RIPng, and IPv6 BGP for IPv6.

- When OSPFv3 is used, set the network type of an OSPFv3 interface to broadcast in a full-mesh network or to P2MP in a hub-spoke network. For more information about OSPFv3 configuration, see *Layer 3—IP Routing Configuration Guide*.
- When RIPng is used, only the full-mesh network is supported. For more information about RIPng configuration, see *Layer 3—IP Routing Configuration Guide*.
- When IPv6 BGP is used, configure a routing policy to make sure the next hop of a route destined for a remote private network meets the following requirements:
  - In a full-mesh network, the next hop is the IP address of the peer spoke. EBGP does not support full-mesh.
  - In a hub-spoke network, the next hop is the IP address of the hub.

  For more information about IPv6 BGP and routing policy configuration, see *Layer 3—IP Routing Configuration Guide*.

Configuring an ADVPN tunnel interface

Restrictions and guidelines

ADVPN establishes tunnels over ADVPN tunnel interfaces. If multiple GRE ADVPN tunnel interfaces have the same source address or source interface, you must configure different GRE keys for the interfaces. For more information about GRE keys, see "Configuring GRE."

For more information about tunnel interface, see "Configuring tunneling." For more information about tunnel interface configuration commands, see tunneling commands in *VPN Command Reference.*

Procedure

1. Enter system view.

   system-view

2. Create an ADVPN tunnel interface and enter its view.

   interface tunnel *number* [**mode advpn** { **gre** | **udp** } [**ipv6**]]

   The two ends of an ADVPN tunnel must use the same tunnel mode.

3. Configure a private address for the tunnel interface.

   IPv4:

   ip address *ip-address* { *mask* | *mask-length* } [**sub**]

IPv6:

ipv6 address *ipv6-address prefix-length*

By default, no private address is configured for the tunnel interface.

All tunnel interfaces in a hub group must reside in the same private network.

4. Specify a source address or source interface for the tunnel interface.

   source { *ip-address* | *interface-type interface-number* }

   By default, no source address or source interface is configured for a tunnel interface.

   The specified source address or the IP address of the specified source interface is used as the source address of sent ADVPN packets.

5. (Optional.) Set the DF bit for ADVPN packets.

   tunnel dfbit enable

   By default, the DF bit is not set for ADVPN packets.

6. (Optional.) Set the source UDP port number of ADVPN packets.

   advpn source-port *port-number*

   By default, the source UDP port number of ADVPN packets is 18001.

   This command is available when the tunnel mode is UDP.

   If the **vam client** command configured on the tunnel interface has the **compatible** keyword, the tunnel interface must have a different source UDP port number than other tunnel interfaces.

7. Bind a VAM client to the tunnel interface.

   IPv4:

   vam client *client-name* [**compatible advpn0**]

   IPv6:

   vam ipv6 client *client-name*

   By default, no VAM client is bound to an ADVPN tunnel interface.

   A VAM client can be bound to only one IPv4 or IPv6 ADVPN tunnel interface.

8. (Optional.) Configure a private network for the tunnel interface.

   IPv4:

   advpn network *ip-address* { *mask-length* | *mask* } [**preference** *preference-value*]

   IPv6:

   advpn ipv6 network *prefix prefix-length* [**preference** *preference-value*]

   By default, no private network is configured for the tunnel interface.

   Set the preference of the private network route to be higher than other dynamic routing protocols, and lower than static routing.

9. (Optional.) Set the keepalive interval and the maximum number of keepalive attempts for the tunnel interface.

   keepalive interval *interval* **retry** *retries*

   By default, the keepalive interval is 180 seconds, and the maximum number of keepalive attempts is 3.

   The keepalive interval and the maximum number of keepalive attempts must be the same on the tunnel interfaces in an ADVPN domain.

10. (Optional.) Set the idle timeout time for the spoke-spoke tunnel.

    advpn session idle-time *time-interval*

    By default, the idle timeout time is 600 seconds.

The new idle timeout setting applies to both existing and subsequently established spoke-spoke tunnels.

11. (Optional.) Set the dumb timer for the tunnel interface.

    advpn session dumb-time *time-interval*

    By default, the dumb timer is 120 seconds.

    The new dumb timer setting only applies to subsequently established tunnels.

12. (Optional.) Configure an ADVPN group name.

    advpn group *group-name*

    By default, no ADVPN group name is configured.

    Perform this step on the spoke.

13. (Optional.) Configure a mapping between an ADVPN group and a QoS policy.

    advpn map group *group-name* **qos-policy** *policy-name* **outbound**

    By default, no ADVPN group-to-QoS policy mappings are configured.

    Perform this step on the hub.

Configuring IPsec for ADVPN tunnels

You can configure an IPsec profile to secure ADVPN tunnels:

1. Configure IPsec transform sets to specify the security protocols, authentication and encryption algorithms, and the encapsulation mode.
2. Configure an IKE-mode IPsec profile that uses the IPsec transform sets.
3. Apply the IPsec profile to an ADVPN tunnel interface.

For more information about IPsec configuration, see *Security Configuration Guide*.

Enabling ADVPN logging

About this task

This feature enables the device to generate logs for the ADVPN module and send the logs to the information center of the device. For the logs to be output correctly, you must also configure the information center on the device. For more information about information center configuration, see *Network Management and Monitoring Configuration Guide*.

Procedure

1. Enter system view.

   system-view

2. Enable ADVPN logging.

   advpn logging enable

   By default, ADVPN logging is disabled.

Display and maintenance commands for ADVPN

△ **CAUTION:**

- The **reset vam server address-map** command clears IPv4 private-public address mapping information for VAM clients registered with the VAM server. When this command is executed, the system sends an error notification to VAM clients that have registered the private IPv4 addresses and logs off the clients.

- The **reset vam server ipv6 address-map** command clears IPv6 private-public address mapping information for VAM clients registered with the VAM server. When this command is executed, the system sends an error notification to VAM clients that have registered the private IPv6 addresses and logs off the clients.
- After you use the **reset vam client fsm** command to reset the FSM for a VAM client, the client will immediately try to come online.
- After you use the **reset vam client ipv6 fsm** command to reset the FSM for an IPv6 VAM client, the client will immediately try to come online.

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display IPv4 private-to-public address mapping information for VAM clients registered with the VAM server.	**display vam server address-map** [**advpn-domain** *domain-name* [**private-address** *private-ip-address*]] [**verbose**]
Display IPv6 private-to-public address mapping information for VAM clients registered with the VAM server.	**display vam server ipv6 address-map** [**advpn-domain** *domain-name* [**private-address** *private-ipv6-address*]] [**verbose**]
Display IPv4 private networks for VAM clients registered with the VAM server.	**display vam server private-network** [**advpn-domain** *domain-name* [**private-address** *private-ip-address*]]
Display IPv6 private networks for VAM clients registered with the VAM server.	**display vam server ipv6 private-network** [**advpn-domain** *domain-name* [**private-address** *private-ipv6-address*]]
Display ADVPN domain statistics on the VAM server.	**display vam server statistics** [**advpn-domain** *domain-name*]
Display FSM information for VAM clients.	**display vam client fsm** [**name** *client-name*]
Display statistics for VAM clients.	**display vam client statistics** [**name** *client-name*]
Display IPv4 spoke-to-spoke tunnel establishment rules for VAM clients.	**display vam client shortcut interest** [**name** *client-name*]
Display IPv6 spoke-to-spoke tunnel establishment rules for VAM clients.	**display vam client shortcut ipv6 interest** [**name** *client-name*]
Display ADVPN group-to-QoS policy mappings.	**display advpn group-qos-map** [**interface tunnel** *number* [**group** *group-name*]]
Display IPv4 ADVPN tunnel information.	**display advpn session** [**interface tunnel** *number* [**private-address** *private-ip-address*]] [**verbose**]
Display IPv6 ADVPN tunnel information.	**display advpn ipv6 session** [**interface tunnel** *number* [**private-address** *private-ipv6-address*]] [**verbose**]
Display the number of ADVPN sessions in different states.	**display advpn session count**
Clear IPv4 private-to-public address	**reset vam server address-map** [**advpn-domain**

Task	Command
mapping information for VAM clients registered with the VAM server.	*domain-name* [**private-address** *private-ip-address*]]
Clear IPv6 private-to-public address mapping information for VAM clients registered with the VAM server.	**reset vam server ipv6 address-map** [**advpn-domain** *domain-name* [**private-address** *private-ipv6-address*]]
Clear ADVPN domain statistics on the VAM server.	**reset vam server statistics** [**advpn-domain** *domain-name*]
Reset the FSM for VAM clients.	**reset vam client** [**ipv6**] **fsm** [**name** *client-name*]
Clear statistics for VAM client.	**reset vam client statistics** [**name** *client-name*]
Delete IPv4 ADVPN tunnels.	**reset advpn session** [**interface tunnel** *number* [**private-address** *private-ip-address*]]
Delete IPv6 ADVPN tunnels.	**reset advpn ipv6 session** [**interface tunnel** *number* [**private-address** *private-ipv6-address*]]
Clear statistics for IPv4 ADVPN tunnels.	**reset advpn session statistics** [**interface tunnel** *number* [**private-address** *private-ip-address*]]
Clear statistics for IPv6 ADVPN tunnels.	**reset advpn ipv6 session statistics** [**interface tunnel** *number* [**private-address** *private-ipv6-address*]]

ADVPN configuration examples

Example: Configuring IPv4 full-mesh ADVPN

Network configuration

As shown in Figure 7, the primary and secondary VAM servers manage and maintain VAM client information for all hubs and spokes. The AAA server performs authentication and accounting for VAM clients. The two hubs back up each other, and perform data forwarding and route exchange.

- Establish a permanent ADVPN tunnel between each spoke and each hub.
- Establish a temporary ADVPN tunnel dynamically between the two spokes in the same ADVPN domain.

Figure 7 Network diagram

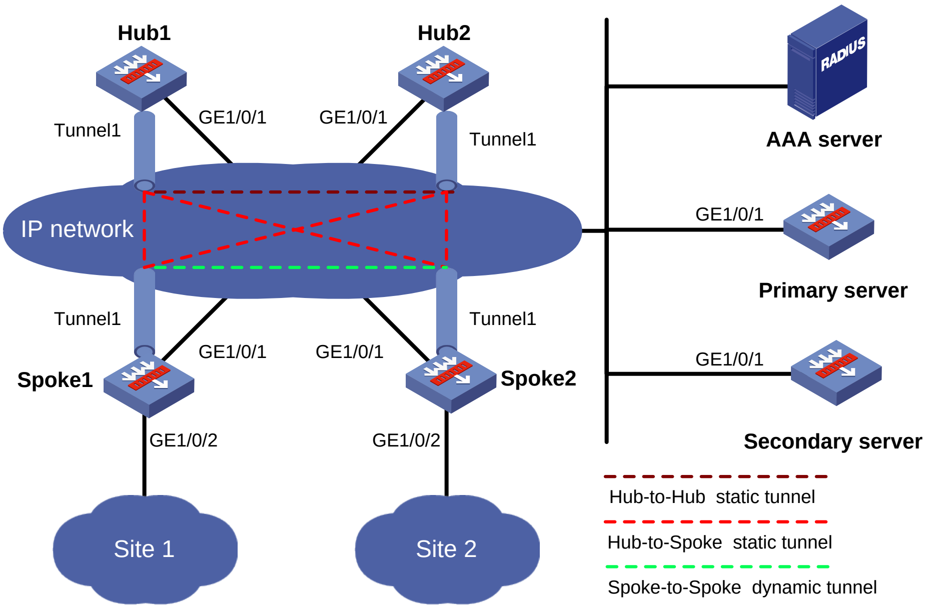


Table 1 Interface and IP address assignment

Device	Interface	IP address	Device	Interface	IP address
Hub 1	GE1/0/1	1.0.0.1/24	Spoke 1	GE1/0/1	1.0.0.3/24
	Tunnel1	192.168.0.1/24		GE1/0/2	192.168.1.1/24
Hub 2	GE1/0/1	1.0.0.2/24		Tunnel1	192.168.0.3/24
	Tunnel1	192.168.0.2/24	Spoke 2	GE1/0/1	1.0.0.4/24
AAA server		1.0.0.10/24		GE1/0/2	192.168.2.1/24
Primary server	GE1/0/1	1.0.0.11/24		Tunnel1	192.168.0.4/24
Secondary server	GE1/0/1	1.0.0.12/24			

Configuring the primary VAM server

1. Assign an IP address to GigabitEthernet 1/0/1.

```
<PrimaryServer> system-view
[PrimaryServer] interface gigabitethernet 1/0/1
[PrimaryServer-GigabitEthernet1/0/1] ip address 1.0.0.11 255.255.255.0
[PrimaryServer-GigabitEthernet1/0/1] quit
```

2. Add the interface to a security zone.

```
[PrimaryServer] security-zone name untrust
[PrimaryServer-security-zone-Untrust] import interface gigabitethernet 1/0/1
[PrimaryServer-security-zone-Untrust] quit
```

3. Configure a security policy:

# Configure a rule named **advpnlocalout** to allow the VAM server to send VAM protocol packets to the VAM clients.

```
[PrimaryServer] security-policy ip
[PrimaryServer-security-policy-ip] rule name advpnlocalout
[PrimaryServer-security-policy-ip-1-advpnlocalout] source-zone local
[PrimaryServer-security-policy-ip-1-advpnlocalout] destination-zone untrust
```

```
[PrimaryServer-security-policy-ip-1-advpnlocalout] source-ip-host 1.0.0.11
[PrimaryServer-security-policy-ip-1-advpnlocalout] destination-ip-range 1.0.0.1
1.0.0.12
[PrimaryServer-security-policy-ip-1-ipseclocalout] action pass
[PrimaryServer-security-policy-ip-1-ipseclocalout] quit
```

# Configure a rule named **advpnlocalin** to allow the VAM server to receive VAM protocol packets from the VAM clients.

```
[PrimaryServer-security-policy-ip] rule name advpnlocalin
[PrimaryServer-security-policy-ip-2-advpnlocalin] source-zone untrust
[PrimaryServer-security-policy-ip-2-advpnlocalin] destination-zone local
[PrimaryServer-security-policy-ip-2-advpnlocalin] source-ip-range 1.0.0.1 1.0.0.12
[PrimaryServer-security-policy-ip-2-advpnlocalin] destination-ip-host 1.0.0.11
[PrimaryServer-security-policy-ip-2-advpnlocalin] action pass
[PrimaryServer-security-policy-ip-2-advpnlocalin] quit
[PrimaryServer-security-policy-ip] quit
```

4. Configure AAA:

# Configure RADIUS scheme **abc**.

```
[PrimaryServer] radius scheme abc
[PrimaryServer-radius-abc] primary authentication 1.0.0.10 1812
[PrimaryServer-radius-abc] primary accounting 1.0.0.10 1813
[PrimaryServer-radius-abc] key authentication simple 123
[PrimaryServer-radius-abc] key accounting simple 123
[PrimaryServer-radius-abc] user-name-format without-domain
[PrimaryServer-radius-abc] quit
[PrimaryServer] radius session-control enable
```

# Configure AAA methods for ISP domain **abc**.

```
[PrimaryServer] domain abc
[PrimaryServer-isp-abc] authentication advpn radius-scheme abc
[PrimaryServer-isp-abc] accounting advpn radius-scheme abc
[PrimaryServer-isp-abc] quit
[PrimaryServer] domain default enable abc
```

5. Configure the VAM server:

# Create ADVPN domain **abc**.

```
[PrimaryServer] vam server advpn-domain abc id 1
```

# Create hub group 0.

```
[PrimaryServer-vam-server-domain-abc] hub-group 0
```

# Specify hub private IPv4 addresses.

```
[PrimaryServer-vam-server-domain-abc-hub-group-0] hub private-address 192.168.0.1
[PrimaryServer-vam-server-domain-abc-hub-group-0] hub private-address 192.168.0.2
```

# Specify a spoke private IPv4 network.

```
[PrimaryServer-vam-server-domain-abc-hub-group-0] spoke private-address network
192.168.0.0 255.255.255.0
[PrimaryServer-vam-server-domain-abc-hub-group-0] quit
```

# Set the preshared key to **123456**.

```
[PrimaryServer-vam-server-domain-abc] pre-shared-key simple 123456
```

# Set the authentication mode to CHAP.

```
[PrimaryServer-vam-server-domain-abc] authentication-method chap
```

# Enable the VAM server for the ADVPN domain.

```
[PrimaryServer-vam-server-domain-abc] server enable
[PrimaryServer-vam-server-domain-abc] quit
```

Configuring the secondary VAM server

# Configure the secondary VAM server in the same way that the primary server is configured. (Details not shown.)

Configuring Hub 1

1. Assign IP addresses to interfaces:

   # Assign an IPv4 address to GigabitEthernet 1/0/1.

   ```
   <Hub1> system-view
   [Hub1] interface gigabitethernet 1/0/1
   [Hub1-GigabitEthernet1/0/1] ip address 1.0.0.1 255.255.255.0
   [Hub1-GigabitEthernet1/0/1] quit
   ```

   # Create interface Tunnel 1 and set its tunnel mode to the GRE-encapsulated IPv4 ADVPN tunnel mode. Then, assign an IPv4 address to the interface.

   ```
   [Hub1] interface tunnel1 mode advpn gre
   [Hub1-Tunnel1] ip address 192.168.0.1 255.255.255.0
   ```

2. Add the interfaces to a security zone.

   ```
   [Hub1] security-zone name untrust
   [Hub1-security-zone-Untrust] import interface gigabitethernet 1/0/1
   [Hub1-security-zone-Untrust] import interface tunnel1
   [Hub1-security-zone-Untrust] quit
   ```

3. Configure a security policy:

   # Configure a rule named **advpnlocalout** to allow Hub 1 to send VAM protocol packets to the VAM server.

   ```
   [Hub1] security-policy ip
   [Hub1-security-policy-ip] rule name advpnlocalout
   [Hub1-security-policy-ip-1-advpnlocalout] source-zone local
   [Hub1-security-policy-ip-1-advpnlocalout] destination-zone untrust
   [Hub1-security-policy-ip-1-advpnlocalout] source-ip-host 1.0.0.1
   [Hub1-security-policy-ip-1-advpnlocalout] destination-ip-range 1.0.0.10 1.0.0.12
   [Hub1-security-policy-ip-1-ipseclocalout] action pass
   [Hub1-security-policy-ip-1-ipseclocalout] quit
   ```

   # Configure a rule named **advpnlocalin** to allow Hub 1 to receive VAM protocol packets from the VAM server.

   ```
   [Hub1-security-policy-ip] rule name advpnlocalin
   [Hub1-security-policy-ip-2-advpnlocalin] source-zone untrust
   [Hub1-security-policy-ip-2-advpnlocalin] destination-zone local
   [Hub1-security-policy-ip-2-advpnlocalin] source-ip-range 1.0.0.10 1.0.0.12
   [Hub1-security-policy-ip-2-advpnlocalin] destination-ip-host 1.0.0.1
   [Hub1-security-policy-ip-2-advpnlocalin] action pass
   [Hub1-security-policy-ip-2-advpnlocalin] quit
   ```

   # Configure a rule named **ipseclocalout** to allow Hub 1 to send IPsec negotiation packets to other VAM clients.

   ```
   [Hub1-security-policy-ip] rule name ipseclocalout
   [Hub1-security-policy-ip-3-ipseclocalout] source-zone local
   [Hub1-security-policy-ip-3-ipseclocalout] destination-zone untrust
   [Hub1-security-policy-ip-3-ipseclocalout] source-ip-host 1.0.0.1
   ```

```
[Hub1-security-policy-ip-3-ipseclocalout] destination-ip-range 1.0.0.2 1.0.0.4
[Hub1-security-policy-ip-3-ipseclocalout] action pass
[Hub1-security-policy-ip-3-ipseclocalout] quit
```

# Configure a rule named **ipseclocalin** to allow Hub 1 to receive IPsec negotiation packets from other VAM clients.

```
[Hub1-security-policy-ip] rule name ipseclocalin
[Hub1-security-policy-ip-4-ipseclocalin] source-zone untrust
[Hub1-security-policy-ip-4-ipseclocalin] destination-zone local
[Hub1-security-policy-ip-4-ipseclocalin] source-ip-range 1.0.0.2 1.0.0.4
[Hub1-security-policy-ip-4-ipseclocalin] destination-ip-host 1.0.0.1
[Hub1-security-policy-ip-4-ipseclocalin] action pass
[Hub1-security-policy-ip-4-ipseclocalin] quit
```

# Configure a rule named **ospflocalout** to allow Hub 1 to send OSPF packets to other VAM clients.

```
[Hub1-security-policy-ip] rule name ospflocalout
[Hub1-security-policy-ip-5-ospflocalout] source-zone local
[Hub1-security-policy-ip-5-ospflocalout] destination-zone untrust
[Hub1-security-policy-ip-5-ospflocalout] service ospf
[Hub1-security-policy-ip-5-ospflocalout] action pass
[Hub1-security-policy-ip-5-ospflocalout] quit
```

# Configure a rule named **ospflocalin** to allow Hub 1 to receive OSPF packets from other VAM clients.

```
[Hub1-security-policy-ip] rule name ospflocalin
[Hub1-security-policy-ip-6-ospflocalin] source-zone untrust
[Hub1-security-policy-ip-6-ospflocalin] destination-zone local
[Hub1-security-policy-ip-6-ospflocalin] service ospf
[Hub1-security-policy-ip-6-ospflocalin] action pass
[Hub1-security-policy-ip-6-ospflocalin] quit
```

4. Configure the VAM client:

# Create VAM client **Hub1**.

```
[Hub1] vam client name Hub1
```

# Specify ADVPN domain **abc** for the VAM client.

```
[Hub1-vam-client-Hub1] advpn-domain abc
```

# Set the preshared key to **123456**.

```
[Hub1-vam-client-Hub1] pre-shared-key simple 123456
```

# Set both the username and password to **hub1**.

```
[Hub1-vam-client-Hub1] user hub1 password simple hub1
```

# Specify the primary and secondary VAM servers.

```
[Hub1-vam-client-Hub1] server primary ip-address 1.0.0.11
[Hub1-vam-client-Hub1] server secondary ip-address 1.0.0.12
```

# Enable the VAM client.

```
[Hub1-vam-client-Hub1] client enable
[Hub1-vam-client-Hub1] quit
```

5. Configure an IPsec profile:

# Configure IKE.

```
[Hub1] ike keychain abc
[Hub1-ike-keychain-abc] pre-shared-key address 0.0.0.0 0.0.0.0 key simple 123456
[Hub1-ike-keychain-abc] quit
```

```
[Hub1] ike profile abc
[Hub1-ike-profile-abc] keychain abc
[Hub1-ike-profile-abc] quit
```

# Configure the IPsec profile.

```
[Hub1] ipsec transform-set abc
[Hub1-ipsec-transform-set-abc] encapsulation-mode transport
[Hub1-ipsec-transform-set-abc] esp encryption-algorithm des-cbc
[Hub1-ipsec-transform-set-abc] esp authentication-algorithm sha1
[Hub1-ipsec-transform-set-abc] quit
[Hub1] ipsec profile abc isakmp
[Hub1-ipsec-profile-isakmp-abc] transform-set abc
[Hub1-ipsec-profile-isakmp-abc] ike-profile abc
[Hub1-ipsec-profile-isakmp-abc] quit
```

6. Configure OSPF to advertise the private network.

```
[Hub1] ospf 1
[Hub1-ospf-1] area 0
[Hub1-ospf-1-area-0.0.0.0] network 192.168.0.0 0.0.0.255
[Hub1-ospf-1-area-0.0.0.0] quit
[Hub1-ospf-1] quit
```

7. Configure interface Tunnel 1.

```
[Hub1] interface tunnel1
[Hub1-Tunnel1] vam client Hub1
[Hub1-Tunnel1] ospf network-type broadcast
[Hub1-Tunnel1] source gigabitethernet 1/0/1
[Hub1-Tunnel1] tunnel protection ipsec profile abc
[Hub1-Tunnel1] quit
```

Configuring Hub 2

1. Assign IP addresses to interfaces:

# Assign an IPv4 address to GigabitEthernet 1/0/1.

```
<Hub2> system-view
[Hub2] interface gigabitethernet 1/0/1
[Hub2-GigabitEthernet1/0/1] ip address 1.0.0.2 255.255.255.0
[Hub2-GigabitEthernet1/0/1] quit
```

# Create interface Tunnel 1 and set its tunnel mode to the GRE-encapsulated IPv4 ADVPN tunnel mode. Then, assign an IPv4 address to the interface.

```
[Hub2] interface tunnel1 mode advpn gre
[Hub2-Tunnel1] ip address 192.168.0.2 255.255.255.0
```

2. Add the interfaces to a security zone.

```
[Hub2] security-zone name untrust
[Hub2-security-zone-Untrust] import interface gigabitethernet 1/0/1
[Hub2-security-zone-Untrust] import interface tunnel1
[Hub2-security-zone-Untrust] quit
```

3. Configure a security policy:

# Configure a rule named **advpnlocalout** to allow Hub 2 to send VAM protocol packets to the VAM server.

```
[Hub2] security-policy ip
[Hub2-security-policy-ip] rule name advpnlocalout
```

```
[Hub2-security-policy-ip-1-advpnlocalout] source-zone local
[Hub2-security-policy-ip-1-advpnlocalout] destination-zone untrust
[Hub2-security-policy-ip-1-advpnlocalout] source-ip-host 1.0.0.2
[Hub2-security-policy-ip-1-advpnlocalout] destination-ip-range 1.0.0.10 1.0.0.12
[Hub2-security-policy-ip-1-ipseclocalout] action pass
[Hub2-security-policy-ip-1-ipseclocalout] quit
```

# Configure a rule named **advpnlocalin** to allow Hub 2 to receive VAM protocol packets from the VAM server.

```
[Hub2-security-policy-ip] rule name advpnlocalin
[Hub2-security-policy-ip-2-advpnlocalin] source-zone untrust
[Hub2-security-policy-ip-2-advpnlocalin] destination-zone local
[Hub2-security-policy-ip-2-advpnlocalin] source-ip-range 1.0.0.10 1.0.0.12
[Hub2-security-policy-ip-2-advpnlocalin] destination-ip-host 1.0.0.2
[Hub2-security-policy-ip-2-advpnlocalin] action pass
[Hub2-security-policy-ip-2-advpnlocalin] quit
```

# Configure a rule named **ipseclocalout** to allow Hub 2 to send IPsec negotiation packets to other VAM clients.

```
[Hub2-security-policy-ip] rule name ipseclocalout
[Hub2-security-policy-ip-3-ipseclocalout] source-zone local
[Hub2-security-policy-ip-3-ipseclocalout] destination-zone untrust
[Hub2-security-policy-ip-3-ipseclocalout] source-ip-host 1.0.0.2
[Hub2-security-policy-ip-3-ipseclocalout] destination-ip-range 1.0.0.1 1.0.0.4
[Hub2-security-policy-ip-3-ipseclocalout] action pass
[Hub2-security-policy-ip-3-ipseclocalout] quit
```

# Configure a rule named **ipseclocalin** to allow Hub 2 to receive IPsec negotiation packets from other VAM clients.

```
[Hub2-security-policy-ip] rule name ipseclocalin
[Hub2-security-policy-ip-4-ipseclocalin] source-zone untrust
[Hub2-security-policy-ip-4-ipseclocalin] destination-zone local
[Hub2-security-policy-ip-4-ipseclocalin] source-ip-range 1.0.0.1 1.0.0.4
[Hub2-security-policy-ip-4-ipseclocalin] destination-ip-host 1.0.0.2
[Hub2-security-policy-ip-4-ipseclocalin] action pass
[Hub2-security-policy-ip-4-ipseclocalin] quit
```

# Configure a rule named **ospflocalout** to allow Hub 2 to send OSPF packets to other VAM clients.

```
[Hub2-security-policy-ip] rule name ospflocalout
[Hub2-security-policy-ip-5-ospflocalout] source-zone local
[Hub2-security-policy-ip-5-ospflocalout] destination-zone untrust
[Hub2-security-policy-ip-5-ospflocalout] service ospf
[Hub2-security-policy-ip-5-ospflocalout] action pass
[Hub2-security-policy-ip-5-ospflocalout] quit
```

# Configure a rule named **ospflocalin** to allow Hub 2 to receive OSPF packets from other VAM clients.

```
[Hub2-security-policy-ip] rule name ospflocalin
[Hub2-security-policy-ip-6-ospflocalin] source-zone untrust
[Hub2-security-policy-ip-6-ospflocalin] destination-zone local
[Hub2-security-policy-ip-6-ospflocalin] service ospf
[Hub2-security-policy-ip-6-ospflocalin] action pass
[Hub2-security-policy-ip-6-ospflocalin] quit
```

```
[Hub2-security-policy-ip] quit
```

4. Configure the VAM client:

   # Create VAM client **Hub2**.

   ```
   <Hub2> system-view
   [Hub2] vam client name Hub2
   ```

   # Specify ADVPN domain **abc** for the VAM client.

   ```
   [Hub2-vam-client-Hub2] advpn-domain abc
   ```

   # Set the preshared key to **123456**.

   ```
   [Hub2-vam-client-Hub2] pre-shared-key simple 123456
   ```

   # Set both the username and password to **hub2**.

   ```
   [Hub2-vam-client-Hub2] user hub2 password simple hub2
   ```

   # Specify the primary and secondary VAM servers.

   ```
   [Hub2-vam-client-Hub2] server primary ip-address 1.0.0.11
   [Hub2-vam-client-Hub2] server secondary ip-address 1.0.0.12
   ```

   # Enable the VAM client.

   ```
   [Hub2-vam-client-Hub2] client enable
   [Hub2-vam-client-Hub2] quit
   ```

5. Configure an IPsec profile:

   # Configure IKE.

   ```
   [Hub2] ike keychain abc
   [Hub2-ike-keychain-abc] pre-shared-key address 0.0.0.0 0.0.0.0 key simple 123456
   [Hub2-ike-keychain-abc] quit
   [Hub2] ike profile abc
   [Hub2-ike-profile-abc] keychain abc
   [Hub2-ike-profile-abc] quit
   ```

   # Configure the IPsec profile.

   ```
   [Hub2] ipsec transform-set abc
   [Hub2-ipsec-transform-set-abc] encapsulation-mode transport
   [Hub2-ipsec-transform-set-abc] esp encryption-algorithm des-cbc
   [Hub2-ipsec-transform-set-abc] esp authentication-algorithm sha1
   [Hub2-ipsec-transform-set-abc] quit
   [Hub2] ipsec profile abc isakmp
   [Hub2-ipsec-profile-isakmp-abc] transform-set abc
   [Hub2-ipsec-profile-isakmp-abc] ike-profile abc
   [Hub2-ipsec-profile-isakmp-abc] quit
   ```

6. Configure OSPF to advertise the private network.

   ```
   [Hub2] ospf 1
   [Hub2-ospf-1] area 0
   [Hub2-ospf-1-area-0.0.0.0] network 192.168.0.0 0.0.0.255
   [Hub2-ospf-1-area-0.0.0.0] quit
   [Hub2-ospf-1] quit
   ```

7. Configure interface Tunnel 1.

   ```
   [Hub2] interface tunnel1
   [Hub2-Tunnel1] vam client Hub2
   [Hub2-Tunnel1] ospf network-type broadcast
   [Hub2-Tunnel1] source gigabitethernet 1/0/1
   [Hub2-Tunnel1] tunnel protection ipsec profile abc
   ```

```
[Hub2-Tunnel1] quit
```

Configuring Spoke 1

1. Assign IP addresses to interfaces:

   # Assign an IPv4 address to interface GigabitEthernet 1/0/1.

   ```
   <Spoke1> system-view
   [Spoke1] interface gigabitethernet 1/0/1
   [Spoke1-GigabitEthernet1/0/1] ip address 1.0.0.3 255.255.255.0
   [Spoke1-GigabitEthernet1/0/1] quit
   ```

   # Create interface Tunnel 1 and set its tunnel mode to GRE-encapsulated IPv4 ADVPN tunnel mode. Then, assign an IPv4 address to the interface.

   ```
   [Spoke1] interface tunnel 1 mode advpn gre
   [Spoke1-Tunnel1] ip address 192.168.0.3 255.255.255.0
   ```

   # Assign IP addresses to other interfaces. (Details not shown.)

2. Add the interfaces to security zones.

   ```
   [Spoke1] security-zone name untrust
   [Spoke1-security-zone-Untrust] import interface gigabitethernet 1/0/1
   [Spoke1-security-zone-Untrust] import interface tunnel1
   [Spoke1-security-zone-Untrust] quit
   [Spoke1] security-zone name trust
   [Spoke1-security-zone-Trust] import interface gigabitethernet 1/0/2
   [Spoke1-security-zone-Trust] quit
   ```

3. Configure a security policy:

   # Configure a rule named **advpnlocalout** to allow Spoke 1 to send VAM protocol packets to the VAM server.

   ```
   [Spoke1] security-policy ip
   [Spoke1-security-policy-ip] rule name advpnlocalout
   [Spoke1-security-policy-ip-1-advpnlocalout] source-zone local
   [Spoke1-security-policy-ip-1-advpnlocalout] destination-zone untrust
   [Spoke1-security-policy-ip-1-advpnlocalout] source-ip-host 1.0.0.3
   [Spoke1-security-policy-ip-1-advpnlocalout] destination-ip-range 1.0.0.10 1.0.0.12
   [Spoke1-security-policy-ip-1-ipseclocalout] action pass
   [Spoke1-security-policy-ip-1-ipseclocalout] quit
   ```

   # Configure a rule named **advpnlocalin** to allow Spoke 1 to receive VAM protocol packets from the VAM server.

   ```
   [Spoke1-security-policy-ip] rule name advpnlocalin
   [Spoke1-security-policy-ip-2-advpnlocalin] source-zone untrust
   [Spoke1-security-policy-ip-2-advpnlocalin] destination-zone local
   [Spoke1-security-policy-ip-2-advpnlocalin] source-ip-range 1.0.0.10 1.0.0.12
   [Spoke1-security-policy-ip-2-advpnlocalin] destination-ip-host 1.0.0.3
   [Spoke1-security-policy-ip-2-advpnlocalin] action pass
   [Spoke1-security-policy-ip-2-advpnlocalin] quit
   ```

   # Configure a rule named **ipseclocalout** to allow Spoke 1 to send IPsec negotiation packets to other VAM clients.

   ```
   [Spoke1-security-policy-ip] rule name ipseclocalout
   [Spoke1-security-policy-ip-3-ipseclocalout] source-zone local
   [Spoke1-security-policy-ip-3-ipseclocalout] destination-zone untrust
   [Spoke1-security-policy-ip-3-ipseclocalout] source-ip-host 1.0.0.3
   [Spoke1-security-policy-ip-3-ipseclocalout] destination-ip-range 1.0.0.1 1.0.0.4
   ```

```
[Spoke1-security-policy-ip-3-ipseclocalout] action pass
[Spoke1-security-policy-ip-3-ipseclocalout] quit
```

# Configure a rule named **ipseclocalin** to allow Spoke 1 to receive IPsec negotiation packets from other VAM clients.

```
[Spoke1-security-policy-ip] rule name ipseclocalin
[Spoke1-security-policy-ip-4-ipseclocalin] source-zone untrust
[Spoke1-security-policy-ip-4-ipseclocalin] destination-zone local
[Spoke1-security-policy-ip-4-ipseclocalin] source-ip-range 1.0.0.1 1.0.0.4
[Spoke1-security-policy-ip-4-ipseclocalin] destination-ip-host 1.0.0.3
[Spoke1-security-policy-ip-4-ipseclocalin] action pass
[Spoke1-security-policy-ip-4-ipseclocalin] quit
```

# Configure a rule named **ospflocalout** to allow Spoke 1 to send OSPF packets to other VAM clients.

```
[Spoke1-security-policy-ip] rule name ospflocalout
[Spoke1-security-policy-ip-5-ospflocalout] source-zone local
[Spoke1-security-policy-ip-5-ospflocalout] destination-zone untrust
[Spoke1-security-policy-ip-5-ospflocalout] service ospf
[Spoke1-security-policy-ip-5-ospflocalout] action pass
[Spoke1-security-policy-ip-5-ospflocalout] quit
```

# Configure a rule named **ospflocalin** to allow Spoke 1 to receive OSPF packets from other VAM clients.

```
[Spoke1-security-policy-ip] rule name ospflocalin
[Spoke1-security-policy-ip-6-ospflocalin] source-zone untrust
[Spoke1-security-policy-ip-6-ospflocalin] destination-zone local
[Spoke1-security-policy-ip-6-ospflocalin] service ospf
[Spoke1-security-policy-ip-6-ospflocalin] action pass
[Spoke1-security-policy-ip-6-ospflocalin] quit
[Spoke1-security-policy-ip] quit
```

4. Configure the VAM client:

# Create VAM client **Spoke1**.

```
<Spoke1> system-view
[Spoke1] vam client name Spoke1
```

# Specify ADVPN domain **abc** for the VAM client.

```
[Spoke1-vam-client-Spoke1] advpn-domain abc
```

# Set the preshared key to **123456**.

```
[Spoke1-vam-client-Spoke1] pre-shared-key simple 123456
```

# Set both the username and password to **spoke1**.

```
[Spoke1-vam-client-Spoke1] user spoke1 password simple spoke1
```

# Specify the primary and secondary VAM servers.

```
[Spoke1-vam-client-Spoke1] server primary ip-address 1.0.0.11
[Spoke1-vam-client-Spoke1] server secondary ip-address 1.0.0.12
```

# Enable the VAM client.

```
[Spoke1-vam-client-Spoke1] client enable
[Spoke1-vam-client-Spoke1] quit
```

5. Configure an IPsec profile:

# Configure IKE.

```
[Spoke1] ike keychain abc
[Spoke1-ike-keychain-abc] pre-shared-key address 0.0.0.0 0.0.0.0 key simple 123456
```

```
[Spoke1-ike-keychain-abc] quit
[Spoke1] ike profile abc
[Spoke1-ike-profile-abc] keychain abc
[Spoke1-ike-profile-abc] quit
```

# Configure the IPsec profile.

```
[Spoke1] ipsec transform-set abc
[Spoke1-ipsec-transform-set-abc] encapsulation-mode transport
[Spoke1-ipsec-transform-set-abc] esp encryption-algorithm des-cbc
[Spoke1-ipsec-transform-set-abc] esp authentication-algorithm sha1
[Spoke1-ipsec-transform-set-abc] quit
[Spoke1] ipsec profile abc isakmp
[Spoke1-ipsec-profile-isakmp-abc] transform-set abc
[Spoke1-ipsec-profile-isakmp-abc] ike-profile abc
[Spoke1-ipsec-profile-isakmp-abc] quit
```

6. Configure OSPF to advertise private networks.

```
[Spoke1] ospf 1
[Spoke1-ospf-1] area 0
[Spoke1-ospf-1-area-0.0.0.0] network 192.168.0.0 0.0.0.255
[Spoke1-ospf-1-area-0.0.0.0] network 192.168.1.0 0.0.0.255
[Spoke1-ospf-1-area-0.0.0.0] quit
[Spoke1-ospf-1] quit
```

7. Configure interface Tunnel 1. Set its DR priority to 0 to prevent Spoke 1 from participating in DR/BDR election.

```
[Spoke1] interface tunnel1
[Spoke1-Tunnel1] vam client Spoke1
[Spoke1-Tunnel1] ospf network-type broadcast
[Spoke1-Tunnel1] ospf dr-priority 0
[Spoke1-Tunnel1] source gigabitethernet 1/0/1
[Spoke1-Tunnel1] tunnel protection ipsec profile abc
[Spoke1-Tunnel1] quit
```

Configuring Spoke 2

1. Assign IP addresses to interfaces:

# Assign an IPv4 address to interface GigabitEthernet 1/0/1.

```
<Spoke2> system-view
[Spoke2] interface gigabitethernet 1/0/1
[Spoke2-GigabitEthernet1/0/1] ip address 1.0.0.4 255.255.255.0
[Spoke2-GigabitEthernet1/0/1] quit
```

# Create interface Tunnel 1 and set its tunnel mode to GRE-encapsulated IPv4 ADVPN tunnel mode. Then, assign an IPv4 address to the interface.

```
[Spoke2] interface tunnel 1 mode advpn gre
[Spoke2-Tunnel1] ip address 192.168.0.4 255.255.255.0
```

# Assign IP addresses to other interfaces. (Details not shown.)

2. Add the interfaces to security zones.

```
[Spoke2] security-zone name untrust
[Spoke2-security-zone-Untrust] import interface gigabitethernet 1/0/1
[Spoke2-security-zone-Untrust] import interface tunnel1
[Spoke2-security-zone-Untrust] quit
```

```
[Spoke2] security-zone name trust
[Spoke2-security-zone-Trust] import interface gigabitethernet 1/0/2
[Spoke2-security-zone-Trust] quit
```

3. Configure a security policy:

# Configure a rule named **advpnlocalout** to allow Spoke 2 to send VAM protocol packets to the VAM server.

```
[Spoke2] security-policy ip
[Spoke2-security-policy-ip] rule name advpnlocalout
[Spoke2-security-policy-ip-1-advpnlocalout] source-zone local
[Spoke2-security-policy-ip-1-advpnlocalout] destination-zone untrust
[Spoke2-security-policy-ip-1-advpnlocalout] source-ip-host 1.0.0.4
[Spoke2-security-policy-ip-1-advpnlocalout] destination-ip-range 1.0.0.10 1.0.0.12
[Spoke2-security-policy-ip-1-ipseclocalout] action pass
[Spoke2-security-policy-ip-1-ipseclocalout] quit
```

# Configure a rule named **advpnlocalin** to allow Spoke 2 to receive VAM protocol packets from the VAM server.

```
[Spoke2-security-policy-ip] rule name advpnlocalin
[Spoke2-security-policy-ip-2-advpnlocalin] source-zone untrust
[Spoke2-security-policy-ip-2-advpnlocalin] destination-zone local
[Spoke2-security-policy-ip-2-advpnlocalin] source-ip-range 1.0.0.10 1.0.0.12
[Spoke2-security-policy-ip-2-advpnlocalin] destination-ip-host 1.0.0.4
[Spoke2-security-policy-ip-2-advpnlocalin] action pass
[Spoke2-security-policy-ip-2-advpnlocalin] quit
```

# Configure a rule named **ipseclocalout** to allow Spoke 2 to send IPsec negotiation packets to other VAM clients.

```
[Spoke2-security-policy-ip] rule name ipseclocalout
[Spoke2-security-policy-ip-3-ipseclocalout] source-zone local
[Spoke2-security-policy-ip-3-ipseclocalout] destination-zone untrust
[Spoke2-security-policy-ip-3-ipseclocalout] source-ip-host 1.0.0.4
[Spoke2-security-policy-ip-3-ipseclocalout] destination-ip-range 1.0.0.1 1.0.0.3
[Spoke2-security-policy-ip-3-ipseclocalout] action pass
[Spoke2-security-policy-ip-3-ipseclocalout] quit
```

# Configure a rule named **ipseclocalin** to allow Spoke 2 to receive IPsec negotiation packets from other VAM clients.

```
[Spoke2-security-policy-ip] rule name ipseclocalin
[Spoke2-security-policy-ip-4-ipseclocalin] source-zone untrust
[Spoke2-security-policy-ip-4-ipseclocalin] destination-zone local
[Spoke2-security-policy-ip-4-ipseclocalin] source-ip-range 1.0.0.1 1.0.0.3
[Spoke2-security-policy-ip-4-ipseclocalin] destination-ip-host 1.0.0.4
[Spoke2-security-policy-ip-4-ipseclocalin] action pass
[Spoke2-security-policy-ip-4-ipseclocalin] quit
```

# Configure a rule named **ospflocalout** to allow Spoke 2 to send OSPF packets to other VAM clients.

```
[Spoke2-security-policy-ip] rule name ospflocalout
[Spoke2-security-policy-ip-5-ospflocalout] source-zone local
[Spoke2-security-policy-ip-5-ospflocalout] destination-zone untrust
[Spoke2-security-policy-ip-5-ospflocalout] service ospf
[Spoke2-security-policy-ip-5-ospflocalout] action pass
[Spoke2-security-policy-ip-5-ospflocalout] quit
```

# Configure a rule named **ospflocalin** to allow Spoke 2 to receive OSPF packets from other VAM clients.

```
[Spoke2-security-policy-ip] rule name ospflocalin
[Spoke2-security-policy-ip-6-ospflocalin] source-zone untrust
[Spoke2-security-policy-ip-6-ospflocalin] destination-zone local
[Spoke2-security-policy-ip-6-ospflocalin] service ospf
[Spoke2-security-policy-ip-6-ospflocalin] action pass
[Spoke2-security-policy-ip-6-ospflocalin] quit
[Spoke2-security-policy-ip] quit
```

4. Configure the VAM client:

# Create VAM client **Spoke2**.

```
<Spoke2> system-view
[Spoke2] vam client name Spoke2
```

# Specify ADVPN domain **abc** for the VAM client.

```
[Spoke2-vam-client-Spoke2] advpn-domain abc
```

# Set the preshared key to **123456**.

```
[Spoke2-vam-client-Spoke2] pre-shared-key simple 123456
```

# Set both the username and password to **spoke2**.

```
[Spoke2-vam-client-Spoke2] user spoke2 password simple spoke2
```

# Specify the primary and secondary VAM servers.

```
[Spoke2-vam-client-Spoke2] server primary ip-address 1.0.0.11
[Spoke2-vam-client-Spoke2] server secondary ip-address 1.0.0.12
```

# Enable the VAM client.

```
[Spoke2-vam-client-Spoke2] client enable
[Spoke2-vam-client-Spoke2] quit
```

5. Configure an IPsec profile:

# Configure IKE.

```
[Spoke2] ike keychain abc
[Spoke2-ike-keychain-abc] pre-shared-key address 0.0.0.0 0.0.0.0 key simple 123456
[Spoke2-ike-keychain-abc] quit
[Spoke2] ike profile abc
[Spoke2-ike-profile-abc] keychain abc
[Spoke2-ike-profile-abc] quit
```

# Configure the IPsec profile.

```
[Spoke2] ipsec transform-set abc
[Spoke2-ipsec-transform-set-abc] encapsulation-mode transport
[Spoke2-ipsec-transform-set-abc] esp encryption-algorithm des-cbc
[Spoke2-ipsec-transform-set-abc] esp authentication-algorithm sha1
[Spoke2-ipsec-transform-set-abc] quit
[Spoke2] ipsec profile abc isakmp
[Spoke2-ipsec-profile-isakmp-abc] transform-set abc
[Spoke2-ipsec-profile-isakmp-abc] ike-profile abc
[Spoke2-ipsec-profile-isakmp-abc] quit
```

6. Configure OSPF to advertise private networks.

```
[Spoke2] ospf 1
[Spoke2-ospf-1] area 0
[Spoke2-ospf-1-area-0.0.0.0] network 192.168.0.0 0.0.0.255
```

```
[Spoke2-ospf-1-area-0.0.0.0] network 192.168.2.0 0.0.0.255
[Spoke2-ospf-1-area-0.0.0.0] quit
[Spoke2-ospf-1] quit
```

7. Configure interface Tunnel 1. Set its DR priority to 0 to prevent Spoke 2 from participating in DR/BDR election.

```
[Spoke2] interface tunnel1
[Spoke2-Tunnel1] vam client Spoke2
[Spoke2-Tunnel1] ospf network-type broadcast
[Spoke2-Tunnel1] ospf dr-priority 0
[Spoke2-Tunnel1] source gigabitethernet 1/0/1
[Spoke2-Tunnel1] tunnel protection ipsec profile abc
[Spoke2-Tunnel1] quit
```

Verifying the configuration

# Display IPv4 address mapping information for all VAM clients registered with the primary VAM server.

```
[PrimaryServer] display vam server address-map
ADVPN domain name: abc
Total private address mappings: 4
Group      Private address  Public address               Type   NAT  Holding time
0          192.168.0.1      1.0.0.1                      Hub    No   0H 52M  7S
0          192.168.0.2      1.0.0.2                      Hub    No   0H 47M 31S
0          192.168.0.3      1.0.0.3                      Spoke  No   0H 28M 25S
0          192.168.0.4      1.0.0.4                      Spoke  No   0H 19M 15S
```

# Display IPv4 address mapping information for all VAM clients registered with the secondary VAM server.

```
[SecondaryServer] display vam server address-map
ADVPN domain name: abc
Total private address mappings: 4
Group      Private address  Public address               Type   NAT  Holding time
0          192.168.0.1      1.0.0.1                      Hub    No   0H 52M  7S
0          192.168.0.2      1.0.0.2                      Hub    No   0H 47M 31S
0          192.168.0.3      1.0.0.3                      Spoke  No   0H 28M 25S
0          192.168.0.4      1.0.0.4                      Spoke  No   0H 19M 15S
```

The output shows that Hub 1, Hub 2, Spoke 1, and Spoke 2 all have registered their address mapping information with the VAM servers.

# Display IPv4 ADVPN tunnel information on Hubs. This example uses Hub 1.

```
[Hub1] display advpn session
Interface         : Tunnel1
Number of sessions: 3
Private address  Public address              Port  Type  State      Holding time
192.168.0.2      1.0.0.2                     --    H-H   Success    0H 46M  8S
192.168.0.3      1.0.0.3                     --    H-S   Success    0H 27M 27S
192.168.0.4      1.0.0.4                     --    H-S   Success    0H 18M 18S
```

The output shows that Hub 1 has established a permanent tunnel to Hub 2, Spoke 1, and Spoke 2.

# Display IPv4 ADVPN tunnel information on Spokes. This example uses Spoke 1.

```
[Spoke1] display advpn session
Interface         : Tunnel1
```

```
Number of sessions: 2
Private address  Public address              Port  Type  State      Holding time
192.168.0.1      1.0.0.1                     --    S-H   Success    0H 46M  8S
192.168.0.2      1.0.0.2                     --    S-H   Success    0H 46M  8S
```

The output shows that Spoke 1 has established a permanent hub-spoke tunnel to Hub 1 and Hub 2.

# Verify that Spoke 1 can ping the private address 192.168.0.4 of Spoke 2.

```
[Spoke1] ping 192.168.0.4
Ping 192.168.0.4 (192.168.0.4): 56 data bytes, press CTRL_C to break
56 bytes from 192.168.0.4: icmp_seq=0 ttl=255 time=4.000 ms

--- Ping statistics for 192.168.0.4 ---
5 packets transmitted, 5 packets received, 0.0% packet loss
round-trip min/avg/max/std-dev = 0.000/1.000/4.000/1.549 ms
```

# Display IPv4 ADVPN tunnel information on Spokes. This example uses Spoke 1.

```
[Spoke1] display advpn session
Interface         : Tunnel1
Number of sessions: 3
Private address  Public address              Port  Type  State      Holding time
192.168.0.1      1.0.0.1                     --    S-H   Success    0H 46M  8S
192.168.0.2      1.0.0.2                     --    S-H   Success    0H 46M  8S
192.168.0.4      1.0.0.4                     --    S-S   Success    0H  0M  1S
```

The output shows the following information:

- Spoke 1 has established a permanent hub-spoke tunnel to Hub 1 and Hub 2.
- Spoke 1 has established a temporary spoke-spoke tunnel to Spoke 2.

Example: Configuring IPv6 full-mesh ADVPN

Network configuration

As shown in Figure 8, the primary and secondary VAM servers manage and maintain VAM client information for all hubs and spokes. The AAA server performs authentication and accounting for VAM clients. The two hubs back up each other, and perform data forwarding and route exchange.

- Establish a permanent ADVPN tunnel between each spoke and each hub.
- Establish a temporary ADVPN tunnel dynamically between the two spokes in the same ADVPN domain.

Figure 8 Network diagram

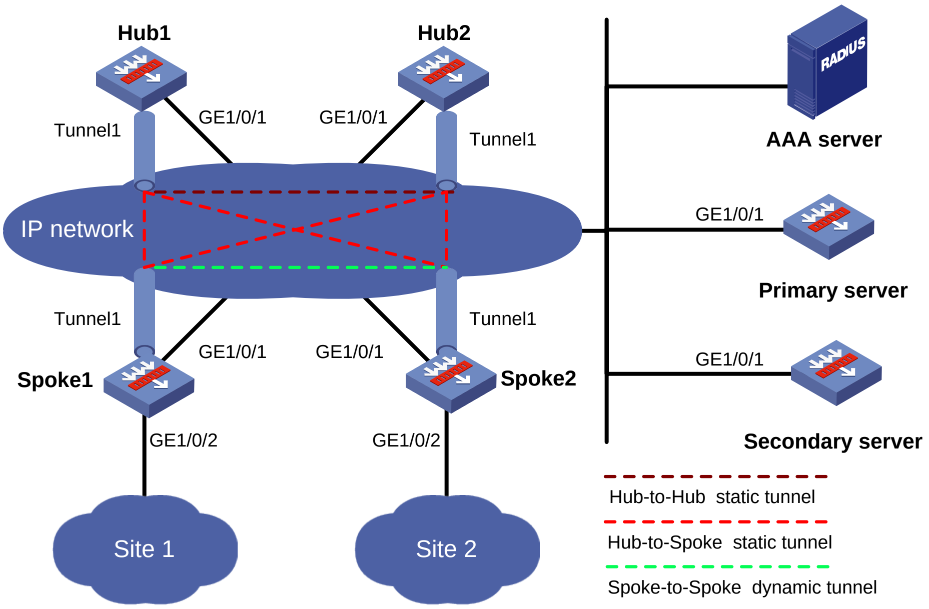

Table 2 Interface and IP address assignment

Device	Interface	IP address	Device	Interface	IP address
Hub 1	GE1/0/1	1::1/64	Spoke 1	GE1/0/1	1::3/64
	Tunnel1	192:168::1/64		GE1/0/2	192:168:1::1/64
Hub 2	GE1/0/1	1::2/64		Tunnel1	192:168::3/64
	Tunnel1	192:168::2/64	Spoke 2	GE1/0/1	1::4/64
AAA server		1::10/64		GE1/0/2	192:168:2::1/64
Primary server	GE1/0/1	1::11/64		Tunnel1	192:168::4/64
Secondary server	GE1/0/1	1::12/64			

Configuring the primary VAM server

1. Assign an IPv6 global unicast address to interface GigabitEthernet 1/0/1.

```
<PrimaryServer> system-view
[PrimaryServer] interface gigabitethernet 1/0/1
[PrimaryServer-GigabitEthernet1/0/1] ipv6 address 1::11/64
[PrimaryServer-GigabitEthernet1/0/1] quit
```

2. Add the interface to a security zone.

```
[PrimaryServer] security-zone name untrust
[PrimaryServer-security-zone-Untrust] import interface gigabitethernet 1/0/1
[PrimaryServer-security-zone-Untrust] quit
```

3. Configure a security policy:

# Configure a rule named **advpnlocalout** to allow the VAM server to send VAM protocol packets to the VAM clients.

```
[PrimaryServer] security-policy ipv6
[PrimaryServer-security-policy-ipv6] rule name advpnlocalout
[PrimaryServer-security-policy-ipv6-1-advpnlocalout] source-zone local
[PrimaryServer-security-policy-ipv6-1-advpnlocalout] destination-zone untrust
```

```
[PrimaryServer-security-policy-ipv6-1-advpnlocalout] source-ip-host 1::11
[PrimaryServer-security-policy-ipv6-1-advpnlocalout] destination-ip-range 1::1 1::12
[PrimaryServer-security-policy-ipv6-1-advpnlocalout] action pass
[PrimaryServer-security-policy-ipv6-1-advpnlocalout] quit
```

# Configure a rule named **advpnlocalin** to allow the VAM server to receive VAM protocol packets from the VAM clients.

```
[PrimaryServer-security-policy-ipv6] rule name advpnlocalin
[PrimaryServer-security-policy-ipv6-2-advpnlocalin] source-zone untrust
[PrimaryServer-security-policy-ipv6-2-advpnlocalin] destination-zone local
[PrimaryServer-security-policy-ipv6-2-advpnlocalin] source-ip-range 1::1 1::12
[PrimaryServer-security-policy-ipv6-2-advpnlocalin] destination-ip-host 1::11
[PrimaryServer-security-policy-ipv6-2-advpnlocalin] action pass
[PrimaryServer-security-policy-ipv6-2-advpnlocalin] quit
[PrimaryServer-security-policy-ipv6] quit
```

4. Configure AAA:

# Configure RADIUS scheme **abc**.

```
<PrimaryServer> system-view
[PrimaryServer] radius scheme abc
[PrimaryServer-radius-abc] primary authentication ipv6 1::10 1812
[PrimaryServer-radius-abc] primary accounting ipv6 1::10 1813
[PrimaryServer-radius-abc] key authentication simple 123
[PrimaryServer-radius-abc] key accounting simple 123
[PrimaryServer-radius-abc] user-name-format without-domain
[PrimaryServer-radius-abc] quit
[PrimaryServer] radius session-control enable
```

# Configure AAA methods for ISP domain **abc**.

```
[PrimaryServer] domain abc
[PrimaryServer-isp-abc] authentication advpn radius-scheme abc
[PrimaryServer-isp-abc] accounting advpn radius-scheme abc
[PrimaryServer-isp-abc] quit
[PrimaryServer] domain default enable abc
```

5. Configure the VAM server:

# Create ADVPN domain **abc**.

```
[PrimaryServer] vam server advpn-domain abc id 1
```

# Create hub group 0.

```
[PrimaryServer-vam-server-domain-abc] hub-group 0
```

# Specify hub private IPv6 addresses.

```
[PrimaryServer-vam-server-domain-abc-hub-group-0] hub ipv6 private-address 192:168::1
[PrimaryServer-vam-server-domain-abc-hub-group-0] hub ipv6 private-address 192:168::2
```

# Specify a spoke private IPv6 network.

```
[PrimaryServer-vam-server-domain-abc-hub-group-0] spoke ipv6 private-address network 192:168::0 64
```

# Set the preshared key to **123456**.

```
[PrimaryServer-vam-server-domain-abc] pre-shared-key simple 123456
```

# Set the authentication mode to CHAP.

```
[PrimaryServer-vam-server-domain-abc] authentication-method chap
```

# Enable the VAM server for the ADVPN domain.

```
[PrimaryServer-vam-server-domain-abc] server enable
[PrimaryServer-vam-server-domain-abc] quit
```

Configuring the secondary VAM server

# Configure the secondary VAM server in the same way that the primary server is configured. (Details not shown.)

Configuring Hub 1

1. Assign IP addresses to interfaces:

   # Assign an IPv6 global unicast address to interface GigabitEthernet 1/0/1.

   ```
   <Hub1> system-view
   [Hub1] interface gigabitethernet 1/0/1
   [Hub1-GigabitEthernet1/0/1] ipv6 address 1::1 64
   [Hub1-GigabitEthernet1/0/1] quit
   ```

   # Create interface Tunnel 1 and set its tunnel mode to the GRE-encapsulated IPv6 ADVPN tunnel mode. Then, assign an IPv6 global unicast addresses and an IPv6 link-local address to the interface.

   ```
   [Hub1] interface tunnel 1 mode advpn gre ipv6
   [Hub1-Tunnel1] ipv6 address 192:168::1 64
   [Hub1-Tunnel1] ipv6 address fe80::1 link-local
   ```

2. Add the interfaces to a security zone.

   ```
   [Hub1] security-zone name untrust
   [Hub1-security-zone-Untrust] import interface gigabitethernet 1/0/1
   [Hub1-security-zone-Untrust] import interface tunnel1
   [Hub1-security-zone-Untrust] quit
   ```

3. Configure a security policy:

   # Configure a rule named **advpnlocalout** to allow Hub 1 to send VAM protocol packets to the VAM server.

   ```
   [Hub1] security-policy ipv6
   [Hub1-security-policy-ipv6] rule name advpnlocalout
   [Hub1-security-policy-ipv6-1-advpnlocalout] source-zone local
   [Hub1-security-policy-ipv6-1-advpnlocalout] destination-zone untrust
   [Hub1-security-policy-ipv6-1-advpnlocalout] source-ip-host 1::1
   [Hub1-security-policy-ipv6-1-advpnlocalout] destination-ip-range 1::10 1::12
   [Hub1-security-policy-ipv6-1-ipseclocalout] action pass
   [Hub1-security-policy-ipv6-1-ipseclocalout] quit
   ```

   # Configure a rule named **advpnlocalin** to allow Hub 1 to receive VAM protocol packets from the VAM server.

   ```
   [Hub1-security-policy-ipv6] rule name advpnlocalin
   [Hub1-security-policy-ipv6-2-advpnlocalin] source-zone untrust
   [Hub1-security-policy-ipv6-2-advpnlocalin] destination-zone local
   [Hub1-security-policy-ipv6-2-advpnlocalin] source-ip-range 1::10 1::12
   [Hub1-security-policy-ipv6-2-advpnlocalin] destination-ip-host 1::1
   [Hub1-security-policy-ipv6-2-advpnlocalin] action pass
   [Hub1-security-policy-ipv6-2-advpnlocalin] quit
   ```

   # Configure a rule named **ipseclocalout** to allow Hub 1 to send IPsec negotiation packets to other VAM clients.

```
[Hub1-security-policy-ipv6] rule name ipseclocalout
[Hub1-security-policy-ipv6-3-ipseclocalout] source-zone local
[Hub1-security-policy-ipv6-3-ipseclocalout] destination-zone untrust
[Hub1-security-policy-ipv6-3-ipseclocalout] source-ip-host 1::1
[Hub1-security-policy-ipv6-3-ipseclocalout] destination-ip-range 1::2 1::4
[Hub1-security-policy-ipv6-3-ipseclocalout] action pass
[Hub1-security-policy-ipv6-3-ipseclocalout] quit
```

# Configure a rule named **ipseclocalin** to allow Hub 1 to receive IPsec negotiation packets from other VAM clients.

```
[Hub1-security-policy-ipv6] rule name ipseclocalin
[Hub1-security-policy-ipv6-4-ipseclocalin] source-zone untrust
[Hub1-security-policy-ipv6-4-ipseclocalin] destination-zone local
[Hub1-security-policy-ipv6-4-ipseclocalin] source-ip-range 1::2 1::4
[Hub1-security-policy-ipv6-4-ipseclocalin] destination-ip-host 1::1
[Hub1-security-policy-ipv6-4-ipseclocalin] action pass
[Hub1-security-policy-ipv6-4-ipseclocalin] quit
```

# Configure a rule named **ospflocalout** to allow Hub 1 to send OSPF packets to other VAM clients.

```
[Hub1-security-policy-ipv6] rule name ospflocalout
[Hub1-security-policy-ipv6-5-ospflocalout] source-zone local
[Hub1-security-policy-ipv6-5-ospflocalout] destination-zone untrust
[Hub1-security-policy-ipv6-5-ospflocalout] service ospf
[Hub1-security-policy-ipv6-5-ospflocalout] action pass
[Hub1-security-policy-ipv6-5-ospflocalout] quit
```

# Configure a rule named **ospflocalin** to allow Hub 1 to receive OSPF packets from other VAM clients.

```
[Hub1-security-policy-ipv6] rule name ospflocalin
[Hub1-security-policy-ipv6-6-ospflocalin] source-zone untrust
[Hub1-security-policy-ipv6-6-ospflocalin] destination-zone local
[Hub1-security-policy-ipv6-6-ospflocalin] service ospf
[Hub1-security-policy-ipv6-6-ospflocalin] action pass
[Hub1-security-policy-ipv6-6-ospflocalin] quit
```

4. Configure the VAM client:

# Create VAM client **Hub1**.

```
<Hub1> system-view
[Hub1] vam client name Hub1
```

# Specify ADVPN domain **abc** for the VAM client.

```
[Hub1-vam-client-Hub1] advpn-domain abc
```

# Set the preshared key to **123456**.

```
[Hub1-vam-client-Hub1] pre-shared-key simple 123456
```

# Set both the username and password to **hub1**.

```
[Hub1-vam-client-Hub1] user hub1 password simple hub1
```

# Specify the primary and secondary VAM servers.

```
[Hub1-vam-client-Hub1] server primary ipv6-address 1::11
[Hub1-vam-client-Hub1] server secondary ipv6-address 1::12
```

# Enable the VAM client.

```
[Hub1-vam-client-Hub1] client enable
[Hub1-vam-client-Hub1] quit
```

5. **Configure an IPsec profile:**

   # Configure IKE.

   ```
   [Hub1] ike keychain abc
   [Hub1-ike-keychain-abc] pre-shared-key address ipv6 :: 0 key simple 123456
   [Hub1-ike-keychain-abc] quit
   [Hub1] ike profile abc
   [Hub1-ike-profile-abc] keychain abc
   [Hub1-ike-profile-abc] quit
   ```

   # Configure the IPsec profile.

   ```
   [Hub1] ipsec transform-set abc
   [Hub1-ipsec-transform-set-abc] encapsulation-mode transport
   [Hub1-ipsec-transform-set-abc] esp encryption-algorithm des-cbc
   [Hub1-ipsec-transform-set-abc] esp authentication-algorithm sha1
   [Hub1-ipsec-transform-set-abc] quit
   [Hub1] ipsec profile abc isakmp
   [Hub1-ipsec-profile-isakmp-abc] transform-set abc
   [Hub1-ipsec-profile-isakmp-abc] ike-profile abc
   [Hub1-ipsec-profile-isakmp-abc] quit
   ```

6. **Configure OSPFv3.**

   ```
   [Hub1] ospfv3 1
   [Hub1-ospfv3-1] router-id 0.0.0.1
   [Hub1-ospfv3-1] area 0
   [Hub1-ospfv3-1-area-0.0.0.0] quit
   [Hub1-ospfv3-1] quit
   ```

7. **Configure interface Tunnel 1.**

   ```
   [Hub1] interface tunnel1
   [Hub1-Tunnel1] vam ipv6 client Hub1
   [Hub1-Tunnel1] ospfv3 1 area 0
   [Hub1-Tunnel1] ospfv3 network-type broadcast
   [Hub1-Tunnel1] source gigabitethernet 1/0/1
   [Hub1-Tunnel1] tunnel protection ipsec profile abc
   [Hub1-Tunnel1] quit
   ```

Configuring Hub 2

1. **Assign IP addresses to interfaces:**

   # Assign an IPv6 global unicast address to interface GigabitEthernet 1/0/1.

   ```
   <Hub2> system-view
   [Hub2] interface gigabitethernet 1/0/1
   [Hub2-GigabitEthernet1/0/1] ipv6 address 1::2 64
   [Hub2-GigabitEthernet1/0/1] quit
   ```

   # Create interface Tunnel 1 and set its tunnel mode to the GRE-encapsulated IPv6 ADVPN tunnel mode. Then, assign an IPv6 global unicast addresses and an IPv6 link-local address to the interface.

   ```
   [Hub2] interface tunnel 1 mode advpn gre ipv6
   [Hub2-Tunnel1] ipv6 address 192:168::2 64
   [Hub2-Tunnel1] ipv6 address fe80::2 link-local
   ```

2. **Add the interfaces to a security zone.**

   ```
   [Hub2] security-zone name untrust
   [Hub2-security-zone-Untrust] import interface gigabitethernet 1/0/1
   ```

```
[Hub2-security-zone-Untrust] import interface tunnel1
[Hub2-security-zone-Untrust] quit
```

3. Configure a security policy:

# Configure a rule named **advpnlocalout** to allow Hub 2 to send VAM protocol packets to the VAM server.

```
[Hub2] security-policy ipv6
[Hub2-security-policy-ipv6] rule name advpnlocalout
[Hub2-security-policy-ipv6-1-advpnlocalout] source-zone local
[Hub2-security-policy-ipv6-1-advpnlocalout] destination-zone untrust
[Hub2-security-policy-ipv6-1-advpnlocalout] source-ip-host 1::2
[Hub2-security-policy-ipv6-1-advpnlocalout] destination-ip-range 1::10 1::12
[Hub2-security-policy-ipv6-1-ipseclocalout] action pass
[Hub2-security-policy-ipv6-1-ipseclocalout] quit
```

# Configure a rule named **advpnlocalin** to allow Hub 2 to receive VAM protocol packets from the VAM server.

```
[Hub2-security-policy-ipv6] rule name advpnlocalin
[Hub2-security-policy-ipv6-2-advpnlocalin] source-zone untrust
[Hub2-security-policy-ipv6-2-advpnlocalin] destination-zone local
[Hub2-security-policy-ipv6-2-advpnlocalin] source-ip-range 1::10 1::12
[Hub2-security-policy-ipv6-2-advpnlocalin] destination-ip-host 1::2
[Hub2-security-policy-ipv6-2-advpnlocalin] action pass
[Hub2-security-policy-ipv6-2-advpnlocalin] quit
```

# Configure a rule named **ipseclocalout** to allow Hub 2 to send IPsec negotiation packets to other VAM clients.

```
[Hub2-security-policy-ipv6] rule name ipseclocalout
[Hub2-security-policy-ipv6-3-ipseclocalout] source-zone local
[Hub2-security-policy-ipv6-3-ipseclocalout] destination-zone untrust
[Hub2-security-policy-ipv6-3-ipseclocalout] source-ip-host 1::2
[Hub2-security-policy-ipv6-3-ipseclocalout] destination-ip-range 1::1 1::4
[Hub2-security-policy-ipv6-3-ipseclocalout] action pass
[Hub2-security-policy-ipv6-3-ipseclocalout] quit
```

# Configure a rule named **ipseclocalin** to allow Hub 2 to receive IPsec negotiation packets from other VAM clients.

```
[Hub2-security-policy-ipv6] rule name ipseclocalin
[Hub2-security-policy-ipv6-4-ipseclocalin] source-zone untrust
[Hub2-security-policy-ipv6-4-ipseclocalin] destination-zone local
[Hub2-security-policy-ipv6-4-ipseclocalin] source-ip-range 1::1 1::4
[Hub2-security-policy-ipv6-4-ipseclocalin] destination-ip-host 1::2
[Hub2-security-policy-ipv6-4-ipseclocalin] action pass
[Hub2-security-policy-ipv6-4-ipseclocalin] quit
```

# Configure a rule named **ospflocalout** to allow Hub 2 to send OSPF packets to other VAM clients.

```
[Hub2-security-policy-ipv6] rule name ospflocalout
[Hub2-security-policy-ipv6-5-ospflocalout] source-zone local
[Hub2-security-policy-ipv6-5-ospflocalout] destination-zone untrust
[Hub2-security-policy-ipv6-5-ospflocalout] service ospf
[Hub2-security-policy-ipv6-5-ospflocalout] action pass
[Hub2-security-policy-ipv6-5-ospflocalout] quit
```

# Configure a rule named **ospflocalin** to allow Hub 2 to receive OSPF packets from other VAM clients.

```
[Hub2-security-policy-ipv6] rule name ospflocalin
[Hub2-security-policy-ipv6-6-ospflocalin] source-zone untrust
[Hub2-security-policy-ipv6-6-ospflocalin] destination-zone local
[Hub2-security-policy-ipv6-6-ospflocalin] service ospf
[Hub2-security-policy-ipv6-6-ospflocalin] action pass
[Hub2-security-policy-ipv6-6-ospflocalin] quit
[Hub2-security-policy-ipv6] quit
```

4. Configure the VAM client:

# Create VAM client **Hub2**.

```
<Hub2> system-view
[Hub2] vam client name Hub2
```

# Specify ADVPN domain **abc** for the VAM client.

```
[Hub2-vam-client-Hub2] advpn-domain abc
```

# Set the preshared key to **123456**.

```
[Hub2-vam-client-Hub2] pre-shared-key simple 123456
```

# Set both the username and password to **hub2**.

```
[Hub2-vam-client-Hub2] user hub2 password simple hub2
```

# Specify the primary and secondary VAM servers.

```
[Hub2-vam-client-Hub2] server primary ipv6-address 1::11
[Hub2-vam-client-Hub2] server secondary ipv6-address 1::12
```

# Enable the VAM client.

```
[Hub2-vam-client-Hub2] client enable
[Hub2-vam-client-Hub2] quit
```

5. Configure an IPsec profile:

# Configure IKE.

```
[Hub2] ike keychain abc
[Hub2-ike-keychain-abc] pre-shared-key address ipv6 :: 0 key simple 123456
[Hub2-ike-keychain-abc] quit
[Hub2] ike profile abc
[Hub2-ike-profile-abc] keychain abc
[Hub2-ike-profile-abc] quit
```

# Configure the IPsec profile.

```
[Hub2] ipsec transform-set abc
[Hub2-ipsec-transform-set-abc] encapsulation-mode transport
[Hub2-ipsec-transform-set-abc] esp encryption-algorithm des-cbc
[Hub2-ipsec-transform-set-abc] esp authentication-algorithm sha1
[Hub2-ipsec-transform-set-abc] quit
[Hub2] ipsec profile abc isakmp
[Hub2-ipsec-profile-isakmp-abc] transform-set abc
[Hub2-ipsec-profile-isakmp-abc] ike-profile abc
[Hub2-ipsec-profile-isakmp-abc] quit
```

6. Configure OSPFv3.

```
[Hub2] ospfv3 1
[Hub2-ospfv3-1] router-id 0.0.0.2
[Hub2-ospfv3-1] area 0
```

```
[Hub2-ospfv3-1-area-0.0.0.0] quit
[Hub2-ospfv3-1] quit
```

7. Configure interface Tunnel 1.

```
[Hub2] interface tunnel1
[Hub2-Tunnel1] vam ipv6 client Hub2
[Hub2-Tunnel1] ospfv3 1 area 0
[Hub2-Tunnel1] ospfv3 network-type broadcast
[Hub2-Tunnel1] source gigabitethernet 1/0/1
[Hub2-Tunnel1] tunnel protection ipsec profile abc
[Hub2-Tunnel1] quit
```

Configuring Spoke 1

1. Assign IP addresses to interfaces:

   # Assign a global unicast address to interface GigabitEthernet 1/0/1.

```
<Spoke1> system-view
[Spoke1] interface gigabitethernet 1/0/1
[Spoke1-GigabitEthernet1/0/1] ipv6 address 1::3 64
[Spoke1-GigabitEthernet1/0/1] quit
```

   # Create interface Tunnel 1 and set its tunnel mode to the GRE-encapsulated IPv6 ADVPN tunnel mode. Then, assign an IPv6 global unicast addresses and an IPv6 link-local address to the interface.

```
[Spoke1] interface tunnel 1 mode advpn gre ipv6
[Spoke1-Tunnel1] ipv6 address 192:168::3 64
[Spoke1-Tunnel1] ipv6 address fe80::3 link-local
```

   # Assign IP addresses to other interfaces. (Details not shown.)

2. Add the interfaces to security zones.

```
[Spoke1] security-zone name untrust
[Spoke1-security-zone-Untrust] import interface gigabitethernet 1/0/1
[Spoke1-security-zone-Untrust] import interface tunnel1
[Spoke1-security-zone-Untrust] quit
[Spoke1] security-zone name trust
[Spoke1-security-zone-Trust] import interface gigabitethernet 1/0/2
[Spoke1-security-zone-Trust] quit
```

3. Configure a security policy:

   # Configure a rule named **advpnlocalout** to allow Spoke 1 to send VAM protocol packets to the VAM server.

```
[Spoke1] security-policy ipv6
[Spoke1-security-policy-ipv6] rule name advpnlocalout
[Spoke1-security-policy-ipv6-1-advpnlocalout] source-zone local
[Spoke1-security-policy-ipv6-1-advpnlocalout] destination-zone untrust
[Spoke1-security-policy-ipv6-1-advpnlocalout] source-ip-host 1::3
[Spoke1-security-policy-ipv6-1-advpnlocalout] destination-ip-range 1::10 1::12
[Spoke1-security-policy-ipv6-1-ipseclocalout] action pass
[Spoke1-security-policy-ipv6-1-ipseclocalout] quit
```

   # Configure a rule named **advpnlocalin** to allow Spoke 1 to receive VAM protocol packets from the VAM server.

```
[Spoke1-security-policy-ipv6] rule name advpnlocalin
[Spoke1-security-policy-ipv6-2-advpnlocalin] source-zone untrust
[Spoke1-security-policy-ipv6-2-advpnlocalin] destination-zone local
```

```
[Spoke1-security-policy-ipv6-2-advpnlocalin] source-ip-range 1::10 1::12
[Spoke1-security-policy-ipv6-2-advpnlocalin] destination-ip-host 1::3
[Spoke1-security-policy-ipv6-2-advpnlocalin] action pass
[Spoke1-security-policy-ipv6-2-advpnlocalin] quit
```

# Configure a rule named **ipseclocalout** to allow Spoke 1 to send IPsec negotiation packets to other VAM clients.

```
[Spoke1-security-policy-ipv6] rule name ipseclocalout
[Spoke1-security-policy-ipv6-3-ipseclocalout] source-zone local
[Spoke1-security-policy-ipv6-3-ipseclocalout] destination-zone untrust
[Spoke1-security-policy-ipv6-3-ipseclocalout] source-ip-host 1::3
[Spoke1-security-policy-ipv6-3-ipseclocalout] destination-ip-range 1::1 1::4
[Spoke1-security-policy-ipv6-3-ipseclocalout] action pass
[Spoke1-security-policy-ipv6-3-ipseclocalout] quit
```

# Configure a rule named **ipseclocalin** to allow Spoke 1 to receive IPsec negotiation packets from other VAM clients.

```
[Spoke1-security-policy-ipv6] rule name ipseclocalin
[Spoke1-security-policy-ipv6-4-ipseclocalin] source-zone untrust
[Spoke1-security-policy-ipv6-4-ipseclocalin] destination-zone local
[Spoke1-security-policy-ipv6-4-ipseclocalin] source-ip-range 1::1 1::4
[Spoke1-security-policy-ipv6-4-ipseclocalin] destination-ip-host 1::3
[Spoke1-security-policy-ipv6-4-ipseclocalin] action pass
[Spoke1-security-policy-ipv6-4-ipseclocalin] quit
```

# Configure a rule named **ospflocalout** to allow Spoke 1 to send OSPF packets to other VAM clients.

```
[Spoke1-security-policy-ipv6] rule name ospflocalout
[Spoke1-security-policy-ipv6-5-ospflocalout] source-zone local
[Spoke1-security-policy-ipv6-5-ospflocalout] destination-zone untrust
[Spoke1-security-policy-ipv6-5-ospflocalout] service ospf
[Spoke1-security-policy-ipv6-5-ospflocalout] action pass
[Spoke1-security-policy-ipv6-5-ospflocalout] quit
```

# Configure a rule named **ospflocalin** to allow Spoke 1 to receive OSPF packets from other VAM clients.

```
[Spoke1-security-policy-ipv6] rule name ospflocalin
[Spoke1-security-policy-ipv6-6-ospflocalin] source-zone untrust
[Spoke1-security-policy-ipv6-6-ospflocalin] destination-zone local
[Spoke1-security-policy-ipv6-6-ospflocalin] service ospf
[Spoke1-security-policy-ipv6-6-ospflocalin] action pass
[Spoke1-security-policy-ipv6-6-ospflocalin] quit
[Spoke1-security-policy-ipv6] quit
```

4. Configure the VAM client:

# Create VAM client **Spoke1**.

```
<Spoke1> system-view
[Spoke1] vam client name Spoke1
```

# Specify ADVPN domain **abc** for the VAM client.

```
[Spoke1-vam-client-Spoke1] advpn-domain abc
```

# Set the preshared key to **123456**.

```
[Spoke1-vam-client-Spoke1] pre-shared-key simple 123456
```

# Set both the username and password to **spoke1**.

```
[Spoke1-vam-client-Spoke1] user spoke1 password simple spoke1
```

# Specify the primary and secondary VAM servers.

```
[Spoke1-vam-client-Spoke1] server primary ipv6-address 1::11
[Spoke1-vam-client-Spoke1] server secondary ipv6-address 1::12
```

# Enable the VAM client.

```
[Spoke1-vam-client-Spoke1] client enable
[Spoke1-vam-client-Spoke1] quit
```

5. Configure an IPsec profile:

   # Configure IKE.

```
[Spoke1] ike keychain abc
[Spoke1-ike-keychain-abc] pre-shared-key address ipv6 :: 0 key simple 123456
[Spoke1-ike-keychain-abc] quit
[Spoke1] ike profile abc
[Spoke1-ike-profile-abc] keychain abc
[Spoke1-ike-profile-abc] quit
```

   # Configure the IPsec profile.

```
[Spoke1] ipsec transform-set abc
[Spoke1-ipsec-transform-set-abc] encapsulation-mode transport
[Spoke1-ipsec-transform-set-abc] esp encryption-algorithm des-cbc
[Spoke1-ipsec-transform-set-abc] esp authentication-algorithm sha1
[Spoke1-ipsec-transform-set-abc] quit
[Spoke1] ipsec profile abc isakmp
[Spoke1-ipsec-profile-isakmp-abc] transform-set abc
[Spoke1-ipsec-profile-isakmp-abc] ike-profile abc
[Spoke1-ipsec-profile-isakmp-abc] quit
```

6. Configure OSPFv3.

```
[Spoke1] ospfv3 1
[Spoke1-ospfv3-1] router-id 0.0.0.3
[Spoke1-ospfv3-1] area 0
[Spoke1-ospfv3-1-area-0.0.0.0] quit
[Spoke1-ospfv3-1] quit
```

7. Configure interface Tunnel 1. Set its DR priority to 0 to prevent Spoke 1 from participating in DR/BDR election.

```
[Spoke1] interface tunnel1 mode advpn gre ipv6
[Spoke1-Tunnel1] vam ipv6 client Spoke1
[Spoke1-Tunnel1] ospfv3 1 area 0
[Spoke1-Tunnel1] ospfv3 network-type broadcast
[Spoke1-Tunnel1] ospfv3 dr-priority 0
[Spoke1-Tunnel1] source gigabitethernet 1/0/1
[Spoke1-Tunnel1] tunnel protection ipsec profile abc
[Spoke1-Tunnel1] quit
```

Configuring Spoke 2

1. Assign IP addresses to interfaces:

   # Assign a global unicast address to interface GigabitEthernet 1/0/1.

```
<Spoke2> system-view
[Spoke2] interface gigabitethernet 1/0/1
[Spoke2-GigabitEthernet1/0/1] ipv6 address 1::4 64
```

```
[Spoke2-GigabitEthernet1/0/1] quit
```

# Create interface Tunnel 1 and set its tunnel mode to the GRE-encapsulated IPv6 ADVPN tunnel mode. Then, assign an IPv6 global unicast addresses and an IPv6 link-local address to the interface.

```
[Spoke2] interface tunnel 1 mode advpn gre ipv6
[Spoke2-Tunnel1] ipv6 address 192:168::4 64
[Spoke2-Tunnel1] ipv6 address fe80::4 link-local
```

# Assign IP addresses to other interfaces. (Details not shown.)

2. Add the interfaces to security zones.

```
[Spoke2] security-zone name untrust
[Spoke2-security-zone-Untrust] import interface gigabitethernet 1/0/1
[Spoke2-security-zone-Untrust] import interface tunnel1
[Spoke2-security-zone-Untrust] quit
[Spoke2] security-zone name trust
[Spoke2-security-zone-Trust] import interface gigabitethernet 1/0/2
[Spoke2-security-zone-Trust] quit
```

3. Configure a security policy:

# Configure a rule named **advpnlocalout** to allow Spoke 2 to send VAM protocol packets to the VAM server.

```
[Spoke2] security-policy ipv6
[Spoke2-security-policy-ipv6] rule name advpnlocalout
[Spoke2-security-policy-ipv6-1-advpnlocalout] source-zone local
[Spoke2-security-policy-ipv6-1-advpnlocalout] destination-zone untrust
[Spoke2-security-policy-ipv6-1-advpnlocalout] source-ip-host 1::4
[Spoke2-security-policy-ipv6-1-advpnlocalout] destination-ip-range 1::10 1::12
[Spoke2-security-policy-ipv6-1-ipseclocalout] action pass
[Spoke2-security-policy-ipv6-1-ipseclocalout] quit
```

# Configure a rule named **advpnlocalin** to allow Spoke 2 to receive VAM protocol packets from the VAM server.

```
[Spoke2-security-policy-ipv6] rule name advpnlocalin
[Spoke2-security-policy-ipv6-2-advpnlocalin] source-zone untrust
[Spoke2-security-policy-ipv6-2-advpnlocalin] destination-zone local
[Spoke2-security-policy-ipv6-2-advpnlocalin] source-ip-range 1::10 1::12
[Spoke2-security-policy-ipv6-2-advpnlocalin] destination-ip-host 1::4
[Spoke2-security-policy-ipv6-2-advpnlocalin] action pass
[Spoke2-security-policy-ipv6-2-advpnlocalin] quit
```

4. Configure the VAM client:

# Create VAM client **Spoke2**.

```
<Spoke2> system-view
[Spoke2] vam client name Spoke2
```

# Specify ADVPN domain **abc** for the VAM client.

```
[Spoke2-vam-client-Spoke2] advpn-domain abc
```

# Set the preshared key to **123456**.

```
[Spoke2-vam-client-Spoke2] pre-shared-key simple 123456
```

# Set both the username and password to **spoke2**.

```
[Spoke2-vam-client-Spoke2] user spoke2 password simple spoke2
```

# Specify the primary and secondary VAM servers.

```
[Spoke2-vam-client-Spoke2] server primary ipv6-address 1::11
[Spoke2-vam-client-Spoke2] server secondary ipv6-address 1::12
```

# Enable the VAM client.

```
[Spoke2-vam-client-Spoke2] client enable
[Spoke2-vam-client-Spoke2] quit
```

5. Configure an IPsec profile:

# Configure IKE.

```
[Spoke2] ike keychain abc
[Spoke2-ike-keychain-abc] pre-shared-key address ipv6 :: 0 key simple 123456
[Spoke2-ike-keychain-abc] quit
[Spoke2] ike profile abc
[Spoke2-ike-profile-abc] keychain abc
[Spoke2-ike-profile-abc] quit
```

# Configure the IPsec profile.

```
[Spoke2] ipsec transform-set abc
```

```
[Spoke2-ipsec-transform-set-abc] encapsulation-mode transport
[Spoke2-ipsec-transform-set-abc] esp encryption-algorithm des-cbc
[Spoke2-ipsec-transform-set-abc] esp authentication-algorithm sha1
[Spoke2-ipsec-transform-set-abc] quit
[Spoke2] ipsec profile abc isakmp
[Spoke2-ipsec-profile-isakmp-abc] transform-set abc
[Spoke2-ipsec-profile-isakmp-abc] ike-profile abc
[Spoke2-ipsec-profile-isakmp-abc] quit
```

6. Configure OSPFv3.

```
[Spoke2] ospfv3 1
[Spoke2-ospfv3-1] router-id 0.0.0.4
[Spoke2-ospfv3-1] area 0
[Spoke2-ospfv3-1-area-0.0.0.0] quit
[Spoke2-ospfv3-1] quit
```

7. Configure interface Tunnel 1. Set its DR priority to 0 to prevent Spoke 2 from participating in DR/BDR election.

```
[Spoke2] interface tunnel1 mode advpn gre ipv6
[Spoke2-Tunnel1] vam ipv6 client Spoke2
[Spoke2-Tunnel1] ospfv3 1 area 0
[Spoke2-Tunnel1] ospfv3 network-type broadcast
[Spoke2-Tunnel1] ospfv3 dr-priority 0
[Spoke2-Tunnel1] source gigabitethernet 1/0/1
[Spoke2-Tunnel1] tunnel protection ipsec profile abc
[Spoke2-Tunnel1] quit
```

Verifying the configuration

# Display IPv6 address mapping information for all VAM clients registered with the primary VAM server.

```
[PrimaryServer] display vam server ipv6 address-map
ADVPN domain name: abc
Total private address mappings: 4
Group      Private address       Public address          Type   NAT  Holding time
0          192:168::1            1::1                    Hub    No   0H 52M  7S
0          192:168::2            1::2                    Hub    No   0H 47M 31S
0          192:168::3            1::3                    Spoke  No   0H 28M 25S
0          192:168::4            1::4                    Spoke  No   0H 19M 15S
```

# Display IPv6 address mapping information for all VAM clients registered with the secondary VAM server.

```
[SecondaryServer] display vam server ipv6 address-map
ADVPN domain name: abc
Total private address mappings: 4
Group      Private address       Public address          Type   NAT  Holding time
0          192:168::1            1::1                    Hub    No   0H 52M  7S
0          192:168::2            1::2                    Hub    No   0H 47M 31S
0          192:168::3            1::3                    Spoke  No   0H 28M 25S
0          192:168::4            1::4                    Spoke  No   0H 19M 15S
```

The output shows that Hub 1, Hub 2, Spoke 1, and Spoke 2 have all registered their address mapping information with the VAM servers.

# Display IPv6 ADVPN tunnel information on Hubs. This example uses Hub 1.

```
[Hub1] display advpn ipv6 session
Interface         : Tunnel1
Number of sessions: 3
Private address       Public address        Port  Type  State      Holding time
192:168::2            1::2                  --    H-H   Success    0H 46M  8S
192:168::3            1::3                  --    H-S   Success    0H 27M 27S
192:168::4            1::4                  --    H-S   Success    0H 18M 18S
```

The output shows that Hub 1 has established a permanent tunnel to Hub 2, Spoke 1, and Spoke 2.

# Display IPv6 ADVPN tunnel information on Spoke 1.

```
[Spoke1] display advpn ipv6 session
Interface         : Tunnel1
Number of sessions: 2
Private address       Public address        Port  Type  State      Holding time
192:168::1            1::1                  --    S-H   Success    0H 46M  8S
192:168::2            1::2                  --    S-H   Success    0H 46M  8S
```

The output shows that Spoke 1 has established a permanent hub-spoke tunnel to Hub 1 and Hub 2.

# Verify that Spoke 1 can ping the private address 192:168::4 of Spoke 2.

```
[Spoke1] ping ipv6 192:168::4
Ping6(56 data bytes) 192:168::4 --> 192:168::4, press CTRL_C to break
56 bytes from 192:168::4, icmp_seq=0 hlim=64 time=3.000 ms
56 bytes from 192:168::4, icmp_seq=1 hlim=64 time=0.000 ms
56 bytes from 192:168::4, icmp_seq=2 hlim=64 time=1.000 ms
56 bytes from 192:168::4, icmp_seq=3 hlim=64 time=1.000 ms
56 bytes from 192:168::4, icmp_seq=4 hlim=64 time=1.000 ms

--- Ping6 statistics for 192:168::4 ---
5 packets transmitted, 5 packets received, 0.0% packet loss
round-trip min/avg/max/std-dev = 0.000/1.200/3.000/0.980 ms
```

# Display IPv6 ADVPN tunnel information on Spokes. This example uses Spoke 1.

```
[Spoke1] display advpn ipv6 session
Interface         : Tunnel1
Number of sessions: 3
Private address       Public address        Port  Type  State      Holding time
192:168::1            1::1                  --    S-H   Success    0H 46M  8S
192:168::2            1::2                  --    S-H   Success    0H 46M  8S
192.168::4            1::4                  --    S-S   Success    0H  0M  1S
```

The output shows the following information:

- Spoke 1 has established a permanent hub-spoke tunnel to Hub 1 and Hub 2.
- Spoke 1 has established a temporary spoke-spoke tunnel to Spoke 2.

Example: Configuring IPv4 hub-spoke ADVPN

Network configuration

As shown in Figure 9, the primary and secondary VAM servers manage and maintain VAM client information for all hubs and spokes. The AAA server performs authentication and accounting for VAM clients. The two hubs back up each other, and perform data forwarding and route exchange.

Establish a permanent ADVPN tunnel between each spoke and each hub.

Figure 9 Network diagram

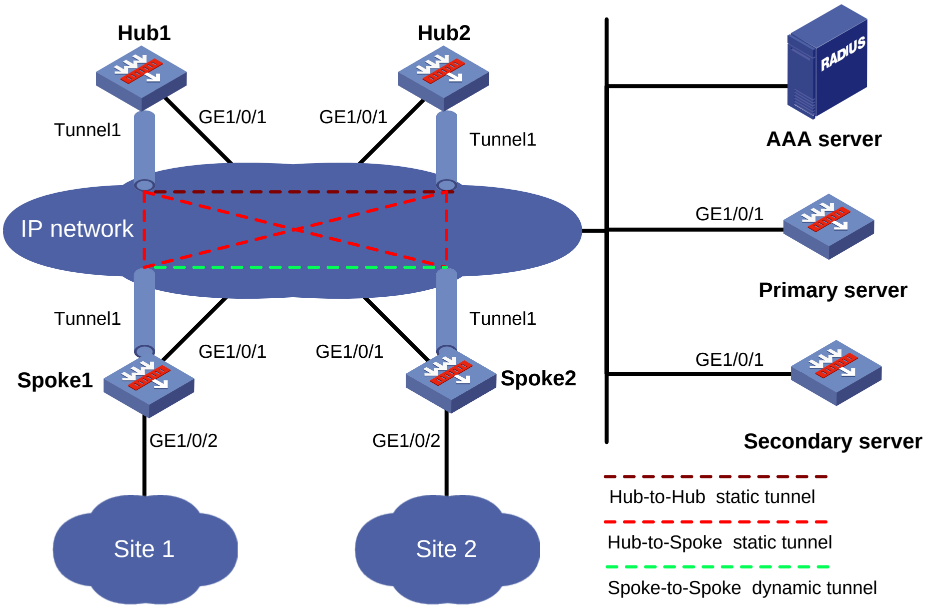

Table 3 Interface and IP address assignment

Device	Interface	IP address	Device	Interface	IP address
Hub 1	GE1/0/1	1.0.0.1/24	Spoke 1	GE1/0/1	1.0.0.3/24
	Tunnel1	192.168.0.1/24		GE1/0/2	192.168.1.1/24
Hub 2	GE1/0/1	1.0.0.2/24		Tunnel1	192.168.0.3/24
	Tunnel1	192.168.0.2/24	Spoke 2	GE1/0/1	1.0.0.4/24
AAA server		1.0.0.10/24		GE1/0/2	192.168.2.1/24
Primary server	GE1/0/1	1.0.0.11/24		Tunnel1	192.168.0.4/24
Secondary server	GE1/0/1	1.0.0.12/24			

Configuring the primary VAM server

1. Assign an IP address to interface GigabitEthernet 1/0/1.

```
<PrimaryServer> system-view
[PrimaryServer] interface gigabitethernet 1/0/1
[PrimaryServer-GigabitEthernet1/0/1] ip address 1.0.0.11 255.255.255.0
[PrimaryServer-GigabitEthernet1/0/1] quit
```

2. Add the interface to a security zone.

```
[PrimaryServer] security-zone name untrust
[PrimaryServer-security-zone-Untrust] import interface gigabitethernet 1/0/1
[PrimaryServer-security-zone-Untrust] quit
```

3. Configure a security policy:

# Configure a rule named **advpnlocalout** to allow the VAM server to send VAM protocol packets to the VAM clients.

```
[PrimaryServer] security-policy ip
[PrimaryServer-security-policy-ip] rule name advpnlocalout
```

```
[PrimaryServer-security-policy-ip-1-advpnlocalout] source-zone local
[PrimaryServer-security-policy-ip-1-advpnlocalout] destination-zone untrust
[PrimaryServer-security-policy-ip-1-advpnlocalout] source-ip-host 1.0.0.11
[PrimaryServer-security-policy-ip-1-advpnlocalout] destination-ip-range 1.0.0.1
1.0.0.12
[PrimaryServer-security-policy-ip-1-ipseclocalout] action pass
[PrimaryServer-security-policy-ip-1-ipseclocalout] quit
```

# Configure a rule named **advpnlocalin** to allow the VAM server to receive VAM protocol packets from the VAM clients.

```
[PrimaryServer-security-policy-ip] rule name advpnlocalin
[PrimaryServer-security-policy-ip-2-advpnlocalin] source-zone untrust
[PrimaryServer-security-policy-ip-2-advpnlocalin] destination-zone local
[PrimaryServer-security-policy-ip-2-advpnlocalin] source-ip-range 1.0.0.1 1.0.0.12
[PrimaryServer-security-policy-ip-2-advpnlocalin] destination-ip-host 1.0.0.11
[PrimaryServer-security-policy-ip-2-advpnlocalin] action pass
[PrimaryServer-security-policy-ip-2-advpnlocalin] quit
[PrimaryServer-security-policy-ip] quit
```

4. Configure AAA:

   # Configure RADIUS scheme **abc**.

```
<PrimaryServer> system-view
[PrimaryServer] radius scheme abc
[PrimaryServer-radius-abc] primary authentication 1.0.0.10 1812
[PrimaryServer-radius-abc] primary accounting 1.0.0.10 1813
[PrimaryServer-radius-abc] key authentication simple 123
[PrimaryServer-radius-abc] key accounting simple 123
[PrimaryServer-radius-abc] user-name-format without-domain
[PrimaryServer-radius-abc] quit
[PrimaryServer] radius session-control enable
```

   # Configure AAA methods for ISP domain **abc**.

```
[PrimaryServer] domain abc
[PrimaryServer-isp-abc] authentication advpn radius-scheme abc
[PrimaryServer-isp-abc] accounting advpn radius-scheme abc
[PrimaryServer-isp-abc] quit
[PrimaryServer] domain default enable abc
```

5. Configure the VAM server:

   # Create ADVPN domain **abc**.

```
[PrimaryServer] vam server advpn-domain abc id 1
```

   # Create hub group 0.

```
[PrimaryServer-vam-server-domain-abc] hub-group 0
```

   # Specify hub private IPv4 addresses.

```
[PrimaryServer-vam-server-domain-abc-hub-group-0] hub private-address 192.168.0.1
[PrimaryServer-vam-server-domain-abc-hub-group-0] hub private-address 192.168.0.2
```

   # Specify a spoke private IPv4 network.

```
[PrimaryServer-vam-server-domain-abc-hub-group-0] spoke private-address network
192.168.0.0 255.255.255.0
[PrimaryServer-vam-server-domain-abc-hub-group-0] quit
```

   # Set the preshared key to **123456**.

```
[PrimaryServer-vam-server-domain-abc] pre-shared-key simple 123456
```

# Set the authentication mode to CHAP.

```
[PrimaryServer-vam-server-domain-abc] authentication-method chap
```

# Enable the VAM server for the ADVPN domain.

```
[PrimaryServer-vam-server-domain-abc] server enable
[PrimaryServer-vam-server-domain-abc] quit
```

Configuring the secondary VAM server

# Configure the secondary VAM server in the same way that the primary server is configured. (Details not shown.)

Configuring Hub 1

1. Assign IP addresses to interfaces:

   # Assign an IPv4 address to GigabitEthernet 1/0/1.

   ```
   <Hub1> system-view
   [Hub1] interface gigabitethernet 1/0/1
   [Hub1-GigabitEthernet1/0/1] ip address 1.0.0.1 255.255.255.0
   [Hub1-GigabitEthernet1/0/1] quit
   ```

   # Create interface Tunnel 1 and set its tunnel mode to the GRE-encapsulated IPv4 ADVPN tunnel mode. Then, assign an IPv4 address to the interface.

   ```
   [Hub1] interface tunnel1 mode advpn gre
   [Hub1-Tunnel1] ip address 192.168.0.1 255.255.255.0
   ```

2. Add the interfaces to a security zone:

   ```
   [Hub1] security-zone name untrust
   [Hub1-security-zone-Untrust] import interface gigabitethernet 1/0/1
   [Hub1-security-zone-Untrust] import interface tunnel1
   [Hub1-security-zone-Untrust] quit
   ```

3. Configure a security policy:

   # Configure a rule named **advpnlocalout** to allow Hub 1 to send VAM protocol packets to the VAM server.

   ```
   [Hub1] security-policy ip
   [Hub1-security-policy-ip] rule name advpnlocalout
   [Hub1-security-policy-ip-1-advpnlocalout] source-zone local
   [Hub1-security-policy-ip-1-advpnlocalout] destination-zone untrust
   [Hub1-security-policy-ip-1-advpnlocalout] source-ip-host 1.0.0.1
   [Hub1-security-policy-ip-1-advpnlocalout] destination-ip-range 1.0.0.10 1.0.0.12
   [Hub1-security-policy-ip-1-ipseclocalout] action pass
   [Hub1-security-policy-ip-1-ipseclocalout] quit
   ```

   # Configure a rule named **advpnlocalin** to allow Hub 1 to receive VAM protocol packets from the VAM server.

   ```
   [Hub1-security-policy-ip] rule name advpnlocalin
   [Hub1-security-policy-ip-2-advpnlocalin] source-zone untrust
   [Hub1-security-policy-ip-2-advpnlocalin] destination-zone local
   [Hub1-security-policy-ip-2-advpnlocalin] source-ip-range 1.0.0.10 1.0.0.12
   [Hub1-security-policy-ip-2-advpnlocalin] destination-ip-host 1.0.0.1
   [Hub1-security-policy-ip-2-advpnlocalin] action pass
   [Hub1-security-policy-ip-2-advpnlocalin] quit
   ```

   # Configure a rule named **ipseclocalout** to allow Hub 1 to send IPsec negotiation packets to other VAM clients.

   ```
   [Hub1-security-policy-ip] rule name ipseclocalout
   ```

```
[Hub1-security-policy-ip-3-ipseclocalout] source-zone local
[Hub1-security-policy-ip-3-ipseclocalout] destination-zone untrust
[Hub1-security-policy-ip-3-ipseclocalout] source-ip-host 1.0.0.1
[Hub1-security-policy-ip-3-ipseclocalout] destination-ip-range 1.0.0.2 1.0.0.4
[Hub1-security-policy-ip-3-ipseclocalout] action pass
[Hub1-security-policy-ip-3-ipseclocalout] quit
```

# Configure a rule named **ipseclocalin** to allow Hub 1 to receive IPsec negotiation packets from other VAM clients.

```
[Hub1-security-policy-ip] rule name ipseclocalin
[Hub1-security-policy-ip-4-ipseclocalin] source-zone untrust
[Hub1-security-policy-ip-4-ipseclocalin] destination-zone local
[Hub1-security-policy-ip-4-ipseclocalin] source-ip-range 1.0.0.2 1.0.0.4
[Hub1-security-policy-ip-4-ipseclocalin] destination-ip-host 1.0.0.1
[Hub1-security-policy-ip-4-ipseclocalin] action pass
[Hub1-security-policy-ip-4-ipseclocalin] quit
```

# Configure a rule named **ospflocalout** to allow Hub 1 to send OSPF packets to other VAM clients.

```
[Hub1-security-policy-ip] rule name ospflocalout
[Hub1-security-policy-ip-5-ospflocalout] source-zone local
[Hub1-security-policy-ip-5-ospflocalout] destination-zone untrust
[Hub1-security-policy-ip-5-ospflocalout] service ospf
[Hub1-security-policy-ip-5-ospflocalout] action pass
[Hub1-security-policy-ip-5-ospflocalout] quit
```

# Configure a rule named **ospflocalin** to allow Hub 1 to receive OSPF packets from other VAM clients.

```
[Hub1-security-policy-ip] rule name ospflocalin
[Hub1-security-policy-ip-6-ospflocalin] source-zone untrust
[Hub1-security-policy-ip-6-ospflocalin] destination-zone local
[Hub1-security-policy-ip-6-ospflocalin] service ospf
[Hub1-security-policy-ip-6-ospflocalin] action pass
[Hub1-security-policy-ip-6-ospflocalin] quit
```

4. Configure the VAM client:

# Create VAM client **Hub1**.

```
<Hub1> system-view
[Hub1] vam client name Hub1
```

# Specify ADVPN domain **abc** for the VAM client.

```
[Hub1-vam-client-Hub1] advpn-domain abc
```

# Set the preshared key to **123456**.

```
[Hub1-vam-client-Hub1] pre-shared-key simple 123456
```

# Set both the username and password to **hub1**.

```
[Hub1-vam-client-Hub1] user hub1 password simple hub1
```

# Specify the primary and secondary VAM servers.

```
[Hub1-vam-client-Hub1] server primary ip-address 1.0.0.11
[Hub1-vam-client-Hub1] server secondary ip-address 1.0.0.12
```

# Enable the VAM client.

```
[Hub1-vam-client-Hub1] client enable
[Hub1-vam-client-Hub1] quit
```

5. Configure an IPsec profile:

# Configure IKE.

```
[Hub1] ike keychain abc
[Hub1-ike-keychain-abc] pre-shared-key address 0.0.0.0 0.0.0.0 key simple 123456
[Hub1-ike-keychain-abc] quit
[Hub1] ike profile abc
[Hub1-ike-profile-abc] keychain abc
[Hub1-ike-profile-abc] quit
```

# Configure the IPsec profile.

```
[Hub1] ipsec transform-set abc
[Hub1-ipsec-transform-set-abc] encapsulation-mode transport
[Hub1-ipsec-transform-set-abc] esp encryption-algorithm des-cbc
[Hub1-ipsec-transform-set-abc] esp authentication-algorithm sha1
[Hub1-ipsec-transform-set-abc] quit
[Hub1] ipsec profile abc isakmp
[Hub1-ipsec-profile-isakmp-abc] transform-set abc
[Hub1-ipsec-profile-isakmp-abc] ike-profile abc
[Hub1-ipsec-profile-isakmp-abc] quit
```

6. Configure OSPF to advertise the private network.

```
[Hub1] ospf 1
[Hub1-ospf-1] area 0
[Hub1-ospf-1-area-0.0.0.0] network 192.168.0.0 0.0.0.255
[Hub1-ospf-1-area-0.0.0.0] quit
[Hub1-ospf-1] quit
```

7. Configure interface Tunnel 1.

```
[Hub1] interface tunnel1
[Hub1-Tunnel1] vam client Hub1
[Hub1-Tunnel1] ospf network-type p2mp
[Hub1-Tunnel1] source gigabitethernet 1/0/1
[Hub1-Tunnel1] tunnel protection ipsec profile abc
[Hub1-Tunnel1] quit
```

Configuring Hub 2

1. Assign IP addresses to interfaces:

# Assign an IPv4 address to GigabitEthernet 1/0/1.

```
<Hub2> system-view
[Hub2] interface gigabitethernet 1/0/1
[Hub2-GigabitEthernet1/0/1] ip address 1.0.0.2 255.255.255.0
[Hub2-GigabitEthernet1/0/1] quit
```

# Create interface Tunnel 1 and set its tunnel mode to the GRE-encapsulated IPv4 ADVPN tunnel mode. Then, assign an IPv4 address to the interface.

```
[Hub2] interface tunnel1 mode advpn gre
[Hub2-Tunnel1] ip address 192.168.0.2 255.255.255.0
```

2. Add the interfaces to a security zone.

```
[Hub2] security-zone name untrust
[Hub2-security-zone-Untrust] import interface gigabitethernet 1/0/1
[Hub2-security-zone-Untrust] import interface tunnel1
[Hub2-security-zone-Untrust] quit
```

3. Configure a security policy:

# Configure a rule named **advpnlocalout** to allow Hub 2 to send VAM protocol packets to the VAM server.

```
[Hub2] security-policy ip
[Hub2-security-policy-ip] rule name advpnlocalout
[Hub2-security-policy-ip-1-advpnlocalout] source-zone local
[Hub2-security-policy-ip-1-advpnlocalout] destination-zone untrust
[Hub2-security-policy-ip-1-advpnlocalout] source-ip-host 1.0.0.2
[Hub2-security-policy-ip-1-advpnlocalout] destination-ip-range 1.0.0.10 1.0.0.12
[Hub2-security-policy-ip-1-ipseclocalout] action pass
[Hub2-security-policy-ip-1-ipseclocalout] quit
```

# Configure a rule named **advpnlocalin** to allow Hub 2 to receive VAM protocol packets from the VAM server.

```
[Hub2-security-policy-ip] rule name advpnlocalin
[Hub2-security-policy-ip-2-advpnlocalin] source-zone untrust
[Hub2-security-policy-ip-2-advpnlocalin] destination-zone local
[Hub2-security-policy-ip-2-advpnlocalin] source-ip-range 1.0.0.10 1.0.0.12
[Hub2-security-policy-ip-2-advpnlocalin] destination-ip-host 1.0.0.2
[Hub2-security-policy-ip-2-advpnlocalin] action pass
[Hub2-security-policy-ip-2-advpnlocalin] quit
```

# Configure a rule named **ipseclocalout** to allow Hub 2 to send IPsec negotiation packets to other VAM clients.

```
[Hub2-security-policy-ip] rule name ipseclocalout
[Hub2-security-policy-ip-3-ipseclocalout] source-zone local
[Hub2-security-policy-ip-3-ipseclocalout] destination-zone untrust
[Hub2-security-policy-ip-3-ipseclocalout] source-ip-host 1.0.0.2
[Hub2-security-policy-ip-3-ipseclocalout] destination-ip-range 1.0.0.1 1.0.0.4
[Hub2-security-policy-ip-3-ipseclocalout] action pass
[Hub2-security-policy-ip-3-ipseclocalout] quit
```

# Configure a rule named **ipseclocalin** to allow Hub 2 to receive IPsec negotiation packets from other VAM clients.

```
[Hub2-security-policy-ip] rule name ipseclocalin
[Hub2-security-policy-ip-4-ipseclocalin] source-zone untrust
[Hub2-security-policy-ip-4-ipseclocalin] destination-zone local
[Hub2-security-policy-ip-4-ipseclocalin] source-ip-range 1.0.0.1 1.0.0.4
[Hub2-security-policy-ip-4-ipseclocalin] destination-ip-host 1.0.0.2
[Hub2-security-policy-ip-4-ipseclocalin] action pass
[Hub2-security-policy-ip-4-ipseclocalin] quit
```

# Configure a rule named **ospflocalout** to allow Hub 2 to send OSPF packets to other VAM clients.

```
[Hub2-security-policy-ip] rule name ospflocalout
[Hub2-security-policy-ip-5-ospflocalout] source-zone local
[Hub2-security-policy-ip-5-ospflocalout] destination-zone untrust
[Hub2-security-policy-ip-5-ospflocalout] service ospf
[Hub2-security-policy-ip-5-ospflocalout] action pass
[Hub2-security-policy-ip-5-ospflocalout] quit
```

# Configure a rule named **ospflocalin** to allow Hub 2 to receive OSPF packets from other VAM clients.

```
[Hub2-security-policy-ip] rule name ospflocalin
[Hub2-security-policy-ip-6-ospflocalin] source-zone untrust
```

```
[Hub2-security-policy-ip-6-ospflocalin] destination-zone local
[Hub2-security-policy-ip-6-ospflocalin] service ospf
[Hub2-security-policy-ip-6-ospflocalin] action pass
[Hub2-security-policy-ip-6-ospflocalin] quit
[Hub2-security-policy-ip] quit
```

4. Configure the VAM client:

   # Create VAM client **Hub2**.

   ```
   <Hub2> system-view
   [Hub2] vam client name Hub2
   ```

   # Specify ADVPN domain **abc** for the VAM client.

   ```
   [Hub2-vam-client-Hub2] advpn-domain abc
   ```

   # Set the preshared key to **123456**.

   ```
   [Hub2-vam-client-Hub2] pre-shared-key simple 123456
   ```

   # Set both the username and password to **hub2**.

   ```
   [Hub2-vam-client-Hub2] user hub2 password simple hub2
   ```

   # Specify the primary and secondary VAM servers.

   ```
   [Hub2-vam-client-Hub2] server primary ip-address 1.0.0.11
   [Hub2-vam-client-Hub2] server secondary ip-address 1.0.0.12
   ```

   # Enable the VAM client.

   ```
   [Hub2-vam-client-Hub2] client enable
   [Hub2-vam-client-Hub2] quit
   ```

5. Configure an IPsec profile:

   # Configure IKE.

   ```
   [Hub2] ike keychain abc
   [Hub2-ike-keychain-abc] pre-shared-key address 0.0.0.0 0.0.0.0 key simple 123456
   [Hub2-ike-keychain-abc] quit
   [Hub2] ike profile abc
   [Hub2-ike-profile-abc] keychain abc
   [Hub2-ike-profile-abc] quit
   ```

   # Configure the IPsec profile.

   ```
   [Hub2] ipsec transform-set abc
   [Hub2-ipsec-transform-set-abc] encapsulation-mode transport
   [Hub2-ipsec-transform-set-abc] esp encryption-algorithm des-cbc
   [Hub2-ipsec-transform-set-abc] esp authentication-algorithm sha1
   [Hub2-ipsec-transform-set-abc] quit
   [Hub2] ipsec profile abc isakmp
   [Hub2-ipsec-profile-isakmp-abc] transform-set abc
   [Hub2-ipsec-profile-isakmp-abc] ike-profile abc
   [Hub2-ipsec-profile-isakmp-abc] quit
   ```

6. Configure OSPF to advertise the private network.

   ```
   [Hub2] ospf 1
   [Hub2-ospf-1] area 0
   [Hub2-ospf-1-area-0.0.0.0] network 192.168.0.0 0.0.0.255
   [Hub2-ospf-1-area-0.0.0.0] quit
   [Hub2-ospf-1] quit
   ```

7. Configure interface Tunnel 1.

   ```
   [Hub2] interface tunnel1
   ```

```
[Hub2-Tunnel1] vam client Hub2
[Hub2-Tunnel1] ospf network-type p2mp
[Hub2-Tunnel1] source gigabitethernet 1/0/1
[Hub2-Tunnel1] tunnel protection ipsec profile abc
[Hub2-Tunnel1] quit
```

Configuring Spoke 1

1. Assign IP addresses to interfaces:

   # Assign an IPv4 address to interface GigabitEthernet 1/0/1.

   ```
   <Spoke1> system-view
   [Spoke1] interface gigabitethernet 1/0/1
   [Spoke1-GigabitEthernet1/0/1] ip address 1.0.0.3 255.255.255.0
   [Spoke1-GigabitEthernet1/0/1] quit
   ```

   # Create interface Tunnel 1 and set its tunnel mode to GRE-encapsulated IPv4 ADVPN tunnel mode. Then, assign an IPv4 address to the interface.

   ```
   [Spoke1] interface tunnel 1 mode advpn gre
   [Spoke1-Tunnel1] ip address 192.168.0.3 255.255.255.0
   ```

   # Assign IP addresses to other interfaces. (Details not shown.)

2. Add the interfaces to security zones.

   ```
   [Spoke1] security-zone name untrust
   [Spoke1-security-zone-Untrust] import interface gigabitethernet 1/0/1
   [Spoke1-security-zone-Untrust] import interface tunnel1
   [Spoke1-security-zone-Untrust] quit
   [Spoke1] security-zone name trust
   [Spoke1-security-zone-Trust] import interface gigabitethernet 1/0/2
   [Spoke1-security-zone-Trust] quit
   ```

3. Configure a security policy:

   # Configure a rule named **advpnlocalout** to allow Spoke 1 to send VAM protocol packets to the VAM server.

   ```
   [Spoke1] security-policy ip
   [Spoke1-security-policy-ip] rule name advpnlocalout
   [Spoke1-security-policy-ip-1-advpnlocalout] source-zone local
   [Spoke1-security-policy-ip-1-advpnlocalout] destination-zone untrust
   [Spoke1-security-policy-ip-1-advpnlocalout] source-ip-host 1.0.0.3
   [Spoke1-security-policy-ip-1-advpnlocalout] destination-ip-range 1.0.0.10 1.0.0.12
   [Spoke1-security-policy-ip-1-ipseclocalout] action pass
   [Spoke1-security-policy-ip-1-ipseclocalout] quit
   ```

   # Configure a rule named **advpnlocalin** to allow Spoke 1 to receive VAM protocol packets from the VAM server.

   ```
   [Spoke1-security-policy-ip] rule name advpnlocalin
   [Spoke1-security-policy-ip-2-advpnlocalin] source-zone untrust
   [Spoke1-security-policy-ip-2-advpnlocalin] destination-zone local
   [Spoke1-security-policy-ip-2-advpnlocalin] source-ip-range 1.0.0.10 1.0.0.12
   [Spoke1-security-policy-ip-2-advpnlocalin] destination-ip-host 1.0.0.3
   [Spoke1-security-policy-ip-2-advpnlocalin] action pass
   [Spoke1-security-policy-ip-2-advpnlocalin] quit
   ```

   # Configure a rule named **ipseclocalout** to allow Spoke 1 to send IPsec negotiation packets to other VAM clients.

   ```
   [Spoke1-security-policy-ip] rule name ipseclocalout
   ```

```
[Spoke1-security-policy-ip-3-ipseclocalout] source-zone local
[Spoke1-security-policy-ip-3-ipseclocalout] destination-zone untrust
[Spoke1-security-policy-ip-3-ipseclocalout] source-ip-host 1.0.0.3
[Spoke1-security-policy-ip-3-ipseclocalout] destination-ip-range 1.0.0.1 1.0.0.4
[Spoke1-security-policy-ip-3-ipseclocalout] action pass
[Spoke1-security-policy-ip-3-ipseclocalout] quit
```

# Configure a rule named **ipseclocalin** to allow Spoke 1 to receive IPsec negotiation packets from other VAM clients.

```
[Spoke1-security-policy-ip] rule name ipseclocalin
[Spoke1-security-policy-ip-4-ipseclocalin] source-zone untrust
[Spoke1-security-policy-ip-4-ipseclocalin] destination-zone local
[Spoke1-security-policy-ip-4-ipseclocalin] source-ip-range 1.0.0.1 1.0.0.4
[Spoke1-security-policy-ip-4-ipseclocalin] destination-ip-host 1.0.0.3
[Spoke1-security-policy-ip-4-ipseclocalin] action pass
[Spoke1-security-policy-ip-4-ipseclocalin] quit
```

# Configure a rule named **ospflocalout** to allow Spoke 1 to send OSPF packets to other VAM clients.

```
[Spoke1-security-policy-ip] rule name ospflocalout
[Spoke1-security-policy-ip-5-ospflocalout] source-zone local
[Spoke1-security-policy-ip-5-ospflocalout] destination-zone untrust
[Spoke1-security-policy-ip-5-ospflocalout] service ospf
[Spoke1-security-policy-ip-5-ospflocalout] action pass
[Spoke1-security-policy-ip-5-ospflocalout] quit
```

# Configure a rule named **ospflocalin** to allow Spoke 1 to receive OSPF packets from other VAM clients.

```
[Spoke1-security-policy-ip] rule name ospflocalin
[Spoke1-security-policy-ip-6-ospflocalin] source-zone untrust
[Spoke1-security-policy-ip-6-ospflocalin] destination-zone local
[Spoke1-security-policy-ip-6-ospflocalin] service ospf
[Spoke1-security-policy-ip-6-ospflocalin] action pass
[Spoke1-security-policy-ip-6-ospflocalin] quit
[Spoke1-security-policy-ip] quit
```

4. Configure the VAM client:

# Create VAM client **Spoke1**.

```
<Spoke1> system-view
[Spoke1] vam client name Spoke1
```

# Specify ADVPN domain **abc** for the VAM client.

```
[Spoke1-vam-client-Spoke1] advpn-domain abc
```

# Set the preshared key to **123456**.

```
[Spoke1-vam-client-Spoke1] pre-shared-key simple 123456
```

# Set both the username and password to **spoke1**.

```
[Spoke1-vam-client-Spoke1] user spoke1 password simple spoke1
```

# Specify the primary and secondary VAM servers.

```
[Spoke1-vam-client-Spoke1] server primary ip-address 1.0.0.11
[Spoke1-vam-client-Spoke1] server secondary ip-address 1.0.0.12
```

# Enable the VAM client.

```
[Spoke1-vam-client-Spoke1] client enable
[Spoke1-vam-client-Spoke1] quit
```

5. Configure an IPsec profile:

   # Configure IKE.

```
[Spoke1] ike keychain abc
[Spoke1-ike-keychain-abc] pre-shared-key address 0.0.0.0 0.0.0.0 key simple 123456
[Spoke1-ike-keychain-abc] quit
[Spoke1] ike profile abc
[Spoke1-ike-profile-abc] keychain abc
[Spoke1-ike-profile-abc] quit
```

   # Configure the IPsec profile.

```
[Spoke1] ipsec transform-set abc
[Spoke1-ipsec-transform-set-abc] encapsulation-mode transport
[Spoke1-ipsec-transform-set-abc] esp encryption-algorithm des-cbc
[Spoke1-ipsec-transform-set-abc] esp authentication-algorithm sha1
[Spoke1-ipsec-transform-set-abc] quit
[Spoke1] ipsec profile abc isakmp
[Spoke1-ipsec-profile-isakmp-abc] transform-set abc
[Spoke1-ipsec-profile-isakmp-abc] ike-profile abc
[Spoke1-ipsec-profile-isakmp-abc] quit
```

6. Configure OSPF to advertise private networks.

```
[Spoke1] ospf 1
[Spoke1-ospf-1] area 0
[Spoke1-ospf-1-area-0.0.0.0] network 192.168.0.0 0.0.0.255
[Spoke1-ospf-1-area-0.0.0.0] network 192.168.1.0 0.0.0.255
[Spoke1-ospf-1-area-0.0.0.0] quit
[Spoke1-ospf-1] quit
```

7. Configure interface Tunnel 1.

```
[Spoke1] interface tunnel1
[Spoke1-Tunnel1] vam client Spoke1
[Spoke1-Tunnel1] ospf network-type p2mp
[Spoke1-Tunnel1] source gigabitethernet 1/0/1
[Spoke1-Tunnel1] tunnel protection ipsec profile abc
[Spoke1-Tunnel1] quit
```

Configuring Spoke 2

1. Assign IP addresses to interfaces:

   # Assign an IPv4 address to interface GigabitEthernet 1/0/1.

```
<Spoke2> system-view
[Spoke2] interface gigabitethernet 1/0/1
[Spoke2-GigabitEthernet1/0/1] ip address 1.0.0.4 255.255.255.0
[Spoke2-GigabitEthernet1/0/1] quit
```

   # Create interface Tunnel 1 and set its tunnel mode to GRE-encapsulated IPv4 ADVPN tunnel mode. Then, assign an IPv4 address to the interface.

```
[Spoke2] interface tunnel 1 mode advpn gre
[Spoke2-Tunnel1] ip address 192.168.0.4 255.255.255.0
```

   # Assign IP addresses to other interfaces. (Details not shown.)

2. Add the interfaces to security zones.

```
[Spoke2] security-zone name untrust
[Spoke2-security-zone-Untrust] import interface gigabitethernet 1/0/1
```

```
[Spoke2-security-zone-Untrust] import interface tunnel1
[Spoke2-security-zone-Untrust] quit
[Spoke2] security-zone name trust
[Spoke2-security-zone-Trust] import interface gigabitethernet 1/0/2
[Spoke2-security-zone-Trust] quit
```

3. Configure a security policy:

# Configure a rule named **advpnlocalout** to allow Spoke 2 to send VAM protocol packets to the VAM server.

```
[Spoke2] security-policy ip
[Spoke2-security-policy-ip] rule name advpnlocalout
[Spoke2-security-policy-ip-1-advpnlocalout] source-zone local
[Spoke2-security-policy-ip-1-advpnlocalout] destination-zone untrust
[Spoke2-security-policy-ip-1-advpnlocalout] source-ip-host 1.0.0.4
[Spoke2-security-policy-ip-1-advpnlocalout] destination-ip-range 1.0.0.10 1.0.0.12
[Spoke2-security-policy-ip-1-ipseclocalout] action pass
[Spoke2-security-policy-ip-1-ipseclocalout] quit
```

# Configure a rule named **advpnlocalin** to allow Spoke 2 to receive VAM protocol packets from the VAM server.

```
[Spoke2-security-policy-ip] rule name advpnlocalin
[Spoke2-security-policy-ip-2-advpnlocalin] source-zone untrust
[Spoke2-security-policy-ip-2-advpnlocalin] destination-zone local
[Spoke2-security-policy-ip-2-advpnlocalin] source-ip-range 1.0.0.10 1.0.0.12
[Spoke2-security-policy-ip-2-advpnlocalin] destination-ip-host 1.0.0.4
[Spoke2-security-policy-ip-2-advpnlocalin] action pass
[Spoke2-security-policy-ip-2-advpnlocalin] quit
```

# Configure a rule named **ipseclocalout** to allow Spoke 2 to send IPsec negotiation packets to other VAM clients.

```
[Spoke2-security-policy-ip] rule name ipseclocalout
[Spoke2-security-policy-ip-3-ipseclocalout] source-zone local
[Spoke2-security-policy-ip-3-ipseclocalout] destination-zone untrust

[Spoke2-security-policy-ip-6-ospflocalin] action pass
[Spoke2-security-policy-ip-6-ospflocalin] quit
[Spoke2-security-policy-ip] quit
```

4. Configure the VAM client:

   # Create VAM client **Spoke2**.

```
<Spoke2> system-view
[Spoke2] vam client name Spoke2
```

   # Specify ADVPN domain **abc** for the VAM client.

```
[Spoke2-vam-client-Spoke2] advpn-domain abc
```

   # Set the preshared key to **123456**.

```
[Spoke2-vam-client-Spoke2] pre-shared-key simple 123456
```

   # Set both the username and password to **spoke2**.

```
[Spoke2-vam-client-Spoke2] user spoke2 password simple spoke2
```

   # Specify the primary and secondary VAM servers.

```
[Spoke2-vam-client-Spoke2] server primary ip-address 1.0.0.11
[Spoke2-vam-client-Spoke2] server secondary ip-address 1.0.0.12
```

   # Enable the VAM client.

```
[Spoke2-vam-client-Spoke2] client enable
[Spoke2-vam-client-Spoke2] quit
```

5. Configure an IPsec profile:

   # Configure IKE.

```
[Spoke2] ike keychain abc
[Spoke2-ike-keychain-abc] pre-shared-key address 0.0.0.0 0.0.0.0 key simple 123456
[Spoke2-ike-keychain-abc] quit
[Spoke2] ike profile abc
[Spoke2-ike-profile-abc] keychain abc
[Spoke2-ike-profile-abc] quit
```

   # Configure the IPsec profile.

```
[Spoke2] ipsec transform-set abc
[Spoke2-ipsec-transform-set-abc] encapsulation-mode transport
[Spoke2-ipsec-transform-set-abc] esp encryption-algorithm des-cbc
[Spoke2-ipsec-transform-set-abc] esp authentication-algorithm sha1
[Spoke2-ipsec-transform-set-abc] quit
[Spoke2] ipsec profile abc isakmp
[Spoke2-ipsec-profile-isakmp-abc] transform-set abc
[Spoke2-ipsec-profile-isakmp-abc] ike-profile abc
[Spoke2-ipsec-profile-isakmp-abc] quit
```

6. Configure OSPF to advertise private networks.

```
[Spoke2] ospf 1
```

```
[Spoke2-ospf-1] area 0
[Spoke2-ospf-1-area-0.0.0.0] network 192.168.0.0 0.0.0.255
[Spoke2-ospf-1-area-0.0.0.0] network 192.168.2.0 0.0.0.255
[Spoke2-ospf-1-area-0.0.0.0] quit
[Spoke2-ospf-1] quit
```

7. Configure interface Tunnel 1.

```
[Spoke2] interface tunnel1
[Spoke2-Tunnel1] vam client Spoke2
[Spoke2-Tunnel1] ospf network-type p2mp
[Spoke2-Tunnel1] source gigabitethernet 1/0/1
[Spoke2-Tunnel1] tunnel protection ipsec profile abc
[Spoke2-Tunnel1] quit
```

Verifying the configuration

# Display IPv4 address mapping information for all VAM clients registered with the primary VAM server.

```

Group      Private address  Public address              Type   NAT  Holding time
0          192.168.0.1      1.0.0.1                     Hub    No   0H 52M  7S
0          192.168.0.2      1.0.0.2                     Hub    No   0H 47M 31S
0          192.168.0.3      1.0.0.3                     Spoke  No   0H 28M 25S
0          192.168.0.4      1.0.0.4                     Spoke  No   0H 19M 15S
```

The output shows that Hub 1, Hub 2, Spoke 1, and Spoke 2 have all registered their address mapping information with the VAM servers.

# Display IPv4 ADVPN tunnel information on Hubs. This example uses Hub 1.

```
[Hub1] display advpn session
Interface         : Tunnel1
Number of sessions: 3
Private address  Public address              Port  Type  State      Holding time
192.168.0.2      1.0.0.2                     --    H-H   Success    0H 46M  8S
192.168.0.3      1.0.0.3                     --    H-S   Success    0H 27M 27S
192.168.0.4      1.0.0.4                     --    H-S   Success    0H 18M 18S
```

The output shows that Hub 1 has established a permanent tunnel to Hub 2, Spoke 1, and Spoke 2.

# Display IPv4 ADVPN tunnel information on Spokes. This example uses Spoke 1.

```
[Spoke1] display advpn session
Interface         : Tunnel1
```

```
Number of sessions: 2
Private address  Public address              Port  Type  State      Holding time
192.168.0.1      1.0.0.1                     --    S-H   Success    0H 46M  8S
192.168.0.2      1.0.0.2                     --    S-H   Success    0H 46M  8S
```

The output shows that Spoke 1 has established a permanent hub-spoke tunnel to Hub 1 and Hub 2.

# Verify that Spoke 1 can ping the private address 192.168.0.4 of Spoke 2.

```
[Spoke1] ping 192.168.0.4
Ping 192.168.0.4 (192.168.0.4): 56 data bytes, press CTRL_C to break

```

Example: Configuring IPv6 hub-spoke ADVPN

Network configuration

As shown in Figure 10, the primary and secondary VAM servers manage and maintain VAM client information for all hubs and spokes. The AAA server performs authentication and accounting for VAM clients. The two hubs back up each other, and perform data forwarding and route exchange.

Establish a permanent ADVPN tunnel between each spoke and each hub.

Figure 10 Network diagram

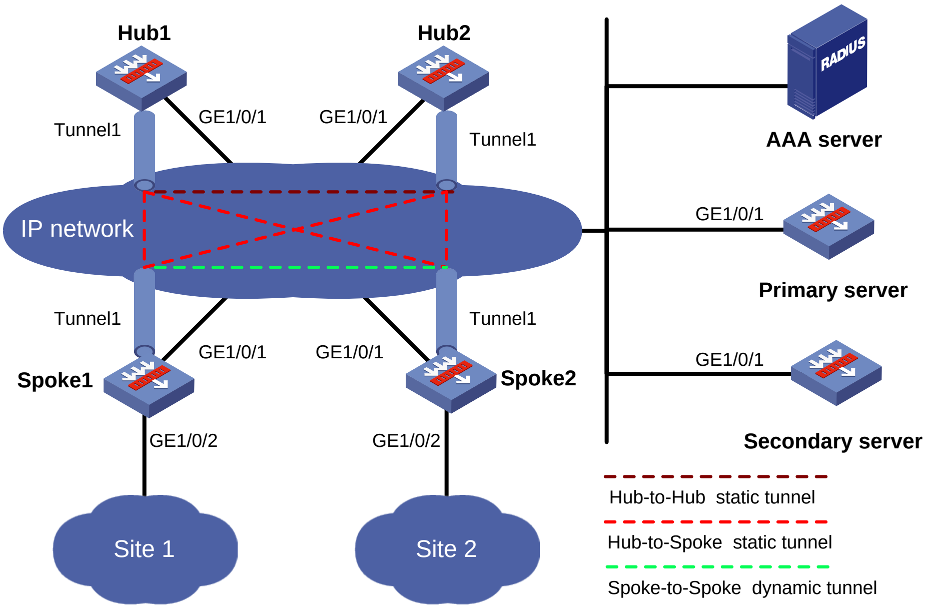

Table 4 Interface and IP address assignment

Device	Interfac e	IP address	Device	Interface	IP address
Hub 1	GE1/0/1	1::1/64	Spoke 1	GE1/0/1	1::3/64
	Tunnel1	192:168::1/64		GE1/0/2	192:168:1::1/64
Hub 2	GE1/0/1	1::2/64		Tunnel1	192:168::3/64
	Tunnel1	192:168::2/64	Spoke 2	GE1/0/1	1::4/64
AAA server		1::10/64		GE1/0/2	192:168:2::1/64
Primary server	GE1/0/1	1::11/64		Tunnel1	192:168::4/64
Secondary server	GE1/0/1	1::12/64			

Configuring the primary VAM server

1. Assign an IPv6 global unicast address to interface GigabitEthernet 1/0/1.

```
<PrimaryServer> system-view
[PrimaryServer] interface gigabitethernet 1/0/1
[PrimaryServer-GigabitEthernet1/0/1] ipv6 address 1::11/64
[PrimaryServer-GigabitEthernet1/0/1] quit
```

2. Add the interface to a security zone.

```
[PrimaryServer] security-zone name untrust
[PrimaryServer-security-zone-Untrust] import interface gigabitethernet 1/0/1
[PrimaryServer-security-zone-Untrust] quit
```

3. Configure a security policy:

# Configure a rule named **advpnlocalout** to allow the VAM server to send VAM protocol packets to the VAM clients.

```
[PrimaryServer] security-policy ipv6
[PrimaryServer-security-policy-ipv6] rule name advpnlocalout
[PrimaryServer-security-policy-ipv6-1-advpnlocalout] source-zone local
[PrimaryServer-security-policy-ipv6-1-advpnlocalout] destination-zone untrust
[PrimaryServer-security-policy-ipv6-1-advpnlocalout] source-ip-host 1::11
[PrimaryServer-security-policy-ipv6-1-advpnlocalout] destination-ip-range 1::1
1::12
[PrimaryServer-security-policy-ipv6-1-advpnlocalout] action pass
[PrimaryServer-security-policy-ipv6-1-advpnlocalout] quit
```

# Configure a rule named **advpnlocalin** to allow the VAM server to receive VAM protocol packets from the VAM clients.

```
[PrimaryServer-security-policy-ipv6] rule name advpnlocalin
[PrimaryServer-security-policy-ipv6-2-advpnlocalin] source-zone untrust
[PrimaryServer-security-policy-ipv6-2-advpnlocalin] destination-zone local
[PrimaryServer-security-policy-ipv6-2-advpnlocalin] source-ip-range 1::1 1::12
[PrimaryServer-security-policy-ipv6-2-advpnlocalin] destination-ip-host 1::11
[PrimaryServer-security-policy-ipv6-2-advpnlocalin] action pass
[PrimaryServer-security-policy-ipv6-2-advpnlocalin] quit
[PrimaryServer-security-policy-ipv6] quit
```

4. Configure AAA:

# Configure RADIUS scheme **abc**.

```
<PrimaryServer> system-view
```

```
[PrimaryServer] radius scheme abc
[PrimaryServer-radius-abc] primary authentication ipv6 1::10 1812
[PrimaryServer-radius-abc] primary accounting ipv6 1::10 1813
[PrimaryServer-radius-abc] key authentication simple 123
[PrimaryServer-radius-abc] key accounting simple 123
[PrimaryServer-radius-abc] user-name-format without-domain
[PrimaryServer-radius-abc] quit
[PrimaryServer] radius session-control enable
```

# Configure AAA methods for ISP domain **abc**.

```
[PrimaryServer] domain abc
[PrimaryServer-isp-abc] authentication advpn radius-scheme abc
[PrimaryServer-isp-abc] accounting advpn radius-scheme abc
[PrimaryServer-isp-abc] quit
[PrimaryServer] domain default enable abc
```

5. Configure the VAM server:

# Create ADVPN domain **abc**.

```
[PrimaryServer] vam server advpn-domain abc id 1
```

# Create hub group 0.

```
[PrimaryServer-vam-server-domain-abc] hub-group 0
```

# Specify hub private IPv6 addresses.

```
[PrimaryServer-vam-server-domain-abc-hub-group-0] hub ipv6 private-address
192:168::1
[PrimaryServer-vam-server-domain-abc-hub-group-0] hub ipv6 private-address
192:168::2
```

# Specify a spoke private IPv6 network.

```
[PrimaryServer-vam-server-domain-abc-hub-group-0] spoke ipv6 private-address
network 192:168::0 64
[PrimaryServer-vam-server-domain-abc-hub-group-0] quit
```

# Set the preshared key to **123456**.

```
[PrimaryServer-vam-server-domain-abc] pre-shared-key simple 123456
```

# Set the authentication mode to CHAP.

```
[PrimaryServer-vam-server-domain-abc] authentication-method chap
```

# Enable the VAM server for the ADVPN domain.

```
[PrimaryServer-vam-server-domain-abc] server enable
[PrimaryServer-vam-server-domain-abc] quit
```

Configuring the secondary VAM server

# Configure the secondary VAM server in the same way that the primary server is configured. (Details not shown.)

Configuring Hub 1

1. Assign IP addresses to interfaces:

# Assign an IPv6 global unicast address to interface GigabitEthernet 1/0/1.

```
<Hub1> system-view
[Hub1] interface gigabitethernet 1/0/1
[Hub1-GigabitEthernet1/0/1] ipv6 address 1::1 64
[Hub1-GigabitEthernet1/0/1] quit
```

# Create interface Tunnel 1 and set its tunnel mode to the GRE-encapsulated IPv6 ADVPN tunnel mode. Then, assign an IPv6 global unicast addresses and an IPv6 link-local address to the interface.

```
[Hub1] interface tunnel 1 mode advpn gre ipv6
[Hub1-Tunnel1] ipv6 address 192:168::1 64
[Hub1-Tunnel1] ipv6 address fe80::1 link-local
```

2. Add the interfaces to a security zone.

```
[Hub1] security-zone name untrust
[Hub1-security-zone-Untrust] import interface gigabitethernet 1/0/1
[Hub1-security-zone-Untrust] import interface tunnel1
[Hub1-security-zone-Untrust] quit
```

3. Configure a security policy:

# Configure a rule named **advpnlocalout** to allow Hub 1 to send VAM protocol packets to the VAM server.

```
[Hub1] security-policy ipv6
[Hub1-security-policy-ipv6] rule name advpnlocalout
[Hub1-security-policy-ipv6-1-advpnlocalout] source-zone local
[Hub1-security-policy-ipv6-1-advpnlocalout] destination-zone untrust
[Hub1-security-policy-ipv6-1-advpnlocalout] source-ip-host 1::1
[Hub1-security-policy-ipv6-1-advpnlocalout] destination-ip-range 1::10 1::12
[Hub1-security-policy-ipv6-1-ipseclocalout] action pass
[Hub1-security-policy-ipv6-1-ipseclocalout] quit
```

# Configure a rule named **advpnlocalin** to allow Hub 1 to receive VAM protocol packets from the VAM server.

```
[Hub1-security-policy-ipv6] rule name advpnlocalin
[Hub1-security-policy-ipv6-2-advpnlocalin] source-zone untrust
[Hub1-security-policy-ipv6-2-advpnlocalin] destination-zone local
[Hub1-security-policy-ipv6-2-advpnlocalin] source-ip-range 1::10 1::12
[Hub1-security-policy-ipv6-2-advpnlocalin] destination-ip-host 1::1
[Hub1-security-policy-ipv6-2-advpnlocalin] action pass
[Hub1-security-policy-ipv6-2-advpnlocalin] quit
```

# Configure a rule named **ipseclocalout** to allow Hub 1 to send IPsec negotiation packets to other VAM clients.

```
[Hub1-security-policy-ipv6] rule name ipseclocalout
[Hub1-security-policy-ipv6-3-ipseclocalout] source-zone local
[Hub1-security-policy-ipv6-3-ipseclocalout] destination-zone untrust
[Hub1-security-policy-ipv6-3-ipseclocalout] source-ip-host 1::1
[Hub1-security-policy-ipv6-3-ipseclocalout] destination-ip-range 1::2 1::4
[Hub1-security-policy-ipv6-3-ipseclocalout] action pass
[Hub1-security-policy-ipv6-3-ipseclocalout] quit
```

# Configure a rule named **ipseclocalin** to allow Hub 1 to receive IPsec negotiation packets from other VAM clients.

```
[Hub1-security-policy-ipv6] rule name ipseclocalin
[Hub1-security-policy-ipv6-4-ipseclocalin] source-zone untrust
[Hub1-security-policy-ipv6-4-ipseclocalin] destination-zone local
[Hub1-security-policy-ipv6-4-ipseclocalin] source-ip-range 1::2 1::4
[Hub1-security-policy-ipv6-4-ipseclocalin] destination-ip-host 1::1
[Hub1-security-policy-ipv6-4-ipseclocalin] action pass
[Hub1-security-policy-ipv6-4-ipseclocalin] quit
```

# Configure a rule named **ospflocalout** to allow Hub 1 to send OSPF packets to other VAM clients.

```
[Hub1-security-policy-ipv6] rule name ospflocalout
[Hub1-security-policy-ipv6-5-ospflocalout] source-zone local
[Hub1-security-policy-ipv6-5-ospflocalout] destination-zone untrust
[Hub1-security-policy-ipv6-5-ospflocalout] service ospf
[Hub1-security-policy-ipv6-5-ospflocalout] action pass
[Hub1-security-policy-ipv6-5-ospflocalout] quit
```

# Configure a rule named **ospflocalin** to allow Hub 1 to receive OSPF packets from other VAM clients.

```
[Hub1-security-policy-ipv6] rule name ospflocalin
[Hub1-security-policy-ipv6-6-ospflocalin] source-zone untrust
[Hub1-security-policy-ipv6-6-ospflocalin] destination-zone local
[Hub1-security-policy-ipv6-6-ospflocalin] service ospf
[Hub1-security-policy-ipv6-6-ospflocalin] action pass
[Hub1-security-policy-ipv6-6-ospflocalin] quit
```

4. Configure the VAM client:

# Create VAM client **Hub1**.

```
<Hub1> system-view
[Hub1] vam client name Hub1
```

# Specify ADVPN domain **abc** for the VAM client.

```
[Hub1-vam-client-Hub1] advpn-domain abc
```

# Set the preshared key to **123456**.

```
[Hub1-vam-client-Hub1] pre-shared-key simple 123456
```

# Set the username and password to **hub1**.

```
[Hub1-vam-client-Hub1] user hub1 password simple hub1
```

# Specify the primary and secondary VAM servers.

```
[Hub1-vam-client-Hub1] server primary ipv6-address 1::11
[Hub1-vam-client-Hub1] server secondary ipv6-address 1::12
```

# Enable the VAM client.

```
[Hub1-vam-client-Hub1] client enable
[Hub1-vam-client-Hub1] quit
```

5. Configure an IPsec profile:

# Configure IKE.

```
[Hub1] ike keychain abc
[Hub1-ike-keychain-abc] pre-shared-key address ipv6 :: 0 key simple 123456
[Hub1-ike-keychain-abc] quit
[Hub1] ike profile abc
[Hub1-ike-profile-abc] keychain abc
[Hub1-ike-profile-abc] quit
```

# Configure the IPsec profile.

```
[Hub1] ipsec transform-set abc
[Hub1-ipsec-transform-set-abc] encapsulation-mode transport
[Hub1-ipsec-transform-set-abc] esp encryption-algorithm des-cbc
[Hub1-ipsec-transform-set-abc] esp authentication-algorithm sha1
[Hub1-ipsec-transform-set-abc] quit
[Hub1] ipsec profile abc isakmp
[Hub1-ipsec-profile-isakmp-abc] transform-set abc
```

```
[Hub1-ipsec-profile-isakmp-abc] ike-profile abc
[Hub1-ipsec-profile-isakmp-abc] quit
```

6. Configure OSPFv3.

```
[Hub1] ospfv3 1
[Hub1-ospfv3-1] router-id 0.0.0.1
[Hub1-ospfv3-1] area 0
[Hub1-ospfv3-1-area-0.0.0.0] quit
[Hub1-ospfv3-1] quit
```

7. Configure interface Tunnel 1.

```
[Hub1] interface tunnel1
[Hub1-Tunnel1] vam ipv6 client Hub1
[Hub1-Tunnel1] ospfv3 1 area 0
[Hub1-Tunnel1] ospfv3 network-type p2mp
[Hub1-Tunnel1] source gigabitethernet 1/0/1
[Hub1-Tunnel1] tunnel protection ipsec profile abc
[Hub1-Tunnel1] quit
```

Configuring Hub 2

1. Assign IP addresses to interfaces:

   # Assign an IPv6 global unicast address to interface GigabitEthernet 1/0/1.

```
<Hub2> system-view
[Hub2] interface gigabitethernet 1/0/1
[Hub2-GigabitEthernet1/0/1] ipv6 address 1::2 64
[Hub2-GigabitEthernet1/0/1] quit
```

   # Create interface Tunnel 1 and set its tunnel mode to the GRE-encapsulated IPv6 ADVPN tunnel mode. Then, assign an IPv6 global unicast addresses and an IPv6 link-local address to the interface.

```
[Hub2] interface tunnel 1 mode advpn gre ipv6
[Hub2-Tunnel1] ipv6 address 192:168::2 64
[Hub2-Tunnel1] ipv6 address fe80::2 link-local
```

2. Add the interfaces to a security zone.

```
[Hub2] security-zone name untrust
[Hub2-security-zone-Untrust] import interface gigabitethernet 1/0/1
[Hub2-security-zone-Untrust] import interface tunnel1
[Hub2-security-zone-Untrust] quit
```

3. Configure a security policy:

   # Configure a rule named **advpnlocalout** to allow Hub 2 to send VAM protocol packets to the VAM server.

```
[Hub2] security-policy ipv6
[Hub2-security-policy-ipv6] rule name advpnlocalout
[Hub2-security-policy-ipv6-1-advpnlocalout] source-zone local
[Hub2-security-policy-ipv6-1-advpnlocalout] destination-zone untrust
[Hub2-security-policy-ipv6-1-advpnlocalout] source-ip-host 1::2
[Hub2-security-policy-ipv6-1-advpnlocalout] destination-ip-range 1::10 1::12
[Hub2-security-policy-ipv6-1-ipseclocalout] action pass
[Hub2-security-policy-ipv6-1-ipseclocalout] quit
```

   # Configure a rule named **advpnlocalin** to allow Hub 2 to receive VAM protocol packets from the VAM server.

```
[Hub2-security-policy-ipv6] rule name advpnlocalin
```

```
[Hub2-security-policy-ipv6-2-advpnlocalin] source-zone untrust
[Hub2-security-policy-ipv6-2-advpnlocalin] destination-zone local
[Hub2-security-policy-ipv6-2-advpnlocalin] source-ip-range 1::10 1::12
[Hub2-security-policy-ipv6-2-advpnlocalin] destination-ip-host 1::2
[Hub2-security-policy-ipv6-2-advpnlocalin] action pass
[Hub2-security-policy-ipv6-2-advpnlocalin] quit
```

# Configure a rule named **ipseclocalout** to allow Hub 2 to send IPsec negotiation packets to other VAM clients.

```
[Hub2-security-policy-ipv6] rule name ipseclocalout
[Hub2-security-policy-ipv6-3-ipseclocalout] source-zone local
[Hub2-security-policy-ipv6-3-ipseclocalout] destination-zone untrust
[Hub2-security-policy-ipv6-3-ipseclocalout] source-ip-host 1::2
[Hub2-security-policy-ipv6-3-ipseclocalout] destination-ip-range 1::1 1::4
[Hub2-security-policy-ipv6-3-ipseclocalout] action pass
[Hub2-security-policy-ipv6-3-ipseclocalout] quit
```

# Configure a rule named **ipseclocalin** to allow Hub 2 to receive IPsec negotiation packets from other VAM clients.

```
[Hub2-security-policy-ipv6] rule name ipseclocalin
[Hub2-security-policy-ipv6-4-ipseclocalin] source-zone untrust
[Hub2-security-policy-ipv6-4-ipseclocalin] destination-zone local
[Hub2-security-policy-ipv6-4-ipseclocalin] source-ip-range 1::1 1::4
[Hub2-security-policy-ipv6-4-ipseclocalin] destination-ip-host 1::2
[Hub2-security-policy-ipv6-4-ipseclocalin] action pass
[Hub2-security-policy-ipv6-4-ipseclocalin] quit
```

# Configure a rule named **ospflocalout** to allow Hub 2 to send OSPF packets to other VAM clients.

```
[Hub2-security-policy-ipv6] rule name ospflocalout
[Hub2-security-policy-ipv6-5-ospflocalout] source-zone local
[Hub2-security-policy-ipv6-5-ospflocalout] destination-zone untrust
[Hub2-security-policy-ipv6-5-ospflocalout] service ospf
[Hub2-security-policy-ipv6-5-ospflocalout] action pass
[Hub2-security-policy-ipv6-5-ospflocalout] quit
```

# Configure a rule named **ospflocalin** to allow Hub 2 to receive OSPF packets from other VAM clients.

```
[Hub2-security-policy-ipv6] rule name ospflocalin
[Hub2-security-policy-ipv6-6-ospflocalin] source-zone untrust
[Hub2-security-policy-ipv6-6-ospflocalin] destination-zone local
[Hub2-security-policy-ipv6-6-ospflocalin] service ospf
[Hub2-security-policy-ipv6-6-ospflocalin] action pass
[Hub2-security-policy-ipv6-6-ospflocalin] quit
[Hub2-security-policy-ipv6] quit
```

4. Configure the VAM client:

# Create VAM client **Hub2**.

```
<Hub2> system-view
[Hub2] vam client name Hub2
```

# Specify ADVPN domain **abc** for the VAM client.

```
[Hub2-vam-client-Hub2] advpn-domain abc
```

# Set the preshared key to **123456**.

```
[Hub2-vam-client-Hub2] pre-shared-key simple 123456
```

# Set both the username and password to **hub2**.

```
[Hub2-vam-client-Hub2] user hub2 password simple hub2
```

# Specify the primary and secondary VAM servers.

```
[Hub2-vam-client-Hub2] server primary ipv6-address 1::11
[Hub2-vam-client-Hub2] server secondary ipv6-address 1::12
```

# Enable the VAM client.

```
[Hub2-vam-client-Hub2] client enable
[Hub2-vam-client-Hub2] quit
```

5. Configure an IPsec profile:

# Configure IKE.

```
[Hub2] ike keychain abc
[Hub2-ike-keychain-abc] pre-shared-key address ipv6 :: 0 key simple 123456
[Hub2-ike-keychain-abc] quit
[Hub2] ike profile abc
[Hub2-ike-profile-abc] keychain abc
[Hub2-ike-profile-abc] quit
```

# Configure the IPsec profile.

```
[Hub2] ipsec transform-set abc
[Hub2-ipsec-transform-set-abc] encapsulation-mode transport
[Hub2-ipsec-transform-set-abc] esp encryption-algorithm des-cbc
[Hub2-ipsec-transform-set-abc] esp authentication-algorithm sha1
[Hub2-ipsec-transform-set-abc] quit
[Hub2] ipsec profile abc isakmp
[Hub2-ipsec-profile-isakmp-abc] transform-set abc
[Hub2-ipsec-profile-isakmp-abc] ike-profile abc
[Hub2-ipsec-profile-isakmp-abc] quit
```

6. Configure OSPFv3.

```
[Hub2] ospfv3 1
[Hub2-ospfv3-1] router-id 0.0.0.2
[Hub2-ospfv3-1] area 0
[Hub2-ospfv3-1-area-0.0.0.0] quit
[Hub2-ospfv3-1] quit
```

7. Configure interface Tunnel 1.

```
[Hub2] interface tunnel1
[Hub2-Tunnel1] vam ipv6 client Hub2
[Hub2-Tunnel1] ospfv3 1 area 0
[Hub2-Tunnel1] ospfv3 network-type p2mp
[Hub2-Tunnel1] source gigabitethernet 1/0/1
[Hub2-Tunnel1] tunnel protection ipsec profile abc
[Hub2-Tunnel1] quit
```

Configuring Spoke 1

1. Assign IP addresses to interfaces:

# Assign a global unicast address to interface GigabitEthernet 1/0/1.

```
<Spoke1> system-view
[Spoke1] interface gigabitethernet 1/0/1
[Spoke1-GigabitEthernet1/0/1] ipv6 address 1::3 64
```

```
[Spoke1-GigabitEthernet1/0/1] quit
```

# Create interface Tunnel 1 and set its tunnel mode to the GRE-encapsulated IPv6 ADVPN tunnel mode. Then, assign an IPv6 global unicast addresses and an IPv6 link-local address to the interface.

```
[Spoke1] interface tunnel 1 mode advpn gre ipv6
[Spoke1-Tunnel1] ipv6 address 192:168::3 64
[Spoke1-Tunnel1] ipv6 address fe80::3 link-local
```

# Assign IP addresses to other interfaces. (Details not shown.)

2. Add the interfaces to security zones.

```
[Spoke1] security-zone name untrust
[Spoke1-security-zone-Untrust] import interface gigabitethernet 1/0/1
[Spoke1-security-zone-Untrust] import interface tunnel1
[Spoke1-security-zone-Untrust] quit
[Spoke1] security-zone name trust
[Spoke1-security-zone-Trust] import interface gigabitethernet 1/0/2
[Spoke1-security-zone-Trust] quit
```

3. Configure a security policy:

# Configure a rule named **advpnlocalout** to allow Spoke 1 to send VAM protocol packets to the VAM server.

```
[Spoke1] security-policy ipv6
[Spoke1-security-policy-ipv6] rule name advpnlocalout
[Spoke1-security-policy-ipv6-1-advpnlocalout] source-zone local
[Spoke1-security-policy-ipv6-1-advpnlocalout] destination-zone untrust
[Spoke1-security-policy-ipv6-1-advpnlocalout] source-ip-host 1::3
[Spoke1-security-policy-ipv6-1-advpnlocalout] destination-ip-range 1::10 1::12
[Spoke1-security-policy-ipv6-1-ipseclocalout] action pass
[Spoke1-security-policy-ipv6-1-ipseclocalout] quit
```

# Configure a rule named **advpnlocalin** to allow Spoke 1 to receive VAM protocol packets from the VAM server.

```
[Spoke1-security-policy-ipv6] rule name advpnlocalin
[Spoke1-security-policy-ipv6-2-advpnlocalin] source-zone untrust
[Spoke1-security-policy-ipv6-2-advpnlocalin] destination-zone local
[Spoke1-security-policy-ipv6-2-advpnlocalin] source-ip-range 1::10 1::12
[Spoke1-security-policy-ipv6-2-advpnlocalin] destination-ip-host 1::3
[Spoke1-security-policy-ipv6-2-advpnlocalin] action pass
[Spoke1-security-policy-ipv6-2-advpnlocalin] quit
```

# Configure a rule named **ipseclocalout** to allow Spoke 1 to send IPsec negotiation packets to other VAM clients.

```
[Spoke1-security-policy-ipv6] rule name ipseclocalout
[Spoke1-security-policy-ipv6-3-ipseclocalout] source-zone local
[Spoke1-security-policy-ipv6-3-ipseclocalout] destination-zone untrust
[Spoke1-security-policy-ipv6-3-ipseclocalout] source-ip-host 1::3
[Spoke1-security-policy-ipv6-3-ipseclocalout] destination-ip-range 1::1 1::4
[Spoke1-security-policy-ipv6-3-ipseclocalout] action pass
[Spoke1-security-policy-ipv6-3-ipseclocalout] quit
```

# Configure a rule named **ipseclocalin** to allow Spoke 1 to receive IPsec negotiation packets from other VAM clients.

```
[Spoke1-security-policy-ipv6] rule name ipseclocalin
[Spoke1-security-policy-ipv6-4-ipseclocalin] source-zone untrust
```

```
[Spoke1-security-policy-ipv6-4-ipseclocalin] destination-zone local
[Spoke1-security-policy-ipv6-4-ipseclocalin] source-ip-range 1::1 1::4
[Spoke1-security-policy-ipv6-4-ipseclocalin] destination-ip-host 1::3
[Spoke1-security-policy-ipv6-4-ipseclocalin] action pass
[Spoke1-security-policy-ipv6-4-ipseclocalin] quit
```

# Configure a rule named **ospflocalout** to allow Spoke 1 to send OSPF packets to other VAM clients.

```
[Spoke1-security-policy-ipv6] rule name ospflocalout
[Spoke1-security-policy-ipv6-5-ospflocalout] source-zone local
[Spoke1-security-policy-ipv6-5-ospflocalout] destination-zone untrust
[Spoke1-security-policy-ipv6-5-ospflocalout] service ospf
[Spoke1-security-policy-ipv6-5-ospflocalout] action pass
[Spoke1-security-policy-ipv6-5-ospflocalout] quit
```

# Configure a rule named **ospflocalin** to allow Spoke 1 to receive OSPF packets from other VAM clients.

```
[Spoke1-security-policy-ipv6] rule name ospflocalin
[Spoke1-security-policy-ipv6-6-ospflocalin] source-zone untrust
[Spoke1-security-policy-ipv6-6-ospflocalin] destination-zone local
[Spoke1-security-policy-ipv6-6-ospflocalin] service ospf
[Spoke1-security-policy-ipv6-6-ospflocalin] action pass
[Spoke1-security-policy-ipv6-6-ospflocalin] quit
[Spoke1-security-policy-ipv6] quit
```

4. Configure the VAM client:

# Create VAM client **Spoke1**.

```
<Spoke1> system-view
[Spoke1] vam client name Spoke1
```

# Specify ADVPN domain **abc** for the VAM client.

```
[Spoke1-vam-client-Spoke1] advpn-domain abc
```

# Set the preshared key to **123456**.

```
[Spoke1-vam-client-Spoke1] pre-shared-key simple 123456
```

# Set both the username and password to **spoke1**.

```
[Spoke1-vam-client-Spoke1] user spoke1 password simple spoke1
```

# Specify the primary and secondary VAM servers.

```
[Spoke1-vam-client-Spoke1] server primary ipv6-address 1::11
[Spoke1-vam-client-Spoke1] server secondary ipv6-address 1::12
```

# Enable the VAM client.

```
[Spoke1-vam-client-Spoke1] client enable
[Spoke1-vam-client-Spoke1] quit
```

5. Configure an IPsec profile:

# Configure IKE.

```
[Spoke1] ike keychain abc
[Spoke1-ike-keychain-abc] pre-shared-key address ipv6 :: 0 key simple 123456
[Spoke1-ike-keychain-abc] quit
[Spoke1] ike profile abc
[Spoke1-ike-profile-abc] keychain abc
[Spoke1-ike-profile-abc] quit
```

# Configure the IPsec profile.

```
[Spoke1] ipsec transform-set abc
```

```
[Spoke1-ipsec-transform-set-abc] encapsulation-mode transport
[Spoke1-ipsec-transform-set-abc] esp encryption-algorithm des-cbc
[Spoke1-ipsec-transform-set-abc] esp authentication-algorithm sha1
[Spoke1-ipsec-transform-set-abc] quit
[Spoke1] ipsec profile abc isakmp
[Spoke1-ipsec-profile-isakmp-abc] transform-set abc
[Spoke1-ipsec-profile-isakmp-abc] ike-profile abc
[Spoke1-ipsec-profile-isakmp-abc] quit
```

6. Configure OSPFv3.

```
[Spoke1] ospfv3 1
[Spoke1-ospfv3-1] router-id 0.0.0.3
[Spoke1-ospfv3-1] area 0
[Spoke1-ospfv3-1-area-0.0.0.0] quit
[Spoke1-ospfv3-1] quit
```

7. Configure interface Tunnel 1.

```
[Spoke1] interface tunnel1
[Spoke1-Tunnel1] vam ipv6 client Spoke1
[Spoke1-Tunnel1] ospfv3 1 area 0
[Spoke1-Tunnel1] ospfv3 network-type p2mp
[Spoke1-Tunnel1] source gigabitethernet 1/0/1
[Spoke1-Tunnel1] tunnel protection ipsec profile abc
[Spoke1-Tunnel1] quit
```

Configuring Spoke 2

1. Assign IP addresses to interfaces:

# Assign a global unicast address to interface GigabitEthernet 1/0/1.

```
<Spoke2> system-view
[Spoke2] interface gigabitethernet 1/0/1
[Spoke2-GigabitEthernet1/0/1] ipv6 address 1::4 64
[Spoke2-GigabitEthernet1/0/1] quit
```

# Create interface Tunnel 1 and set its tunnel mode to the GRE-encapsulated IPv6 ADVPN tunnel mode. Then, assign an IPv6 global unicast addresses and an IPv6 link-local address to the interface.

```
[Spoke2] interface tunnel 1 mode advpn gre ipv6
[Spoke2-Tunnel1] ipv6 address 192:168::4 64
[Spoke2-Tunnel1] ipv6 address fe80::4 link-local
```

# Assign IP addresses to other interfaces. (Details not shown.)

2. Add the interfaces to security zones.

```
[Spoke2] security-zone name untrust
[Spoke2-security-zone-Untrust] import interface gigabitethernet 1/0/1
[Spoke2-security-zone-Untrust] import interface tunnel1
[Spoke2-security-zone-Untrust] quit
[Spoke2] security-zone name trust
[Spoke2-security-zone-Trust] import interface gigabitethernet 1/0/2
[Spoke2-security-zone-Trust] quit
```

3. Configure a security policy:

# Configure a rule named **advpnlocalout** to allow Spoke 2 to send VAM protocol packets to the VAM server.

```
[Spoke2] security-policy ipv6
```

```
[Spoke2-security-policy-ipv6] rule name advpnlocalout
[Spoke2-security-policy-ipv6-1-advpnlocalout] source-zone local
[Spoke2-security-policy-ipv6-1-advpnlocalout] destination-zone untrust
[Spoke2-security-policy-ipv6-1-advpnlocalout] source-ip-host 1::4
[Spoke2-security-policy-ipv6-1-advpnlocalout] destination-ip-range 1::10 1::12
[Spoke2-security-policy-ipv6-1-ipseclocalout] action pass
[Spoke2-security-policy-ipv6-1-ipseclocalout] quit
```

# Configure a rule named **advpnlocalin** to allow Spoke 2 to receive VAM protocol packets from the VAM server.

```
[Spoke2-security-policy-ipv6] rule name advpnlocalin
[Spoke2-security-policy-ipv6-2-advpnlocalin] source-zone untrust
[Spoke2-security-policy-ipv6-2-advpnlocalin] destination-zone local
[Spoke2-security-policy-ipv6-2-advpnlocalin] source-ip-range 1::10 1::12
[Spoke2-security-policy-ipv6-2-advpnlocalin] destination-ip-host 1::4
[Spoke2-security-policy-ipv6-2-advpnlocalin] action pass
[Spoke2-security-policy-ipv6-2-advpnlocalin] quit
```

# Configure a rule named **ipseclocalout** to allow Spoke 2 to send IPsec negotiation packets to other VAM clients.

```
[Spoke2-security-policy-ipv6] rule name ipseclocalout
[Spoke2-security-policy-ipv6-3-ipseclocalout] source-zone local
[Spoke2-security-policy-ipv6-3-ipseclocalout] destination-zone untrust
[Spoke2-security-policy-ipv6-3-ipseclocalout] source-ip-host 1::4
[Spoke2-security-policy-ipv6-3-ipseclocalout] destination-ip-range 1::1 1::3
[Spoke2-security-policy-ipv6-3-ipseclocalout] action pass
[Spoke2-security-policy-ipv6-3-ipseclocalout] quit
```

# Configure a rule named **ipseclocalin** to allow Spoke 2 to receive IPsec negotiation packets from other VAM clients.

```
[Spoke2-security-policy-ipv6] rule name ipseclocalin
[Spoke2-security-policy-ipv6-4-ipseclocalin] source-zone untrust
[Spoke2-security-policy-ipv6-4-ipseclocalin] destination-zone local
[Spoke2-security-policy-ipv6-4-ipseclocalin] source-ip-range 1::1 1::3
[Spoke2-security-policy-ipv6-4-ipseclocalin] destination-ip-host 1::4
[Spoke2-security-policy-ipv6-4-ipseclocalin] action pass
[Spoke2-security-policy-ipv6-4-ipseclocalin] quit
```

# Configure a rule named **ospflocalout** to allow Spoke 2 to send OSPF packets to other VAM clients.

```
[Spoke2-security-policy-ipv6] rule name ospflocalout
[Spoke2-security-policy-ipv6-5-ospflocalout] source-zone local
[Spoke2-security-policy-ipv6-5-ospflocalout] destination-zone untrust
[Spoke2-security-policy-ipv6-5-ospflocalout] service ospf
[Spoke2-security-policy-ipv6-5-ospflocalout] action pass
[Spoke2-security-policy-ipv6-5-ospflocalout] quit
```

# Configure a rule named **ospflocalin** to allow Spoke 2 to receive OSPF packets from other VAM clients.

```
[Spoke2-security-policy-ipv6] rule name ospflocalin
[Spoke2-security-policy-ipv6-6-ospflocalin] source-zone untrust
[Spoke2-security-policy-ipv6-6-ospflocalin] destination-zone local
[Spoke2-security-policy-ipv6-6-ospflocalin] service ospf
[Spoke2-security-policy-ipv6-6-ospflocalin] action pass
```

```
[Spoke2-security-policy-ipv6-6-ospflocalin] quit
[Spoke2-security-policy-ipv6] quit
```

4. Configure the VAM client:

   # Create VAM client **Spoke2**.

   ```
   <Spoke2> system-view
   [Spoke2] vam client name Spoke2
   ```

   # Specify ADVPN domain **abc** for the VAM client.

   ```
   [Spoke2-vam-client-Spoke2] advpn-domain abc
   ```

   # Set the preshared key to **123456**.

   ```
   [Spoke2-vam-client-Spoke2] pre-shared-key simple 123456
   ```

   # Set both the username and password to **spoke2**.

   ```
   [Spoke2-vam-client-Spoke2] user spoke2 password simple spoke2
   ```

   # Specify the primary and secondary VAM servers.

   ```
   [Spoke2-vam-client-Spoke2] server primary ipv6-address 1::11
   [Spoke2-vam-client-Spoke2] server secondary ipv6-address 1::12
   ```

   # Enable the VAM client.

   ```
   [Spoke2-vam-client-Spoke2] client enable
   [Spoke2-vam-client-Spoke2] quit
   ```

5. Configure an IPsec profile:

   # Configure IKE.

   ```
   [Spoke2] ike keychain abc
   [Spoke2-ike-keychain-abc] pre-shared-key address ipv6 :: 0 key simple 123456
   [Spoke2-ike-keychain-abc] quit
   [Spoke2] ike profile abc
   [Spoke2-ike-profile-abc] keychain abc
   [Spoke2-ike-profile-abc] quit
   ```

   # Configure the IPsec profile.

   ```
   [Spoke2] ipsec transform-set abc
   [Spoke2-ipsec-transform-set-abc] encapsulation-mode transport
   [Spoke2-ipsec-transform-set-abc] esp encryption-algorithm des-cbc
   [Spoke2-ipsec-transform-set-abc] esp authentication-algorithm sha1
   [Spoke2-ipsec-transform-set-abc] quit
   [Spoke2] ipsec profile abc isakmp
   [Spoke2-ipsec-profile-isakmp-abc] transform-set abc
   [Spoke2-ipsec-profile-isakmp-abc] ike-profile abc
   [Spoke2-ipsec-profile-isakmp-abc] quit
   ```

6. Configure OSPFv3.

   ```
   [Spoke2] ospfv3 1
   [Spoke2-ospfv3-1] router-id 0.0.0.4
   [Spoke2-ospfv3-1] area 0
   [Spoke2-ospfv3-1-area-0.0.0.0] quit
   [Spoke2-ospfv3-1] quit
   ```

7. Configure interface Tunnel 1.

   ```
   [Spoke2] interface tunnel1
   [Spoke2-Tunnel1] vam ipv6 client Spoke2
   [Spoke2-Tunnel1] ospfv3 1 area 0
   [Spoke2-Tunnel1] ospfv3 network-type p2mp
   ```

```
    [Spoke2-Tunnel1] source gigabitethernet 1/0/1
    [Spoke2-Tunnel1] tunnel protection ipsec profile abc
    [Spoke2-Tunnel1] quit
```

Verifying the configuration

# Display IPv6 address mapping information for all VAM clients registered with the primary VAM server.

```
[PrimaryServer] display vam server ipv6 address-map
ADVPN domain name: abc
Total private address mappings: 4
Group      Private address       Public address         Type   NAT  Holding time
0          192:168::1            1::1                   Hub    No   0H 52M  7S
0          192:168::2            1::2                   Hub    No   0H 47M 31S
0          192:168::3            1::3                   Spoke  No   0H 28M 25S
0          192:168::4            1::4                   Spoke  No   0H 19M 15S
```

# Display IPv6 address mapping information for all VAM clients registered with the secondary VAM server.

```
[SecondaryServer] display vam server ipv6 address-map
ADVPN domain name: abc
Total private address mappings: 4
Group      Private address       Public address         Type   NAT  Holding time
0          192:168::1            1::1                   Hub    No   0H 52M  7S
0          192:168::2            1::2                   Hub    No   0H 47M 31S
0          192:168::3            1::3                   Spoke  No   0H 28M 25S
0          192:168::4            1::4                   Spoke  No   0H 19M 15S
```

The output shows that Hub 1, Hub 2, Spoke 1, and Spoke 2 have all registered their address mapping information with the VAM servers.

# Display IPv6 ADVPN tunnel information on Hubs. This example uses Hub 1.

```
[Hub1] display advpn ipv6 session
Interface         : Tunnel1
Number of sessions: 3
Private address       Public address        Port  Type  State      Holding time
192:168::2            1::2                  --    H-H   Success    0H 46M  8S
192:168::3            1::3                  --    H-S   Success    0H 27M 27S
192:168::4            1::4                  --    H-S   Success    0H 18M 18S
```

The output shows that Hub 1 has established a permanent tunnel to Hub 2, Spoke 1, and Spoke 2.

# Display IPv6 ADVPN tunnel information on Spokes. This example uses Spoke 1.

```
[Spoke1] display advpn ipv6 session
Interface         : Tunnel1
Number of sessions: 2
Private address       Public address        Port  Type  State      Holding time
192:168::1            1::1                  --    S-H   Success    0H 46M  8S
192:168::2            1::2                  --    S-H   Success    0H 46M  8S
```

The output shows that Spoke 1 has established a permanent hub-spoke tunnel to Hub 1 and Hub 2.

# Verify that Spoke 1 can ping the private address 192:168::4 of Spoke 2.

```
[Spoke1] ping ipv6 192:168::4
Ping6(56 data bytes) 192:168::4 --> 192:168::4, press CTRL_C to break
56 bytes from 192:168::4, icmp_seq=0 hlim=64 time=3.000 ms
```

```
56 bytes from 192:168::4, icmp_seq=1 hlim=64 time=0.000 ms
56 bytes from 192:168::4, icmp_seq=2 hlim=64 time=1.000 ms
56 bytes from 192:168::4, icmp_seq=3 hlim=64 time=1.000 ms
56 bytes from 192:168::4, icmp_seq=4 hlim=64 time=1.000 ms

--- Ping6 statistics for 192:168::4 ---
5 packets transmitted, 5 packets received, 0.0% packet loss
round-trip min/avg/max/std-dev = 0.000/1.200/3.000/0.980 ms
```

NSFOCUS Firewall Series

NF Internet Access Behavior Management Configuration Guide

NSFOCUS Technologies, Inc.

Document version: 6W600-20230221

Preface

- This configuration guide describes the fundamentals and configuration procedures for Internet access behavior management features, including:bandwidth management, application audit and management and NetShare control.
- Security zones, security policies, object groups, object policies, APR, and session management.
- User access and authentication features (such as AAA, portal, user identification, password control, and PKI).
- Data security features (such as public key management, SSL, SSH, and crypto engine).
- Attack protection features (such as ASPF, connection limit, IP source guard, ARP attack protection, ND attack defense, uRPF, attack detection and prevention, and IP-MAC binding).

This preface includes the following topics about the documentation:

- Audience.
- Conventions.

Audience

This documentation is intended for:

- Network planners.
- Field technical support and servicing engineers.
- Network administrators.

Conventions

The following information describes the conventions used in the documentation.

Command conventions

Convention	Description
Boldface	**Bold** text represents commands and keywords that you enter literally as shown.
Italic	*Italic* text represents arguments that you replace with actual values.
[ ]	Square brackets enclose syntax choices (keywords or arguments) that are optional.
{ x | y | ... }	Braces enclose a set of required syntax choices separated by vertical bars, from which you select one.
[x | y | ...]	Square brackets enclose a set of optional syntax choices separated by vertical bars, from which you select one or none.
{ x | y | ... } *	Asterisk marked braces enclose a set of required syntax choices separated by vertical bars, from which you select a minimum of one.
[x | y | ...] *	Asterisk marked square brackets enclose optional syntax choices separated by vertical bars, from which you select one choice, multiple choices, or none.
&<1-n>	The argument or keyword and argument combination before the ampersand (&) sign can be entered 1 to n times.
#	A line that starts with a pound (#) sign is comments.

GUI conventions

Convention	Description
Boldface	Window names, button names, field names, and menu items are in Boldface. For example, the **New User** window opens; click **OK**.
>	Multi-level menus are separated by angle brackets. For example, **File** > **Create** > **Folder**.

Symbols

Convention	Description
⚠ **WARNING!**	An alert that calls attention to important information that if not understood or followed can result in personal injury.
△ **CAUTION:**	An alert that calls attention to important information that if not understood or followed can result in data loss, data corruption, or damage to hardware or software.
❗ **IMPORTANT:**	An alert that calls attention to essential information.
NOTE:	An alert that contains additional or supplementary information.
💡 **TIP:**	An alert that provides helpful information.

Network topology icons

Convention	Description
	Represents a generic network device, such as a router, switch, or firewall.
	Represents a routing-capable device, such as a router or Layer 3 switch.
	Represents a generic switch, such as a Layer 2 or Layer 3 switch, or a router that supports Layer 2 forwarding and other Layer 2 features.
	Represents an access controller, a unified wired-WLAN module, or the access controller engine on a unified wired-WLAN switch.
	Represents an access point.
	Represents a wireless terminator unit.
	Represents a wireless terminator.
	Represents a mesh access point.
	Represents omnidirectional signals.
	Represents directional signals.
	Represents a security product, such as a firewall, UTM, multiservice security gateway, or load balancing device.

Convention	Description
	Represents a security module, such as a firewall, load balancing, NetStream, SSL VPN, IPS, or ACG module.

Examples provided in this document

Examples in this document might use devices that differ from your device in hardware model, configuration, or software version. It is normal that the port numbers, sample output, screenshots, and other information in the examples differ from what you have on your device.

Contents

Configuring bandwidth management

About bandwidth management

Bandwidth management provides fine-grained control over traffic that flows through the device by using the following information:

- Source and destination security zones.
- Source and destination IP addresses.
- Services.
- Users/user groups.
- Applications.
- DSCP priorities.

Application scenario

Bandwidth management is used in the following scenarios:

- Enterprise intranet users need far more bandwidth than the amount of bandwidth leased from an ISP. This creates a bandwidth bottleneck at the intranet egress.
- The P2P traffic on the intranet egress consumes a majority of the bandwidth resources. As a result, bandwidth cannot be guaranteed for key services.

Bandwidth management allows you to deploy traffic rules on the network egress for different traffic types. Bandwidth management improves bandwidth efficiency and guarantees bandwidth for key services when congestion occurs.

Bandwidth management process

Bandwidth management is implemented through the traffic policy. You can configure traffic profiles and traffic rules in traffic policy view. A traffic profile specifies the guaranteed bandwidth and maximum bandwidth. A traffic rule specifies match criteria to match packets and the traffic profile to apply to matching packets.

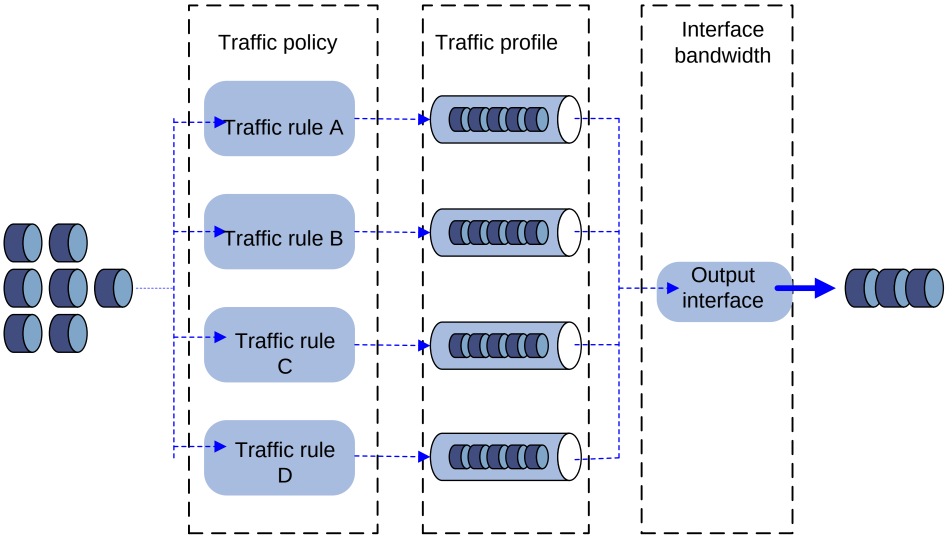
As shown in Figure 1, the bandwidth management process is as follows:

1. The device matches the packet against the match criteria in a traffic rule.

   The packet meets a match criterion if it matches any of its match values. A packet does not match a match criterion if it matches none of its match values.
2. If the packet meets all match criteria in the traffic rule (for the user and user group criteria or application and application group criteria, only one criterion needs to be matched), the packet matches the traffic rule. Otherwise, the packet does not match the traffic rule and continues to be matched by the next traffic rule. If the packet does not match any traffic rule, the packet is forwarded without bandwidth management.
3. After the packet matches a traffic rule, the interface processes the packet according to the traffic profile (if any) specified for the traffic rule.

   If no traffic profile is specified for the traffic rule, the packet is forwarded without bandwidth management.
4. The traffic profile processes the packet according to its settings.
5. If the interface is configured with a QoS feature in the outbound direction, the interface performs bandwidth management before performing QoS.
6. The packet is controlled by the interface bandwidth of the output interface.

Figure 1 Bandwidth management process



Traffic rule

Multiple traffic rules can be configured in the traffic policy. For a traffic rule, you can define the match criteria to match packets and specify the traffic profile to apply to matching packets.

Traffic rules support rule nesting, which allows a traffic rule to have a parent traffic rule. A maximum of four nesting levels are supported.

Match criteria in a traffic rule

A traffic rule can have multiple match criteria. You can configure the following match criteria in a traffic rule:

- Source and destination security zones.
- Source and destination IP addresses.
- Services.
- Users/user groups.
- Applications.
- DSCP priorities.

One match criterion can contain multiple match values. For example, you can configure multiple applications for an application match criterion.

Action in a traffic rule

You can use a traffic profile for an action in a traffic rule. The device limits the matching traffic according to the settings in the traffic profile.

Match order for parent and child traffic rules

The following rules apply when the device matches a traffic rule with a parent traffic rule:

- The parent traffic rule is first matched. After the parent traffic rule is matched, the child traffic rule is matched. If the parent traffic rule is not matched, the child traffic rule is ignored and the matching process fails.
- If both parent and child traffic rules are matched, the traffic profile for the child traffic rule is executed before the traffic profile for the parent traffic rule is executed. If both parent and child traffic rules are about the same parameter, the smaller value for an upper-limit parameter or the

larger value for a lower-limit parameter is applied. If only the parent traffic rule is matched, the traffic profile for the parent traffic rule is applied.

Traffic profile

A traffic profile defines bandwidth resources that can be used by a traffic type. The interface bandwidth can be allocated among multiple traffic profiles. You can configure the following bandwidth limit parameters and priority parameters in a traffic profile:

Rate limit mode for a traffic profile

You can limit the traffic rate in one of the following ways:

- Limit the upstream bandwidth and downstream bandwidth separately.
- Limit the upstream bandwidth and downstream bandwidth as a whole.

Total bandwidth limits

- **Total guaranteed bandwidth**—Guarantees the total minimum bandwidth for key services when congestion occurs.
- **Total maximum bandwidth**—Controls the total maximum bandwidth for non-key services to prevent them consuming a large amount of bandwidth.

Per-IP or per-user bandwidth limits

- **Per-IP or per-user guaranteed bandwidth**—Guarantees the minimum bandwidth per IP address or per user to provide for bandwidth management at finer granularity.
- **Per-IP or per-user maximum bandwidth**—Controls the maximum bandwidth allowed per IP address or per user to provide for bandwidth management at finer granularity.

Per-rule, per-IP, or per-user connection limits

- **Per-rule, per-IP, or per-user connection limits**—You can set the connection count limit and connection rate limit to prevent the following situations:
  - The system resources on the device are exhausted because internal users initiate a large number of connections to external networks in a short time period.
  - An internal server cannot process normal connection requests because it receives a large number of connection requests in a short time period.

Priority parameters

- **Traffic priority**—When an interface is congested with packets of multiple traffic profiles, packets with higher priority are sent first. Packets with the same priority have the same chance of being forwarded.
- **DSCP marking**—Modifies the DSCP value in packets. Network devices can classify traffic by using DSCP values and provide different treatment for packets according to the modified DSCP values.

Restrictions and guidelines: Bandwidth management configuration

When you configure bandwidth management, follow these restrictions and guidelines:

- As a best practice, observe the depth-first principle when creating policies. Always create a policy with a smaller management scope before a policy with a larger management scope.
- An interface with small default expected bandwidth might experience traffic loss if the following conditions exist:
  - There is a large amount of traffic on the interface.

  - The interface uses the default expected bandwidth.

  To avoid traffic loss, implicitly set the expected bandwidth to a large value for such an interface. For example, you can set the expected bandwidth of a tunnel interface to a value greater than 64 kbps (the default) if there is a large amount of traffic on the interface.

Prerequisites for bandwidth management

Before configuring bandwidth management, complete the following tasks:

- Configure time ranges (see time range configuration in *ACL and QoS Configuration Guide*).
- Configure IP address object groups and service object groups (see object group configuration in *Security Configuration Guide*).
- Configure applications (see APR configuration in *Security Configuration Guide*).
- Configure users and user groups (see user identification configuration in *Security Configuration Guide*).
- Configure security zones (see security zone configuration in *Security Configuration Guide*).

Bandwidth management tasks at a glance

To configure bandwidth management, perform the following tasks:

1. Configuring a traffic profile
   - Creating a traffic profile
   - Configuring bandwidth limits for the traffic profile
   - (Optional.) Configuring bandwidth detection for the traffic profile
   - Setting the reference mode for the traffic profile
   - (Optional.) Renaming the traffic profile
2. Configuring a traffic rule
   - Creating a traffic rule
   - Configuring match criteria for the traffic rule
   - Specifying an action for the traffic rule
   - (Optional.) Specifying a time range for the traffic rule
3. (Optional.) Managing and maintaining a traffic rule
   - Copying a traffic rule
   - Renaming a traffic rule
   - Moving a traffic rule
   - Disabling a traffic rule
4. (Optional.) Enabling bandwidth management statistics collection

Configuring a traffic profile

Creating a traffic profile

1. Enter system view.

   `system-view`
2. Enter traffic policy view.

   `traffic-policy`

3. Create a traffic profile and enter traffic profile view.

   profile name *profile-name*

Configuring bandwidth limits for the traffic profile

About this task

A traffic profile defines the bandwidth resources that can be used and takes effect after it is specified for a traffic rule.

Restrictions and guidelines

- Any two of the following settings are mutually exclusive:
  - Per-IP maximum bandwidth.
  - Per-user maximum bandwidth.
  - Dynamic and even allocation for maximum bandwidth.

  The most recent configuration takes effect.
- The per-IP guaranteed bandwidth setting and per-user guaranteed bandwidth setting are mutually exclusive.

Procedure

1. Enter system view.

   system-view
2. Enter traffic policy view.

   traffic-policy
3. Enter traffic profile view.

   profile name *profile-name*
4. Configure bandwidth settings.
   - Set the total guaranteed bandwidth or maximum bandwidth for the traffic profile.

     bandwidth { **downstream** | **total** | **upstream** } { **guaranteed** | **maximum** } *bandwidth-value*

     By default, the total guaranteed bandwidth and maximum bandwidth are not set.

     The maximum bandwidth must be greater than or equal to the guaranteed bandwidth.

     Before you can enable dynamic and even allocation for maximum bandwidth, you must set the total maximum bandwidth.
   - Set the per-IP or per-user guaranteed bandwidth or maximum bandwidth for the traffic profile.

     bandwidth { **downstream** | **total** | **upstream** } { **guaranteed** | **maximum** } { **per-ip** | **per-user** } *bandwidth-value*

     By default, the per-IP or per-user guaranteed bandwidth and maximum bandwidth are not set.
   - Set the TCP MSS for the traffic profile.

     tcp mss *mss-value*

     By default, the TCP MSS is not set.
5. Set the per-IP monthly traffic quota.

   bandwidth total traffic-quota per-ip monthly *quota-value*

   By default, the amount of traffic used by an IP address per month is not limited.
6. Enable dynamic and even allocation for maximum bandwidth.

   bandwidth average enable

By default, dynamic and even allocation for maximum bandwidth is disabled.

7. Configure connection limit settings.
   - Set the connection count limit for the traffic profile.

     connection-limit count { **per-rule** | **per-ip** | **per-user** } *connection-number*

     By default, the connection count limit is not set.
   - Set the connection rate limit for the traffic profile.

     connection-limit rate { **per-rule** | **per-ip** | **per-user** } *connection-rate*

     By default, the connection rate limit is not set.
8. Configure priority settings.
   - Set the traffic priority for packets of the traffic profile.

     traffic-priority *priority-value*

     By default, the traffic priority for packets of a traffic profile is 1.
   - Mark the DSCP value for packets of the traffic profile.

     remark dscp *dscp-value*

     By default, the DSCP value for packets of a traffic profile is not marked.

Configuring bandwidth detection for the traffic profile

About this task

This feature monitors the traffic rates based on source IP addresses in real time to identify the maximum rate and minimum rate of each IP address. If the traffic rate of an IP address exceeds or falls below a user-configured bandwidth threshold, the device sends logs to the log host by using the fast log output feature.

You can configure static bandwidth thresholds or configure the dynamic bandwidth threshold learning feature.

- **Static bandwidth threshold**—Allows you to configure a minimum threshold and a maximum threshold.
- **Dynamic threshold learning**—Allows the device to obtain minimum and maximum bandwidth thresholds by dynamically learning traffic rates. This feature is useful if you do not know the traffic patterns in a network and cannot determine appropriate bandwidth thresholds. With this feature enabled, the device measures the traffic rates over a user-configured duration and calculates an average rate. Then, the device obtains the minimum and maximum bandwidth thresholds by using the average rate multiplied by the minimum and maximum tolerance values.

If you configure both static bandwidth thresholds and the dynamic bandwidth threshold learning feature for the traffic profile, the following rules apply:

- Before the device learns the average traffic rate, it uses the static bandwidth thresholds.
- After the device learns the average traffic rate, it uses the dynamic bandwidth thresholds.

Procedure

1. Enter system view.

   system-view
2. Enter traffic policy view.

   traffic-policy
3. Enter traffic profile view.

   profile name *profile-name*

4. Enable per-IP bandwidth threshold detection.

   per-ip bandwidth-threshold-detect enable

   By default, per-IP threshold bandwidth detection is disabled.

5. Configure per-IP static bandwidth thresholds.
   - Set the maximum bandwidth threshold.

     per-ip bandwidth-threshold max-value *max-value*

     By default, the maximum bandwidth threshold is not set.
   - Set the minimum bandwidth threshold.

     per-ip bandwidth-threshold min-value *min-value*

     By default, the maximum bandwidth threshold is not set.

6. Configure per-IP dynamic bandwidth threshold learning.
   a. Enable per-IP dynamic bandwidth threshold learning.

      per-ip bandwidth-threshold-learn enable

      By default, per-IP dynamic bandwidth threshold learning is disabled.

   b. Set the duration for per-IP dynamic bandwidth threshold learning.

      per-ip bandwidth-threshold-learn duration *duration-value*

      By default, the duration for per-IP dynamic bandwidth threshold learning is 1440 minutes (24 hours).

      As a best practice, set the learning duration to be longer than 1440 minutes for the device to learn traffic for no less than a whole day.

   c. Set the maximum tolerance value.

      per-ip bandwidth-threshold-learn tolerance max-value *max-value*

      By default, the maximum tolerance value is not set.

   d. Set the minimum tolerance value.

      per-ip bandwidth-threshold-learn tolerance m min-value *min-value*

      By default, the minimum tolerance value is not set.

Setting the reference mode for the traffic profile

About this task

A traffic profile can be referenced by multiple traffic rules in one of the following ways:

- **per-rule**—Each rule that uses the profile can reach the bandwidth limits and connection limits specified in the profile.
- **rule-shared**—All rules that use the profile share the bandwidth limits and connection limits specified in the profile.

Procedure

1. Enter system view.

   system-view

2. Enter traffic policy view.

   traffic-policy

3. Enter traffic profile view.

   profile name *profile-name*

4. Set the reference mode for the traffic profile.

   profile reference-mode { **per-rule** | **rule-shared** }

The default setting is **per-rule**.

Renaming the traffic profile

1. Enter system view.
   system-view
2. Enter traffic policy view.
   traffic-policy
3. Rename a traffic profile.
   profile rename *old-name new-name*

Configuring a traffic rule

Creating a traffic rule

About this task

For a new traffic rule to inherit the match criteria of an existing traffic rule, specify the existing traffic rule as the parent of the new traffic rule. You can specify traffic profiles for both parent and child traffic rules.

Restrictions and guidelines

A level-4 rule cannot act as a parent rule.

You can specify a parent traffic rule only when creating a traffic rule. You cannot add or modify a parent traffic rule for an existing traffic rule.

Procedure

1. Enter system view.
   system-view
2. Enter traffic policy view.
   traffic-policy
3. (Optional.) Enable bandwidth management for traffic flows of the IP layer and upper layers.
   all-traffic-control enable

   By default, bandwidth management is performed only for traffic flows of Layer 4 and upper layers.

   Use this feature when there is a large number of IP traffic flows in the network.
4. Create a traffic rule and enter traffic rule view.
   rule [*rule-id*] **name** *rule-name* [**parent** *parent-rule-name*]

   You can specify a traffic rule as the parent traffic rule for multiple child traffic rules.

Configuring match criteria for the traffic rule

1. Enter system view.
   system-view
2. Enter traffic policy view.
   traffic-policy
3. Enter traffic rule view.

Choose one option as needed:

- **rule** *rule-id*
- **rule** [*rule-id*] **name** *rule-name* [**parent** *parent-rule-name*]

4. Configure a security zone as a match criterion.

- Configure a destination security zone as a match criterion.

  destination-zone *destination-zone-name*
- Configure a source security zone as a match criterion.

  source-zone *source-zone-name*

By default, no security zone is used as a match criterion.

5. Configure an IP address object group as a match criterion.

- Configure a destination IP address object group as a match criterion.

  destination-address address-set *object-group-name*
- Configure a source IP address object group as a match criterion.

  source-address address-set *object-group-name*

By default, no IP address object group is used as a match criterion.

6. Configure a service object group as a match criterion.

service *object-group-name*

By default, no service object group is used as a match criterion.

7. Configure an application or application group as a match criterion.

application { **app** *application-name* | **app-group** *application-group-name* }

By default, no application or application group is used as a match criterion.

8. Configure a user or user group as a match criterion.

- Configure a user as a match criterion.

  user *user-name* [**domain** *domain-name*]
- Configure a user group as a match criterion.

  user-group *user-group-name* [**domain** *domain-name*]

By default, no user or user group is used as a match criterion.

9. Configure a DSCP priority as a match criterion.

dscp *dscp-value*

By default, no DSCP priority is used as a match criterion.

10. Configure an IPv6 packet attribute as a match criterion.

- Configure the flow label attribute as a match criterion

  ipv6 flow-label { **nonzero** | **zero** }

  By default, the flow label attribute is not used as a match criterion.
- Configure the extension header attribute as a match criterion

  ipv6 extension-header { **authentication** | **destination** | **encapsulating** | **fragment** | **hop-by-hop** | **routing** }

  By default, the extension header attribute is not used as a match criterion.

Support for this command depends on the device model. For more information, see the command reference.

Support for this command depends on the device model. For more information, see the command reference.

11. Configure a terminal or terminal group as a match criterion.

- Configure a terminal as a match criterion.

terminal *terminal-name*

By default, no terminal is used as a match criterion.

- Configure a terminal group as a match criterion.

  terminal-group *group-name*

  By default, no terminal group is used as a match criterion.

Specifying an action for the traffic rule

About this task

If a packet matches a traffic rule, the device performs the action specified in the traffic rule on the packet.

Restrictions and guidelines

When you specify traffic profiles for parent and child traffic rules, make sure the following conditions are met:

- The maximum bandwidth for a child traffic rule must be smaller than or equal to that for the parent traffic rule.
- The guaranteed bandwidth for a child traffic rule must be smaller than or equal to that for the parent traffic rule.
- The traffic profiles cannot be the same for the child and parent traffic rules.

Procedure

1. Enter system view.

   system-view

2. Enter traffic policy view.

   traffic-policy

3. Enter traffic rule view.

   Choose one option as needed:

   - **rule** *rule-id*
   - **rule** [*rule-id*] **name** *rule-name* [**parent** *parent-rule-name*]

4. Specify an action for the traffic rule.

   action { **deny** | **none** | **qos profile** *profile-name* }

   The default action is **none**, which allows matching packets to pass through without bandwidth management.

Specifying a time range for the traffic rule

1. Enter system view.

   system-view

2. Enter traffic policy view.

   traffic-policy

3. Enter traffic rule view.

   Choose one option as needed:

   - **rule** *rule-id*
   - **rule** [*rule-id*] **name** *rule-name* [**parent** *parent-rule-name*]

4. Specify a time range during which the traffic rule is in effect.

time-range *time-range-name*

By default, a traffic rule is in effect at any time.

Managing and maintaining a traffic rule

Copying a traffic rule

1. Enter system view.
   system-view
2. Enter traffic policy view.
   traffic-policy
3. Copy a traffic rule.
   rule copy *rule-name new-rule-name*

Renaming a traffic rule

1. Enter system view.
   system-view
2. Enter traffic policy view.
   traffic-policy
3. Rename a traffic rule.
   rule rename *old-rule-name new-rule-name*

Moving a traffic rule

1. Enter system view.
   system-view
2. Enter traffic policy view.
   traffic-policy
3. Move a traffic rule to a new position.
   rule move *rule-name1* { **after** *rule-name2* | **before** [*rule-name2*] }

Disabling a traffic rule

1. Enter system view.
   system-view
2. Enter traffic policy view.
   traffic-policy
3. Enter traffic rule view.
   Choose one option as needed:
   - **rule** *rule-id*
   - **rule** [*rule-id*] **name** *rule-name* [**parent** *parent-rule-name*]
4. Disable the traffic rule.
   disable

By default, a traffic rule is enabled.

Enabling bandwidth management statistics collection

About this task

This feature can collect the following statistics:

- Traffic statistics.
- Connection limit statistics.
- Rule-hit statistics.

Restrictions and guidelines

This feature affects device performance. As a best practice, enable this feature only if you need to view statistics.

Procedure

1. Enter system view.
   system-view
2. Enter traffic policy view.
   traffic-policy
3. Enable bandwidth management statistics collection.
   - Enable traffic statistics collection.
     statistics bandwidth enable
     By default, traffic statistics collection is disabled.
   - Enable connection limit statistics collection.
     statistics connection-limit enable
     By default, connection limit statistics collection is disabled.
   - Enable rule-hit statistics collection.
     statistics rule-hit enable
     By default, rule-hit statistics collection is disabled.

Display and maintenance commands for bandwidth management

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display traffic statistics for traffic rules.	**display traffic-policy statistics bandwidth** { **downstream** | **total** | **upstream** } { **per-ip** { **ipv4** [*ipv4-address*] | **ipv6** [*ipv6-address*] } **rule** *rule-name* | **per-rule** [**name** *rule-name*] | **per-user** [**user** *user-name*] **rule** *rule-name* } [**slot** *slot-number*]
Display connection limit statistics.	**display traffic-policy statistics connection-limit** { **per-ip** { **ipv4** [*ipv4-address*]

Task	Command
	| **ipv6** [*ipv6-address*] } **rule** *rule-name* | **per-rule** [**name** *rule-name*] | **per-user** [**user** *user-name*] **rule** *rule-name* } } [**slot** *slot-number*]
Display rule-hit statistics.	**display traffic-policy statistics rule-hit** [**rule** *rule-name*] [**slot** *slot-number*]
Clear traffic statistics for traffic rules.	**reset traffic-policy statistics bandwidth** { **downstream** | **total** | **upstream** } { **per-ip** { **ipv4** [*ipv4-address*] | **ipv6** [*ipv6-address*] } **rule** *rule-name* | **per-rule** [**name** *rule-name*] | **per-user** [**user** *user-name*] **rule** *rule-name* } [**slot** *slot-number*]
Clear connection limit statistics.	**reset traffic-policy statistics connection-limit** { **per-ip** { **ipv4** [*ipv4-address*] | **ipv6** [*ipv6-address*] } **rule** *rule-name* | **per-rule** [**name** *rule-name*] | **per-user** [**user** *user-name*] **rule** *rule-name* } } [**slot** *slot-number*]
Clear rule-hit statistics.	**reset traffic-policy statistics rule-hit** [**rule** *rule-name*] [**slot** *slot-number*]

Bandwidth management configuration examples

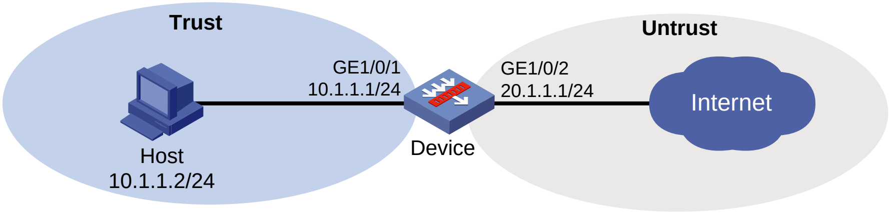
Example: Configuring a single traffic profile

Network configuration

As shown in Figure 2, configure bandwidth management on the device to meet the following requirements:

- The maximum bandwidth is limited to 30720 kbps for both upstream and downstream iQiYiPPS application traffic of the host in the intranet.
- The guaranteed bandwidth is 30720 kbps for both upstream and downstream FTP traffic of the host .
- The bandwidth of the interface to the Internet is limited to 102400 kbps.

Figure 2 Network diagram



Procedure

1. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

```
<Device> system-view
[Device] interface gigabitethernet 1/0/1
[Device-GigabitEthernet1/0/1] ip address 10.1.1.1 255.255.255.0
```

```
[Device-GigabitEthernet1/0/1] quit
```

# Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. **Configure settings for routing.**

   This example configures static routes, and the next hop in the routes is 20.1.1.2.

   ```
   [Device] ip route-static 3.1.1.2 24 20.1.1.2
   ```

3. Add interfaces to security zones.

   ```
   [Device] security-zone name trust
   [Device-security-zone-Trust] import interface gigabitethernet 1/0/1
   [Device-security-zone-Trust] quit
   [Device] security-zone name untrust
   [Device-security-zone-Untrust] import interface gigabitethernet 1/0/2
   [Device-security-zone-Untrust] quit
   ```

4. Configure a security policy:

   # Configure a rule named **trust-untrust** to allow the host to access the Internet.

   ```
   [Device] security-policy ip
   [Device-security-policy-ip] rule name trust-untrust
   [Device-security-policy-ip-1-trust-untrust] source-zone trust
   [Device-security-policy-ip-1-trust-untrust] destination-zone untrust
   [Device-security-policy-ip-1-trust-untrust] source-ip-host 10.1.1.2
   [Device-security-policy-ip-1-trust-untrust] action pass
   [Device-security-policy-ip-1-trust-untrust] quit
   [Device-security-policy-ip] quit
   ```

5. Configure traffic profiles:

   # Create a traffic profile named **aiqiyi**, and enter traffic profile view.

   ```
   [Device] traffic-policy
   [Device-traffic-policy] profile name aiqiyi
   ```

   # Set the maximum bandwidth to 30720 kbps for both upstream and downstream traffic.

   ```
   [Device-traffic-policy-profile-aiqiyi] bandwidth upstream maximum 30720
   [Device-traffic-policy-profile-aiqiyi] bandwidth downstream maximum 30720
   [Device-traffic-policy-profile-aiqiyi] quit
   ```

   # Create a traffic profile named **profileftp**, and enter traffic profile view.

   ```
   [Device-traffic-policy] profile name profileftp
   ```

   # Set the guaranteed bandwidth to 30720 kbps for both upstream and downstream traffic.

   ```
   [Device-traffic-policy-profile-profileftp] bandwidth upstream guaranteed 30720
   [Device-traffic-policy-profile-profileftp] bandwidth downstream guaranteed 30720
   [Device-traffic-policy-profile-profileftp] quit
   [Device-traffic-policy] quit
   ```

6. Set the expected bandwidth to 102400 kbps for interface GigabitEthernet 1/0/2.

   ```
   [Device] interface gigabitethernet 1/0/2
   [Device-GigabitEthernet1/0/2] bandwidth 102400
   [Device-GigabitEthernet1/0/2] quit
   ```

7. Configure traffic rules:

   # Enter traffic policy view.

   ```
   [Device] traffic-policy
   ```

   # Create a traffic rule named **aiqiyi**, and enter traffic rule view.

   ```
   [Device-traffic-policy] rule name aiqiyi
   ```

   # Configure the predefined application iQiYiPPS as a match criterion.

```
[Device-traffic-policy-rule-1-aiqiyi] application app iQiYiPPS
```

# Specify traffic profile **aiqiyi** for traffic rule **aiqiyi**.

```
[Device-traffic-policy-rule-1-aiqiyi] action qos profile aiqiyi
[Device-traffic-policy-rule-1-aiqiyi] quit
```

# Create a traffic rule named **ruleftp**, and enter traffic rule view.

```
[Device-traffic-policy] rule name ruleftp
```

# Configure the predefined application FTP as a match criterion.

```
[Device-traffic-policy-rule-2-ruleftp] application app ftp
```

# Specify traffic profile **profileftp** for traffic rule **ruleftp**.

```
[Device-traffic-policy-rule-2-ruleftp] action qos profile profileftp
[Device-traffic-policy-rule-2-ruleftp] quit
[Device-traffic-policy] quit
```

Verifying the configuration

# Verify that the iQiYiPPS application traffic rate cannot exceed 30720 kbps and the FTP traffic rate can reach a minimum of 30720 kbps when the total traffic rate on GigabitEthernet 1/0/2 reaches 102400 kbps. (Details not shown.)

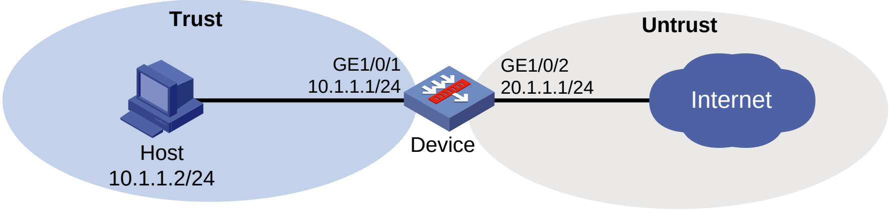
Example: Configuring parent/child traffic profiles

Network configuration

As shown in Figure 3, configure bandwidth management on the device to meet the following requirements:

- The maximum bandwidth is limited to 30720 kbps for both upstream and downstream iQiYiPPS application traffic of the host in the intranet.
- The guaranteed bandwidth is 30720 kbps for both upstream and downstream FTP traffic of the host .
- The total traffic rate of the host is limited to 40960 kbps.

Figure 3 Network diagram



Procedure

1. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

   ```
   <Device> system-view
   [Device] interface gigabitethernet 1/0/1
   [Device-GigabitEthernet1/0/1] ip address 10.1.1.1 255.255.255.0
   [Device-GigabitEthernet1/0/1] quit
   ```

   # Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Configure settings for routing.

   This example configures static routes, and the next hop in the routes is 20.1.1.2.

   ```
   [Device] ip route-static 3.1.1.2 24 20.1.1.2
   ```

3. Add interfaces to security zones.

```
[Device] security-zone name trust
[Device-security-zone-Trust] import interface gigabitethernet 1/0/1
[Device-security-zone-Trust] quit
[Device] security-zone name untrust
[Device-security-zone-Untrust] import interface gigabitethernet 1/0/2
[Device-security-zone-Untrust] quit
```

4. Configure a security policy:

# Configure a rule named **trust-untrust** to allow the host to access the Internet.

```
[Device] security-policy ip
[Device-security-policy-ip] rule name trust-untrust
[Device-security-policy-ip-1-trust-untrust] source-zone trust
[Device-security-policy-ip-1-trust-untrust] destination-zone untrust
[Device-security-policy-ip-1-trust-untrust] source-ip-host 10.1.1.2
[Device-security-policy-ip-1-trust-untrust] action pass
[Device-security-policy-ip-1-trust-untrust] quit
[Device-security-policy-ip] quit
```

5. Configure traffic profiles:

# Create a traffic profile named **profile**, and enter traffic profile view.

```
[Device] traffic-policy
[Device-traffic-policy] profile name profile
```

# Set the maximum bandwidth to 40960 kbps for both upstream and downstream traffic.

```
[Device-traffic-policy-profile-profile] bandwidth upstream maximum 40960
[Device-traffic-policy-profile-profile] bandwidth downstream maximum 40960
[Device-traffic-policy-profile-profile] quit
```

# Create a traffic profile named **aiqiyi**, and enter traffic profile view.

```
[Device-traffic-policy] profile name aiqiyi
```

# Set the maximum bandwidth to 30720 kbps for both upstream and downstream traffic.

```
[Device-traffic-policy-profile-aiqiyi] bandwidth upstream maximum 30720
[Device-traffic-policy-profile-aiqiyi] bandwidth downstream maximum 30720
[Device-traffic-policy-profile-aiqiyi] quit
```

# Create a traffic profile named **profileftp**, and enter traffic profile view.

```
[Device-traffic-policy] profile name profileftp
```

# Set the guaranteed bandwidth to 30720 kbps for both upstream and downstream traffic.

```
[Device-traffic-policy-profile-profileftp] bandwidth upstream guaranteed 30720
[Device-traffic-policy-profile-profileftp] bandwidth downstream guaranteed 30720
[Device-traffic-policy-profile-profileftp] quit
```

6. Configure traffic rules:

# Create a traffic rule named **rule**, and enter traffic rule view.

```
[Device-traffic-policy] rule name rule
```

# Specify traffic profile **profile** for traffic rule **rule**.

```
[Device-traffic-policy-rule-1-rule] action qos profile profile
[Device-traffic-policy-rule-1-rule] quit
```

# Create a traffic rule named **aiqiyi**, enter traffic rule view, and specify traffic rule **rule** as its parent rule.

```
[Device-traffic-policy] rule name aiqiyi parent rule
```

# Configure the predefined application iQiYiPPS as a match criterion.

```
[Device-traffic-policy-rule-2-aiqiyi] application app iQiYiPPS
```

# Specify traffic profile **aiqiyi** for traffic rule **aiqiyi**.

```
[Device-traffic-policy-rule-2-aiqiyi] action qos profile aiqiyi
[Device-traffic-policy-rule-2-aiqiyi] quit
```

# Create a traffic rule named **ruleftp**, enter traffic rule view, and specify traffic rule **rule** as its parent rule.

```
[Device-traffic-policy] rule name ruleftp parent rule
```

# Configure the predefined application FTP as a match criterion.

```
[Device-traffic-policy-rule-3-ruleftp] application app ftp
```

# Specify traffic profile **profileftp** for traffic rule **ruleftp**.

```
[Device-traffic-policy-rule-3-ruleftp] action qos profile profileftp
[Device-traffic-policy-rule-3-ruleftp] quit
[Device-traffic-policy] quit
```

Verifying the configuration

# Verify that the total traffic rate of the host is limited to 40960 kbps, and that the iQiYiPPS application traffic rate is limited to 30720 kbps. When congestion occurs, FTP traffic is not affected. (Details not shown.)

Example: Configuring a user-based traffic profile

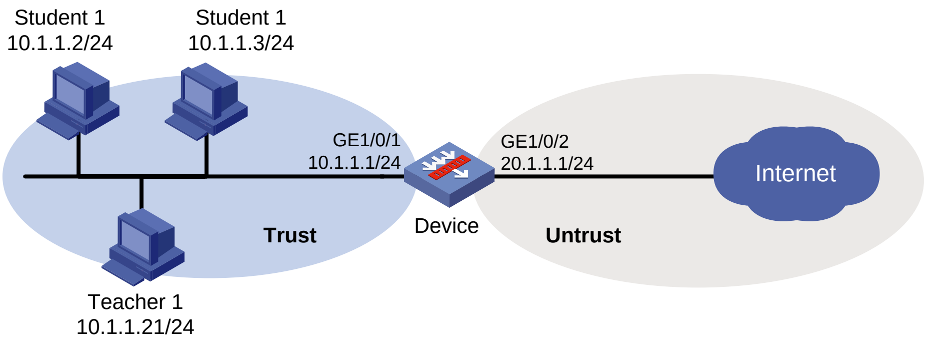
Network configuration

As shown in Figure 4, an intranet has two user groups: a teacher group with two teachers and a student group with five students.

Configure per-user bandwidth management on the device to meet the following requirements:

- The IP addresses of students **student1** through **student5** are 10.1.1.2/24 through 10.1.1.6/24, respectively. The IP addresses of teachers **teacher1** and **teacher2** are 10.1.1.21/24 and 10.1.1.22/24, respectively.
- The bandwidth is limited to 10000 kbps for each teacher in both the upstream and downstream directions, and the bandwidth is limited to 2000 kbps for each student in both the upstream and downstream directions.
- The connection count limit is limited to 10000 for each teacher, and the connection count limit is also limited to 10000 for each student.
- Teachers have higher priority over students to access the Internet.

Figure 4 Network diagram



Procedure

1. Assign IP addresses to interfaces:

# Assign an IP address to interface GigabitEthernet 1/0/1.

```
<Device> system-view
[Device] interface gigabitethernet 1/0/1
[Device-GigabitEthernet1/0/1] ip address 10.1.1.1 255.255.255.0
[Device-GigabitEthernet1/0/1] quit
```

# Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Configure settings for routing.

This example configures static routes, and the next hop in the routes is 20.1.1.2.

```
[Device] ip route-static 3.1.1.2 24 20.1.1.2
```

3. Add interfaces to security zones.

```
[Device] security-zone name trust
[Device-security-zone-Trust] import interface gigabitethernet 1/0/1
[Device-security-zone-Trust] quit
[Device] security-zone name untrust
[Device-security-zone-Untrust] import interface gigabitethernet 1/0/2
[Device-security-zone-Untrust] quit
```

4. Configure a security policy:

# Configure a rule named **trust-untrust** to allow the host to access the Internet.

```
[Device] security-policy ip
[Device-security-policy-ip] rule name trust-untrust
[Device-security-policy-ip-1-trust-untrust] source-zone trust
[Device-security-policy-ip-1-trust-untrust] destination-zone untrust
[Device-security-policy-ip-1-trust-untrust] source-ip-host 10.1.1.2
[Device-security-policy-ip-1-trust-untrust] source-ip-host 10.1.1.3
[Device-security-policy-ip-1-trust-untrust] source-ip-host 10.1.1.4
[Device-security-policy-ip-1-trust-untrust] source-ip-host 10.1.1.5
[Device-security-policy-ip-1-trust-untrust] source-ip-host 10.1.1.6
[Device-security-policy-ip-1-trust-untrust] source-ip-host 10.1.1.21
[Device-security-policy-ip-1-trust-untrust] source-ip-host 10.1.1.22
[Device-security-policy-ip-1-trust-untrust] action pass
[Device-security-policy-ip-1-trust-untrust] quit
[Device-security-policy-ip] quit
```

5. Configure local users:

# Create a network access user named **student1**.

```
[Device] local-user student1 class network
```

# Set the password to **student** in plaintext form for the user.

```
[Device-luser-network-student1] password simple student
```

# Specify the service types as IKE, Portal, and SSL VPN for the user.

```
[Device-luser-network-student1] service-type ike
[Device-luser-network-student1] service-type portal
[Device-luser-network-student1] service-type sslvpn
[Device-luser-network-student1] quit
```

# Create four network access users named **student2**, **student3**, **student4**, and **student5**, and set the password to **student** in plaintext form for each of these users. (Details not shown.)

# Create two network access users named **teacher1** and **teacher2**, and set the password to **teacher** in plaintext form for each of these users. (Details not shown.)

# Specify the service types as IKE, Portal, and SSL VPN for each of the six users. (Details not shown.)

# Create a user group named **student**, and assign users **student1** through **student5** to the user group as identity users.

```
[Device] user-group student
[Device-ugroup-student] identity-member user student1
[Device-ugroup-student] identity-member user student2
[Device-ugroup-student] identity-member user student3
[Device-ugroup-student] identity-member user student4
[Device-ugroup-student] identity-member user student5
[Device-ugroup-student] quit
```

# Create a user group named **teacher**, and assign users **teacher 1** and **teacher2** to the user group as identity users.

```
[Device] user-group teacher
[Device-ugroup-teacher] identity-member user teacher1
[Device-ugroup-teacher] identity-member user teacher2
[Device-ugroup-teacher] quit
```

# Configure static identity users.

```
[Device] user-identity static-user student1 bind ipv4 10.1.1.2
[Device] user-identity static-user student2 bind ipv4 10.1.1.3
[Device] user-identity static-user student3 bind ipv4 10.1.1.4
[Device] user-identity static-user student4 bind ipv4 10.1.1.5
[Device] user-identity static-user student5 bind ipv4 10.1.1.6
[Device] user-identity static-user teacher1 bind ipv4 10.1.1.21
[Device] user-identity static-user teacher2 bind ipv4 10.1.1.22
```

# Enable the user identification feature.

```
[Device] user-identity enable
```

6. Configure traffic profiles:

# Create a traffic profile named **profile-teacher**, and enter traffic profile view.

```
[Device] traffic-policy
[Device-traffic-policy] profile name profile-teacher
```

# Set the per-user maximum bandwidth to 10000 kbps for both upstream and downstream traffic.

```
[Device-traffic-policy-profile-profile-teacher] bandwidth upstream maximum per-user
10000
[Device-traffic-policy-profile-profile-teacher] bandwidth downstream maximum
per-user 10000
```

# Set the per-user connection count limit to 10000.

```
[Device-traffic-policy-profile-profile-teacher] connection-limit count per-user
10000
```

# Set the traffic priority to 2.

```
[Device-traffic-policy-profile-profile-teacher] traffic-priority 2
```

# Create a traffic profile named **profile-student**, and enter traffic profile view.

```
[Device-traffic-policy] profile name profile-student
```

# Set the per-user maximum bandwidth to 2000 kbps for both upstream and downstream traffic.

```
[Device-traffic-policy-profile-profile-student] bandwidth upstream maximum per-user
2000
[Device-traffic-policy-profile-profile-student] bandwidth downstream maximum
per-user 2000
```

# Set the per-user connection count limit to 10000.

```
[Device-traffic-policy-profile-profile-student] connection-limit count per-user
10000
```

# Set the traffic priority to 1 (lowest).

```
[Device-traffic-policy-profile-profile-student] traffic-priority 1
```

7. Configure traffic rules:

# Create a traffic rule named **rule-teacher**, and enter traffic rule view.

```
[Device-traffic-policy] rule name rule-teacher
```

# Configure user group **teacher** as a match criterion, and specify traffic profile **profile-teacher** for traffic rule **rule-teacher**.

```
[Device-traffic-policy-rule-1-rule-teacher] user-group teacher
[Device-traffic-policy-rule-1-rule-teacher] action qos profile profile-teacher
[Device-traffic-policy-rule-1-rule-teacher] quit
```

# Create a traffic rule named **rule-student**, and enter traffic rule view.

```
[Device-traffic-policy] rule name rule-student
```

# Configure user group **student** as a match criterion, and specify traffic profile **profile-student** for traffic rule **rule-student**.

```
[Device-traffic-policy-rule-2-rule-student] user-group student
[Device-traffic-policy-rule-2-rule-student] action qos profile profile-student
[Device-traffic-policy-rule-2-rule-student] quit
[Device-traffic-policy] quit
```

Verifying the configuration

# Verify that the bandwidth is limited to 10000 kbps for each teacher, and that the bandwidth is limited to 2000 kbps for each student.

# Verify that the per-user connection count is limited to 10000 for both students and teachers.

Contents

Configuring application audit and management

About application audit and management

Application audit and management audits and records Internet access behaviors of users by identifying behaviors (for example, login and message sending in IM applications) and behavior objects (for example, account information for IM login).

NOTE:

This feature parses personal information from user packets and must be used for legitimate purposes.

Application audit and management policy

You can configure match criteria, audit rules, and actions in an application audit and management policy to audit matching packets.

Policy types

Application audit and management policies have the following types:

- **Audit policy**—Audits packets that meet match criteria in the policy.
- **Audit-free policy**—Does not audit packets that meet match criteria in the policy.
- **Deny policy**—Drops packets that meet match criteria in the policy.

Match criteria

Multiple match criteria can be configured in an application audit and management policy.

The following match criteria are available:

- Source and destination security zones.
- Source and destination IP addresses.
- Services.
- Users/user groups.
- Applications.

One match criterion can contain multiple match values. For example, you can configure multiple source security zones for a source security zone match criterion.

Audit rule

Audit rules can be configured for an audit policy to perform more granular control on user behaviors and to generate audit logs.

The following rule match modes are available:

- **in-order**—The device compares packets with audit rules in ascending order of rule ID. When a packet matches a rule, the device stops the match process and performs the action defined in the rule.
- **all**—The device compares packets with audit rules in ascending order of rule ID.
  - If a packet matches a rule with the permit action, all subsequent rules continue to be matched.

The device takes the action with higher priority on matching packets. The deny action has higher priority than the permit action.

  - If a packet matches a rule with the deny action, the device stops the match process and performs the deny action.

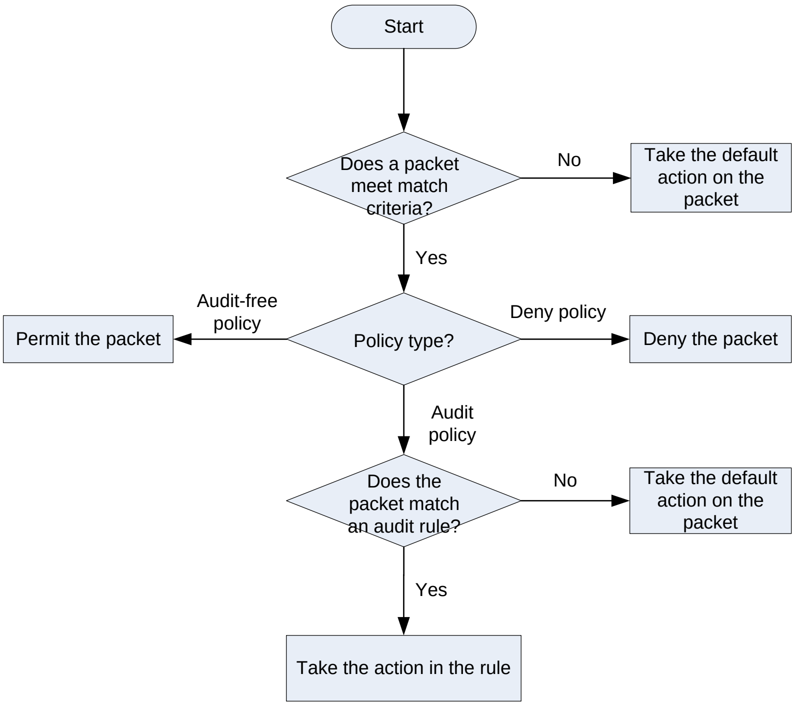
Audit log

The device can generate and output audit logs for packets that match an audit rule. The audit logs can be output as common logs or output by using the fast log output feature.

Application audit and management workflow

Figure 1 shows the application audit and management workflow.

Figure 1 Application audit and management workflow



Start
Does a packet meet match criteria?
No
Take the default action on the packet
Yes
Audit-free policy
Permit the packet
Policy type?
Deny policy
Deny the packet
Audit policy
Does the packet match an audit rule?
No
Take the default action on the packet
Yes
Take the action in the rule

The application audit and management workflow is as follows:

1. The device matches the packet against the match criteria in an application audit and management policy.

   The packet meets a match criterion if it matches any of its match values. A packet does not match a match criterion if it matches none of its match values.

2. If the packet meets all match criteria in the policy (for the user and user group criteria, only one criterion needs to be matched), the packet matches the policy. Otherwise, the packet does not match the policy and continues to be matched by the next policy. If the packet does not match any policy, the device takes the policy's default action on the packet.

3. If the packet matches a policy, it is processed according to the policy type.
   - If the policy is an audit-free policy, the packet is allowed to pass.
   - If the policy is a deny policy, the packet is denied.
   - If the policy is an audit policy, the packet is matched against the audit rules in the policy.

4. The device processes the packet as follows:
   - If a packet matches all items in an audit rule, the action in the audit rule is taken on the packet.

  - If a packet matches only the specified application or application category in an audit rule, the packet is allowed to pass through.
  - If a packet does not match the specified application or application category in an audit rule, the default action for audit rules is taken on the packet.

Restrictions and guidelines: Application audit and management configuration

As a best practice to audit packets more accurately, observe the depth-first principle when creating policies. Always create a policy with a smaller audit scope before a policy with a larger audit scope.

Prerequisites for application audit and management

Before configuring application audit and management, complete the following tasks:

- Update the APR signature library to the latest version (see APR configuration in *Security Configuration Guide*).
- Configure time ranges (see time range configuration in *ACL and QoS Configuration Guide*).
- Configure IP address object groups and service object groups (see object group configuration in *Security Configuration Guide*).
- Configure applications (see APR configuration in *Security Configuration Guide*).
- Configure users and user groups (see user identification configuration in *Security Configuration Guide*).
- Configure security zones (see security zone configuration in *Security Configuration Guide*).

Application audit and management tasks at a glance

To configure application audit and management, perform the following tasks:

1. Creating an application audit and management policy
2. Configuring match criteria for the policy
3. (Optional.) Specifying a time range for the policy
4. Configuring an audit rule for the policy
5. Configuring a keyword group
6. (Optional.) Managing and maintaining an application audit and management policy
7. Activating policy and rule settings of all DPI service modules

Creating an application audit and management policy

1. Enter system view.

   ```
   system-view
   ```

2. Enter application audit and management view.

uapp-control

3. Create an application audit and management policy and enter its view.

   policy name *policy-name* { **audit** | **deny** | **noaudit** }

4. Configure the default action for the policy.

   policy default-action { **deny** | **permit** }

   By default, the default action for a policy is **permit**.

Configuring match criteria for the policy

1. Enter system view.

   system-view

2. Enter application audit and management view.

   uapp-control

3. Enter application audit and management policy view.

   policy name *policy-name* [**audit** | **deny** | **noaudit**]

4. Configure a security zone as a match criterion.
   - Configure a source security zone as a match criterion.

     source-zone *source-zone-name*

   - Configure a destination security zone as a match criterion.

     destination-zone *destination-zone-name*

   By default, no security zone is used as a match criterion.

5. Configure an IP address object group as a match criterion.
   - Configure a source IP address object group as a match criterion.

     source-address { **ipv4** | **ipv6** } *object-group-name*

   - Configure a destination IP address object group as a match criterion.

     destination-address { **ipv4** | **ipv6** } *object-group-name*

   By default, no IP address object group is used as a match criterion.

6. Configure a service object group as a match criterion.

   service *service-name*

   By default, no service object group is used as a match criterion.

7. Configure a user or user group as a match criterion.
   - Configure a user as a match criterion.

     user *user-name* [**domain** *domain-name*]

   - Configure a user group as a match criterion.

     user-group *user-group-name* [**domain** *domain-name*]

   By default, no user or user group is used as a match criterion.

8. Configure an application or application group as a match criterion.

   application { **app** *application-name* | **app-group** *application-group-name* }

   By default, no application or application group is used as a match criterion.

   The application and application group match criteria can be configured only in audit-free policies and deny policies.

Specifying a time range for the policy

1. Enter system view.

   `system-view`

2. Enter application audit and management view.

   `uapp-control`

3. Enter application audit and management policy view.

   `policy name` *`policy-name`* { **`audit`** | **`deny`** | **`noaudit`** }

4. Specify a time range during which the policy is in effect.

   `time-range` *`time-range-name`*

   By default, an application audit and management policy is in effect at any time.

Configuring an audit rule for the policy

About this task

An audit rule provices the following functions:

- **General auditing**—Performs granular control on user behaviors.
- **Email protection**—Detects incoming emails, counts emails based on recipients, and protects recipients from attacks. Specifically, you can configure the following functions:
  - **Limit email sending**—Prevents users from sending emails to users of a different domain. For example, the user at user1@abc.com cannot receive emails from the user at user2@123.com.
  - **Prevent email bombing**—Protects recipients from being overwhelmed by large numbers of emails from the same sender during a short period of time.

You can configure audit rules only for an audit policy.

If you specify the **`audit-logging`** keyword for an audit rule, the following rules apply:

- The device sends audit log messages to the information center as common logs by default. With the information center, you can set log message filtering and output rules, including output destinations. The information center can output audit logs to any destinations except the console and the monitor terminal. If you configure the console or monitor terminal as an output destination, the output destination setting will not take effect. To view audit logs stored on the device, use the **`display logbuffer`** command. Make sure you do not disable log output to the log buffer, which is enabled by default. For more information about configuring the information center, see *Network Management and Monitoring Configuration Guide*.
- If you also configure the **`customlog format dpi audit`** command, the device outputs audit logs by using the fast log output feature. For more information about fast log output, see fast log output configuration in *Network Management and Monitoring Configuration Guide*.

Restrictions and guidelines

For WeChat and QQ, specific messages and voice calls cannot be blocked..

Procedure

1. Enter system view.

   `system-view`

2. Enter application audit and management view.

   `uapp-control`

3. Enter application audit and management policy view of the audit type.

policy name *policy-name* [**audit**]

4. Configure an audit rule for the policy.

   rule *rule-id* { **app** *app-name* | **app-category** *app-category-name* | **any** } **behavior** { *behavior-name* | **any** } **bhcontent** { *bhcontent-name* | **any** } { **keyword** { **equal** | **exclude** | **include** | **unequal** } { *keyword-group-name* | **any** } | **integer** { **equal** | **greater** | **greater-equal** | **less** | **less-equal** | **unequal** } { *number* } } **action** { **deny** | **permit** } [**audit-logging**]

   rule *rule-id* { **email-bomb-defense** [**interval** *interval* **max-number** *email-number*] | **email-send-restriction** } * **action** { **deny** | **permit** } [**audit-logging**]

   By default, a policy does not have audit rules.

5. Configure the match mode for audit rules in the policy.

   rule match-method { **all** | **in-order** }

   By default, the match mode for audit rules is **in-order**.

6. Configure the default action for audit rules in the policy.

   rule default-action { **deny** | **permit** }

   By default, the default action for audit rules is **permit**.

Configuring a keyword group

About this task

A keyword group can be used by an audit rule to match more specific information.

Procedure

1. Enter system view.

   system-view

2. Enter application audit and management view.

   uapp-control

3. Create a keyword group and enter its view.

   keyword-group name *keyword-group-name*

4. (Optional.) Configure a description for the keyword group.

   description *text*

   By default, a keyword group does not have a description.

5. Add a keyword to the keyword group.

   keyword *keyword-value*

   By default, a keyword group does not contain keywords.

Managing and maintaining an application audit and management policy

Copying an application audit and management policy

1. Enter system view.

   system-view

2. Enter application audit and management view.

uapp-control

3. Copy an application audit and management policy.

   policy copy *policy-name new-policy-name*

Renaming an application audit and management policy

1. Enter system view.

   system-view

2. Enter application audit and management view.

   uapp-control

3. Rename an application audit and management policy.

   policy rename *old-policy-name new-policy-name*

Moving an application audit and management policy

1. Enter system view.

   system-view

2. Enter application audit and management view.

   uapp-control

3. Move an application audit and management policy.

   policy move *policy-name1* { **after** *policy-name2* | **before** [*policy-name2*] }

Disabling an application audit and management policy

1. Enter system view.

   system-view

2. Enter application audit and management view.

   uapp-control

3. Enter application audit and management policy view.

   policy name *policy-name*

4. Disable the application audit and management policy.

   disable

   By default, an application audit and management policy is enabled.

Activating policy and rule settings of all DPI service modules

About this task

After a policy or rule of a DPI service module is created, modified, or deleted, you must perform this task for the configuration to take effect.

For more information about this task, see DPI engine configuration in *DPI Configuration Guide*.

Restrictions and guidelines

This task will interrupt DPI service processing. To reduce the impact on DPI services, perform this task after you complete policy and rule settings of all DPI service modules.

Procedure

1. Enter system view.

   `system-view`

2. Activate policy and rule settings of all DPI service modules.

   `inspect activate`

   By default, policy and rule settings of all DPI service modules are deactivated.

Application audit and management configuration examples

Example: Configuring account login audit

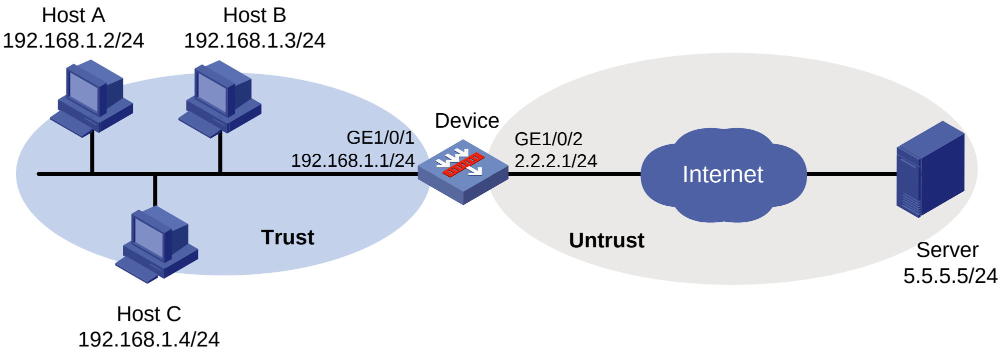
Network configuration

As shown in Figure 2, all departments of a company access the Internet through the device. The working hours of the company are 8:00:00 through 18:00:00 from Monday to Friday.

Configure an application audit and management policy on the device to meet the following requirements:

- Permit login from all QQ accounts during working hours.
- Generate audit logs.

Figure 2 Network diagram



Procedure

1. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

   ```
   <Device> system-view
   [Device] interface gigabitethernet 1/0/1
   [Device-GigabitEthernet1/0/1] ip address 192.168.1.1 255.255.255.0
   [Device-GigabitEthernet1/0/1] quit
   ```

   # Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Configure settings for routing.

   This example configures static routes, and the next hop in the routes is 2.2.2.2.

```
[Device] ip route-static 5.5.5.5 24 2.2.2.2
```

3. Add interfaces to security zones.

```
[Device] security-zone name trust
[Device-security-zone-Trust] import interface gigabitethernet 1/0/1
[Device-security-zone-Trust] quit
[Device] security-zone name untrust
[Device-security-zone-Untrust] import interface gigabitethernet 1/0/2
[Device-security-zone-Untrust] quit
```

4. Configure a security policy:

   # Configure a rule named **trust-untrust** to allow the host to access the Internet.

```
[Device] security-policy ip
[Device-security-policy-ip] rule name trust-untrust
[Device-security-policy-ip-1-trust-untrust] source-zone trust
[Device-security-policy-ip-1-trust-untrust] destination-zone untrust
[Device-security-policy-ip-1-trust-untrust] source-ip-host 192.168.1.2
[Device-security-policy-ip-1-trust-untrust] source-ip-host 192.168.1.3
[Device-security-policy-ip-1-trust-untrust] source-ip-host 192.168.1.4
[Device-security-policy-ip-1-trust-untrust] action pass
[Device-security-policy-ip-1-trust-untrust] quit
[Device-security-policy-ip] quit
```

5. Configure a time range named **work** to cover 8:00:00 through 18:00:00 from Monday to Friday.

```
[Device] time-range work 08:00 to 18:00 working-day
```

6. Update the APR signature library to the latest version (in this example, 1.0.106). (Details not shown.)

7. Configure an application audit and management policy:

   # Enter application audit and management view.

```
[Device] uapp-control
```

   # Create an audit policy named **audit-qq** and enter its view.

```
[Device-uapp-control] policy name audit-qq audit
```

   # Configure source security zone **Trust** as a match criterion for audit policy **audit-qq**.

```
[Device-uapp-control-policy-audit-qq] source-zone trust
```

   # Configure destination security zone **Untrust** as a match criterion for audit policy **audit-qq**.

```
[Device-uapp-control-policy-audit-qq] destination-zone untrust
```

   # Specify time range **work** for audit policy **audit-qq**.

```
[Device-uapp-control-policy-audit-qq] time-range work
```

   # Configure an audit rule to permit login from all QQ accounts and generate audit logs.

```
[Device-uapp-control-policy-audit-qq] rule 1 app QQ behavior Login bhcontent any
keyword equal any action permit audit-logging
[Device-uapp-control-policy-audit-qq] quit
[Device-uapp-control] quit
```

   # Activate the configuration.

```
[Device] inspect activate
```

Verifying the configuration

When QQ accounts attempt to access the Internet, the device permits the login requests and generates audit log messages.

Example: Configuring sensitive information audit

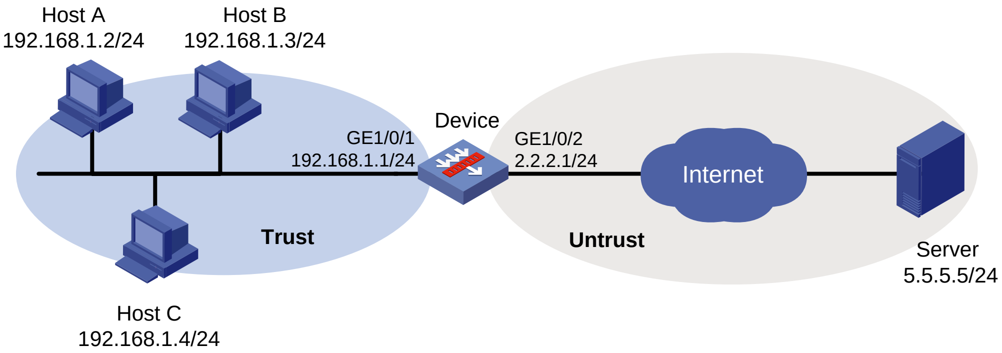
Network configuration

As shown in Figure 3, all departments of a company access the Internet through the device. The working hours of the company are 8:00:00 through 18:00:00 from Monday to Friday.

Configure an application audit and management policy on the device to meet the following requirements:

- Deny search requests for Bing that include keyword **confidential** or **terrorist attack**.
- Generate audit logs.

Figure 3 Network diagram



Procedure

1. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

```
<Device> system-view
[Device] interface gigabitethernet 1/0/1
[Device-GigabitEthernet1/0/1] ip address 192.168.1.1 255.255.255.0
[Device-GigabitEthernet1/0/1] quit
```

   # Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Configure settings for routing.

   This example configures static routes, and the next hop in the routes is 2.2.2.2.

```
[Device] ip route-static 5.5.5.5 24 2.2.2.2
```

3. Add interfaces to security zones.

```
[Device] security-zone name trust
[Device-security-zone-Trust] import interface gigabitethernet 1/0/1
[Device-security-zone-Trust] quit
[Device] security-zone name untrust
[Device-security-zone-Untrust] import interface gigabitethernet 1/0/2
[Device-security-zone-Untrust] quit
```

4. Configure a security policy:

   # Configure a rule named **trust-untrust** to allow the host to access the Internet.

```
[Device] security-policy ip
[Device-security-policy-ip] rule name trust-untrust
[Device-security-policy-ip-1-trust-untrust] source-zone trust
[Device-security-policy-ip-1-trust-untrust] destination-zone untrust
[Device-security-policy-ip-1-trust-untrust] source-ip-host 192.168.1.2
```

```
[Device-security-policy-ip-1-trust-untrust] source-ip-host 192.168.1.3
[Device-security-policy-ip-1-trust-untrust] source-ip-host 192.168.1.4
[Device-security-policy-ip-1-trust-untrust] action pass
[Device-security-policy-ip-1-trust-untrust] quit
[Device-security-policy-ip] quit
```

5. Update the APR signature library to the latest version (in this example, 1.0.106). (Details not shown.)
6. Configure an application audit and management policy:

   # Enter application audit and management view.

   ```
   [Device] uapp-control
   ```

   # Configure a keyword group named **keyword-bing**.

   ```
   [Device-uapp-control] keyword-group name keyword-bing
   ```

   # Add keywords **confidential** and **terrorist attack** to keyword group **keyword-bing**.

   ```
   [Device-uapp-control-keyword-group-keyword-bing] keyword confidential
   [Device-uapp-control-keyword-group-keyword-bing] keyword terrorist attack
   [Device-uapp-control-keyword-group-keyword-bing] quit
   ```

   # Create an audit policy named **audit-bing** and enter its view.

   ```
   [Device-uapp-control] policy name audit-bing audit
   ```

   # Configure source security zone **Trust** as a match criterion for audit policy **audit-bing**.

   ```
   [Device-uapp-control-policy-audit-bing] source-zone trust
   ```

   # Configure destination security zone **Untrust** as a match criterion for audit policy **audit-bing**.

   ```
   [Device-uapp-control-policy-audit-bing] destination-zone untrust
   ```

   # Configure an audit rule to deny search requests for Bing that include keyword **confidential** or **terrorist attack**, generating audit logs.

   ```
   [Device-uapp-control-policy-audit-bing] rule 2 app Bing behavior Search bhcontent
   Keyword keyword include keyword-bing action deny audit-logging
   [Device-uapp-control-policy-audit-bing] quit
   [Device-uapp-control] quit
   ```

   # Activate the configuration.

   ```
   [Device] inspect activate
   ```

Verifying the configuration

When a user searches for information that includes keyword **confidential** or **terrorist attack** by using Bing, the device denies the search request and generates a log message.

Contents

Configuring NetShare control

About NetShare control

NetShare control uses the NetShare control policy to identify and control network sharing behaviors.

The network sharing behavior is the behavior of multiple terminals using the same IP address for network access through NAT or proxy. If an IP address is detected to be used as the source IP address in packets sent by multiple terminals, the IP address is a shared IP address. NetShare control monitors the number of terminals sharing the IP address and takes the NetShare control action if the number of terminals sharing the IP address exceeds the limit.

NetShare detection methods

NetShare control uses the following methods to detect network sharing behaviors:

- **APR-based detection**—The device analyzes the application layer information of packets based on the Application Recognition (APR)-based packet analysis to detect NetShare behaviors of terminals. For more information about APR, see APR configuration in *Security Configuration Guide*.
- **IPID trail tracking**—The device tracks the values of the IPID fields in packets to detect NetShare behaviors.

NetShare control policy

The device uses the NetShare control policy to detect NetShare behaviors.

A NetShare control policy defines the following attributes:

- Filtering criteria.
- Detection methods.
- Maximum number of terminals allowed to share an IP address.
- Actions on terminals that exceed the NetShare control upper limit.

If the number of terminals sharing the IP address exceeds the limit, NetShare control takes the NetShare control actions specified in the policy.

NetShare control mechanism

As shown in Figure 1, the NetShare control module processes a packet as follows:

1. Determines if the NetShare policy is enabled.
   - If the policy is disabled, NetShare control permits the packet to pass through.
   - If the policy is enabled, NetShare control proceeds to step 2.
2. Determines if the source IP address of the packet is frozen:
   - If yes, NetShare control drops the packet.
   - If not, NetShare control proceeds to step 3.
3. Compares the packet attributes with the NetShare inspection criteria in the NetShare control policy to determine if the packet matches the policy.
   - If the packet does not match the policy, NetShare control permits the packet to pass through.
   - If the packet matches the policy, NetShare control proceeds to step 4.

4. Determines if the source IP address of the packet is shared by multiple terminals:

- If not, NetShare control permits the packet to pass through.
- If yes, NetShare control further determines whether the number of terminals sharing the IP address exceeds the limit:
  - If the limit is exceeded, NetShare control takes the NetShare control action specified in the policy.
  - If the limit is not exceeded, NetShare control permits the packet to pass through.

NetShare control tasks at a glance

To configure NetShare control, perform the following tasks:

1. Creating a NetShare control policy
2. Configuring NetShare inspection filtering criteria
3. Configuring a NetShare detection method
    - Enabling APR-based detection
    - Enabling IPID trail tracking
4. Setting the maximum number of terminals sharing an IP address
5. Setting the NetShare control action
6. Activating NetShare control policy settings
7. (Optional.) Disabling the NetShare control policy
8. (Optional.) Manually freezing and unfreezing a shared IP address

Prerequisites for NetShare control

Before you configure NetShare control, you must perform the following tasks:

- Upgrade the APR signature library on the device to the most recent version.
- Configure IP address object groups. For information about the configuration procedure, see object group configuration in *Security Configuration Guide*.
- Configure users and user groups. For information about the configuration procedures, see user identification configuration in *Security Configuration Guide*.
- Configure security zones. For information about the configuration procedure, see security zone configuration in *Security Configuration Guide*.

Creating a NetShare control policy

Restrictions and guidelines

The device supports only one NetShare control policy.

Procedure

1. Enter system view.
   `system-view`
2. Enter NetShare control configuration view.
   `netshare-control`
3. Create a NetShare control policy and enter its view.
   `policy name` *`policy-name`*
4. (Optional.) Configure a description for the NetShare control policy.
   `description` *`string`*
   By default, a NetShare control policy does not have a description.

Configuring NetShare inspection filtering criteria

About this task

In the NetShare control policy, you can configure multiple criteria of different criterion types to filter the packets to be analyzed for NetShare inspection. A packet must match a minimum of one criterion in each configured criterion type to be inspected by the NetShare control module.

The following filtering criterion types are supported:

- Source IP address.
- Destination IP address.
- Source security zone.
- Destination security zone.
- User, including username- and user group-based filtering criteria.

Procedure

1. Enter system view.

   `system-view`

2. Enter NetShare control configuration view.

   `netshare-control`

3. Enter NetShare control policy view.

   `policy name` *`policy-name`*

4. Configure source and destination security zone criteria:
   - Configure a source security zone criterion.

     `source-address` { **`ipv4`** | **`ipv6`** } *`object-group-name`*

     By default, the NetShare control policy does not contain any source security zone criterion.
   - Configure a destination security zone criterion.

     `destination-address` { **`ipv4`** | **`ipv6`** } *`object-group-name`*

     By default, the NetShare control policy does not contain any destination security zone criterion.
5. Configure source and destination address criteria:
   - Configure a source address criterion.

     `source-address` { **`ipv4`** | **`ipv6`** } *`object-group-name`*

     By default, the NetShare control policy does not contain any source address criterion.
   - Configure a destination address criterion:

     `destination-address` { **`ipv4`** | **`ipv6`** } *`object-group-name`*

     By default, the NetShare control policy does not contain any destination address criterion.
6. Configure user and user group criteria:
   - Configure a user criterion.

     `user` *`username`* [**`domain`** *`domain-name`*]

     By default, the NetShare control policy does not contain any user criterion.
   - Configure a user group criterion.

     `user-group` *`user-group-name`* [**`domain`** *`domain-name`*]

     By default, the NetShare control policy does not contain any user group criterion.

Configuring a NetShare detection method

Enabling APR-based detection

About this task

This feature supports detecting only a limited set of applications in the APR signature library.

Restrictions and guidelines

You can enable both APR-based detection and IPID trail tracking to detect NetShare behaviors.

APR-based NetShare detection uses the APR signature library to inspect only specific applications, such as QQ and WeChat. If an application is encrypted, APR-based NetShare detection cannot inspect it. As a best practice, enable APR-based detection only when explicitly required, because the detection might degrade the device performance.

Procedure

1. Enter system view.
   `system-view`
2. Enter NetShare control configuration view.
   `netshare-control`
3. Enter NetShare control policy view.
   `policy name` *`policy-name`*
4. Enable APR-based detection in the NetShare control policy.
   `application-inspect enable`
   By default, APR-based detection is enabled.

Enabling IPID trail tracking

About this task

By default, the device uses only the APR-based detection method to detect NetShare behaviors. APR-based NetShare detection applies only to a limited set of applications in the APR signature library. To meet the NetShare control requirements of various application scenarios, you can enable the IPID trail tracking method so the device can use both detection methods for NetShare behavior detection.

IPID trail tracking tracks the values of the IPID fields in packets to detect NetShare behaviors.

Restrictions and guidelines

You can enable both APR-based detection and IPID trail tracking to detect NetShare behaviors.

IPID trail tracking might degrade the device performance. Enable it only when explicitly required.

IPID trail tracking supports detecting the terminals that are running the Windows system, and detecting packets in which values of the IPID fields change regularly. Mobile terminals are not supported.

IPID trail tracking supports detecting IPv4 packets.

Procedure

1. Enter system view.
   `system-view`
2. Enter NetShare control configuration view.

netshare-control

3. Enter NetShare control policy view.

   policy name *policy-name*

4. Enable IPID trail tracking in the NetShare control policy.

   ipid-trail enable

   By default, IPID trail tracking is disabled in the NetShare control policy.

Setting the maximum number of terminals sharing an IP address

About this task

If the number of terminals sharing an IP address exceeds the limit, the device will take the NetShare control action set in the NetShare control policy.

Procedure

1. Enter system view.

   system-view

2. Enter NetShare control configuration view.

   netshare-control

3. Enter NetShare control policy view.

   policy name *policy-name*

4. Set the maximum number of terminals that can share an IP address.

   per-ip-shared max-terminals *number*

   By default, the number of terminals that can share an IP address is not limited.

Setting the NetShare control action

About this task

The NetShare control action is taken when the number of terminals sharing an IP address exceeds the limit.

The following NetShare control actions are supported:

- **Freeze**—Freezes the shared IP address for the specified freezing time. All packets sourced from the frozen IP address will be dropped.
- **Permit**—Permits the packets sourced from the IP address to pass through.
- **Logging**—Logs the NetShare control event.

Restrictions and guidelines

The **logging** keyword enables the NetShare control module to log NetStream control events and send log messages to the information center.

With the information center, you can set log message filtering and output rules, including output destinations.

The information center can output NetShare control logs to any destinations except the console and the monitor terminal. If you configure the console or monitor terminal as an output destination, the output destination setting will not take effect.

To view NetShare control logs stored on the device, use the **display logbuffer** command. Make sure you do not disable log output to the log buffer, which is enabled by default.

For more information about configuring the information center, see *Network Management and Monitoring Configuration Guide*.

Procedure

1. Enter system view.

   system-view

2. Enter NetShare control configuration view.

   netshare-control

3. Enter NetShare control policy view.

   policy name *policy-name*

4. Set the NetShare control action.

   action { **freeze** *freeze-time* | **permit** } [**logging**]

   By default, the NetShare control policy uses the **permit** action.

Activating NetShare control policy settings

About this task

After you create or delete a NetShare control policy, perform this task to activate the configuration.

Restrictions and guidelines

This task can cause temporary outage for all DPI services. As a best practice, perform the task after all DPI service policy and rule settings are complete.

For more information about activating DPI service module configuration, see DPI engine configuration in *DPI Configuration Guide*.

Procedure

1. Enter system view.

   system-view

2. Activate NetShare control policy settings.

   inspect activate

   By default, NetShare control policy creation and deletion do not take effect.

Disabling the NetShare control policy

About this task

If the NetShare control feature is not required on the network, disable the NetShare control policy.

Restrictions and guidelines

The device supports only one NetShare control policy. After you disable the NetShare control policy, the NetShare control feature becomes invalid.

Procedure

1. Enter system view.

   system-view

2. Enter NetShare control configuration view.

   netshare-control

3. Enter NetShare control policy view.

   policy name *policy-name*

4. Disable the NetShare control policy.

   disable

   By default, a NetShare control policy is enabled.

Manually freezing and unfreezing a shared IP address

About this task

You can manually unfreeze a frozen IP address or freeze a shared IP address that is not in frozen state.

Procedure

1. Enter system view.

   system-view

2. Enter NetShare control configuration view.

   netshare-control

3. Manually freeze a shared IP address.

   freeze { **ipv4** | **ipv6** } **ip-address** [**vpn-instance** *vpn-instance-name*] **time** *freeze-time*

4. Manually unfreeze a frozen IP address.

   unfreeze { **ipv4** | **ipv6** } **ip-address** [**vpn-instance** *vpn-instance-name*]

Display and maintenance commands for NetShare control

Execute **display** commands in any view.

Task	Command
Display NetShare control information about shared IP addresses.	**display netshare-control** [{ **ipv4** | **ipv6** } **ip-address** | **status** { **frozen** | **unfrozen** }] [**slot** *slot-number*]

NetShare control configuration examples

Example: Configuring NetShare control

Network configuration

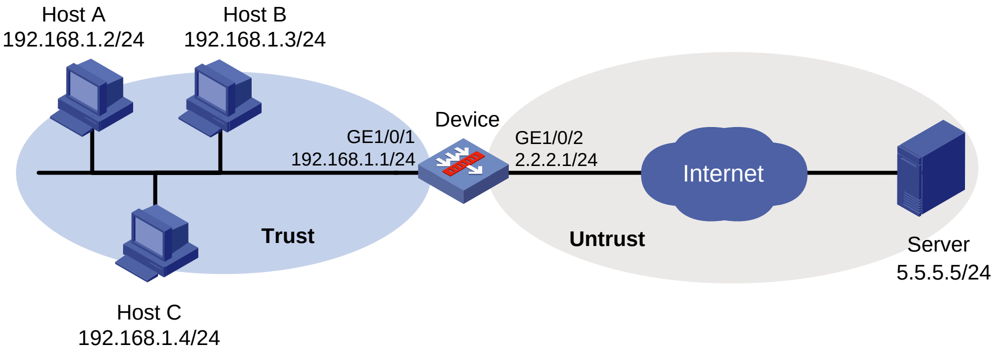
As shown in Figure 2, the device connects to the LAN and Internet through security zones **Trust** and **Untrust**, respectively.

Configure NetShare control on the device to meet the following requirements:

- Monitor the packets sent by the hosts on the LAN to the Internet for network sharing behavior inspection.

- If an IP address is detected to be shared by more than one host for Internet access, NetShare control will freeze the IP address for 1 hour and logs the event.

Figure 2 Network diagram



Procedure

1. Assign IP addresses to interfaces:

   # Assign an IP address to interface GigabitEthernet 1/0/1.

```
<Device> system-view
[Device] interface gigabitethernet 1/0/1
[Device-GigabitEthernet1/0/1] ip address 192.168.1.1 255.255.255.0
[Device-GigabitEthernet1/0/1] quit
```

   # Assign IP addresses to other interfaces in the same way. (Details not shown.)

2. Configure settings for routing.

   This example configures a static route to reach the server, and the next hop in the route is 2.2.2.2.

```
[Device] ip route-static 5.5.5.0 24 2.2.2.2
```

3. Add interfaces to security zones.

```
[Device] security-zone name trust
[Device-security-zone-Trust] import interface gigabitethernet 1/0/1
[Device-security-zone-Trust] quit
[Device] security-zone name untrust
[Device-security-zone-Untrust] import interface gigabitethernet 1/0/2
[Device-security-zone-Untrust] quit
```

4. Enter IPv4 security policy view and create a security policy rule named **trust-untrust** to permit the packets from security zone **Trust** to security zone **Untrust**.

```
[Device] security-policy ip
[Device-security-policy-ip] rule name trust-untrust
[Device-security-policy-ip-1-trust-untrust] source-zone trust
[Device-security-policy-ip-1-trust-untrust] destination-zone untrust
[Device-security-policy-ip-1-trust-untrust] source-ip-host 192.168.1.2
[Device-security-policy-ip-1-trust-untrust] source-ip-host 192.168.1.3
[Device-security-policy-ip-1-trust-untrust] source-ip-host 192.168.1.4
[Device-security-policy-ip-1-trust-untrust] action pass
[Device-security-policy-ip-1-trust-untrust] quit
[Device-security-policy-ip] quit
```

5. Create a NetShare control policy named **a**. Configure NetShare control to freeze an IP address for 1 hour if the number of endpoints sharing the IP address exceeds 1 and to log the event.

```
[Device] netshare-control
```

```
[Device-netshare-control] policy name a
[Device-netshare-control-policy-a] source-zone trust
[Device-netshare-control-policy-a] destination-zone untrust
[Device-netshare-control-policy-a] per-ip-shared max-terminals 1
[Device-netshare-control-policy-a] action freeze 60 logging
[Device-netshare-control-policy-a] quit
[Device-netshare-control] quit
```

6. Activate the NetShare control policy settings.

```
[Device] inspect activate
```

Verifying the configuration

# Verify that if a host on the LAN accesses the Internet by using a shared IP address through a proxy, the device can detect the network sharing behavior. In addition, the device will freeze the shared IP address for 1 hour and log the event. (Details not shown.)

NSFOCUS Firewall Series

NF Load Balancing Configuration Guide

NSFOCUS Technologies, Inc.

Document version: 6W600-20230221

Preface

- This configuration guide describes the fundamentals and configuration procedures for load balancing features.
- Security zones, security policies, object groups, object policies, APR, and session management.
- User access and authentication features (such as AAA, portal, user identification, password control, and PKI).
- Data security features (such as public key management, SSL, SSH, and crypto engine).
- Attack protection features (such as ASPF, connection limit, IP source guard, ARP attack protection, ND attack defense, uRPF, attack detection and prevention, and IP-MAC binding).

This preface includes the following topics about the documentation:

- Audience.
- Conventions.

Audience

This documentation is intended for:

- Network planners.
- Field technical support and servicing engineers.
- Network administrators.

Conventions

The following information describes the conventions used in the documentation.

Command conventions

Convention	Description
Boldface	**Bold** text represents commands and keywords that you enter literally as shown.
Italic	*Italic* text represents arguments that you replace with actual values.
[ ]	Square brackets enclose syntax choices (keywords or arguments) that are optional.
{ x | y | ... }	Braces enclose a set of required syntax choices separated by vertical bars, from which you select one.
[x | y | ...]	Square brackets enclose a set of optional syntax choices separated by vertical bars, from which you select one or none.
{ x | y | ... } *	Asterisk marked braces enclose a set of required syntax choices separated by vertical bars, from which you select a minimum of one.
[x | y | ...] *	Asterisk marked square brackets enclose optional syntax choices separated by vertical bars, from which you select one choice, multiple choices, or none.
&<1-n>	The argument or keyword and argument combination before the ampersand (&) sign can be entered 1 to n times.
#	A line that starts with a pound (#) sign is comments.

GUI conventions

Convention	Description
Boldface	Window names, button names, field names, and menu items are in Boldface. For example, the **New User** window opens; click **OK**.
>	Multi-level menus are separated by angle brackets. For example, **File** > **Create** > **Folder**.

Symbols

Convention	Description
⚠ **WARNING!**	An alert that calls attention to important information that if not understood or followed can result in personal injury.
△ **CAUTION:**	An alert that calls attention to important information that if not understood or followed can result in data loss, data corruption, or damage to hardware or software.
❗ **IMPORTANT:**	An alert that calls attention to essential information.
NOTE:	An alert that contains additional or supplementary information.
💡 **TIP:**	An alert that provides helpful information.

Network topology icons

Convention	Description
	Represents a generic network device, such as a router, switch, or firewall.
	Represents a routing-capable device, such as a router or Layer 3 switch.
	Represents a generic switch, such as a Layer 2 or Layer 3 switch, or a router that supports Layer 2 forwarding and other Layer 2 features.
	Represents an access controller, a unified wired-WLAN module, or the access controller engine on a unified wired-WLAN switch.
	Represents an access point.
	Represents a wireless terminator unit.
	Represents a wireless terminator.
	Represents a mesh access point.
	Represents omnidirectional signals.
	Represents directional signals.
	Represents a security product, such as a firewall, UTM, multiservice security gateway, or load balancing device.

Convention	Description
	Represents a security module, such as a firewall, load balancing, NetStream, SSL VPN, IPS, or ACG module.

Examples provided in this document

Examples in this document might use devices that differ from your device in hardware model, configuration, or software version. It is normal that the port numbers, sample output, screenshots, and other information in the examples differ from what you have on your device.

Contents

Load balancing overview

Load balancing (LB) is a cluster technology that distributes services among multiple network devices or links.

Advantages of load balancing

Load balancing has the following advantages:

- **High performance**—Improves overall system performance by distributing services to multiple devices or links.
- **Scalability**—Meets increasing service requirements without compromising service quality by easily adding devices or links.
- **High availability**—Improves overall availability by using backup devices or links.
- **Manageability**—Simplifies configuration and maintenance by centralizing management on the load balancing device.
- **Transparency**—Preserves the transparency of the network topology for end users. Adding or removing devices or links does not affect services.

Load balancing types

LB includes the following types:

Link load balancing—Link load balancing applies to a network environment where there are multiple carrier links to implement dynamic link selection. This enhances link utilization. Link load balancing supports IPv4 and IPv6, but does not support IPv4-to-IPv6 packet translation. Link load balancing is classified into the following types based on the direction of connection requests:

- **Outbound link load balancing**—Load balances traffic among the links from the internal network to the external network.
- **Inbound link load balancing**—Load balances traffic among the links from the external network to the internal network.
- **Transparent DNS proxy**—Load balances DNS requests among the links from the internal network to the external network.

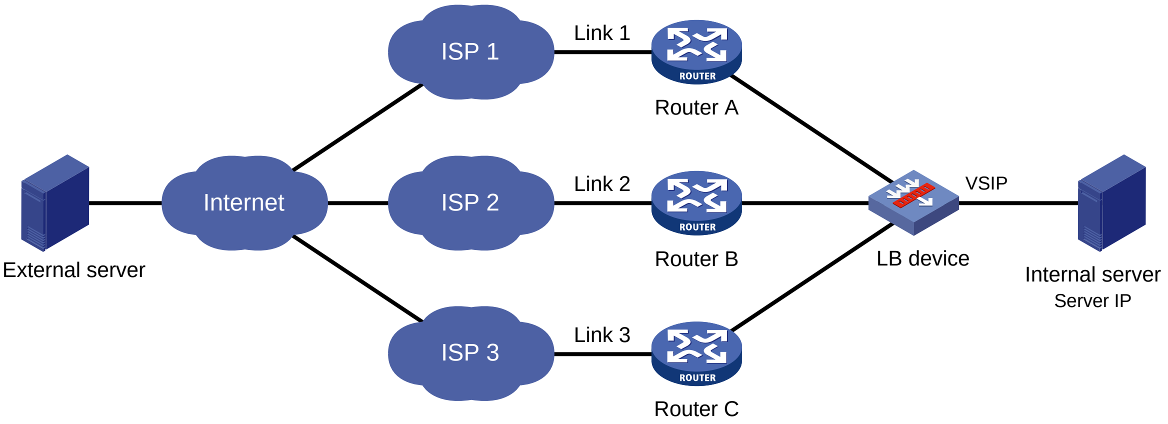
Configuring outbound link load balancing

About outbound link load balancing

Outbound link load balancing load balances traffic among the links from the internal network to the external network.

Typical network diagram

Figure 1 Network diagram



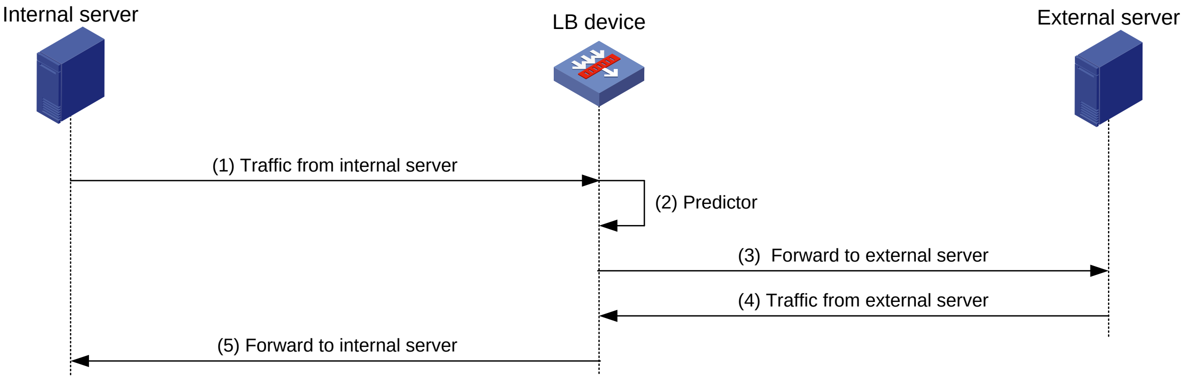
As shown in Figure 1, outbound link load balancing contains the following elements:

- **LB device**—Distributes outbound traffic among multiple links.
- **Link**—Physical links provided by ISPs.
- **VSIP**—Virtual service IP address of the cluster, which identifies the destination network for packets from the internal network.
- **Server IP**—IP address of a server.

Workflow

Figure 2 shows the outbound link load balancing workflow.

Figure 2 Outbound link load balancing workflow



Internal server
LB device
External server
(1) Traffic from internal server
(2) Predictor
(3) Forward to external server
(4) Traffic from external server
(5) Forward to internal server

The workflow for outbound link load balancing is as follows:

1. The LB device receives traffic from the internal server.
2. The LB device selects the optimal link based on the LB policy, sticky method, proximity algorithm, and scheduling algorithm (typically the bandwidth algorithm or maximum bandwidth algorithm) in turn.
3. The LB device forwards the traffic to the external server through the optimal link.
4. The LB device receives traffic from the external server.
5. The LB device forwards the traffic to the internal server.

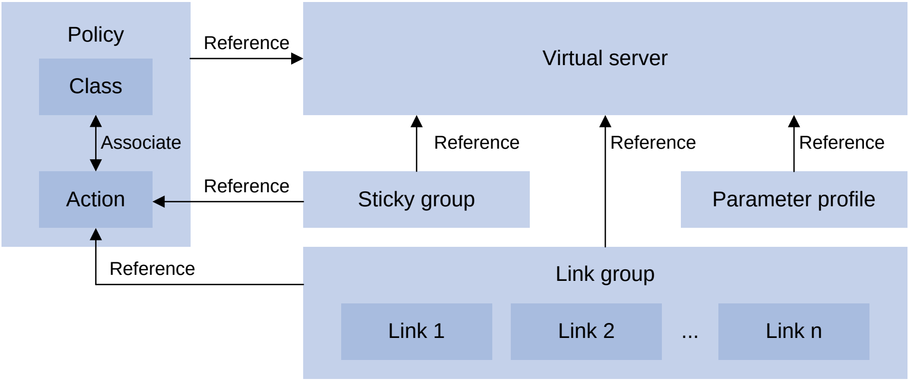
Outbound link load balancing tasks at a glance

Relationship between configuration items

Figure 3 shows the relationship between the following configuration items:

- **Link group**—A collection of links that contain similar functions. A link group can be referenced by a virtual server or an LB action.
- **Link**—Physical links provided by ISPs.
- **Virtual server**—A virtual service provided by the LB device to determine whether to perform load balancing for packets received on the LB device. Only the packets that match a virtual server are load balanced.
- **LB class**—Classifies packets to implement load balancing based on packet type.
- **LB action**—Drops, forwards, or modifies packets.
- **LB policy**—Associates an LB class with an LB action. An LB policy can be referenced by a virtual server.
- **Sticky group**—Uses a sticky method to distribute similar sessions to the same link. A sticky group can be referenced by a virtual server or an LB action.
- **Parameter profile**—Defines advanced parameters to process packets. A parameter profile can be referenced by a virtual server.

Figure 3 Relationship between the main configuration items



Tasks at a glance

To configure outbound link load balancing, perform the following tasks:

1. Configuring a link group
2. Configuring a link

3. Configuring a virtual server
4. (Optional.) Configuring an LB policy
    a. Configuring an LB class
    b. Configuring an LB action
    c. Configuring an LB policy
5. (Optional.) Configuring a sticky group
6. (Optional.) Configuring a parameter profile
7. (Optional.) Configuring ISP information
8. (Optional.) Setting the aging time for DNS cache entries
9. (Optional.) Configuring the ALG feature
10. (Optional.) Performing a load balancing test
11. (Optional.) Configuring SNMP notifications and logging for load balancing
    - Enabling SNMP notifications
    - Enabling load balancing logging

Configuring a link group

You can add links that contain similar functions to a link group to facilitate management.

Link group tasks at a glance

To configure a link group, perform the following tasks:

1. Creating a link group
2. (Optional.) Adding and configuring a link group member
3. Configuring a scheduling algorithm for a link group
4. Setting the availability criteria
5. Disabling NAT
6. (Optional.) Configuring SNAT
7. (Optional.) Enabling the slow online feature
8. (Optional.) Configuring health monitoring
9. (Optional.) Specifying a fault processing method
10. (Optional.) Configuring the proximity feature

Creating a link group

1. Enter system view.
    system-view
2. Create a link group and enter link group view.
    loadbalance link-group *link-group-name*
3. (Optional.) Configure a description for the link group.
    description *text*

    By default, no description is configured for a link group.

Adding and configuring a link group member

About this task

Perform this task to create a link group member or add an existing link as a link group member in link group view. You can also specify a link group for a link in link view to achieve the same purpose (see "Creating a link and specifying a link group").

After adding a link group member, you can configure the following parameters and features for the link in the link group:

- Weight.
- Priority.
- Connection limits.
- Health monitoring.
- Slow offline.

The member-based scheduling algorithm selects the best link based on these configurations.

Adding a link group member

1. Enter system view.
   `system-view`
2. Enter link group view.
   `loadbalance link-group` *`link-group-name`*
3. Create and add a link group member and enter link group member view.
   `link` *`link-name`*
   If the link already exists, the command adds the existing link as a link group member.
4. (Optional.) Configure a description for the link group member.
   `description` *`text`*
   By default, no description is configured for the link group member.

Setting the weight and priority of the link group member

1. Enter system view.
   `system-view`
2. Enter link group view.
   `loadbalance link-group` *`link-group-name`*
3. Enter link group member view.
   `link` *`link-name`*
4. Set the weight of the link group member.
   `weight` *`weight-value`*
   The default setting is 100.
5. Set the priority of the link group member.
   `priority` *`priority`*
   The default setting is 4.

Setting the connection limits of the link group member

1. Enter system view.
   `system-view`
2. Enter link group view.
   `loadbalance link-group` *`link-group-name`*

3. Enter link group member view.

   `link` *`link-name`*

4. Set the connection rate of the link group member.

   `rate-limit connection` *`connection-number`*

   The default setting is 0 (the connection rate is not limited).

5. Set the maximum number of connections allowed for the link group member.

   `connection-limit max` *`max-number`*

   The default setting is 0 (the maximum number of connections is not limited).

Configuring health monitoring for the link group member

1. Enter system view.

   `system-view`

2. Enter link group view.

   `loadbalance link-group` *`link-group-name`*

3. Enter link group member view.

   `link` *`link-name`*

4. Specify a health monitoring method for the link group member.

   `probe` *`template-name`*

   By default, no health monitoring method is specified for the link group member.

   You can specify an NQA template for health monitoring. For information about NQA templates, see NQA configuration in *Network Management and Monitoring Configuration Guide*.

5. Specify the health monitoring success criteria for the link group member.

   `success-criteria` { **`all`** | **`at-least`** *`min-number`* }

   By default, health monitoring succeeds only when all the specified health monitoring methods succeed.

Enabling the slow offline feature for the link group member

1. Enter system view.

   `system-view`

2. Enter link group view.

   `loadbalance link-group` *`link-group-name`*

3. Enter link group member view.

   `link` *`link-name`*

4. Enable the slow offline feature for the link group member.

   `slow-shutdown enable`

   By default, the slow offline feature is disabled.

5. Shut down the link group member.

   `shutdown`

   By default, the link group member is activated.

Configuring a scheduling algorithm for a link group

About this task

Perform this task to specify a scheduling algorithm for a link group and specify the number of links to participate in scheduling. The LB device calculates the links to process user requests based on the specified scheduling algorithm.

The device provides the following scheduling algorithms for a link group:

- **Weighted least connection algorithm (link-based)**—Always assigns user requests to the link with the fewest number of weighted active connections (the total number of active connections in all link groups divided by weight). The weight value used in this algorithm is configured in real server view.
- **Weighted least connection algorithm (link group member-based)**—Always assigns user requests to the link with the fewest number of weighted active connections (the total number of active connections in the specified link group divided by weight). The weight value used in this algorithm is configured in link group member view.
- **Random algorithm**—Randomly assigns user requests to links.
- **Round robin algorithm**—Assigns user requests to links based on the weights of links. A higher weight indicates more user requests will be assigned.
- **Bandwidth algorithm**—Distributes user requests to links according to the weights and remaining bandwidth of links.
- **Maximum bandwidth algorithm**—Distributes user requests always to an idle link that has the largest remaining bandwidth.
- **Source IP address hash algorithm**—Hashes the source IP address of user requests and distributes user requests to different links according to the hash values.
- **Source IP address and port hash algorithm**—Hashes the source IP address and port number of user requests and distributes user requests to different links according to the hash values.
- **Destination IP address hash algorithm**—Hashes the destination IP address of user requests and distributes user requests to different links according to the hash values.

Procedure

1. Enter system view.

   system-view

2. Enter link group view.

   loadbalance link-group *link-group-name*

3. Specify a scheduling algorithm for the link group.

   - Specify a link-based scheduling algorithm.

     predictor { **least-connection** | { **bandwidth** | **max-bandwidth** } [**inbound** | **outbound**] }

   - Specify a link group member-based scheduling algorithm.

     predictor hash address { **destination** | **source** | **source-ip-port** } [**mask** *mask-length*] [**prefix** *prefix-length*]

     predictor { **least-connection member** | **random** | **round-robin** }

   By default, the scheduling algorithm for a link group is weighted round robin.

4. Specify the number of links to participate in scheduling.

   selected-link min *min-number* **max** *max-number*

   By default, the links with the highest priority participate in scheduling.

Setting the availability criteria

About this task

Perform this task to set the criteria (lower percentage and higher percentage) to determine whether a link group is available. This helps implement traffic switchover between the master and backup link groups.

- When the number of available links to the total number of links in the master link group is smaller than the lower percentage, traffic is switched to the backup link group.
- When the number of available links to the total number of links in the master link group is greater than the upper percentage, traffic is switched back to the master link group.

Procedure

1. Enter system view.

   system-view
2. Enter link group view.

   loadbalance link-group *link-group-name*
3. Set the criteria to determine whether the link group is available.

   activate lower *lower-percentage* **upper** *upper-percentage*

   By default, when a minimum of one link is available, the link group is available.

Disabling NAT

Restrictions and guidelines

Typically, outbound link load balancing networking requires disabling NAT for a link group.

Procedure

1. Enter system view.

   system-view
2. Enter link group view.

   loadbalance link-group *link-group-name*
3. Disable NAT for the link group.

   transparent enable

   By default, NAT is enabled for a link group.

Configuring SNAT

About this task
